Glossary
Preface

This guide describes how to configure and use Oracle Communications Session Monitor Mediation Engine Connector.

The Oracle Communications Session Monitor product family includes the following products:

- Operations Monitor
- Enterprise Operations Monitor
- Fraud Monitor
- Control Plane Monitor

Audience

This guide is intended for SIP and IMS network operators who install and administer Oracle Communications Session Monitor.

Downloading Oracle Communications Documentation

Oracle Communications Session Monitor documentation and additional Oracle documentation is available from the Oracle Help Center Web Site:

http://docs.oracle.com

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit

http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit

http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Document Revision History

Overview of the Mediation Engine Connector User Interface

This chapter provides an overview of the Oracle Communications Session Monitor Mediation Engine Connector (Mediation Engine Connector) user interface.

Logging In to Mediation Engine Connector

You must first install an instance of Mediation Engine Connector (MEC), connect it to your network, and access the user interface using a Web browser. See the referenced sections when changing settings for additional details.

Note: The Web interface requires a browser with JavaScript enabled. Additionally, allowing "HTTP cookie" is recommended for several of the features.

Point the browser to the configured IP address of the management interface to load the login screen (see Figure 1–1). Log into the pre-configured account with user name admin and password oracle.

Figure 1–1 Login Screen
About Mediation Engine Connector Dashboard

After you log in, you should see the MEC dashboard. In the top-right corner, a drop down menu displays the current user and contains links to the Mediation Engines window, the HTML version of this manual (opens in a new browser window), and the option to logout.

Figure 1–2 shows the MEC dashboard.

Figure 1–2  Mediation Engine Connector Dashboard

The Mediation Engine Connector (MEC) dashboard is similar to the dashboard of the Mediation Engines. It allows you to view at a glance important information retrieved from single probes, as well as information aggregated from all Mediation Engines. The dashboard contains a configurable number of panels, which can be added or removed by the user. The following functionality is available for the MEC dashboard.

Adding a Dashboard Panel

To add a dashboard panel:

1. Right-click on the dashboard.
   
   A context menu appears.

2. Select Add a panel...
   
   A wizard appears in a new window, which guides you through the creation of the new dashboard panel.

Removing a Dashboard Panel

To remove a dashboard panel:

1. Click the cross button in the upper-right corner of the panel.
Rearranging Dashboard Panels
Dashboard panels can be rearranged using drag and drop. Drag a dashboard panel by clicking and holding the title bar and drop it where you would like it to stay on the page.

Enabling Dashboard Panel Refresh
The information in a dashboard panel refreshes only when it is active in a dashboard tab. Panels refresh only when they are visible to the user in an active browser window. You can change this behavior to enable panels to continue to refresh when they are not displayed in an active browser window.

To enable dashboard panels to refresh:
1. Select the menu title that displays your user name.
2. Click My Profile.
   The Edit own user information menu appears.
3. From the Widgets Refresh list, select refresh options that you would like to enable.
4. Click Finish.

About Dashboard Panels
This section describe only panels containing aggregated information. Panels containing Mediation Engine-related information are the same as the panels for the dashboard of the Mediation Engine.

The MEC dashboard can have the following types of panels:
- Panels containing aggregated information
- Panels containing information retrieved from a single Mediation Engine

Call Search Panel
The Call Search panel allows you to specify the search criteria and display matching unique calls on all probes simultaneously.

Figure 1–3 shows the Call Search panel.

The Call Search panel provides the following functionality:

Enter search criteria: To enter the search criteria, click Add search criteria button and select the field for which you want to enter a search criterion. A new row appears in the center-right area of the Call Search panel. You can enter a comparison operator and a comparison value for the criterion in this row.

Note: Enabling panel refresh can cause decreased system performance.
Execute a search: Click **Search** to execute the active search. The Call Search Results page appears.

Save search and retrieve saved searches: You can save a search by clicking **Save Search**. A new node appears in the tree to the left of the panel, under the **Saved Searches** folder. To give a name to the saved search, click the tree node for the search and enter a name. To retrieve a previously saved search, click select a node from under the **Saved Searches** folder. You can also delete a saved search by selecting its node and clicking **Delete**. Clicking **Delete all** deletes all saved searches. Note, that saved searches will be gone, once you reload the page or logout from the MEC and login again.

**Figure 1–3  Call Search Panel**

![Call Search Panel](image)

Call Search Results page: The Call Search Results page appears after you execute a search and displays unique calls matching the search criteria found on all Mediation Engines.

**Figure 1–4** shows an example call search results.
**Active Calls Counter Panel**

The Active Calls counter panel displays a chart which is computed based on values aggregated from all Mediation Engines. Currently the active calls counter is available. It is the only option present in the dashboard add panel wizard, when you choose **Display a counter**.

*Figure 1–5* shows the Active Calls counter panel.
About Mediation Engine Selection and View

Mediation Engine selection refers to the controls in the header bar of the MEC user interface. These controls allow you to select a Mediation Engine to display in the Mediation Engine view.

Figure 1–6 shows the Mediation Engine selection drop-down list.

Select the Mediation Engine you want to view from the drop-down list and the Mediation Engine view for this Mediation Engine is displayed. The Mediation Engine view is displayed in an iframe inside the MEC user interface. You are automatically logged in with the user name that you used to log into the MEC.

Figure 1–7 shows the Mediation Engine view page.

You can also display the Mediation Engine view in its own window by clicking **Open in new window** button.
Figure 1–7  Mediation Engine View Page
This chapter describes how to configure Oracle Communications Session Monitor Mediation Engine Connector (Mediation Engine Connector).

## Changing the Default Administrator Password

Start by changing the default administrator password. Click on the user name in the top-right corner and then on the **My Profile** link. The Edit own user information dialog box appears. Enter the new password twice and click **Finish**.

---

**Warning:** The default administrator password is easy to guess and is given in the product documentation, which is generally available to sub-users. Oracle strongly recommends changing the administrator password before creating any sub-users.

---

## Configuring Users and Realms

Due to the powerful visibility that Mediation Engine Connector (MEC) offers inside a network and the associated user privacy risks, a comprehensive user rights management system is available to restrict MEC users to defined views and functionalities.

When using multiple Mediation Engines with a MEC, the MEC is responsible for managing users and realms. The user database and the realm definitions are entered using the MEC user interface, which then distributes the information across the Mediation Engines. User database and realm definitions should be set up before the Mediation Engines are connected.

## Configuring Realms

Realms are used to partition the captured data for presenting a separate view to each MEC user. This is especially useful in cases where different resellers share the same MEC instance, each being allowed to view only the SIP users served by themselves.

In the MEC, a realm is defined by a pattern containing a set of telephone numbers, a set of domains, or both. Realms defined only by a range of telephone numbers should be used when the resellers share the same domain, but have different SIP users. Realms defined only by domain should be used when the MEC is analyzing the traffic from multiple domains. A combination of both cases defines a pattern with a domain and a telephone number range.

*Figure 2-1* shows the Realms Definitions section on the MEC Settings page.
To add a pattern that defines a realm, click the **Add pattern** button. A new row appears at the top of the table. The pattern is editable by double clicking on the row.

**Name**: The name of the realm that defines a reseller.

**First Number**: The lower limit of the telephone numbers range.

**Last Number**: The higher limit of the telephone numbers range.

**Domain**: The domain name. The field is optional as the realm might be identified only by number range.

**Comment**: An optional comment line, only for convenience.

To delete a selected pattern, click **Delete selection**. You can import and export realm configuration to and from CSV files, which helps in maintaining the realm configuration when many patterns have been defined.

You may also provision realm patterns automatically by uploading a similar CSV file via FTP.

---

**Figure 2–1  Realm Configuration**

A user is identified by a name, a set of access rights, a set of relations with other users, a realm to which the user belongs, an e-mail address, and a logo image file.

Users are organized hierarchically, with **admin** being the root user (default password **oracle**) with unrestricted access. Every user can create a set of **sub-users**, who have less permissions than their parent user.

User interface access is defined by permissions, that control which pages or sections from the user interface the user can see and use, and should be defined by the parent user when the user is created.

User management is similar to the process in the Mediation Engines. The difference being that users provisioned in the MEC are duplicated to all Mediation Engines belonging to it.
Configuring the Mediation Engine Connector URL and Authentication Secret

Mediation Engines communicate with their MEC using an http address under which the MEC is reachable. In most cases, it appears in the form of http://fully.qualified.hostname/, where fully.qualified.hostname is the fully qualified hostname of the MEC in your network.

You also need to enter an authentication secret, which is used to authenticate the Mediation Engines to the MEC.

These two settings can be entered on the Settings page in the Mediation Engine: ME Connector section.

Figure 2–2 shows an example of Mediation Engine Connector settings.

Figure 2–2 Mediation Engine Connector Settings

Adding Mediation Engines

The last step in setting up the MEC is to add connections to the Mediation Engines. You must first prepare each Mediation Engine so that it is ready for connections from the MEC. To prepare probing for a connection from the MEC, go to the Settings page of the Mediation Engine, navigate to the Network: Mediation Engine Connector section, and set the secret key.

Figure 2–3 shows an example of secret key setting.
You can now add the Mediation Engine to the MEC configuration in the Mediation Engine Management section of the MEC’s Settings page.

Figure 2–4 shows an example of a Mediation Engine configuration.

Click Add, a new row appears at the top of the table. To edit a field, double click on it. Enter a name for the Mediation Engine. The name you enter forms part of the URL under which the Mediation Engine is reachable from the MEC. You also must enter the Mediation Engine’s base URL along with the Mediation Engine’s secret. The former must be the HTTP URL under which the Mediation Engine’s user interface is
reachable. The secret must match the one you entered while preparing the probe. Click **Save** when you are finished.

The Mediation Engine is added to the MEC and is available in the Mediation Engine selection in the header bar of the MEC user interface.

---

**Important:** When adding a new Mediation Engine, the list of local users on the Mediation Engine might be lost. Any local users and realms in the Mediation Engine will be replaced with the current list of users and realms that exist on the Mediation Engine Connector. If there are users and realms on the Mediation Engine that do not exist on the Mediation Engine Connector, these will be lost.
Configuring Mediation Engines

This chapter describes how to set the location of Oracle Communications Mediation Engine Connector (MEC) and Mediation Engines URLs and test the connections between each Mediation Engine and the MEC and between every two Mediation Engines.

Setting Mediation Engine Connector Configurations

The URL of Mediation Engine Connector represents the location of the MEC instance. Mediation Engines use the password for authenticating probes at Mediation Engine Connector. The default password is oracle and should be changed by the administrator. Its value should be identical with the password set in the Mediation Engines (Proxy authentication secret field of the System Settings panel).

Click Save to commit changes to these fields.

Figure 3–1 shows an example of Mediation Engine Connector configuration settings.
Setting Mediation Engine Configurations

The Mediation Engines subordinated to the MEC can be configured from the Mediation Engine Management section. To add a Mediation Engine, click Add. A new row appears at the top of the table.

To edit a field, double click on the table entry. Name, URL, and password should be given to each Mediation Engine. The name of the Mediation Engine is used by the MEC to form the URL under which the Mediation Engine is reached. The base URL field holds the address of the Mediation Engine's Web interface. The Shared secret is the password required by the Mediation Engine to authenticate itself while connecting to the MEC. The same password needs to be set in the connecting Mediation Engine under the System Settings section. To commit any changes done to the Mediation Engine's table, click Save.

To delete Mediation Engines from the table, select them and click Delete selected button. The Disabled? column is used to disconnect a Mediation Engine from the MEC. The configuration of the MEC (for example, users and realms) may be replicated to any Mediation Engine by clicking Replicate configuration button. Changes to the Mediation Engine configuration need to be committed by clicking Save.

Figure 3–2 shows an example of Mediation Engine configuration.

Figure 3–2  Mediation Engine Management

Setting Node Connection Timeout

Node connection timeout is the timeout value for connecting to nodes, for example when replicating settings to nodes. The value is given in seconds.

Testing Connections between Mediation Engines

After the Mediation Engines have been configured in the Mediation Engine Management section, the link between any two Mediation Engines (including the MEC) may be tested by clicking Start Connection Test button. A ping is sent by each Mediation Engine and by the MEC to each other in order to determine the link quality presented by the Round trip time value.
The **Status** is displayed as **OK** in case the source and destination Mediation Engines are connected to each other, or **Failed** otherwise. The **Clear Results** button deletes the test results from the panel.

Figure 3–3 shows an example of Mediation Engine connection test results.

### Understanding Call Correlation

Message segments (call legs) of a call event can be distributed and stored on multiple mediation engines. Call correlation is the process of collecting all the distributed message segments of the call event from each mediation engine, merging them in the order of the call, and displaying the call event as a whole.

Mediation Engine Connector allows a user to monitor multiple mediation engines. Because each mediation engine contains its own list of call events, which may contain only call legs of the full call event, Mediation Engine Connector has to decide which of the call events from each mediation engine are from the same call. When passing a call event through a device monitored by multiple mediation engines, the Mediation Engine Controller locates any identical call events and consolidates the data. The consolidated call event data is displayed as one single call event flow in Mediation Engine Connector.

### Implementing Call Correlation

Mediation Engine Connector will correlate the call event when call events share a common call leg.

For each call leg that is a candidate for being the common call leg, the mediation engine runs a hash function over the INVITE message and stores it in the database together with a pointer to the call event of the call leg. A candidate call leg is a call leg where one of the two endpoints is a neighbor device. A neighbor device is a device configured on one of the other mediation engines, which is not marked as an **External** device.

When displaying the call event, each mediation engine is checked for an identical hash in their database. If true, the details of their call event are included in the display.
Understanding Call Correlation

For example:

You have a device configuration that contains multiple sites containing one mediation engine for each site. Each site also contains several devices and all of the call’s event traffic involved in one of these devices is sent to the site's mediation engine. To correlate a call event:

1. The call event leaves site A and directly enters site B, such as there is a call leg with one device on site A and one device on site B.
2. A device is configured as an Internal device on its site's mediation engine.
3. If there is direct traffic between a device on site A and a device on site B, the device on site B is configured as an External device on the mediation engine of site A. If there is direct traffic between a device on site B and a device on site A, the device on site A is configured as an External device on the mediation engine of site B.
4. Additional devices on a site can be configured as External devices on other sites mediation engines.

Configuration 1

The call event traverses five devices.

Devices DEV1 and DEV 2 are on site A, devices DEV 3, DEV 4, and DEV 5 are on site B. The following Internal assignments satisfy the requirement in point 2.

<table>
<thead>
<tr>
<th>DEVICES</th>
<th>SITE A</th>
<th>SITE B</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEV1</td>
<td>Internal</td>
<td></td>
</tr>
<tr>
<td>DEV2</td>
<td>Internal</td>
<td></td>
</tr>
<tr>
<td>DEV3</td>
<td>Internal</td>
<td>Internal</td>
</tr>
<tr>
<td>DEV4</td>
<td>Internal</td>
<td>Internal</td>
</tr>
<tr>
<td>DEV5</td>
<td>Internal</td>
<td>Internal</td>
</tr>
</tbody>
</table>

Configuration 2

If there is traffic from DEV2 to DEV3, add External devices as follows:

<table>
<thead>
<tr>
<th>DEVICES</th>
<th>SITE A</th>
<th>SITE B</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEV1</td>
<td>Internal</td>
<td></td>
</tr>
<tr>
<td>DEV2</td>
<td>Internal</td>
<td></td>
</tr>
<tr>
<td>DEV3</td>
<td>Internal</td>
<td>External</td>
</tr>
<tr>
<td>DEV4</td>
<td>Internal</td>
<td></td>
</tr>
<tr>
<td>DEV5</td>
<td>Internal</td>
<td></td>
</tr>
</tbody>
</table>

Because leg2 goes from DEV2 to DEV3 the above configuration satisfies the requirement in point 1 for this call event. This is a functioning configuration.

Note: In Operations Monitor, the Mediation Engine Connector hash on P-Charging-Vector icid-value parameter and the Mediation Engine Connector hash search on all external legs settings affect the generation of hashes.

For more information on the "Mediation Engine Connector hash on P-Charging-Vector icid-value parameter" and the "Mediation Engine Connector hash search on all external legs" settings, see "System Settings Summary" in Operations Monitor User's Guide.

Note: This could have a small performance impact, but it ensures that the device name is available for display purposes on that mediation engine.
Configuring Multiple Mediation Engine Nodes for Call Correlation

To configure multiple mediation engine nodes for call correlation, do the following:

1. **Setting the Authentication of a Mediation Engine**
2. **Setting the Authentication of Mediation Engine Connector**
3. **Adding the Mediation Engines to the Mediation Engine Connector Node List**
4. **Testing the Connection**
5. **Setting the Platform Devices for Each Mediation Engine**
6. **Applying Configuration Changes**
7. **(Optional) Setting the Timeout for Call Searches**
8. **Viewing Correlation Calls**

**Setting the Authentication of a Mediation Engine**

Mediation engines communicate with Mediation Engine Connector using the fully qualified host name or IP address of Mediation Engine Connector and an authentication password, which is used by Mediation Engine Connector to verify the authentication of the mediation engines.

To set the authentication of a mediation engine:

1. In a web browser, log in to Mediation Engine Connector.
   
   The Mediation Engine Connector window appears.

2. From the *user* list, select **Settings**, where *user* is your login name.
   
   The Settings window appears.

3. Under **Mediation Engines**, select **ME Connector**.
   
   The **ME Connector** page appears.

4. In the **Hostname or IP of MEC** text box, enter the host name of Mediation Engine Connector.

5. In the **Password for Mediation Engine nodes**, enter a secure password.

6. Click **Save**.

**Setting the Authentication of Mediation Engine Connector**

Before a connection is made between Mediation Engine Connector and a mediation engine, an authentication token (password) is used to verify the authentication of Mediation Engine Connector.

All mediation engines require their own individual authentication token. Apply the following steps to each mediation engine in your network.

To set the authentication of Mediation Engine Connector:

1. In a web browser, log in to Operations Monitor.
The Operations Monitor window appears.

2. From the user list, select Settings, where user is your login name.
   The Settings window appears.

   The System Settings page appears.

4. Scroll down to the Authentication token (shared secret between MEC and ME) row.

5. Double-click the Authentication token (shared secret between MEC and ME) row.
   The Update System Setting dialog box appears.

6. In the Default value text box, enter the mediation engine's authentication secret.

7. Click Update.

   The Mediation Engine Connector page appears.

9. In the Authentication token (shared secret between MEC and ME) text box, enter the mediation engine's authentication secret.

10. Click Update.

11. Click Close, which closes the Settings window.

Adding the Mediation Engines to the Mediation Engine Connector Node List
Adding the mediation engines to the Mediation Engine Connector node list makes each mediation engine available as a node in the top menu bar of Mediation Engine Connector.

To add the mediation engines to the Mediation Engine Connector node list:

1. Verify that the Settings window is still open.

2. Under Mediation Engines, select ME Management.
   The ME Management page appears.

3. In the ME Management toolbar, click Add.

4. In the Node Name column, enter a name for the mediation engine's node.

5. In the Hostname or IP column, enter the host name of the mediation engine.

6. In the Share secret column, enter the mediation engine's authentication secret.

7. Apply steps 3-6 for all the mediation engines in your network.

8. In the ME Management tool bar, click Replicate configuration, which propagates the changes to all your mediation engines.

9. In the ME Management tool bar, click Save.

Testing the Connection
To test the connection:

1. Verify the Settings window is still open.

2. Under Mediation Engines, select Connection test.
The Connection test page appears.

3. In the Connection test toolbar, click Start Connection Test.

4. Verify that the Status column displays OK, which confirms that the configuration is working and all the machines are reachable.

5. Click Close, which closes the Settings window.

Setting the Platform Devices for Each Mediation Engine
To set the platform devices for each mediation engine:

1. In a web browser, log in to Operations Monitor.
   The Operations Monitor window appears.

2. From the user list, select Settings, where user is your login name.
   The Settings window appears.

   The Platform Devices page appears.

4. Select the device you wish to set as an External device.
   By default, devices are set as Internal devices.

5. In the Platform Devices tool bar, click Toggle external, which sets the device as an External device and makes it visible to other mediation engines on Mediation Engine Connector.

6. Click Close, which closes the Settings window.

Applying Configuration Changes
It is important to replicate the configuration after any change related to platform devices on any Mediation Engine node. When you have finished configuring your devices, apply the configuration changes.

To apply configuration changes:

1. In a web browser, log in to Mediation Engine Connector.
   The Mediation Engine Connector window appears.

2. From the user list, select Settings, where user is your login name.
   The Settings window appears.

3. Under Mediation Engines, select ME Management.
   The ME Management page appears.

4. In the ME Management tool bar, click Replicate configuration, which propagates the changes to all your mediation engines.

5. In the ME Management tool bar, click Save.

6. Click Close, which closes the Settings window.

(Optional) Setting the Timeout for Call Searches
When searching for a call event in Mediation Engine Connector, all mediation engine nodes are queried. If a mediation engine node finds a call event, it queries the neighboring nodes to check for additional call legs. Use the Timeout for Mediation
**Engine querying** system setting to set the timeout for these queries on the mediation engine nodes.

To set the timeout for call searches:

1. In a web browser, log in to Operations Monitor.  
   The Operations Monitor window appears.
2. From the *user* list, select **Settings**, where *user* is your login name.
3. Under **System Management**, select **Systems Settings**. 
   The **System Settings** page appears.
4. Scroll down the **System Settings** page until you see the **Timeout for Mediation Engine querying** row.
5. Double-click the **Timeout for Mediation Engine querying** row. 
   The Update System Setting dialog box appears.
6. In the **Maximum value** text box, enter a number between 5 and 120.
7. Click **Update**.

**Viewing Correlation Calls**

A correlated call event is only viewable when a mediation engine is accessed from Mediation Engine Connector. If you access the mediation engine directly from a web browser and not from Mediation Engine Connector, only the call events content found in the mediation engine is displayed.

To view correlation calls:

1. In a web browser, log in to Mediation Engine Connector. 
   The Mediation Engine Connector window appears.
2. In the top menu bar, select a mediation engine from the **Select a node** list. 
   The Operations Monitor window appears.
3. From the Navigation pane under **Operations**, click **Calls**.
4. In the **Recent calls** table, right-click the row for which to display the correlated call event’s message flow. 
   The **Message Flow for Call: caller and callee** window appears.
   where *caller* is the number that initiated the call and *callee* is the call number that received the call.
5. When you have finished viewing the call event’s message flow, press the **ESC** key, which closes the message flow window.
AOR
Address Of Record.

B2BUA
Back-to-back User Agent. A logical entity that receives a request and processes it as a UAS. In order to determine how the request should be answered, it acts as a UAC and generates requests. See RFC 3261 for details.

BSS
Business Support System.

Call leg
A call leg is the portion of the call between two SIP devices.

CDR
Call Detail Record.

Codec
COmpressor/DECompressor, algorithms for compressing and decompressing data.

CSV
Comma Separated Values. An exchange format for tabular data understood by Microsoft Excel, OpenOffice.org, and many other applications.

DHCP
Dynamic Host Configuration Protocol. Used for automatically assigning network addresses.

Diameter
Network protocol for data exchange, database access, accounting and policy control, successor of Radius.

DNS
Domain name service.

DoS
Denial of Service.
ENUM
Protocol based on DNS used within IMS for routing decisions.

E-Model

Egress device
An egress device is the SIP device through which the call leaves the platform.
A more formal definition: An egress call leg is one which has as source a device from the platform, and the destination IP address is from outside the platform. A device is an egress device from a call if it is the source device of an egress call leg. If the call is terminated by a gateway device, this device is also considered an egress device.

Ethernet
Family of frame-based computer networking technologies for local area networks (LANs).

FTP
File Transfer Protocol.

HA
High Availability.

HTML
HyperText Markup Language.

HTTP cookie
Information unit from a web server for purposes of identification and customization. It is stored by the web browser and accessed by the server during subsequent visits.

H.248
Gateway control protocol.

H.323
VoIP protocol defined by ITU-T.

ICMP
Internet Control Message Protocol. Defined in RFC 792.

I.e-eff
Effective equipment impairment factor. See ITU recommendation G.107.

IMS
IP Multimedia Subsystem.

Ingress device
An ingress device is the SIP device through which the call enters the platform.
A more formal definition: An ingress call leg is one which has as destination a device from the platform, and the source IP address is from outside the platform. A device is an ingress device from a call if it is the destination device of an ingress call leg. If the call is created by a gateway device, this device is also considered an ingress device.
IP

ISUP
ISDN user part.

ITU
International Telecommunication Union.

JavaScript
A scripting programming language most commonly used to add interactive features to web pages.

Jitter
A measure of the variability over time of the latency across a network. Term generally used in the VoIP environment describing the variation in delay between packets.

JSON
JavaScript Object Notation, a lightweight computer data interchange format.

LISP
Mature high-level programming language based on lambda calculus.

ME
Mediation Engine. The ME is the core of the Session Monitor product family running the real-time data processing and serves the frontend and interfaces.

Megaco
Gateway control protocol.

MEGACO TerminationID
Termination IDs of physical Terminations are provisioned in the Media Gateway.

MEGACO ContextID
A Context is an association between a number of Terminations. The Context describes the topology (who hears/sees whom) and the media mixing and/or switching parameters if more than two Terminations are involved in the association.

MEGACO Transaction
MEGACO Commands between the Media Gateway Controller and the Media Gateway are grouped into Transactions.

MGCP
Media Gateway Control Protocol.

MIB
Management Information Base.

MOS
The Mean Opinion Score (MOS) provides a numerical indication of the perceived quality of the received media. The MOS is expressed as a single number in the range of 1 to 5. MOS is always measured by humans. Software products and devices like Session
Monitor Operations Monitor can only estimate it, the result being MOS-LQE (listening quality estimate).

The estimation is done based on a set of static parameters and taking into account a set of factors related to the flow of the voice packets throughout the network. The content of the packets is not deeply inspected. This can have an impact in such cases where a call is hopping over multiple media processors, resulting in multiple legs, some of which are not available to Session Monitor Operations Monitor (like foreign network segments, TDM etc). In these cases, only the maximum possible voice quality over the inspected segments is provided, rather than an absolute estimate, end-to-end.

In other words, if one of the media legs not accessible to Session Monitor Operations Monitor will degrade the quality, a processor downstream will decode the signal and re-packetize it to good parameters, but without enhancing it back, Session Monitor Operations Monitor might rate the call higher than the human listener will actually perceive it.

<table>
<thead>
<tr>
<th>MOS</th>
<th>Quality</th>
<th>Impairment</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Excellent</td>
<td>Imperceptible</td>
</tr>
<tr>
<td>4</td>

</tr>
</tbody>
</table>

**NIC**
Network Interface Card.

**NTP**
Network Time Protocol.

**OID**
Object IDentifiers.

**OSI**

**OSS**
Operations Support System.

**PCAP**
Packet Capture file format. Used by many network analyzers including the open source tool Wireshark. The stored messages contain TCP/UDP headers, IP header and Layer 2 headers, plus the timestamp at which the message was received.

**PDF**
Portable Document Format. PDF is used for representing two-dimensional documents in a manner independent of the application software, hardware, and operating system.

**Probe**
A probe is software that collects raw signaling data and media traffic. You can configure probes to run locally within the Mediation Engine (embedded probe), or
integrated with Oracle Communications Session Border Controller (embedded probe), or run on dedicated machines (standalone probe).

**Proxy**
An intermediary entity that acts as both a server and a client for the purpose of making requests on behalf of other clients. A proxy server primarily plays the role of routing. See RFC 3261 for details.

**PSTN**
Public Switched Telephone Network.

**R-Factor**
Voice quality score on a scale from 0 (worst) to 100 (best).

**RADIUS**
Remote Authentication Dial-In User Service is a networking protocol that provides centralized Authentication, Authorization, and Accounting (AAA) management for computers to connect and use a network service.

**REST**
Representational State Transfer. A convention for web services.

**RSPAN**
Remote SPAN.

**RTP**

**RTCP**
Real-time Transport Control Protocol. Used for reporting end point media quality information.

**RTT**
Round-Trip Time. The time elapsed for a message to a remote target and back again.

**SBC**
Session Border Controller. Used in some VoIP networks to offer decoupling, interoperability, and to hide the internal topology. They are typically involved in the signalling and often also relay the media streams. From the SIP point of view, they are usual B2BUAs.

**SCTP**
Stream Control Transmission Protocol. Is a Transport Layer protocol ensuring reliable, insequence transport of messages with congestion control.

**SDP**
Session Description Protocol. Defined in RFC 4566.

**SIGTRAN**
Suite of protocols to enable the use of SS7 over IP networks.

**SIP**
**SNMP**  

**SPAN**  
Switched Port Analyzer.

**SPIT**  
SPAM over Internet Telephony.

**SS7**  
Signaling System 7.

**TCP**  
Transmission Control Protocol.

**UAC**  
User Agent Client. The SIP element that creates a new request; usually the caller’s SIP device in case of calls, or the user’s SIP device in case of registrations. For details, see [RFC 3261], Section 6.

**UAS**  
User Agent Server. The SIP element answering the request; usually the callee’s SIP device, or a SIP server. For details, see [RFC 3261], Section 6.

**UDP**  
User Datagram Protocol.

**URI**  
Uniform Resource Identifier.

**VLAN**  
Virtual Local Area Network.

**VRRP**  
Virtual Router Redundancy Protocol. A redundancy protocol described in [RFC 3768].

**XML**  
The eXtensible Markup Language is a flexible text format for creating structured computer documents.
