Value-Added Reseller (VAR) Language

Oracle Retail VAR Applications

Applications. For purposes of this section, "alteration" refers to all alterations, translations, upgrades, enhancements, customizations or modifications of all or any portion of the VAR Applications including all reconfigurations, reassembly or reverse assembly, re-engineering or reverse engineering and recompilations or reverse compilations of the VAR Applications or any derivatives of the VAR Applications. You acknowledge that it shall be a breach of the agreement to utilize the relationship, and/or confidential information of the VAR Applications for purposes of competitive discovery.

The VAR Applications contain trade secrets of Oracle and Oracle's licensors and Customer shall not attempt, cause, or permit the alteration, decompilation, reverse engineering, disassembly or other reduction of the VAR Applications to a human perceivable form. Oracle reserves the right to replace, with functional equivalent software, any of the VAR Applications in future releases of the applicable program.

Send Us Your Comments

Oracle Retail Merchandise Financial Planning Cloud Service Implementation Guide, Release 16.0

Oracle welcomes customers' comments and suggestions on the quality and usefulness of this document.

Your feedback is important, and helps us to best meet your needs as a user of our products. For example:

- Are the implementation steps correct and complete?

- Did you understand the context of the procedures?

- Did you find any errors in the information?

- Does the structure of the information help you with your tasks?

- Do you need different information or graphics? If so, where, and in what format?

- Are the examples correct? Do you need more examples?

If you find any errors or have any other suggestions for improvement, then please tell us your name, the name of the company who has licensed our products, the title and part number of the documentation and the chapter, section, and page number (if available).

> **Note:** Before sending us your comments, you might like to check that you have the latest version of the document and if any concerns are already addressed. To do this, access the Online Documentation available on the Oracle Technology Network web site. It contains the most current Documentation Library plus all documents revised or released recently.

Send your comments to us using the electronic mail address: retail-doc_us@oracle.com

Please give your name, address, electronic mail address, and telephone number (optional).

If you need assistance with Oracle software, then please contact your support representative or Oracle Support Services.

If you require training or instruction in using Oracle software, then please contact your Oracle local office and inquire about our Oracle University offerings. A list of Oracle offices is available on our web site at `http://www.oracle.com`.

x

Preface

This document provides critical information about the processing and operating details of Oracle Retail Merchandise Financial Planning Cloud Service.

Audience

This document is for:

- Systems administration and operations personnel
- Systems analysts
- Integrators and implementers
- Business analysts who need information about Oracle Retail Merchandise Financial Planning Cloud Service processes and interfaces

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at
http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit
http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit
http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents in the Oracle Retail Merchandise Financial Planning Cloud Service Release 16.0 documentation set:

- *Oracle Retail Merchandise Financial Planning Cloud Service Administration Guide*
- *Oracle Retail Merchandise Financial Planning Cloud Service Release Notes*
- *Oracle Retail Merchandise Financial Planning Cost Cloud Service User Guide*
- *Oracle Retail Merchandise Financial Planning Retail Cloud Service User Guide*

Improved Process for Oracle Retail Documentation Corrections

To more quickly address critical corrections to Oracle Retail documentation content, Oracle Retail documentation may be republished whenever a critical correction is needed. For critical corrections, the republication of an Oracle Retail document may at times not be attached to a numbered software release; instead, the Oracle Retail document will simply be replaced on the Oracle Technology Network Web site, or, in the case of Data Models, or, in the case of Data Models, to the applicable My Oracle Support Documentation container where they reside.

Oracle Retail documentation is available on the Oracle Technology Network at the following URL:

http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html

An updated version of the applicable Oracle Retail document is indicated by Oracle part number, as well as print date (month and year). An updated version uses the same part number, with a higher-numbered suffix. For example, part number E123456-02 is an updated version of a document with part number E123456-01.

If a more recent version of a document is available, that version supersedes all previous versions.

Oracle Retail Documentation on the Oracle Technology Network

Oracle Retail product documentation is available on the following web site:

http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html

(Data Model documents are not available through Oracle Technology Network. You can obtain them through My Oracle Support.)

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1

Introduction

Oracle Retail Merchandise Financial Planning (MFP) Cloud Service provides strategic and financial product planning functions. These functions support industry planning standards for pre-season and in-season processes. For a more detailed overview of the functionality within MFP Cloud Service, see the *Oracle Retail Merchandise Financial Planning Cost Cloud Service User Guide* and *Oracle Retail Merchandise Financial Planning Retail Cloud Service User Guide*.

Contents of this Guide

This implementation guide addresses the following topics:

- Chapter 1, "Introduction". Overview of the MFP Cloud Service business workflow and skills needed for implementation.

- Chapter 2, "Implementation Considerations". Explanation of the factors to take into consideration before performing the implementation.

- Appendix A, "Appendix: Exports": List of measures for the available exports.

- Appendix B, "Appendix: Files Needed by OCI for Domain Build/Patch": List of files needed by Oracle OCI for implementation.

- Appendix C, "Appendix: Generating the Configuration for Plug-in Options": Information on the generating the configuration for the plug-in options.

- Appendix D, "Appendix: Batch Process and Control Files": Description of the batch process and control files.

Business Process Flow

Figure 1–1 shows a typical workflow for MFP Cloud Service.

Figure 1–1   Business Process Workflow
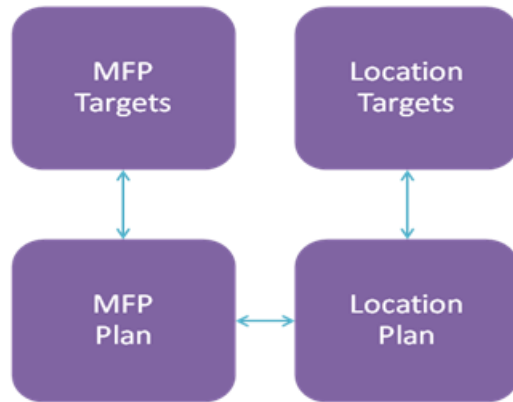

Table 1–1 describes the parts of the business process workflow in Figure 1–1.

Table 1–1   Business Process Workflow Components

Component	Description
MFP Targets	■ Planning Leader ■ A combination of traditional Top Down and Middle Out Roles ■ Plan Level is Department, Week, and Channel ■ Plan Sales, Markdowns, and Inventory by Type plus Receipts
MFP Plan	■ Merch Planner ■ Traditional Bottom Up Role ■ Plan Level is Subclass, Week, and Channel ■ Plan Sales, Markdowns, and Inventory by Type plus Receipts
Location Targets	■ Planning Leader or designate ■ Create a version of LY Sales/Markdowns that is corrected for non-repeated events such as store closures due to bad weather, construction, and so on ■ Plan Level is Company, Location, and Week ■ Plan total sales, markdowns, and so on
Location Plan	■ Loc Planner ■ Plan total sales, markdowns, and so on, through the use of average store metrics using a number of User Defined Hierarchies with Location attributes (comp, volume, size, climate, demographics, and so on) ■ Plan level is Department, Location, and Week

Key Features of MFP Cloud Service

MFP Cloud Service provides the following features:

■ Setting and passing targets

■ Creating a financial plan in a structured method

■ Plan reconciliation

- Plan approval

- Plan maintenance

- Replanning

- Plan monitoring

Skills Needed for Implementation

The implementer must have an understanding of the following applications and technical concepts.

Applications

The implementer must understand interface requirements of the integrated applications and data sources for the master data, demand, and inventory history. For full implementation, the implementer requires this knowledge for the following applications:

- Oracle Retail Predictive Application Server (RPAS)

- Oracle Retail Merchandise Financial Planning (MFP)

- Oracle Retail Merchandising System (RMS) or other merchandising system

Technical Concepts

The implementer must understand the following technical concepts:

- UNIX system administration, shell scripts, and job scheduling

- Performance constraints based on the retailer's infrastructure

- Retailer's hierarchical (SKU/store/day) data

- MFP batch processes

- Understanding of how RPAS rule language works

- Understanding of measures and dimension constructs

2

Implementation Considerations

The following information must be considered before configuring MFP Cloud Service:

- Configuration Considerations
- Data
- Integration
- User Roles and Security
- Internationalization
- Batch Process and Scheduling

Configuration Considerations

MFP Retail Cloud Service and MFP Cost Cloud Service both provide the following configuration options for a retailer to implement. Each can be chosen with or without the Whole Sale Franchise option and Local Currency option using automation plug-ins.

For more information about generating configurations for the plug-in options using the Configuration Tools, see Appendix C, "Appendix: Generating the Configuration for Plug-in Options".

Whole Sale Franchise Option

Retailers having whole sale franchise capabilities and wanting to plan specific metrics to support those functions can choose the Whole Sale Franchise option. Selecting a provision with this option provides additional tasks in the task flow, worksheets, and measures to support this process. For more information about these tasks, see the *Oracle Retail Merchandise Financial Planning Cost Cloud Service User Guide* or *Oracle Retail Merchandise Financial Planning Retail Cloud Service User Guide*. If a provision containing this option is chosen, the retailer must also provide additional data files to support this process. For more details, see "Data Files".

Local Currency Option

Retailers who want to plan in both primary currency as well as local currency can chose provisions containing this option. Selecting provisions with this option provides additional tasks, worksheets, and measures to support this process. The retailer must set up the Local Currency conversion details in the administration workbooks specific to this option. For more information details, see the *Oracle Retail Merchandise Financial Planning Cost Cloud Service User Guide* or *Oracle Retail Merchandise Financial Planning Retail Cloud Service User Guide*.

Data

MFP Retail and Cost Cloud Service both need following sets of data from customers, which are broadly classified as hierarchy files and data files. The data is described in the following sections:

- Hierarchy Files

- Data Files

Figure 2–1   MFP Cloud Service Data Interfaces
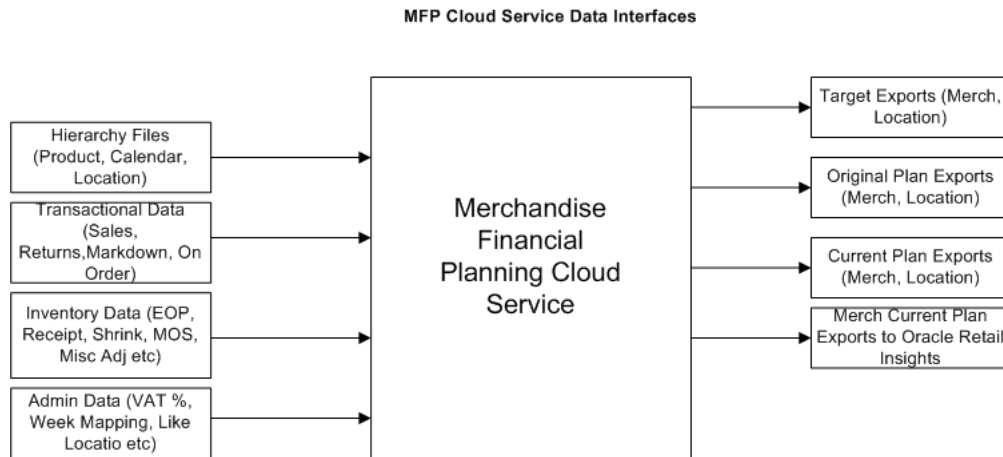

Hierarchy Files

This is the foundation data to build any RPAS solution. MFP Cloud Service requires the standard three hierarchy files, Calendar, Product, and Location.

> **Note:**   In all the hierarchy files, the hierarchy type User Defined Alternates (UDA) and data for those alternates do not need to be present in the hierarchy files. Administration users can directly set values for those alternates directly in the application. For more information, see the *Oracle Retail Predictive Application Server Administration Guide for the Fusion Client*. If a retailer also provides these details in the hierarchy files, data for all user alternates for that hierarchy must be present in that file with header information.

> **Note:**   If hierarchy files contain header information, then columns can be in any order but the file name must be in the format <hier>.hdr.csv.dat. If the hierarchy files does not contain hierarchy header, the hierarchy data must be in same order as specified in the tables in the following sections without UDA dimensions. The file must be named <hier>.csv.dat.

For information on the hierarchy files, see the following sections:

- Calendar Hierarchy File

- Product Hierarchy File

- Location Hierarchy File

■   Custom Messages Hierarchy File

Calendar Hierarchy File

File name: clnd.hdr.csv.dat

File format: comma-separated values file

The following table describes the fields in this file.

Name	Label	Hierarchy Type	Parent
DAY	Day	Main	None
WEEK	Week	Main	DAY
MNTH	Month	Main	WEEK
QRTR	Quarter	Main	MNTH
HALF	Half	Main	QRTR
YEAR	Year	Main	HALF
HLDY	Holiday	UDA	WEEK
EVNT	Event	UDA	WEEK
WOYR	Week of Year	Alternate	WEEK
STDB	STD/BTA	UDA	WEEK

Example:

```
day,day_label,week,week_label,mnth,mnth_label,qrtr,qrtr_label,half,half_

```

Note:

In MFP Cloud Service, the lowest level of planning is done at the Subclass level. It also needs aggregated actual data only at the subclass level. Base MFP configuration is defined to load actual data only at the Subclass level, but the lowest hierarchy level is still defined at the Style/Color level.

During implementation, the following options are available:

- If a retailer has all the actual data readily available at the Style/Color level and wants to do aggregation to the subclass level within MFP, the retailer can load style/color in the hierarchy. It involves changing the labeled intersection #Act_Load_Int# in the configuration to load actual at the Style/Color level. This increases the domain size considerably in a cloud environment and also increases the batch processing time.

- If domain size is a constraint and the retailer can provide pre-aggregated data at the Subclass level, no change is needed to the configuration. The retailer can ignore loading the style/color in the hierarchy file by loading the same subclass data in place of style/color.

If the hierarchy and data load are both at the Style/Color level, during item reclassifications at the Style/Color level, reloading the hierarchy with correct classifications and running the weekly batch calculations moves the correct historical data into the application. However, if the data load is only at the Subclass level, then during reclassifications at item level, the historical data must be loaded again.

Location Hierarchy File

File name: loc.hdr.csv.dat

File format: comma-separated values file

The following table describes the fields in this file.

Name	Label	Hierarchy Type	Parent
STOR	Location	Main	None
DSTR	District	Main	STOR
REGN	Region	Main	DSTR
CHNL	Channel	Main	REGN
CHAN	Chain	Main	CHNL
COMP	Company	Main	CHAN
CURR	Currency	UDA	CHNL
CHNG	Chain Group	UDA	CHAN
RGNG	Region Group	UDA	REGN
DSTG	District Group	UDA	DSTR
SCST	Store Comp Status	UDA	STOR
CLMT	Climate	UDA	STOR
SPCE	Space	UDA	STOR
LOCT	Location Type	UDA	STOR
FFLT	Fulfillment Type	UDA	STOR
INCM	Income	UDA	STOR

```

Custom Messages Hierarchy File

MFP Cloud Service also has an additional internal hierarchy for custom messages used in the application called Custom Messages Hierarchy (CMSH). Custom messages used in the application are pre-configured in that hierarchy file and, unless a retailer needs different custom messages, that file does not need to be changed.

File name: cmsh.hdr.csv.dat

File format: comma-separated values file

The following table describes the fields in this file.

Name	Label	Hierarchy Type	Parent
CMSD	Messages	Main	None

Example:

"CMS01","Seeding completed successfully!"

"CMS02","Seeding not successful. Please select Wp Seed Source."

Data Files

The following tables describe the data files (measures) needed, base intersection, data type, measure type, required/option, and expected data source details. In the Data Source column, DW means any Data Warehouse or equivalent system, RMS means Oracle Retail Merchandising System or its equivalent, and Internal means either any retailer internal system or administration user.

> **Note:** The selected value for each file in the Required/Optional column in the following tables is specific to the Provision option chosen. If the Wholesale Franchise Provision option is chosen for implementation, all wholesale franchise specific measures are required.

To simplify the integration, all measure files are configured to be loaded as one measure per file. Each measure's data must be present in a separate file and the file name must be the same as measure name with the extension .csv.ovr. All files must be in csv format.

Example:

Measure: drtysls1r

Base Intersection: week/scls/stor

Data Type: real

File Name: drtysls1r.csv.ovr

```
w01_2016,100000,1000,610.62
w02_2016,100000,1000,1938.61
w03_2016,100000,1000,1903.9
w04_2016,100000,1000,1291.73
```

Historical Data

It is recommended that you have at least two years of historical sales and inventory data for creating MFP targets. Less data can be used, but the more data that is available, the more statistical significance can be given to the MFP targets.

It is also important to have two years of history to produce an optimal forecast. Both MFP Cost and Retail Cloud Service use the embedded forecast.

Loading and Extracting Data

Data is loaded into MFP Cloud Service using the Online Administration Tools, which in turn use standard RPAS utilities. For more information on loading and extracting data using Online Administration Tools, see the *Oracle Retail Merchandise Financial Planning Cloud Service Administration Guide*.

Integration

MFP Cloud Service only supports the flat file integration of hierarchy and data files from source systems. There are no in-built interfaces to integrate with source systems such as RMS or Data Warehouse systems to extract hierarchy and actual data. Retailers

must extract and provide the hierarchy files and data files from their respective source systems as flat files in the required format and upload them to the Oracle Cloud SFTP server. The automated process send those files over to the RPAS DB Server and from there the files can be accessed by batch process triggered using the Online Administration Tools. In the same way, exported files in CSV format from the solution are pushed back to the Oracle Cloud SFTP server and from there retailers can download the extracted files. The retailer must integrate it with any other system that requires extracted plan data from MFP Cloud Service.

Integration with Oracle Retail Insights is enabled through Online Admin Tool tasks to export plan data to RI. For information on the integration and file format, see Appendix A. For more information on the tasks, see the *Oracle Retail Merchandise Financial Planning Cloud Service Administration Guide*.

User Roles and Security

To define workbook template security, the system administrator grants individual users, or user groups, access to specific workbook templates. Granting access to workbook templates provides users with the ability to create, modify, save, and commit workbooks for the assigned workbook templates. Users are typically assigned to groups based on their user application (or solution) role. Users in the same group can be given access to workbook templates that belong to that group alone. Users can be assigned to more than one group and granted workbook template access without belonging to the user group that typically uses a specific workbook template. Workbook access is either denied, read-only, or full access. Read-only access allows a user to create a workbook for the template, but the user is not able to edit any values or commit the workbook. The read-only workbook can be refreshed.

When users save a workbook, they assign one of three access permissions to the workbook:

- World—Allow any user to open and edit the workbook.
- Group—Allow only those users in their same group to open and edit the workbooks.
- User—Allow no other users to open and edit the workbook.

> **Note:** Users must have access to workbooks based on their role. The administrator must always follow the principal of least privilege; that is, each user must only be granted access to the product areas for which the user is responsible.

The following table provides guidance regarding which MFP users must have access to each of the workbooks.

Table 2–3   User's Access Permission for MFP Workbooks

Workbook	User Roles
MFP Admin	Merchandise Financial Planner
Merch Plan Targets	Merchandise Financial Planning Manager/Executive
Merch Plan	Merchandise Financial Planner
Location Plan Targets	Merchandise Financial Planning Manager/Executive
Location Plan	Merchandise Financial Planner

For more information on security, see the *Oracle Retail Predictive Application Server Administration Guide for the Fusion Client*. For more information on data security in a cloud environment, see the Hosting Policy documents for the cloud solution.

Internationalization

Internationalization is the process of creating software that can be translated more easily. Changes to the code are not specific to any particular market.

Oracle Retail applications have been internationalized to support multiple languages.

The RPAS platform supports associated solution extensions and solution templates.

- A solution extension includes a collection of code and generally available configurations. Typically, solution extensions are implemented by a retailer with minimal configuration.

- A solution template does not include code. A solution template is most typically implemented as a retailer configuration.

Oracle Retail releases the translations of the RPAS server and client, as well as strings from the solution extensions.

Translations of the solution templates are not released. Since the labels for measures, hierarchies, dimensions, and workbook templates are typically changed by the retailer at implementation time, languages for the templates are not released. All templates have the ability to support multi-byte characters.

For more information on internationalization, see the *Oracle Retail Predictive Application Server Administration Guide for the Fusion Client*.

Translations are available for MFP Cloud Service for the following languages:

- Dutch

- French

- German

- Italian

- Japanese

- Portuguese

- Spanish

Batch Process and Scheduling

Batch scripts are lists of commands or jobs executed without human intervention. A batch window is the time frame in which the batch process must run. It is the upper limit on how long the batch can take. Batch scripts are used for importing and exporting data and for generating targets. The retailer must decide the best time for running batch scripts within the available batch window.

How often to upload updated sales and inventory data and how often to re-create targets must be determined.

- You must consider at what interval to load the latest sales and inventory data. A weekly load of transactional type data is supported, since the base intersection is at week. It is recommended that the information transactional system, such as RMS, be loaded daily.

- Product availability and seasonal changes can be reasons for recalculating the targets. This can also be triggered by the addition of new products and availability of substantial new sales and inventory history.

The recommended batch schedule for MFP Cloud Service is to load historical and actual data on a weekly basis. All hierarchy changes can be loaded on a weekly or monthly basis.

In MFP Cloud Service, batch tasks can be controlled by a system administrator by using the Online Administration Tools. The tools are a predefined set of online administration tasks that are pre-configured for MFP Cloud Service. Those tasks, in turn, call the required batch scripts with preset parameters to perform the required tasks. For more information on the Online Administration Tool tasks, see the *Oracle Retail Merchandise Financial Planning Cloud Service Administration Guide*.

In MFP Cloud Service, the entire batch process is controlled using a set of batch control files. A predefined set of batch scripts reads those control files during the batch process. Though users cannot make any changes to underlying batch scripts, they can make some changes to batch control by uploading override control files. Those override control files are control files with the same name but with the extension *.ctl.

During upgrade or patches, any changes to base control files will be automatically updated, but user-provided override control files will not be touched. So during each upgrade/patch process, the retailer should maintain any changes to override control files that are uploaded by them.

For more details about the list of batch control files and batch process using them, see Appendix D, "Appendix: Batch Process and Control Files".

A

Appendix: Exports

The tables in this appendix list the measures for the MFP Cloud Service exports.

MFP Cloud Service provides exports of multiple versions of approved and working plan data for all major workbook templates Merch Target, Merch Plan, Location Target, and Location Plan. Exported approved plans (Current Plan and Original Plan) data can be used by a retailer to interface with any other applications for reporting purposes or as input to other systems that need MFP Plan data. All exported files are in CSV format.

For more information related to extracted measures, the approval process, and the administration process related to export, see the *Oracle Retail Merchandise Financial Planning Retail Cloud Service User Guide* and *Oracle Retail Merchandise Financial Planning Cost Cloud Service User Guide*.

MFP Retail Cloud Service Exports

This section lists the measures for the MFP Retail Cloud Service exports.

MFP Cloud Service Integration with RI

MFP Cloud Service integrates with Oracle Retail Insights (RI) to export the approved Original and Current Merch Plans.

This section covers the details of the exports, list of measures exported, and the format.

All approved Merch Plans (CP and OP) for all the unelapsed weeks are exported to RI during each export at the Sub-Class/Channel/Week Level.

The retailer can either implement MFP Retail Cloud Service or MFP Cost Cloud Service. The RI staging table loads data from both Retail and Cost into a single staging table; a file with the same name is extracted from MFP Cloud Service but only with the required columns data for Retail and Cost. The list of measures that are extracted and

that need to loaded into the RI staging table are specified in following CTX files. The files are present in the MFP Cloud Service install package under the bin directory:

- W_RTL_MFPOP_PROD1_LC1_T1_FS.dat.ctx

- W_RTL_MFPCP_PROD1_LC1_T1_FS.dat.ctx

These need to be provided to RI during implementation so that RI can integrate with MFP Retail Cloud Service or MFP Cost Cloud Service.

The following two files are exported and compressed into a single file named RI_MFP_DATA.zip. It is copied to the common Cloud Service applications share location $RGBU_CLOUD_DATA from where RI can access the files:

- W_RTL_MFPOP_PROD1_LC1_T1_FS.dat

- W_RTL_MFPCP_PROD1_LC1_T1_FS.dat

The interface can be scheduled to run on a daily or weekly basis by scheduling the respective Export to RA task in the Online Admin Tools.

Appendix: Files Needed by OCI for Domain Build/Patch

Oracle OCI will do the implementation for a Cloud Service. The retailer needs to send a set of files to OCI to do the initial domain build or patch. This appendix describes the format of those files.

Configuration Files to Send

Oracle OCI requires the whole configuration together with the required hierarchy files and data files for the domain build. For patching, only the updated configuration file is needed.

The following files need to be sent to Oracle OCI for implementation:

1. mfprcs.tar.gz (if MFP Retail Cloud Service) or mfpccs.tar.gz (if MFP Cost Cloud Service)

   This file should be a tar and gzip of the entire configuration folder for the selected provision options.

2. mfpcs_hiers.tar.gz

   This file should be a tar and gzip of the required hierarchies to build the initial MFP Cloud Service domain. Ensure it contains all the hierarchy files as .hdr.csv.dat or .csv.dat.

   There should be no directories or folders in the mfpcs_hiers.tar.gz file.

3. mfpcs_data.tar.gz

   This file should be a tar and gzip of the required data files to build the initial MFP Cloud Service domain. Ensure it contains all the data files that need to be loaded after the domain build.

   There should be no directories or folders in the mfpcs_data.tar.gz file.

C

Appendix: Generating the Configuration for Plug-in Options

MFP Cloud Service supports generating different configurations using plug-in automation for different configuration options. Implementers are expected to start with the MFP Cloud Service GA configuration and run plug-in automation to generate the configuration with the required configuration options.

Creating the Configuration Using Plug-ins

To create the configuration using plug-ins:

1. Once the base GA configuration is copied, open the configuration using Configuration Tools.

2. From the Configuration Tools toolbar, select the Automation menu. Select the MFP Retail or MFP Cost solution and then select Specify Parameters.
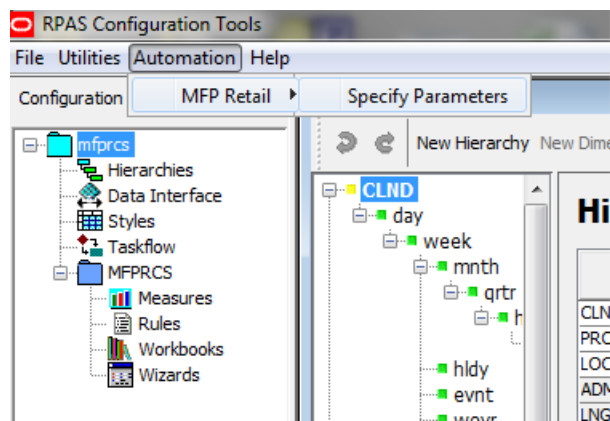

3. A window opens with the available configuration options. Select the configuration options needed for the configuration by checking or un-checking each option. Click **OK**.
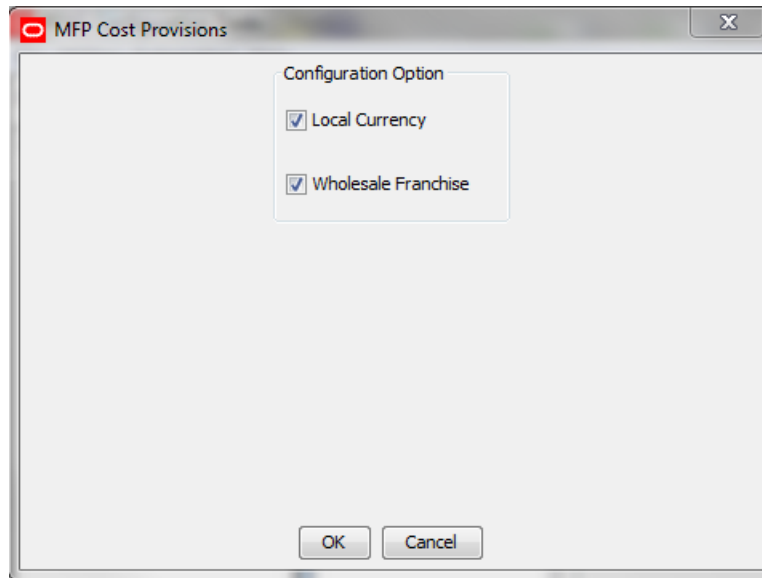

4. The automation will run and generate the configuration for the selected option. Save the generated configuration.

D

Appendix: Batch Process and Control Files

MFP Cloud Service batch operations require that the retailer administrative user, who will not have command-line server access, must be able to select, initiate, and schedule RPAS batch activities.

The RPAS platform includes an Online Administration Tool (OAT) capability, which allows simple parameterization and scheduling of pre-configured batch tasks. The OAT framework allows a sequence of several batch tasks to be defined. This sequence is built from a list of available batch services, such as measure loading, calculation, workbook refresh, and so on. These service tasks run in a defined order, so that the user can know, for example, that their daily data updates have been loaded before their workbook refresh tasks are run. The MFP Cloud Service batch tasks are configured to run under the existing OAT framework, so that scheduling them to run once, or on a repeating basis, is the same as for other OAT tasks.

The batch task sequences are defined in a small set of text files called batch control files, which are specified below, with some examples.

Batch Processes Under the Control of the Implementer

In MFP Cloud Service, the following are under implementer control:

- List of batch operations to be run, with available parameterization

- Order in which batch operations are to be run

- Scheduling of one or more recurring batch tasks (can be modified by retailer administrator, as needed)

Batch Processes Not Under the Control of the Implementer

Due to the operational and security constraints of the Cloud Service environment, the following are not under implementer control:

- Parallelization: Batch process automatically parallelizes any applicable batch tasks with a number of processes set to match the provisioned server environment.

- Script file names, file and directory locations: Custom scripting is not supported for this environment, and no knowledge of file system names or locations is necessary in defining and parameterizing the batch task files.

- Incoming and outgoing file (ftp) location: These details are fixed within the MFP Cloud Service environment.

Batch Processes Catalog

This section describes the list of batch control files and the batch script that uses them.

Batch Load: batch_load_list.txt

The loadmeas.ksh batch script allows loading of groups of measures. It is called by the Data Load OAT task and can also be called by including them in another control file such as the Batch Exec set. Groups of measures to be loaded are specified in the control file, batch_load_list.txt.

Following is the list of columns in the batch_load_list control file delimited by '|':

- Load Set Name
- Parameter type, which must be one of the following:
    - M - Measure name (at least one entry required).
    - V - To validate if all the measure files exist before the load.
    - C - To copy the files from the location specified by an environment variable to the domain input directory before running the load. Currently, only two environmental variables can be used, INCOMING_FTP_PATH and RGBU_CLOUD_DATA.

        INCOMING_SRC1_PATH and INCOMING_SRC2_PATH are two additional source paths. If not set externally, INCOMING_SRC1_PATH is defaulted to INCOMING_FTP_PATH and INCOMING_SRC2_PATH is defaulted to RGBU_CLOUD_DATA.
- Measure Name (for M) and Environment Variable (for C).

Example control file:

The following example shows the setting to load three on-orders measures that need to be loaded. Before loading, they need to be copied from the common cloud share location RGBU_CLOUD_DATA and it needs to be validated that the files are present before the data load.

```
# load on-order measures
load_oo|M|drtyoou
load_oo|M|drtyoor
load_oo|M|drtyooc
load_oo|V|
load_oo|C|RGBU_CLOUD_DATA
```

Batch Calculations: batch_calc_list.txt

The batchcalc.ksh batch scripts allows running the RPAS mace utility to run a predefined set of batch calculations. It is called by the Process - Batch Calc OAT task. It can also be called by including them in another control file such the Batch Exec set. It uses a control file called batch_calc_list.txt. Following is the format of this file:

```
calc_list | [G or L] | [group or expression] | [group name or expr text
```

The first column provides an identifier for each group of calc instructions. These identifiers are used to select calculations to be run either directly, or as part of a Batch Exec run. (The identifiers can match the Batch Exec identifier, but this is not required.) The second column specifies whether this calculation is to be run in the (G)lobal domain on across all (L)ocal domains. The third column indicates whether the calculation to be run is a registered rule group or an individual expression. The final

column provides either the name of the rule group to be executed or the text of the expression to be run.

As with the other control files, any line starting with # is ignored and can be used to comment or document the file, as needed.

Following is an example file for the calculation service:

```
# Calc Set for Batch Aggregation Weekly batch_week | G | group | Batch_GB batch_
week | L | group | Batch_AggW batch_week | L | group | Batch_InvRoll
batch_week | G | expression | LTWPNSlsR = DRTYNSls1R+DRTYNSls2R
batch_week | G | expression | LTWPNSlsU = DRTYSls1U+DRTYSls2U-DRTYRtn1U-DRTYRtn2U

# Calc Set for Generating Forecast batch_fcst | G | group | Batch_Fcst_G batch_
fcst | L | group | Batch_Fcst_L
```

Export Measures: batch_export_list.txt

The batchexport.ksh scripts allows the flat-file export of one or more measures, using a control file, batch_export_list.txt, to group (and parameterize) the measure lists for particular export operations. It is called by the Export - Plan Data OAT task. It can also be called by including them in another control file such as the Batch Exec set. The format of the control file is a bit complicated, as several types of instructions or parameters can be associated with each export group.

Following are the columns in the export control file:

- Export Set Name
- Parameter type, which must be one of the following:
    - M - Measure name (at least one entry required)
    - F - Filter mask measure
    - X - Base intersection (F or X is required)
    - O - Output file name (optional). If not provided, it will create under domain/output with name export_<export_set>.dat
    - C - Copy output file from output directory to another directory
    - M - Move output file from output directory to another directory
    - I - Output individual files (optional). If a user wants to create each individual measure as separate file in an export set.
    - D - Delimiter (optional)

        If PIPE is the delimiter, it will actually use the | character.
- Parameter value (relative to the parameter type selected above).
- Measure Format Name (Optional) (It is the valid format name from measure_format_list.txt).

Example control file:

Following is an example control file for the Export Data:

```
# Export Loc Target
lttg|F|lttgexportb
lttg|M|lttgmkdr
lttg|M|lttgnslsr
lttg|M|lttgnslsu
lttg|M|lttgrtnr
```

```
lttg|M|lttgrtnu
lttg|M|lttgslsr
lttg|M|lttgslsu
```

measure_format_list.txt

The batchexport.ksh scripts also use another control file, measure_format_list.txt, which maintains the different measure formats.

Parameters should be separated by | and no spaces. Each line should have:

- Measure format name

- Format string (as specified by exportMeasure RPAS utility)

- Precision string (as specified by exportMeasure RPAS utility)

Example:

```
Real0|%1.0f|1
Real2|%1.2f|0.01
```

Batch Execution: batch_exec_list.txt

The batchexec.ksh is the main controller script to call multiple scripts by specifying groups of tasks to be run, their sequences, and top-level parameters. This script is called by the Process - Run Batch and Export - Plan Data OAT tasks. This script has an option to restart the process from a particular script.

It uses the control file batch_exec_list.txt. In this file, each active line takes the following form:

```
batch_type | called_script | script parameters
```

The first column is an identifier, which may be repeated on several lines to define a grouping of tasks to be run together. The second column indicates which script needs to be called. The third column gives parameter details for that task (as necessary). If more than one parameter, then those should be delimited with "~". Comments may be placed in the batch_exec_list.txt file by starting a comment line with the hash sign (#).

Example:

Following is a example batch_exec_list.txt file for reference:

```
# Daily Batch Cyle
daily | batchcalc.ksh | exp_set
daily | batchexport.ksh | mttg
daily | batchexport.ksh | mpop
daily | batchexport.ksh | mpcp
daily | batchexport.ksh | mpwa
daily | batchexport.ksh | lttg
daily | batchexport.ksh | lpop
daily | batchexport.ksh | lpcp
daily | batchtrigger.ksh | INCOMING_SRC1_PATH~mfp_data.complete
daily | loadmeas.ksh | load_oo
daily | batchcalc.ksh | batch_oo

# Batch Cycle to Load OO
load_oo | loadmeas.ksh | load_oo
load_oo | batchcalc.ksh | batch_oo

# Export All Working Plan Data
exp_work | batchcalc.ksh | exp_set
```

```
exp_work | batchexport.ksh | mtwp
exp_work | batchexport.ksh | mpwp
exp_work | batchexport.ksh | ltwp
exp_work | batchexport.ksh | lpwp
```

In this example file, three batch task groups are specified: daily, load_oo, and exp_work. Note that these names are implementer-defined identifiers; there is nothing special about the names daily or weekly. Each identifier is thus associated with a sequence of tasks, which will run in the order they are listed in the file.

Note also that no information is provided about times or schedules on which these task groups should be run. This information is specified in the RPAS Online Administration Tool.

The scripts listed for each batch task group are run in the order specified when that type of batch run is requested through the OAT interface.

The list of scripts and their parameters that are available to be used are listed in the following table:

Batch Script	Purpose	Parameters
loadhier.ksh	To load the hierarchy files	<Hierarchy Name> <Purge Age> <withUDD(Y/N>
loadmeas.ksh	To load the set of measures	<Measure Set Name>
batchcalc.ksh	To run batch calculations	<Batch Calc Set Name>
batchexport.ksh	To export the set of measures	<Batch Export Set Name>
batchtrigger.ksh	To wait for the trigger file passed as a parameter	<Trigger File Path> <Trigger File Name>
refresh.ksh	To refresh workbooks in batch	
autobuild.ksh	To run auto-workbook builds in batch	

Batch Online Admin Tasks Pick List: batch_oat_plist.txt

The Online Admin tool MFP Admin tasks in MFP Cloud Service uses dynamic pick-lists for different options for a task. A new task cannot be added, but existing tasks pick-lists can be changed. The list of options for the pick-lists is present in the control file batch_oat_plist.txt. This control file can be updated to add or remove options in the pick-list for the existing OAT tasks.

It uses control file called batch_oat_plist.txt. Following is the format of this file:

```
Pick-list Set Name | Pick-list Option Value | Pick-list Option Label
```

- Pick-list Set Name: Those names should not be changed as those are linked to specific OAT tasks.

- Pick-list Option Value: This is the corresponding set name used in that specific tasks batch control file.

- Pick-list Option Label: The Pick-list Option Label shown to users in Online Admin Tools.

Examples:

```
# Batch Calculation Picklist
```

```
batch_calc|batch_week|Process Actuals
batch_calc|batch_fcst|Run Generate Forecast
batch_calc|exp_set|Set Export Flags

# Load data Picklist
load_data|load_act|Load Actuals
load_data|load_oo|Load On Order
load_data|load_adm|Load Admin
```

Process to Change Batch Control Files

The starter kit contains the list of batch control files used in the MFP Cloud Service package. An implementer can make changes to any of the above batch control files, but should name them with the extension .ctl and upload the files using the standard SFTP process in Online Admin Tools. That process will copy the *.ctl files to the override control file directory.

Uploaded *.ctl files will not be updated during an upgrade or patch process. So the implementer or retailer needs to maintain changes to those *.ctl files during a patch or upgrade.

It is recommended to make minor changes to control files to avoid changes during each upgrade or patch process.

To simplify the process, rather than editing all the sets in a control file, users can only override the set that they want to modify in a control file and only use that set in their new control file.

Examples

In the batch_load_list.txt control file, it currently contains the following data for loading On Order measures:

```
# load on-order measures
load_oo|M|drtyoou
load_oo|M|drtyoor
load_oo|M|drtyooc
```

If a retailer wants to load only two measures, drtyoou and drtyoor, validate file presence, and load them from the cloud share location, the retailer can edit only the load_oo set name in the new control file with the name batch_load_list.ctl with only the following content:

```
# load on-order measures
load_oo|M|drtyoou
load_oo|M|drtyoor
load_oo|V|
load_oo|C|RGBU_CLOUD_DATA
```

The retailer does not have to copy the contents of other load sets into this control file. Each batch process will look for the control set names first in the override control file. If they are not present, it will look for them in the default base control files. During an upgrade or patch process, even if other load sets got changed during the patch process, it will not be impacted by the presence of override control files.

There is no process to delete the override control file, so users can upload an empty *.ctl file to not use the override control files, if they have already uploaded it. Since the override control file will be empty, the batch process will use the base control files.
