

**Oracle® Communications  
Performance Intelligence Center  
Centralized Configuration Guide  
Release 10.2.1  
E77497-01**

June 2017

Copyright © 2003, 2017 Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notices are applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

**CAUTION: Use only the guide downloaded from Oracle Help Center.**

## Table of Contents

<b>Chapter 1: About This Help Text.....</b>	<b>21</b>
Overview .....	21
Scope and Audience .....	21
General Information .....	21
<b>Chapter 2: Key Concepts.....</b>	<b>22</b>
About Oracle® Performance Intelligence Center .....	22
Centralized Configuration Overview .....	22
About Data Acquisition and Processing.....	22
Integrated Acquisition Data Acquisition.....	23
Probed Acquisition E1/T1 Data Acquisition .....	23
Probed Acquisition IP Data Acquisition.....	24
NTP Sources for Accurate Time Stamping.....	24
Overall Performance Intelligence Center Configuration.....	25
Monitored Network Elements.....	25
About PDU Collection.....	26
PDU Collection on SS7 Networks (Integrated Acquisition).....	26
PDU Collection on SS7 Networks (Probed Acquisition) and GPRS .....	26
PDU Collection on IP Networks (Integrated Acquisition or Probed Acquisition) .....	27
PDU Routing and Filtering.....	27
About Traffic Classification Filtering .....	28
About IP Dataflows .....	28
About Dataflows .....	28
Dataflows Versus IP Streams .....	28
About Data Transport Service (DTS).....	28
About Input Streams .....	28
About Routing.....	29
About RID Groups.....	29
About Auto RID .....	29
About Q752 Processing .....	29
About xDR Generation.....	29
About Sessions and Dictionaries.....	29
KPI Generation .....	30
About xDR Mediation DataFeeds.....	30
About Network Views .....	30
About Security and Permissions.....	31

About Equipment Registry .....	31
About Sites .....	31
About Hosts .....	31
About Subsystems .....	31
About Report Configuration .....	32
<b>Chapter 3: Using Centralized Configuration .....</b>	<b>33</b>
About Centralized Configuration.....	33
Opening Centralized Configuration .....	34
Understanding the Centralized Configuration Screen .....	35
About Tool bar and Right-click Menu Functions .....	35
Buttons and Pop-up Menus.....	35
Column Functions.....	35
<b>Chapter 4: Home Screen Operations.....</b>	<b>36</b>
About Centralized Configuration Home Page Operations.....	36
Network Elements .....	36
Nodes.....	36
Signaling Points List Screen.....	37
SS7 Linksets List Screen .....	37
SS7 Links List Screen .....	38
GPRS Signaling Point List Screen .....	38
GPRS Gb Link List Screen.....	38
IP Signaling Point List Screen.....	38
Network View Lists .....	39
Session Views .....	39
Link Views .....	39
xDR-Related Elements.....	39
xDR Sessions.....	40
Dictionaries .....	40
PDU Hiding.....	40
Bulk Load .....	41
Bulk Loading Process .....	42
Integrated Acquisition Element Configurations.....	42
Importing Integrated Acquisition Configurations .....	45
Probed Acquisition Element Configurations .....	46
Importing Probed Acquisition Configurations.....	51
PDU Filter Configurations.....	52
Importing PDU Filters.....	53
Probed Acquisition IP Filter Configurations.....	54
Importing Probed Acquisition IP Filters.....	55
Probed Acquisition GB Filter Configuration.....	56
Importing Probed Acquisition GB Filters .....	56

Q708 Parameter Configuration .....	57
Q850 Parameter Configuration .....	58
Importing Q708 and Q850 Parameter Configurations .....	60
Exporting Bulk Load Configurations .....	61
Creating a Configuration Report .....	63
Configure Alarm Severity Offset .....	64
Managing Acquisition Datafeed Export (External) Applications .....	65
Creating a Acquisition Datafeed Export Session .....	65
Modifying a Acquisition Datafeed Export Session .....	66
Deleting a Acquisition Datafeed Export Session .....	66
Auto Synch Parameters .....	66
Acquisition Synchronization Reports .....	67
<b>Chapter 5: Equipment Registry.....</b>	<b>68</b>
About Equipment Registry .....	68
Sites .....	68
Site Creation and Discovery Process .....	68
About Subsystems.....	70
Adding a Data Warehouse (DWH) .....	70
Modifying a Data Warehouse (DWH) .....	71
Deleting a Data Warehouse (DWH) .....	71
Assignment .....	71
Adding a Mediation Subsystem.....	72
Modifying a Mediation Subsystem .....	73
Deleting a Mediation Subsystem .....	73
Re-discovering Applications .....	74
Managing a Mediation Storage Pool .....	74
Data Record Storage Server Designations .....	74
Adding a Data Record Storage Server to a DR Storage Pool .....	75
Deleting a Storage Server.....	75
About Acquisition (Integrated Acquisition and Probed Acquisition) Subsystems .....	76
Adding an Integrated Acquisition Subsystem to a Site .....	76
Modifying an Acquisition Subsystem.....	78
Adding a Probed Acquisition Subsystem to a Site.....	79
Adding a Production Interface to a Probed Acquisition .....	81
Adding a Production Route to a Probed Acquisition .....	82
Modifying a Probed Acquisition Subsystem Host .....	82
Deleting a Probed Acquisition Subsystem .....	83
Edit a Production Interface .....	83
Remove a Production Interface .....	83
Edit a Production Route .....	83
Remove a Production Route .....	84
Adding An Integrated ODCDSR Monitoring To A Site .....	84
Modifying An Integrated ODCDSR Monitoring .....	84

Deleting An Integrated ODCDSR Monitoring.....	84
<b>Chapter 6: Network Element Configuration.....</b>	<b>85</b>
About Network Elements .....	85
Filtering Network Elements .....	85
About Nodes.....	86
Creating a Node .....	87
Modifying a Node.....	87
Deleting a Node .....	87
About Non-node Network Elements .....	87
About SS7 Network Elements .....	88
About GPRS Network Elements .....	96
About GPRS Signaling Points .....	98
About IP Network Elements .....	99
<b>Chapter 7: Network View Configuration.....</b>	<b>106</b>
About Network Views .....	106
Creating Network Views .....	106
Creating Network Session Views .....	108
Nesting Network Views.....	108
About Network Views that Separate xDR Sessions .....	109
About Link-based Network Views.....	110
Configuring Link Views.....	110
Creating Link-based Network Views.....	110
Adding an SS7 Linkset to a Link View .....	111
Selecting Gb Links for a Link View .....	113
Selecting Traffic Classifications.....	114
Adding SS7 Linksets and Gb Links .....	115
Modifying Link-based Network Views .....	116
Deleting Link-based Network View.....	116
<b>Chapter 8: Acquisition Subsystem.....</b>	<b>117</b>
About the Acquisition Perspective .....	117
About Acquisition Subsystem Management.....	117
Synchronizing an Acquisition Subsystem .....	118
Applying Changes to an Integrated Acquisition Subsystem.....	119
Viewing Changes to an Acquisition Subsystem.....	120
Enabling and Disabling Acquisition Subsystem Automatic Failover.....	120
Loading an Empty Configuration on to an Acquisition Subsystem .....	120
Cancelling Changes to an Acquisition Subsystem .....	120
About Acquisition Subsystem Settings.....	121
Viewing Acquisition subsystem Status.....	124
About Feeder Thresholds.....	124
About Acquisition Applications .....	126

Adding an E1/T1 (SPAN) Card (Probed Acquisition) .....	126
Configuring E1/T1 Cards (Probed Acquisition) .....	127
Modifying Acquisition Applications.....	128
Deleting Acquisition Applications .....	128
About Monitoring Groups (Integrated Acquisition).....	128
About Traffic Classifications (Probed Acquisition).....	133
About PMIA (for Probed Acquisition Subsystems) .....	137
About PDU Filters.....	138
Acquisition MSU and EMP Correspondance Values.....	139
About SS7 Subsystem Number (SSN) Filters .....	140
About GPRS Gb Filters (Probed Acquisition).....	159
About IP PDU Filters.....	163
About SigTran Protocol Filters.....	173
About PDU Dataflows.....	188
Adding a GPRS Gb Dataflow .....	188
Modifying a GPRS Gb Dataflow .....	189
Deleting a GPRS Gb Dataflow.....	189
Adding a SS7 Dataflow .....	189
Modifying a SS7 Dataflow .....	193
Deleting a SS7 Dataflow .....	193
About IP Dataflows .....	194
Adding an IP Dataflow Using Probed Acquisition.....	194
Adding an IP Dataflow Using Integrated Acquisition FastCopy.....	197
Modifying an IP Dataflow .....	198
Deleting an IP Dataflow .....	198
About SS7 Q.752 Dataflows .....	198
About Alarms .....	200
About SS7 OAM Alarms .....	201
Managing SLOR Thresholds .....	201
Managing Q.752 Alarms .....	202
About Resource ID Groups (RID).....	203
About Auto RID .....	203
About Q.752 Counters .....	205
Listing Q.752 Counters.....	205
Modifying a Q.752 counter Record.....	205
About Probed Acquisition Sigtran Configuration Use Case .....	206
Configuration Overview .....	206
Configuration Use Case Description.....	208
About Probed Acquisition Diameter Configuration Use Case.....	210
Configuration overview .....	210
Configuration Use Case Description.....	211
About Integrated OCDSR Monitoring Configuration Use Case.....	213
Configuration overview .....	213
Configuration use case description .....	213

<b>Chapter 9: Mediation</b> .....	<b>216</b>
About Mediation Perspective.....	216
About Managing each Mediation Subsystem.....	216
About Mediation Subsystem Functions.....	217
About applying changes to a subsystem (Synchronizing).....	217
Viewing Changes to an Mediation Subsystem.....	218
Enabling and Disabling Mediation Subsystem Automatic Failover.....	218
Loading an Empty Configuration on to a Mediation Subsystem.....	218
Cancelling Changes to an Mediation Subsystem.....	218
Backup and restoring an Mediation Subsystem.....	219
Deleting an archived Backup.....	219
Discovering Frame and Port Position.....	220
Modifying a server Role.....	220
About Data Record Storage Servers.....	220
Changing the State of a Data Record Storage Server.....	220
Data Recors Storage Pool States.....	221
Configuring Servers in an Mediation Subsystem.....	222
About Streams.....	222
Adding an External PDU Stream.....	225
No External PDU Stream available in PIC 10.2.1.....	225
Configuring xDR Dataflow Processings.....	225
About Dataflow Processings.....	225
About Dataflow Processing Retention Times.....	226
Listing xDR Dataflow Processings.....	226
About xDR Dataflow Assistant.....	227
About Managing Dataflow Processings Manually.....	232
About Partial xDRs.....	259
Modifying an xDR session for a dataflow Processing.....	261
About Q.752 Dataflows.....	262
About the Q.752 Dataflow Assistant.....	262
About Distributions.....	265
About Software.....	265
About Subsystem Preferences.....	266
Managing Multiple Mediation Subsystems.....	267
About Q.752 Filters.....	267
Creating SSN Filters.....	267
Modifying an SSN Filter.....	269
Using Remove from List Operation.....	269
Deleting a SSN Filter.....	269
Listing OPC-DPC-SIO Filters.....	269
Modifying an OPC-DPC-SIO Filter.....	271
Removing an OPC-DPC-SIO number from filter List.....	271
Deleting an OPC-DPC-SIO Filter.....	271

About Dictionaries .....	271
Creating a Dictionary .....	272
Modifying a Dictionary .....	273
Enabling or Disabling PDU Decode Hiding for a Dictionary .....	274
Editing Category Titles in a Dictionary .....	274
Enabling and Disabling PDU Summary Hiding.....	275
Deleting a Dictionary.....	275
Viewing a Dictionary Source.....	275
Listing Unused Dictionaries .....	276
About xDR Filters .....	277
Adding xDR Filters.....	277
Modifying xDR Filters.....	279
Deleting xDR Filters .....	279
About Sessions.....	279
About xDR Session Table Layout .....	280
Listing xDR Sessions.....	280
Adding a Protocol-Specific xDR Session .....	281
Modifying an xDR Sessions.....	282
Deleting xDR Sessions.....	282
Purging Static Sessions.....	283
Creating an xDR filter for an existing Session.....	283
Mediation Protocol Parameters.....	283
About Enrichment Files .....	283
Adding Enrichment Files .....	284
Deleting Enrichment Files.....	284
Viewing Enrichment File Source Code .....	284
Defining Enrichment file automated update .....	285
<b>Chapter 10: Monitoring Policies .....</b>	<b>286</b>
About 3G Monitoring Policies.....	286
The Monitoring Policies Screen.....	286
Adding a Monitoring Policy.....	286
Modifying a Monitoring Policy.....	287
Deleting a Monitoring Policy .....	287
Activating and Deactivating Monitoring Policies .....	287
About Filtering Monitoring Policies.....	288
Filtering Monitoring Policies.....	288
<b>Appendix A: Configuration Workflows .....</b>	<b>289</b>
Provisioning Guide for Configuring Performance Intelligence Center .....	289
Setting up Performance Intelligence Center Sites .....	289
SS7 Data Acquisition Using Integrated Acquisition .....	290
SS7 Data Acquisition Using Probed Acquisition.....	290

GPRS Network Data Acquisition Using Probed Acquisition .....	290
IP Network Data Acquisition for Probed Acquisition.....	290
Configuring for 3G Intelligent Data Monitoring (IDM) .....	291
Routing PDUs to Mediation Protocol.....	291
Routing PDUs to Mediation Protocol for SigTran.....	292
Points to consider when creating Routes and Data Flows .....	292
Associating Sessions for Link-based Network Views.....	292
Configuring Q.752 Processing.....	293
Alarm Configuration .....	293
Duplicate IP Packet Suppression Configuration .....	293
<b>Appendix B: Mediation Protocol Parameters .....</b>	<b>296</b>
List of Parameters for Each Mediation Protocol.....	296
Initial Parameters .....	296
IP Transport Screen.....	296
SS7 SCCP Parameters .....	298
SS7 SUA Parameters .....	299
SS7 Transport Parameters.....	300
<b>Appendix C: About STC Copy and Fast Copy Effects on Monitoring Groups and Dataflows .....</b>	<b>301</b>
Considerations When Working with STC/Fastcopy .....	301
About STC Copy to Fast Copy Interactions .....	302
Automatic Monitoring of Un-Monitored Links.....	302
Inter-monitoring Groups Link Transfer (M3UA).....	303
Monitoring as Before (M3UA).....	304
Inter-monitoring Groups Link Transfer (M2PA).....	305
About Fast Copy to STC Copy Interactions .....	306
Automatic Monitoring of Un-Monitored Links (Linkset) .....	307
Inter-monitoring Groups Link Transfer (Linkset).....	308
About Moving Fast Copy from M3UA to M2PA .....	309
Inter-monitoring Groups Link Transfer (M2PA to M3UA) .....	309
Inter-monitoring Groups Link Transfer (M2PA).....	310
<b>Appendix D: Defining and Modifying Flavor (PC Format) of Session at Centralized Configuration .....</b>	<b>312</b>
Define Flavor (PC Format) of Session .....	312
Defining flavor while creating session through xDR DataFlow Assistant .....	312

Defining flavor while adding Session through session list .....	312
Defining flavor while defining store DFP .....	313
Modifying Flavor of a xDR Session .....	313
<b>Appendix E: xDR Filters during Protocol Upgrade .....</b>	<b>314</b>
Adding xDR Filters .....	314
Modifying xDR Filters .....	314
<b>Appendix F: FSE Enrichment File Syntax .....</b>	<b>315</b>
<b>Appendix G: PMIA Filter Syntax .....</b>	<b>316</b>
<b>Appendix H: My Oracle Support .....</b>	<b>320</b>

## List of Figures

Figure 1: Integrated Acquisition Sequence .....	23

# Chapter 1: About This Help Text

---

## Overview

The Oracle® Communications Performance Intelligence Center system monitors a network to collect PDUs for correlation and storage.

The Centralized Configuration is a management application for configuring the system so that these PDUs can be utilized in different ways by the Management Applications such as KPI, Dashboard, Alarm, Troubleshooting, SS7 Surveillance and Mediation DataFeed Export.

A typical Performance Intelligence Center system consists of many computer servers and data storage systems that are connected to each other over an IP network. The computer systems that collect, process and store data are located in the premises of the service provider that contains the switching, signaling and routing equipment. These provider locations are referred to as sites. A large system consists of many such sites with each site containing multiple servers performing the functions of data collection and storage, xDR generation and storage as well as KPI generation and storage. A site may also contain a data storage unit storing terabytes of data.

Performance Intelligence Center web-based applications, such as Centralized Configuration, are hosted by a cluster of application servers located at the customer's Network Operations Center (NOC). It is quite common for a system to consist of over 100 computer servers located across a wide geographical area. Centralized Configuration enables system administrators to configure the system using the following principles:

- Administration from a single point - all system administration tasks are performed from the system administration console.
- Administration utilizing a global view - the system administrator provisions the system as a single logical entity. The centralized configuration is automatically propagated to the appropriate servers where applications share common data.
- Multi-user access - the system allows multiple users to provision simultaneously.

## Scope and Audience

This guide is designed to assist the nspManager and nspAdmin in working with the Centralized Configuration administration application. Users should find the information they need to cover important activities required to manage data feed export.

## General Information

You can find general information about Performance Intelligence Center, such as product overview, list of other guides, workstation requirements, login and logout procedures, user preference settings, in the Quick Start Guide. This document is available from the Portal menu or can be downloaded from Oracle Help Center (OHC).

## Chapter 2: Key Concepts

---

### About Oracle® Performance Intelligence Center

The Performance Intelligence Center, functionality is based on the following general flow. The Integrated Acquisition server is used to capture SS7 and SigTran traffic. The Probed Acquisition server is used to capture both SS7 and IP traffic. Both products forward the PDUs to the Mediation server. The Mediation server stores this traffic data and correlates the data into detailed records (CDRs, IPDRs, TDRs, etc.). The Mediation server then stores the data on the system for future analysis. The Management Application provides applications that mine the detailed records to provide value-added services such as network performance analysis, call tracing and reporting.

The centralized configuration tasks fall into one of two categories:

- Data Acquisition and Processing – the configuration of the probes, routing of PDUs to the Mediation Protocol setup, KPI generation, Mediation DataFeeds, etc.
- System Administration - the configuration of monitoring sites, configuring the servers, setting up permissions, etc.

### Centralized Configuration Overview

*Centralized Configuration* is developed to consolidate all configuration data (Integrated Acquisition, Probed Acquisition and Mediation) into a single database. The common network-wide configuration is used to enhance the capabilities of Management applications.

### About Data Acquisition and Processing

Data acquisition and processing refers to collecting PDUs from monitored networks, generating xDRs and KPIs from the collected PDUs and storing/forwarding the data for use by applications.

## Integrated Acquisition Data Acquisition

Integrated Acquisition data acquisition comprises three general steps. They are:

1. Eagle timestamps and delivers MSUs to an Integrated Acquisition
2. Integrated Acquisition processes the MSUs and filters it for delivery to an Mediation
3. The Mediation processes the MSUs for storage, xDR correlation and KPIs

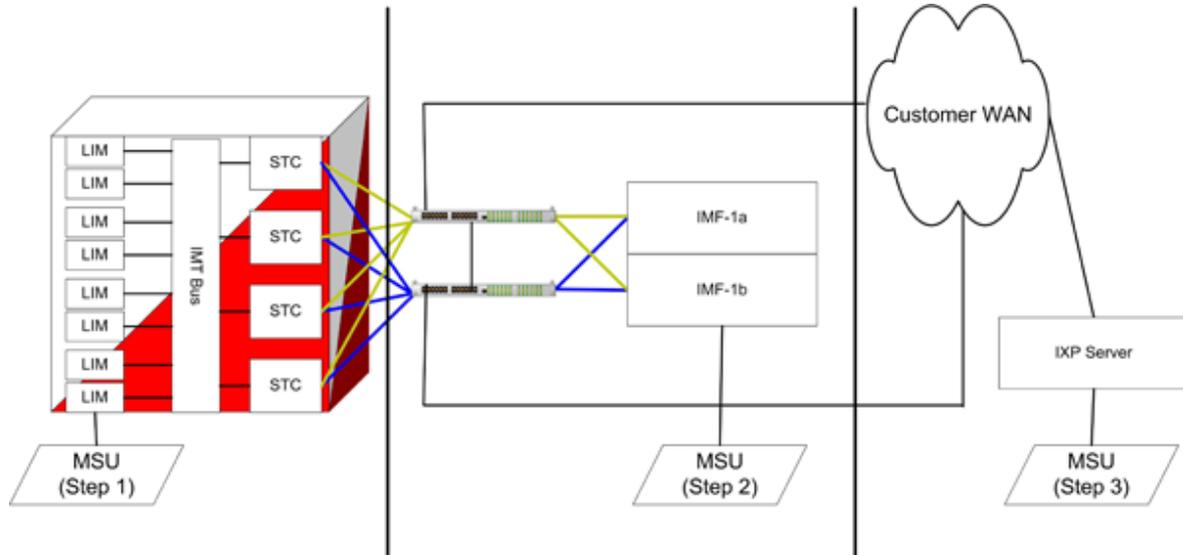

Figure 1: Integrated Acquisition Sequence

## Probed Acquisition E1/T1 Data Acquisition

Probed Acquisition E1/T1 data acquisition comprises three general steps. They are:

1. Probed Acquisition acquires MSUs from SS7 tap and timestamps them
2. Probed Acquisition processes the MSUs and filters them for delivery to an Mediation
3. The Mediation processes the MSUs for storage, xDR correlation and KPIs

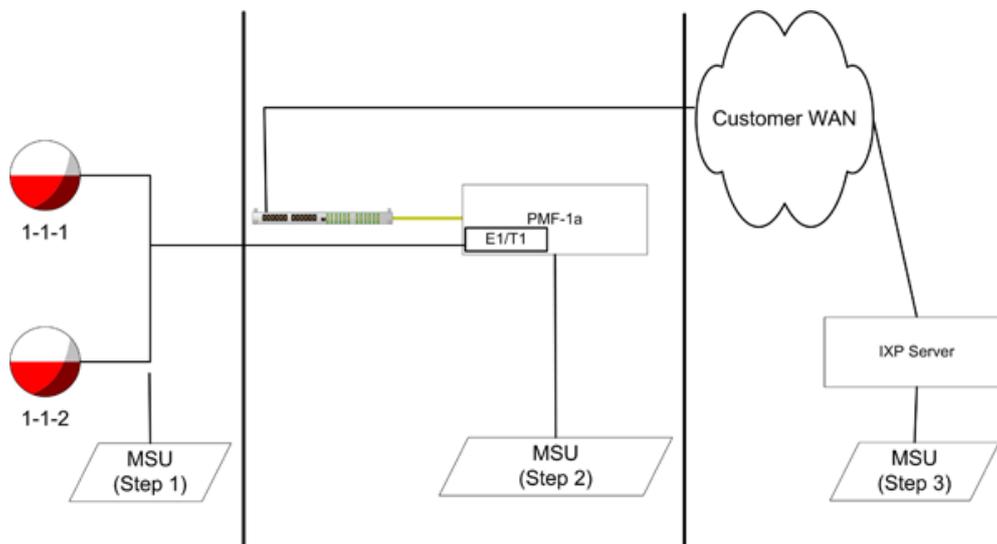

Figure 2: Probed Acquisition E1/T1 Data Acquisition Sequence

## Probed Acquisition IP Data Acquisition

Probed Acquisition IP data acquisition comprises three general steps. They are:

1. Probed Acquisition acquires MSUs that match a filter from the IP tap and timestamps them
2. Probed Acquisition processes the MSUs and filters them for delivery to an Mediation
3. The Mediation processes the MSUs for storage, xDR correlation and KPIs

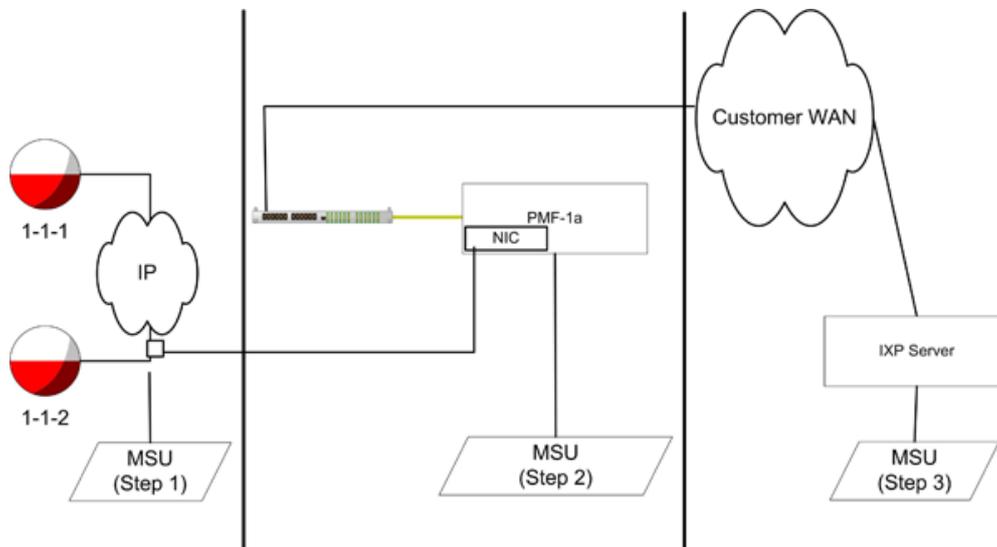

Figure 3: Probed Acquisition IP Data Acquisition Sequence

## NTP Sources for Accurate Time Stamping

The figure shows the Performance Intelligence Center NTP timestamping process and an example of a valid NTP configuration. In this example, an NTP server provided by the customer is referenced as the NTP source for the Management Application server. The Mediation servers use the Management Application server as their NTP source. The Integrated Acquisition servers also use the Management Application server as their NTP source, and then also the “IMF-1a” and “IMF-1b” servers broadcast NTP to the Eagle for it to use to timestamp MSUs. The Probed Acquisition servers, not shown, also use the Management Application server as their NTP source, and then timestamps MSU’s internally.

**Note:** Some MSUs that need to be correlated into an xDR happen with 5 milliseconds between them, therefore the NTP server that is provided by the customer must meet the specification of a stratum 3 (+/- 4.6 microseconds) to insure accurate correlation of xDRs.

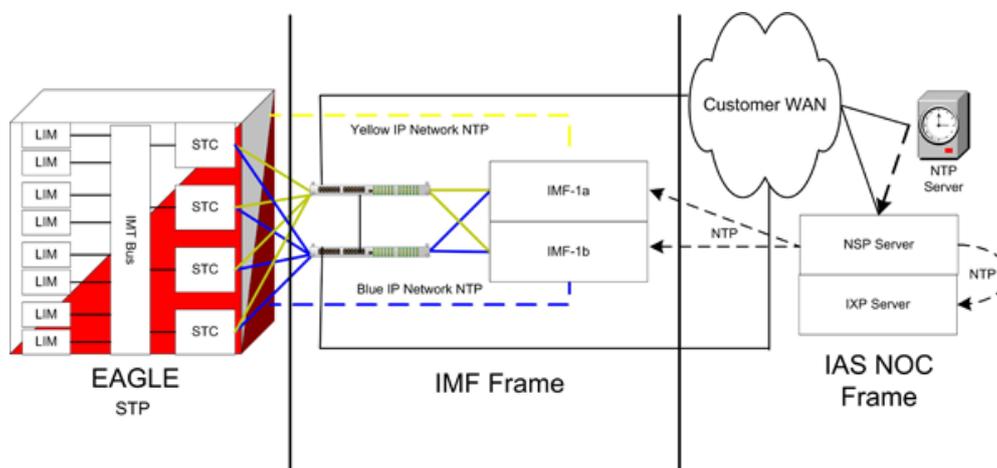

Figure 4: Performance Intelligence Center NTP Example

## Overall Performance Intelligence Center Configuration

This figure illustrates the three major data acquisition processes described above and shows the components at each level of functionality that have access to the acquired and correlated data.

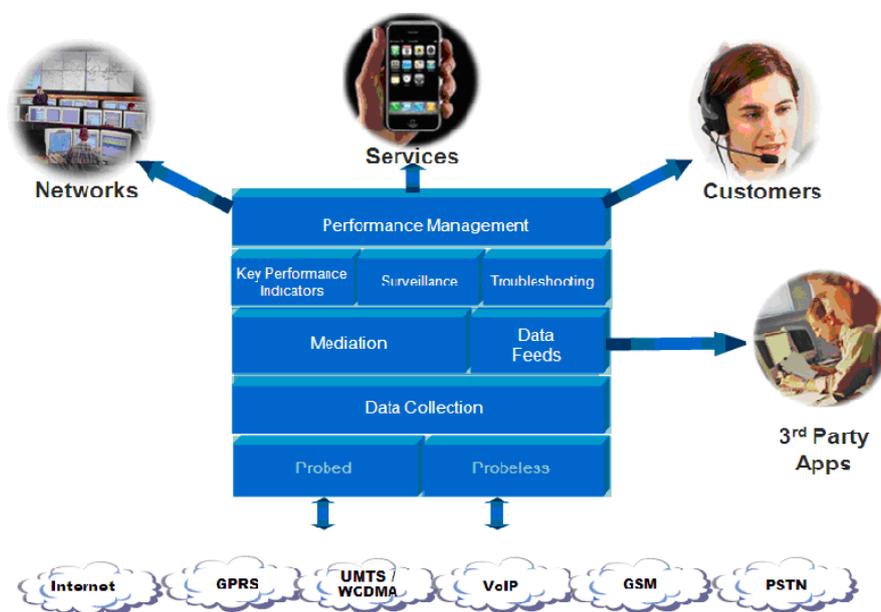

Figure 5: Performance Intelligence Center System

Configuration is required at each level of the system, up to and including the storage of the data. The configuration concepts related to the various components shown in the figure.

These concepts are:

- Monitored Network Elements
- PDU Collection
- PDU Filtering and Routing
  - Input Stream
  - Dataflow
  - Destination (Datasource)
  - Routing
  - RID Groups
- Q.752 Processing
- xDR Generation
  - Sessions and Dictionaries
- KPI Generation
- Network Views

### Monitored Network Elements

The term, Network Elements, refers to customer network SS7, GPRS and IP elements. These elements are divided into:

- Node Elements - elements, linksets and links that are contained in SS7, GPRS and IP nodes.
- Non-node Elements - SS7, GPRS and IP elements. Non-node elements are divided into three main categories

- SS7 elements:
  - Linksets
  - Associations
  - Links
  - Signaling Points (SPs)
- GPRS elements:
  - Gb links
  - Signaling Points (SPs)
- IP elements:
  - Signaling Points (SPs)
  - IP Cards
  - Application Servers (AS)
  - Associations
  - Application Server Process (ASP)

Examples of network elements include: SS7 service switching points (SSP), SS7 linksets, GPRS service switching gateway node (SGSN), Voice over IP (VoIP), etc. The system monitors some of these elements and collects the messages transported between the elements. The messages are referred to as PDUs.

The differentiation between nodes and non-node network elements enables greater flexibility in working with linksets, links and associations.

In Centralized Configuration, network elements are added to the centralized database in one of the following two ways:

- Through discovery from associated Integrated Acquisition data collectors - you can select a specific data collector and issue the command to discover or synchronize network elements. The data collector reports to Centralized Configuration all of the network elements it discovers and Centralized Configuration adds them to the centralized database.
- Through manual creation - for configuring Probed Acquisition you can define each individual network element using the user interface.

Because network elements are so fundamental to the rest of the provisioning process, it is recommended that they be setup right after a site has been created.

## About PDU Collection

Data collectors monitor and collect PDUs exchanged between nodes. The data collectors include the Integrated Acquisition and Probed Acquisition.

### PDU Collection on SS7 Networks (Integrated Acquisition)

In order for the PDUs to be collected by Integrated Acquisition for SS7 networks, you must complete these actions in the following order:

1. Create monitoring group(s) which are assigned automatically to an Integrated Acquisition server.
2. Assign linksets, (network elements), to the monitoring group(s)

**Note:** In the case of utilizing SigTran Fast Copy you assign an association to a monitoring group.

3. Create PDU dataflows
4. Route the assigned PDU dataflows to input streams on Mediation.

### PDU Collection on SS7 Networks (Probed Acquisition) and GPRS

In order for the PDUs to be collected by Probed Acquisition for SS7 networks, following steps must be completed:

1. Select an E1/T1 card

**Note:** For PDUs from SS7-GPRS networks, you can select a SPAN (E1/T1) card on a specific Probed Acquisition server.

2. Configure the required ports on the E1/T1 card
3. Create an SS7 or Gb link for each E1/T1 card port
4. Assign links to ports on the E1/T1 card
5. Create PDU dataflows
6. Route the assigned PDU dataflows to input streams on Mediation

### **PDU Collection on IP Networks (Integrated Acquisition or Probed Acquisition)**

For collecting PDUs from IP networks perform the following actions:

1. Select a NIC card on a specific Probed Acquisition server
2. Create IP link(s) to be monitored by each NIC port
3. Assign these links to a monitoring port on a specific Probed Acquisition server
4. Create a link network view and choose an IP link
5. Create an IP dataflow
6. For Probed Acquisition, assign the link network view to the IP dataflow  
For Integrated Acquisition, assign an association to the IP dataflow
7. Route the assigned PDU dataflows to input streams on Mediation

### **PDU Routing and Filtering**

The PDUs collected by the data collectors must be routed to one or more Mediation Protocol for creating xDR records. These routes are configured using Centralized Configuration.

There are some important considerations in configuring PDU routes.

- Not all PDUs need to be sent to an Mediation Protocol, therefore, a data collector allows filters to be applied to the PDUs it receives. (See Centralized Configuration step 2 in Integrated Acquisition Sequence, Probed Acquisition E1/T1 Data Acquisition Sequence, Probed Acquisition IP Data Acquisition Sequence.)
- A PDU can be routed to multiple Mediation Protocol for building different types of xDR records. (See Centralized Configuration step 2 in in Integrated Acquisition Sequence, Probed Acquisition E1/T1 Data Acquisition Sequence, Probed Acquisition IP Data Acquisition Sequence.)
- An Mediation Protocol needs to receive related PDUs that can be converted into an xDR record. For example, in order for the Mediation Protocol to create an ISUP CDR, it needs to receive all the PDUs associated with a call (IAM, ACM, ANM, REL, RLC). (See Centralized Configuration in Integrated Acquisition Sequence, Probed Acquisition E1/T1 Data Acquisition Sequence, Probed Acquisition IP Data Acquisition Sequence.) At the same time, the xDR processing can be distributed across multiple Mediation Protocol for load sharing (see Centralized Configuration About Distributions). The routing must be configured to support such grouping. This is often the most complex configuration task.
- An SS7 Mediation Protocol needs to “know” when to handle multi-legged PDUs it receives from a data collector. Duplicate PDUs can result when multiple points in the customer network are being monitored by the same data collector and the same PDU passes through these points. Reference ID groups (see Centralized Configuration topic About RID Groups) provide a mechanism for handling duplicate PDUs. If this area is not properly planned and configured, then xDR correlation problems can occur.
- There is a resource “cost” to routing PDUs to the Mediation Protocol if the data collectors and the Mediation Protocol are at different geographical locations and WAN resources have to be used. While routing, consider minimizing WAN traffic by routing PDUs to local Mediation Protocol or routing over a least-cost route.

**Note:** The resource cost is bandwidth usage and therefore to conserve bandwidth you can use filtering.

For more details on these important considerations, see Centralized Configuration About the xDR Dataflow Assistant. For details on data flow procedures see Centralized Configuration topic Configuring Dataflow Processings.

The following sections describe the logical constructs you use to configure the routes between the data collector and Mediation Protocol for generating the xDRs required for Management Applications.

### **About Traffic Classification Filtering**

Input Streams enable IP traffic to be classified, (using filtering), from one or more NIC ports into streams of data. A stream is created on a group of NIC ports by defining an IP Filter. After input streams are configured, if a received PDU does not match any of the filtering criteria, it is discarded.

**Note:** Because of the large volume of IP traffic, it is a common practice to discard unnecessary PDUs at the data collector level for IP networks.

### **About IP Dataflows**

An IP Dataflow routes PDUs from an IP stream to Mediations.

### **About Dataflows**

A Dataflow provides a way to filter and route MSUs.

### **Dataflows Versus IP Streams**

A Dataflow is similar to an IP stream because it allows SS7 and Gb traffic to be filtered. A Dataflow has a filter that is applied to a group of SS7 linksets or Gb links (instead of NIC ports in case of input streams). In the case of IP traffic, an IP dataflow is basically a "pass through" in terms of filtering. Dataflows are also used to configure additional routing information.

An IP stream is very similar, in concept, to a dataflow because applies filters to classify traffic. The difference is that for input streams, the classification is performed as soon as a PDU is received by a Probed Acquisition. For Dataflows, the classification is done after the data has been received by Integrated Acquisition / Probed Acquisition and then stored. The reason for this difference is that the volume of IP traffic is much larger and it is more efficient to discard unnecessary PDUs rather than storing them and discarding them later. One limitation of input filters, like input streams, is that Q.752 or similar processing cannot be done on discarded traffic since the Q.752 processing is done on cached PDUs.

### **About Data Transport Service (DTS)**

Routing data from Integrated Acquisition or Probed Acquisition to Mediation uses Data Transport Service (DTS) exclusively. Input Streams are created on Mediation to route the dataflow from the Integrated Acquisition or Probed Acquisition.

All the Streams created on the Mediation subsystems can be viewed in the PDU Dataflow routing screen.

PDU Dataflows are also routed to one or more input streams. The PDU Dataflow defines the criteria (linkset/links and filters) for PDUs to be sent for correlation. The input Streams provide the interface for the Mediation to receive the flow of PDUs.

### **About Input Streams**

Input streams, (for more information, see topics About Dataflows and About Streams, are constructs for grouping Dataflows for the purpose of routing to one or more Mediation Protocol. The grouping is done so that PDUs belonging to a Dataflow are routed over a single communication stream to an xDR generator, resulting in optimized data collection resources.

Centralized Configuration supports both Message Feeder Protocol (legacy applications only) and Data Transport Service.

When using DTS, the Mediation pulls data from a Datasource (an IP address and port on the Integrated Acquisition or Probed Acquisition).

**Note:** An Mediation subsystem has a limit of 255 input Streams. Mediation also uses four input Streams for monitoring purposes, so the functional limit is 251. If this limit is exceeded, then Centralized Configuration produces an error message stating that the limit has been exceeded. If this happens, streams will have to be routed differently to keep within the limit.

### **About Routing**

Is the process of routing Dataflows to Mediation input Streams.

### **About RID Groups**

An RID group enables differentiation of multi-legged PDUs. For example, an SS7 Mediation Protocol needs to know how to differentiate multi-legged PDUs it receives so that it does not discard the original and multi-legged PDUs as erroneous during error checking, resulting in loss of xDR records. A multi-legged PDU occurs when two points (linksets) in the customer's network are being monitored and the same PDU passes through both points (it is collected twice) and the PDU traffic from both linksets is routed to the same Mediation Protocol. To handle this situation, the SS7 linksets must be grouped carefully into RID groups, (see [About Resource ID Groups \(RID\)](#)), and the Mediation Protocol informed of the associated RID group for each PDU so that a multi-legged PDU that has already been reported from a different RID group can be processed separately by the Mediation Protocol. This prevents the first PDU from being discarded as well, and the xDR record for it can be generated and stored.

### **About Auto RID**

Auto RID is used for Integrated Acquisition servers where links are monitored at the Eagle side. This feature is also used where "edge" devices, devices that do origin-based routing, are involved. In addition, Auto RID can be used for network elements (ssp/scp) with one point code. Auto RID Reverse is used when probes are linked near the network elements (scp/ssp).

### **About Q752 Processing**

Performance Intelligence Center supports a subset of the ITU Q.752 standards. Q.752 defines a standard set of measurements and alarms for monitoring the health of SS7 networks. Both Integrated Acquisition and Probed Acquisition perform the low-level processing required for Q.752. That is, Integrated Acquisition and Probed Acquisition apply processing on received PDUs to record key performance indicators (see [KPI Generation](#)) and generate alarms if thresholds are exceeded. The KPI counters are sent over special Dataflows to Mediation Protocol for consolidation and further processing. One of the tasks of a Centralized Configuration user is to configure the Q.752 Dataflows as well as the Q.752 alarms thresholds (see [About Q.752 Counters](#)).

## **About xDR Generation**

Mediation Protocol configurations are managed by Centralized Configuration in the Mediation perspective. The details of the Mediation Protocol use and configuration are outlined in the Mediation perspective.

### **About Sessions and Dictionaries**

Once xDR generation is configured for a Mediation Protocol, xDR records are stored in a session. A session is associated with a dictionary. The dictionary mechanism is a way of describing the content of the xDR fields. Management Application, such as Troubleshooting use the dictionary to access and display the data making the applications independent of the xDR record format.

The Mediation and Data Server (legacy) applications provide a mechanism for Centralized Configuration to discover sessions and dictionaries. Once discovered, the sessions can be accessed by Management Applications such as Troubleshooting.

**Note:** A session name must be unique for each Mediation Subsystem or Dataserver, but sessions can have identical names if they reside on separate Mediation subsystems.

## KPI Generation

Performance Intelligence Center system enables you to configure KPIs using the Management Application KPI Configuration. KPI defines the rules for generating KPIs from the xDR records that have been configured.

KPI data is stored in KPI sessions in a dictionary format like xDR records. Similarly, KPI sessions are discovered by Centralized Configuration. Once discovered, the sessions can be accessed by Management Applications like Mediation DataFeed Export or Dashboard.

## About xDR Mediation DataFeeds

Performance Intelligence Center supports exporting of xDRs to third-party applications. This function is referred to as a data feed export. All data feeds are configured by using the Mediation DataFeed Export application. For more information on data feeds, see the *Data Feed Configuration Guide*.

## About Network Views

Network views are logical, user-defined groupings of elements in a Performance Intelligence Center system. The term network view is used to denote some aspect, or perspective, of a customer network. For example, it could be the physical elements comprising a network, or a sub-network, or another carrier's network or a certain type of traffic on the network.

Network views can be nested in hierarchical order and contain other network views (children) that themselves may contain network views and so on depending on how large or complex the network is.

Grouping elements together into network views enables you to divide up the network into more manageable units, not only for convenience, (elements in a network view can be referred to from other parts of the system as a single unit, by referring to the network view), but also for authorization purposes. For example, you can create a network view that only shows certain application users a subset of the total data and this is managed by assigning users rights (privacy settings) to specific network views. Network views are designed to be the primary mechanism in the system to select a dataset. Applications like Troubleshooting and SS7 Surveillance use network views.

The types of elements that can be grouped together into a network view include PDU sources such as SS7 linksets, Gb links, Input streams or xDR sessions. There are two types of network views:

- Session-based network views - xDR sessions can be grouped together to create a view of the network. The Troubleshooting application uses session-based network views for filtering and call tracing.
- Link-based network views - links (SS7, Gb, IP) can be grouped together to create a view of the network. This type of network view is used for associating linksets, links, and Input streams to PDU Dataflows. The Troubleshooting also uses link-based network views for filtering and call tracing.

## About Security and Permissions

Management Application comes with a security and privacy module, (see *Security Guide* for more information), that enables objects, such as network views, that are a part of the Management Application system to be protected. Each of these objects has an owner and the owner can set the privacy level so that users who belong to specified user groups can have read, write and/or execute privileges on an object(s).

Centralized Configuration enables an owner to create and modify objects. It also allows the owner of an object to set the privacy of that object. When an object is created or discovered, the user who created or discovered the object becomes the owner of that object and can assign privacy privileges for that object and can set the level of access for other users, or groups of users using that object.

## About Equipment Registry

Performance Intelligence Center system is comprised of many applications that are running in a distributed environment. These applications need to be configured for them to perform their functions. Applications are created, discovered and configured using the Equipment Registry perspective.

The principle elements in equipment registry are:

- Sites
- Subsystems
- Hosts

### About Sites

Sites represent logical locations where an application is located. An application either runs on a single server or it may be distributed over a group of servers (referred to as a subsystem). Using Centralized Configuration, you define sites.

When you create a site, follow this guideline:

- There can be, at most, one Acquisition subsystem (Integrated Acquisition or Probed Acquisition) for a given site. For example, you can have one Integrated Acquisition or Probed Acquisition subsystem along with multiple Mediation subsystems. For this reason, a physical location where there are multiple Acquisition subsystems needs to be represented in Centralized Configuration by multiple sites.

**Note:** An Integrated Acquisition subsystem can monitor only one Eagle STP.

### About Hosts

A host refers to a server that runs a Performance Intelligence Center application. For each server in a site, there is a host in Centralized Configuration, therefore, allowing one site to contain multiple hosts.

### About Subsystems

Some Performance Intelligence Center applications are stand-alone and some are clustered. A stand-alone application has only one instance running on one host. Examples of stand-alone applications include Mediation and Data Record Server (legacy systems). Some of the applications run in more than one server or cluster, but to the outside world they behave as a single entity. A cluster of application instances is referred to as a subsystem. Examples of applications that run as subsystems include:

- Acquisition (Integrated Acquisition or Probed Acquisition)
- Mediation
- Data Records Storage

### **About Server Roles**

Primary and secondary roles are not assigned to the servers in the Acquisition subsystems anymore. Server roles are made transparent to the user and server role changes are also automatic. For an Mediation subsystem, the Centralized Configuration assigns the primary role to server 1a and secondary role to server 1b. The rest of the servers are assigned ancillary roles.

When you discover the first application that belongs to the subsystem, that application is automatically designated as the primary application, and a subsystem entry is automatically created in the system. When subsequent applications are discovered, the applications are designated as backup and ancillary respectively.

### **About Report Configuration**

Centralized Configuration provides a means of configuring a configuration report using MS Excel spreadsheet. When you have run the report, each page is dedicated to a specific aspect of the system (Network Views, Network Elements, Role Profiles, Acquisition, etc). The configuration report is created from the Home Page.

## Chapter 3: Using Centralized Configuration

---

### About Centralized Configuration

This chapter provides a general overview of Centralized Configuration. The topics covered are:

- Logging into Centralized Configuration
- Understanding the Centralized Configuration user interface

## Opening Centralized Configuration

To open an application, click the Centralized Configuration icon located in the Configuration Section of the Portal Screen.

The Centralized Configuration Home screen opens.

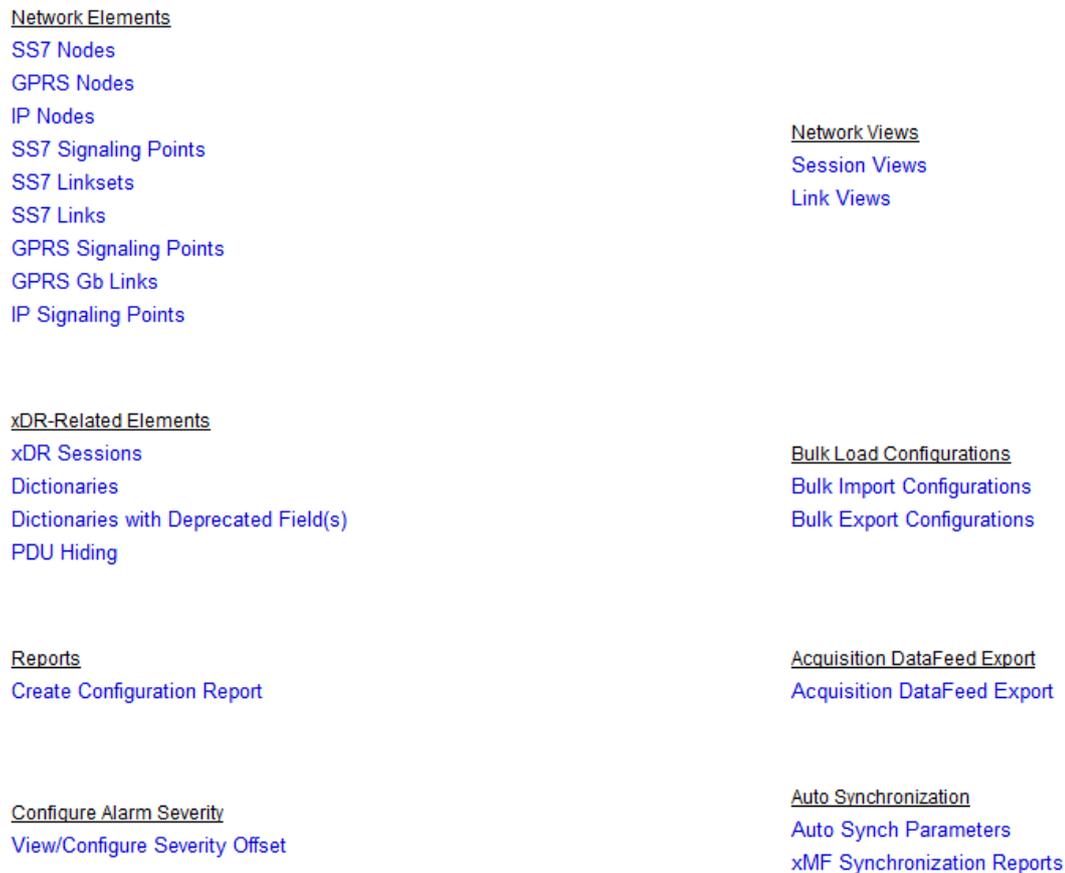

Figure 6: Centralized Configuration Home Screen

The screen is divided into two main sections:

- Menu Tree - located on the left-hand section shows the three main perspectives and enables you to navigate through the data (not shown).

The six perspectives are:

- Equipment Registry
  - Network Elements
  - Network Views
  - Acquisition
  - Mediation
  - Monitoring Policies
- Screen Body - on the Home screen provides links for *Network Elements*, *Network Views* and *xDR-Related Elements*, *Bulk Load Configurations*, *Reports*, *Thirdparty applications* and *Alarm Severity Configuration*.

On other screens it allows you to create, modify, delete, or list configured data. Each of these objects is discussed as specific subjects.

## Understanding the Centralized Configuration Screen

This section provides a brief overview of the screen elements for Centralized Configuration. For more detailed information Management Application screen elements such as the toolbar and function buttons.

**Note:** Do not use the Function Keys (F1 through F12) when using the Management Application. Function keys work in unexpected ways. For example, the F1 key will not open Management Application help but will open help for the browser in use. The F5 key will not refresh a specific screen, but will refresh the entire session and will result in a loss of any entered information.

### About Tool bar and Right-click Menu Functions

The section describes the list screen and pop-up menu that have similar toolbar functionality. The functionality is divided into three sections:

- Buttons
- Column functions
- Right-click menu options from the element list

### Buttons and Pop-up Menus

Buttons are located either on a List screen toolbar or on the right click pop-up menu in the element section. They are:

**Note:** Not all tool bar button functions appear in the pop-up menus. Pop-up menu is specifically for the element. The tool bar buttons are general functions for that screen such as first record, next record, previous record, etc.

- First record - enables you to move to the first record
- Next record - enables you to move to the next record
- Previous record - enables you to move to the previous record
- Last record - enables you to move to the last record
- Add - enables you to add a record
- Modify - enables you to modify the selected record
- Delete - enables you to delete the selected record
- Search - enables you to search for a specific record
- Synchronize/Discover - enables you to either discover new applications or Synchronize the Subsystem after any changes

**Note:** Do not use the Function Keys (F1 through F12) when using the Management Application. Function keys work in unexpected ways. For example, the F1 key will not open Management Application help but will open help for the browser in use. The F5 key will not refresh a specific screen, but will refresh the entire session and will result in a loss of any entered information.

### Right Click Pop-up Menus

Right clicking on an element opens the pop-up menu for that specific element. For example, right clicking on the Sites element in the Equipment Registry perspective opens the pop-up menu that has options such as: **Add**, **Modify**, **Delete**, List and Refresh. Right clicking on the Sites element in the Mediation perspective opens the pop-up menu just shows Refresh.

### Column Functions

The column functions enable you to perform the following actions:  
Each column can be sorted by ascending or descending order

Each column can be moved to a different order within the screen to facilitate reading and searching for specific records. This action is accomplished through the Select Columns button.

**Note:** The Select Columns button also enables you to view or hide columns on a screen.

## Chapter 4: Home Screen Operations

---

### About Centralized Configuration Home Page Operations

One of the perspectives that Centralized Configuration provides is a global listing functionality on its Home screen. These links enable you to view the objects listed below as you would view them using the Management Application legacy application system configuration. In addition to these views, there are also Bulk Load and Reports functionalities. The areas covered in this chapter are:

- Network Elements
- Network Views
- xDR-Related Elements
- Bulk Load (Import and Export)
- Reports (Creating a Configuration Report)
- Thirdparty (Linking with external applications)
- Alarm Severity Configuration

### Network Elements

The Centralized Configuration Home screen provides links for a global listing of the following SS7, GPRS and IP network elements:

- SS7 Nodes
- GPRS Nodes
- IP Nodes
- SS7 Signaling Points
- SS7 Linksets
- SS7 Links
- GPRS Signaling Points
- GPRS Gb Links
- IP Signaling Points

### Nodes

The Home page lists each type of node separately to make searches easier and quicker. Clicking a specific link provides a list of the specific node configured in your system along with their associated signaling points. Clicking the link opens the specific Node(s) List screen (SS7 Nodes list page is shown).

**Note:** The Home screen section shows the list of Nodes independently of the Object Tree on the left-hand section of the screen.

#	Node Name	Description of Node	Owner	State	Created
1	SS7_1		TkicSrv	N	16/06/2015 01:50:43
2	Test2		TkicSrv	N	26/06/2015 03:23:31

SS7 signalling points list for node SS7\_1

#	SP	Description	Node Name	Code	Flavour Country	Flavour Format	OID
1	Test		SS7_1	0-1-4	DENMK-SS7	3-8-3	.1.3.6.1.4.1.4404.2.1.4.1.1.33554444

Figure 7: SS7 Node(s) List Screen

From this screen you can: add, modify, delete and show details of any selected Node as well as refreshing the screen to view any changes that have occurred to the Node records.

### Signaling Points List Screen

Each type of signaling point is located under the network element category (SS7, GPRS or IP). The signaling points link provides a list of ALL the signaling points configured in your system. Clicking the link opens the Signaling Point(s) List screen (SS7 Signaling Points screen shown).

**Note:** The Home screen section shows the list of Signaling Points independently of the Object Tree on the left-hand section of the screen.

#	SP	Description	Node Name	Code	Flavour Country	Flavour Format	OID	Owner	State	Created
1	Test		SS7_1	0-1-4	DENMK-SS7	3-8-3	.1.3.6.1.4.1.4404.2.1.4.1.1.33554444	TkicSrv	N	26/06/2015 03:22:44
2	Test2		SS7_1	0-0-78	ANSI-SS7	8-8-8	.1.3.6.1.4.1.4404.2.1.4.1.1.16777294	TkicSrv	N	26/06/2015 03:24:53

Figure 8: SS7 Signaling Points List Screen

### SS7 Linksets List Screen

The linksets link provides a list of all the SS7 linksets configured in your system. Clicking on SS7 Linksets in the Home page opens the SS7LinksetList screen shown below that has two tables. Selecting a linkset in the top (linkset) table shows the links that belong to that set. From this screen you can modify, delete, search, override custom name, assign RID groups and see details of a linkset. You can also: add, modify, delete, search, override custom name and see details of a linkset's associated links.

SS7 link list for linkset SS7\_LinkSet

#	Linkset Custom Name	Custom Name Override	Eagle Name	Description	RID Group Id	Linkset Type	Near End Point Code	Far End Point Code	OID
1	SS7_LinkSet	Disabled			65535	A	Test	Test2	.1.3

#	Link Custom Name	Eagle Name	Description	SLC	Interface Name	Protocol Name	Error Correction	Removed	OID
1	SS7_Link1			0	DS0A_56K	GB_FR	NONE		.1.3.6.1.4.1.4404.2.1.6.1.1.3355444

Figure 9: Selected SS7 Linkset List Showing Associated Links

### SS7 Links List Screen

The links link provides a list of all the SS7 links configured in your system. Clicking the link opens the Link List screen. From this screen you can: modify, delete, search, set the custom name override or see the details of a particular link.

**Note:** The Home screen section shows the list of Link independently of the Object Tree on the left-hand section of the screen.

#	Link Custom Name	Custom Name Override	Eagle Name	Description	Linkset Custom Name	SLC	Interface Name	Protocol Name	Error Correction
---	------------------	----------------------	------------	-------------	---------------------	-----	----------------	---------------	------------------

Figure 10: SS7 Links List Screen

### GPRS Signaling Point List Screen

The GPRS signaling point list screen provides a list of GPRS linksets configured in your system. The GPRS linkset screen is shown below.

#	SP	Description	Node Name	SGSN Id	OID	Owner	State	Created
1	GPRS_1_Node		GPRS_1	10	.1.3.6.1.4.1.4404.2.1.4.1.2.10	TkicSrv	N	26/06/2015 04:10:31

Figure 11: Gprs Signaling Point List Screen

### GPRS Gb Link List Screen

The GPRS Gb links list screen provides a list of the GPRS Gb links configured in your system. The GPRS Gb link list screen is shown below.

#	Link Custom Name	Description	PCM Id	Link Interface	SP	OID
1	GPRS_Gb_Link1		10	7	GPRS_1_Node	.1.3.6.1.4.1.4404.2.1.6.1.1.10.10

Figure 12: Gprs Gb Link List Screen

### IP Signaling Point List Screen

The IP signaling point list screen provides a list of IP signaling points configured in your system. The IP signaling point list screen is shown below.

#	SP	Description	Node Name	IP Id	OID	Owner	State	Created
---	----	-------------	-----------	-------	-----	-------	-------	---------

Figure 13: IP Signaling Point List Screen

## Network View Lists

The Centralized Configuration Home screen provides links for a global listing of the following network views:

- Session Views
- Link Views

These links provide a complete list of these elements.

### Session Views

The Network Session Views link provides a list of ALL the session views configured in your system. Clicking the link opens the Network Session View(s) List screen.

**Note:** In the Home screen, the Network Sessions View section shows the list of Network Views independently of the Object Tree on the left-hand section of the screen.

#	Name	Type	Description
1	Test	sessionnetworkview	

Figure 14: Network Sessions View(s) List Screen

### Link Views

The Link Views link provides a list of all the link network views configured in your system. Clicking the link opens the Link Network View(s) List screen.

**Note:** In the Home screen, the Link Views section shows the list of Link Views independently of the Object Tree on the left-hand section of the screen.

#	Name	Type	Description
1	Link_1	linknetworkview	

Figure 15: Link Network View(s) List Screen

## xDR-Related Elements

The Centralized Configuration Home screen provides links for a global listing of the following xDR-related elements:

- xDR Sessions
- Dictionaries
- PDU Hiding

These links provide a complete list of these elements. Each element is discussed separately.

## xDR Sessions

The xDR sessions link provides a list of ALL the xDR sessions configured in your system. Clicking the link opens the Sessions present.

**Note:** The Home screen section shows the list of Sessions independently of the Object Tree on the left-hand section of the screen.

Session	Start date	End date	xDR/s	Kbps	Dictionary Type	Format	Dictionary	Subsystem
MAP_SESS_ARJ	18/01/2038 19:14:07	-	0	0	RECONSTITUTION	SINGLE	SS7 MAP2 TDR_1.1.1	DWH_Pool
CapacityManagement	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	Generic FlowMonitor Stats_1.1.2	DWH_Pool
ixp1002StreamMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	StreamMonitor	DWH_Pool
ixp1002BuildMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	BuildMonitor	DWH_Pool

Figure 16: xDR Sessions List Screen

## Dictionaries

The Dictionaries link provides a list of all the dictionaries discovered in your system. Clicking the link opens the Dictionaries list screen.

**Note:** The Home screen section shows the list of dictionaries independently of the Object Tree on the left-hand section of the screen.

Dictionary	Type	Protocol	Stack	Replaced By	Version	Used
AggSessionMonitor	STATISTICS	N/A	N/A	-	VERSION	Y
BuildMonitor	STATISTICS	N/A	N/A	-	VERSION	Y
BuildThreadMonitor	STATISTICS	N/A	N/A	-	VERSION	Y
GPRS Gb TDR_7.1.0	RECONSTITUTION	GPRS Gb	GENERIC	-	7.1.0	Y
GPRS Gb TDR_CAPTURE_7.1.0	CAPTURE	GPRS Gb	GENERIC	-	7.1.0	Y

IMS DIAMETER Gq TDR_CAPTURE_7.0.2	CAPTURE	IMS DIAMETER	GENERIC	-	7.0.2	Y

Figure 17: Dictionaries Present Screen

## PDU Hiding

The Stacks link provides a list of all the stacks in your system. Clicking the link opens the Stacks list screen.

**Note:** The Home screen section shows the PDU Hiding option. This option provides the ability to enable or disable the PDU decode hiding and PDU summary hiding for a specific protocol. Enabling PDU hiding will take away the ability to view the hexadecimal values (header of the decoding) and columns 1, 3 and 4 in the decode screen in Troubleshooting.

## Enabling or Disabling PDU Hiding

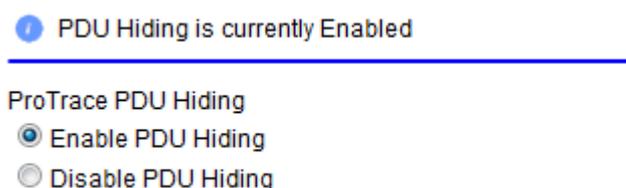

Figure 18: PDU Hiding

Complete these steps to enable or disable PDU hiding in Troubleshooting.

**Note:** This operation can only be performed by users with the role NSPAdministrator or NSPConfigManager.

1. From the Home Page, click **PDU Hiding**. The *PDU Hiding* screen opens. The default setting is "enabled."
2. Select either **Enable PDU Hiding** or **Disable PDU Hiding** depending on the need.
3. Click **Apply** at the bottom of the screen. The heading will signify what state the PDU hiding is in (enabled or disabled).
4. Click **Close**.

## Bulk Load

Centralized Configuration's Bulk Load process enables you to load both Integrated Acquisition and Probed Acquisition configurations offline without requiring Acquisition to be up and running. For Integrated Acquisition configurations this process includes the capability to import sites, hosts, applications, signaling points (both SS7 and Gb), linksets, links (both SS7 and Gb), SS7 filters, IP filters, probe assignment configurations and monitoring groups.

After importing the configuration for the first time, you can also update the same configurations again. You take the export of the existing configuration and make the changes to this configuration in the CSV files generated. Re-importing the files updates the changes made to the files.

**Note:** To create a new object, the ObjectIDs will be "NA". This will signify whether it is a new insert or not. To update an object, the ObjectID should be NSP\_ID (this can be generated through CSV export).

The bulk loading process supports the following file types:

- SSN filters
- SS7 combination filters
- GT filters
- DLCI filters
- IP Combination Filters
- IP filters
- Port filters
- VLAN filters
- PC filters
- Raw filters
- Sites
- Hosts
- Nodes

- SS7 Signaling Points
- Linksets
- SS7 Links
- Gb Signaling Points
- Monitoring Groups
- Probed Acquisition cards
- Probed Acquisition ports
- Probed Acquisition Port Assignments

These file types can be uploaded in any order.

## Bulk Loading Process

The separate files should be prepared for the file formats specified in the next sections. If some configuration already exists in the system, (for example, Sites added from the Centralized Configuration Add Site screen), then the Bulk load of the corresponding .csv file can be skipped. While preparing the .csv files for initial import, the Object ID fields should be set to NA value (for example, the SiteID field in Sites.csv or the HostID fields in Hosts.csv are set to NA). Finally, during the Bulk Load Process, files can be uploaded in any order but all dependent files should be imported together (for example, Hosts.csv and Sites.csv should be uploaded together).

### Integrated Acquisition Element Configurations

These tables show the basic Integrated Acquisition element configurations needed when importing Integrated Acquisition configurations using the bulk load operations.

**Note:** All these csv files must exist and must be imported so that the import process is error free.

ID	Field	Data Type	Value	Optional	Can Be Updated	Max Length
1	Bulk Load		1		No	
2	Site ID	Number			No	
3	Name	String			Yes	30
4	Description	String		Yes	Yes	255

Table 1: Site Configuration

7	EagleID		"comma separated EagleIDs for associations under quotes"	Yes	Yes	

Table 7: Monitoring Group Configuration

### Sample of an Integrated Acquisition Configuration CSV File

Here is an example of the .csv files that comprise an Integrated Acquisition configuration.

**Note:** ID is an Management Application identifier for mobile entries. It is used in the update/delete process for existing entries through import feature. It can be left blank for new entries.

### Site csv file

```
#Sites.csv,,,
#BulkLoadType,SiteID,SiteName,Description
1,NA,IMF_Delhi,Delhi Site
1,NA,IMF_Chennai,Chennai site
1,NA,IMF_Mumbai,Mumbai site
1,NA,IMF_Kolkata,Kolkatta site
```

### Host csv file

```
#Hosts.csv,,,,,,,,

## Importing Integrated Acquisition Configurations

### Pre-conditions for importing Integrated Acquisition Configurations

1. Management Application server is running.

2. You have logged into the Management Application server and launched Centralized Configuration.
3. You have created the necessary CSV files in the proper format.

Complete these steps when importing an Integrated Acquisition configuration.

1. Click **Bulk Import Configurations** on the Home Page. The Import Files screen opens.

Figure 19: Bulk Load Import Screen for Integrated Acquisition

2. Select the Sites from the drop-down menu.
3. Click **Browse** in the first field. The Choose File screen opens.
4. Select the **Sites.csv**.
5. Click **Open**. The directory path with the file appears in the field.
6. Repeat steps 2-4 for the following files.

**Note:** You can import the files in any order and you do not have to import all files at one time.

**Note:** To add more files, click the plus (+) sign above the first file field.

- a. Hosts.csv
- b. SS7SP.csv
- c. Linksets.csv
- d. Associations.csv
- e. SS7 Links.csv
- f. MonitoringGroups.csv

7. Click **Load**. The files are uploaded to the system.

Once you have imported the files, you must **Synchronize** the Subsystem.

### Probed Acquisition Element Configurations

These tables show the basic Probed Acquisition element configurations needed when importing Probed Acquisition subsystem configurations using the bulk load operations.

ID	Field	Data Type	Value	Optional	Can Be Updated	Max Length
1	Bulk Load		1		No	
2	Site ID	Number			No	
3	Name	String			Yes	30
4	Description	String		Yes	Yes	255

Table 8: Site Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated	Max Length
1	Bulk Load		2		No	
2	Host ID	String			No	
3	HostName	String			Yes	30
4	Description	String		Yes	Yes	255
5	Frame	Number			Yes	
6	Position	Number			Yes	
7	Admin IP Address	String			Yes	30
8	Application Name	String			No	30
9	Application Description	String		Yes	Yes	255
10	Application	String	IMF-NG PMF-NG		No	
11	Site Name-ID	String			No	30

Table 9: Host Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated	Max Length
1	Bulk Load		3			
2	NodeID	Number			No	
3	Name	String			Yes	80
4	Description	String		Yes	Yes	255
5		String	SS7, IP, GPRS		No	255

Table 10: Node Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated	Max Length
1	Bulk Load Type		4		No	
2	SPID	Number			No	
3	SP Name	String			Yes	30
4	Description	String		Yes	Yes	255
5	Flavor ID	Number			No	
6	Point Code	Number			No

## Importing Probed Acquisition Configurations

### Pre-conditions for importing Probed Acquisition configurations

1. Management Application server is running.
2. You have logged into the Management Application server and launched Centralized Configuration.
3. You have created the necessary CSV files in the proper format.

Complete these steps when importing an Probed Acquisition configuration.

1. Click **Bulk Import Configurations** on the Home Page. The *Import Files* screen opens.

Figure 20: Bulk Load Import Screen for Probed Acquisition

2. Select the **Sites** from the drop-down menu.
  3. Click **Browse** in the first field. The *Choose File* screen opens.
  4. Select the **Sites.csv**.
  5. Click **Open**. The directory path with the file appears in the field.
  6. Repeat steps 2-4 for the following files.
- Note:** You can import the files in any order and you do not have to import all files at one time.  
**Note:** To add more files, click the plus (+) sign above the first file field.

- a. Hosts.csv
- b. Nodes.csv
- c. SS7SPs.csv
- d. GbSPs.csv
- e. GB Links.csv
- f. PMFCards.csv
- g. PMFPorts.csv
- h. PMFPortsAssignments.csv

7. Click **Load**. The files are uploaded to the system.

Once you have imported the files, you must **Synchronize** the Subsystem.

### PDU Filter Configurations

These tables show the basic PDU filter configurations needed when importing PDU filters using the bulk import operations.

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load Type		30		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5	Type	String	Calling, Called, Both		Yes
6	SSN List	String			Yes

Table 19: SSN Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load Type		31		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes

5	Type	String	OPC, DPC, Both		Yes
6	Flavor	String	ANSI-SS7, etc.		
7	PC List	String			Yes

Table 20: PC Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load Type		32		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5	Type	String	Calling, Called, Both		Yes
6	GT List	String			Yes

Table 21: GT Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load Type		34		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5	Expression	String			Yes

Table 22: Raw Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load Type		33		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5	Expression	String			Yes

Table 23: SS7 Combo Filter Configuration

## Importing PDU Filters

### Pre-conditions for importing PDU filters

1. Management Application server is running.

2. You have logged into the Management Application server and launched Centralized Configuration.
3. You have created the necessary CSV files in the proper format.
4. A log entry exists in the Audit Viewer application.

Complete these steps when importing an PDU Filters.

1. Click **Bulk Import Configurations** on the Home Page. The Import Files screen opens.
2. Click **Browse** in the first field. The Choose File screen opens.

Figure 21: Browse Screen

3. Select the **SSN.csv**.
4. Click **Open**. The directory path with the file appears in the field.
5. Repeat steps 2-4 for the following files.
 

**Note:** You can import the files in any order and you do not have to import all files at one time.

**Note:** To add more files, click the plus (+) sign above the first file field.

  - a. PCFilters.csv
  - b. GTFilters.csv
  - c. RawFilters.csv
  - d. SS7ComboFilters.csv
6. Click **Load**. The files are uploaded to the system.

Once you have imported the files, you must **Synchronize** the Subsystem.

### Probed Acquisition IP Filter Configurations

These tables show the basic Probed Acquisition IP filter configurations needed when importing Probed Acquisition IP filters using the bulk import operations.

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load		37		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
	Location	String	Source Destination		
5	Adress Type	String	Host Address, Network Address		Yes

Table 24: IP Address Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load		36		No

ID	Field	Data Type	Value	Optional	Can Be Updated
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5		String	Source Destination		Yes
6	Selected Ports	String	All, Even, Odd		Yes
7	Ports List	String			Yes

Table 25: IP Port Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load Type		35		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5	VLAN List	String			Yes

Table 26: VLAN Filter Configuration

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load		38		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
5	Expression	String			Yes

Table 27: IP Combo Filter Configuration

## Importing Probed Acquisition IP Filters

### Pre-conditions for importing Probed Acquisition IP filters

1. Management Application server is running.
2. You have logged into the Management Application server and launched Centralized Configuration.
3. You have created the necessary CSV files in the proper format.

Complete these steps when importing Probed Acquisition IP Filters.

1. Click **Bulk Import Configurations** on the Home Page. The Import Files screen opens.
2. Click **Browse** in the first field. The *Choose File* screen opens.

Figure 22: Browse Screen

3. Select the **IPFilters.csv**.
4. Click **Open**. The directory path with the file appears in the field.
5. Repeat steps 2-4 for the following files.

**Note:** You can import the files in any order and you do not have to import all files at one time.

**Note:** To add more files, click the plus (+) sign above the first file field.

- a. PortFilters.csv
- b. VLANFilters.csv
- c. ComboFilters.csv
6. Click **Load**. The files are uploaded to the system.

Once you have imported the files, you must Synchronize the Subsystem.

### Probed Acquisition GB Filter Configuration

This table shows the basic Probed Acquisition GB filter configuration, (DLCI Filter), needed when importing GB filters using the bulk import process along with an example of a DLCI Filter.

ID	Field	Data Type	Value	Optional	Can Be Updated
1	Bulk Load		39		No
2	Object ID	Number			No
3	Name	String			Yes
4	Description	String		Yes	Yes
	Selected DLCI Numbers	String	INCLUDE EXCLUDE		Yes
6	DLCI List	String			Yes

Table 28: DLCI Filter Configuration

Bulk Load	FieldID	Name	Description		DLCI List
39	NA	DLCI_Test_2	test	INCLUDE	8
39	NA	DLCI_Test_1	test	EXCLUDE	2,4

Table 29: DCLI.csv file

### Importing Probed Acquisition GB Filters

#### Pre-conditions for importing Probed Acquisition GB filters

1. Management Application server is running.
2. You have logged into the Management Application server and launched Centralized Configuration.
3. You have created the necessary CSV files in the proper format.

Complete these steps when importing an Probed Acquisition GB Filters:

1. Click **Bulk Import Configurations** on the Home Page. The *Import Files* screen opens.
2. Click **Browse** in the first field. The *Choose File* screen opens.

Figure 23: Browse Screen

3. Select the **DLCIFilters.csv**.
4. Click **Open**. The directory path with the file appears in the field.
5. Click **Load**. The files are uploaded to the system.

Once you have imported the files, you must resynchronize the subsystem.

### Q708 Parameter Configuration

Q708 parameters is a network parameter that is used to enrich xDRs. Q708 Parameters map a point code to a country code. They are used by ISUP, TUP, and SSUTR2 xDR builders. As the party number field for international calls carried in the national network of the destination country (for example, having no more country code).

Q708 parameters utilize the following reference data:

- Q708 Country Point Code Prefix - consists of the single table Country Point Code Prefix

ID	Field
1	Point Code
2	Country Name
3	Description

Table 30: Country Point Code Prefix Configuration

- Q708 Country Code - consists of the single table Country Codes

ID	Field
1	Country Code
2	Country Name
3	Country Type

Table 31: Country Code Configuration

### Sample of an Q708 Parameter Configuration CSV File

Here is an example of the *.csv* files that comprise Q708 Parameter Configuration.

#### CountryPointCodePrefix csv file

```
#"Point Code","Country Name","Description"
"2.0","Liechtenstein","2.0 Liechtenstein"
"2.1","Italy","2.1 Italy"
"2.10","Netherlands","2.10 Netherlands"
"2.100","Russian Federation","2.100 Russian Federation"
"2.101","Russian Federation","2.101 Russian Federation"
```

"2.102", "Russian Federation", "2.102 Russian Federation"  
 "2.103", "Russian Federation", "2.103 Russian Federation"  
 "2.104", "Russian Federation", "2.104 Russian Federation"

**CountryCodes csv file**

```
#"Country Code", "Country Name", "Country Type"
"0", "Default country code", "Non Home Country"
"1", "Anguilla", "Non Home Country"
"1", "Antigua and Barbuda", "Non Home Country"
"1", "Bahamas (Commonwealth of the)", "Non Home Country"
"1", "Barbados", "Non Home Country"
"1", "Bermuda", "Non Home Country"
"1", "British Virgin Islands", "Non Home Country"
"1", "Canada", "Non Home Country"
"1", "Cayman Islands", "Non Home Country"
"1", "Dominica (Commonwealth of)", "Non Home Country"
"1", "Dominican Republic", "Non Home Country"
```

**Q850 Parameter Configuration**

Q850 parameters are a reference data grouping used to enrich xDRs.

Q850 Parameters map cause values and failure messages to location values and cause families to fill xDRs' appropriate fields. They are used by ISUP, ISDN, TUP, SSUTR2, IUP, and BTNUP xDR builders.

Q850 parameters utilize the following reference data:

- Q850 SSUTR2 Cause Values
- Q850 TUP Cause Values

ID	Field
1	Keyword
2	Failure Message
3	Cause Value Enum
4	Location Name

Table 32: SSUTR2 and TUP Cause Values Configuration

- Q850 BTNUP Cause Values
- Q850 IUP Cause Values

ID	Field
1	Release Reason
2	Release Reason Message
3	Cause Value Enum
4	Location Name

Table 33: BTNUP and IUP Cause Values Configuration

- Q850 ISUP/ISDN Cause Values

### Sample of an Q850 Parameter Configuration CSV File

Here is an example of the *.csv* files that comprise Q850 Parameter Configuration.

#### Ssutr2CauseValues csv file

```
#"Keyword","Failure Message","Cause Value Enum","Location Name"
"ACI_RX","Acces interdit en reception","87","BI"
"ACI_TX","Acces interdit en emission","55","BI"
"EAR_1","Echec de lappel RNIS (cause value = 18 ou 19)","16","RPN"
"ECH","Echec de lappel","31","BI"
```

#### TupCauseValues csv file

```
#"Keyword","Failure Message","Cause Value Enum","Location Name"
"ACB_RX","Access bared on incoming way","53","LN"
"ACB_TX","Access bared on outgoing way","55","RLN"
"ADI","Address incomplete","28","LN"
"CFL","Call failure","128","LN"
```

#### BtntpCauseValues csv file

```
#"Release Reason","Release Reason Message","Cause Value Enum","Location Name"
"0","Number Unobtainable","1","UNKNOWN"
"1","Address Incomplete","28","UNKNOWN"
"10","Incoming Calls Barred","55","UNKNOWN"
"12","N/W Protective Controls","2","UNKNOWN"
"128","COM Congestion message","34","UNKNOWN"
```

#### IupCauseValues csv file

```
#"Release Reason","Release Reason Message","Cause Value Enum","Location Name"
"0","Number Unobtainable","1","UNKNOWN"
"1","Address Incomplete","28","UNKNOWN"
"10","Subscriber Controls Incoming Calls Barred","55","UNKNOWN"
"12","Network Protective Controls","2","UNKNOWN"
"128","CNG Congestion Message","34","UNKNOWN"
```

#### IsupIsdnCauseValues csv file

```
#Cause Value,Cause Family Name,Location Name
"5","MPR","USER"
"17","SSB","USER"
"25","CFL","USER"
```

"82", "IFL", "USER"

#### LocationValues csv file

```
#"Location Name", "Label"  
"BI", "Network beyond interworking point"  
"INTL", "International network"  
"LN", "Public network serving the local user"  
"LPN", "Private network serving the local user"
```

#### CauseValues csv file

```
#"Cause Value", "Message"  
"0", "Unknown"  
"1", "Unallocated (unassigned) number"  
"2", "No route to specified transit network"  
"3", "No route to destination"  
"4", "Send special information tone"
```

#### CauseFamilies csv file

```
#"Value", "Cause Family Name", "Label"  
"0", "NA", "No answer"  
"1", "SSB", "Subscriber busy"  
"2", "NNC", "National network congestion"  
"3", "CGC", "Circuit group congestion"  
"4", "HE", "Hang up during establishmen"
```

### Importing Q708 and Q850 Parameter Configurations

#### Pre-conditions for importing Q708 and Q850 Parameter Configurations

1. Management Application server is running.
2. You have logged into the Management Application server and launched Centralized Configuration.
3. You have created the necessary CSV files in the proper format.

Complete these steps when importing the required configuration.

1. Click **Bulk Import Configurations** on the Home Page. The Import Files screen opens.

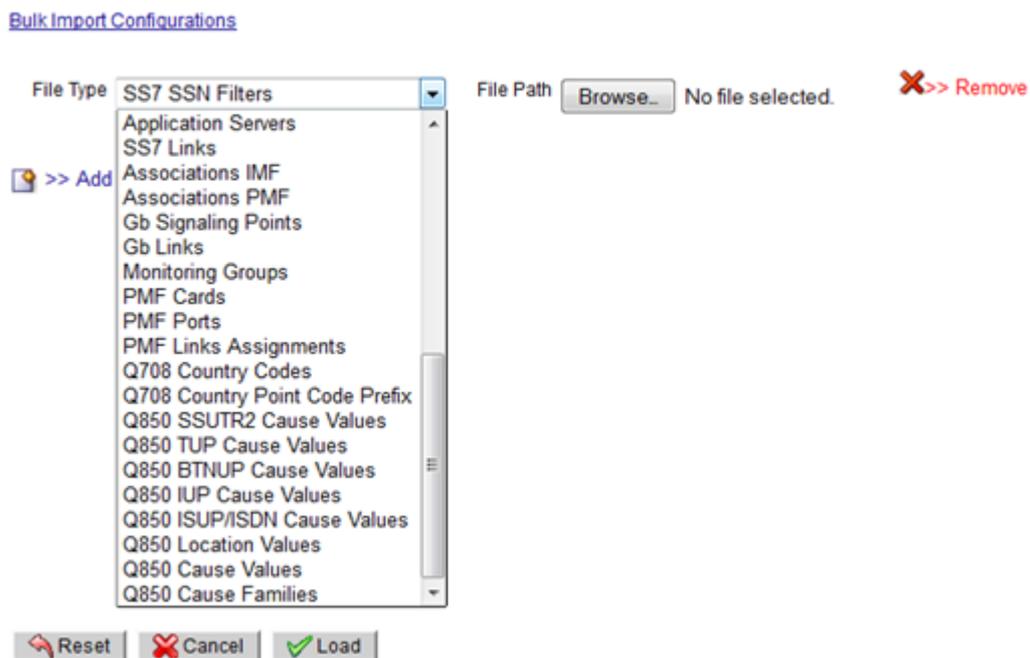

Figure 24: Bulk Load Import Screen for Q708 and Q850 Parameters

2. Select one of the Q708 or Q850 Parameters(eg. IUP Cause Values) from the drop-down menu.
3. Click **Browse** in the first field. The Choose File screen opens.
4. Select the **IupCauseValues.csv**.
5. Click **Open**. The directory path with the file appears in the field.
6. Repeat steps 2-4 for the following files.

**Note:** You can import the files in any order and you do not have to import all files at one time.

**Note:** To add more files, click the plus (+) sign above the first file field.

- a. Sstr2CauseValues.csv
- b. IsupIsdnCauseValues.csv
- c. CountryPointCodePrefix.csv
- d. BtnupCauseValues.csv and so on.

7. Click **Load**. The files are uploaded to the system.

Once you have imported the files, you must **Synchronize** the Subsystem.

## Exporting Bulk Load Configurations

The Home page screen contains a Bulk Export Configurations function that is used to update your configurations using csv formatted files. You use this function for uploading the following configurations:

- Sites
- Hosts
- Applications (Only for Integrated Acquisition and Probed Acquisition)
- SS7 Network Elements
- Gb Network Elements
- Integrated Acquisition Linkset Assignments
- Probed Acquisition Link Assignments
- SS7 PDU filters
- IP Filters
- Q708 and Q850 Parameters

If you are not on the Home page complete the following steps. If you are on the Home page skip step 1.

1. From the Home menu, select **Home Page** The *Home Page* screen opens.
2. Click **Bulk Export Configurations**  
The *Bulk Export* Prompt appears.

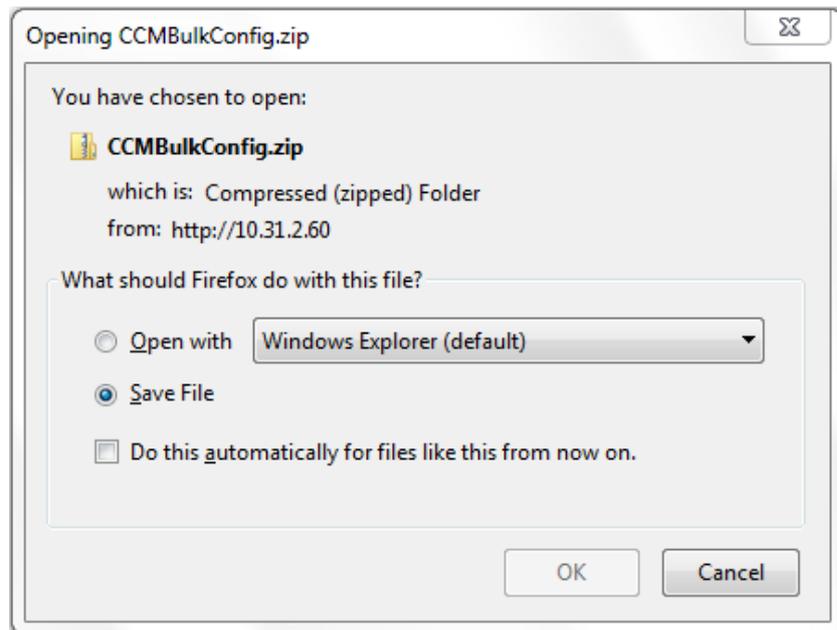

Figure 25: Bulk Export Configurations Prompt

At this step you can either save the zip file or open it to extract the files you want to use. To begin the extract process, complete the next step.

3. Click **Open**. The zip extract screen opens.

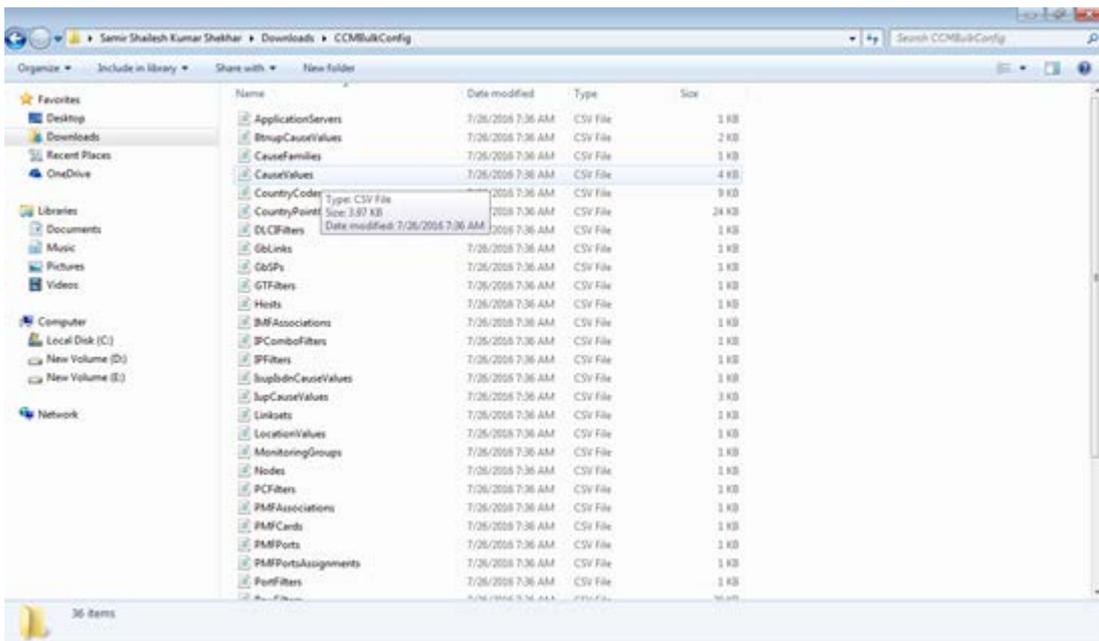

Figure 26: Bulk Export Configurations Directory

At this stage, you can extract any of the files needed.

## Creating a Configuration Report

The Centralized Configuration Home page also provides a Create Configuration Report feature that produces a report in MS Excel format. This report provides a spreadsheet (as a tab in the spreadsheet) for each element that is configured in your system as well as KPI and Alarm applications.

Selecting the **Create Configuration Report** option initiates a prompt shown below.

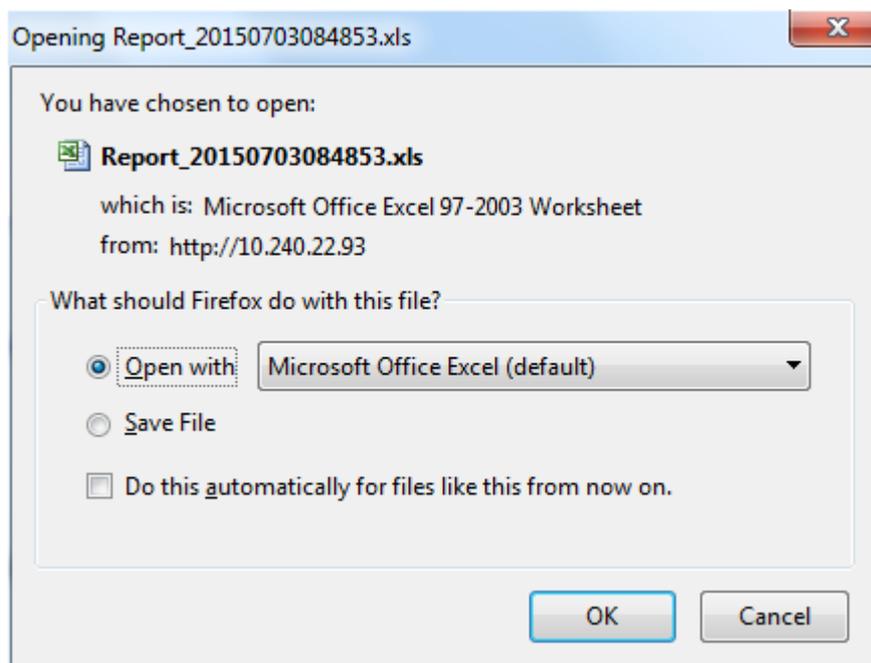

Figure 27: Open/Save Prompt For Configuration Report

You can either open the report (see below) or save the report to a local directory. When you open the report a spreadsheet opens shown in the figure below.

Name	Internet Protocol	Transp Association	Applic Forwardi	Filter	Filter	Card	Port	Applicatio	Ann
TEST_TC	IPv4	All	All	Packets		pmf10-	1	pmf10-0a	
Pri_Test_T C	IPv4	All	All	Packets	Test_filter_Pri (dst host 10.240.19.50)	pmf10-	1	pmf10-0a	
TC1	IPv4	All	All	Packets		pmf10-	1	pmf10-0a	

Figure 28: Sample Report

At this point you can select each tab and see information on each element in the system.

## Configure Alarm Severity Offset

The View/Configure Severity offset link provides a list of all the alarm specific problems present in your system. It allows to override incoming alarm severity according its specific problem. This mechanism is applied at listening time when each alarm event is received.

**Note:** The Home screen section shows the list of Alarm Specific Problems independently of the Object Tree on the left-hand section of the screen.

Specific Problem	Probable Cause	Alarm Type	Expected Severities	Action
TKPIC25028: DX: xDRs created critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25029: DX: Received frames critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25030: DX: Not created xDRs critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25031: DX: Out of time xDRs critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25032: DX: Unknown frames critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25033: DX: Erroneous frames critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25034: DX: Rejected frames critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25035: DX: Frames not accepted by xDR consumers critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25037: DX: Filtered frames critical rate crossed	THRESHOLD_CROSSED	QUALITY_OF_SERVICE_ALARM	WARNING	No Change
TKPIC25040: DX: Q.752 counter 7.3 - Routing failure, MTP failure	COMMUNICATION_PROTOCOL_ERROR	COMMUNICATIONS_ALARM	MINOR	No Change
TKPIC25044: DX: Q.752 counter 7.7 - Routing failure, unequipped user	CALL_ESTABLISHMENT_ERROR	COMMUNICATIONS_ALARM	MINOR	No Change
TKPIC25048: DX: xDR Loss	TRANSMIT_FAILURE	EQUIPMENT_ALARM	MAJOR	No Change
TKPIC25050: DX: xDR Consumer Connection Loss	TRANSMIT_FAILURE	EQUIPMENT_ALARM	MAJOR	No Change
TKPIC25052: DX: xDR consumer max allowed input rate overflow	CONFIGURATION_OR_CUSTOMIZING_ERROR	PROCESSING_ERROR_ALARM	MINOR	No Change
TKPIC25053: DX: Close license expiry	CONFIGURATION_OR_CUSTOMIZING_ERROR	PROCESSING_ERROR_ALARM	MAJOR	No Change
TKPIC25054: DX: License expiry	CONFIGURATION_OR_CUSTOMIZING_ERROR	PROCESSING_ERROR_ALARM	CRITICAL	No Change
TKPIC25056: DX: Invalid configuration	CONFIGURATION_OR_CUSTOMIZING_ERROR	PROCESSING_ERROR_ALARM	MAJOR	No Change
TKPIC25057: DX: Datawarehouse connection error	CALL_ESTABLISHMENT_ERROR	COMMUNICATIONS_ALARM	MAJOR	No Change
TKPIC25058: DX: Transfer late	PERFORMANCE_DEGRADED	QUALITY_OF_SERVICE_ALARM	MAJOR	No Change
TKPIC25060: DX: PDU disk full	STORAGE_CAPACITY_PROBLEM_M3100	PROCESSING_ERROR_ALARM	MAJOR	No Change
TKPIC25061: DX: MFP Deconnection	TRANSMIT_FAILURE	EQUIPMENT_ALARM	MAJOR	No Change
TKPIC25062: DX: Unknown Source	CONFIGURATION_OR_CUSTOMIZING_ERROR	PROCESSING_ERROR_ALARM	WARNING	No Change

Figure 29: Alarms Severity Offset Screen

1. Display the **Alarm** Specific Problem to be modified.
2. Modify offset setting in Action column. It will modify incoming alarm event severity (or reject event) according its specific problem according below table

Incoming severity	Increase severity			No change	Decrease severity			Ignore
	By 3	By 2	By 1		By 1	By 2	By 3	
CRITICAL	CRITICAL	CRITICAL	CRITICAL	CRITICAL	MAJOR	MINOR	WARNING	NONE
MAJOR	CRITICAL	CRITICAL	CRITICAL	MAJOR	MINOR	WARNING	WARNING	NONE
MINOR	CRITICAL	CRITICAL	MAJOR	MINOR	WARNING	WARNING	WARNING	NONE
WARNING	CRITICAL	MAJOR	MINOR	WARNING	WARNING	WARNING	WARNING	NONE

Table 38: Alarm severity Offsets

**Note:** To update the alarm list, click the Refresh button on the toolbar. The list is updated to show the latest changes.

## Managing Acquisition Datafeed Export (External) Applications

The Centralized Configuration Home page also provides a means of managing Acquisition Datafeed Export (external) applications. Clicking on the link enables you to add, modify or delete an external application.

The list screen shows the following application information.

#	Host Name	IP Address	Application	Version	Description	Actions
---	-----------	------------	-------------	---------	-------------	---------

Figure 30: Acquisition Datafeed Export List Screen

Column	Description
Host Name	Provides the name of the server housing the application
IP Address	Gives the IP Address of the server
Application	Shows the application name
Version	Shows the version of the application
Description (Optional)	Shows any specific information (if any) about the application
Actions	Provides icons to perform specific actions on the applicaiton such as deleting an application.

Table 39: Acquisition Datafeed Export (External) Application Columns

### Creating a Acquisition Datafeed Export Session

Complete these steps to create a Acquisition Datafeed Export session:

1. From the Home Page, click **Manage Acquisition Datafeed Export Applications**.  
The *List* screen opens.

#	Host Name	IP Address	Application	Version	Description	Actions
---	-----------	------------	-------------	---------	-------------	---------

Figure 31: Acquisition Datafeed Export List Screen

2. Click **Add** from the tool bar. The *Add* screen opens

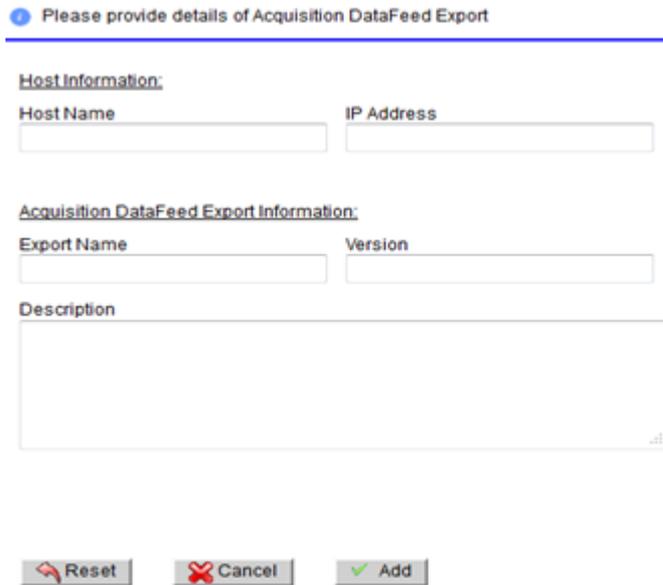

Figure 32: Thirdparty Application Add Screen

3. Enter the **Host Name**.
4. Enter the **IP Address** of the host machine.
5. Enter the **Application Name**.
6. Enter the **Version**.
7. (Optional) Enter a **Description** of the application.
8. Click **Add**. The session information is added to the system

### Modifying a Acquisition Datafeed Export Session

Complete these steps to modify a Acquisition Datafeed Export application session:

1. Select **Home Page > Manage Acquisition Datafeed Export Applications**.  
The *List* screen opens.
2. Select the **session** to be modified.
3. Click **Modify** the session screen opens.
4. Make the necessary modifications.
5. Click **Modify**. The modifications are saved and you are returned to the list screen.

### Deleting a Acquisition Datafeed Export Session

Complete these steps to delete a Acquisition Datafeed Export application session:

1. Select **Home Page > Manage Acquisition Datafeed Export Applications** .  
The *List* screen opens.
2. Select the **session** to be deleted.
3. Click **Delete** the session screen opens.
4. Click **OK** at the prompt. The session is deleted from the system.

## Auto Synch Parameters

The Centralized Configuration Home page provides a Auto Synch Parameters feature that automates the synchronization and apply process at timed intervals for Integrated Acquisition subsystems.

**Note:** The Auto Synchronization process is only for Integrated Acquisition subsystems. Both Mediation and Probed Acquisition subsystems need to be manually synchronized and applied.

Clicking on the **Auto Synch Parameters** feature on the Home Page opens the Auto Synch Parameters pop-up window. This pop-up window has two options.

- Configure Auto Synch - this option enables the user to turn on or turn off the auto synch feature.

**Note:** The default is **Off**.

- Synch Interval (in minutes) - once the auto synch feature is turned on, then the user can enter a time interval in minutes and the auto synch process will continue to occur at that interval.

Once the parameters have been set, click **OK**. The pop-up window vanishes and the system is now set.

## Acquisition Synchronization Reports

The Centralized Configuration Home page provides an Acquisition Synchronization Reports feature that provides a text file providing the information traditionally given in the manual synchronization process. This feature works in combination with the Auto Synch Parameters feature. If the Auto Synch Parameters feature is turned on, then the Integrated Acquisition synchronization reports are generated at the intervals set in Auto Synch Parameters.

**Note:** Default interval is 5 minutes

#	Subsystem Name	Last Sync Time	Last Apply Time
1	E5-APP-B-Samsung.XMF	2015-11-26 08:08:37.771291 (MANUAL)	2015-11-26 08:32:52.784384 2015-11-26 08:27:48.48854 2015-11-26 08:13:47.181052 2015-11-26 08:08:16.258108 2015-11-26 07:50:11.388881 2015-11-26 07:49:18.883989 2015-11-26 07:23:30.714431

3	MRVE5-APP-B.XMF	2015-11-23 07:44:48.031548 (MANUAL) 2015-11-23 07:41:44.718784 (MANUAL) 2015-11-23 04:06:16.699149 (MANUAL) 2015-11-23 03:49:27.637884 (MANUAL) 2015-11-23 03:43:01.732095 (MANUAL)	2015-12-07 06:28:59.946448 2015-11-23 07:46:25.941825 2015-11-23 04:07:17.241815 2015-11-23 04:00:32.186233 2015-11-23 03:44:56.497057 2015-11-20 03:47:17.046022 2015-11-20 03:32:06.554629 2015-11-19 10:07:09.280377 2015-11-19 10:06:15.705594 2015-11-18 11:01:17.786081

Figure 33: Acquisition Synchronization Report

Column	Description
Subsystem Name	Name of the subsystem
Last Sync Time	Time the subsystem was last synchronized
Last Apply Time	Last apply change time

Table 40: Acquisition Datafeed Export (External) Application Columns

The Acquisition synchronization report, like the manual process, provides the following information in text format.

- Elements Added - shows the number of elements added to the Integrated Acquisition subsystem.
- Elements Removed - shows the number of elements added from the Integrated Acquisition subsystem.
- Elements Modifies - shows that number of elements modified in the Integrated Acquisition subsystem.
- No Change - shows the number of elements that were not affected in the synchronization process.
- Errors - shows errors that occurred during the synchronization process.

## Chapter 5: Equipment Registry

---

### About Equipment Registry

The Equipment Registry perspective is used to manage (create, modify and delete) sites, subsystems and physical servers. This perspective presents you with a graphic orientation of the physical equipment defined in Performance Intelligence Center.

In addition, subsystem creation is accomplished in an automated single-step discovery process. Centralized Configuration automatically discovers all applications and application specific data. Once a subsystem is created, the applications and application specific data can be modified using the Acquisition and Mediation perspectives.

### Sites

A site consists of different kinds of subsystems with each subsystem having one or more hosts. Upon installation, Centralized Configuration, by default, creates two sites (colored blue to denote that they are default sites):

- Legacy - has four categories - MSW and XMF-LEGACY. For legacy systems you only have the capability to create subsystems and add hosts to the Centralized Configuration system. Discovery of application, network elements and sessions happens automatically on creating the subsystem and adding hosts to the subsystem. No further configuration is possible with the legacy systems.
- NOC - gives information of the servers that make up the Centralized Configuration. For all servers you do not need to change/add anything under the NOC site. You do not need to change/add anything under the NOC site.

Apart from these two default sites, you can add any number of sites. The number of sites depends on the logical grouping of the monitored location. Once you create a site four categories of subsystems are automatically created under the site:

- DWH - Data Warehouse
- Mediation
- Acquisition - Integrated Acquisition and Probe Acquisition (Acquisition Perspective)
- EFS - Exported Filer Server
- OCDSR - Integrated OCDSR Monitoring

### Site Creation and Discovery Process

On creating the subsystems and adding the hosts under the subsystem, Centralized Configuration conducts a one-step process of creating subsystems, discovering the applications, network elements (in case of a Acquisition subsystem), discovering Mediation Protocol and dictionaries (Mediation subsystem) when you click the **Create** button. A summary of the hosts and the elements discovered is provided to the user.

### Listing Sites

When you select *Sites* from the object tree, all sites are listed in the left-hand workspace. The figure shown here shows an expanded Equipment Registry Object tree with the sites listed in the workspace. The railway shows the List function being active.

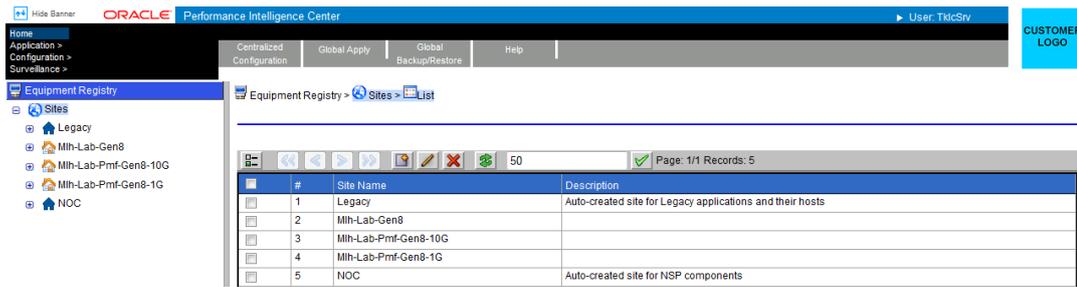

Figure 34: Site List Screen

## Creating a Site

Complete these steps to add a site.

1. On the object tree, select **Sites**.
2. Select **Add** from the pop-up menu. The *Add* screen opens shown in the figure.

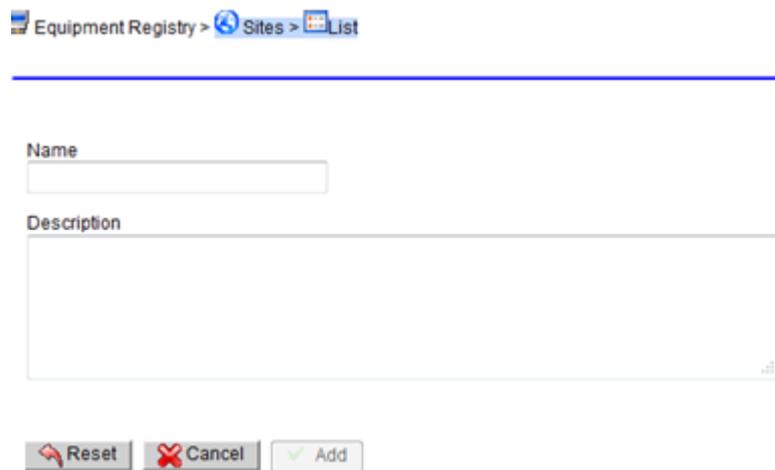

Figure 35: Site Add Screen

3. Type in the **Name** of the site.
4. (Optional) Type in a **Description** of the site.
5. Click **Add**.

A prompt appears stating that the site has been successfully added, and the site appears in the object tree list in alphanumerical order with associated subsystems shown in this figure.

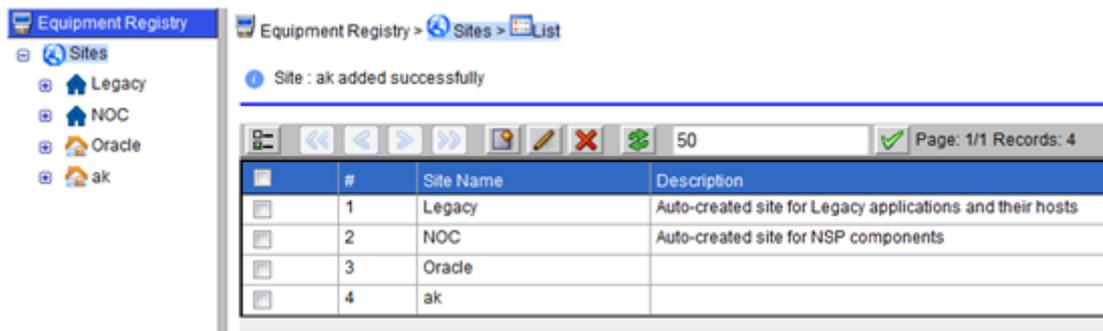

Figure 36: New Site With Subsystems

## Modifying a Site

Complete these steps to modify a site.

1. Select the **Site** from the object tree.

- Right-click and select **Modify**.

Equipment Registry > Sites > List

---

Name  
PMF\_60

Description

Reset Cancel Add

Figure 37: Site Modify Screen

- Make necessary modifications to the site information.
- Click **Modify**. The modifications are saved.

### Deleting a Site

Complete these steps to delete a site.

**Note:** Before deleting a site, all the hosts belonging to that site must first be deleted.

- Select the **Site** to be deleted from the *object tree*.
- Click **Delete** from the *pop-up menu*.
- Click **OK** at the prompt. The site is deleted from the *object tree*.

### About Subsystems

When you create a site, the following subsystems are created:

- DWH for storage
- Mediation for storage and correlation
- Acquisition subsystem for data acquisition
- EFS for exported files

Tree nodes are automatically created for these subsystems. From this perspective you can configure these subsystems by adding hosts and discovering applications that make up the subsystem.

### Adding a Data Warehouse (DWH)

Complete these steps to add a Data Warehouse to the DWH subsystem.

- Select **Equipment Registry > Site > DWH**.
- Right-click on **DWH**.
- Select **Add** from the pop-up menu. The *Addscreen* appears.  
Add DATA WAREHOUSE subsystem screen - field descriptions

Field	Description
Storage Name	The name of the DWH server

Version	Vesion of the Oracle database (default 10.2) housed in the DWH
Description (optional)	Text field to add useful descriptions about the DWH (Default phrase is, "Created for external storage."
Login User ID	User ID to log into the DWH
Password	Password for logging into the DWH
Service Name	Alphanumeric field to provide the name of the service running the database
Port	Numeric field to enter the port number of the DWH
IP Address	TheIP address of DWH

Table 41: Data Warehouse Add Screen

4. Enter the **Storage Name** of the DWH .
5. Enter the **Version** of the Oracle database running on the DWH.
6. (Optional) Enter a **Description** of the DWH
7. Enter the **Login User ID** for the DWH
8. Enter the **Password**.
9. Enter the **Service Name** of the DWH.
10. Enter the **Port number**.
11. Type in the **IP Address** of the DWH
12. Click **Add** to add the subsystem to the list. The DWH is added to the system.

### Modifying a Data Warehouse (DWH)

Complete these steps to modify a subsystem.

1. Select **Equipment Registry > Site > DWH** to be modified.
2. Select **Modify** from the popup menu.
3. Make the necessary modifications.
4. Click **Modify**.

A prompt appears stating that the subsystem was modified. You must now apply changes to that subsystem for the changes to take effect.

### Deleting a Data Warehouse (DWH)

Complete these steps to delete a DWH subsystem.

1. Select the **Equipment Registry > Site > DWH** to be deleted.
2. Select **Delete** from the popup menu.
3. Click **OK** at the prompt.

### Assignment

To assign a Virtual IP Address (VIP address) the following criteria need to be met.

- The VIP must be in the same subnet for the subsystem (Mediation or Acquisition) and not being used for a host.

In addition, it is recommended to take the last available IP from the subnet since the IP is always assigned from the small number to the big number starting with server "1a."

**Note:** To find out the last available IP address, run `ifconfig` from one of the servers (or `platcfg` for the user) to get the broadcast address.

Here is an example of using the `ifconfig` for finding the last available IP address.

```
[root@ixp0301-1c ~]# ifconfig
eth01    Link encap:Ethernet HWaddr 00:24:81:FB:CB:78
         inet addr:10.240.9.102 Bcast:10.240.9.127 Mask:255.255.255.192
         UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
         RX packets:100220031 errors:0 dropped:0 overruns:0 frame:0
```

```

TX packets:103153021 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:1000
RX bytes:1700925078 (1.5 GiB) TX bytes:3351841865 (3.1 GiB)
Interrupt:185 Memory:f8000000-f8011100

```

```

lo          Link encap:Local Loopback
inet addr:127.0.0.1 Mask:255.0.0.0
UP LOOPBACK RUNNING MTU:16436 Metric:1
RX packets:10626760 errors:0 dropped:0 overruns:0 frame:0
TX packets:10626760 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:0
RX bytes:1952272307 (1.8 GiB) TX bytes:1952272307 (1.8 GiB)

```

In this example the Bcast 10.240.9.127 is one plus the last IP in the subnet, so 10.240.9.126 is the best candidate for the VIP.

### Adding a Mediation Subsystem

**Note:** You can have an unlimited number of Mediation subsystems per site.

Complete these steps to add an Mediation subsystem to a site and discover its elements.

1. Select **Equipment Registry > Site** that has the Mediation subsystem.
2. Right-click on the site **IXP**.
3. Select **Add**. The *Add* screen appears.

Add Mediation subsystem screen - field descriptions

Field	Description
Subsystem Name	The name of the Mediation subsystem (required).
VIP Address	This is the Virtual IP address of the server where the Mediation subsystem resides.  <b>Note:</b> The VIP address is established when the Mediation subsystem is initially installed and integrated into the customer network. The assignment of the VIP address can be the default of the broadcast address (broadcast-1) for the subnet, or it can be manually assigned to an address in the subnet. See <a href="#">Virtual IP Address Assignment</a> .
IP Address	The IP address of Mediation server where the Mediation subsystem resides.
Add button	Adds the IP address to the list (you can have more than one IP address for a subsystem).
Delete button	Deletes the subsystem parameters from the list.
Reset button	Resets all settings to default.
Cancel button	Cancels the current process and returns back to original screen.
Create button	Adds the subsystem to the site.

Table 42: Mediation Subsystem Add Screen Field Descriptions

4. Enter the **Name** of the Mediation subsystem.
5. Enter the **VIP Address** of the subsystem.
6. Enter the **IP Address** of the subsystem.
7. Click **Add** to add the subsystem to the list.

**Note:** Repeat steps 4-7 to add each additional subsystem.

8. Click **Create**. A progress bar appears as the system searches out the IP address, applications and protocols. When the discovery process is completed a Results Summary screen opens.

**Note:** Some systems use a large number of protocols and the time span for the discovery process can take several minutes.

**Note:** Use the Modify function to add a host(s) to an Mediation subsystem.

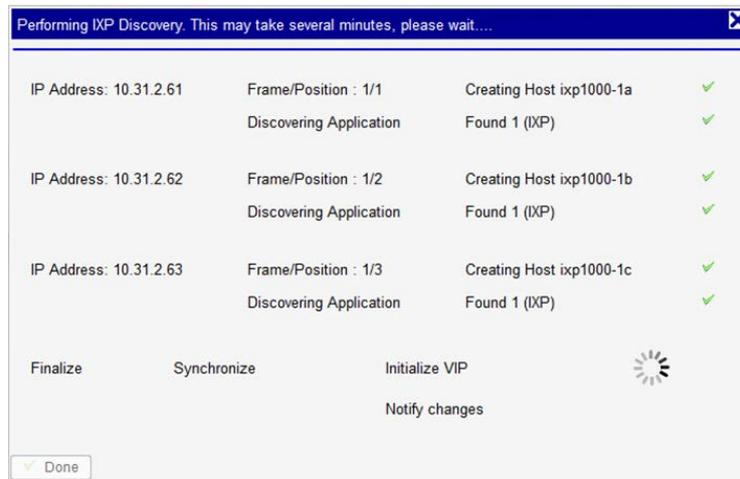

Figure 38: Subsystem Results Summary Screen

The screen has four tabs with five subtabs:

- a. Host - Shows the host parameters and status (added successfully or not)
- b. Application - Shows a summary of the number of applications discovered
- c. Synchronize Mediation - shows if the synchronization was successful or not.

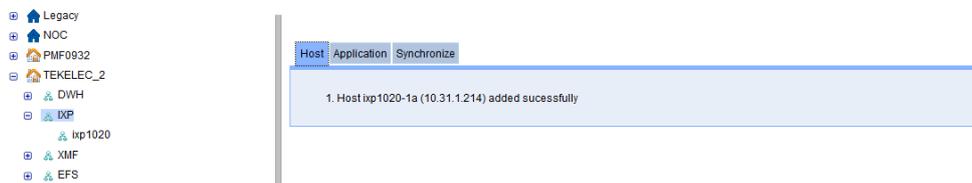

Figure 39: Object Tree Showing Added Subsystem With Results Screen

At this stage legacy subsystems can be added or additional Mediation subsystems can be manually added.

9. Right click on the **Mediation subsystem** and select **Apply Changes** for the changes to take effect.

### Modifying a Mediation Subsystem

Complete these steps to modify a subsystem.

1. Select the subsystem to be modified. The *List* screen opens.
2. Select Modify from the popup menu.
3. Make the necessary modifications.
4. Click Modify. A prompt appears stating that the subsystem was modified. You must now apply changes to that subsystem for the changes to take effect.

### Deleting a Mediation Subsystem

**Note:** You cannot delete a subsystem that has dependent applications such as sessions. You must first delete the dependent applications, then you can delete the subsystem.

Complete these steps to delete a subsystem.

1. Select the **subsystem** to be deleted from the list. The List screen opens.
2. Select **Delete** from the popup menu.
3. Click **OK** at the prompt, the subsystem is deleted.

You must now apply changes for that subsystem for the changes to take effect.

## Re-discovering Applications

Once a Mediation subsystem has been created, you can re-discover applications by completing the following steps.

1. Select the **subsystem** to be modified. The *List* screen opens shown below.

#	Host Name	Description	Frame	Position	IP Address	Owner
1	ixp1001-1a		1	1	10.31.2.61	tekelec
2	ixp1001-1b		1	2	10.31.2.62	tekelec
3	ixp1001-1c		1	3	10.31.2.63	tekelec

Figure 40: Mediation Subsystem List Screen

2. Select **Host** from the list.
3. Click **Discover Applications** on the toolbar. The screen changes, shown below, to show the re-discovered applications.

Name	Type	Details
ixp1001-1a	IXP	Nothing has been updated in the Centralized Configuration.

Figure 41: Mediation Subsystem List Screen

**Note:** For adding protocols and Mediation Protocol to an Mediation subsystem, see [Discovering Mediation Protocol](#) and [Configuring xDR Dataflow Processings](#)."

## Managing a Mediation Storage Pool

There can be an unlimited number of storage servers in a subsystem. Data Record Storage servers can be created, modified and removed from a subsystem without interrupting the Mediation performance. Each storage server can exist in one of three states.

Server State	Description
Active	Insertion and queries are allowed on a storage server in this state
Query	Only queries are allowed on a storage server in this state
Maintenance	The Data Record Storage server will not allow any insertion or queries of sessions while in this state.

Table 43: Data Record Storage Server States

**Note:** If an Data Record Storage server is in "Query" state, no configuration actions can be undertaken. All servers must be in "Active" state when sessions are created for queries on such sessions to be successful. Otherwise, if a query is launched in Troubleshooting on a newly created session, a "Unable to execute query: ORA-00942: table or view does not exist." will appear.

## Data Record Storage Server Designations

Once an Mediation subsystem has been created, you can an unlimited amount of servers in that subsystem.

Once the servers have been discovered, Centralized Configuration provides one of the following designations for each server on the subsystem.

Server Designation	Description
IXP-XDR	This server is used as an Data Record Storage server

IXP-PDU	This server is used as the PDU Storage server
IXP-BASE	This server is used as the Mediation server

Table 44: Mediation Server Designations

At least one server must have the designation IXP-XDR otherwise the discovery will fail. Once the designations have been made, Centralized Configuration creates the pool of storage servers with designation IXP-XDR.

The first IP Address should be assigned to the storage server.

**Note:** It is recommended that the sequence of IP Address for server should be the following order:

- All Data Record Storage servers
- All Mediation servers
- All PDU Storage servers

### Adding a Data Record Storage Server to a DR Storage Pool

Complete these steps to add a Data Record Storage server to a DR storage pool.

**Note:** Data Record Storage servers can be added to a pool without interrupting Mediation activity. After adding a Data Record Storage server to a pool, Mediation evenly distributes xDRs to all Data Record Storage servers in the pool.

1. From the *Equipment Registry* object tree, select **Sites > DWH subsystem > DWH**
2. Right-click on **DWH**.
3. Select **Add** from the pop-up menu. The *Add DWH server* screen opens shown in the figure below.

Figure 42: Add Data Record Storage Subsystem Screen

Add Data Record Storage screen - field descriptions

Field	Description
Storage Name	The name of the Data Record Storage (required). That will be the name of the Pool if this is the first Data Record Storage added (StorageName_Pool)
IP Address	The IP address of Data Record Storage (required)
SID	The SID to access to the Mediation database (required)
Add button	Adds the Data Record Storage to the site.
Cancel button	Cancel the current process and returns back to original screen.

Table 45: Data Record Storage Add Screen

4. Type in the **Name** of the Data Record Storage
5. Type in the **IP Address** of the Data Record server.
6. Click **Add**.

### Deleting a Storage Server

Complete these steps to delete a storage server in a storage pool.

1. Select the **Mediation > site > subsystem > DWH > DWH Pool > Storage** to be deleted.
2. Make the server in **Maintenance state**.
3. Select **Mediation > site > subsystem > DWH > DWH Pool > Server**.
4. **Delete** the application.
5. Select **Equipment registry > site > subsystem > DWH > DWH Pool**.
6. Select **Delete** from the tool bar.
7. Click **OK** at the prompt. The server is deleted

**Note:** You must **Apply Changes** before the changes take place.

### About Acquisition (Integrated Acquisition and Probed Acquisition) Subsystems

You have the ability to discover Acquisition Subsystem information. Acquisition subsystems include both Integrated Acquisition and Probed Acquisition. Once the subsystem has been created and hosts discovered you must go to either the Acquisition perspective to configure the Subsystem.

**Note:** You can only have one Integrated Acquisition or Probed Acquisition subsystem per site. To add another Acquisition Subsystem, you need to create another site.

### Adding an Integrated Acquisition Subsystem to a Site

After you have created a site, complete these steps to add an Integrated Acquisition subsystem.

**Note:** A site can only have one Integrated Acquisition subsystem.

**Note:** When an Integrated Acquisition subsystem is added all network elements are automatically discovered.

1. Select **Equipment Registry > Sites > Acquisition Subsystem**.
2. Click **Add** on the Acquisition subsystem tool bar.

**Note:** The right-click menu on the Acquisition folder can be also used. Select Add from the menu options.

Field	Description
Subsystem Name	Name is identical to site name since only one Acquisition subsystem can exist on a site.
VIP Address	This is the Virtual IP address of the server where the Acquisition subsystem resides. <b>Note:</b> The VIP is established by the Acquisition subsystem when it is installed and integrated into the customer network. The assignment of the VIP address can be the default of the broadcast address for the subnet or it can be manually assigned to an address in the subnet. See <a href="#">Virtual IP Address Assignment</a> .
IP Address	The IP address of Integrated Acquisition subsystem.
Add button	Adds the IP address to the list (you can have more than one IP address for a subsystem).
Delete button	Deletes the subsystem parameters from the list.
Reset button	Resets all settings to default.
Cancel button	Cancels the current process and returns back to original screen.
Create button	Adds the subsystem to the site.

Table 46: Acquisition Subsystem Add Screen Field Descriptions

3. Enter the **VIP Address**. (See [Virtual IP Address Assignment](#) for more information on using VIPs.)
4. Enter the **IP Address** for the Integrated Acquisition host.

**Note:** This address is established when the Integrated Acquisition subsystem is installed and integrated into the customer network.

5. Click **Add**.
6. Click **Create**. The *Verification* screen opens to show the discovery process.

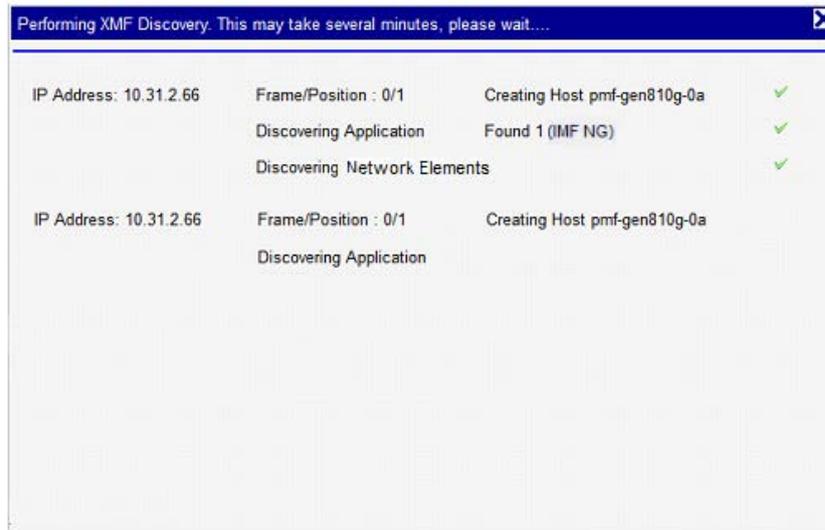

Figure 43: Verification Screen - Done Button Not Shown

7. Click **Done**. The Results screen opens showing the following information:

**Note:** The Results Summary screen only opens when the discovery process has finished.

- a. Host tab - showing the IP addresses of the discovered hosts and the result
- b. Application - showing the applications that were discovered
- c. Network Element Discovery - showing the links belonging to the hosts that has the following five tabs:
  - Added - shows any elements that have been added to the host since the last discovery process
  - Removed - shows any elements that have been removed since the last discovery process
  - Modified - shows any elements that have been modified since the last discovery process
  - No change - shows the elements that have not changed since the last discovery process
  - Error - shows any errors that occurred in the discovery process

**Note:** If this is the first discovery process, all the tabs will be empty except for Added and Error. The other tabs are only populated when changes have been made to an existing Integrated Acquisition subsystem and the Synchronize function is used and the discovery process is repeated (see how to modify hosts).

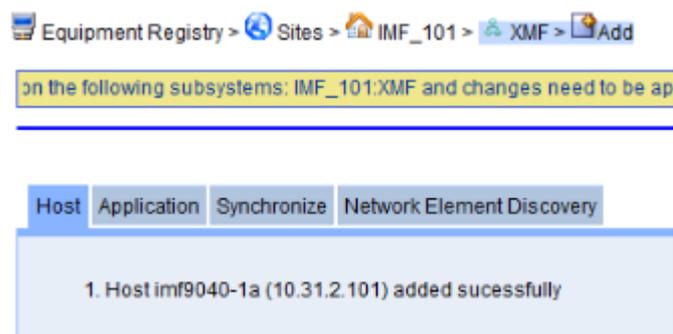

Figure 44: Results Summary Screen - Host Tab

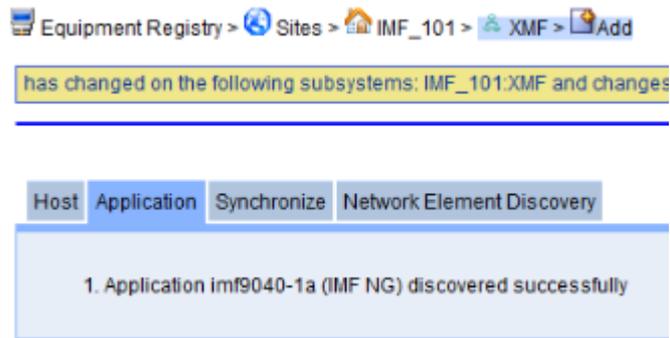

Figure 45: Results Summary Screen - Application Tab

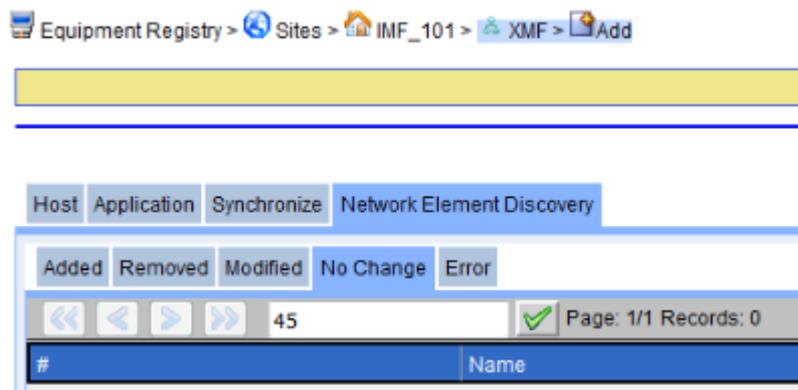

Figure 46: Results Summary Screen - Network Element Discovery

8. Select the subsystem again to see the newly created hosts and applications.

### Modifying an Acquisition Subsystem

Complete these steps to modify an Acquisition subsystem host.

1. Select the **Site > Acquisition subsystem** to be modified from the object tree. The *List* screen opens.
2. Select the **Host**.
3. Click **Modify** from the tool bar.
4. Make necessary **modifications** on either screen (click Next) to open the next screen.
5. Click **Modify** after you have made the necessary modifications.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### Modifying an Integrated Acquisition Subsystem Host

Complete these steps to modify an Acquisition subsystem host.

1. Select the **Site > Acquisition subsystem** to be modified from the object tree. The *List* screen opens.
2. Select the **Host**.
3. Click **Modify** from the tool bar.
4. Make necessary **modifications** on either screen (click Next) to open the next screen.
5. Click **Modify** after you have made the necessary modifications.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

## Deleting an Acquisition Subsystem

**Note:** You can only delete a subsystem if there are no dependent applications to the subsystem. You must delete all hosts and applications first before deleting the subsystem.

Complete these steps to delete an Acquisition subsystem.

1. Select **Site > Acquisition subsystem** to be deleted. The *List* screen opens. (Or select the subsystem from the Site List screen.)
2. Click **Delete**.
3. Click **OK** at the prompt. The subsystem is deleted.

## Adding a Probed Acquisition Subsystem to a Site

After you have created a site, complete these steps to add a Probed Acquisition subsystem to a site.

**Note:** Each site can only have one Probed Acquisition subsystem.

1. Select **Equipment Registry > Site > Acquisition subsystem**.
2. From the Acquisition subsystem right-click menu select **Add**.

Field	Description
Subsystem Name	Name is identical to site name since only one Acquisition subsystem can exist on a site.
VIP Address	This is the Virtual IP address of the server where the Probed Acquisition subsystem resides. <b>Note:</b> The VIP address is established when the Probed Acquisition subsystem is initially installed and integrated into the customer network. The assignment of the VIP address can be the default of the broadcast address (broadcast-1) for the subnet, or it can be manually assigned to an address in the subnet. See <a href="#">Virtual IP Address Assignment</a> .
IP Address	The IP address of Acquisition server where the Probed Acquisition subsystem resides.
Add button	Adds the IP address, to the list (you can have more than one IP address for a subsystem).
Delete button	Deletes the subsystem parameters from the list.
Reset button	Resets all settings to default.
Cancel button	Cancels the current process and returns back to original screen.
Create button	Adds the subsystem to the site.

Table 47: Acquisition Subsystem Add Screen Field Descriptions

3. Enter the **VIP Address**.
4. Enter an **IP Address** for the Probed Acquisition host.
5. Click **Add**.
6. Click **Create**.

The system discovers the hosts and cards that belong to the Probed Acquisition subsystem. All successful discoveries are shown with a check mark beside it. See the figure below.

**Note:** If there is an error, a red x will appear beside the host or application that could not be discovered.

**Note:** E1/T1 Span cards are not auto-discovered, they are manually added to the Probed Acquisition subsystem. See [Adding an E1/T1 \(SPAN\) Card Probed Acquisition](#) for more information.

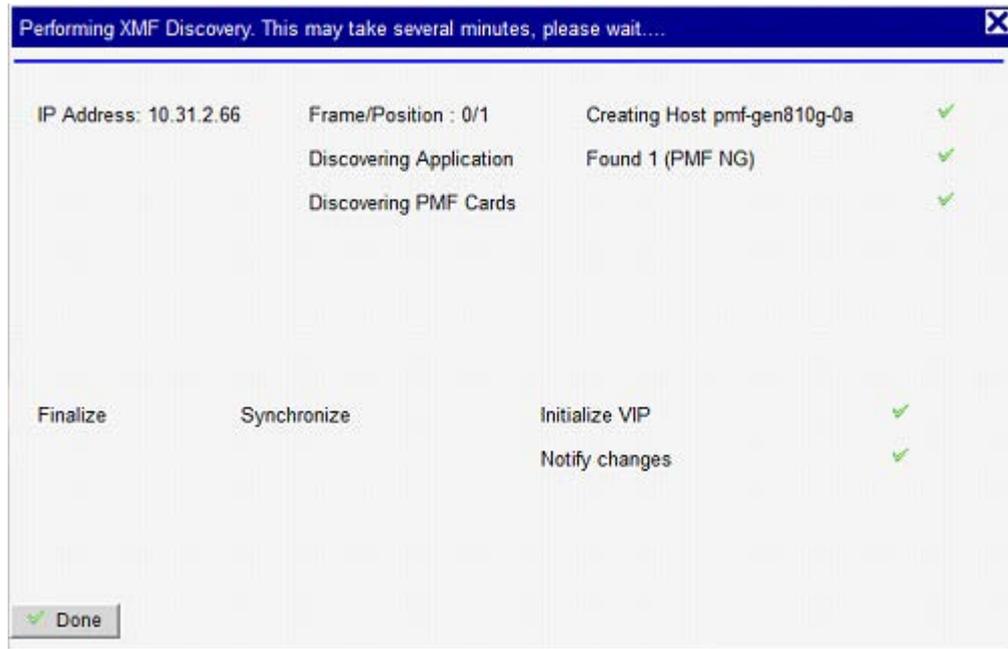

Figure 47: PROBES ACQUISITION Results Summary Screen

7. Click **Done** to close the Results Summary screen and view the discovery summary. The screen has the following tab information shown in the figure shown here:
  - a. Host tab - showing the IP addresses of the discovered hosts and the result
  - b. Application - showing the applications that were discovered
  - c. Probed Acquisition Card Discovery - showing the cards installed on the host

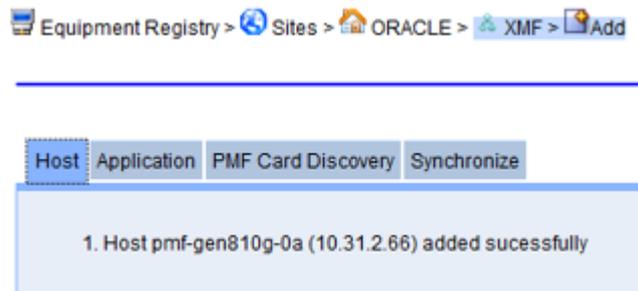

Figure 48: Discovery Summary Screen - Hosts Tab

Figure 49: Discovery Summary Screen - Application Tab

**Note:** The Results screen only opens when the discovery process has been completed.

**Note:** If this is the first discovery process, all the tabs will be empty except for Added and Error. The other tabs are only populated when the discovery process is repeated after there has been some modification to the host (see how to modify hosts.).

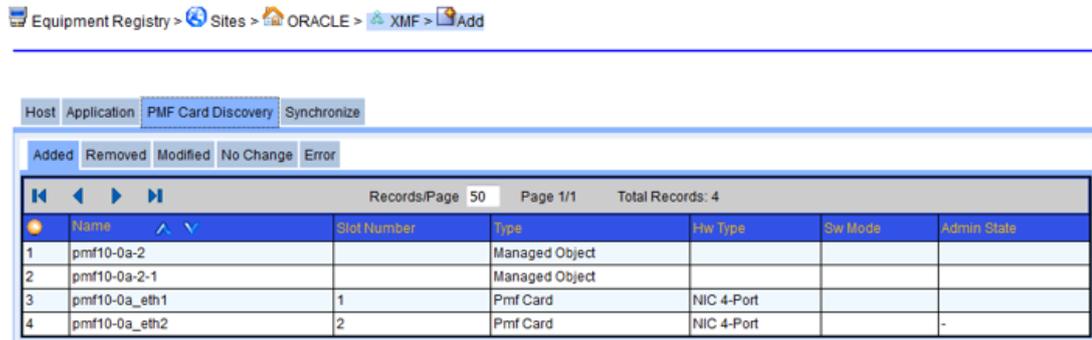

Figure 50: Discovery Summary Screen - Probed Acquisition Card Discovery

8. Select the **subsystem** again to see the newly created hosts and applications.  
If there is an E1/T1 card for the Probed Acquisition, open the Acquisition perspective to configure the card.

**Note:** Network cards and NGP cards are automatically discovered and do not have to be manually added.

### Adding a Production Interface to a Probed Acquisition

This action can be executed during Probed Acquisition site creation. Complete these steps to add a Production Interface to a Probed Acquisition site.

1. Select **Equipment Registry > Sites > Subsystem > xMF > Probed Acquisition name**.
2. Select the **Host** to be modified.
3. Select **Modify** from the toolbar.
4. Enter/Modify the **Production Interface Name**.
5. Enter the **Production IP Address** for the Probed Acquisition host.
6. Enter/modify the **Production Netmask**.
7. Click **Add**.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

Production Interface	IP Address	Netmask	
<input type="text" value="bond0"/>	<input type="text"/>	<input type="text" value="255.255.255.0"/>	<input type="button" value="Add"/>
Selected Production Interface			
<input type="text"/>	<input type="button" value="Edit"/>	<input type="button" value="Remove"/>	

Figure 51: Production Interface Setup Screen

Field	Description
Production Interface	Can be any available Probed Acquisition physical interface. Default value is bond0.
IP Address	This is the IP address assigned to the Production Interface.
Netmask	This is the Nestmask value assigned to the Production Interface. Default value is 255.255.255.0.
Add button	Adds the IP production address, to the field "Selected Production Interface".
Edit button	Allows to edit/modify production interface parameters.
Remove button	Allows to remove the production interface displayed in field "Selected Production Interface".

Table 48: Acquisition Production Interface Fields Description

### Adding a Production Route to a Probed Acquisition

This action can be executed during Probed Acquisition site creation. Complete these steps to add a Production Route to a Probed Acquisition site.

1. Select **Equipment Registry > Sites > Subsystem > xMF > Probed Acquisition name**.
2. Select the **Host** to be modified.
3. Select **Modify** from the toolbar.
4. Enter the **Production Route IP**.
5. Enter the **Mask**.
6. Enter the **Gateway**.
7. Enter the **Interface Name**.
8. Click **Add**.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

The screenshot shows a web interface for adding a production route. At the top, there are four text input fields labeled 'Production Route', 'Mask', 'Gateway', and 'Interface', each followed by an 'Add' button. Below this is a section titled 'Selected Route' which contains a large empty rectangular box and two buttons labeled 'Edit' and 'Remove'.

Figure 52: Production Route Setup Screen

Field	Description
Production Route	This is the target network IP or single machine IP we want to connect to.
Mask	This is the Mask corresponding to the IP range for the target network or single machine we want to connect to. If the Production Route IP correspond to a single machine, this field must be set to "255.255.255.255".
Gateway	This is the IP address of the gateway we used to reach the target network or single machine.
Interface	This is the name of the Production Interface used to connect to the target network or single machine.
Selected Route	This field summarizes all created Production Routes.
Edit button	Allows to edit/modify Production Route parameters.
Remove button	Allows to remove the Production Route selected in field "Selected Route".

Table 49: Acquisition Production Route Fields Description

### Modifying a Probed Acquisition Subsystem Host

Once a Probed Acquisition subsystem has been created, you can modify the hosts that belong to the subsystem.

Complete these steps to modify a host in a Probed Acquisition subsystem.

1. Select the **Acquisition > Site > subsystem** to be modified from the object tree. The *List* screen opens.
2. Select the **Host** to be modified.
3. Select **Modify** from the toolbar.
4. Make necessary **modifications**.
5. Click **Modify** after you have made the necessary modifications.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### Deleting a Probed Acquisition Subsystem

**Note:** You can only delete a subsystem if there are no dependent hosts or applications to the subsystem.

You must delete all hosts and applications before deleting the subsystem.

Complete these steps to delete an Probed Acquisition subsystem.

1. Select **Acquisition > Site > Subsystem > server > Probed AcquisitionName** to be deleted. (Or select the subsystem from the Site List screen.)
2. Delete all **hosts and applications** that belong to the Probed Acquisition subsystem.
3. Select the **Probed Acquisition** subsystem.
4. Click **Delete**.
5. Click **OK** at the prompt. The subsystem is deleted. You must now *apply changes* for the changes to take effect.

### Edit a Production Interface

Complete these steps to edit a Production Interface.

1. Select **Equipment Registry > Site > XMF > Probed Acquisition name**.
2. Select the **Host** to be modified.
3. Select **Modify** from the toolbar.
4. Select the **Production Interface** from "Selected Production Interface".
5. Click **Edit**.
6. Modify the parameters that need to be modified.
7. Click **Add**.

### Remove a Production Interface

Complete these steps to edit a Production Interface.

1. Select **Equipment Registry > Site > XMF > Probed Acquisition name**.
2. Select the **Host** to be modified.
3. Select **Modify** from the toolbar.
4. Select the **Production Interface** from "Selected Production Interface".
5. Click **Remove**.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### Edit a Production Route

This action can be executed during Probed Acquisition site creation. Complete these steps to add a Production Route to a Probed Acquisition site.

1. Select **Equipment Registry > Site > XMF > Probed Acquisition name**.
2. Select the **Host** to be modified.
3. Select **Modify** from the toolbar.
4. Select the **Production Route** from "Selected Route".
5. Click **Edit**
6. Modify the parameters that need to be modified.

7. Click Add.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### Remove a Production Route

This action can be executed during Probed Acquisition site creation. Complete these steps to add a Production Route to a Probed Acquisition site.

1. Select **Equipment Registry > Site > xMF > Probed Acquisition name**.
2. Select the Host to be modified.
3. Select Modify from the toolbar.
4. Select the Production Route from "Selected Route".
5. Click Remove.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### Adding An Integrated OCDSR Monitoring To A Site

Complete these steps to add Integrated OCDSR Monitoring.

1. Select the **Equipment Registry > Sites > Site > OCDSR**. The *List* screen opens.
2. Keep default **OCDSR Name** or change it if preferred.
3. Enter **Probe Acquisition IP** (IP address of Probed Acquisition interconnected to the OCDSR).
4. Enter probe **OCDSR IP** (VIP address of OCDSR's SO).

**Remark:** OCDSR Monitoring must be added in the same site as Mediation servers in order to be able to discover **Sync OCDSR Streams**.

### Modifying An Integrated OCDSR Monitoring

Complete these steps to modify Integrated OCDSR Monitoring. **This menu allow to configure the Production interface for a Integrated OCDSR server.**

1. Select the **Equipment Registry > Sites > Site > OCDSR**. The *List* screen opens.
2. Select the OCDSR to be modified.
3. Select **Modify** from the toolbar.
4. Make necessary **modifications**, see following chapters to configure OCDSR Production interface:
  - [Adding a Production Interface to a Probed Acquisition](#)
  - [Adding a Production Route to a Probed Acquisition](#)
5. Click **Modify** after the necessary modifications are updated.

### Deleting An Integrated OCDSR Monitoring

Complete these steps to delete Integrated OCDSR Monitoring.

1. Select the **Equipment Registry > Sites > Site > OCDSR**. The *List* screen opens.
2. Select the OCDSR to be deleted.
3. Click **Delete**. The OCDSR is deleted.

**Remark:** If you'd like to change the OCDSR IP address, then you must delete and add again the new Integrated OCDSR Monitoring.

## Chapter 6: Network Element Configuration

### About Network Elements

The term, Network Elements, refers to customer network SS7, GPRS and IP elements. The perspective is divided into four categories:

- Nodes that include SS7, GPRS and IP
- SS7 Elements that includes Linksets, Links and Signaling Points
- GPRS Elements that includes GB links and Signaling Points
- IP Elements that include Signaling Points, Cards, Application Servers and Associations and Application Server Processes. Associations are divided into two subcategories: Integrated Acquisition and Probed Acquisition.

In addition, each network element has a child table showing all dependent elements down to the link level. For example, selecting a linkset (shown in the figure) and clicking on the selecting Show Details button on the tool bar shows all the links belonging to that particular linkset.

The figure shows two screenshots from a network configuration tool. The top screenshot displays a table of linksets. The bottom screenshot shows the details for a selected linkset, displaying a table of links.

#	Linkset Custom Name	Custom Name Override	Eagle Name	Description	RID Group Id	Linkset Type	Near End Point Code	Far End Point Code	OID
1	SS7_LinkSet	Disabled			65535	A	Test	Test2	.1.3
2	LinkSet1	Disabled			65535	B	SS7_Link1	Test2	.1.3

SS7 link list for linkset SS7\_LinkSet

#	Link Custom Name	Eagle Name	Description	SLC	Interface Name	Protocol Name	Error Correction	Removed	OID
1	SS7_Link1			0	DS0A_56K	GB_FR	NONE		.1.3.6.1.4.1.4404.2.1.6.1.1.33554444

Figure 53: Selected Linkset with Corresponding Links

For quick reference, you can query for specific network elements such as nodes, linksets, links or signaling points. This function is very helpful in large networks.

In addition, for linksets and links, you can use the Eagle name or by using the custom override operation create a custom name for a linkset or link.

### Filtering Network Elements

The search option enables you to search for specific elements using the network element filter (query) wizard. Complete these steps to filter a network element.

1. Select the Network Element (Node, Linkset, Link, SP) category from the object menu. The *List* screen opens.
2. Click the Filter icon on the tool bar (magnifying glass icon). The *network element filter screen* opens.

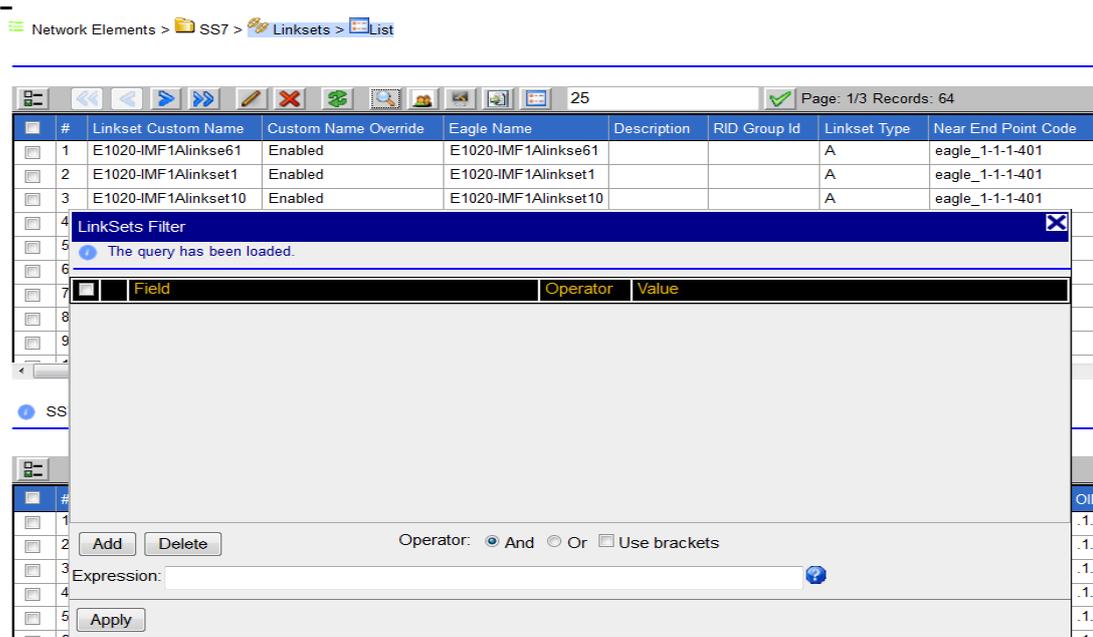

Figure 54: Network Element Filter Screen (Linkset shown)

3. Click **Add**. The screen changes to show fields, operators and values.
4. Select a **Field**.
5. Select an **Operator**.
6. Select a **Value**.

**Note:** To create a filter that has multiple expressions, repeat steps 3 through 6 and select the proper Operator (and, or, use brackets).

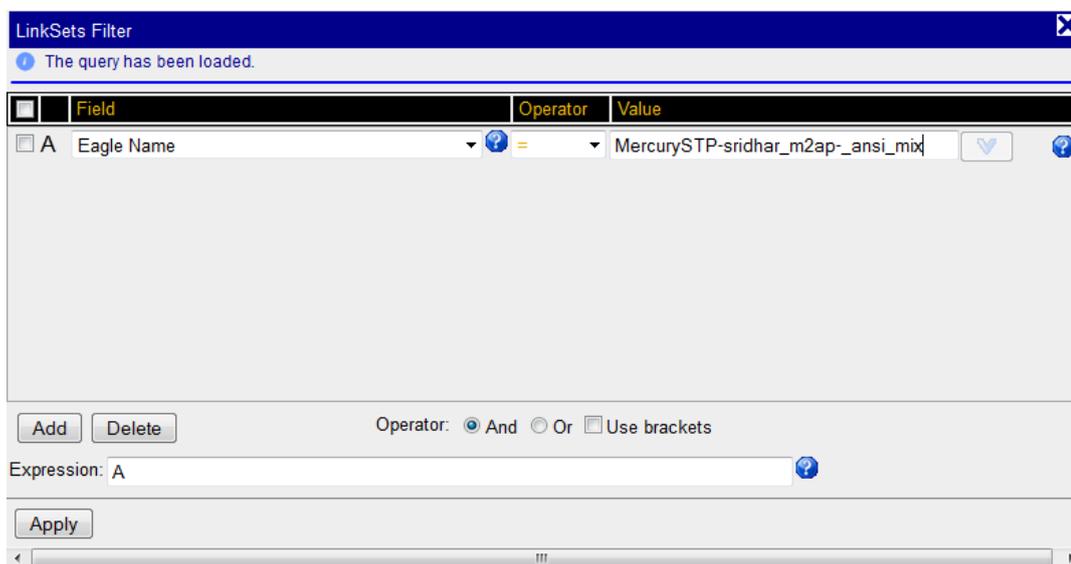

Figure 55: Filter Screen Filled

7. Click **Apply**. The found network elements appear in the list table.

## About Nodes

Nodes are the containers for linksets and links. Using Centralized Configuration, you can create SS7, GPRS and IP nodes.

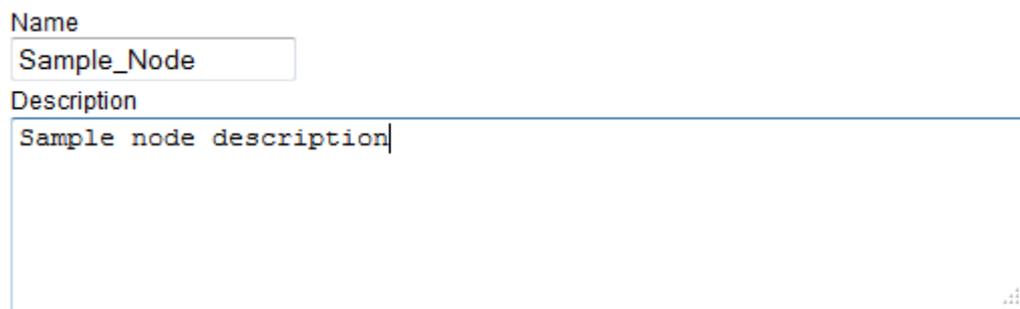

## Creating a Node

Complete these steps to add a node.

1. Select **Network Elements > Nodes > Node Type (SS7, GPRS, IP) > Add Node**.  
The *Add Node* screen opens shown below.

Field	Description
Name	The name of the node
Description	Optional field to describe the node
Add button	Saves the record to the system and the node shows up in the object tree
Reset button	Resets the screen to default settings
Cancel button	Cancels the procedure

Table 50: Add Node Screen

The screenshot shows the 'Node Add Screen' interface. It features two input fields: a 'Name' field containing the text 'Sample\_Node' and a 'Description' field containing the text 'Sample node description'. The fields are outlined in blue, and the description field is significantly larger than the name field.

Figure 56: Node Add Screen

2. Type in the **Name** of the Node. (Optional) Type in a **description** of the node.
3. Click **Add**. The node is added to the object tree.

## Modifying a Node

Complete these steps to modify a node.

1. Select **Network Elements > Nodes > Node Type (SS7, GPRS, IP) > Node** to be modified.
2. Select **Modify**.
3. Make the necessary **modifications**.
4. Click **Modify**. A prompt appears stating that the node was modified.

## Deleting a Node

Complete these steps to delete a node.

**Note:** You must delete the Signaling Points (SPs) associated with the node before deleting it.

1. Select **Network Elements > Nodes > Node Type (SS7, GPRS, IP) > Node** to be deleted from the list.
2. Select **Delete** from the popup menu.
3. Click **OK** at the prompt, the node is deleted.

## About Non-node Network Elements

The non-node network element menu has three main categories:

- SS7 which is subdivided into

- Linksets
- Associations
- Links
- Signaling Points (SPs)
- GPRS which is subdivided into:
  - Gb links
  - Signaling Points (SPs)
- IP which is subdivided into:
  - Signaling Points (SPs)

The differentiation between nodes and non-node network elements enables greater flexibility in working with linksets, links and associations.

Because network elements are so fundamental to the rest of the provisioning process, it is recommended that they be setup right after a site has been created.

### About SS7 Network Elements

The SS7 network element menu has four main categories:

- Linksets - linksets that are manually created (Integrated Acquisition) and discovered (Probed Acquisition)
- Associations - are SCTP connections
- Links
- Signaling Points (SPs)

The differentiation between nodes and non-node network elements enables greater flexibility in working with linksets, links and associations.

### About Linksets

Linksets can exist as one or a combination of SS7 links each linkset can contain up to 16 links.

### Creating a Linkset

Complete these steps to create a linkset.

**Note:** Signaling points must be configured before linksets can be created.

1. Select **Node > Signaling Point > Linkset > Add** from the Network Elements tree. The Add linkset screen opens shown in Figure 67: Add Linkset Screen.

Field	Description
Name	Required field used for the name of the linkset
Description	Optional field to describe the linkset
Reset button	Resets the screen to default values
Cancel button	Cancels the procedure
Next button	Opens the next screen/step of the sequence

Table 51: Add Linkset Screen

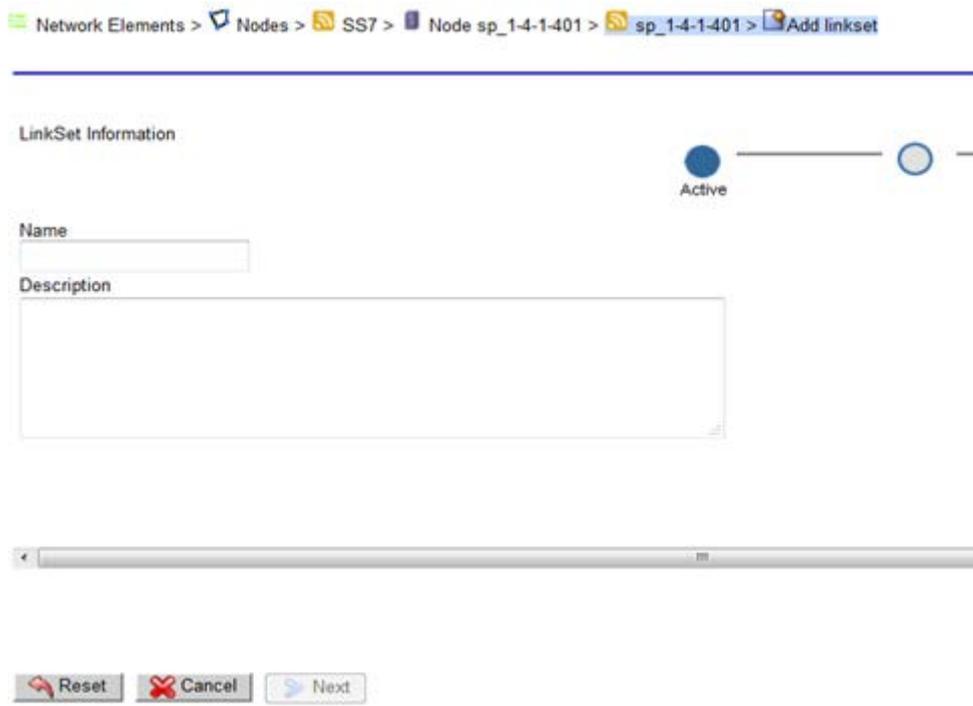

Figure 57: Add Linkset Screen

2. Type in the **Name** of the linkset.
3. (Optional) Type in a **description** of the linkset.
4. Click **Next**. The *Signaling Points* screen opens shown in Figure 68: Associating A Linkset To Signaling Points.

Field	Description
SP1	This field contains the originating signaling point that the linkset belongs to
SP2	(Search field) Drop-down list for selecting the second signaling point
Previous button	Opens the preceding screen
Next button	Opens the next screen in the procedure

Table 52: Second Add Signaling Point Screen

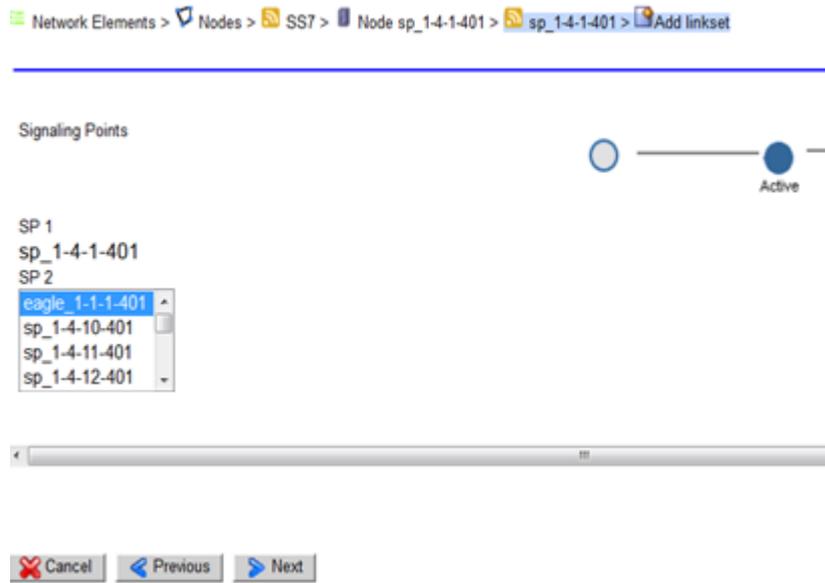

Figure 58: Associating A Linkset To Signaling Points

5. Select a **signaling point** in the SP2 field.
6. Click **Next**. The *Additional Information* screen opens shown below.

Field	Description
Linkset Type	(Search field) Drop-down list for selecting the type of linkset
Resource ID Group (optional)	(Search field) Drop-down list for selecting a specific group
Add button	Saves the record to the system
Next button	Opens the Linkset Summary screen

Table 53: Third Add Signaling Point Screen

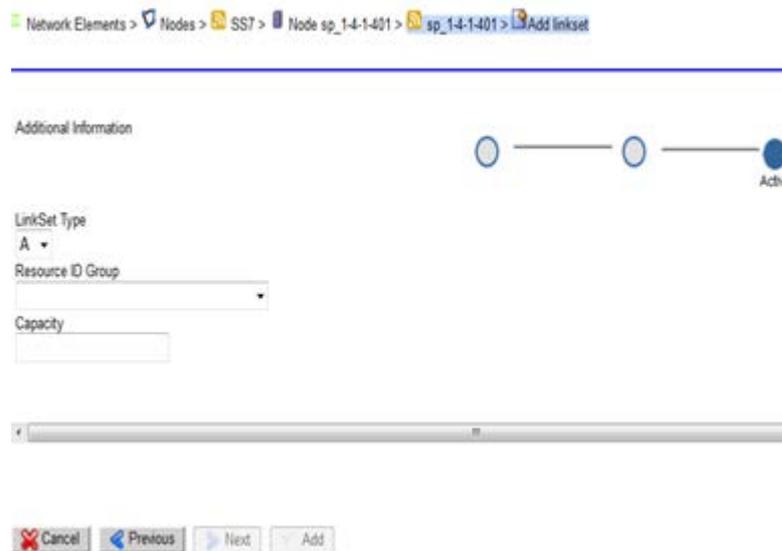

Figure 59: Linkset Additional Information

7. Select a **Linkset Type**.

8. Select a **Resource ID Group**. (Auto RID or user-defined RID group see [About Resource ID Groups \(RID\)](#)).
9. Click **Add**.

The linkset is added to the signaling point shown below.

#	Linkset Custom Name	Custom Name Override	Eagle Name	Description	RID Group Id	Linkset Type	Near End Point Code	Far End
1	E1020-IMF1Alinkset1	Enabled	E1020-IMF1Alinkset1			A	eagle_1-1-1-401	sp_14-1
2	Samplelinkset	Disabled			65534	A	sp_14-1-401	sp_14-1

Figure 60: Linkset List With New Linkset Added

### Modifying a Linkset

To modify a linkset, Complete these steps.

**Note:** For discovered linksets, you can only modify the Name and Description fields.

1. Select the **linkset** to be modified.
2. Select **Modify**.
3. Make the necessary **modifications**.
4. Click **Modify**. A prompt appears stating that the linkset was modified.

### Deleting a Linkset

**Note:** If a linkset has links, then the links that belong to that linkset are also deleted at the same time.

**Note:** If a linkset is the only linkset in the signaling point, then the signaling point is also deleted what that linkset is deleted.

To delete a linkset, complete these steps.

1. Select the **linkset** to be deleted from the list.
2. Select **Delete**.
3. Click **OK** at the prompt, the linkset is deleted.

### Modifying RID Group Settings when Modifying a Linkset

This feature enables you to set Auto-RID or Auto Reverse RID settings for a linkset (Auto RID or user-defined RID group see [About Resource ID Groups \(RID\)](#)). Complete these steps to modify the RID Group settings for a linkset.

1. Select the **Node > Linkset** to be modified.
2. Click **Modify**.
3. Click **next** until the Resource ID Group field appears.  
The RID groups defined in the system are displayed under the Resource ID Group drop-down.
4. Select **one** of the two automatically created RID groups.
5. Click **Modify** to save your changes.

**Note:** You should set the same RID group value for related linksets from mated pair STPs.

### Custom Name Override Function

You can choose to have the custom name of a linkset to be the same as the Eagle name. When using this function the values are:

- Enable - the custom name is the same as the Eagle name
- Disable - the custom name is different from the Eagle name

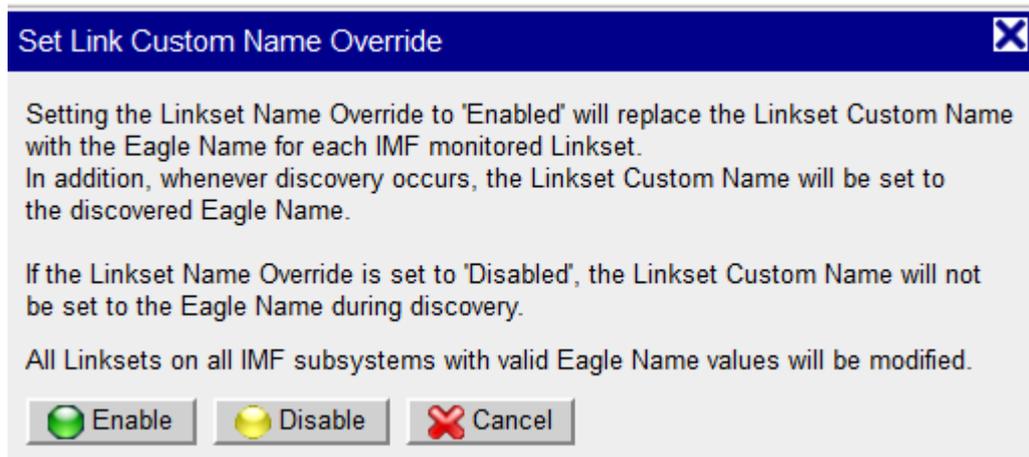

Figure 61: Custom Name Override Function Popup

The function is available on the Linksets list page tool bar.

### About SS7 Links

SS7 Links belong to linksets. Links can be created only from manually created linksets, not discovered linksets. Centralized Configuration also supports links defined on the Eagle E5-E1T1 card that are discovered by Integrated Acquisition. There is a column labeled "Interface Name" that designates the interface id value found during the discovery process.

**Note:** If a link(s) name is modified, all running feeds, that use the translation of the link names or pointcodes need to be deactivated and activated again for proper functioning.

### Creating an SS7 Link

To add a SS7 link Complete these steps.

1. Select **Network Elements > Node > Signaling Point > Linkset > Add** from the Object tree. The *Add* screen opens shown in Figure 63: Add Screen.

Field	Description
Name	Required field to name the link
Description	Optional field that can describe the link
Cancel	Cancels the procedure
Next button	Opens the second phase of the setup procedure

Table 54: Link Network View Initial Setup Screen

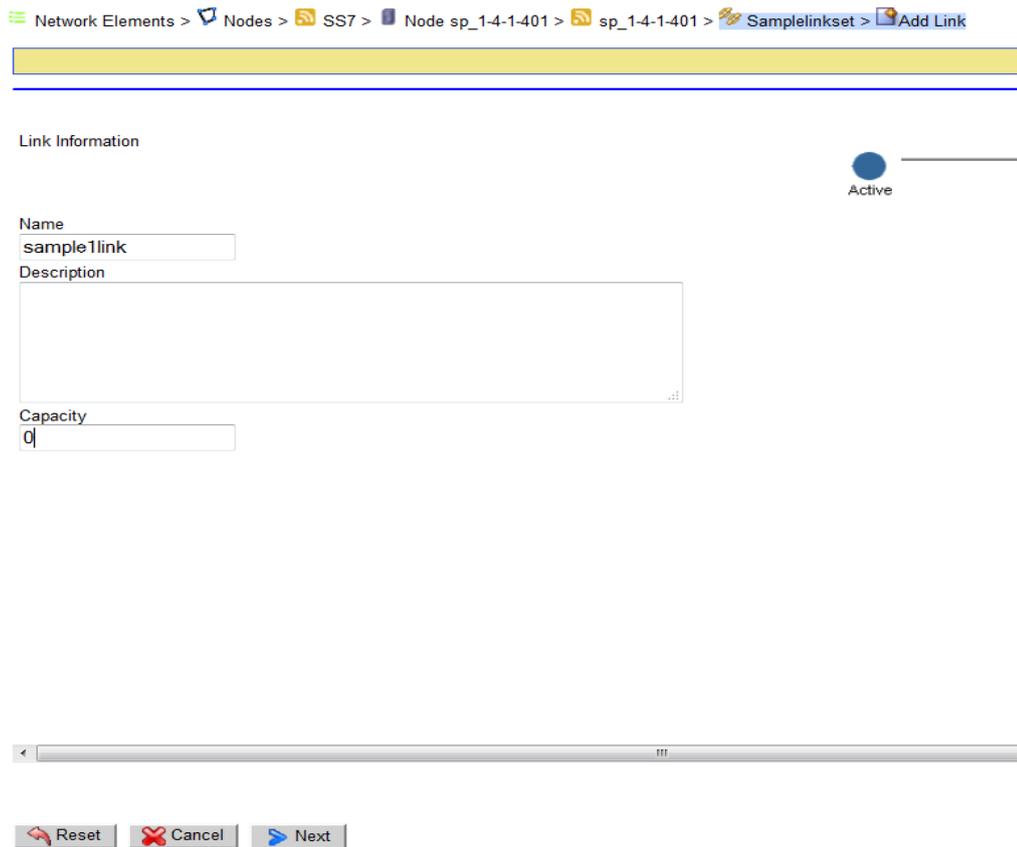

Figure 62: Add Screen

2. Enter the link **Name**.
3. (Optional) Type in a **Description**.
4. Click **Next**.

The View Type Selection screen opens shown in Figure 64: View Type Selection Screen.

Field	Description
SLC	Drop-down list to choose an integer for the SLC
Interface	Drop-down list to choose the type of interface for the link
Transport Protocol	Drop-down list to choose the TP for the link
Cancel button	Cancels the procedure
Previous button	Returns you to the previous screen
Next button	Opens the Network/Link Summary screen
Add button	Add the link record to the linkset

Table 55: Link Network Setup Phase Two

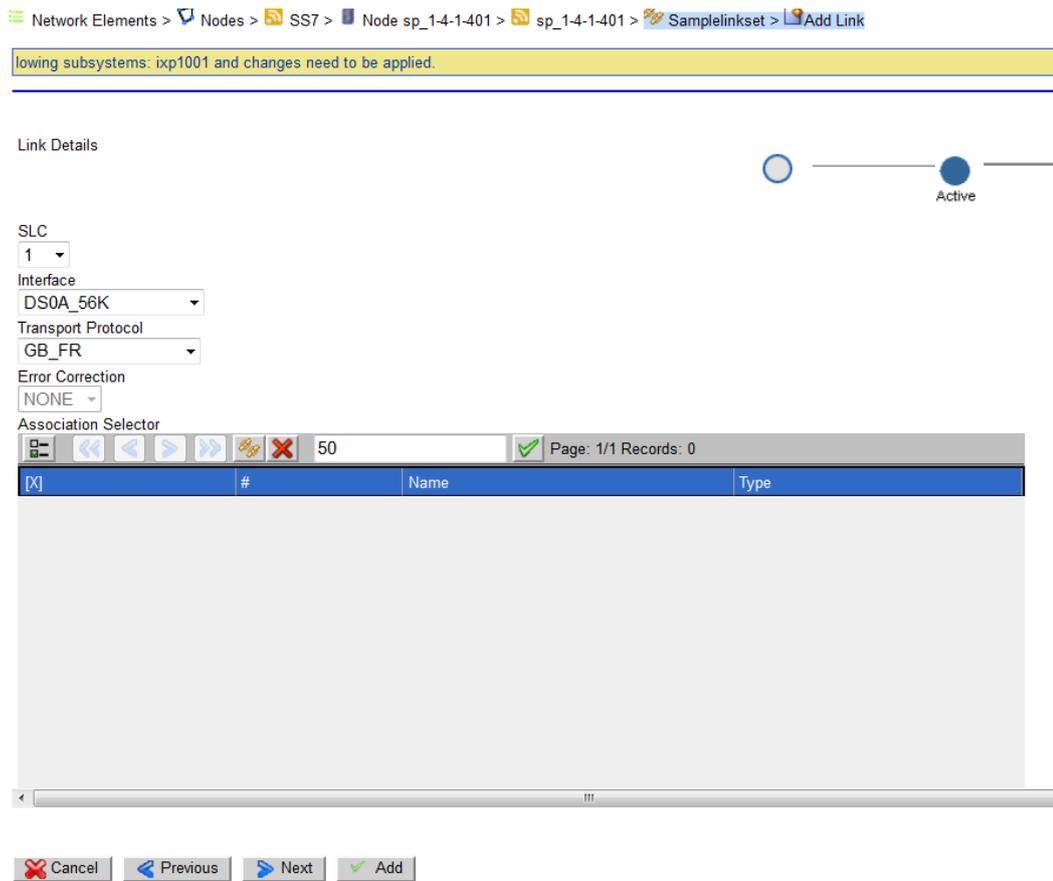

Figure 63: View Type Selection Screen

5. Select the **SLC** from the drop-down menu.
6. Select the **Interface** from the drop-down menu.
7. Select the **Transport Protocol** from the drop-down menu.
8. Click **Add**. The link is added to the linkset shown below.

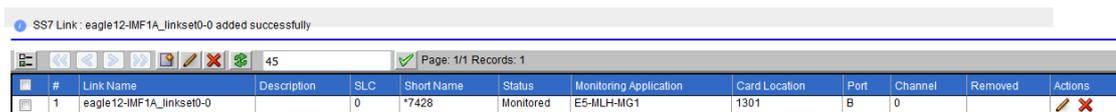

Figure 64: View Type Selection Screen after add

**Note:** Click Next to view the Summary screen

### Modifying an SS7 Link

Follow these steps to modify a link.

**Note:** If a link(s) name is modified, all running feeds, that use the translation of the link names or point codes need to be deactivated and activated again for proper functioning.

1. Select **Node > Signaling Point > Linkset > Link** to be modified.
2. Make the necessary **modifications**.
3. Click **Modify**.

The record is modified.

## Deleting an SS7 Link

Follow these steps to delete a link.

**Note:** If a linkset or an association has only one link, then if the link is deleted then the linkset or association is also deleted.

1. Select **Node > Signaling Point > Linkset > Link** to be deleted.
2. Click **Delete**.
3. Click **OK** at the prompt. The link is deleted.

## Configuring SS7 Signaling Points

Signaling points provide a central nexus for SS7 linksets and links. Signaling points are discovered when the subsystem is created and all the elements are discovered. You can create signaling points only on non-discovered nodes.

**Note:** If a point code(s) is modified, all running feeds that use the translation of the link names or point codes need to be deactivated and activated again for proper functioning.

## Creating a SS7 Signaling Point

Complete these steps to create a SS7 signaling point for a node.

1. Select **Network Elements > Nodes > SS7**. The *Node List* screen opens showing the node list table with signaling point table.

#	Node Name	Description of Node	Owner	State	Created
1	Node1		Nitin	N	29/06/2015 02:03:12
2	Eagle E1020		Gaurav	N	30/06/2015 22:25:34
3	Node sp_1-4-1-401		Gaurav	N	30/06/2015 22:25:34
4	Node sp_1-4-10-401		Gaurav	N	30/06/2015 22:25:34
5	Node sp_1-4-11-401		Gaurav	N	30/06/2015 22:25:34
6	Node sp_1-4-12-401		Gaurav	N	30/06/2015 22:25:35
7	Node sp_1-4-13-401		Gaurav	N	30/06/2015 22:25:35
8	Node sp_1-4-14-401		Gaurav	N	30/06/2015 22:25:35
9	Node sp_1-4-15-401		Gaurav	N	30/06/2015 22:25:35
10	Node sp_1-4-16-401		Gaurav	N	30/06/2015 22:25:35

#	SP	Description	Node Name	Code	Flavour Country	Flavour Format	OID	Owner	State	Created
---	----	-------------	-----------	------	-----------------	----------------	-----	-------	-------	---------

Figure 65: Add Signaling Point Screen

2. Click **Add** on the signaling point tool bar. The *IP signaling point add* screen opens.

---

Name

Description

Point Code

Figure 66: SS7 Signaling Point Add Screen

3. Enter the **Name** of the SS7 signaling point
4. (Optional) Enter a **Description**.
5. Select a **Point Code protocol** from the pull-down list.
6. Enter the **point code**.
7. Click **Add**. The SS7 signaling point is added to the Node.

### Modifying an SS7 Signaling Point

Complete these steps to modify a SS7 signaling point.

**Note:** If a point code(s) name is modified, all running feeds, that use the translation of the link names or point codes need to be deactivated and activated again for proper functioning.

1. Select **Network Elements >SS7 >SPs**
2. Select the **SS7 signaling point** to be modified.
3. Select **Modify**
4. Make the necessary **modifications**.
5. Click **Modify**. A prompt appears stating that the signaling point was modified.

### Deleting an SS7 Signaling Point

Complete these steps to delete an SS7 signaling point.

**Note:** When deleting a signaling point, all links and linksets associated with that signaling point are also deleted.

1. Select **Network Elements > SS7 > SPs**.
2. Select the **SS7 signaling point** to be modified.
3. Select **Delete**.
4. Click **OK** at the prompt. A prompt appears stating that the signaling point was deleted.

### About GPRS Network Elements

GPRS (General Packet Radio Service) non-node network element menu has two categories:

- Gb links
- Signaling Points (SPs)

The differentiation between nodes and non-node network elements enables greater flexibility in working with linksets and links and associations.

Because network elements are so fundamental to the rest of the provisioning process, it is recommended that they be setup right after a site has been created.

## About Gb Links

Gb links belong to GPRS nodes.

## Adding a Gb Link

Complete these steps to add a Gb link to a GPRS signaling point.

1. Select the **GPRS signaling point** that needs a Gb link.
2. Select **Add** from the pop-up menu. The *Add Gb link* screen opens shown below.

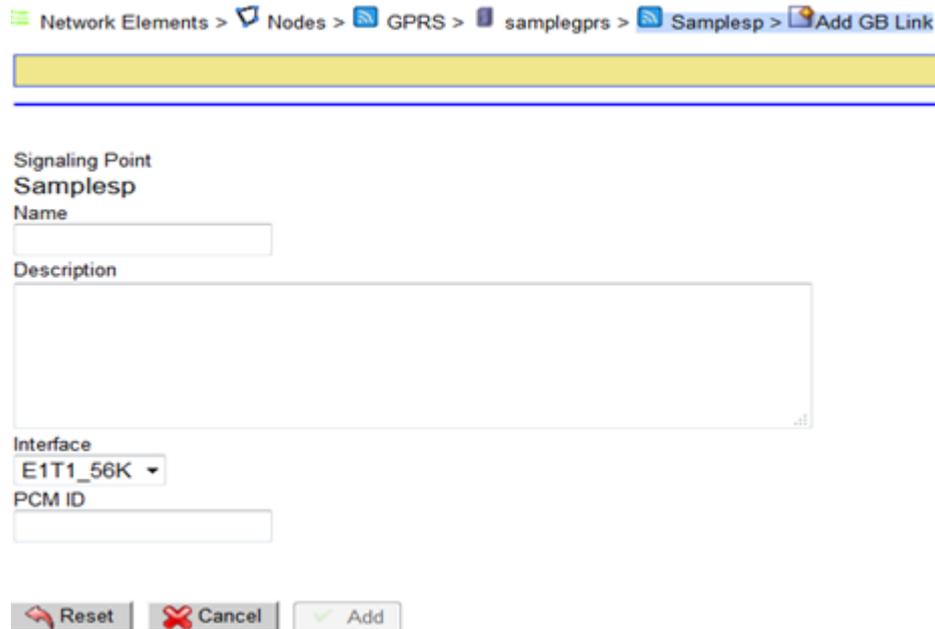

Figure 67: Add Gb Link Screen

Table below describes the Gb link add GUI:

Field	Description
Name	A required alphanumeric field that shows the name of the link
Description	An optional text box used for providing any specific information about the link
Interface	A required pull-down menu for selecting the interface for the link
PCM ID	A required numeric (0-99) field for entering the PCM ID
Add button	Adds the link information to the system
Cancel button	Cancels the procedure
Reset button	Resets the screen to the original state

Table 56: Gb Add Screen

3. Type in a **Name** for the Gb link.
4. (Optional) Type in a **Description** for the link.
5. Select an **Interface** for the link.
6. Type in a **PCM ID** for the link.
7. Click **Add**. The link is added to the signaling point.

## Modifying a Gb Link

Follow these steps to modify a link.

1. Select **Node > GPRS Signaling Point > Link** to be modified.
2. Make the necessary **modifications**.

3. Click **Modify**. The record is modified.

### Deleting a Gb Link

Follow these steps to delete a link.

1. Select **Node > GPRS Signaling Point > Link** to be deleted.
2. Click **Delete**.
3. Click **OK** at the prompt. The link is deleted.

### About GPRS Signaling Points

Centralized Configuration enables you to configure and manage General Package Radio Service (GPRS) signaling points. GPRS signaling points are discovered when the network is configured. You can create signaling points only on network nodes that you have created, not from discovered nodes. You can only modify, delete and filter discovered signaling points.

### Creating a GPRS Signaling Point

Complete these steps to create a GPRS signaling point.

**Note:** You can only create signaling points from GPRS nodes that you have created, not discovered.

1. Select **Network Elements > Node > GPRS**. The *Nodes list* screen opens with the signaling points list table on the bottom of the screen.

Network Elements > Nodes > GPRS > List

#	Node Name	Description of Node	Owner	State	Created
1	samplegprs		TklcSrv	N	06/07/2015 04:56:15

GPRS signalling points list for node samplegprs

#	SP	Description	Node Name	SGSN Id	OID	Owner	State	Created
1	Samplesp		samplegprs	55	.1.3.6.1.4.1.4404.2.1.4.1.2.55	TklcSrv	N	06/07/2015 04:56:50

Figure 68: Nodes and Signaling Points List Screen

2. Click **Add** on the signaling points tool bar. The *GPRS signaling point add* screen opens

Figure 69: GPRS Signaling Points Add Screen

3. Type the **Name** of the signaling point.
4. (Optional) Type in a **Description**.
5. Type in a **SGSN ID** (this is the number that identifies the Serving GPRS Support Node.  
**Note:** The ID needs to be a positive integer.
6. Click **Add**. The GPRS signaling point is added to the Node.

### Modifying a GPRS Signaling Point

Complete these steps to modify a GPRS signaling point.

1. Select the **GPRS signaling point** to be modified.
2. Select **Modify**.
3. Make the necessary **modifications**.
4. Click **Modify**. A prompt appears stating that the signaling point was modified.

### Deleting a GPRS Signaling Point

**Note:** When deleting a signaling point, all links and linksets associated with that signaling point are also deleted.

To delete a GPRS signaling point, complete these steps.

1. Select the **GPRS signaling point** to be deleted from the list.
2. Select **Delete**.
3. Click **OK** at the prompt, the signaling point is deleted.

### About IP Network Elements

The IP network element menu contains IP signaling points. These signaling points enable the proper flow of IP packets.

The differentiation between nodes and non-node network elements enables greater flexibility in working with linksets and links and associations.

Because network elements are so fundamental to the rest of the provisioning process, it is recommended that they be setup right after a site has been created.

### About IP Signaling Points

Centralized Configuration enables you to configure IP signaling points. Like other signaling points, IP signaling points are discovered when the network is created. You can only modify, delete and filter IP signaling points.

### Creating an IP Signaling Point

Complete these steps to create an IP signaling point for a node.

1. Select **Network Elements >Nodes > IP**. The *Node List* screen opens showing the node list table with signaling point table.

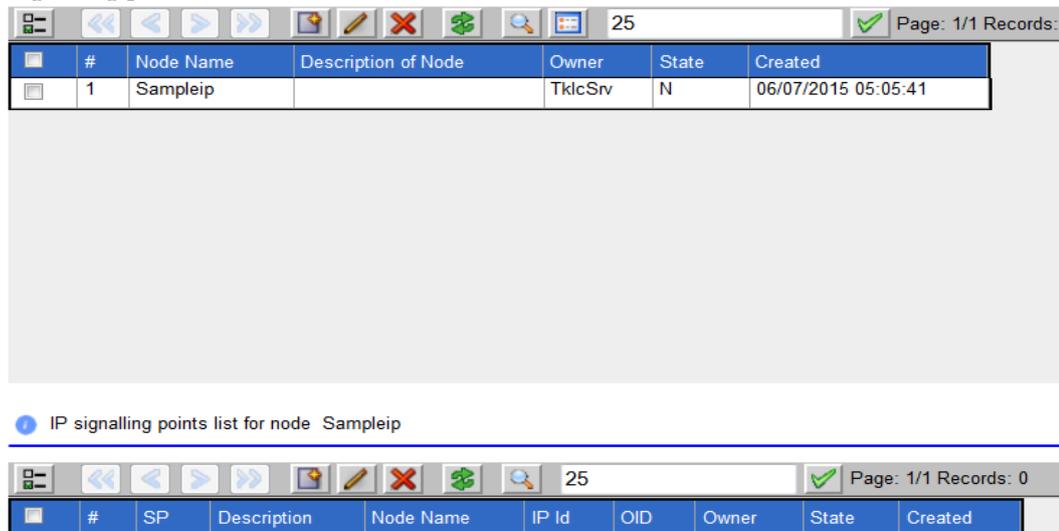

Figure 70: Add Signaling Point Screen

2. Click **Add** on the signaling point tool bar to open the IP signaling point screen.
3. Enter the **Name** of the IP signaling point
4. (Optional) Enter a **Description**.
5. Click **Add**. The IP signaling point is added to the Node.

### Modifying an IP Signaling Point

Complete these steps to modify a IP signaling point.

1. Select **Network Elements >IP >SPs**
2. Select the **IP signaling point** to be modified.
3. Select **Modify**
4. Make the necessary **modifications**.
5. Click **Modify**. A prompt appears stating that the signaling point was modified.

### Deleting an IP Signaling Point

Complete these steps to delete an IP signaling point.

**Note:** When deleting an association, all mappings to that association will be broken.

1. Select the **IP signaling point** to be deleted.
2. Select **Delete**.
3. Click **OK** at the prompt. The signaling point is deleted.

### About IP Cards

Centralized Configuration supports E5-ENET card running IPSG or IPGW for either STC or FastCopy capability. Cards can support either STC-style monitoring or FastCopy monitoring but not both. Cards configured on Centralized Configuration show this information on the Card list screen.

- Card Number - shows the order that the card was configured. The first card configured on the system would have the number "1", the second "2" and so on.
- Card Name - a text field that provides the name of the card.
- Capacity - shows the capacity in TPS that the card can handle. This information is utilized in the SigTran SS7 Surveillance Application for monitoring purposes.

## IP Card Functional Specifications

The system supports both STC-style and Fast Copy on Integrated Acquisition with both Eagle IPGW as well as IPSG cards.

This table shows the functional expectations on a per card basis.

**Note:** The cards supported depend on the version of Eagle that is installed on the system. This list is for Eagle release 42.

Application	Hardware	GPL	Protocols	ANSI/ITU	Monitoring Type
SS7IPGW	SSEDCM	SS7IPGW	M3UA	ANSI	STC-STYLE
SS7IPGW	E5-ENET	IPGHC	SUA / M3UA	ANSI	STC-STYLE or Fast Copy
IPGWI	SSEDCM	IPGWI	M3UA	ITU	STC-STYLE
IPGWI	E5-ENET	IPGHC	SUA / M3UA	ITU	STC-STYLE or Fast Copy
IPSG	E5-ENET	IPSG	M2PA / M3UA	ANSI+ITU	STC-STYLE or Fast Copy

Table 57: IP Card Specifications

### Adding an IP Card

Complete these steps to add an IP card to the system.

1. Select **Network Elements >IP > Cards**. The Card list screen opens showing the cards configured for the system.
2. Click **Add** on the tool bar.
3. Enter the **Name** of the IP card
4. (Optional) Enter the **Capacity** of the card in (TPS).
5. Click **Add**.
6. The card is added to the system.

**Note:** Apply Changes to have the card become functionally available for monitoring by the SigTran SS7 Surveillance application.

### Modifying an IP Card

Complete these steps to modify an IP card.

1. Select **Network Elements >IP >Cards**
2. Select the **Card** to be modified from the list.
3. Click **Modify** from the tool bar.
4. Make the necessary **modifications**.
5. Click **Modify**. A message appears stating that the card was modified.

### Deleting an IP Card

Complete these steps to delete an IP card.

**Note:** When deleting an association, all mappings to that association will be broken.

1. Select the **Card** to be deleted.
2. Select **Delete**.

**Note:** A prompt will appear stating the following:

This action will delete the third party card from the Associations mapped with it. Please review the following:

The card (name) can not be deleted, mapped with # association(s)

Are you sure you want to delete this Card?

3. To delete the card, click **OK**.

### About Application Servers

Centralized Configuration allows for the configuration of IP Application Servers (AS). An AS is a logical entity serving a specific Routing Key. An example of an Application Server is a virtual IP database element handling all requests for an SCCP-user. The AS contains a set of one or more unique Application Server Processes (ASPs), where one or more is normally actively processing traffic.

**Note:** For Integrated Acquisition subsystems the network elements are automatically discovered and cannot be created manually. Probed Acquisition subsystems are manually discovered and their network elements must be created manually.

### Adding an Application Server

Complete these steps to add an application server (AS) to the system.

**Note:** For each AS, the associations mapped to in can also be managed from the bottom table.

1. Select **Network Elements >IP > Application Servers**.  
The *Application Server List* screen opens showing the AS list table on top with its mapped associations table on the bottom.
2. Click **Add** from the tool bar. The add screen opens.
3. Enter the **Name** of the AS
4. (Optional) Enter a **Description**.
5. Enter a valid **Routing Context** for the AS.
6. Click **Add**. The association server is added to the system.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select Apply Changes from the menu.

### Mapping Associations to an Application Server

Complete these steps to map an association to an application server (AS).

1. Select **Network Elements >IP > Application Servers**.  
The *Application Server List* screen opens showing the AS list table on top with its mapped associations table on the bottom.
  2. Select the **AS** to have the association.
- Note:** If the AS needs to be added, first click Add on the tool bar and follow the steps to add an AS.
3. Click **Show Details** on the tool bar.
  4. From the bottom table, click **Add** on the tool bar.
  5. Enter the **Name** of the Association.
  6. Select the **Protocol** (SUA, M2UA or M3UA).
  7. Select the **Probed Acquisition Server** that houses the association.  
**Note:** You must add a Probed Acquisition server. See [Adding a Probed Acquisition server](#).
  8. Enter the **Maximum Capacity** for the association.
  9. Enter the **End Points**
    - a. Enter the **Source Port**.
    - b. Enter the **Destination Port**
  10. Enter the **Source IP Address(es)**
  11. Click **Add** to List. Repeat steps 10-11 to add multiple addresses.
  12. Enter the **Destination IP Address(es)**.
  13. Click **Add** to List. Repeat steps 12-13 to add multiple addresses.
  14. Click **Finish**.

**Note:** For the changes to take effect, click Apply Changes.

### Modifying a Mapped Association

Complete these steps to modify an Application Server (AS).

1. Select **Network Elements >IP > Application Servers**.

2. Select the **AS** to be modified.
3. Click **Modify** on the tool bar.
4. Make the necessary **modifications**.
5. Click **Modify** at the bottom of the screen. A prompt appears stating that the signaling point was modified.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select Apply Changes from the menu.

### **Deleting an Association Mapped to an Application Server**

Complete these steps to delete an association mapped to an application server.

**Note:** The links and application servers will no longer exist if the association is deleted.

1. Select **Network Elements > IP > Application Servers**.
2. Select the **Application Server** that has the association.
3. From the bottom table, select the **association** to be deleted..
4. Click **Delete** from the tool bar.
5. Click **OK** at the prompt. The association is deleted.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select Apply Changes from the menu.

### **Modifying an Application Server**

Complete these steps to modify an Application Server.

1. Select **Network Elements >IP >Application Server**.
2. Select the **Application Server** to be modified.
3. Select **Modify**
4. Make the necessary **modifications**.
5. Click **Modify**. A prompt appears stating that the Application Server was modified.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select Apply Changes from the menu.

### **Deleting an Application Server**

Complete these steps to delete an application server.

**Note:** When deleting an association, all mappings to that association will be broken.

1. Select **Network Elements > IP > Application Server**.
2. Select the **Application Server** to be deleted.
3. Select **Delete**.
4. Click **OK** at the prompt.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select Apply Changes from the menu.

### **About Integrated Acquisition or Probed Acquisition Associations**

Associations refer to SCTP associations. Associations provide the transport for the delivery of SCCP-User protocol data units and SUA layer peer messages. In their simplest form, they are combinations of links that are discovered from an Integrated Acquisition subsystem but can exist as Probed Acquisition (utilizing traffic classifications) elements. Network element associations are discovered as part of the site creation process.

**Note:** For Integrated Acquisition subsystems the network elements are automatically discovered and manual creation of elements is not allowed. On the other hand, all elements on a Probed Acquisition subsystem require manual creation.

### Showing Details of an Associations (Integrated Acquisition or Probed Acquisition)

Complete these steps to show the details (endpoints, associations or links mapped to either an Integrated Acquisition or a Probed Acquisition association).

1. Select **Network Elements > IP > Associations > IMF or PMF** (depending on what type of association is being researched).
2. From the list screen, select the **Association** to be viewed.
3. Click **Details** from the tool bar. The *mappings* for that association appear in the bottom table.

### Deleting Associations (Integrated Acquisition and Probed Acquisition)

Complete these steps to delete either an Integrated Acquisition or a Probed Acquisition association.

**Note:** When deleting an association, all mappings to that association will be broken.

1. Select **Network Elements > IP > Associations > IMF or PMF** (depending on what association needs to be deleted).
2. From the list screen, select the **Association** to be deleted.
3. Click **Delete** from the tool bar.
4. Click **OK** at the prompt.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### About OCDSR Associations

Associations refer to SCTP or TCP connections. Associations provide all Diameter connections detected by Integrated OCDSR Monitoring. This connections information consists of Local IP Address, Local Port, Protocol (SCTP or TCP), Peer IP Address and Peer Port. They are enriched with OCDSR configuration information (Local and Peer Node).

This menu allows to disable the monitoring of some specific Peer by unchecking the Peer Monitoring check box.

### About Application Servers Processes

Centralized Configuration allows the monitoring of Application Server Processes. An Application Server Process (ASP) serves as an active or backup process of an Application Server, for example as a distributed signaling node or database element. Examples of ASPs are MGCs, IP SCPs, or IP-based HLRs. An ASP contains an SCTP endpoint and may be configured to process traffic within more than one Application Server.

**Note:** For Integrated Acquisition subsystems the network elements are automatically discovered and manual creation of elements is not allowed. On the other hand, all elements on a Probed Acquisition subsystem require manual creation.

### Viewing Application Server Processes

The list screen for configured application server processes (ASPs) can be viewed in the ASP list screen. Selecting **Network Elements > IP > Application Server Process** opens the list page. The ASP table contains the following information.

- ASP Name - the name of the process
- Association Name - the name of the association mapped to the ASP
- Application Server Name - the name of the Application Server that the association is related to.

- Removed - shows the date and time that the process was removed through synchronizing the system.

# Chapter 7: Network View Configuration

## About Network Views

You can access Session and Link Network Views sby selecting the Network View perspective from the directory tree. Then expand the tree to view these three objects. Session views can be hierarchical and can be one of two types:

- Network Views - A network, hierarchy or networks or session view.
- Link Network Views - A network view containing one or more links of the type - SS7 linkset, Gb links and Input streams.

The Network Views perspective provides a means of logically grouping SS7 linksets, Gb links, Input streams and xDR sessions used by other configuration operations as well as those operations used by applications.

Network views are hierarchical in that one network view can contain other network views, for example, a network view of a country could contain regional networks that contain state networks that contain city networks.

The figure shows the Network View Perspective object tree.

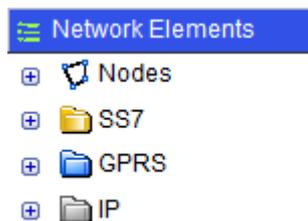

Figure 71: Network View Perspective

## Creating Network Views

Network views function as an organizing entity. In complex networks, you can have several levels of networks (for more information, see [Nesting Network Views](#)).

Complete these steps to create a network view.

1. Select **Network View > Session Views > Add** from the *Object tree*. The *Initial Setup* screen opens shown in the figure below.

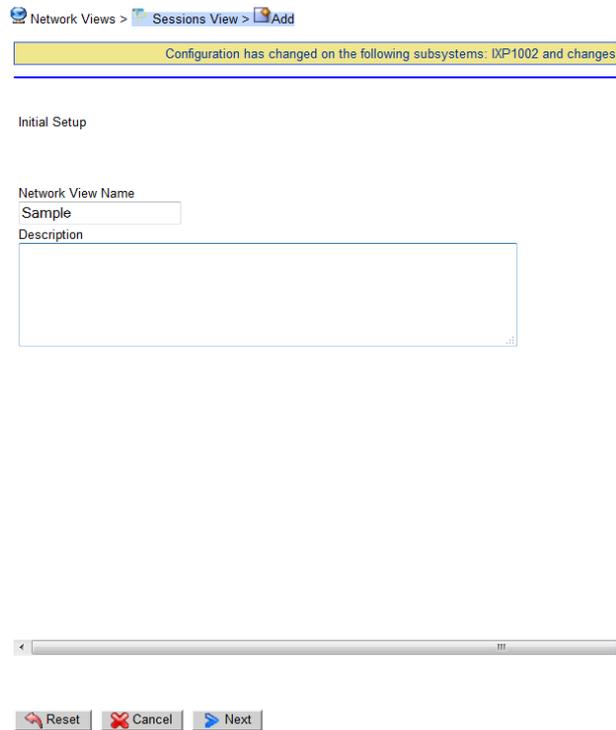

Figure 72: Initial Setup Screen

2. Type in **Network View Name**.
3. (Optional) Type in a **Description**.
4. Click **Next**. The *View Type Selection* screen opens shown below.

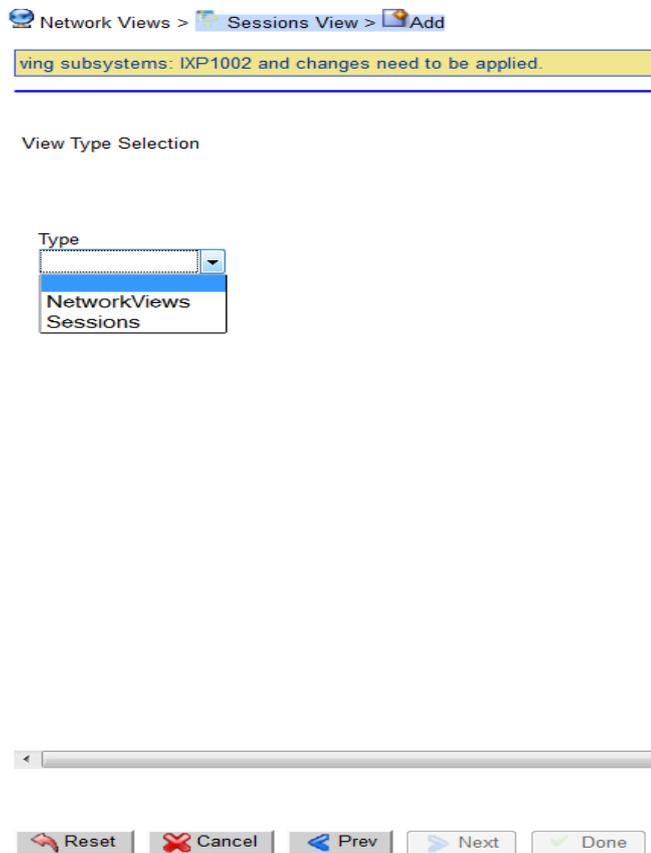

Figure 73: View Type Selection Screen

5. Select **Network Views** from the Type drop-down menu.
6. Click **Done** without selecting any available networks.

You have created a container network view that is empty and can function as a container for other networks within it.

**Note:** See [Nesting Network Views](#) for steps to include existing networks in the view.

### Creating Network Session Views

You can access Session and Link Network Views by selecting the Network View option from the directory tree. Then expand the tree to see these three objects.

Like Container Network views, session views can also be hierarchical. Complete these steps to create a session view

1. Select **Network Views > Sessions View**.
2. Click **Add** from the tool bar.
3. Type in **Network View Name**.
4. (Optional) Type in a **Description**.
5. Click **Next**.
6. From the Type drop-down menu select **Sessions**.
7. Click the **Session Selector** Filter icon on the far right of the tool bar.
8. From the Session Selector Filter screen, select one or more **Dictionaries**.
9. Select the **Site(s)**
10. Click **Apply Filter** to filter on specific sessions and/or sites.
11. Click **Select**. The system searches the dictionaries and sites. Any matches for the filter are shown in the Filtered Sessions field.
12. Click **Close** to close the screen.
13. Click **Done** without selecting any available networks.

You have created a session view.

### Nesting Network Views

Container-based network views function as a shell that contains other networks. This type of network is helpful in organizing very large networks that contain other networks. For example, one might have a region network that contains several state networks which in turn contain city networks. Creating a container network enables you to create hierarchies for greater specificity in analysis and troubleshooting.

Complete the steps in Creating Network Views to create your parent (container) view. Once you have created the networks for your system. You can begin to “nest” the networks to form hierarchies.

Follow these steps to create children of the parent.

1. Select **Network View > Session Views > List**. The *Network View List* screen opens.

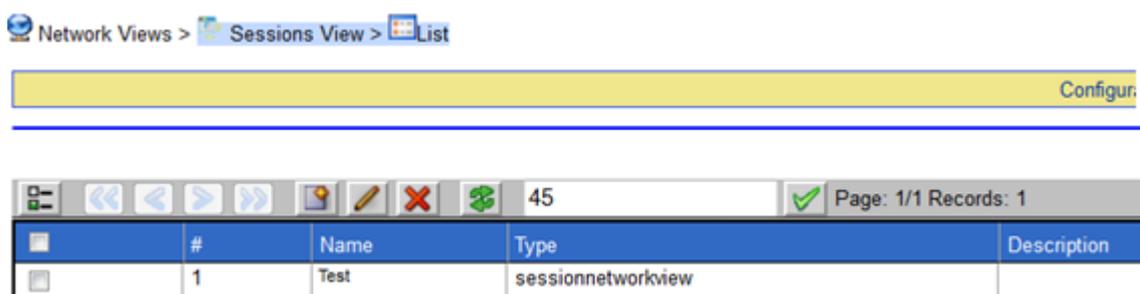

Figure 74: Network View List Screen

2. Select the **Parent Network View** from the list.
3. Click **Modify**. The *Network View* screen opens.

- Click **Next** to open the View Type Selection screen.

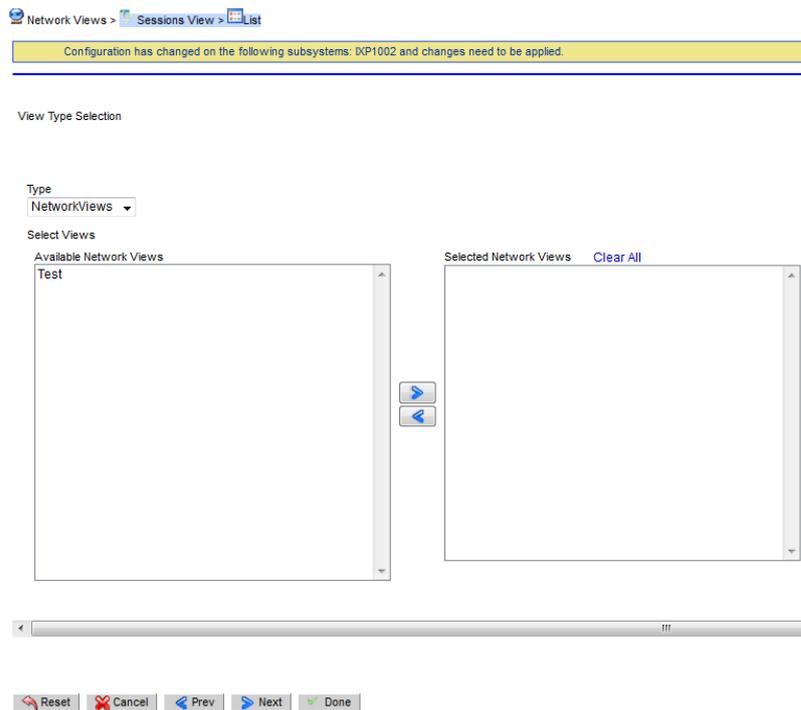

Figure 75: View Type Selection Screen

- Select a **network(s)** that will belong to the container network.
- Click the **right-arrow** to place the networks into the Selected Networks field.
- Click **Done**. You created a nested or hierarchical network view.

### About Network Views that Separate xDR Sessions

You can access Session and Link Network Views by selecting the Network View perspective from the directory tree. Then expand the tree to view these three objects. Session views can be hierarchical and can be one of two types:

- Network Views** - A network, hierarchy or networks or session view.
- Link Network Views** - A network view containing one or more links of the type - SS7 linkset, Gb links and Input streams.

The Network Views perspective provides a means of logically grouping SS7 linksets, Gb links, Input streams and xDR sessions used by other configuration operations as well as those operations used by applications.

Network views are hierarchical in that one network view can contain other network views, for example, a network view of a country could contain regional networks that contain state networks that contain city networks.

The figure shows the Network View Perspective object tree.

Figure 76: Network View Perspective

## About Link-based Network Views

Link-based network views (SS7, Gb, IP) can be grouped together to create a view of the network that a system administrator uses for routing link data to the Mediation. All links in an SS7 linkset are considered part of any network view containing the linkset. If a linkset is part of a network view and a new link is added to that linkset either manually or through discovery, the new link also automatically becomes part of the network view.

## Configuring Link Views

You can add three types of links to a link-based network view using Centralized Configuration.

Note: Link views contain only linksets and are the lowest level of network view that can be created.

- SS7
- GB
- Traffic Classifications (IP streams)

## Creating Link-based Network Views

Complete these steps to add a leaf network view.

1. Select Network View > Link View> Add. The *Initial Setup* screen opens shown in the figure shown below.

Figure 77: Link Network View Create Info-Initial Setup

2. Type in **Network View Name**.
3. (required) Type in a **Description**.
4. Click **Next**. The *View Type Selection* screen opens shown in Figure 79: View Type Selection Screen.
5. Select **Links** from the drop-down menu. The link type screen opens shown below.

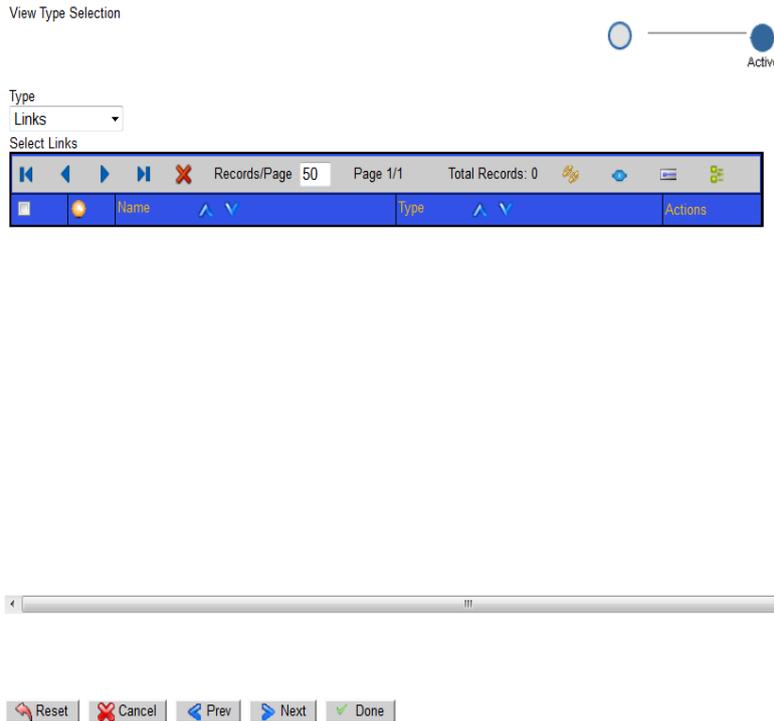

Figure 78: View Type Selection Screen

6. Click a **link type** from the toolbar.
 

**Note:** To add a specific linkset or link type, click on one of the links below.

  - a. Adding an SS7 Linkset to a Link View
  - b. Selecting Gb Links for a Link View
  - c. Selecting Traffic Classifications
  - d. Adding SS7 Linksets and Gb Links
7. After you have added the links you need, click **Next**. The *Add Link Network View* screen opens shown below.

Item	Option	Description
Field		
	Type	Pull-down menu to select between Network or Links
Toolbar		
	Delete	Deletes a existing link that is selected
	Select SS7 Linksets	Opens Add SS7 Linkset screen
	Select Gb Links	Opens Add Gb link screen
	Select IP Streams	Opens Add IP Stream screen
	Select SS7 Linksets & Gb Links	Opens Add SS7 Gb link screen

Table 58: Link Network View Fields

### Adding an SS7 Linkset to a Link View

Complete these steps to add an SS7 linkset to your link view.

Item	Description
Point Code	List of available point codes
Type	Point Code type (A-F)
Resource ID	Alphanumeric field to declare an ID for the linkset
Sites	List field of available sites on point code
Apply Filter	Begins search for parameters selected above

Item	Description
Filtered SS7 Linksets	Lists linksets found.
Select & Close	Selects chosen links
Close	Closes the screen

Table 59: Select SS7 Linkset Screen

1. Click **Select SS7 Linksets**

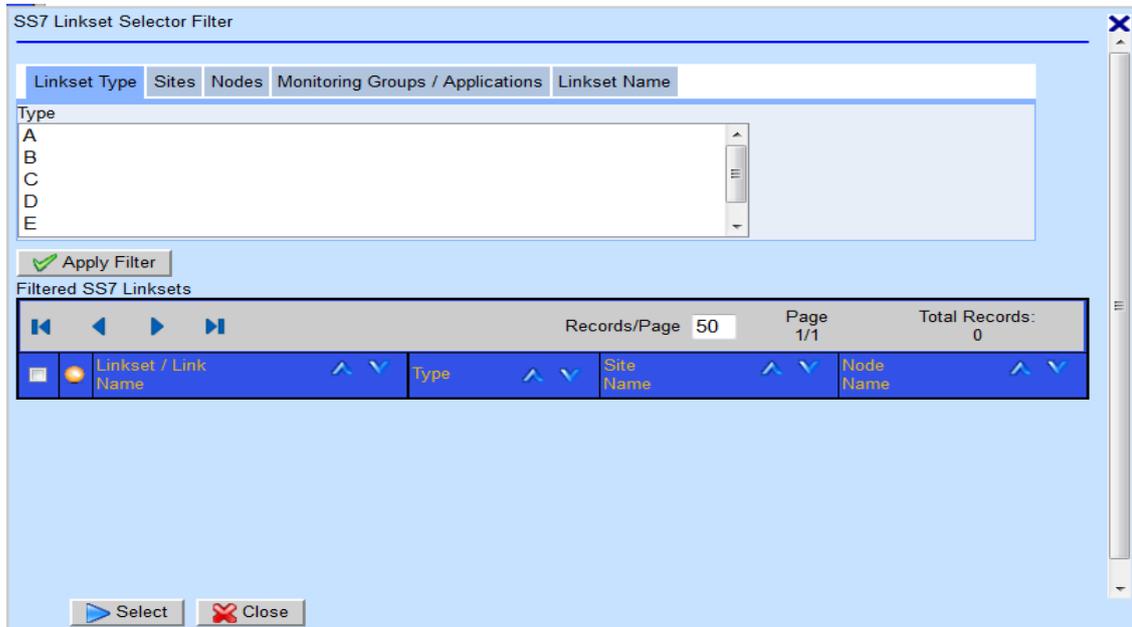

Figure 79: SS7 Linkset Selector Filter Screen

- a. Select the **Linkset Type** from the Linkset type tab.
- b. Select the **Site** from the Sites tab shown in the figure below.

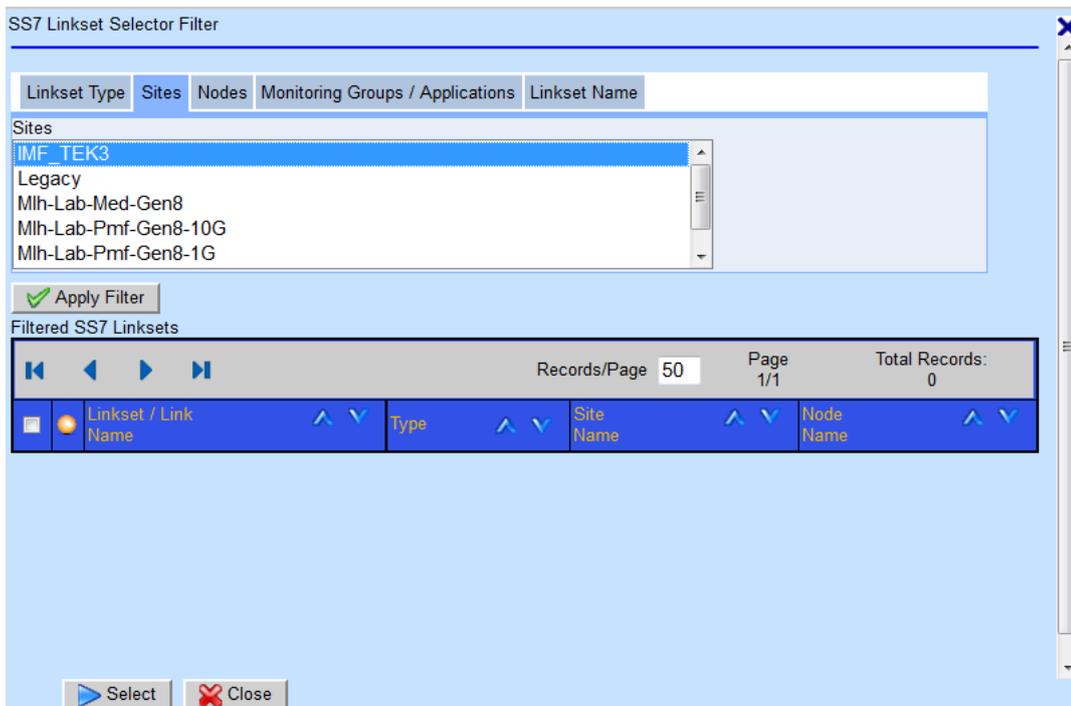

Figure 80: Sites Screen

Select the **Node(s)** from the Nodes tab shown in the figure below.

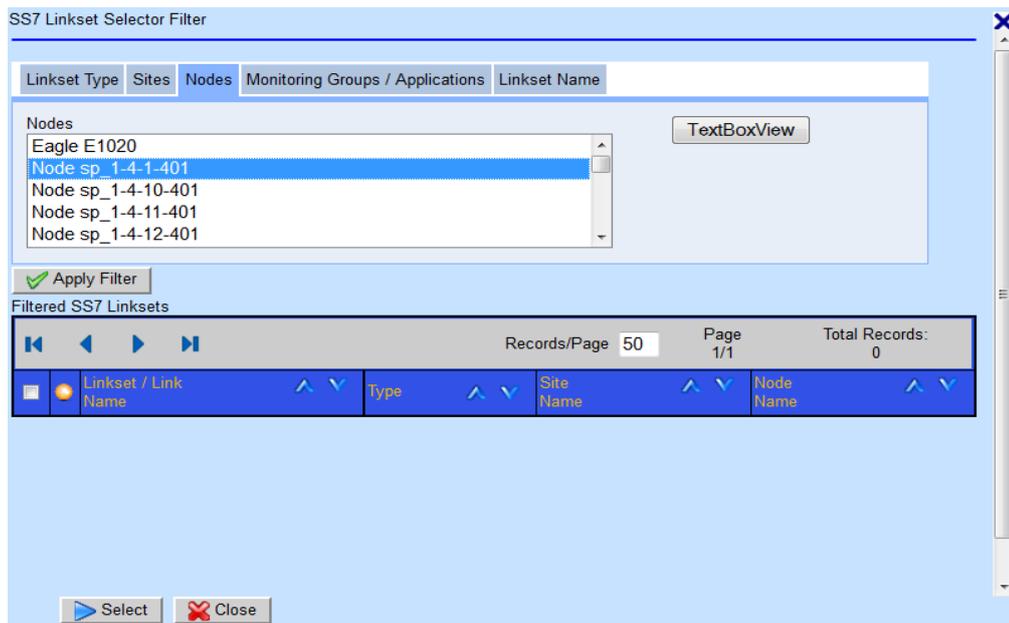

Figure 81: SS7 Node Screen

c. Assign a **Linkset Name** from the Linkset Name tab.

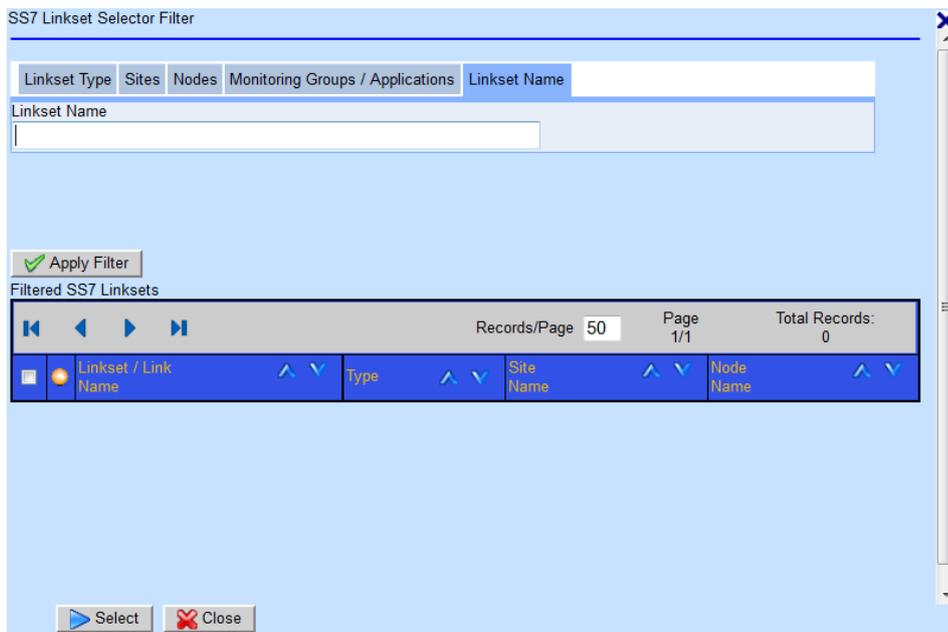

Figure 82: SS7 Linkset Name Screen

- d. Click **Apply Filter** to apply the filter to the linkset.
  - e. Click **Select**. The *View Type Selection* screen opens with the selected linkset(s).
2. Click **Close**. The *SS7 linkset* is added to the link view.

### Selecting Gb Links for a Link View

Complete these steps to select a Gb link to a link view.

1. Click **Gb link** from View Type Selection screen shown in Figure 93: View Type Selection Screen. The *Gb Link Selector Filter* shown below opens.

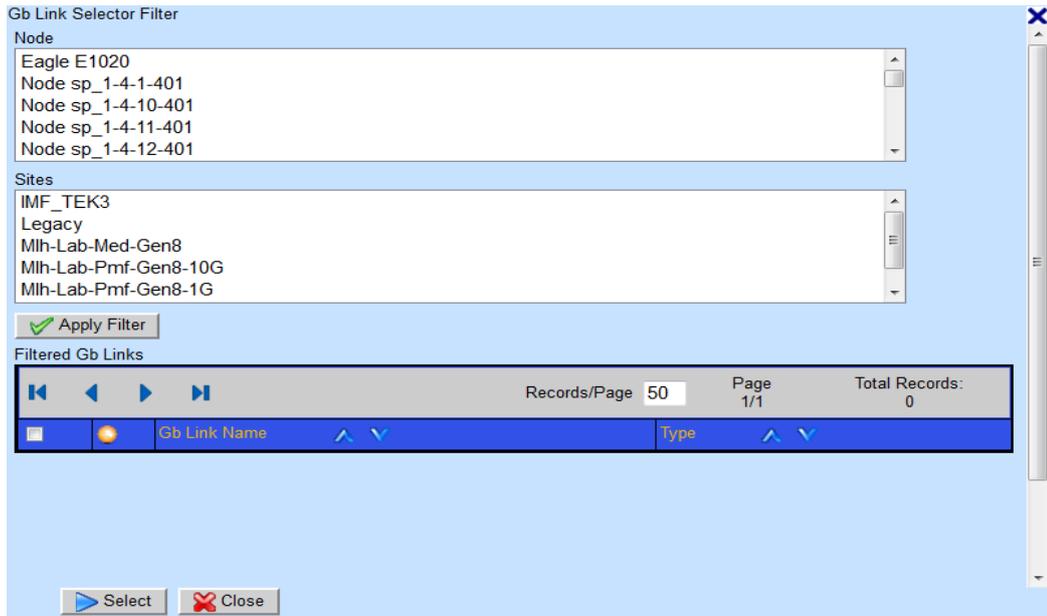

Figure 83: View Type Selection Screen

Item	Description
Node	Shows all the nodes within a network view
Sites	Shows all the sites available in a network view
Apply Filter	Begins search for available Gb links
Filtered Gb Links	Lists all the available links
Select & Close	Selects chosen links
Close	Closes the screen

Table 60: Select Gb Links Screen

2. Select a **Node**.
3. Select the **Site(s)**.
4. Click **Apply Filter**. The search begins.
5. Select the **Gb links** for the link view.
6. Click **Select**. The Gb link is selected.
7. Click **Close**. The links are added to the network view.

### Selecting Traffic Classifications

Complete the following steps to select a Traffic Classification.

1. Click **Select Traffic Classifications** from View Type Selection screen tool bar shown below. The *Traffic Classification* screen opens.

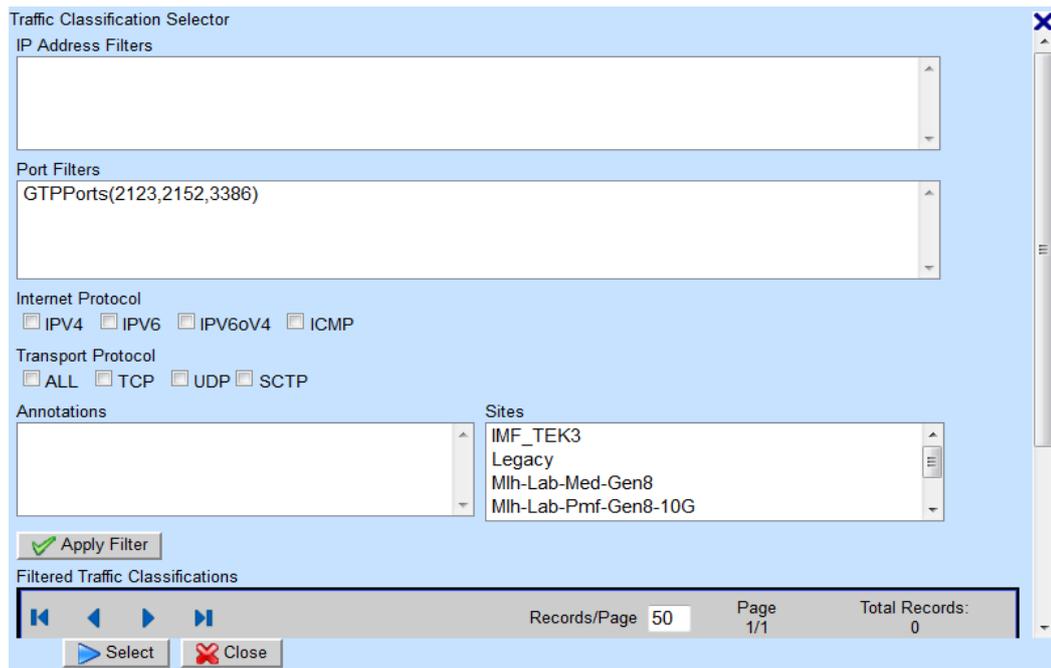

Figure 84: View Type Classification Screen

Item	Description
IP Address Filters	Lists available IP Addresses
Port Filters	Lists available Port Filters
Protocols	Check boxes for the following protocols <ul style="list-style-type: none"> <li>• TCP</li> <li>• UDP</li> <li>• SCTP</li> <li>• ICMP</li> </ul>
Annotations	A specific label or title you add for identification
Apply Filter	Begins search for Input streams
Traffic Classification List	Lists Traffic classifications found in search
Select	Selects chosen links
Close	Closes the screen

Table 61: IP Stream Selector Filter Fields

2. Select **IP Address Filters** from the list.
3. Select the **Port Filters** from the list.
4. Select the **Protocol(s)** for the filter.
5. Click **Apply Filter** to begin the search for available traffic selections.
6. Select the **traffic classification** from the list.
7. Click **Save** to save the selection to the link view.
8. Click **Close** the screen closes.

### Adding SS7 Linksets and Gb Links

Complete the following steps to add SS7 linksets & Gb links.

1. Click **Select SS7 and Gb links** from View Type Selection tree. The *Link Selector* filter opens.

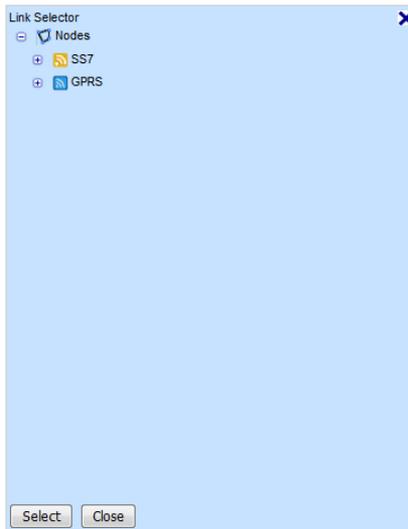

Figure 85: Link Selector Screen

1. Expand the **Object Tree**.
2. Select the **Link**.
3. Click **Save & Close**. The *link* is selected.

### Modifying Link-based Network Views

Complete these steps to modify a link-based network view.

1. Select the **network view** to be modified.
2. Select **Modify** from the popup menu.
3. Make the necessary **modifications**.
4. Click **Done**. The *network view* record is updated.

### Deleting Link-based Network View

Complete these steps to delete a link-based network view.

1. Select the **network view** to be deleted.
2. Select **Delete** from the popup menu.
3. Click **OK** at the prompt. The *session* is deleted.

# Chapter 8: Acquisition Subsystem

## About the Acquisition Perspective

Once an Acquisition subsystem (Integrated Acquisition / Probed Acquisition) is created and its applications and network elements are discovered, you configure the subsystem in the Acquisition perspective.

In the Acquisition perspective, only the sites that have Acquisition subsystems are visible in the Acquisition object tree (shown in the figure below). In this perspective you can:

- Create monitoring groups linked to monitor linksets
- Create PDU Filters
- Configure Alarms
- Manage Resource ID Groups
- Configure Q.752 counters (Routes Dataflows to Thirdparty ((external)) Data Feeds)

Figure 86: Acquisition Perspective Overview

## About Acquisition Subsystem Management

The general maintenance and configuration options for a specific Acquisition subsystem are accessed by right-clicking on the selected Acquisition subsystem. (Select **Sites > subsystem**) The pop-up menu opens.

The functions are briefly described in the table.

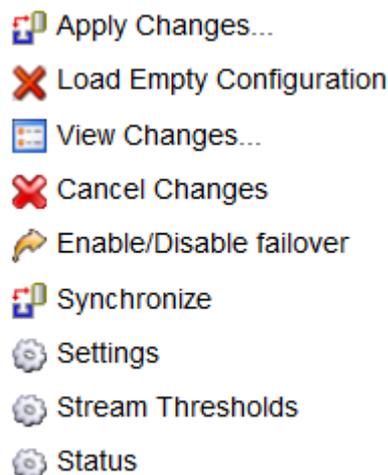

Figure 87: Acquisition Subsystem Pop-Up Menu

Option	Description
Apply changes	enables you to apply any changes that have been made to the particular Acquisition subsystem. You are notified if there are any changes to the system and you use this option to accept the changes.
Load Empty Configuration	enables you to remove the existing configuration for the subsystem.
View changes	enables you to view any changes that have occurred in the subsystem in order to accept the change or cancel them.
Cancel changes	Enables you to cancel any changes that have been made to the subsystem. <b>Note:</b> Routing is also deleted after this operation is performed.
Config backup/restore	Enables you to backup or restore a previous backup configuration in case of system failure. <b>Note:</b> Routing is also deleted after this operation is performed.
Synchronize	Enables you to discover (or re-discover) any applications or network elements on the subsystem.
Settings	Enables you view and set some Acquisition parameters, such as PDF Idb Storage and Threshold Kbps, on a per-subsystem basis.
Stream Thresholds	Enables you to set the limit for traffic passing through different destinations within an Acquisition subsystem.
Status	Enables you to view the status of the system

Table 62: Acquisition Subsystem Pop-Up Menu Options

## Synchronizing an Acquisition Subsystem

Using the synchronize option, you can discover any new applications or changes to the Acquisition subsystem.

Complete these steps to synchronize an Acquisition subsystem.

1. Select **Acquisition > Sites > Acquisition subsystem (Probed Acquisition or Integrated Acquisition)** shown below.

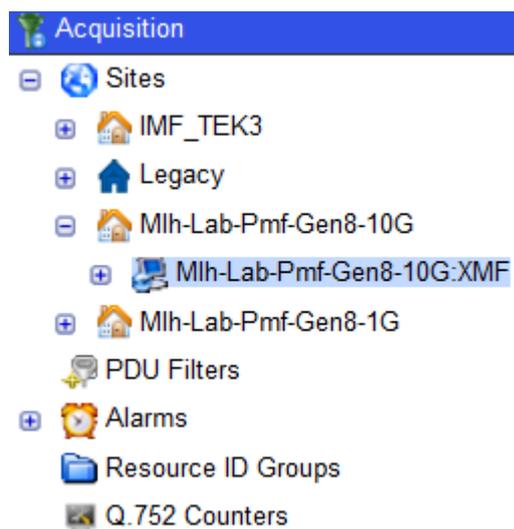

Figure 88: Selected Acquisition Subsystem

2. Right click on the **Subsystem**.

3. Select **Synchronize**. The system begins the process. After completion, the status screen opens shown in the figure below.

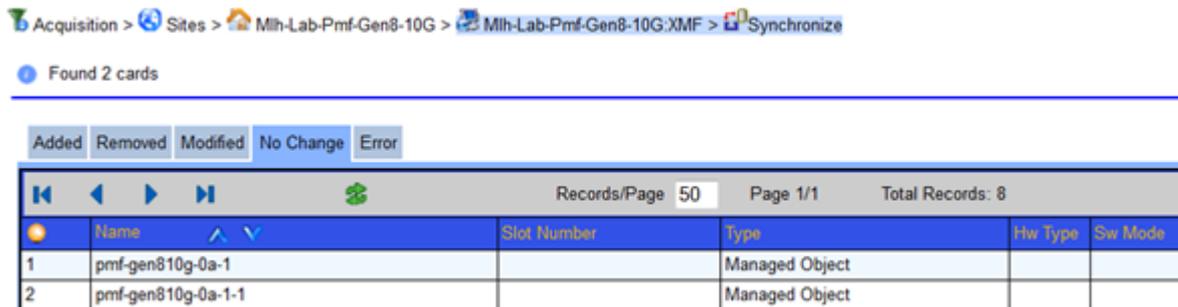

Figure 89: Synchronization Results Screen

You are provided the following information.

- How many elements were found in the subsystem
- What elements were added
- What elements were removed
- What elements were modified
- What elements had no changes
- Any errors that occurred during synchronization

In addition, if it is a Probed Acquisition subsystem, then you are also notified as to how many cards were found.

### Applying Changes to an Integrated Acquisition Subsystem

Once changes have been made to an Integrated Acquisition subsystem, click **Apply Changes** on the subsystem right-click menu. The results screen opens:

Figure 90: Apply Changes Screen

The screen has two tabs.

- Configuration Changes - shows all the actions during the process.
- Warnings - shows the changes that may have errors.

**Note:** In the process of applying changes to an Integrated Acquisition subsystem, the changes are first validated to make sure that no limits have been exceeded. This is especially important for monitoring groups. If the maximum of 512 links and associations has been exceeded, when changes are applied, there will be a warning prompt that appears stating that there is an invalid or exceeded capacity of

monitoring groups and it must be corrected before applying changes. The monitoring groups in question will be listed on the prompt. In this situation, the monitoring group(s) in question must be modified. For more information see [Modifying Monitoring Groups](#).

### Viewing Changes to an Acquisition Subsystem

Complete these steps to view the most recent synchronization and any pending changes on an Acquisition subsystem.

1. Select **Acquisition > Site > Acquisition subsystem**.
2. From the subsystem right-click menu select **View Changes**. The screen shows the time and date of the last synchronization and any pending changes in the bottom table.

### Enabling and Disabling Acquisition Subsystem Automatic Failover

Complete these steps to enable or disable the automatic failover for an Acquisition subsystem.

1. Select **Acquisition > Site > Acquisition subsystem**.
2. Right-click and select **Enable / Disable Auto Failover**.

**Note:** Enabling and disabling an IXP subsystem can also be performed from the Actions column in the IXP list screen.

3. Select either **Enable (default setting) or Disable**.
4. Click **Done**.

**Note:** For the changes to take effect, click **Apply Changes**.

### Loading an Empty Configuration on to an Acquisition Subsystem

Complete these steps to load an empty configuration on an Acquisition subsystem.

1. Select the **Acquisition > Site > Acquisition subsystem**.
2. From right-click menu select **Load Empty Configuration**

**Note:** A warning appears stating that loading an empty configuration un-route PDU dataflows at the associated Acquisition subsystem. (For more information, see [Avoiding Lost PDU Routes Due to Cancel Changes on an Acquisition Subsystem](#).)

3. To continue to load an empty configuration, click **OK**.

**Note:** For changes to take effect, click **Apply Changes** from the subsystem right-click menu.

### Cancelling Changes to an Acquisition Subsystem

You can cancel changes to a subsystem by using the Cancel Changes option.

**Note:** Choosing "Cancel Changes" on an Acquisition subsystem removes the existing configuration (any changes that have occurred) of that subsystem and restores the latest applied (active) configuration which includes Monitoring Groups in the case of Integrated Acquisition or Card/Port/Link Mapping and Traffic Classifications (TCs) in the case of Probed Acquisition. Feeder Thresholds, Acquisition subsystem parameters and PDU dataflows are preserved (but the PDU routes are not preserved). This action also enables the "Apply Changes" banner for that Acquisition subsystem. PDU dataflow routing can be restored either by modifying the Build DFPs on the Mediation subsystem in order to re-associate the dataflows with the DFPs, or by restoring the last applied configuration on the Mediation subsystem that contains the Build DFPs (see next note for constraints on restoring Mediation).

**Note:** Care must be taken in restoring the last applied Mediation subsystem configuration because any un-applied configurations to that Mediation subsystem will be lost.

Complete these steps to cancel changes for a subsystem. Again, if any changes have occurred, you are prompted with this message:

Configuration has occurred on the following IXP subsystems: IXPSubsystemName, changes must be applied or cancelled.

**Note:** To apply changes to a subsystem you need to be assigned the role NSP Config Manager or NSP Administrator.

1. Select the **subsystem** that needs to have the changes cancelled.
2. Right-click and select **Cancel Changes** from the pop-up menu.  
Centralized Configuration displays the configuration changes that will be applied to the selected Acquisition subsystem. At this point, you are prompted if you want to continue, cancel, or undo.
3. Click **Undo**.  
The last configuration that was applied to the Acquisition subsystem is reloaded.
4. Click **Apply Changes** for the Acquisition subsystem.  
To avoid loss of PDU Routes on the Mediation subsystems associated with the Acquisition subsystem follow steps 5-8.
5. Select the Mediation **Subsystem** associated with the Acquisition subsystem.
6. From the right-click menu on the Mediation subsystem, select **Config Backup / Restore**.
7. From the screen select the last **Active** backup.
8. Click **Restore** from the tool bar.  
If prompted, click **Apply Changes**.

### **Avoiding Lost PDU Routes Due to Cancel Changes on an Acquisition Subsystem**

How to avoid losing PDU routes when "Cancel Changes" option has been used on Mediation and Acquisition (see [Losing PDU Routes Due to Cancel Changes](#)).

Complete one of these two actions to avoid losing PDU routes.

Either:

Click **Cancel Changes** only for the Mediation subsystem leaving the associated Acquisition subsystem unchanged.

Or

After clicking **Cancel Change** on an Acquisition subsystem, select the Mediation subsystem(s) that is receiving the data from the Acquisition and complete the Config Backup/Restore procedure (see [Restoring Lost PDU Routes Due to Cancel Changes on an Acquisition Subsystem](#)).

### **Restoring Lost PDU Routes Due to Cancel Changes on an Acquisition Subsystem**

How to restore PDU routes lost when "Cancel Changes" option has been used on Mediation and Acquisition (see [Losing PDU Routes Due to Cancel Changes](#)).

Complete these steps to restore lost PDU routes.

1. Select the **Mediation > Sites > Mediation Subsystem > Config Backup/Restore** that is receiving traffic from the Acquisition subsystem.  
**Note:** The backup configuration must be in a state labeled as "Active."
2. Select the **Configuration** that is to be restored from the backup list.
3. Click **Restore** from the tool bar. The configuration that was selected is reloaded.
4. **Apply changes** to all **Mediation** and Acquisition subsystems affected.

### **About Acquisition Subsystem Settings**

The settings option for a specific Acquisition subsystem is accessed by right-clicking on the selected Acquisition subsystem. (Select **Acquisition > Sites > Subsystem > Settings**) The subsystem settings list screen opens.

The settings option has Six default parameters described in the table.

- CountUploadFreq - Probed Acquisition uses the set value as the frequency for uploading to the Mediation. It is measured in seconds, 1 (default) - 2147483647 (max java int).

- NoDataAlarmThreshold - MSU Feed no activity alarm threshold in minutes. All connections are working, but no activity on the network. Threshold is defined in minutes between 1 min and 24 hours, with default of 5 min (Range: 1-1440).
- PDUStorage - saves monitored IP RAW data to RAM or disk
- PDUStorageAssoc - saves monitored IP RAW data to RAM or to disk
- SigtranMonitor - has three setting values 0=Off (if Sigtran is not utilized), 1=On if there are configured associations and application server processes, 2=ON(All)
- ThresholdKbps - sets the threshold for Kbps for a subsystem

**Note:** For ThresholdKbps values, it is recommended that the value range be:

- 100,000 - 500,000 Kbps for a system that has no disk storage
- 10,000 - 50,000 Kbps for a system that has disk storage
- UseGTPFilters - Enables and disables GTP post filtering on Probed Acquisition. It has two setting values, 0=Disable and 1=Enable. (Enable is the default.)

In addition you can create additional settings for your subsystem.

**Note:** You cannot delete the default setting parameters only those parameters that you have created.

Centralized Configuration provides the capability for you to view and edit some Acquisition parameters on a per-subsystem basis. Initially, the following are the ranges for pre-defined parameters.

Parameter	Default Values	Comment
Pdu Idb Storage	0	PDU IDB Storage = 0, means data is buffered only in memory and has limited recover after network outage, but has higher speed. Recommended for Probed Acquisition /IP
Threshold Kbps	100,000	ThresholdKbps = maximum allowed throughput of Acquisition AFTER PMIA filtering. If exceeded, the system will start to drop MSUs to protect itself.
Pdu Idb Storage	1	PDU IDB Storage = 1, means data is buffered on disk in case of network outage to be able to recover up to six hours. Recommended for Integrated Acquisition and Probed Acquisition /E1T1

Table 63: Ranges for Pre-defined Subsystem Parameters

### About Acquisition Subsystem Parameter Settings

There are two considerations when enabling or disabling PDUStorage and PDUStorageAssoc.

- PDUStorage - the default setting is enabled. When enabled, monitored data is stored to the disk.  
**Note:** If IP RAW data should be stored to the disk, then both PDUStorage and PDUStorageAssoc must be enabled. If disabled, the monitored data is stored only to RAM.
- PDUStorageAssoc - the default setting is disabled. If this parameter is enabled, then IP RAW data is stored to the disk.

**Note:** This parameter is valid only if PDUStorage is enabled. If it is disabled (default setting), then the monitored IP RAW data is stored only to RAM.

### Creating a Subsystem Parameter

Complete these steps to create a subsystem parameter for an Acquisition application.

1. Select **Acquisition > Sites > Acquisition subsystem**.
2. Right click and select Settings. The *Settings List* screen opens.

#	Parameter Name	Value	Description
1	CountUploadFreq	1	Traffic Classification Counter Upload Frequency
2	DuplpPktTimeoutMs	20	Duplicate Suppression interval (in Milliseconds). Value can be from 0 to 20 msec. 0 means Duplicate suppression
3	NoDataAlarmThreshold	5	MSU Feed no activity alarm threshold in minutes. All connections are working, there is simply no activity
4	PDUStorage	0	xMF Parameter holding default value for PDUStorage

Figure 91: Acquisition Subsystem Settings List Screen

- Click Add on the tool bar. The *Add* screen opens.

Figure 92: Acquisition Subsystem Parameter Add Screen

- Enter the **Name** of the parameter.
- Enter the **Value** (integer).
- (Optional) Enter the **Description**.
- Click **Add**. The parameter is added.

**Note:** The subsystem must be synchronized for the changes to be incorporated into the system.

### Modifying a Subsystem Parameter

Complete these steps to modify an Acquisition subsystem parameter.

- Select **Acquisition > Sites > Acquisition subsystem** that needs modification.
- Right click and select **Settings**. The *Settings List* screen opens.
- Select the **parameter** to be modified.

**Note:** You can only modify the values of the three default parameters.

- Click **Modify** on the tool bar. The *Modify* screen opens.
- (Optional) Modify the **Value**.

**Note:** You can also reset the value of the parameter to default settings only if you are modifying one of the three default parameters.

- (Optional) Modify the **Description**.
- Click **Modify** to save the settings. The parameter is modified.

### Deleting a Subsystem Parameter

Complete these steps to delete an Acquisition subsystem parameter.

- Select **Acquisition > Sites > Acquisition subsystem**.
- Right click and select **Settings**. The *Settings List* screen opens.
- Select the **parameter** to be deleted.

**Note:** You can only modify the values of the three default parameters.

- Click **Delete** on the tool bar.
- Click **OK** at the prompt. The parameter is deleted.

## Viewing Acquisition subsystem Status

Complete these steps to view the status of subsystem applications.

1. Select the **Acquisition subsystem** that will have the setting.
2. Select **Status** from the pop-up menu.
3. The *Status List* screen opens.

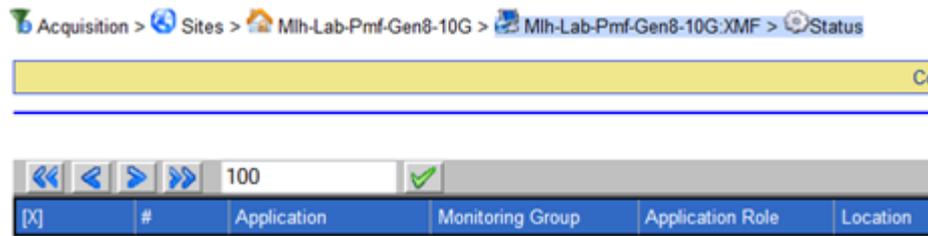

Figure 93: Acquisition subsystem Stream Threshold List Screen

You can view the:

- Application
- Monitoring group associated with the subsystem
- Application role
- Location

## About Feeder Thresholds

Feeder thresholds provide limits that trigger alarms for different kinds of traffic (MSU, Gb, IP, MF) passing through the Acquisition system. Acquisition subsystem thresholds can be set thresholds in the Acquisition perspective of Centralized Configuration.

**Note:** If you have any questions as about feeder alarms, please contact your Tekelec representative.

## Feeder Threshold Values

Threshold Name	Description	Value
hiThreshold	High Threshold for PDU Stream	95%
holdOn	Hold for PDU Stream	5%
loThreshold	Low Threshold for PDU Stream	80%
maxThroughput	Max Throughput (Kbps) for PDU Stream	3000
msuInMaxThroughput	MSU Max Throughput (Kbps) for Incoming Traffic	50000
msuInHiThreshold	MSU High Threshold for Incoming Traffic	95%
msuInLowThreshold	MSU Low Threshold for Incoming Traffic	80%
msuOutMaxThroughput	MSU Max Throughput (Kbps) for Outgoing Traffic	50000
msuOutHiThreshold	MSU High Threshold for Outgoing Traffic	95%
msuOutLowThreshold	MSU Low Threshold for Outgoing Traffic	80%
msuOutHoldOn	MSU Hold for Outgoing Traffic	5%
gbInMaxThroughput	Gb Max Throughput (Kbps) for Incoming Traffic	80000
gbInHiThreshold	Gb High Threshold for Incoming Traffic	95%
gbInLowThreshold	Gb Low Threshold for Incoming Traffic	80%
gbInHoldOn	Gb Hold for Incoming Traffic	5%
gbOutMaxThroughput	Gb Max Throughput (Kbps) for Outgoing Traffic	150000
gbOutHiThreshold	Gb High Threshold for Outgoing Traffic	95%
gbOutLowThreshold	Gb Low Threshold for Outgoing Traffic	80%
gbOutHoldOn	Gb Hold for Outgoing Traffic	5%
ipInMaxThroughput	IP Max Throughput (Kbps) for Incoming Traffic	400000

ipInHiThreshold	IP High Threshold for Incoming Traffic	95%
ipInLowThreshold	IP Low Threshold for Incoming Traffic	80%
ipInHoldOn	IP Hold for Incoming Traffic	5%
ipOutMaxThroughput	IP Max Throughput (Kbps) for Outgoing Traffic	150000
ipOutHiThreshold	IP High Threshold for Outgoing Traffic	95%
ipOutLowThreshold	IP Low Threshold for Outgoing Traffic	80%
ipOutHoldOn	IP Hold for Outgoing Traffic	5%
mfInMaxThroughput	Message Feeder Max Throughput (Kbps) for Incoming Traffic	150000
mfInHiThreshold	Message Feeder High Threshold for Incoming Traffic	95%
mfInLowThreshold	Message Feeder Low Threshold for Incoming Traffic	80%
mfInHoldOn	Message Feeder Hold for Incoming Traffic	5%
mfOutMaxThroughput	Message Feeder Max Throughput (Kbps) for Outgoing Traffic	150000
mfOutHiThreshold	Message Feeder High Threshold for Outgoing Traffic	95%
mfOutLowThreshold	Message Feeder Low Threshold for Outgoing Traffic	80%
mfOutHoldOn	Message Feeder Hold for Outgoing Traffic	5%

Table 64: Threshold Values

### Setting Stream Thresholds

Stream thresholds enable you to set the limit for traffic passing through different Destinations within an Acquisition subsystem. In Centralized Configuration you set these limits using the stream threshold option.

Stream threshold alarms are raised for every Stream whenever the traffic for that Stream crosses the specified threshold. The percentages that you set are for the high and low thresholds for the maxThroughput value (the limit of traffic passing through Acquisition server), that you define for every Stream.

**Note:** Because thresholds can vary according to the size of your system, it is recommended that you contact your Tekelec representative to set the percentages most compatible for your system.

Complete these steps to set a subsystem stream threshold.

1. Select the **Acquisition subsystem** or server that will have the setting.
2. Select **Stream Thresholds** from the pop-up menu. The *Stream Thresholds List* screen opens.

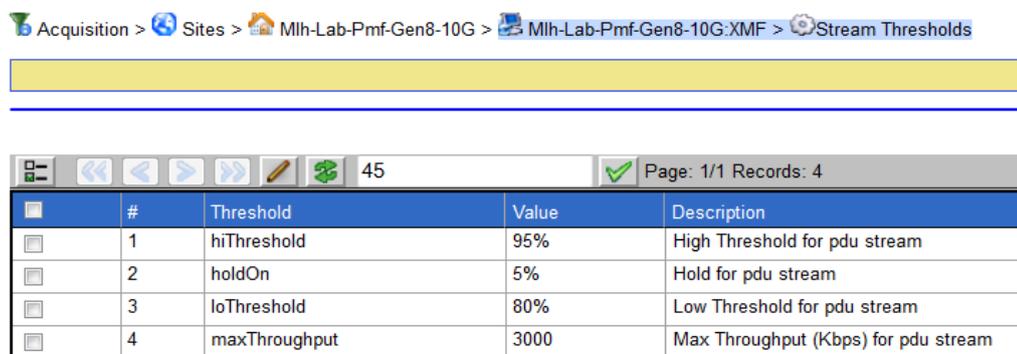

Figure 94: Stream Threshold List Screen

3. Select the **Stream** to be set.
4. Click **Modify** from the tool bar. The *Stream Threshold Modify* screen opens.

Acquisition > Sites > Mlh-Lab-Pmf-Gen8-10G > Mlh-Lab-Pmf-Gen8-10G.XMF > Stream Thresholds

---

45 Page: 1/1 Records: 4

#	Threshold	Value	Description
<input checked="" type="checkbox"/> 1	hiThreshold	95%	High Threshold for pdu stream
<input type="checkbox"/> 2	holdOn	5%	Hold for pdu stream
<input type="checkbox"/> 3	loThreshold	80%	Low Threshold for pdu stream
<input type="checkbox"/> 4	maxThroughput	3000	Max Throughput (Kbps) for pdu stream

Figure 95: Stream Threshold Parameters Screen

- Set the **Value** for the selected threshold.
- Click **Apply**. The *stream threshold* is modified.

### About Acquisition Applications

Once an Acquisition subsystem and its applications have been discovered, you can manage the following application functions:

- Modify an application
- Delete an application
- Manage applications

### Adding an E1/T1 (SPAN) Card (Probed Acquisition)

If E1/T1 cards are being used for a Probed Acquisition system, these cards have to be manually added and configured.

These procedures are performed from the Acquisition perspective. Complete these steps to add an E1/T1 SPAN card to a Probed Acquisition subsystem.

- Select **Acquisition > Site > subsystem > Probed AcquisitionName > Server > Cards**.
- Select **Add** from the pop-up menu. The *Add Card* screen appears.

Slot Number  
1

Hardware Type  
SPAN

Software Mode  
SS7-T1

Admin. State  
Disable

Figure 96: Add Card Screen

- Select the **Slot Number**.
- Select the **Hardware Type** to SPAN.
- Select the **Software Mode**.
  - SS7-T1
  - SS7-E1
  - GB-E1

- GB-T1

6. Modify the various **parameters** in the port.
7. Select the **Admin. State** (enable/disable).
8. Click **Create** for the Linkset. The card is created.

**Note:** For the changes to take effect, right-click Probed Acquisition subsystem that has the card and select **Apply Changes** from the menu.

### Configuring E1/T1 Cards (Probed Acquisition)

After you have created a Probed Acquisition subsystem and discovered its applications, you can configure the Probed Acquisition applications. Complete these steps to configure a Probed Acquisition application (E1/T1 Span Card).

1. Select **Acquisition > Site > Subsystem > Probed Acquisition Name > Server > Cards**.
2. Select the appropriate **Card**.

**Note:** E1/T1 Cards will be labeled in numerical order with name of SPAN, for example 1: SPAN.

3. Right-click on the **Card**.
4. Click **Modify**. The *Card* screen opens showing the cards ports.

Slot Number : 4      Hardware Type : Span      Span Type SS7-T1      Admin. State Disable

Port	Configured	Zero Suppression	Framing	Access Mode	Bit Inversion
1	0	-	-	-	-
2	1	-	-	-	-
3	2	-	-	-	-
4	3	-	-	-	-
5	4	-	-	-	-
6	5	-	-	-	-
7	6	-	-	-	-

Figure 97: Span Card Screen with Unconfigured Ports

5. Select the port you want to configure by clicking the check box in the Configured column. The screen changes to show configurable parameters such as Zero Suppression, Framing, Access Mode and Bit Inversion along with the Channel Link Mapping screen for that port.

Slot Number : 4      Hardware Type : Span      Span Type SS7-T1      Admin. State Disable

Port	Configured	Zero Suppression	Framing	Access Mode	Bit Inversion
1	0	B8ZS	SF	Auto Config	Off
2	1	-	-	-	-
3	2	-	-	-	-
4	3	-	-	-	-
5	4	-	-	-	-
6	5	-	-	-	-
7	6	-	-	-	-

Channel to Link Mapping for port 0

LinkSet	Channel
SS7 Link	

Figure 98: Span Card Configure Screen with Channel Link Mapping Section

6. Modify the various **parameters** in the port.
7. Click the **Add** icon on the tool bar in the Channel to Link Mapping section.

**Note:** Only unmonitored links (SS7 and Gb) are shown.

**Note:** Other Probed Acquisition configurations such as site configuration, discovery, network elements (linkset and link), traffic classifications and PDU data flows remain unchanged and remain consistent across the Probed Acquisition subsystem.

Figure 99: Span Card Configure Screen with Channel Link Mapping Add Screen

8. Click **Browse** for the Linkset.

**Note:** You can also use the "auto complete" text box to search the linksets or Gb links quickly if you know the name.

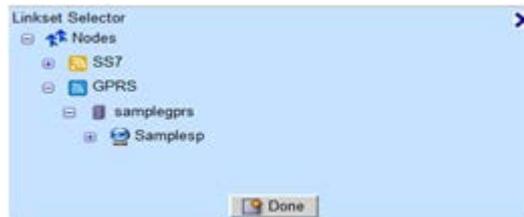

Figure 100: Link Selector Tree View

When you have selected the linkset, click **Done**.

9. Select the **Link** associated with the linkset.
10. Select the **Port** associated with the linkset.
11. Click **Modify**. The card port is configured.

Make sure to apply the changes to the subsystem when you have finished using the subsystem right-click menu.

### Modifying Acquisition Applications

**Note:** You can only modify the description of an application once the application has been discovered.

### Deleting Acquisition Applications

Complete the following steps to delete an Acquisition application.

**Note:** You cannot delete an Integrated Acquisition application where number of Integrated Acquisition monitoring groups is less than or equal to the number of operational Integrated Acquisition servers.

**Note:** You cannot delete an Probed Acquisition application that has a configuration. You must delete the dependent elements first before deleting the application.

1. Select **Acquisition > Site > Acquisition subsystem > Host > Application**.
2. Select the **application** from the Integrated Acquisition or Probed Acquisition to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The application is deleted. You must then synchronize the subsystem for the changes to take effect in the system.

### About Monitoring Groups (Integrated Acquisition)

A Monitoring Group is used to configure a Integrated Acquisition to monitor specific Linksets and/or Associations.

Once a Linkset/Association is part of a Monitoring Group, the Integrated Acquisition instructs the Eagle to send MSUs/PDUs to the Integrated Acquisition for capturing. When Linksets and/or Associations are monitored by the Integrated Acquisition, the Integrated Acquisition captures the MSUs/PDUs received from Eagle and forwards these to the Mediation for processing/storage based

on PDU Data Flows Configurations on Integrated Acquisition and Dataflow Processing Configurations on Mediation.

Monitoring Groups support Associations for *SigTran Fast Copy* capability. This capability provides efficient configuration and maintenance of the Integrated Acquisition subsystem by integrating it with the Eagle without impacting the internal Eagle IMT bus. In addition, the SigTran data is monitored in real time, similar to the port mirroring with Probed Acquisition, again with no internal impact to the IMT bus. For more information on supporting and configuring Fast Copy, refer the documentation for Eagle.

**Note:** Since monitoring groups must be associated with a linkset, you must have existing linksets before you can assign a monitoring group.

**Note:** Linksets that have not been associated with any monitoring group will not be monitored. It is recommended that when creating an association, you also monitor the other links in the linkset(s).

The monitoring group list page has five columns:

- Groups listed for a site - shows the record number of the monitoring group
- Group Name - shows the name of the monitoring group
- Description - shows a short description of the group (optional).
- Number Links - shows the number of monitored linksets
- Number Associations - shows the number of monitored associations

### **Automatic Failover Capability**

Integrated Acquisition has an automatic failover capability to reduce PDU loss in case of server hardware failure.

Whenever an Integrated Acquisition server fails, the Integrated Acquisition subsystem automatically shifts all the linksets/links monitored by the failed server to an available spare server within the subsystem. In order to support this feature, there needs to be one Integrated Acquisition server (spare) that does not have a monitoring group assigned to it.

The maximum number of monitoring groups you can configure is *equal to the number of servers available in the subsystem*. You can assign linksets to each monitoring group. A linkset can be assigned to only one monitoring group. You can also configure *n-1 monitoring groups* (n is the number of servers), to guarantee one server being available for failover.

### **Enabling or Disabling Subsystem Failover**

Described here are the steps to disable or enable the automatic Integrated Acquisition subsystem failover for a specific Integrated Acquisition subsystem.

**Note:** The subsystem default is **Enabled**.

To disable an Integrated Acquisition subsystem failover complete the following:

1. Select **Acquisition > Sites > Subsystem > Integrated Acquisition name** subsystem.
2. Right-click on the **Subsystem**.
3. Select **Disable**.
4. Click **Done**.
5. **Apply Changes** for that subsystem.

**Note:** To enable the disabled subsystem failover operation, select **Enable** in step 3.

### **Considerations When Working with STC/Fastcopy**

The following is a list of points one should consider when working with the STC/Fastcopy feature:

- Existing STC links that are monitored remain in the same Monitoring Group.
- Monitored links which were part of an association and are changed back to STC copy will remain in the same Monitoring Group if the linkset belongs to the same Monitoring Group.

- Monitored links that are part of an association and are changed back to STC copy will switch to the same Monitoring Group as part of the linkset if the linkset belongs to a different Monitoring Group.
- Any un-monitored links which are part of an Association and are changed back to STC copy will be added to the same Monitoring Group as the linkset.
- The monitoring group panel in Centralized Configuration does not show association as a possible selection to monitor if the association no longer contains Fast Copy links. However, the linkset(s) will be available as a possible selection.
- Un-monitored links that switch from STC to an association will be added to the same Monitoring Group as the Association if the association is monitored.
- The Monitoring Group panel in Centralized Configuration does not show a linkset as a possible selection if all the links in the linkset belong to association(s). However, the Association(s) will be available as a possible selection.
- If a Monitoring Group no longer contains any links, then the Monitoring Group is automatically deleted.
- If a Dataflow no longer contains any links, then the Dataflow is automatically deleted.
- If the movement of linksets or Associations from one Monitoring Group to another results in removal of all routes in one or more Dataflows, then those Dataflows are deleted automatically. You will then need to create new or modify existing Dataflows in order to re-route the linksets or Associations.
- Dataflows may need to be modified or added in order to accommodate automatic Monitoring Group changes. The routes within the existing Dataflows may be removed automatically, but may need to be added manually by selecting the necessary linksets or associations.
- The Dataflow Processings and Streams will not be modified or removed automatically due to any automatic changes to Dataflows during the STC-FC switching, although you may need to manually modify or remove the Dataflow Processings later.
- Because associations are included in the calculation of Monitoring Group capacity, it is possible for some of the links that changed from STC to FC to be monitored after the discovery process. For example, the Monitoring Group capacity for a linkset containing 3 M2PA associations and 12 STC links would equate to 18. Therefore, it is highly recommended that after synchronizing the Integrated Acquisition that the Monitoring Groups, Dataflows and number of streams should be verified of changes prior to applying changes to the Integrated Acquisition subsystem. The verification also applies to the load balance on Integrated Acquisition based on Monitoring Groups, Dataflows, and Streams.
- Make sure that you apply changes in Centralized Configuration when converting STC to Fast Copy or Fast Copy to STC because of the possibility of traffic loss during the synchronization period up until you have applied all changes to the subsystem (modifying or removing Dataflows and Monitoring Groups).

### Adding a Monitoring Group (Integrated Acquisition)

Complete these steps to add a Monitoring Group to an Integrated Acquisition subsystem.

1. Select **Acquisition > Sites > Acquisition subsystem > servers > Monitoring Group**.  
The *Monitoring Groups List* screen opens.
2. Click **Add** from the toolbar. The *Monitoring Group Add* screen opens.

**Note:** There must be monitored links and associations present for the Monitoring Group to be created. If no linksets or Associations are present, they must be added and then the changes applied to the Integrated Acquisition Subsystem.

Field	Description
Group Name	Provides the name of the monitoring group that is being added.
(Optional) Description	Provides some useful information about the monitoring group.
Linksets and Associations Notation	Shows the number of linksets and

	associations that belong to the Integrated Acquisition subsystem.
Linksets Tab	Shows un-monitored and monitored linksets on the Integrated Acquisition server.
Associations Tab	Shows un-monitored and monitored associations on the Integrated Acquisition server.
Cards Tab	Shows un-monitored and monitored cards on the Integrated Acquisition server.
Reset Button	Resets the screen back to its default status.
Cancel Button	Cancels any changes in progress.
Add Button	Adds the monitoring group to the Integrated Acquisition server.

Table 65: Adding monitoring group

3. Enter the **Group Name**.
4. (Optional) Enter a **Description**.
5. Select the **Un-monitored Linksets** that will belong to the Monitoring Group.

**Note:** Each linkset is listed by name and how many STC links and associations it has. The notation is: linksetname (STC=<n>,ASSOC=<n>)

For example,

s1cssg-lsto12551 (STC=2,ASSOC=0)

6. Click the **right arrow** to move the linkset(s) to the monitored linksets field.
7. Click the **Associations** Tab and select the un-monitored association(s).
8. Click the **right arrow** to move the selected association(s) to the monitored field.
9. Click the **Card Tab** and select the un-monitored card(s).
10. Click the **right arrow** to move the selected card(s) to the monitored field.
11. Click **Add**. The *Monitoring Group* is added to the list.

**Note:** For the changes to take effect, right-click on the Integrated Acquisition subsystem and select **Apply Changes** from the menu.

**Note:** You can assign both linksets and associations to a Monitoring Group when you are monitoring more than just SS7 linksets such as SigTran Links.

### Moving Linksets and Association Monitoring

This feature provides a shortcut for moving linksets, associations and cards from one Monitoring Group to another.

Complete these steps to move elements of one monitoring group to another Monitoring Group.

1. Select **Acquisition > Sites > subsystem > Integrated Acquisition**.
2. From the Actions column select **Move Linkset and Association Monitoring** (the icon on the right side of the column).
3. Click the **Tab (Linkset, Association, Card)** for the element that is to be moved.

**Note:** Default tab is Linkset.

This table describes the Move Linkset and Association Monitoring screen columns.

Column	Description
Selection	Provides a check box to select the linkset, association or card.
#	Shows the record number of element within the table.
Component (Linkset, Association, Cards)	Shows the name of the element.

Monitoring Group	Shows the monitoring groups in the system along with a radio button showing what monitoring group the element belongs to. <b>Note:</b> The network signaling element(s) will have the monitoring group radio button selected based on the current configuration.
------------------	---

Table 66: Move Linkset and Association Monitoring Screen

4. Select the **Element(s)** to be moved.
5. To choose the new Monitoring Group for the selected element(s), click on the **Radio Button** under the desired Monitoring Group heading.

**Note:** The list of available Monitoring Groups is based on what has been previously configured. It is therefore possible for the list of monitoring groups to be empty or only have a single Monitoring Group.

6. Click **Done**.
7. Repeat steps 3-6 for each element (Linkset, Association or Card) to be moved.  
For the changes to take effect, right-click on the subsystem and select **Apply Changes**.

### Modifying a Monitoring Group (Integrated Acquisition)

Complete these steps to modify a Monitoring Group.

1. Select **Acquisition > Sites > subsystem > Server > Monitoring Group**.
2. Select the **Monitoring Group** from the list.
3. Click **Modify**. The *Monitoring Group* screen opens.
4. Make the necessary **Modifications**.
5. Click **Modify**. For the changes to take effect, right-click on the Subsystem and select **Apply Changes**.

### Deleting a Monitoring Group (Integrated Acquisition)

Complete these steps to delete a monitoring group.

**Note:** To delete a Monitoring Group, the links assigned to that group have to be unassigned before the Monitoring Group can be deleted.

1. Select **Acquisition > Sites > subsystem > Server > Monitoring Group**.
2. Select the **Monitoring Group** that is to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The Monitoring Group is deleted. You need to **Synchronize** the Subsystem for the changes to take effect.

### About Associations (Integrated Acquisition)

Associations refer to SCTP associations within a SIGTRAN (SS7 over IP) network. An association provides the transport mechanism for the delivery of SCCP-User protocol data units and SUA layer peer messages. Associations are similar to a TCP connection, because they support multiple IP addresses at either or both ends (multi-homing). In addition, associations support multiple logical streams (multi-streaming) as well as provide sequenced delivery for user datagram within a single input stream.

### Adding an Association (Integrated Acquisition)

Complete these steps to add an association to a Monitoring Group.

1. Select **Acquisition > Sites > subsystem > Server > Monitoring Group** to open the Monitoring Group screen.
2. Click **Add** from the tool bar.

Alternative procedure: **Select Acquisition > Sites > subsystem. Right-click** on Monitoring Group and select Add.

3. Enter the **Group Name**.
4. (Optional) Type a **Description**.
5. Click the **Associations** tab. The *Associations* screen opens showing all un-monitored associations.
6. Select one or more **un-Monitored Associations**
7. Click the **right arrow** to place the Un-monitored associations to the Monitored Associations field.

**Note:** The bottom field (Un-monitored Linksets and Associations) shows those elements that are un-monitored but are part of the monitored linkset/Association. This list appears when a linkset is monitored but the Association is not (and vice versa). It is recommended that these related elements be monitored together so as to keep all linksets and Associations in the same group.

8. Select the **Cards** tab.
9. Select one or more **Cards** from the Un-monitored Cards section.
10. Click the **right arrow** to place the Un-monitored Cards to the Monitored Cards field.
11. Click **Add**. The monitoring group with associations is added to the list.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### **About Traffic Classifications (Probed Acquisition)**

A Traffic Classification on Probed Acquisition is similar to a Monitoring Group on an Integrated Acquisition because the settings made for a Traffic Classification are used by the Probed Acquisition to process the captured MSUs/PDUs received from the network. These captured MSUs/PDUs are forwarded to the Mediation for processing/storage. The forwarding is based on PDU Data Flow Configurations, filters on the Probed Acquisition and Dataflow Processing Configurations on Mediation.

A Traffic Classification on Probed Acquisition is similar to a Monitoring Group on an Integrated Acquisition in that a Traffic Classification is used by the Probed Acquisition to process the captured MSUs/PDUs received from the IP probe. A Traffic Classification is a filter-like construct that is applied on an IP probe (NIC). Each input stream (IP stream) selects a part of the traffic from one or more IP probes. The basic idea is that each IP stream splits the traffic into manageable partitions that are used by downstream applications hence the term "traffic classifications". These captured MSUs/PDUs are forwarded to the Mediation for processing/storage. The forwarding is based on PDU Data Flow Configurations, filters on the Probed Acquisition and Dataflow Processing Configurations on Mediation.

Performance Intelligence Center filters IP traffic on the protocols.

- TCP
- UDP
- ICMP
- SCTP
- RTP

### **About Chunk and Packet Forwarding**

Stream Control Transmission Protocol (SCTP) packets contain a common header and variable length blocks (chunks) of data. The SCTP packet structure is designed to offer the benefits of connection-

oriented data flow (sequential) with the variable packet size and the use of Internet protocol (IP) addressing.

A packet represents a whole IP packet. When at least one chunk in a packet matches the filter, then the whole IP packet is sent. When forwarding packets it is best to use IP raw filters.

A chunk represents a common format where contents can vary. In chunk forwarding, only the chunk that matches the filter is forwarded along with the IP and SCTP header.

**Note:** When collecting statistical information only packets provide accurate size information. If chunk forwarding is selected, only the chunk size is used so statistical information will not be accurate. Therefore, avoid the activation of the SCTP stats and all the other SigTran stats (M2PA, M2UA, M3UA & SUA) on the SigTran Mediation Protocol (IPTransport & SS7Transport) when using chunk forwarding.

### Listing a Traffic Classification (Probed Acquisition)

You can view the list of traffic classifications (Input streams) for a Probed Acquisition subsystem by selecting **Acquisition > Sites > subsystem > Probed Acquisition name > Servers > Application > Traffic Classifications**.

The Traffic Classification screen has a tool bar and table.

The tool bar enables you to manage (add, modify, delete, refresh and set privileges) as well as activate or deactivate one or more input streams.

The table provides this specific information:

Field	Description
Traffic Classification Name	An alphanumeric field 30 characters max. Name can contain underscores, spaces and hyphens. An example of a traffic classification name is: 1_Traffic Class-Gb.
Description	Text field 225 characters max.
Internet Protocol	Lists the protocols filtered by traffic classification (All or ICMP).
Transport Protocol	Lists the transport protocols filtered by traffic classification (All, SCTP, TCP, UDP)
Application Layer	Lists the application layer (GTP-C or GTP-U) used by the traffic classification.
Forwarding	Lists the forwarding constraints (packets alone or packets and counters) for filtering the stream
Policy	Lists what IDM (intelligent data monitoring) policy, if any, is used in the traffic classification.
Annotations	Text field that lists any annotations for the stream.
Status	NA
Owner	Lists what user has created the traffic classification.
Duplicate Suppression	Tells whether duplicate IP suppression is

	activated/deactivated
--	-----------------------

Table 67: Traffic Classification Fields

### Adding a Traffic Classification (Probed Acquisition)

Complete these steps to add a traffic classification (IP stream).

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Servers > Application > Traffic Classifications**.  
The *List* screen opens.
2. Click **Add** on the tool bar to open the wizard.
3. Enter the **Name** of the traffic classification.
4. (Optional) Enter a **Description**.
5. Select an **Internet Protocol** from the pull-down list.

**Note:** If ICMP is selected, no transport or application layers are utilized. Proceed to step 8.)

6. Select a **Transport Protocol** from the pull-down menu.

**Note:** If SCTP is selected, then all application layers are also selected by default (see step 7).

7. Select an **Application Layer** from the pull-down list.
8. Select a **Filter**.

**Note:** The list of filters presented is dependent upon the Transport Protocol selected.

9. Select the **Forwarding** method.

**Note:** If SCTP is selected as transport protocol, then the chunks or packets can be sent.

- If chunk is selected as the forwarding mechanism, then only matched chunks are sent (as well as the IP and SCTP header).
- If packet (IP Raw) is selected as the forwarding mechanism, then the whole IP packet is sent when at least one chunk in the packet matches the filter.

10. Select an **Association** to be associated with the TC.
  - a. If SCTP is selected, click **Association Selector** from the Association Selector tool bar.
  - b. Select one or more **Associations** from the Association Selector pop-up screen.
  - c. Click **Select** to add the associations to the traffic classification.

11. Click **Next** to open the probe assignment screen.
12. Select one or more **probes** from the available options field.
13. Click the **right arrow (>)** to move them to the selected options field.
14. Click **Next** to open the Annotation screen.
15. Enter an **Annotation**.
16. (Optional) Click **Add To List**.

The *annotation* is added to the Selected Annotations list.

**Note:** You can also select existing annotations by typing the first letter and select from the list that appears.

**Note:** To remove an annotation, select the annotation and click **Remove From List**.

17. Click **Create**. The traffic classification is added to the list.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

**Note:** To configure Duplicate IP Packets Suppression on a traffic classification Please refer Duplicate IP Packet Suppression Configuration

## Modifying Traffic Classifications

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Server > Application > Traffic Classifications**. The *List* screen opens.
2. Select the specific **Traffic Classification (IP Stream)**.
3. Click **Modify** from the tool bar.
4. Modify the appropriate **information** in the record.
5. Click **Modify** at the bottom of the screen.

**Note:** To activate/deactivate Duplicate IP Packets Suppression on a traffic classification Please refer Duplicate IP Packet Suppression Configuration

**Note:** You must **Apply Changes** to the Probed Acquisition subsystem for the changes to take effect.

## Deleting Traffic Classifications

Complete these steps to delete an IP Stream record from a Probed Acquisition Traffic Classification.

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application > Traffic Classifications**. The *List* screen opens.
2. Select the **Traffic Classification(s)** to be deleted.
3. Click **Delete** on the tool bar.
4. Click **OK** at the prompt. The *Traffic Classification(s)* is deleted from the list.

**Note:** You must **Apply Changes** to the Probed Acquisition subsystem for the changes to take effect.

## Start Capture Feature for a Traffic Classifications

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application > Traffic Classifications**. The List screen opens.
2. Select the **Ethereal Capture configuration** from the tool bar.
3. The List of active traffic classifications opens and gives current status of capture feature for each traffic classification.
4. Select the traffic classification(s) and click on **Start Ethereal Capture** button on the tool bar.
5. Click **OK** at the prompt.  
The **Capture Status** is: Capture is running on Probed Acquisition [**Probed Acquisition server name**] and pcap files will be available at */tekelec/capture/completed*
6. When capture is completed, upload the file in */tekelec/capture/completed* from Probed Acquisition server by using SSH access

**Note:** the changes takes effect without making an **Apply Changes**.

## Stop capture feature for a Traffic Classifications

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application > Traffic Classifications**. The List screen opens.
2. Select the **Ethereal Capture configuration** from the tool bar.
3. The List of active traffic classifications opens and gives current status of capture feature for each traffic classification.
4. Select the traffic classification(s) on which capture has been enabled and click on **Stop Ethereal Capture** button on the tool bar.
5. Click **OK** at the prompt.

The Capture Status is: Capture is not running on Probed Acquisition [**Probed Acquisition server name**] and pcap files will be available at */tekelec/capture/completed*

6. Upload the file in */tekelec/capture/completed* from Probed Acquisition server by using SSH access

**Note:** the changes takes effect without making an **Apply Changes**.

### Modify capture feature Parameters

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application > Traffic Classifications**. The List screen opens.
2. Select the **Ethereal Capture configuration** from the tool bar.
3. The List of active traffic classifications opens and gives current status of capture feature for each traffic classification.
4. Click on **Capture Parameters** button on the tool bar.

The capture parameters screen opens:

- **Capture File Location:** indicates the path where the completed captured are stored on Probed Acquisition (read only)
  - **File Size In MB:** size of the capture files in Mbytes, default: 10 (read/write)
  - **Auto Rollover:** enable or disable the auto rollover function. If enable, then continue the capture when **File Size In MB** has been reached by removing oldest file in a circular manner. By default, auto rollover function is disabled and the capture is stopped when **File Size In MB** has been reached.
5. Click **Update** to validate the changes.
  6. Click **Close**.

**Note:** Capture parameters have been modified and will be taken into account during subsequent startup of capture process.

### About PMIA (for Probed Acquisition Subsystems)

This option supports PMIA means Pattern Matching IP Algorithms (PMIA) configuration for Probed Acquisition.

For monitoring IP traffic, Centralized Configuration provides a traffic classification for each Acquisition (Probed Acquisition) server. Each Probed Acquisition server can be run in two modes either normal mode or expert mode.

In normal mode, you define IP Filters using Centralized Configuration and optionally can apply on traffic classification.

In expert mode, you browse the file which can be interpreted by Probed Acquisition server. While server running in expert mode, all predefined IP filters will be disabled for this server.

### Using Normal and Expert Mode (Probed Acquisition)

For each Probed Acquisition server, you have an option to switch from normal mode to expert mode and back from expert mode to normal mode. Complete these steps to switch between *normal* and *expert* modes.

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application > PMIA Configuration**. The PMIA screen opens.

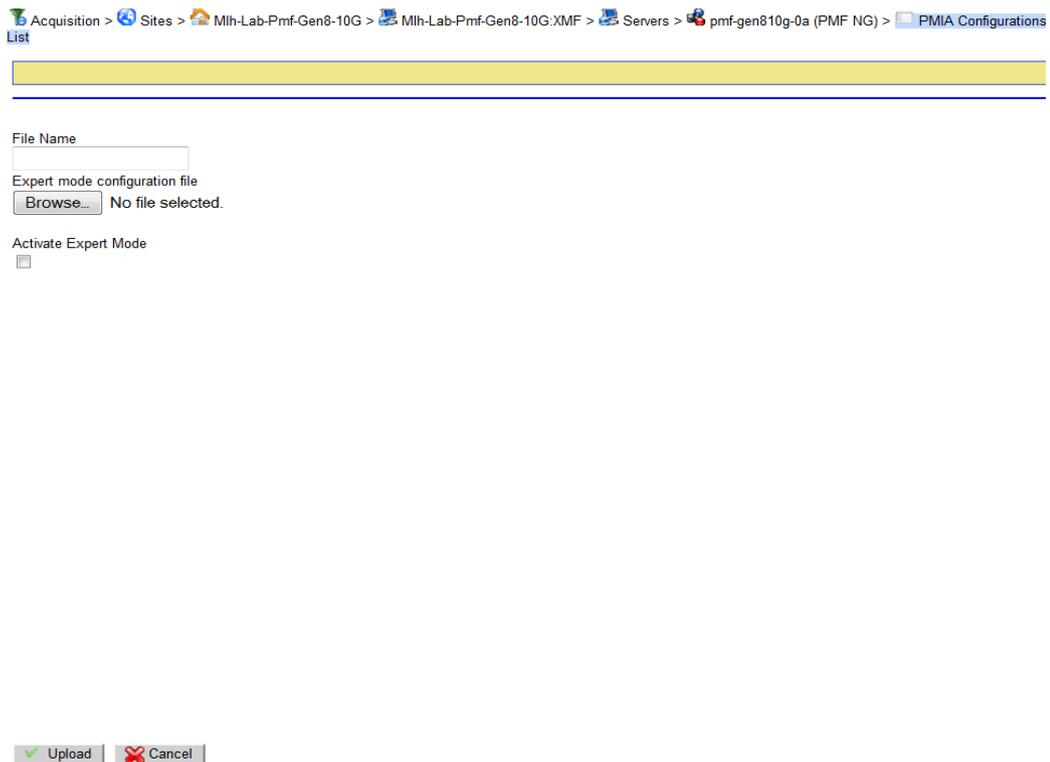

Figure 101: PMIA Screen

2. Enter the **File Name**.
3. Select the **Activate Expert Mode** field.

**Note:** Before using this option, consult with Tekelec personnel.

4. Browse the **File** that can be interpreted by Acquisition server.
5. Click **Upload** to upload the selected file and place the PMIA into expert status.

### PMIA (Probed Acquisition) Activating and De-activating a Configuration

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application >PMIA Configuration**. The *PMIA List* screen opens.
2. Select the **PMIA** to be converted.
3. Select **Modify**. The *Modify* screen opens.
4. Select the **Activate Expert Mode** field to de-activate the PMIA.
5. Click **Modify**. The *PMIA* is modified.

**Note:** You can use the alternate method by select the PMIA from the List, and clicking De-activate from the toolbar.

### Deleting a PMIA (in a Probed Acquisition Subsystem)

1. Select **Acquisition > Sites > subsystem > Probed Acquisition name > Application >PMIA Configuration**. The *PMIA List* screen opens.
2. Select the **PMIA** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The *PMIA* is deleted.

### About PDU Filters

The PDU dataflows that are configured in the acquisition perspective can have filters applied to them. These Filters provide a way to route selective data from an Acquisition subsystem to the Mediation subsystem.

The Filters are broadly categorized into four protocol types: SS7, IP, GPRS Gb and SIGTRAN protocols. These protocols provide greater efficiency in data analysis and manipulation. This is a list of protocols and their Filter types.

**Note:** There can be an unlimited number of Filters, but only one Filter can be associated with a dataflow at one time.

**Note:** The maximum size of any filter is 4000 bytes. If the Filter exceeds this constraint, an error message appears stating that the Filter has exceeded the size limit.

- GPRS Gb Protocol Filters
  - DLCI
  - SAPI
  - Combination
- IP Protocol Filters
  - IP Address
  - PORT
  - VLAN
  - SAPI
  - Raw filter
  - Combination
- SS7 Protocol Filters
  - SSN
  - PC
  - GT
  - RAW
  - Combination
- SigTran Protocol Filters
  - Association
  - SS7 Protocol
  - Data Chunk Payload Protocol Identifier
  - Raw filter
  - Combination
- SigTran SS7 Protocol Filters
  - Point Code (PC)
  - Service Information Octet (SIO)
  - Global Title Filter (GT)
  - Subsystem Number (SSN)

### Acquisition MSU and EMP Correspondance Values

This list provides the corresponding EMP message type with an Acquisition MSU type.

Acquisition MSU Type	EMP Message Type
2	LSSU
3	MTP2 LSL / HSL
5	SS7_Layer3
6	ISDN_Layer3
10	RAS
11	Q9331
12	H245
13	SIP
14	RTCP
40	SigTran_M3UA
41	SigTran_M2UA_MTP3
42	SigTran_M2PA_MTP3
43	SigTran_SUA

Acquisition MSU Type	EMP Message Type
60	MTP2a HSL
61	SS7_MTP3
69	SS7_MTP2A_LSSU
70	SS7_M2PA_MTP3_ANSI_NoSCTP_NoIP
71	SS7_M2UA_MTP3_ANSI_NoSCTP_NoIP
72	SS7_M3UA_NoSCTP_NoIP
73	SS7_SUA_NoSCTP_NoIP
74	SS7_M2PA_MTP3_ITU_NoSCTP_NoIP
75	SS7_M2UA_MTP3_ITU_NoSCTP_NoIP

Table 68: MSU and EMP coresspondance values

## About SS7 Subsystem Number (SSN) Filters

SSN Filters are designed to filter PDU data related to one or more subsystem numbers.

Figure 102: Add SSN Filter Screen

## About SS7 Filters

There are five types of SS7 Filters:

- SSN: Filters for data associated with one or more subsystem numbers
- Point Code: Filters for data with one or more point codes, or a point code range.
- Global Title: Filters for data associated with one or more full or partial phone numbers.
- Combination: Filters for data based on any combination of the other four SS7 Filter types.
- Raw: Free-format Filter that allows a user to configure filter criteria.

## Adding an SSN Filter

1. Select **Acquisition > PDU filters > SS7 > SSN filters**.
2. Click **Add** from the *right-click* menu.
3. (Optional) Enter a **Description**.
4. Enter in the **Filter Name**.
5. Select the **Call Type** (Called, Calling or Both)
6. Type in the **SSN** in the Enter SSN field.
7. Click **Add** to List.  
The SSN appears in the SSN List field.  
To add multiple SSN's to a filter, repeat steps 6-7.
8. Click **Create** to accept the values. The *SSN Filter* is added to the object tree.

## Add SSN Filter Field Descriptions

Field	Description
Filter Name	User assigned filter name. Clicking on this opens the Add / Modify SSN Filter screen.
Call Type	Indicates call direction it can be: <ul style="list-style-type: none"><li>• called</li><li>• calling</li><li>• both</li></ul>
Enter SSN	This field is for typing in a Sub System Number
Add to List	Clicking on this adds the SSN to the SSN List.
Remove from List	Clicking on this will remove the SSN from the SSN List.
Create	Clicking on this saves the information entered.

Table 69: Add SSN Filter Screen Fields

### Removing a SSN from an SSN Filter List

To remove an SSN from the *SSN List* list, complete these steps.

1. Select the **SSN** from the list
2. Click **Remove from List**. The SSN is deleted from the list.
3. Click **Create/Modify**.

### Modifying an SSN Filter

1. Select **Acquisition > PDU filters > SS7 filters > SSN** from the object tree.
2. Click **Modify** from the *right-click* menu. The *Modify* screen opens
3. Make the appropriate **Modifications**.
4. Click **Modify**. The changes are saved.

### Deleting an SSN Filter

**Note:** You cannot delete an SSN Filter if there are any Dataflows associated with it. You must first delete the Dataflow(s) and then delete the filter.

1. Select **Acquisition > PDU filters > SS7 filters > SSN** from the object tree.
2. Click **Delete** from the *right-click* menu.
3. Click **OK** at the prompt. The *Filter* is deleted.

**Note:** All the PDU Dataflows using this filter are affected by the change.

### About Global Title (GT) Filters

Global Title Filters specify data associated with one or more full or partial phone numbers.

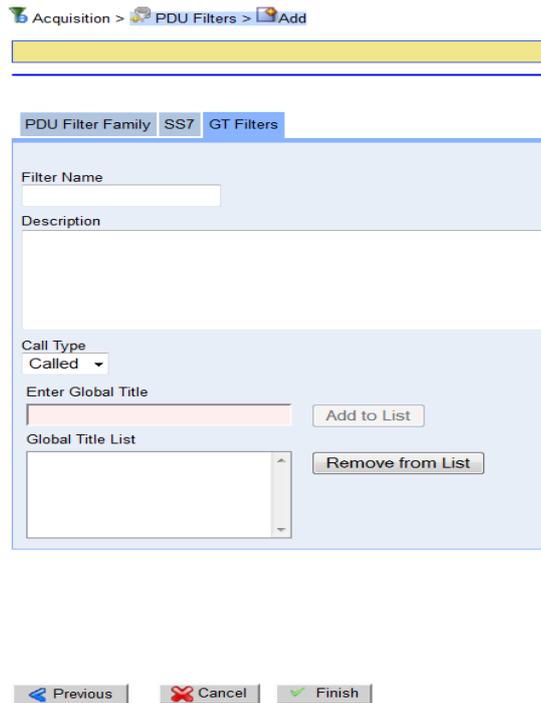

Figure 103: Global Title (GT) Filter

The table describes the fields on the Add Global Title Filter screen.

Field	Description
Filter Name	User assigned Global Title filter name.
Call Type	Indicates call direction. <ul style="list-style-type: none"> <li>• Calling: Global Title is associated with the party that made the call.</li> <li>• Called: Global Title is associated with the party that was called.</li> <li>• Both: Associates with both call and called</li> </ul>
Enter Global Title	Type in a numeric value, or a numeric value ending with * (wildcard).
Add to List button	Adds data entered in the Enter Global Title field to the Global Title list field.
Global Title List	Shows all of the Global Title values assigned to the same Global Title filter. Values can be added to or deleted from this list.
Remove from List button	Removes highlighted Global Titles from the Global Title List field. Multiple Global Titles can be removed at the same time.
Create button	Saves information entered.

Table 70: Add Global Title Filter Screen Fields

### Adding a GT Filter

Complete these steps to add a GT Filter.

1. Select **GT Filters** from the SS7 submenu.
2. Click **Add** from the submenu. The *Add Global Title Filter* screen opens.
3. Type in the **Filter Name**.
4. Select the **Call Type** from the drop-down menu (Called, Calling, Both).
5. Type in a **Global Title** name. (Or select one from an existing list by typing the first letter of the global title.)
6. Click **Add** to List. The title is added to the list.
7. Click **Create**. The title appears in the GT filter object-tree list in alphanumerical order.

**Note:** To add more than one title, repeat steps 5-7.

## Modifying a GT Filter

Complete these steps to modify GT Filter.

1. Select the **GT Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

## Deleting a GT Filter

Complete these steps to delete a GT Filter.

1. Select the **Resource ID Group** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *Filter* is deleted.

## About Point Code (PC) Filters

Point Code Filters specify data associated with one or more point codes or a point-code range. A point code is a unique SS7 address that identifies a SS7 signaling point. A point code has three segments. Each segment of the point code must contain a number between 0 and 255.

Figure 104: Point Code Filter Create/Modify Information Screen

The table describes the fields on the Point Code Filter Create/Modify Information screen.

Field	Description
PC Filter Name	User assigned name for the Point Code filter.
Description	Enter a description.
Type	Choices are: <ul style="list-style-type: none"> <li>• OPC.</li> <li>• DPC.</li> <li>• Both.</li> </ul>
Select Flavor From	Protocol / flavor of the point code for the specified point code or point code range.
Add to List	Clicking on this adds the Point Code to the Point Code List.
Remove from List	Clicking on this will remove the Point Code from the Point Code List.
Create	Saves filter information to the system.

Table 71: Point Code Filter Create/Modify Information Screen Fields

## Adding a PC Filter

Complete these steps to add a PC Filter.

1. Select **PC Filters** from the SS7 submenu.
2. Click **Add** from the pop-up menu. The *Add PC Filter* screen opens.

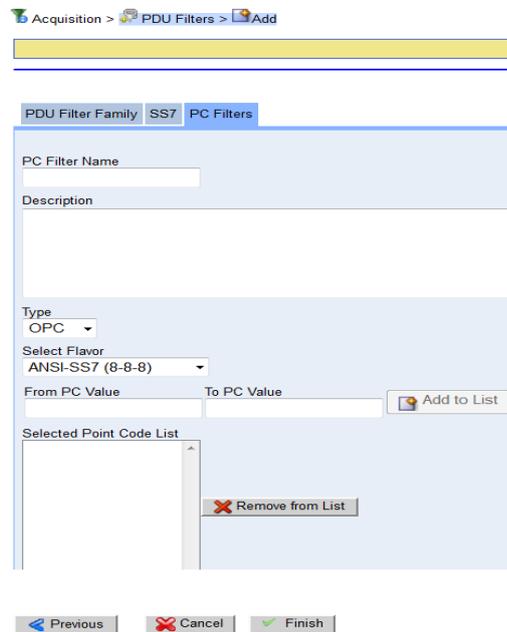

Figure 105: Add PC Filter Screen

3. Type in the **PC Filter Name**.
4. (Optional) Type in a **description** of the filter.
5. Select the **Type** of filter (OPC, DPC, Or Both).
6. Select the **Flavor** to be used.
7. Enter the **From PC Value**.
8. Select the **To PC Value**.
9. Click **Add** to List to add it to the Selected Point Code List.
10. Click **Create**. The *Point Code (PC) Filter* is added to the list in alphanumerical order.

## Removing a Point Code

Complete these steps to remove a point code.

1. Select the **Point Code record** that needs modification.
2. Select the **Point Code** from the list.
3. Click **Remove** from List. The *Point Code* is removed.
4. Click **Done** to save the changes.

## Modifying a Point Code Filter

Complete these steps to modify a Point Code filter.

1. Select the **Point Code** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

## Deleting a Point Code Filter

Complete these steps to delete a Point Code filter.

1. Select the **Resource ID Group** to be deleted.

2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The group is deleted.

### About Raw Filters

Raw Filters allow you to configure filtering criteria. Using this filter you can take advantage of filtering features not otherwise available from the GUI screen. Raw Filters use a free-format input in a 'where Clause' like string. This is done through a message match string with imbedded mnemonics.

In order to use the Raw Filter section of the GUI, you should know how to write 'where Clause' like strings, interpret mnemonics, and convert data into binary and hexadecimal format.

**WARNING:** If you do not know how to write 'whereClause' like strings, interpret mnemonics, and convert data into binary and hexadecimal format, do not attempt to use this GUI feature or you may experience unpredictable results.

### Syntax

The following syntax tree describes the 'whereClause' format of the input for Raw Filters.

whereClause:

lexpression

lexpression:

lprimary  
 lexpression or lexpression  
 lexpression and lexpression  
 not lexpression

lprimary:

expression comparator expression  
 expression between expression and expression  
 expression not between expression and expression  
 expression in ( valueList )  
 expression not in ( valueList )  
 expression in substitutionValueSet  
 expression not in substitutionValueSet  
 expression like string

expression not like string

comparator:

= < > <= >= <> !=

valueList:

constant  
 constant, valueList

expression:

term  
 term binaryOp expression  
 unaryOp expression  
 ( expression )

term:

constant

fieldSpecifier

constant:

decimalConstant (e.g., -89.7)  
integerConstant (e.g., -897)  
string (e.g., 'hello world')  
substitutionValue

substitutionValue:

%l.subTag (e.g., %l.aLong)  
%s.subTag (e.g., %s.aString)  
%f.subTag (e.g., %f.aFloat)

substitutionValueSet:

%L.subTag (e.g., %L.aLongSet)  
%S.subTag (e.g., %S.aStringSet)  
%F.subTag (e.g., %F.aFloatSet)

fieldSpecifier:

fldName (e.g., name)  
fldName [ unsignedValue ] (e.g., name[5])

binaryOp:

& >> <<  
|  
\* / %  
+ -

unaryOp:

+ -

**Mnemonics:** The Probed Acquisition subsystem has its own set of mnemonics that are used during Raw Filter creation. The mnemonics are used to specify what data you want to filter. The following table describes the mnemonics available for use with the Raw Filter Configuration page. Refer to this table for more information.

Field	Description	Value Entry Format
AIN_CALLED	Advanced Intelligent Network Called Number	Phone Number
AIN_CALLING	Advanced Intelligent Network Calling Number	Phone Number
AIN_CHARGE	Advanced Intelligent Network Charge Number	Phone Number
AIN_DIRECTORY	Advanced Intelligent Network Directory Number	Phone Number
AIN_MT	Advanced Intelligent Network Message	Hex
AIN_TRUNK_GROUP_ID	Advanced Intelligent Network Trunk Group Identifier	Hex
ANSI_BILLING	American National Standards Institute Billing ID	Decimal

MAP_VLR	GSM Mobile Application Part Visitor Location Registry Number	Phone Number
N00_ORIG_LATA	TR-533 Origination Local Access Transport Area	Phone Number
N00_ORIG_TYPE	TR-533 Originating Station Type	Hex
N00Q_CALLED	TR-533 Called Number	Phone Number
N00Q_CALLING	TR-533 Calling Number	Phone Number

Field	Description	Value Entry Format
N00Q_CARRIER	TR-533 Carrier ID	Phone Number
N00Q_ROUTING	TR-533 Routing Number	Phone Number
NETTST_MT	Network Test and Maintenance Message Type	Hex
OPC	Originating Point Code	Point Code
SCCP_CLD_ADDRESS	Signaling Connection Control Party Called Address	Phone Number
SCCP_CLD_IND	Signaling Connection Control Part Called Party Address Indicator	Decimal
SCCP_CLG_ADDRESS	Signaling Connection Control Part Calling Party Address	Phone Number
SCCP_CLG_IND_OCT	Signaling Connection Control Part Calling Party Address Indicator Octet	Decimal
SCCP_CLG_PC	Signaling Connection Control Part Calling Party Point Code	Point Code
SCCP_CLG_SSN	Signaling Connection Control Part Calling Party Subsystem Number	Decimal
SCCP_DLR	Signaling Connection Control Part Destination Local Reference	Hex
SCCP_GTI	Signaling Connection Control Part Global Title Indicator	Decimal
SCCP_MT	Signaling Connection Control Part Message Type	Hex
SCCP_RET_CAUSE	Signaling Connection Control Part Return Cause	Hex
SCCP_RTE_IND	Signaling Connection Control Part Routing Indicator	Decimal
SCCP_SLR	Signaling Connection Control Part Source Local Reference	Hex
SCCP_SSN	Signaling Connection Control Part Called Party Subsystem Number	Decimal
SCCP_SSN_TT	Signaling Connection Control Part Called Party Subsystem Number (if not equal to zero) or Translation Type	Decimal
SCCP_TT	Signaling Connection Control Part Translation Type	Decimal
SCCPM_MT	Signaling Connection Control Part Message Type	Hex
SI	Message Transfer Part Level Three Service Indicator	Decimal
SIGNET_CPC	Signaling Network Concerned Point Code	Point Code
SIGNET_CSLC	Signaling Network Concerned Signaling Link Code	Decimal
SIGNET_MT	Signaling Network Message Type	Hex
SLS	ISUP/TUP Signaling Link Selection	Decimal
TCAP_1ST_PARAM	Transaction Capabilities 1st Application Level Parameter within the Component portion of the TCAP message	Hex
TCAP_ABORT_CAUSE	Transaction Capabilities Application Part Abort Cause	Hex
TCAP_COMP_MT	Transaction Capabilities Application Part Component Type	Hex
TCAP_DEST_TID	Transaction Capabilities Application Part Destination transaction ID	Reverse Hex
TCAP_ERROR	Transaction Capabilities Application Part Error	Hex

Field	Description	Value Entry Format
	Code	
TCAP_FLAVOR	ITU Standard =3, ANSI Standard=7	Decimal
TCAP_INVOKE_ID	Transaction Capabilities Application Part Invoke ID	Decimal
TCAP_MT	Transaction Capabilities Application Part Transaction/Package Type	Hex
TCAP_OPER	Transaction Capabilities Application Part Operation Code	Hex
TCAP_ORIG_TID	Transaction Capabilities Application Part Originating Transaction ID	Reverse Hex
TUP_CALL_CAT	Telephone User Part Calling Party's Category	Decimal
TUP_CALLED	Telephone User Part Called Number	Phone Number
TUP_CALLING	Telephone User Part Calling Number	Phone Number
TUP_CIC	Telephone User Part Circuit Identification Code	Decimal
TUP_INTERNATL	Telephone User Part International Indicator	Decimal
TUP_INTERWRK	Telephone User Part Interworking Indicator	Decimal
TUP_MT	Telephone User Part Message Type	Hex
TUP_REL_CAUSE	Telephone User Part Release Cause	Decimal

Table 72: Raw Filter Configuration Mnemonics

### Raw Filter Value Entry Formats

Raw filtering is not a direct input operation. When you set up a Raw Filter, you must translate the data you are filtering for into a format the Probed Acquisition subsystem can understand. Each Raw Filter value entry category has its own formatting rules. There are seven categories:

- Phone Number
- Point Code
- Decimal
- Reverse Decimal
- Hex
- Reverse Hex
- Text String

### Phone Number

The Probed Acquisition subsystem uses Telephony Binary Coded Decimal (TBCD) encoding for phone numbers. This means that phone numbers are encoded from right to left and top to bottom. If you want to search for a phone number, the user must filter for the number in this format. For example, if you want to search for the phone number string 1234 then you must input 0x2143.

- 0x: Indicator that what follows is a hexadecimal indicator.
- 2143: Phone number string 1234 in top-bottom, left-right format.

For odd numbers, such as 123-4567, an extra zero must be added to the string in order to account for the zero filler digit in the Octet. So the proper format is: 0x21436507.

- 0x: Indicator that what follows is a hexadecimal indicator.
- 214365: Phone number string 123456 in top-bottom, left-right format.
- 07: Phone number string 70 in top-bottom, left-right format, with extra zero to account for zero filler digit.

## Point Code

Point codes need to be translated into the appropriate binary format, then converted to a hex number, or the decimal equivalent of the hex number.

### MTP3

Unlike most point codes, MTP3 point codes are translated into binary format starting with the first number and working toward the last number. Once each point code segment is translated into the appropriate binary format, each binary number must be translated into either a hexadecimal number or its decimal equivalent. The Probed Acquisition subsystem deals with two different Octet patterns.

### ANSI

ANSI point codes are divided into three consecutive 8-bit binary Octets. So, point code 7-200-6 should be translated into:

- 7 in 8-bit: 00000111.
- 200 in 8-bit: 11001000.
- 6 in 8-bit: 00000110.

Next, use a scientific calculator to determine the hexadecimal of each number, or the decimal equivalent. For 7-200-6 this would equal:

- Hexadecimal: 07C806.
- Decimal: 509958.

So to build a raw filter for the MTP3 point code in ANSI you would use Relevant\_mnemonic = 509958.

### ITU

ITU point codes are divided into three segments. The first is 3-bit binary. The second is 8-bit binary. The last segment is 3-bit binary. So, point code 7-200-6 should be translated into:

- 7 in 3-bit: 111
- 200 in 8-bit: 11001000
- 6 in 3-bit: 110

Next, use a scientific calculator to determine the hexadecimal of each number, or the decimal equivalent. For 7-200-6 this would equal:

- Hexadecimal: 3E46
- Decimal: 15942

So to build a raw filter for the point code in ITU you would use Relevant\_mnemonic = 15942

### Non MTP3

For all point codes other than MTP3, the point code values need to be translated in 'reverse' order. For example, point code 7-200-6, should be translated into binary starting with 6 in 3-bit, 200 in 8-bit, and 7 in 3-bit.

### ANSI

ANSI is divided into three consecutive 8-bit binary Octets. So, point code 7-200-6 should be translated into:

- 6 in 8-bit: 00000110
- 200 in 8-bit: 11001000
- 7 in 8-bit: 00000111

Next, use a scientific calculator to determine the hexadecimal of each number, or the decimal equivalent. For 7-200-6 this would equal:

- Hexadecimal: 06C807
- Decimal: 444423

So to build a raw filter for the point code in ANSI you would use Relevant\_mnemonic = 444423

## ITU

ITU is divided into three Octets. The first is 3-bit binary. The second is 8-bit binary. The last Octet is 3-bit binary. So, point code 7-200-6 should be translated into:

- 6 in 3-bit: 110
- 200 in 8-bit: 11001000
- 7 in 3-bit: 111

Next, use a scientific calculator to determine the hexadecimal of each number, or the decimal equivalent. For 7-200-6 this would equal:

- Hexadecimal: 3647
- Decimal: 13895

So to build a raw filter for the point code in ITU you would use Relevant\_mnemonic = 13895

## Decimal

This is the only data type which is entered directly. To build a raw filter for a decimal type mnemonic for the value 584, you would enter Relevant\_mnemonic = 584.

## Reverse Decimal

A Reverse Decimal must first be converted into to a hex number, then the Octets must be reversed. You can use a scientific calculator to determine the hex equivalent of any decimal. For example, a value of 61873 would be:

- Hex: f1b1.
- Reversed to: b1f1

So to build a raw filter for a reverse decimal type mnemonic you would use Relevant\_mnemonic = 0xb1f1.

## Hex

Hex values are entered with a leading 0x to indicate hex. For example, a value of 842ea35c would be entered as

- 0x: Indicator that what follows is a hexadecimal indicator
- 842ea35c: Hex number

So to build a raw filter for a hex type mnemonic you would use Relevant\_mnemonic = 0x842ea35c.

## Reverse Hex

These are entered the same as Hex numbers above, except the Octets are reversed. For example, a value of 842ea35c would be entered as

- 0x: Indicator that what follows is a hexadecimal indicator
- 5ca32e84: Hex number with Octets reversed

So to build a raw filter for a reverse hex type mnemonic you would use Relevant\_mnemonic = 0x5ca32e84

## Text String

Text String is a series of successive ASCII characters. Please consult a standard ASCII character-code mapping table for the correct values. For example, to build a raw filter for the Text String "My Example" you would use Relevant\_mnemonic = 0x4d79204578616d706c65.

## Example of a SCCP Raw Filter

Shown here is an example of an SCCP protocol Raw Filter that can be created using the raw filter page.

Protocol	Raw Filter Value
MAP	(TCAP_FLAVOR=3)
IS41	((TCAP_FLAVOR=7) and (TCAP_1ST_PARAM !=97))
INAP	((TCAP_FLAVOR=3) and (SCCP_SSN=241))
CAMEL	((TCAP_FLAVOR=3) and ((SCCP_SSN=5) or (SCCP_SSN=146)))

Table 73: SCCP raw filter example

The figure below shows the *Add Raw Filter* screen

Figure 106: Add Raw Filter Screen

The following table describes the fields on the *Add Raw Filter* screen.

Field	Description
Filter Name	User defined name for filter.
Description	Enables you to add a description of the filter for added information.
Filter Flavour	Protocol / Flavour of the raw filter.
Filter Expression	Allows a user to enter data that will create a new filter. The data must be in syntax supported by the current Probed Acquisition release. When the Accept button is clicked, the information in the Filter Expression window becomes the new Raw filter.
Create button	Creates or modifies filter based on the information shown in the Filter Expression field.

Table 74: Add Raw Filter Screen Fields

### Adding a Raw Filter

Complete these steps to add a RAW filter.

1. Select **RAW Filters** from the SS7 submenu.
2. Click **Add** from the submenu. The *Add RAW Filter* screen opens.
3. Type in the **Filter Name**.
4. Select a **Filter Flavor** from the pull-down menu.
5. Type in a **Filter Expression**.
6. Click **Accept**. The filter is added to the RAW filter object tree in alphanumeric order.

### Modifying Raw Filters

1. Select the **RAW Filter** to be modified.
2. Select **Modify** from the menu.
3. Make the necessary **modifications**.
4. Click **Modify**. The filter is modified

### Deleting a Raw Filter

Complete these steps to delete a Raw filter.

1. Select the **RAW Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The filter is deleted.

### About Combination Filters

Combination filters are for data based on any combination of the other four SS7 filter types.

**Note:** The maximum size of any filter is 4000 bytes. If the Filter exceeds this constraint, an error message appears stating that the filter has exceeded the size limit.

Acquisition > PDU Filters > Add

PDU Filter Family SS7 Combination Filters

Filter Name

Description

Filter Expression \* Filters List Logical Operators

Previous Cancel Finish

Figure 107: Add Combination Filter Screen

The table describes the fields on the *Combination Filter Create/Modify* Information screen.

Field	Description
Filter Name	User-defined name for filter.
Description	Provides pertinent information about the filter.
Filter Expression	Provides a view of the combination filter value as it is created. Selected filters and logical operators appear in this window. When the Accept button is clicked, the information in the Filter Expression window becomes the new Combination filter.
Left arrow button	Moves highlighted filter into Filter Expression box.
Filters List	List of existing filters a user can combine.
And button	Data must match all filters tied together with this operation.
Or button	Data can match both or any one of the filters tied together by this operation.
Not button	Data must match the first filter, but cannot match the second filter tied together by this operation.
Create button	Saves information entered.

Table 75: Add / Modify Combination Filter Screen Fields

### Adding an SS7 Combination PDU Filter

Complete these steps to add a combination filter.

**Note:** The maximum size of any filter is 4000 bytes. If the Filter exceeds this constraint, an error message appears stating that the filter has exceeded the size limit.

1. Select **Acquisition > PDU Filters**.
2. Click **Add** from the PDU Filter tool bar.
3. From the PDU Filter Family tab, select **SS7 - Signaling System 7**.
4. Click **Next**.
5. From the SS7 tab, select **Combination - Combination Filter**.
6. Click **Next**.
7. Type in the **Filter Name**.
8. (Optional) Type in a **Description**.
9. Click **Select** to select a Filter Expression.
10. Click the appropriate **Logical Operator** for the **Filters List** (And, Or, Not).
11. Click **Finish**. The Combination filter is appears in the Combination Filters object tree in alphanumerical order.

### Modifying a Combination PDU Filter

Complete these steps to modify a combination filter.

1. Select the **Combination Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

### Deleting a Combination PDU Filter

Complete these steps to delete a combination filter.

1. Select the **Combination Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The filter is deleted.

## About GPRS Gb Filters (Probed Acquisition)

The General Packet Radio Service (GPRS) Gb Filters option allows you to define the three types of filters in this type of protocol. The three types of filters are:

- Data Link Collection Identifier (DLCI) filters
- Service Access Point Identifier (SAPI) filters
- Combination filters

Centralized Configuration provides a separate wizard to configure each of these Filters in this protocol.

You must provide a list of Data Link Collection Identifier DLCI values to filter at the Dataflow level. The DLCI is a field in the Frame Relay header in the GPRS Gb packet.

Figure 108: Add Gb DLCI Filter Screen

This table describes the fields in the DLCI filter screen.

Field	Description
Filter Name	User assigned name for the DLCI Filter.
Description (Optional)	Provides a description of the DLCI filter
Selected DLCI numbers	Drop-down menu to Include or Exclude a range of DLCI numbers.
Enter DLCI number or range	Type in either a single DLCI number or a range of DLCI numbers.
Add to list button	Adds the information entered DLCI number or range to the DLCI List.
DLCI List	Contains all of the user-specified DLCI numbers and/or ranges of DLCI numbers. You can add multiple DLCI numbers and/or ranges to this list, or remove DLCI numbers and/or ranges from the list. All DLCI numbers and/or ranges in this list at the time of the filter

Field	Description
	creation will be used to filter data.
Remove from list button	Deletes DLCI numbers and/or DLCI number ranges, from the DLCI List field.
Create / Reset / Cancel	<ul style="list-style-type: none"> <li>• Create: Creates and saves the DLCI Filter information.</li> <li>• Reset: Changes back to the original DLCI filter settings.</li> <li>• Cancel: No information is saved for this filter.</li> </ul>

Table 76: Add DLCI Filter Screen Fields

### Adding a Gb DLCI Filter

To add a Gb DLCI Filter, complete these steps.

1. Select **DLCI Filters** from the GB submenu.
  2. Click **Add** from the submenu.
- The Gb DLCI Filter screen opens.

**Note:** You must provide a list of Data Link Collection Identifier DLCI values to filter at the Dataflow level. The DLCI is a field in the Frame Relay header in the GPRS Gb packet.

Figure 109: Gb DLCI Filter Screen

This table describes the fields in the DLCI Filter screen.

Field	Description
Filter Name	User assigned name for the DLCI Filter.
Description (Optional)	Provides a description of the DLCI filter
Selected DLCI numbers	Drop-down menu to Include or Exclude a range of DLCI numbers.
Enter DLCI number or range	Type in either a single DLCI number or a range of DLCI numbers.

Add to list button	Adds the information entered DLCI number or range to the DLCI List.
DLCI List	Contains all of the user-specified DLCI numbers and/or ranges of DLCI numbers. You can add multiple DLCI numbers and/or ranges to this list, or remove DLCI numbers and/or ranges from the list. All DLCI numbers and/or ranges in this list at the time of the filter creation will be used to filter data.
Remove from list button	Deletes DLCI numbers and/or DLCI number ranges, from the DLCI List field.
Create / Reset / Cancel	<ul style="list-style-type: none"> <li>• Create: Creates and saves the DLCI Filter information.</li> <li>• Reset: Changes back to the original DLCI filter settings.</li> <li>• Cancel: No information is saved for this filter.</li> </ul>

Table 77: Add DLCI Filter Screen Fields

3. Type in the **Filter Name**.
4. Select a **DLCI Number Function** from the pull-down menu.
5. Type in an **DLCI Number** or **Number Range**.
6. Click **Add**. The *number* or *range* appears in the ID List field.
7. (Optional) Type in a **Description** of the DLCI filter.
8. Click **Create**.

The *filter* is added to the GB DLCI filter object tree in alphanumerical order.

#### Removing a number or number range from the List

To remove a DLCI number or number range, complete these steps.

1. Select the **DLCI Record** that needs modification.
2. Click **Edit**.
3. Select the **Number** or **Range** from the DLCI number list.
4. Click **Remove**. The *number* or *range* is removed.
5. Click **Done** to save the changes.

#### Modifying a Gb DLCI filter Record

Complete these steps to modify a Gb DLCI filter.

1. Select the **Gb DLCI Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

#### Deleting a Gb DLCI Filter

Complete these steps to delete a Gb DLCI filter.

1. Select the **Gb DLCI Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

#### Adding a Gb SAPI Filter (Probed Acquisition)

Complete these steps to add a Gb SAPI filter.

1. Select **Acquisition > PDU Filters** from the object menu.  
The *PDU Filters* list screen opens.
2. Click **Add** on the tool bar. The *PDU Filter Family* tab appears.
3. Select **GPRS** from the list.
4. Click **Next**. The *Gb* tab appears.
5. Select **SAPI Filter** from the list.
6. Click **Next**. The *SAPI Filters* tab appears.

This table describes the fields in the Gb SAPI filter screen.

Field	Description
Filter Name	User assigned name for the SAPI Filter.
Description (Optional)	Provides a description of the SAPI filter
Selected SAPI numbers	Drop-down menu with options to Include or Exclude a range of SAPI numbers. (More than one) <b>Note:</b> The range of SAPI numbers is 0-15.
SAPI filter	Radio button to select a SAPI filter.
No SAPI filter	Radio button to select if there is no SAPI filter.
Add to List	After typing in a number, click this button to add the SAPI number to the List field.
Remove from List	Select a number from the List field and click this button to remove the number from the List field.
Previous / Finish / Cancel (Not shown)	<ul style="list-style-type: none"> <li>• Finish: Creates and saves the SAPI Filter information.</li> <li>• Previous: Takes you back to the previous screen.</li> <li>• Cancel: No information is saved for this filter.</li> </ul>

Table 78: Add Gb SAPI Filter Screen Fields

7. Type in the **Filter Name**.
8. (Optional) Enter the **Description**.
9. Select a **SAPI Number Function** from the pull-down menu.
10. Select to use or not use a **SAPI Filter**.
11. (Optional) If SAPI filter is selected, type in **SAPI Numbers**, (one at a time) and click **Add** to list.

**Note:** Range is 0-15.

**Note:** To remove SAPI numbers, select number(s) in the List field and click **Remove from List**.

12. Click **Finish**. The *filter* is added to the PDU filter list screen.

### Modifying a Gb DLCI filter Record

Complete these steps to modify a Gb DLCI filter.

1. Select the **Gb DLCI Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a Gb DLCI Filter

Complete these steps to delete a Gb SAPI filter.

1. Select the **Gb SAPI Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

### Adding a GPRS Combination PDU Filter

Complete these steps to add a combination filter.

**Note:** The maximum size of any filter is 4000 bytes. If the filter exceeds this constraint, an error message appears stating that the filter has exceeded the size limit.

1. Select **Acquisition > PDU Filters**.
2. Click **Add** from the PDU Filters tool bar.
3. From the PDU Filter Family tab, select **GPRS - General Packet Radio Service**.

4. Click **Next**.
5. From the GB tab, select **Combination - Combination Filter**.
6. Click **Next**.
7. Type in the **Filter Name**.
8. (Optional) Type in a **Description**.
9. Click **Select** to select a Filter Expression.
10. Click the appropriate **Logical Operator** for the **Filters List** (And, Or, Not).
11. Click **Finish**. The *GPRS Combination Filter* appears in the *Combination Filters object tree* in alphanumerical order.

### Modifying a Gb Combination PDU Filter

Complete these steps to modify a Gb Combination filter.

1. Select the **Gb Combination Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a Gb Combination PDU Filter

Complete these steps to delete a Gb Combination PDU filter.

1. Select the **Gb Combination PDU Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The filter is deleted.

### About IP PDU Filters

IP Filters are used to filter based on IP addresses. IP filters allow you to limit the data forwarded by a dataflow to the IP addresses included in the Filter. There are five types of IP Filters:

- IP address Filters - Filters based on its IP Address
- Port Filters - Filters based on the port numbers (Probed Acquisition only). When creating a Port Filter, you should include only those port numbers you want to obtain information about. This will filter out all Port numbers not included in your Filter.

**Note:** The range for port numbers is 1-65535. You have the option of selecting all, even, odd ports within a specified range. Port Filters have the ability to combine any overlap of ranges.

**Note:** There is a limitation of 20 entries for a port filter. An individual port number or a range are counted as one entry.

- VLAN filters - Filters
- SAPI filters - Filters based on the stream control transmission protocol numbers
- Raw filter - allow to create filters using filter string syntax and without GUI assistance (see [Appendix G: PMIA filter syntax](#))
- Combination filters - Filters based on a combination of one or more of the other filters

### About IP Address Filters

IP Address Filters allow you to filter for IP addresses. When you create an IP Filter, you should include the IP addresses you want information about. This will filter out all IP addresses not included in your Filter. To create filters that filter out specific IP addresses only, you must use Combination Filters.

The add IP Filter screen is used for adding IP address Filters.

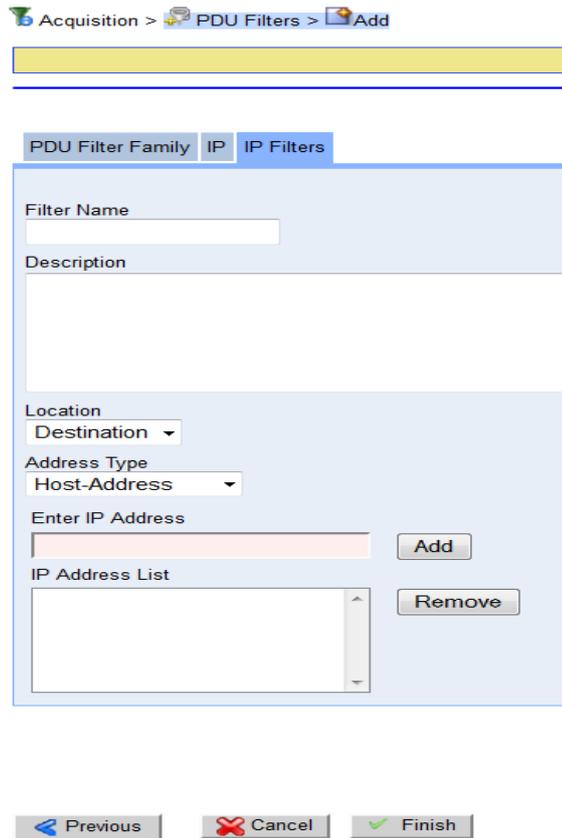

Figure 110: Add IP Address Filter Screen

Field	Description
Filter Name	User assigned name of filter. The filter name is used to identify the filter when setting up dataflows or combination filters.
Description	(Optional) Enables you to add information about the filter.
Location	Select one of the following from the drop-down menu: <ul style="list-style-type: none"> <li>• Destination: Outgoing IP ports.</li> <li>• Source: Incoming IP ports.</li> </ul>
Enter IP Address	Where you can add a valid IP address.
Add button	Adds the IP address to the IP Address List.
IP Address List	Shows the IP addresses that the filter uses.
Create button	Create: Creates and saves the Port Filter information.

Table 79: Add / Modify Port Filter Screen Fields

### Adding an IP Address PDU Filter

Complete these steps to add an IP Address.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filter* list screen opens.
2. Click **Add** from the tool bar. The *PDU Filter Family* screen opens.
3. Select **IP - Internet Protocol**. The *IP* tab opens.
4. Select **IP Address Filter**. The *IP Filters* screen opens.

The screenshot shows a web form for configuring IP filters. It has a light blue background. At the top, there is a 'Filter Name' text input field. Below it is a 'Description' text area. The 'Location' section has a dropdown menu currently set to 'Destination'. The 'Address Type' section has a dropdown menu currently set to 'Host-Address'. Below these is an 'Enter IP Address' text input field with a pink border, followed by an 'Add' button. At the bottom is an 'IP Address List' text area with a vertical scrollbar, followed by a 'Remove' button.

Figure 111: IP Filters Screen

Field	Description
Filter Name	User assigned name of filter. The filter name is used to identify the filter when setting up dataflows or combination filters.
Description	(Optional) Enables you to add information about the filter.
Location	Select one of the following from the drop-down menu: <ul style="list-style-type: none"> <li>Destination: Outgoing IP ports.</li> <li>Source: Incoming IP ports.</li> </ul>
Address Type	Select one of the following from the drop-down menu <ul style="list-style-type: none"> <li>Host-Address : Specific address of a host</li> <li>Network-Address: An address of a network</li> </ul>
Enter IP Address	Where you can add a valid IP address.
Add button	Adds the IP address to the IP Address List.
Remove button	Removes the IP address from the list.
IP Address List	Shows the IP addresses that the filter uses.
Finish button (Not shown)	Creates and saves the Port Filter information.
Previous button (Not shown)	Takes you back to the previous (IP)screen
Cancel button (Not shown)	Cancels the procedure with no information saved.

Table 80: IP Filter Screen Fields

5. Type in the **Filter Name**.
6. (Optional) Type in a **Description** of the IP Address.
7. Select a **Location** from the pull-down menu.
8. Select the **Address Type** from the *pull-down* menu.
9. Type in an **IP Address** in the *Enter IP Address* field.
10. Click **Add** to add the port to the *Port List*.
11. Click **Finish**. The *filter* is added to the IP Address filter object tree in alphanumerical order.

### Removing an IP Address from the List

To remove an IP Address, Complete these steps.

1. Select the **IP Address Record** that needs modification.
2. Click **Edit**.
3. Select the **IP Address** from the *IP Address List*.
4. Click **Remove**. The *IP Address* is removed.

5. Click **Done** to save the changes.

### Modifying an IP Address filter Record

Complete these steps to modify an IP Address filter.

1. Select the **IP Address Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**.
5. The *changes* are saved.

### Deleting a IP Address Filter

Complete these steps to delete a IP Address filter.

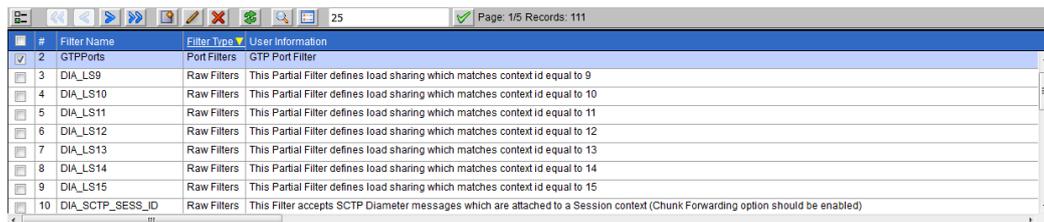

1. Select the **IP Address Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The filter is deleted.

### About IP Port Filters

IP Port Filters provide a means of filtering through specific ports (all, odd or even). This helps in distributing traffic to the system.

### Listing IP Port Filters to Show Default GTP Port Filter

There is a default GTP Port Filter provided in the IP Port Filters list screen shown in the figure below.

#	Filter Name	Filter Type	User Information
2	GTPPorts	Port Filters	GTP Port Filter
3	DIA_LS9	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 9
4	DIA_LS10	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 10
5	DIA_LS11	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 11
6	DIA_LS12	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 12
7	DIA_LS13	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 13
8	DIA_LS14	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 14
9	DIA_LS15	Raw Filters	This Partial Filter defines load sharing which matches context id equal to 15
10	DIA_SCTP_SESS_ID	Raw Filters	This Filter accepts SCTP Diameter messages which are attached to a Session context (Chunk Forwarding option should be enabled)

Figure 112: IP Port Filter Screen With GTP Port Filter Default

This Filter comes with three default GTP ports. They are:

- 2123
- 2152
- 3386

There may be network configurations that use more GTP Port Filters or different GTP Filters than the defaults provided. In this case you can modify the default Filter by completing the steps described in [Modifying a Port Record](#) and [Removing a Port from the List](#).

### Removing a Port from the List

To remove a Port, Complete these steps.

1. Select the **Port Record** that needs modification.
2. Click **Edit**.
3. Select the **Port** from the *Port List*.
4. Click **Remove**. The *Port* is removed.
5. Click **Done** to save the changes.

### Adding IP Port PDU Filters

Complete these steps to add a Port filter.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filter* list screen opens.

2. Click **Add** from the tool bar. The *PDU Filter Family* screen opens.
3. Select **IP Filters**.
4. Click **Next**. The IP screen opens.
5. Select **PORT - IP Port Filter**. The *Port Filters* screen opens.

Figure 113: Add Port Filter Screen

This table describes the fields on the Add Port Filter screen.

Field	Description
Filter Name	User assigned name of filter. The filter name is used to identify the filter when setting up dataflows or combination filters.
Description	Enter pertinent information for this filter.
Location	Select one of the following from the drop-down menu: <ul style="list-style-type: none"> <li>• Destination: Outgoing IP ports.</li> <li>• Source: Incoming IP ports.</li> </ul>
Selected ports	This is a drop-down menu option with the following selections: <ul style="list-style-type: none"> <li>• Even: All even port numbers.</li> <li>• Odd: All odd port numbers.</li> <li>• All: Both odd and even port numbers.</li> </ul>
Enter Port or Port range	Allows you to enter individual port numbers or a range of port numbers to be monitored.
Add	Adds the number typed in the Enter Port box to the Port List box.
Port List	Shows all of the chosen Ports being filtered.
Remove	Deletes highlighted values from the Port List box. Multiple entries can be removed at the same time.
Finish button (Not Shown)	Saves the Port Filter information to the system.

Table 81: Port Filter Screen Fields

6. Type in the **Filter Name**.

7. (Optional) Enter a **Description**.
8. Select a **Location** from the *pull-down* menu.
9. Select a **Port** from the *Selected Ports pull-down* menu.
10. Type in a **Port** in the *Enter Port field*.
11. Click *Add* to add the port to the *Port List*.
12. Click **Finish**.

### Modifying a Port Record

Complete these steps to modify a Port filter.

1. Select the **Port Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a Port Filter

Complete these steps to delete a port filter.

1. Select the **Port Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

### About IP VLAN PDU Filters

VLAN filtering is a user-defined filter based on VLAN ID in the Ethernet layer. It allows a user to filter IP packets of a matching VLAN tag in the Ethernet layer.

A list of up to 10 VLANs can be identified and entered during configuration. If a VLAN list is empty, then no filtering is applied for VLAN.

If the traffic is using 802.1Q VLAN tagging, then you must use a VLAN filter to pass the traffic through to an IP dataflow. This can be done using a combination filter. Conversely, if a VLAN filter is used to filter a dataflow, then any traffic that does not use VLAN tagging will not pass through the dataflow.

### Adding an IP VLAN PDU Filter

Complete these steps to add an IP VLAN filter.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Next**. PDU Filter Family screen opens.
3. Select **IP - Internet Protocol**
4. Click **Next**. The IP screen opens.
5. Select **VLAN Filter**.
6. Click **Next**. The *VLAN Filters* screen opens.

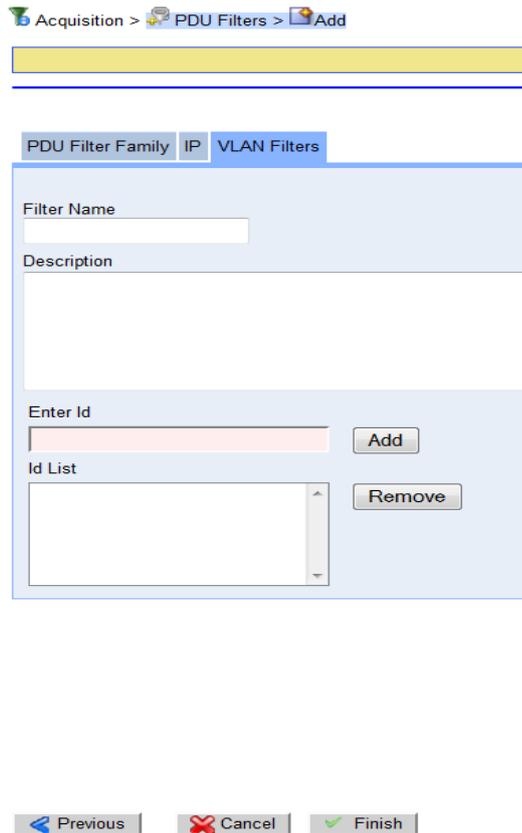

Figure 114: Add IP VLAN Filter Screen

The table describes the fields on this screen.

Field	Description
Filter Name	User-defined name for filter.
Enter Id	Type in the VLAN Id.
Add	Adds the Id information entered to the ID List.
ID List	Moves highlighted filter into Filter Expression box.
Remove	Data must match all filters tied together with this operation.
Finish button	Saves filter settings based on the information shown in the Filter Expression field.

Table 82: VLAN Filter Screen Fields

1. Type in the **Filter Name**.
2. (Optional) Type in a **Description** of the VLAN Filter.
3. Type in an **ID** in the Enter ID field.
4. Click **Add**. The *ID* appears in the *ID List* field.
5. Click **Finish**. The *filter* is added to the VLAN filter object tree in alphanumerical order.

### Removing an ID from the List

To remove an ID, Complete these steps.

1. Select the **VLAN Record** that needs modification.
2. Click **Edit**.
3. Select the **ID** from the *ID List*.
4. Click **Remove**. The *ID* is removed.
5. Click **Done** to save the changes.

## Modifying an IP VLAN Filter Record

Complete these steps to modify an IP VLAN filter.

1. Select the **IP VLAN Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

## Deleting a IP VLAN PDU Filter

Complete these steps to delete an IP VLAN filter.

1. Select the **IP VLAN Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The Filter is deleted.

## About SAPI Filters

SAPI filtering is a user-defined filter based on in the Ethernet layer. It allows a user to filter IP packets of a matching VLAN tag in the Ethernet layer.

## Adding a IP SAPI Filter (Probed Acquisition)

Complete these steps to add a IP SAPI filter.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Add** on the tool bar. The *PDU Filter Family* tab appears.
3. Select **IP** from the list.
4. Click **Next**. The *IP* tab appears.
5. Select **SAPI Filter** from the list.
6. Click **Next**. The *SAPI Filters* tab appears.

The screenshot shows a configuration window with three tabs: "PDU Filter Family", "IP", and "SAPI Filters". The "SAPI Filters" tab is active. The form contains the following elements:

- Filter Name:** A text input field.
- Description:** A larger text area for notes.
- Selected SAPI numbers:** A dropdown menu currently showing "EXCLUDE".
- Radio buttons:** Two options are present: "SAPI filter" (which is selected) and "No SAPI filter".

Figure 115: Add SAPI for Gb over IP Filter Screen

This table describes the fields in the Gb SAPI filter screen.

Field	Description
Filter Name	User assigned name for the SAPI Filter.
Description (Optional)	Provides a description of the SAPI filter
Selected SAPI numbers	Drop-down menu to Include or Exclude a range of SAPI numbers.
SAPI filter	Radio button to select a SAPI filter. The range for a SAPI filter can be from 0-16.
No SAPI filter	Radio button to select if there is no SAPI filter.
Previous / Finish / Cancel (not shown)	<ul style="list-style-type: none"> <li>• Finish: Creates and saves the SAPI Filter information.</li> <li>• Previous: Takes you back to the previous screen.</li> <li>• Cancel: No information is saved for this filter.</li> </ul>

Table 83: Add SAPI Filter for GP over IP Screen Fields

7. Type in the **Filter Name**.
8. (Optional) Enter the **Description**.
9. Select a **SAPI Number Function** from the *pull-down* menu (include or exclude).
10. Select to use or not use a **SAPI Filter**.
11. Click **Finish**. The *filter* is added to the PDU filter list screen.

### Modifying a SAPI Filter for Gb over IP

Complete these steps to modify a Gb over IP PDU filter.

1. Select the **SAPI Gb over IP Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a SAPI Filter for Gb over IP

Complete these steps to delete a SAPI for Gb over IP filter.

1. Select the **Gb SAPI for Gb over IP Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

### About IP Raw Filter

IP Raw filters are used to configure filter using filter string expressions which follow PMIA filter syntax, which is described in [Appendix G: PMIA filter syntax](#).

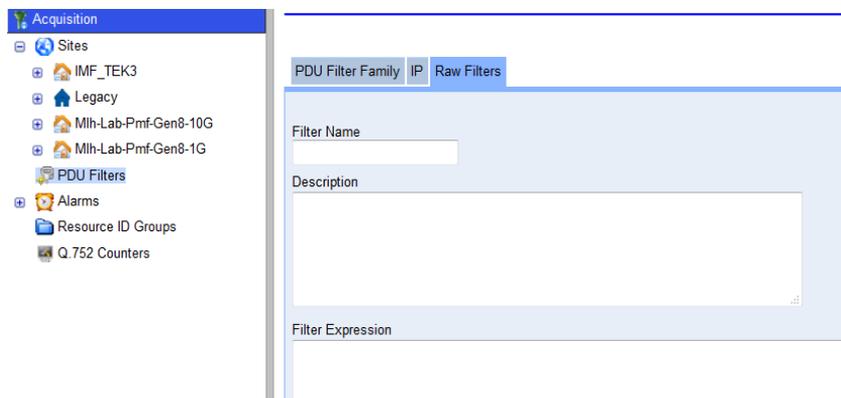

Figure 116: IP Raw Filters Screen

## About IP Combination Filters

Combination filters are for using the existing IP and Port (Gb) filters to filter for information. The various operators can be used to filter in or filter out information.

**Note:** The maximum size of any filter is 4000 bytes. If the filter exceeds this constraint, an error message appears stating that the filter has exceeded the size limit.

## Adding an IP PDU Combination Filter

Complete these steps to add an IP Combination filter..

1. Select **Acquisition > PDU Filters** from the object menu.  
The *PDU Filters* screen opens.
2. Click **Add** from the tool bar. The *PDU Filter Family* screen opens.
3. Select **IP-Internet Protocol**.
4. Click **Next**. The *IP* screen opens.
5. Select **IP Combination Filter**. The *Combination Filters* screen opens.

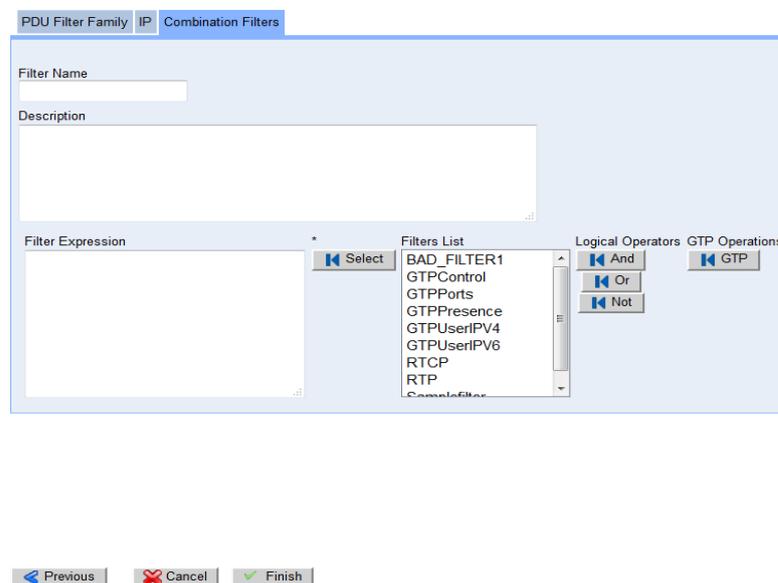

Figure 117: Combination Filters Screen

The table describes the fields on this screen.

Field	Description
Filter Name	User-defined name for filter.
Filter Description	Enter pertinent information for the combination filter.
Filter Expression	Provides a view of the combination filter value as it is created. Selected filters and logical operators appear in this window. When the Accept button is clicked, the information in the Filter Expression window becomes the new Combination filter.
Filter List	List of existing filters a user can combine.
Select button	Moves highlighted filter into Filter Expression box.
And button	Data must match all filters tied together with this operation.
Or button	Data can match both or any one of the filters tied together by this operation.
Not button	Data must match the first filter, but cannot match the second filter tied together by this operation.
GTP button in GTP Operations Section	Using GTP operations allows you to filter IP packets that contain a GTP layer by performing one of the following GTP operations within the GTP layer.

Field	Description
	<ul style="list-style-type: none"> <li>GTP Presence: Can be defined, if the GTP layer is contained in the packet.</li> <li>GTP Control: Can be defined, if the GTP layer contains control plane or data plane.</li> </ul>
Finish button (not shown)	Saves the information to the system.

Table 84: Combination Filter Screen Fields

- Type in the **Filter Name**.
- (Optional) Type in a **Description** of the Filter.
- Type in or select a **Filter Expression** in the *Filter Expression* field.
- Click **Select**. The expression is added to the Filters List.
- Select a **Logical Operator** (And, Or, Not), by clicking the appropriate Operator from the *pull-down* menu.

**Note:** IF you use a GTP filter in a Combination Filter, you may want to specify the “OR” condition with the GTP Control filter in order to pass GTP-C-PDUs.

**Note:** The VLAN filter can be used in the Filter Expression, but is limited to use of only 1 VLAN filter an expression. As an example, v1 and v2 are VLAN filters; f1 filter:

- Correct: v1 and f1
- Correct: not (v1) and f1
- Incorrect: f1 and v1
- Incorrect: not (v1 and f1)

If applicable, click to select a **GTP Operation** and specify the **GTP Expression** within the parenthesis.

**Note:** Example of a correct GTP Combination Filter: GTP (src5000 and dest500) or GTPControl.

**Note:** Example of an incorrect GTP Combination Filter GTP (src5000 and dest500 and GTPControl). The correct GTP filter has GTPControl outside of the GTP expression contained within the parenthesis.

- Click **Done**. The *Combination Filter* is added to the object tree in alphanumerical order.

### Modifying an IP Combination Filter

Complete these steps to modify an IP Combination filter.

- Select the **IP Combination Filter** that needs modification.
- Select **Modify**.
- Modify the **appropriate information**.
- Click **Modify**. The *changes* are saved.

### Deleting an IP Combination Filter

Complete these steps to delete an IP Combination filter.

- Select the **IP Combination Filter** to be deleted.
- Select **Delete** from the menu.
- Click **OK** at the prompt. The *filter* is deleted.

### About SigTran Protocol Filters

**Note:** See [About Probed Acquisition Sigtran configuration use case](#) to have an overview of the configuration of Probed Acquisition with Sigtran network.

There are four categories of SigTran Protocol filters:

- Association Filters - Stream Control Transmission protocol (SCTP) filters as well as other Association Filters
- SS7 Protocol Filters - Point Code (PC), Service Information Octet (SIO), Global Title (GT) and Subsystem Number (SSN) Filters
- Data Chunk Payload Protocol Identifier filter - Filter for SCTP Payload Protocol Identifier field (M2UA, M3UA, SUA, M2PA, H248/MEGACO, BICC, H323 or Other values)
- Raw filter - allow to create filters using filter string syntax and without GUI assistance (see [Appendix G: PMIA filter syntax](#))
- Combination - Filters for data based on any combination of the other SigTran Filter Types.

### About SigTran Association Filters

There are two types of SigTran Association filters:

- Stream Control Transmission protocol (SCTP) filters
- Other Association filters

### Adding a SigTran SCTP PDU Filter

Complete these steps to add a SigTran SCTP PDU filter.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Add**. *PDU Filter Family* screen opens.
3. Select **SigTran - Protocol**
4. Click **Next**. The *SigTran* screen opens.
5. Select **SCTP Association Filter**.
6. Click **Next**. The *SigTran Association Filters* screen opens.

The table describes the fields on this screen.

Field	Description
Filter Name	Alphanumeric field providing name of the filter
Description	(Optional) Alphanumeric field for short description of the filter
IP Protocol ID	Pull-down list (SCTP only selection).
Local Port	Numeric field that provides location of port.
Local IP Address	IP address for local port
Remote Port	Numeric field that provides port for association
Remote IP Address	IP address for the remote port for association
Add to List	Button to add association to list
Association List	List box showing associations
Remove from List	Button to remove selected associations from list

Table 85: SCTP Association Filter Screen Fields

7. Enter the **Filter Name**.
8. (Optional) Enter a **Description** of the SCTP filter.
9. Select the **IP Protocol ID**
10. Enter a **Local Port**.
11. Enter the **Local IP Address**.
12. Enter the **Remote Port**.
13. Enter the **Remote Port IP Address**
14. Click **Add to List** to add the association to the *Association List*.
  - a. Repeat steps 11-15 to add more associations.
15. Click **Finish**. The filter appears in the PDU filter list.
16. **Apply Changes** to the Acquisition system to update the system.

## Modifying a SigTran SCTP PDU Filter

Complete these steps to modify a SigTran SCTP filter.

1. Select the **SigTran SCTP Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

## Deleting a SigTran SCTP PDU Filter

Complete these steps to delete a SigTran SCTP filter.

1. Select the **SigTran SCTP Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt.
4. The *filter* is deleted.

## Adding a SigTran Other Association PDU Filter

Complete these steps to add a SigTran Other Association filter.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Next**. *PDU Filter Family* screen opens.
3. Select **SigTran Filter**
4. Click **Next**. The *SigTran* screen opens.
5. Select **SigTran Other Association**.
6. Click **Next**. The *SigTran OtherProt Assoc Filter* screen opens.

Figure 118: SigTran OtherProt Assoc Filter Screen

The table describes the fields on this screen.

Field	Description
Filter Name	Alphanumeric field providing name of the filter
Description	(Optional) Alphanumeric field for short description of the filter

IP Protocol ID	Pull-down list (SCTP only selection).
Local Port	Numeric field that provides location of port.
Local IP Address	IP address for local port
Remote Port	Numeric field that provides port for association
Remote IP Address	IP address for the remote port for association
Add to List	Button to add association to list
Association List	List box showing associations
Remove from List	Button to remove selected associations from list

Table 86: SigTran OtherProt Assoc Filter Screen Fields

7. Type in the **Filter Name**.
8. (Optional) Type in a **Description** of the VLAN filter.
9. Enter in an **IP Protocol ID** (positive number).
10. (Optional) Enter **Local Port** and **Local IP Address**.
11. (Optional) Enter **Remote Port** and **Remote IP Address**.
12. (If ports and addresses have been entered) Click **Add** to List.
13. Click **Finish**. The *filter* is added.

### Modifying a SigTran Other Association PDU Filter

Complete these steps to modify a SigTran Other Association filter.

1. Select the **SigTran Other Association Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

### Deleting a SigTran Other Association PDU Filter

Complete these steps to delete a SigTran Other Association filter.

1. Select the **SigTran Other Association Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

### About SigTran SS7 Protocol Filters

There are four types of SigTran SS7 filters:

- Point Code (PC)
- Service Information Octet Filter (SIO)
- Global Title (GT)
- Subsystem Number (SSN)

### Adding a SigTran SS7 PC PDU Filter

Complete these steps to add a SigTran SS7 Point Code filter.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Next**. *PDU Filter Family* screen opens.
3. Select **SigTran Filter**
4. Click **Next**. The *SigTran* screen opens.
5. Select **SS7 Protocol Filter**. The *SigTran SS7 Filters* screen opens.
6. Select **Point Code Filter**.
7. Click **Next**. The *SigTran PC Filters* screen opens.

The table describes the fields on this screen.

Field	Description
Filter Name	User-defined name for filter.

Description	Enables you to describe the characteristics of the filter
Select Flavor	Provides the protocol for specified point code or point code range
Protocol	Shows the protocols you can use: <ul style="list-style-type: none"> <li>• M2PA/SCTP</li> <li>• M3UA/SCTP</li> <li>• M2UA/SCTP</li> </ul>
PC Type	Lists the types of point codes: <ul style="list-style-type: none"> <li>• PC</li> <li>• OPC</li> <li>• DPC</li> </ul>
Point Code	Enter point code(s) to be used
Add to List	Adds the Id information entered to the Association List.
Remove from List	Removes the selected port from the Association List.
PC List	Lists the added point codes
Logical Operators	Provides the following operators: <ul style="list-style-type: none"> <li>• And = conjunction between two sub-filters</li> <li>• Or = disjunction between two sub-filters</li> <li>• Not = operator means negation of the sub-filter</li> <li>• ( ) = used to group sub-filters and modify the priority of operators</li> </ul>
Filter Expression	Shows the finished expression to be used
Finish button (not shown)	Saves filter settings based on the information shown in the Filter Expression field.

Table 87: SigTran PC Filter Screen Fields

8. Type in the **Filter Name**.
9. (Optional) Type in a **Description** of the SigTran filter.
10. Select a **Flavor** from the list.
11. Select a **Protocol**.
12. Select a **PC Type** and enter **Point Code**.
13. Click **Add** to List .
14. Select the appropriate **Logical Operator(s)**.
15. Click **Finish**. The *filter* is added.

**Note:** Sigtran filters can be combined using the Combination Filter operation.

**Note:** A choice can be made at this point to use "chunk forwarding" or to the forward whole IP packet (IP raw).

**Note:** To complete the filtering process the filter must be connected with a data flow, traffic classification and Dataflow process in Mediation. See Routing PDUs to Mediation Protocol for SigTran or Routing PDUs to Mediation Protocol for more information.

### Modifying a SigTran SS7 PC PDU Filter

Complete these steps to modify a SigTran SS7 PC Filter:

1. Select the **SigTran SS7 PC Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

### Deleting a SigTran SS7 PC PDU Filter

Complete these steps to delete a SigTran SS7 PC filter.

1. Select the **SigTran SS7 PC Filter** to be deleted.
2. Select **Delete** from the menu.

3. Click **OK** at the prompt. The *filter* is deleted.

### Adding a SigTran SS7-SIO PDU Filter

1. Select **Acquisition > PDU Filters**.
2. Click **Add** on the tool bar.
3. Select **SigTran - Protocol**.
4. Click **Next**.
5. Select **SS7 Protocol Filters**.
6. Click **Next**.
7. Select **SIO Filter**.
8. Click **Next**.
9. Select **NISI (Network Indicator + Service Indicator)**.

**Note:** If only SI is selected, there is no need to select a Network Indicator.

10. Click **Next**.

The table describes the fields on the SIO screen.

Field	Description
Filter Name	User-defined name for filter.
Description	Enables you to describe the characteristics of the filter
Protocol	Shows the protocols you can use: <ul style="list-style-type: none"> <li>• M2PA</li> <li>• M3UA</li> <li>• M2UA</li> </ul>
Network Indicator	Lists the network indicators available: <ul style="list-style-type: none"> <li>• National</li> <li>• International</li> </ul>
Service Indicator	Lists the service indicators available: <ul style="list-style-type: none"> <li>• Signaling Network Management Messages</li> <li>• Signaling Network Testing and Maintenance Messages</li> <li>• Signaling Network Testing and Maintenance Special Messages</li> <li>• SCCP</li> <li>• Telephone User Part</li> <li>• ISDN User Part</li> <li>• Broadband User Part</li> <li>• Satellite ISDN User Part</li> <li>• AAL Type 2 Signaling</li> <li>• Bearer Independent Call Control</li> <li>• Gateway Control Protocol</li> <li>• Other</li> </ul>
Value	Called
Add to List	Adds the Id information entered to the SIO List.
SIO List	Shows all SI + NI combinations added.
Select	Selects the highlighted SIO and places it in the Filter Expression Field
Filter Expression	Shows the expressions that have been created in the SIO list.
Logical Operators	Provides the following operators: <ul style="list-style-type: none"> <li>• And = conjunction between two sub-filters</li> <li>• Or = disjunction between two sub-filters</li> <li>• Not = operator means negation of the sub-filter</li> <li>• () = used to group sub-filters and modify the priority of operators</li> </ul>
Select / Remove buttons	Clicking Select, adds a highlighted SIO to the Filter Expression Field. Clicking Remove removes the highlighted SIO from the list in the Filter Expression field.

Field	Description
Finish button (not shown)	Saves filter settings based on the information shown in the Filter Expression field.

Table 88: SigTran SS7 SIO Screen Fields

11. Enter in the **Filter Name**.
12. (Optional) Enter a **Description**.
13. Select the **Protocol** for the filter.
14. Select a **Network Indicator** and **Service Indicator**.

**Note:** Choose from either the pre-defined list or select **Other**. If Other is selected, the specific Service Indicator is manually entered.

15. Click **Add** to list.
16. Select the **SIO** from the *SIO* list.
17. Click **Select** to add the expression to the Filter Expression list. To remove an expression from the field, click **Remove** on the bottom right side of the screen.

**Note:** To create a more complex expression, use the **Logical Operator(s)**. A name then can be assigned to the filter as well as a description of the filter.

**Note:** More than one filter can be created.

**Note:** This filter can be used in conjunction with other filters using the Combination filter option.

18. Click **Finish** to accept the values.

**Note:** Sigtran filters can be combined using the Combination Filter operation.

**Note:** A choice can be made at this point to use "chunk forwarding" or to the forward whole IP packet (IP raw.).

**Note:** To complete the filtering process the filter must be connected with a data flow, traffic classification and dataflow process in Mediation. See Routing PDUs to Mediation Protocol for SigTran or Routing PDUs to Mediation Protocol for more information.

### Modifying a SigTran SS7-SIO PDU Filter

Complete these steps to modify a SigTran SS7-SIO PDU Filter:

1. Select the **SigTran SS7-SIO Filter** that needs modification.
2. Click **Modify** on the tool bar.
3. Modify the **appropriate information**.
4. Click **Modify**.
5. The *changes* are saved.

### Deleting a SigTran SS7 SIO PDU Filter

Complete these steps to delete a SigTran SS7 SIO PDU Filter:

1. Select the **SigTran SS7 SIO PDU Filter** to be deleted.
2. Click **Delete** on the tool bar.
3. Click **OK** at the prompt.
4. The *filter* is deleted.

### Adding a SigTran GT PDU Filter

1. Select **Acquisition > PDU Filters**.
2. Click **Add** on the tool bar.
3. Select **SigTran - Protocol**.
4. Click **Next**.
5. Select **SS7 Protocol Filters**.
6. Click **Next**.

7. Select **Global Title**.

**Note:** If No Global Title is selected then complete steps 9-13 before clicking Finish.

**Note:** In step 13 only Call Type is used for Non-Global Title SigTran filters.

8. Click **Next** to move to the Global Title filter screen.

The table describes the fields on the Global Title screen.

Field	Description
Filter Name	User-defined name for filter.
Description	Enables you to describe the characteristics of the filter
Protocol	Shows the protocols you can use: <ul style="list-style-type: none"> <li>• M2PA</li> <li>• M3UA</li> <li>• M2UA</li> </ul>
SCCP Format	Lists the SCCP formats available: <ul style="list-style-type: none"> <li>• ITU</li> <li>• ANSI</li> </ul>
MTP3 Format	Lists the MTP3 formats available: <ul style="list-style-type: none"> <li>• ITU</li> <li>• ANSI</li> <li>• Japan</li> </ul>
Call Type	Lists the three different call types available: <ul style="list-style-type: none"> <li>• Calling</li> <li>• Called</li> <li>• Both</li> </ul>
Numbering Plan	Lists the different numbering plans available: <ul style="list-style-type: none"> <li>• Unknown</li> <li>• ISDN/telephony numbering plan - E.164</li> <li>• Generic</li> <li>• Data numbering plan - X.121</li> <li>• Telex numbering plan - F.69</li> <li>• Maritime mobile numbering plan - E.210/E.211</li> <li>• Land mobile numbering plan - E.212</li> <li>• ISDN/mobile numbering plan - E.214</li> <li>• Private network or Network-specific numbering plan</li> <li>• Reserved</li> </ul>
Nature of Address	<ul style="list-style-type: none"> <li>• International</li> <li>• National</li> </ul>
Global Title Value	A valid number.
Add to List	Adds the Id information entered to the GT List.
GT List	Show list of GT combinations created
Filter Expression	Shows the expressions and combinations that have been created from the use of the GT list and operators.
Logical Operators	Provides the following operators: <ul style="list-style-type: none"> <li>• And = conjunction between two sub-filters</li> <li>• Or = disjunction between two sub-filters</li> <li>• Not = operator means negation of the sub-filter</li> <li>• ( ) = used to group sub-filters and modify the priority of operators</li> </ul>
Select / Remove buttons	Clicking Select, adds a highlighted SIO to the Filter Expression Field. Clicking Remove removes the highlighted SIO from the list in the Filter

Field	Description
	Expression field.
Finish button (not shown)	Saves filter settings based on the information shown in the Filter Expression field.

Table 89: SigTran SS7 Global Title (GT) Screen Fields

9. Enter in the **Filter Name**.
10. (Optional) Enter a **Description**.
11. Select the **Protocol** for the filter.
12. Select a **SCCP** and **MTP3 Format**.
13. Select a **Call Type, Numbering Plan, Nature of Address, and Global Title Value**
14. Click **Add** to list.
15. Select the **GT** from the *GT* list.
16. Click **Select** to add the expression to the Filter Expression list. To remove an expression from the field, click **Remove** on the bottom right side of the screen.

**Note:** To create a more complex expression, use the **Logical Operator(s)**. A name then can be assigned to the Filter as well as a description of the filter.

**Note:** More than one filter can be created.

**Note:** This filter can be used in conjunction with other filters using the Combination Filter option.

17. Click **Finish** to accept the values.

**Note:** Sigtran filters can be combined using the Combination Filter operation.

**Note:** A choice can be made at this point to use "chunk forwarding" or to forward the whole IP packet (IP raw.).

**Note:** To complete the filtering process the filter must be connected with a data flow, traffic classification and dataflow process in Mediation. See Routing PDUs to Mediation Protocol for SigTran or Routing PDUs to Mediation Protocol for more information.

### Modifying a SigTran GT PDU Filter

Complete these steps to modify a SigTran GT PDU Filter:

1. Select the **SigTran GT PDU Filter** that needs modification.
2. Click **Modify** on the tool bar.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a SigTran GT PDU Filter

Complete these steps to delete an SigTran GT Filter:

1. Select the **SigTran GT Filter** to be deleted.
2. Click **Delete** on the tool bar.
3. Click **OK** at the prompt. The *filter* is deleted.

### Adding a SigTran SS7 SSN PDU Filter

Complete these steps to add a SigTran SS7 SSN Filter:

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Add** on the tool bar. *PDU Filter Family* screen opens.
3. Select **SigTran - Protocol**
4. Click **Next**. The *SigTran* screen opens.
5. Select **SS7 Protocol Filter**. The *SigTran SS7 Filters* screen opens.
6. Select **SS7 - Subsystem Number Filter**.
7. Click **Next**.

8. Select **Subsystem Number**.
9. Click **Next**.

The table describes the fields on this screen.

Field	Description
Filter Name	User-defined name for filter.
Description	Enables you to describe the characteristics of the filter
Protocol	Lists the sigtran protocols to use: <ul style="list-style-type: none"> <li>• M2PA</li> <li>• M3UA</li> <li>• M2UA</li> </ul>
SCCP Format	Lists the types of sccp formats available: <ul style="list-style-type: none"> <li>• ITU</li> <li>• ANSI</li> </ul>
MTP3 Format	Lists the MTP3 formats available: <ul style="list-style-type: none"> <li>• ITU</li> <li>• ANSI</li> <li>• Japan</li> </ul>
Calling Type	Lists the call type to be used: <ul style="list-style-type: none"> <li>• Calling</li> <li>• Called</li> <li>• Both</li> </ul>
Subsystem Number Value	Enter the Subsystem Number Value to be used for the filter. (Range is integer 1-255)
Add to List	Adds the subsystem value to the SSN List.
Remove from List	Removes the subsystem value to the SSN List.
Logical Operators	Provides the following operators: <ul style="list-style-type: none"> <li>• And = conjunction between two sub-filters</li> <li>• Or = disjunction between two sub-filters</li> <li>• Not = operator means negation of the sub-filter</li> <li>• ( ) = used to group sub-filters and modify the priority of operators</li> </ul>
Select	Places a selected SSN and moves it to the filter expression list.
Filter Expression	Shows the finished expression to be used
Finish button	Saves filter settings based on the information shown in the Filter Expression field.

Table 90: SigTran SS7 SSN Filter Screen Fields

10. Type in the **Filter Name**.
11. (Optional) Type in a **Description** of the SigTran Filter.
12. Select a **Protocol** to be used.
13. Select a **SCCP Format** to be used.
14. Select a **MTP3 Format** to be used.
15. Select the **Call Type** to be used.
16. Enter the **Subsystem Number Value** to be used.
17. Click **Add** to List to place the SSN in the SSN List.
18. (Optional) Repeat steps 16 & 17 to place more SSN values in the SSN list field.
19. Select an **SSN** and click **Select** to place it in the Filter Expression field.
20. (Optional) **Select** the appropriate **Logical Operator(s)** to create more complex expressions.
21. Repeat steps 18 & 19 if more complex expressions are needed.
22. Click **Finish**. The *filter* is added.

**Note:** Sigtran filters can be combined using the Combination Filter operation.

**Note:** A choice can be made at this point to use "chunk forwarding" or to forward the whole IP packet (IP raw.)

**Note:** To complete the filtering process the filter must be connected with a data flow, traffic classification and dataflow process in Mediation. See Routing PDUs to Mediation Protocol for SigTran or Routing PDUs to Mediation Protocol for more information.

### Adding a SigTran SS7 SSN PDU Filter-No Subsystem Number

Complete these steps to add a SigTran SS7 SSN Filter:

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* list screen opens.
2. Click **Add** on the tool bar. *PDU Filter Family* screen opens.
3. Select **SigTran - Protocol**
4. Click **Next**. The *SigTran* screen opens.
5. Select **SS7 Protocol Filter**. The *SigTran SS7 Filters* screen opens.
6. Select **SS7 - Subsystem Number Filter**.
7. Click **Next**.
8. Select **No Subsystem Number**.
9. Click **Next**.

The table describes the fields on this screen.

Field	Description
Filter Name	User-defined name for filter.
Description	Enables you to describe the characteristics of the filter
Protocol	Lists the sigtran protocols to use: <ul style="list-style-type: none"> <li>• M2PA</li> <li>• M3UA</li> <li>• M2UA</li> </ul>
SCCP Format	Lists the types of sccp formats available: <ul style="list-style-type: none"> <li>• ITU</li> <li>• ANSI</li> </ul>
MTP3 Format	Lists the MTP3 formats available: <ul style="list-style-type: none"> <li>• ITU</li> <li>• ANSI</li> <li>• Japan</li> </ul>
Calling Type	Lists the call type to be used: <ul style="list-style-type: none"> <li>• Calling</li> <li>• Called</li> <li>• Both</li> </ul>
Subsystem Number Value	Enter the Subsystem Number Value to be used for the filter. (Range is integer 1-255)
Add to List	Adds the subsystem value to the SSN List.
Remove from List	Removes the subsystem value to the SSN List.
Logical Operators	Provides the following operators: <ul style="list-style-type: none"> <li>• And = conjunction between two sub-filters</li> <li>• Or = disjunction between two sub-filters</li> <li>• Not = operator means negation of the sub-filter</li> <li>• ( ) = used to group sub-filters and modify the priority of operators</li> </ul>
Select	Places a selected SSN and moves it to the filter expression list.
Filter Expression	Shows the finished expression to be used
Finish button	Saves filter settings based on the information shown in the Filter Expression field.

Table 91: SigTran SS7 SSN Filter Screen Fields

10. Type in the **Filter Name**.
11. (Optional) Type in a **Description** of the SigTran Filter.
12. Select a **Protocol** to be used.

13. Select a **SCCP Format** to be used.
14. Select a **MTP3 Format** to be used.
15. Select the **Call Type** to be used.
16. Click **Finish**.
17. The *filter* is added.

### Modifying a SigTran SS7 SSN PDU Filter

Complete these steps to modify a SigTran SS7 SSN Filter:

1. Select the **SigTran SS7 SSN Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a SigTran SS7 SSN PDU Filter

Complete these steps to delete a SigTran SS7 SSN Filter:

1. Select the **SigTran SS7 SSN Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

### About SigTran Data Chunk Payload Protocol Identifier filter

#### Adding a SigTran Data Chunk Payload Protocol Identifier Filter

Complete these steps to add a SigTran Data Chunk Payload Protocol Identifier Filter:

1. Select Acquisition > PDU Filters from the object menu. The *PDU Filters* list screen opens.
2. Click **Add** on the tool bar. *PDU Filter Family* screen opens.
3. Select **SigTran - Protocol**
4. Click **Next**. The *SigTran* screen opens.
5. Select **Data Chunk Payload Protocol Identifier filter**. The *SigTran Data Chunk Payload Protocol Identifier Filters* screen opens.

Field	Description
Filter Name	User assigned name for the DCPPI Filter.
Description (Optional)	Provides a description of the DCPPI filter
Selected DCPPI numbers	Drop-down menu to Include or Exclude a list of DCPPI numbers.
Chunk Type	Already defined DCPPI (M2UA, M3UA, SUA, M2PA, H248/MEGACO, BICC, H323) or Other DCPPI numbers if <b>Chunk Type</b> is not already defined in the <b>Chunk Type</b> list
Add to list button	Adds the information entered DCPPI <b>Chunk Type</b> to the DCPPI List.
DCPPI List	Contains all of the user-specified <b>Chunk Type</b>
Remove from list button	Deletes DCPPI <b>Chunk Type</b> from the DCPPI List field.

Table 92: Add DCPPI Filter Screen Fields

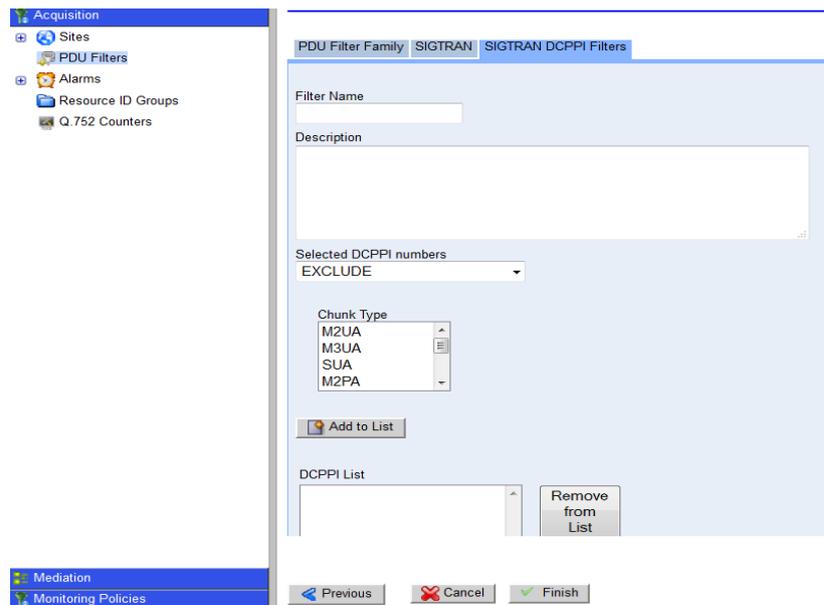

Figure 119: Sigtran Data Chunk Payload Protocol Identifier Filters Screen

6. Enter in the **Filter Name**.
7. (Optional) Enter a **Description**.
8. Select the **DCPPI numbers**
9. Click **Add** to List
10. Click **Finish** to accept the values.

### Modifying a SigTran Data Chunk Payload Protocol Identifier Filter

Complete these steps to modify a SigTran Data Chunk Payload Protocol Identifier Filter:

1. Select the **SigTran Data Chunk Payload Protocol Identifier Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The *changes* are saved.

### Deleting a SigTran Data Chunk Payload Protocol Identifier PDU Filter

Complete these steps to delete a SigTran Data Chunk Payload Protocol Identifier Filter:

1. Select the **SigTran Data Chunk Payload Protocol Identifier Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *filter* is deleted.

### About SigTran Raw Filter

SigTran Raw filters are used to configure filter using filter string expressions which follow PMIA filter syntax, which is described in [Appendix G: PMIA filter syntax](#).

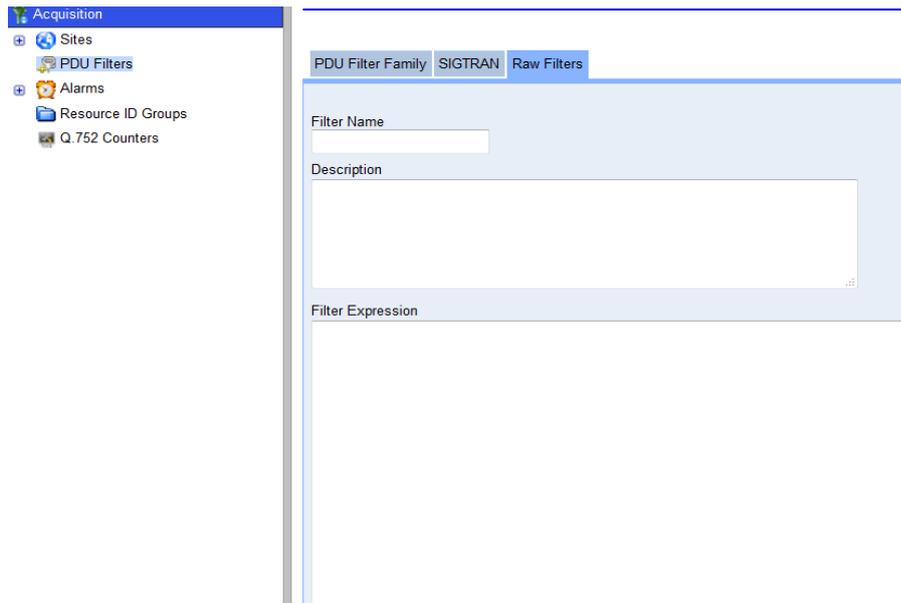

Figure 120: Sigtran Raw Filters Screen

### About SigTran Combination Filter

SigTran Combination filters are literally combinations of the other three types of SigTran Filters. This type of filter provides greater flexibility in routing PDUs.

### Adding a SigTran Combination PDU Filter

Complete these steps to add a SigTran Combination Filter:

**Note:** The maximum size of any filter is 4000 bytes. If the Filter exceeds this constraint, an error message appears stating that the filter has exceeded the size limit.

1. Select **Acquisition > PDU Filters** from the object menu. The *PDU Filters* screen opens.
2. Click **Add** from the tool bar. The *PDU Filter Family* screen opens.
3. Click **Next**. The SigTran screen opens.
4. Select SigTran Combination Filter. The *Combination Filters* screen opens.

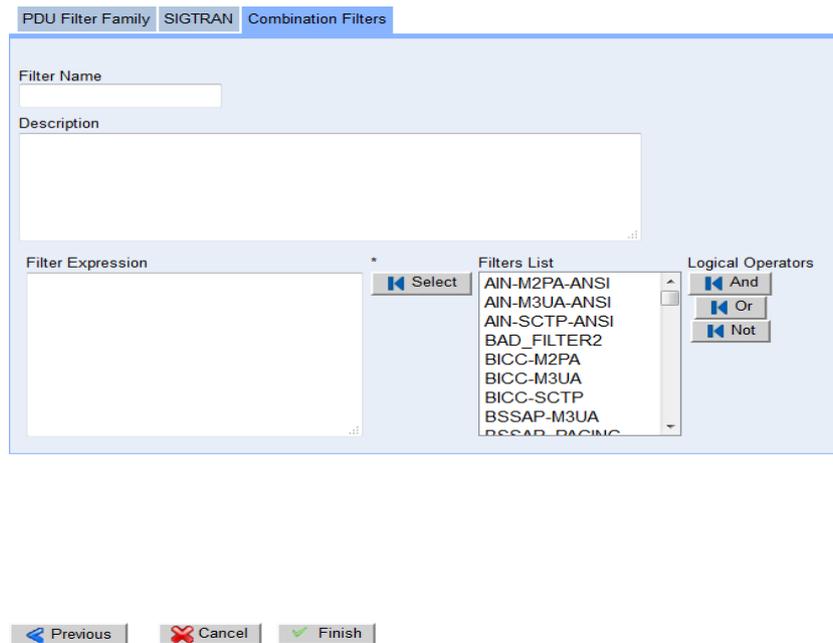

Figure 121: Combination Filters Screen

The table describes the fields on this screen.

Field	Description
Filter Name	User-defined name for filter.
Filter Description	Enter pertinent information for the combination filter.
Filter Expression	Provides a view of the combination filter value as it is created. Selected filters and logical operators appear in this window. When the Accept button is clicked, the information in the Filter Expression window becomes the new Combination filter.
Filter List	List of existing filters a user can combine.
Select button	Moves highlighted filter into Filter Expression box.
And button	Data must match all filters tied together with this operation.
Or button	Data can match both or any one of the filters tied together by this operation.
Not button	Data must match the first filter, but cannot match the second filter tied together by this operation.
Finish button (not shown)	Saves the information to the system.

Table 93: Combination Filter Screen Fields

5. Type in the **Filter Name**.
6. (Optional) Type in a **Description** of the Filter.
7. Type in or select a **Filter Expression** in the *Filter Expression* field.
8. Click **Select**. The *expression* is added to the Filters List.
9. Select a **Logical Operator (And, Or, Not)**, by clicking the appropriate *Operator*. From the *pull-down* menu.
10. Click **Done**. The *Combination Filter* is added to the object tree in alphanumerical order.

### Modifying a SigTran Combination PDU Filter

Complete these steps to modify a SigTran Combination Filter:

1. Select the **SigTran Combination Filter** that needs modification.
2. Select **Modify**.
3. Modify the **appropriate information**.
4. Click **Modify**. The changes are saved.

### Deleting a SigTran Combination PDU Filter

Complete these steps to delete a SigTran Combination Filter:

1. Select the **SigTran Combination Filter** to be deleted.
2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The filter is deleted.

## About PDU Dataflows

PDU Data Flows are used to group Linksets and/or Associations that are being captured on the Integrated Acquisition / Probed Acquisition and deliver them to the Mediation for protocol analysis and storage. The MSUs/PDUs are packaged and shipped to the Mediation over an input stream (IP Stream). Once configured, the PDU Data Flows can be used by the Mediation for processing xDR storage.

PDU dataflows are created for each specific Acquisition (Integrated Acquisition or Probed Acquisition) subsystem to route both filtered and unfiltered data to Mediation for xDR creation. The PDU dataflows contain linksets which can belong to different servers across a subsystem or all together different subsystems. There are different categories of PDU dataflows defined to route different types of data.

Centralized Configuration provides the capability to configure PDU Dataflows for each Acquisition subsystem. The capability allows for greater flexibility and quicker search capabilities when creating dataflows.

The following PDU dataflows can be configured in a subsystem:

- GPRS dataflows (for Probed Acquisition only)
- SS7 MSU dataflows (Including BICC monitoring over SigTran and L2 LSSU)
- IP dataflows
- Q.752 dataflows

**Note:** In an Integrated Acquisition subsystem there is a hard-coded limit of 20 input streams a dataflow can be routed per server.

### Adding a GPRS Gb Dataflow

Complete these steps to add an GPRS data flow for a Probed Acquisition subsystem.

1. Select **Acquisition > Sites > Subsystem > PDU Data Flows > GPRS > Add**.
2. Type in the **Name** of the *Gb dataflow*.
3. (Optional) Type in a **description** of the dataflow record.
4. Click **Next**.
5. Select a **Gb Filter** from the *drop-down* menu.
6. Enter the **Number** for packet truncation.
7. Click **Next**.
8. Click the **Gb Link** icon.
9. Enter the **Gb Link Name**.
10. Click **Apply Filter**.
11. Select **Gb Link Record** from the list.
12. Click **Select**.
13. Click **Close**.
14. Click **Add**. The *GPRS dataflow* is added to the system.

**Note:** For the changes to take effect, right-click on the Probed Acquisition subsystem and select **Apply Changes** from the menu.

### Modifying a GPRS Gb Dataflow

Complete these steps to modify a GPRS Gb Dataflow:

1. Select the **GPRS Gb Dataflow Record** to be modified.
2. Click **Modify**. The Modify screen opens.
3. Make the **necessary modifications**.
4. Click **Modify**. The *changes* are saved.

### Deleting a GPRS Gb Dataflow

Complete these steps to delete an GPRS Gb Dataflow:

1. Select the **GPRS Gb Dataflow Record** to be deleted.
2. Click **Delete**.
3. Click **OK** at the prompt. The *record* is deleted.

### Adding a SS7 Dataflow

Complete these steps to create a SS7 PDU dataflow.

1. Select **Acquisition > Site > Subsystem > PDU Data Flows > SS7**.  
The Add SS7 dataflow list screen opens.

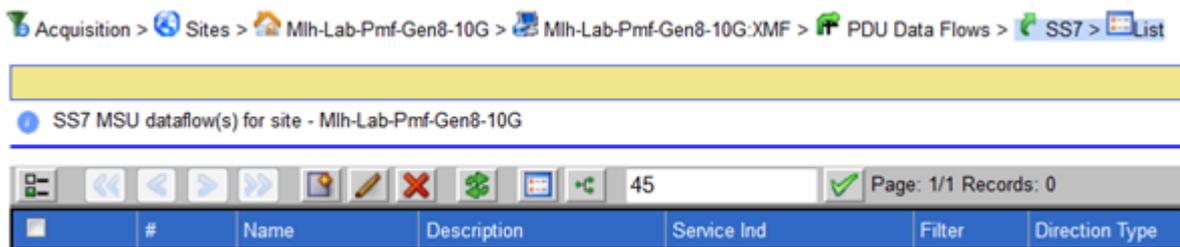

Figure 122: SS7 Dataflow List Screen

2. Click Add on the tool bar.
3. Type in the Name of the SS7 dataflow.
4. (Optional) Type in a Description of the dataflow record.
5. Click Next.

Direction Type  
CALL

Direction  
TX

Service Indicator  
ALL

SS7 Filters  
None

Packet Truncation  
0

Cancel Previous Next

Figure 123: Direction, Service Indicator, Filter & Truncation Details Screen

The table describes the default fields on this screen.

**Note:** For LSSU support (selecting the Non-Call), the screen has only three fields with the following choices:

- Direction Type - Non-Call
- Direction - TX, RX or BOTH
- Service Indicator - ALL

Field	Description
Direction Type	Drop-down menu has the following options: <ul style="list-style-type: none"> <li>• CALL or MSUCALL: For certain SCCP, TUP, or ISUP Service Indicator Message Types. Direction for this Direction Type can be only either RX or TX.</li> <li>• MSU: All other MSU data types including BICC over SigTran. Call direction can be RX, TX or Both</li> <li>• Non_Call: (For LSSU support.) The Direction for this message type can be RX, TX or Both. The service indicator will always be "ALL"</li> </ul>
Direction	What is the source of the dataflow Either RX, TX, or Both (MSU and LSSU)
Service Indicator	• Drop-down menu of supported SS7 types <b>Note:</b> For LSSU support ALL is the only selection
SS7 Filters	Select the filters to be associated with the dataflow.
Packet Truncation	Enter an integer for the maximum length, in bytes, for each PDU. The range is between 0-4000.
Cancel / Previous /Next	Click on one of the following: <ul style="list-style-type: none"> <li>• Cancel: Information is not saved.</li> <li>• Previous: Returns you to the SS7 Dataflow Information screen.</li> <li>• Next: The Monitored Linksets Details screen opens.</li> </ul>

Table 94: Direction, Service Indicator, Filter&Truncation Details of SS7 Dataflow Screen Fields

6. Select the **Direction Type**. (MSU, Call, or NON\_CALL).
7. Select the **Direction**. (Both, Rx, Tx)

8. Select the **Service Indicator**. (For Non\_Call only ALL is available).
9. Select a **SS7 Filter**.
10. Enter the **Length of the PDU** in the *Packet Truncation* field. (Integer between 0-4000)
11. Click **Next**. The Monitored Linkset Details screen opens.

Figure 124: Monitored Linkset Details Screen

12. Click the **Linksets** icon to show the existing linksets. You can also create linksets if you need to.
13. Click **Add** to add the record to the database. SS7 Linkset Selector Filter opens.

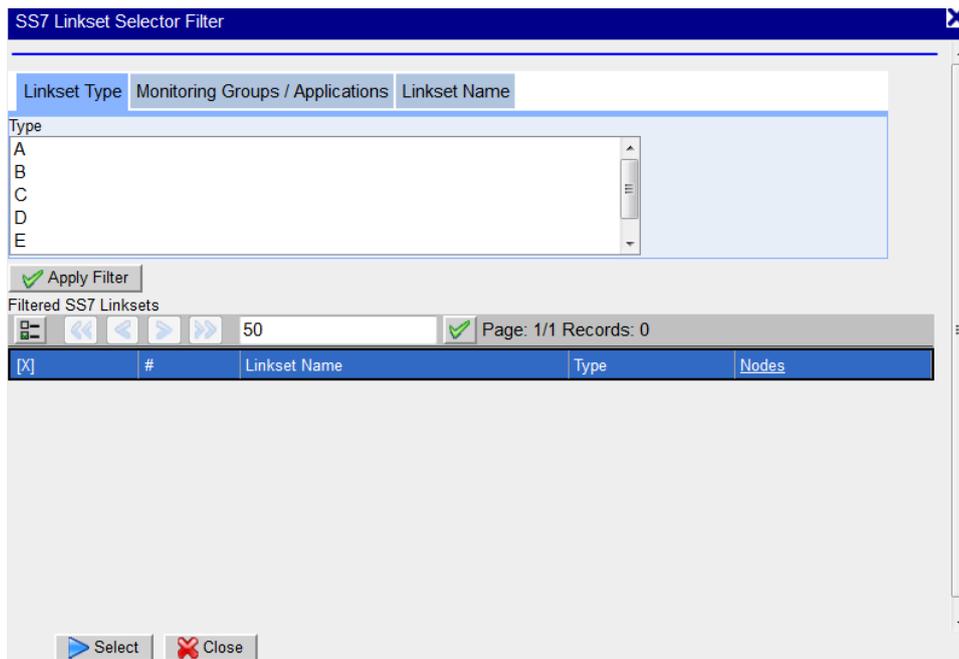

Figure 125: SS7 Linkset Selector Filter Screen

14. Select the **Linkset Type (A-F)** from the Linkset Type tab.
15. (Optional) Select an **option** from the Monitoring Group/ Applications tab.
16. Select the **Linkset Name** tab and enter a **Linkset Name**.
17. Click **Apply Filter** to apply the filter you created.
18. Select a **Filtered Linkset** from the list at the bottom table.
19. Select the **Monitored Linkset**.
20. Click **Add**.

**Note:** For the changes to take effect, right-click on the Integrated Acquisition Subsystem and select **Apply Changes** from the menu.

### Managing MFP Streams to Acquisition Datafeed Export Applications

PDU Dataflows can be linked to Mediation or Acquisition Datafeed Export applications. Complete these steps create a Stream from a PDU Dataflow:

1. Click **Manage MFP Routes** (to an Mediation or Acquisition Datafeed Export application) to add the routes to a Dataflow.

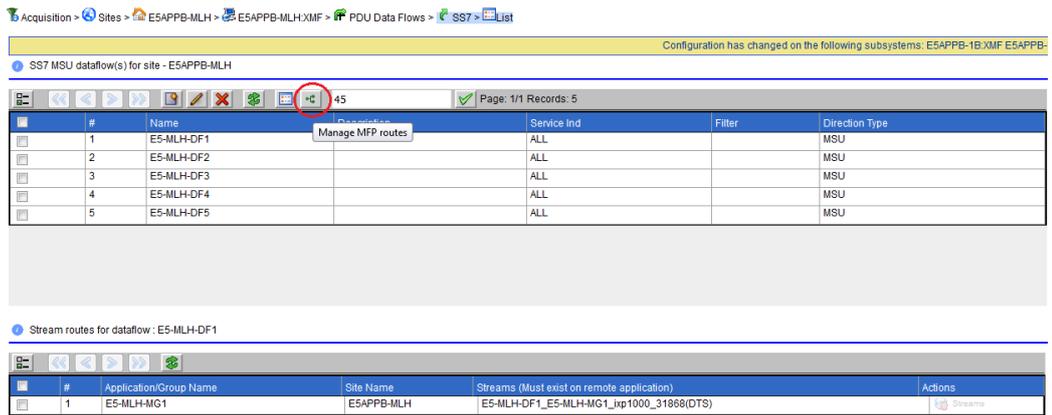

Figure 126: Dataflows And Stream Routes-New Routes

2. Click **Manage MFP Routes** (in Actions column of routes table) to add new streams. The add *Route* screen opens.

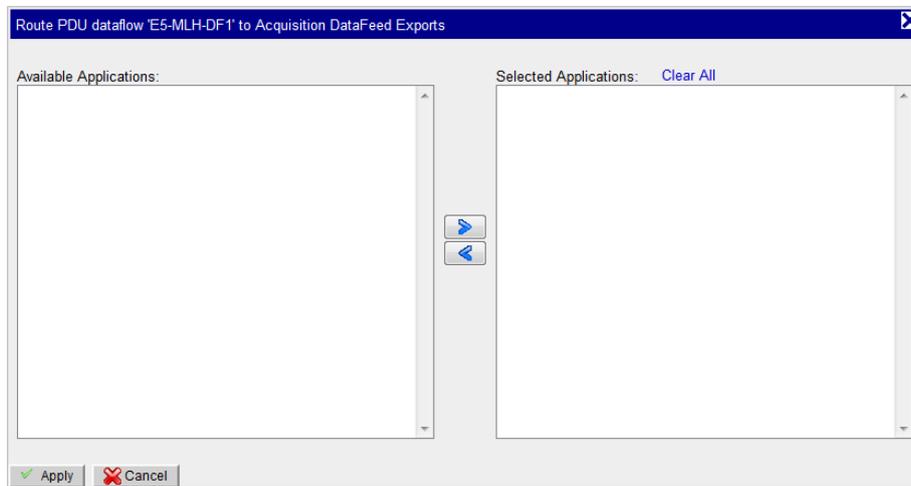

Figure 127: Dataflows And Stream Routes-Streams Screen

3. Select the **Available Routes** for the Dataflow.
4. Click the **Right Arrow**.
5. Click **Apply**. The *Stream* is added to the Dataflow.

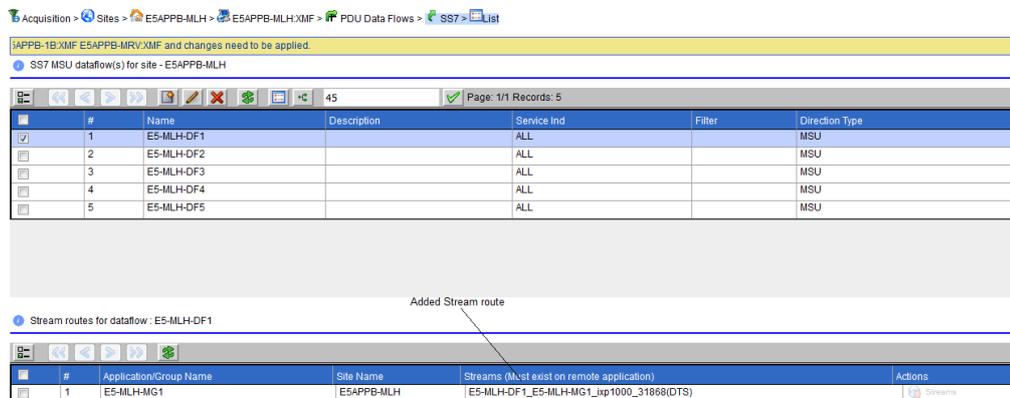

Figure 128: Dataflows and Routes Screen

## Modifying a SS7 Dataflow

Complete these steps to modify an SS7 Dataflow:

1. Select the **SS7 Dataflow Record** to be modified.
2. Click **Modify**. The *Modify* screen opens.
3. Make the **necessary modifications**.
4. Click **Modify**. The *changes* are saved.

## Deleting a SS7 Dataflow

Complete these steps to delete an SS7 dataflow

1. Select the **SS7 Dataflow Record** to be deleted.
2. Click **Delete**.
3. Click **OK** at the prompt. The *record* is deleted.

## About IP Dataflows

### Probed Acquisition

When you create an IP Dataflow, you select one or more Ethernet devices connected to a selected Probed Acquisition server. When an Ethernet device, referred to as an IP device in the user interface, is assigned to a dataflow, the Dataflow will forward all IP traffic related to the selected Ethernet device to the Mediation upon Dataflow creation. If you wish to limit the IP traffic that is sent to the Mediation, you must define and assign a filter to your Dataflow Filters.

### Integrated Acquisition

When you create an IP dataflow in Integrated Acquisition, you can utilize fastcopy to select one or more Ethernet devices connected to a selected Integrated Acquisition server. When an Ethernet device, referred to as an IP device in the user interface, is assigned to a dataflow, the dataflow will forward all IP traffic related to the selected Ethernet device to the Mediation upon dataflow creation. If you wish to limit the IP traffic that is sent to the Mediation, you must define and assign a filter to your dataflow filters.

You can use these options to send information about the direction of IP traffic to the Mediation subsystem. To do this you must select the Way Management option and enter the specific network and/or host address(es) you want the directional information for. When this option is used, the data sent to the Mediation will indicate whether the IP address is the source, Tx, or the destination, Rx, address in the IP packets.

**Note:** Way Management only provides directional information for IP addresses added to the IP address list. IP traffic data for unspecified IP addresses associated with the selected Ethernet device(s) will still be forwarded to the Mediation without the directional information.

XOR is a mechanism for load distribution of the messages to different Mediations servers. The groups can comprise of exactly 2, 4, or 8 Mediation servers, hence XOR\_2, XOR\_4, and XOR\_8. A dataflow with XOR\_4 needs to be routed to destinations on the routing screen. Selecting any more or less than 4 would cause an error.

XOR preserves the call context. All messages belonging to one call are always forwarded to the same destination in order for correlation to be successful.

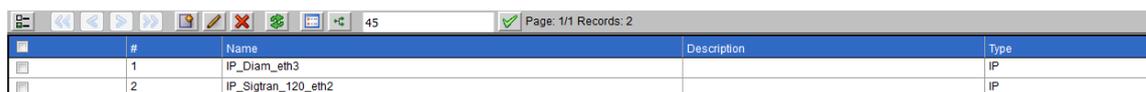

XOR allows a Dataflow with higher throughput of traffic to be load shared to a group of Mediation servers.

**Note:** To create an IP data flow, IP filters have to be already defined and the link-based Network Views used for specifying the IP source has also to be defined.

### Adding an IP Dataflow Using Probed Acquisition

Complete these steps to create an IP data flow:

1. Select **Acquisition > Site > PDU Data Flows > IP**. The IP Dataflow list screen opens.

#	Name	Description	Type
1	IP_Diam_eth3		IP
2	IP_Sigtran_120_eth2		IP

Figure 129: IP Dataflow List Screen

2. Click **Add**. The *Add* screen opens.

IP Data Flow General Configuration

Name

Description

Figure 130: IP Data Flow Add Screen

3. Type in the **Name of the IP Dataflow**
4. (Optional) Type in a **Description** of the dataflow record.
5. Click **Next** to move to the IP Data Flow Load Share Configuration screen.

Section	Field	Description
Load Sharing	Is a set of fields where you can set number of destinations and utilize either GTP user plane, GTP control plane or both for load sharing.	
	Load Sharing Across "N" destinations	Pull-down field (0, 2-8) <ul style="list-style-type: none"> <li>• 0 is default and no load sharing is available.</li> <li>• 2 or greater enables you to load share.</li> </ul>
	Utilize GTP User Plane For Load Share Algorithm	Check box - must have minimum of two destinations for load sharing
	Send GTP Control Plane To All Load Share Destinations	Check box - must have a minimum of two destination for load sharing
Send Traffic Classification Counters Only		Check box to select if only counters are used. Use this when not load sharing.
Enter IP Address for Way Management		Allows you to define a list of IP addresses you want directional information for. When selected, IP packet data forwarded to an Mediation subsystem will include information about the

Section	Field	Description
		direction of the packet in relation to IP addresses defined in the Ip List. If this is not selected, IP address directional information is not be included in the information sent to the Mediation subsystem. <ul style="list-style-type: none"> <li>Host-Address: Point-to-point. For example, 10.25.130.22</li> <li>Network-Address: Monitors whole network. For example, entering 10.254.100.32/27 includes all IP addresses between 10.254.100.32 - 10.254.100.63.</li> </ul>
Add to list button		When clicked, adds value in Ip Address field to the Ip List field.
IP Address List		Shows the IP addresses subject to Way Management for this dataflow. You can add to or remove IP addresses from this list. If Way Management is not selected, then this field is irrelevant to the dataflow.
Remove from list button		Deletes IP addresses from the Ip List field. When an IP address is deleted from the IP List, it is no longer subject to Way Management.
Reset / Cancel Previous / Next		Click on one of the following: <ul style="list-style-type: none"> <li>Reset: Restores original settings.</li> <li>Cancel: Information is not saved.</li> <li>Previous: Returns you to the Add IP Dataflows screen.</li> <li>Next: The Add IP Dataflows Network View screen opens.</li> </ul>

Table 95: Add / Modify IP Dataflow Screen Fields

- (Optional for Load Sharing) Select the **Number of Destinations** that will be used in load sharing (must be two or more).
- (Optional) Select whether the system should utilize the **GTP User Plane** for loadsharing. action.
- (Optional) Select (or not) whether the system should utilized the **GTP Control** Plane to all shared destinations.
- Type in a valid **IP Address(es)**.
- Click **Add**. The IP address is added to the IP Address list.
- Click **Next** to move to the IP Data Flow Truncation Configuration screen.
- Enter a **Packet Truncation Value** (integer).
- (Optional) Select any **Annotations** you want to be associated with the dataflow.
- Click **Next** to move to the IP Data Flow Stream Configuration screen. The *Traffic Classifications* screen opens.

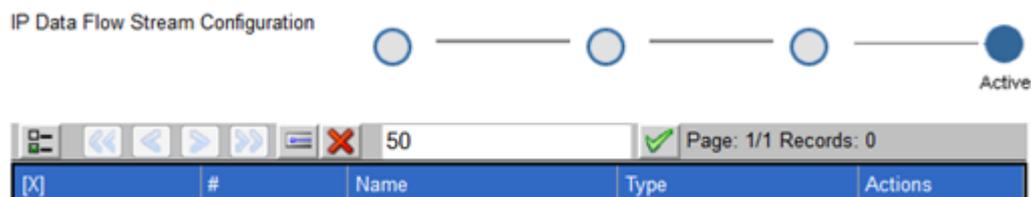

Figure 131: Traffic Classifications Screen

- Click **Select Traffic Classifications** on the tool bar. The *Traffic Classification* Selector screen opens.

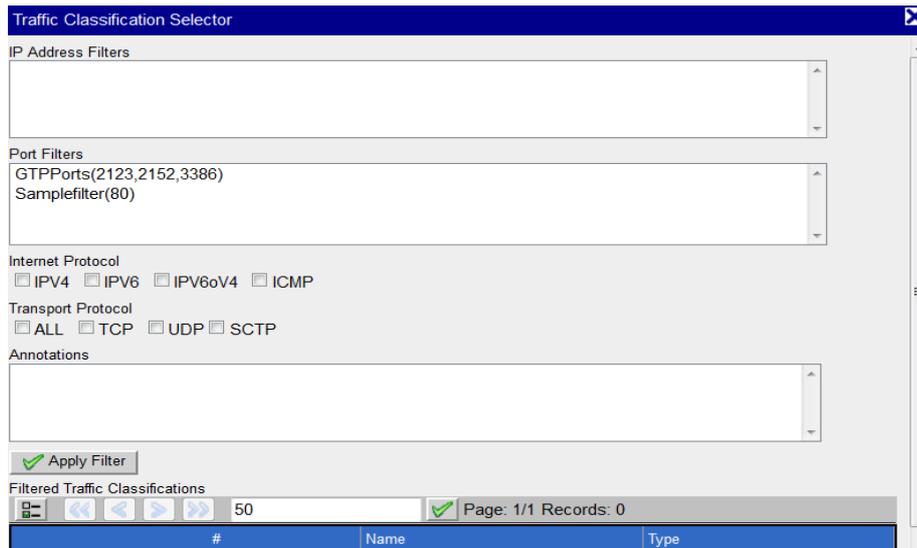

Figure 132: Traffic Classifications Selector Screen

16. Select either an **IP Address Filter** or a **Port Filter**.
17. Select a **Protocol**.
18. Select an **Annotation**.
19. Click **Apply Filter**. The *Filter* appears in the bottom table.
20. Click **Select**. The *Traffic Classification* is added to the dataflow.
21. Click **Add**. The *IP Dataflow* is added to the system.
22. You must now **Apply Changes** for the changes to take effect in the subsystem.

### Adding an IP Dataflow Using Integrated Acquisition FastCopy

Complete these steps to create an IP dataflow using Integrated Acquisition FastCopy.

1. Select **Acquisition > Sites > Subsystem > Integrated Acquisition name > PDU Data Flows > IP**. The *IP Dataflow* list screen opens.

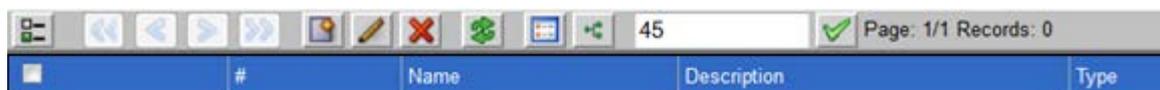

Figure 133: IP Dataflow List Screen

2. Click **Add**. The *Add* screen opens.

Figure 134: IP Data Flow Add Screen

3. Type in the **Name of the IP Dataflow**
4. (Optional) Type in a **Description** of the dataflow record.
5. Click **Next**.

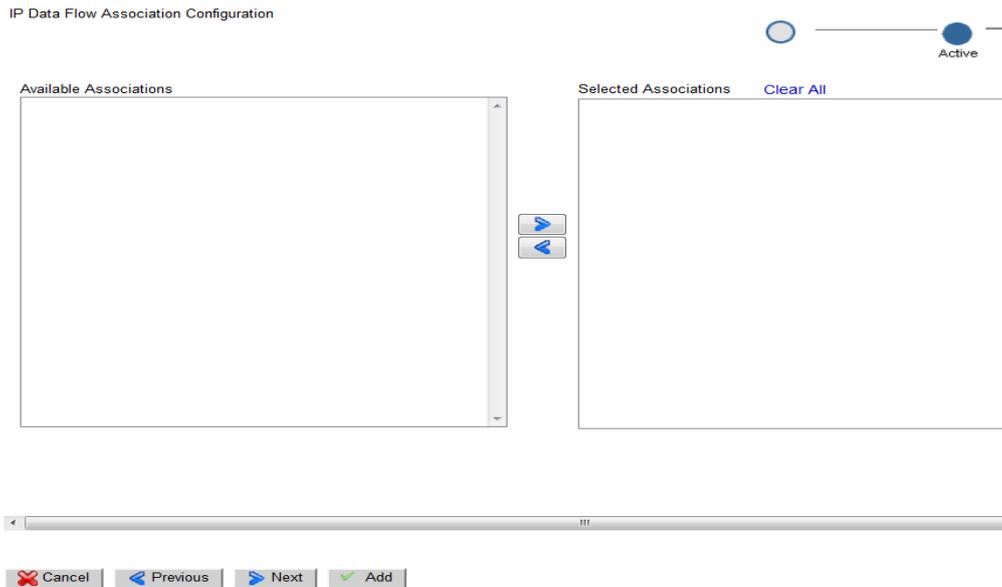

Figure 135: IP Dataflow Associations Selector Screen

6. Select one or more **Available Associations**.
7. Click the **Right Arrow** to place them into the *Selected Associations Field*.
8. Click **Add**.

**Note:** For the changes to take effect, right-click on the Integrated Acquisition subsystem and select **Apply Changes** from the menu.

### Modifying an IP Dataflow

Complete these steps to modify an IP Dataflow:

1. Select the **IP Dataflow Record** to be modified.
2. Click **Modify**. The *Modify* screen opens.
3. Make the **necessary modifications**.
4. Click **Modify**. The *changes* are saved.
5. You must now **Synchronize** the subsystem.

### Deleting an IP Dataflow

Complete these steps to delete an IP Dataflow:

**Note:** You must de-select any IP stream that is associated with an IP dataflow before deleting it.

1. Select the **IP Dataflow Record** to be deleted.
2. Click **Routes**. The bottom table changes to show the *Input streams* for the dataflow.
3. Click **Streams**. The *streams selection* screen opens.
4. **De-select** all the selected streams.
5. Click **Apply**.
6. Click **Delete** on the selected dataflow.
7. Click **OK** at the prompt. The *record* is deleted.
8. You must now **Synchronize** the subsystem.

### About SS7 Q.752 Dataflows

This dataflow is used to monitor Q.752 data, which can be sent to a Mediation. A Q.752 dataflow definition consists of a dataflow name and a description.

## Adding an SS7 Q.752 Dataflow

Complete these steps to create a Q.752 Dataflow:

1. Select **Acquisition > PDU Data Flows > Q.752 Dataflows**.
2. Right-Click and select **Add**. The *Add Q.752 Dataflow* screen opens.

Figure 136: Add Q.752 Dataflow Screen

3. Type in the **Name of the MSU Dataflow**.
4. (Optional) Type in a **Description** of the dataflow record.
5. Click **Next**. The *Q.752 Dataflow View Details* screen opens.

#	Name	Type	Actions
1	eagle12-IMF1A_linkset06	SS7 Linkset (A)	

Figure 137: Network Linkset Details Of Q.752 Record Screen

6. Select the SS7 linksets to select the Linkset type.
7. Click **Add** to add the record to the database.

#	Name	Description	Service Ind	Filter	Direction Type
1	E5-MLH-DF1		ALL		MSU
2	E5-MLH-DF2		ALL		MSU
3	E5-MLH-DF3		ALL		MSU
4	E5-MLH-DF4		ALL		MSU
5	E5-MLH-DF5		ALL		MSU

#	Application/Group Name	Site Name	Streams (Must exist on remote application)	Actions
1	E5-MLH-MG1	E5APPB-MLH	E5-MLH-DF1_E5-MLH-MG1_xp1000_31868(DTS)	

Figure 138: Dataflow Summary Screen

- To route this dataflow go to mediation and select this dataflow.

The screenshot shows a web interface for managing dataflows. At the top, there is a breadcrumb trail: Acquisition > Sites > ESAPPB-MLH > ESAPPB-MLH:XMFB > PDU Data Flows > Q.752 Dataflows > List. Below this, a yellow banner indicates that changes need to be applied. The main content area displays a table of dataflows for site ESAPPB-MLH. The table has columns for #, Name, Description, Service Ind, Filter, and Direction Type. Five dataflows are listed, all with 'ALL' as the service indicator and 'MSU' as the direction type. Below the table, there is a section titled 'Stream routes for dataflow: E5-MLH-DF1' which contains a sub-table with columns for #, Application/Group Name, Site Name, Streams (Must exist on remote application), and Actions. One stream route is shown, linking application E5-MLH-MG1 at site ESAPPB-MLH to streams E5-MLH-DF1\_E5-MLH-MG1\_up1000\_31868(DTS).

#	Name	Description	Service Ind	Filter	Direction Type
1	E5-MLH-DF1		ALL		MSU
2	E5-MLH-DF2		ALL		MSU
3	E5-MLH-DF3		ALL		MSU
4	E5-MLH-DF4		ALL		MSU
5	E5-MLH-DF5		ALL		MSU

#	Application/Group Name	Site Name	Streams (Must exist on remote application)	Actions
1	E5-MLH-MG1	ESAPPB-MLH	E5-MLH-DF1_E5-MLH-MG1_up1000_31868(DTS)	Remove

Figure 139: Dataflows And Stream Routes Streams Screen

- You must now synchronize the subsystem.

### Modifying an SS7 Q.752 Dataflow

Complete these steps to modify an SS7 Q.752 Dataflow:

- Select the **SS7 Q.752 Dataflow Record** to be modified.
- Click **Modify**. The *Modify* screen opens.
- Make the **necessary modifications**.
- Click **Modify**. The *changes* are saved.
- Click **OK** at the prompt. The *record* is deleted.
- You must now **Synchronize** the subsystem.

### Deleting an SS7 Q.752 Dataflow

**Note:** You must de-select any IP stream that is associated with an IP dataflow before deleting it.

- Select the **Q.752 Dataflow Record** to be deleted.
- Click **Routes**. The bottom table changes to show the Input streams for the dataflow.
- Click **Streams**. The *streams* selection screen opens.
- De-select** all the **Selected Streams**.
- Click **Apply**.
- Click **Delete** on the selected dataflow.
- Click **OK** at the prompt. The record is deleted.
- You must now **Synchronize** the subsystem.

### About Alarms

Various types of alarm-related parameters are managed through Centralized Configuration. Alarm management includes enabling/disabling alarms, setting threshold levels as well as other functions. The Performance Intelligence Center system receives alarms from the monitored network as well as the various applications generate alarms based on PDUs received, traffic condition, etc. In addition, users can configure KPI statistical sessions and set alarm thresholds. This release of Centralized Configuration supports the management of alarms that are either received by or generated by the Next-Gen Integrated Acquisition or Probed Acquisition subsystems. This release of Centralized Configuration supports these operations at a global level. For example, if the user enables or disables a particular type of alarm, the action takes effect for all sites. By default all the alarms are enabled. You have to explicitly disable alarms.

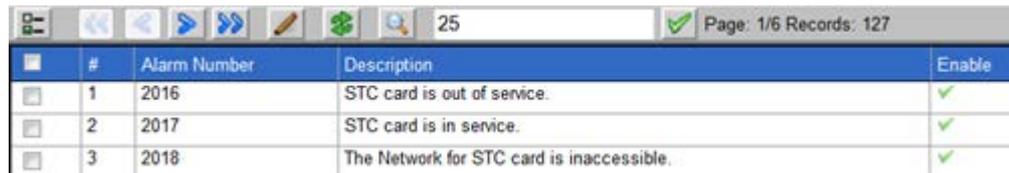

## About SS7 OAM Alarms

This section describes how to use Centralized Configuration to enable and disable Eagle OAM alarms. The Eagle STP reports alarms to an Integrated Acquisition subsystem. The Integrated Acquisition subsystem forwards these alarms to *Alarm* application. The user can enable or disable forwarding of such alarms globally. For a listing of OAM alarms, see *Alarm Configuration User Guide*.

## Enabling and Disabling SS7 OAM Alarms

Complete these steps to enable or disable Eagle OAM alarms:

1. Select **Acquisition > Alarms > Eagle OAM > List**. The screen opens showing the list of Eagle OAM alarms shown below.

#	Alarm Number	Description	Enable
1	2016	STC card is out of service.	<input checked="" type="checkbox"/>
2	2017	STC card is in service.	<input checked="" type="checkbox"/>
3	2018	The Network for STC card is inaccessible.	<input checked="" type="checkbox"/>

Figure 140: Alarms Configuration Screen

2. Select the **Alarm** to be enabled or disabled.
3. Click **Modify**. The Modify Eagle OAM Alarm Configuration screen opens with the alarm record details shown below.

Alarm Number  
2017

Name  
STC card is in service.

Enable

Reset Cancel Done

Figure 141: Modify Eagle OAM Alarm Configuration Screen

4. **Enable** or **Disable** the alarm.
    - a. **Enable** - select the Enable check box.
    - b. **Disable** - click on the Enable check box to remove check mark.
  5. Click **Done**. The modifications are saved and you are returned to the alarm list.
- Note:** To update the alarm list, click the **Refresh** button on the toolbar. The list is updated to show the latest changes.

## Managing SLOR Thresholds

This section describes how the Q.752 alarms parameters are set by the Centralized Configuration application. The Integrated Acquisition and Probed Acquisition servers examine the received PDUs and count types of events. You can set threshold values for these counts. When the count exceeds or falls below the specified level, an alarm is generated.

There are three levels of SLOR alarms:

- High - Default threshold is 40 %
- Low - Default threshold is 20%
- Hold - Default threshold is 5%

**Note:** The thresholds are set for all Integrated Acquisition across subsystems. You cannot have different thresholds for different subsystems.

**Note:** It is recommended that a lower SLOR threshold should not be set above a higher threshold. For example, the threshold for a Low SLOR set at 50% while the High SLOR threshold being set to 40%.

### Setting Signaling Link Occupancy Counter (SLOR) Thresholds

Complete these steps to modify a SLOR threshold:

1. Select **Acquisition > Alarms > SLOR Threshold > List**. The *SLOR threshold configuration* screen opens shown below.

#	Name	Description	Threshold Value
1	HiThresholdSLOR	High threshold of the SLOR (in percentage)	40
2	LowThresholdSLOR	Low threshold of the SLOR (in percentage)	10
3	HoldOnSLOR	Percentage below Hi or Low threshold to auto-clear the alarm	5

Figure 142: Slor Threshold List

2. Select the **Alarm** to be modified.
3. Click **Modify**. The *Modify SLOR Threshold Configuration* screen opens with the alarm record details shown below.

Name  
HiThresholdSLOR

Description  
High threshold of the SLOR (in percentage)

Value  
40

Reset Cancel Done

Figure 143: Modify SLOR Threshold Configuration Screen

4. Type in the new **Value** for the threshold.
5. Click **Done**. The *modifications* are saved and you are returned to the alarm list.

**Note:** To update the alarm list, click the **Refresh** button on the toolbar. The list is updated to show the latest changes.

### Managing Q.752 Alarms

This section describes how the Q.752 alarms are enabled or disabled by the Centralized Configuration application. The Integrated Acquisition / Probed Acquisition system can raise or clear alarms based on the counter thresholds. If an alarm condition is detected, it reports them to the Integrated Acquisition / Probed Acquisition system. The Integrated Acquisition / Probed Acquisition subsystem forwards these alarms to *Alarm* application. You can enable or disable forwarding of such alarms globally. For a listing of Q.752 alarms, see *Alarm Configuration User Guide*.

#### Enabling and Disabling Q.752 Alarms

Complete these steps to enable or disable a Q.752 alarm:

1. Select **Acquisition > Alarms > Q.752/SS7 > List**. The *Q.752/SS7 Alarms Configuration* screen opens.

#	Alarm Number	Description	Enable	AutoClear
1	0	Link Failure	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
2	15	Link Occupancy Rate (Rx)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
3	16	Link Occupancy Rate (Tx)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Figure 144: Q752/SS7 Alarms Configuration Screen

2. Select the **Alarm** to be enabled or disabled.
3. Click **Actions Icon** (modify) the Modify Platform Alarm Configuration screen opens with the alarm record details.

Alarm Number  
15

Link Occupancy Rate (Rx)

Alarms  
SLOR Rx Threshold (Major level)  
SLOR Rx Threshold (minor level)  
SLOR Rx Threshold (Clear event)

Enable

AutoClear

Reset Cancel Done

Figure 145: Modify Platform Alarm Configuration Screen

4. **Enable** or **Disable** the alarm.
  - a. **Enable** - select the Enable check box.
  - b. **Disable** - click on the Enable check box to remove check mark.
5. **Select** or **de-select** AutoClear function.
6. Click **Done**. The *modifications* are saved and you are returned to the alarm list.

**Note:** To update the alarm list, click the Refresh button on the toolbar. The list is updated to show the latest changes.

## About Resource ID Groups (RID)

Resource ID Groups (RID Groups) are used to create SS7 and Sigtran linksets. You manage Resource ID Groups using the Acquisition perspective.

### About Auto RID

Auto RID provides two automatically configured RID groups: one for 'AUTO RID' with a value of 65535 and another for 'AUTO RID REVERSE' with a value of 65534. The figure below shows the default settings in the Resource ID group list screen. See [About Auto RID](#) for more information.

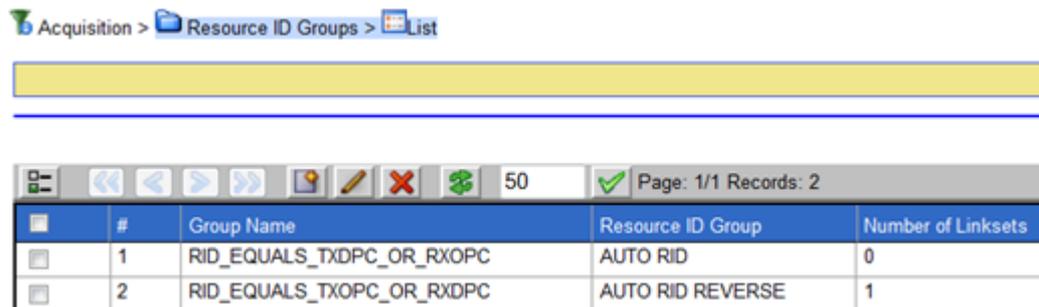

#	Group Name	Resource ID Group	Number of Linksets
1	RID_EQUALS_TXDPC_OR_RXOPC	AUTO RID	0
2	RID_EQUALS_TXOPC_OR_RXDPC	AUTO RID REVERSE	1

Figure 146: Modify Resource ID Group List Screen (Default)

## Creating a Resource ID Group

Complete these steps to create a Resource ID Group:

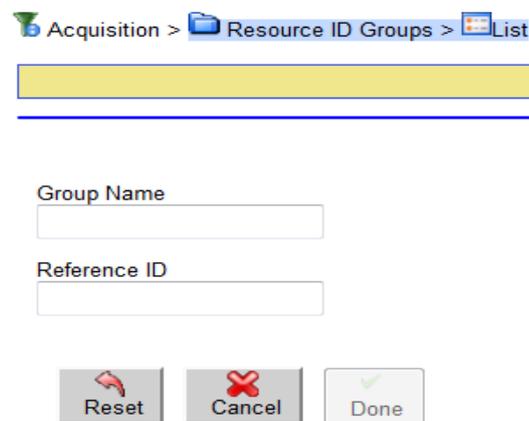

1. Select **Acquisition > Resource ID Groups**. The *Resource ID* group list screen opens.

#	Group Name	Resource ID Group	Number of Linksets
1	RID_EQUALS_TXDPC_OR_RXOPC	AUTO RID	0
2	RID_EQUALS_TXOPC_OR_RXDPC	AUTO RID REVERSE	1

Figure 147: Resource ID Group List Screen

2. Click **Add**. The *Add* screen opens.

Group Name

Reference ID

Figure 148: Resource ID Group List Screen

3. Type in the **Group Name**.
4. Type in the **Reference Group** (this must be a number)  
**Note:** The Referenced ID must be a number. No symbols or letters are allowed.
5. Click **Done**. The *Resource ID Group* is added to the Settings list.

## Modifying a Resource ID Group

Complete these steps to modify a Resource ID Group:

1. Select the **Resource ID Group** that needs modification from the Object Tree.
2. Select **Modify**.
3. Modify the **appropriate information**.

**Note:** You can only modify the Group Name. To change any other information, you must either add a new group, or delete the existing group and add it again with the new information.

4. Click **Modify**. The *changes* are saved.

## Deleting a Resource ID Group

Complete these steps to delete a Resource ID Group:

**Note:** You cannot delete an RID group if it has linksets assigned to it or if the RID group is pre-defined.

1. Select the **Resource ID Group** to be deleted.

2. Select **Delete** from the menu.
3. Click **OK** at the prompt. The *group* is deleted.

## About Q.752 Counters

### Listing Q.752 Counters

Complete these steps to list a Q.752 counter:

1. Select **Acquisition > Q.752 counters > List**. The Q.752 Counters List screen opens shown below.

#	Name	Low Threshold	High Threshold	Status	Actions
1	Q.752_1_10_30M	100	500	✓	
2	Q.752_1_1_30M	20	80	✓	
3	Q.752_1_7_30M	20	80	✓	
4	Q.752_1_8_30M	20	80	✓	

Figure 149: Q752 Counters List Screen

2. From the list you can **modify** a record(s).

### Modifying a Q.752 counter Record

Complete these steps to modify a Q.752 counter record:

1. Select **Acquisition > Q.752 counters > List** to open the **Q.752 Counters List** screen.
2. Select the **Counter** to be modified.
3. Click **Modify** on the right-hand column. The *Q.752 Counter Modify Information* screen opens.

**Note:** You can also select the record to be modified by clicking in the left-hand column then click the Modify button on the tool bar.

Name  
Q.752\_1\_10\_30M

Low Threshold  
100 events

High Threshold  
500 events

Status  
Active

Reset Cancel Done

Figure 150: Q752 Counter Modify Information Screen

4. The only **Fields** you can modify are:
  - a) **Low Threshold** (number)
  - b) **High Threshold** (number)
  - c) **Active** (to activate or de-activate the counter)
5. Click **Done** to send the changes to the database. You are returned to the List screen.
6. Click **Refresh** to view changes.

**Note:** It takes approximately 10 seconds for the changes to be registered by the Acquisition system.

## About Probed Acquisition Sigtran Configuration Use Case

### Configuration Overview

The main goal of Probed Acquisition in Sigtran network monitoring is to classify the network traffic to be able to feed the appropriate Mediation Protocol.

This table describes relation between Mediation Protocol and Probed Acquisition Sigtran filters:

Mediation Protocol	Probed Acquisition Filter
RAN CC 2 CDR	RANAP-M3UA BSSAP-M3UA
RAN CC CDR	RANAP-M3UA BSSAP-M3UA
RAN MM TDR	RANAP-M3UA BSSAP-M3UA
RAN SMS TDR	RANAP-M3UA BSSAP-M3UA
RAN USSD TDR	RANAP-M3UA BSSAP-M3UA
SS7 AIN TDR RECONSTITUTION	AIN-SCTP-ANSI OR AIN-M3UA-ANSI OR AIN-M2PA-ANSI
SS7 BICC ANSI CDR CAPTURE	BICC-SCTP OR BICC-M3UA OR BICC-M2PA
SS7 BICC ANSI CDR RECONSTITUTION	BICC-SCTP OR BICC-M3UA OR BICC-M2PA
SS7 BICC ETSI CDR CAPTURE	BICC-SCTP OR BICC-M3UA OR BICC-M2PA

Table 96: Probed Acquisition Sigtran filters usage

**Remark:** The choice between M3UA and M2PA depends of the Sigtran network interface to monitor.

The figure below describes an overview of the final Probed Acquisition Sigtran configuration:

- Predefined Protocol filtering at xMF level in order to avoid filtering on IXP and use only one builder per DFP
- In some case Predefined filters might be customized (MAP/INAP SSN for example)
- SS7 DFP Capacity 40M
- CN-AN DFP Capacity 25M
- If the volume of traffic is over the capacity of one DFP loadshare the Traffic using Capacity management qualification information

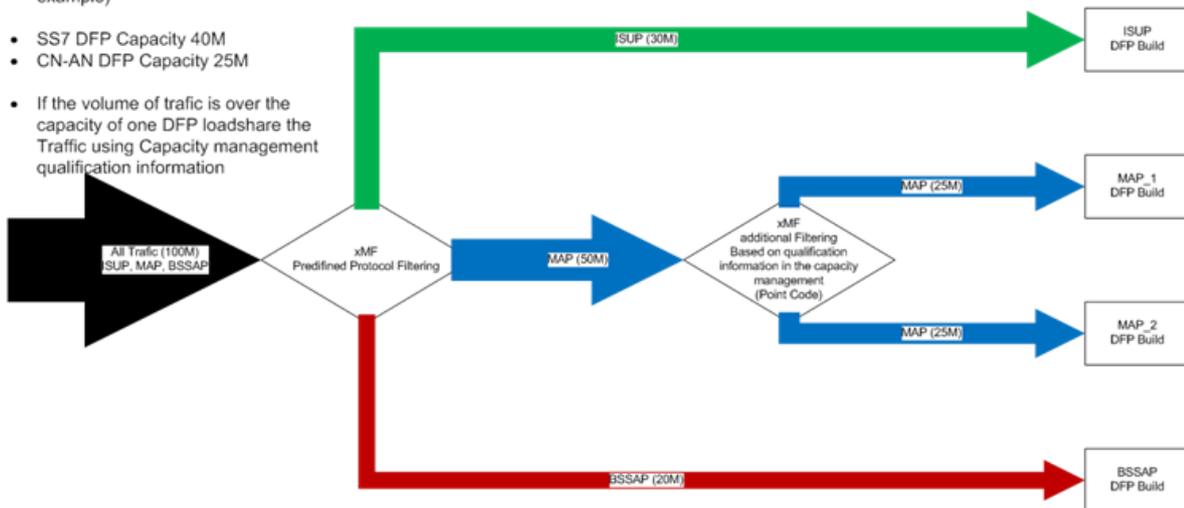

Figure 151: Final Probed Acquisition Sigtran configuration overview

## Configuration Use Case Description

### Analysing Network Traffic

1. Configure the Traffic Classifications :
  - a. Identify the type of network to monitor: ETSI or ANSI and M2PA or M3UA traffic
  - b. Using “Probed Acquisition Sigtran Filters Usage” table, identify needed Traffic Classifications and create them using following option – cf. [About Traffic Classifications \(Probed Acquisition\)](#) :

- Name: e.g. "MAP", "ISUP", "MNGT", "INAP", "IS41", "AIN" ...
  - Transport Protocol: SCTP
  - Forwarding: Chunk
  - Filters: see "Probed Acquisition Sigtran Filters Usage" table
- c. Apply the configuration

#	Traffic Classification Name	Description	Internet Protocol	Transport Protocol	Application Layer	Forwarding	Status	Duplicate Suppression
1	MAP		IPV4	SCTP	All	Chunks	✓	✗
2	Pri_Tc		IPV4	All	All	Packets	✓	✗
3	SK_TC		IPV4	All	All	Packets	✓	✗

Figure 152: Configure the Traffic Classifications

2. Monitor and Analyse Capacity Management Session Records:

Ideally, let the system running during one full day and analyze the Capacity Management session identify the peak of traffic period.

**Create Final Probed Acquisition Configuration**

1. Create the Point Code Filter Rules:

Using Capacity Management session, extracts Point Code filter rules to limit bandwidth of each Traffic Classification.

2. Create the PDU Filters:

Following step must be done for each Point Code filter rules:

- a. In **Acquisition >PDU Filters**, create a new Sigtran Raw Filter and paste your Point Code filter rules – don't forget to add the m3ua/m3uaa/m2pa/m2paa keyword depending of the type of network to monitor:

```
E.g. "PC-3-MAP" filter:  
m3ua((pc 1142 and pc 1223) or (pc 1142 and pc 1482)  
or (pc 1142 and pc 10703) or (pc 1142 and pc 10704)  
or (pc 1142 and pc 10201) or (pc 1142 and pc 1511)...)

```

- b. In **Acquisition >PDU Filters**, create a new Sigtran Combination Filter which combines a Point Code filter AND its Probed Acquisition Sigtran filter:

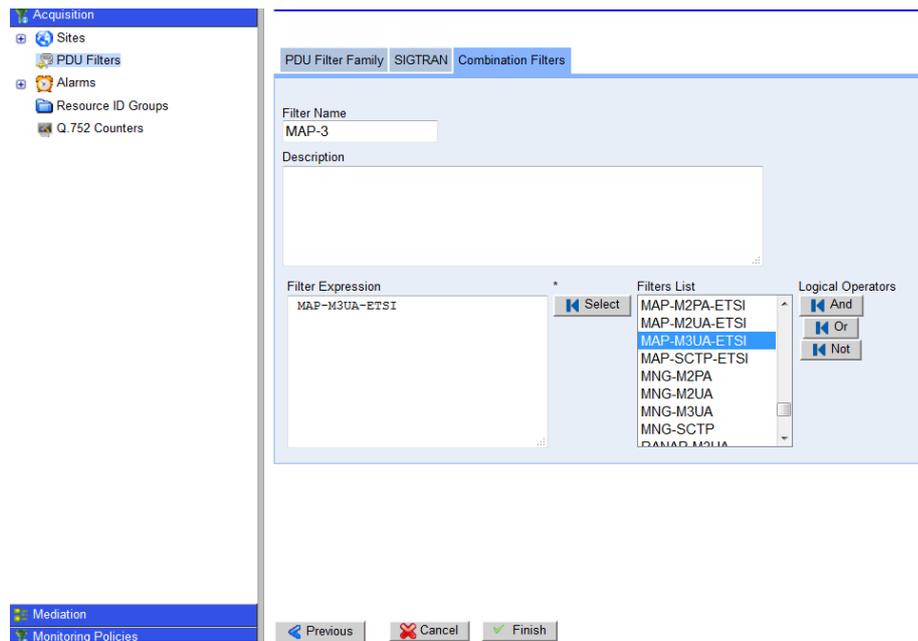

Figure 153: Creation of Sigtran Combination Filter

- c. In **Acquisition > Site > Server > Traffic Classification**, create a Traffic Classification which uses this Sigtran Combination Filter using same option as before (Transport Protocol: SCTP and Forwarding: Chunk). This Traffic Classification can be used to send traffic to Mediation Protocol without overload its bandwidth limitation.

## About Probed Acquisition Diameter Configuration Use Case

### Configuration overview

The main goal of Probed Acquisition Diameter is to classify the network traffic to be able to feed the appropriate Mediation Protocol.

This table describes relation between Mediation Protocol and Probed Acquisition Diameter filters:

Mediation Protocol	Probed Acquisition Filter
LTE DIAMETER TDR	DIA_NO_SESS_ID IPV6 DIA_SESS_ID
LTE DIAMETER AAA TDR	DIA_APP_AAA
LTE DIAMETER GX TDR	DIA_APP_GX
LTE DIAMETER GY TDR	DIA_APP_GY
LTE DIAMETER LCS TDR	DIA_APP_LCS
LTE DIAMETER RX TDR	DIA_APP_RX
LTE DIAMETER S6 TDR	DIA_APP_S6 DIA_APP_S13
LTE DIAMETER S9 TDR	DIA_APP_S9
LTE DIAMETER SUDR Accounting	DIA_APP_S6
IMS DIAMETER Sh TDR	DIA_APP_SH

Table 97: Probed Acquisition Diameter Filters Usage

## Configuration Use Case Description

### Analysing network traffic

1. Configure the traffic classifications :
  - a. Identify the Diameter port values and update the **DIA\_PORTS** PDU Filter
  - b. Create **IPv6** traffic classification
    - i. Name: IPv6
    - ii. Transport Protocol: IPV6
    - iii. Forwarding: Packets
  - c. Create **DIA\_NO\_SESS\_ID** traffic classification
    - i. Name: DIA\_NO\_SESS\_ID
    - ii. Transport Protocol: ALL
    - iii. Forwarding: Chunks and TcpFlow
    - iv. Filter: DIA\_NO\_SESS\_ID
  - d. Create **DIA\_SESS\_ID** traffic classification
    - i. Name: DIA\_SESS\_ID
    - ii. Transport Protocol: ALL
    - iii. Forwarding: Chunks and TcpFlow
    - iv. Filter: DIA\_SESS\_ID
  - e. Apply the configuration
2. Monitor and analyse CapacityManagement session records to determine the Diameter traffic bandwidth. This information will be necessary to size the Mediation processing:

Diameter traffic load	Probed Acquisition output Streams	Number of Mediation servers	Production interface
< 125 Mbps	1	1	Optional
< 250 Mbps	2	1	Optional
< 375 Mbps	3	1	Optional
< 500 Mbps	4	1	Optional
< 625 Mbps	5	2	Optional
< 750 Mbps	6	2	Mandatory
< 875 Mbps	7	2	Mandatory
< 1000 Mbps	8	2	Mandatory
< 1125 Mbps	9	3	Mandatory
< 1250 Mbps	10	3	Mandatory
< 1375 Mbps	11	3	Mandatory

< 1500 Mbps	12	3	Mandatory
< 1625 Mbps	13	4	Mandatory
< 1750 Mbps	14	4	Mandatory
< 1875 Mbps	15	4	Mandatory
< 2000 Mbps	16	4	Mandatory
Not supported	-	-	-

Table 98: Dimensioning Rules

**Remark:** It is highly recommended to connect the Acquisition server on the same switch then Mediation servers sub-system to avoid any customer network dimensioning issue. If this recommendation is followed and Production interface is necessary, then it is possible to define local production IP addresses, i.e. 192.168.1.0/24 - these IP addresses are only known by Acquisition and Mediation server (no production routes must be configured).

#### Create basic Probed Acquisition Configuration

1. If **Probed Acquisition output Streams**, necessary to process Diameter traffic, are greater than 1, then update the **DIA\_LS\_MAX** PDU Filter value with this value,
2. Create additional traffic classifications (one for each **Probed Acquisition output Streams**):

Example with **DIA\_LS\_MAX** PDU Filter value equal to 3:

Traffic Classification	Filter	Transport	Forwarding
DIA_SESS_ID	DIA_SESS_ID_LS0	ALL	Chunks and TcpFlow
DIA_SESS_ID_LS1	DIA_SESS_ID_LS1	ALL	Chunks and TcpFlow
DIA_SESS_ID_LS2	DIA_SESS_ID_LS2	ALL	Chunks and TcpFlow

3. Create one PDU Data Flow for each traffic classification

#### Create Probed Acquisition configuration to Feed Specific LTE DIAMETER session

The PDU Filters, named **DIA\_APP\_\***, can be used to feed Specific LTE DIAMETER session (see table, [Probed Acquisition Diameter Filter Usage](#)).

To avoid traffic duplication and processing at Probed Acquisition output, it is recommended to create new **DIA\_SESS\_ID\*** filters by removing these Application Identifier values.

**Important:** All Diameter filter must be created using **IP - Internet protocol** family of **PDU Filters**.

Example of syntax:

*(DIA\_SCTP and sctp(not(dia\_appid 16777255 or dia\_appid 16777291) and (load\_share(dia\_sessid) or not dia\_sessid))) or (DIA\_TCP and tcp(not(dia\_appid 16777255 or dia\_appid 16777291) and (load\_share(dia\_sessid) or not dia\_sessid)))*

**Remark:** it is possible to load share, **DIA\_APP\_\*** and modified **DIA\_SESS\_ID\*** with same kind of filter rules used in default **DIA\_SESS\_ID\*** filter rules.

**Remark:** each filter rule can be combined with IP address and Port filter rules in order to reject some Diameter IP connections if necessary.

## About Integrated OCDSR Monitoring Configuration Use Case

### Configuration overview

The main goal of Integrated OCDSR Monitoring is to classify the network traffic to be able to feed the appropriate Mediation Protocol.

This table describes relation between Mediation Protocol and Probed Acquisition output streams:

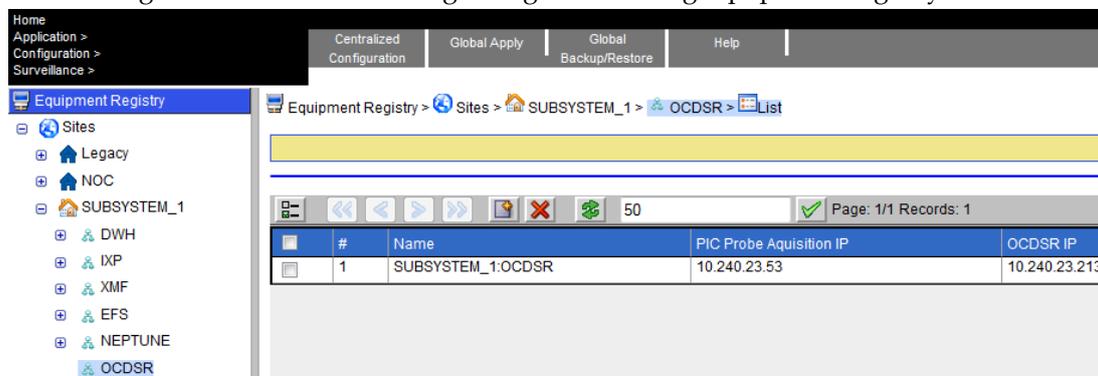

Mediation Protocol	Probed Acquisition output streams
LTE DIAMETER TDR	{pmf-hostname}_DIA_NO_SESS_ID {pmf-hostname}_IPV6 {pmf-hostname}_DIA_SESS_ID
LTE DIAMETER AAA TDR	{pmf-hostname}_DIA_S6b_SESS_ID {pmf-hostname}_DIA_Sta_SESS_ID {pmf-hostname}_DIA_SWm_SESS_ID {pmf-hostname}_DIA_SWx_SESS_ID
LTE DIAMETER GX TDR	{pmf-hostname}_DIA_Gx_SESS_ID
LTE DIAMETER GY TDR	{pmf-hostname}_DIA_Gy_SESS_ID
LTE DIAMETER LCS TDR	{pmf-hostname}_DIA_SLg_SESS_ID {pmf-hostname}_DIA_SLh_SESS_ID
LTE DIAMETER RX TDR	{pmf-hostname}_DIA_Rx_SESS_ID
LTE DIAMETER S6 TDR	{pmf-hostname}_DIA_S6a_SESS_ID {pmf-hostname}_DIA_S13_SESS_ID
LTE DIAMETER S9 TDR	{pmf-hostname}_DIA_S9_SESS_ID
LTE DIAMETER SUDR Accounting	{pmf-hostname}_DIA_S6a_SESS_ID
IMS DIAMETER Sh TDR	{pmf-hostname}_DIA_Sh_SESS_ID

Table 99: Integrated OCDSR Monitoring Streams Usage

### Configuration use case description

#### Configure a LTE DIAMETER TDR session

1. Add an Integrated OCDSR Monitoring configuration using Equipment Registry menu:

**Remark:** OCDSR Monitoring must be added in the same site as Mediation servers in order to be able to discover *Sync OCDSR Streams*.

2. Configure LTE DIAMETER TDR Data Flow Processing
  - a. Use **Associations - OCDSR** menu in **Network Elements** to get all Diameters port values (all **Peer Port** values):

#	Local Name	Local IP Address	Local Port	Protocol	Peer Name	Peer IP Address	Peer Port	Peer Monitoring
1	localnode	192.168.2.21	3868	TCP	mme1	192.168.2.6	3869	<input checked="" type="checkbox"/>
2	localnode	192.168.2.21	3868	TCP	mme4	192.168.2.6	3870	<input checked="" type="checkbox"/>
3	localnode	192.168.2.21	3868	TCP	mme3	192.168.2.6	3871	<input checked="" type="checkbox"/>
4	localnode	192.168.2.21	3868	TCP	mme5	192.168.2.6	3873	<input checked="" type="checkbox"/>
5		192.168.2.21	49150	TCP	hss1	192.168.2.7	3869	<input checked="" type="checkbox"/>
6		192.168.2.21	49145	TCP	hss2	192.168.2.7	3870	<input checked="" type="checkbox"/>
7		192.168.2.21	49147	TCP	hss3	192.168.2.7	3871	<input checked="" type="checkbox"/>
8		192.168.2.21	49143	TCP	hss5	192.168.3.7	3873	<input checked="" type="checkbox"/>
9		192.168.3.21	49151	TCP	hss1	192.168.3.7	3869	<input checked="" type="checkbox"/>

These values will be used in Mediation Protocol configuration.

- b. **Sync OCDSR Streams** in **Mediation > Sites > Mediation Subsystem > Streams** menu
- c. Using **Data Flow Processing Assistant**, select following {pmf-hostname}\_DIA\_NO\_SESS\_ID, {pmf-hostname}\_IPV6 and {pmf-hostname}\_DIA\_SESS\_ID PDU streams to create LTE DIAMETER TDR session
- d. Update Mediation Protocol specific parameters:
  - In **IMS DIAMETER Decoding**, check **Activate Optimized Diameter Mode**
  - In **IP Transport**, add the Diameters port values in the **IMS Diameter** list for **Builders Subscriptions** and **List of servers ports known**.

### Configure a Specific LTE DIAMETER session

Thanks to LTE DIAMETER TDR session, it is possible to have a global view of Diameter traffic on your network. However specific Mediation Protocol are available to provide more accurate information depending of Diameter type of interface (AAA, Gx, Gy, LCS, Rx, S6, S9). This section describes how to enable a specific Diameter session.

1. On Probed Acquisition, execute **Application Identifier customization** procedure described in TSG for all Application Identifier values on which you'd like to create a specific session
2. Configure specific LTE DIAMETER TDR Data Flow Processing
  - a. **Sync OCDSR Streams** in **Mediation > Sites > Mediation Subsystem > Streams** menu. Additional stream should be detected with name {pmf-hostname}\_DIA\_{Application Identifier Label}\_SESS\_ID
  - b. Using **Data Flow Processing Assistant**, select following {pmf-hostname}\_DIA\_{Application Identifier Label}\_SESS\_ID stream to create specific LTE DIAMETER TDR session (see table, INTEGRATED OCDSR MONITORING STREAMS USAGE)
  - c. Update Mediation Protocol specific parameters:
    - i. In **IP Transport**, add the Diameters port values in the **IMS Diameter** list for **Builders Subscriptions** and **List of servers ports known**.

**Remark:** For specific LTE DIAMETER session, the parameter **Activate Optimized Diameter Mode** in **IMS DIAMETER Decoding** SHALL NOT be activated.

### **Configure an additional Data Flow Processing in case of automatic load-sharing**

The Integrated OCDSR Monitoring can automatically load-share traffic on several output streams if the bandwidth exceed limitation (by default 125 Mbps). This new output stream can be configured to another Data Flow Processing, using following procedure:

1. **Sync OCDSR Streams** in **Mediation > Sites > Mediation Subsystem > Streams** menu.  
Additional stream should be detected with name {base-stream-name}\_LSn (with **n** between 1 and 15).
2. Using **Data Flow Processing Assistant**, select each {base-stream-name}\_LSn and create appropriate LTE DIAMETER session
3. Update Mediation Protocol specific parameters (same configuration as for base-stream-name session)

**Remark:** Integrated OCDSR Monitoring dimensioning rules are equivalent to Probed Acquisition Diameter (see table, Dimensioning rules).

## Chapter 9: Mediation

### About Mediation Perspective

The *Mediation Perspective* enables you to manage the Mediation, (and Data Warehouse (DWH)), subsystems. The entire configuration in this perspective is designed to configure Dataflow Processings, data sources, input Streams, xDR filters, distributions, platform parameters of xDRs in either a *DWH* or Mediation subsystem.

### About Managing each Mediation Subsystem

The *Mediation Perspective* object tree has the Site object where you can manage Mediation subsystems belonging to a particular site. Once you have discovered all the elements of each Mediation subsystem, you go to the Mediation perspective to configure the subsystem.

In addition, once the Subsystem is discovered, you can click on the Subsystem in the *Mediation Perspective* to view a platform overview of the system.

Properties		Value		
Subsystem name		isp0900		
User information		Auto-generated sub-system		

Host Name	Type	IP Address	Last Update	User information
isp0900-1b	Primary	10.31.1.122	2015-10-09 09:41:22.0

Figure 154: Mediation Subsystem Overview

**Note:** You must explicitly apply all Mediation configuration changes to each Mediation subsystem. You are prompted if there is any change to the subsystem by a message banner at the top of the screen.

## About Mediation Subsystem Functions

The general maintenance and configuration options for a specific Mediation Subsystem are accessed by right-clicking on the selected Mediation subsystem. (Select **Sites > Mediation subsystem**) The pop-up menu opens, shown below. The options are described in the table and sections below.

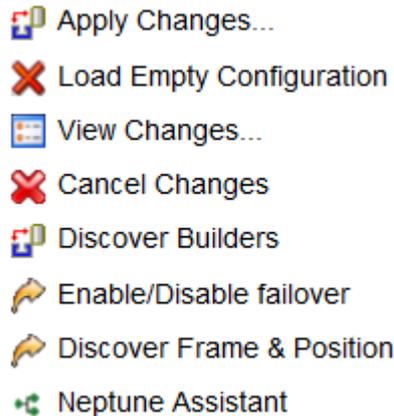

Figure 155: Subsystem Pop-Up Menu

Option	Description
Apply Changes	Enables you to apply any changes that have been made to the particular Mediation subsystem. You are notified if there are any changes to the system and you use this option to accept the changes.
Load Empty Configuration	Enables you to configure an Mediation subsystem by using a template configuration.
View Changes	Enables you to view any changes that have occurred in the subsystem in order to accept the change or cancel them.
Cancel Changes	Enables you to cancel any changes that have been made to the subsystem.
Config Backup/Restore	Enables you to backup or restore a previous backup configuration in case of system failure.
Discover Builders	Enables you to discover Mediation Protocol for the subsystem if upgrades to Mediations Protocols have been installed on the system.
Modify server roles	Enables you to change the role of a server
Synchronize Frame and Position	Enables you to synchronize the subsystem after you have modified the frame and position of a host in the Mediation subsystem.

Table 100: Mediation Subsystem Pop-Up Menu Options

### About applying changes to a subsystem (Synchronizing)

**Note:** To Apply Changes to a Subsystem you need to be assigned the role *NSPConfigManager*.

Anytime you add, modify or delete an object in an Mediation Subsystem, you need to Synchronize the Subsystem so that the changes are recognized by the system. Centralized Configuration has an Mediation Subsystem prompt option that alerts you to any changes that have occurred.

Configuration has occurred on the following Mediation subsystems: *MediationSubsystemName*, changes must be applied or cancelled.

Complete these steps to Apply Changes to a Subsystem: Select the **Subsystem** that has been modified:

1. Right-click and select **Apply Changes...** from the pop-up menu. Centralized Configuration displays the *configuration changes* that will be applied to the selected Mediation subsystem. At this point, you are prompted if you want to continue, cancel, or undo.
2. Click **Continue**. The *configuration* is validated and any warning messages are displayed.

**Note:** If there are warnings, you are prompted if you still want to apply changes.

3. To apply changes, click **Apply**.

### Viewing Changes to an Mediation Subsystem

Complete these steps to view the most recent synchronization and any pending changes on an Mediation Subsystem:

1. Select **Mediation > Site >Mediation Subsystem**.
2. From the subsystem right-click menu select **View Changes**.  
The screen shows the *time* and *date* of the last synchronization and any pending changes in the bottom table.

### Enabling and Disabling Mediation Subsystem Automatic Failover

Complete these steps to enable or disable the automatic failover for an Mediation Subsystem:

1. Select **Mediation > Site > Mediation Subsystem**.
2. Right-click and select **Enable / Disable Auto Failover**.

**Note:** Enabling and disabling an Mediation subsystem can also be performed from the Actions column in the Mediation list screen.

3. Select either **Enable** (default setting) or **Disable**.
4. Click **Done**.

**Note:** For the changes to take effect, click **Apply Changes**.

### Loading an Empty Configuration on to a Mediation Subsystem

Complete these steps to load an empty configuration on an Mediation Subsystem:

1. Select the **Acquisition > Site >Mediation Subsystem**.
2. From right-click menu select **Load Empty Configuration**.

**Note:** A warning appears stating that loading an empty configuration un-route PDU Dataflow at the associated Acquisition subsystem. (For more information, see [Avoiding Lost PDU Routes Due to Cancel Changes on an Acquisition Subsystem](#).)

3. To continue to load an empty configuration, click OK.

**Note:** For changes to take effect, click **Apply Changes** from the subsystem right-click menu.

### Cancelling Changes to an Mediation Subsystem

You can cancel changes to a subsystem by using the Cancel Changes option.

**Note:** Choosing "Cancel Changes" on an Acquisition Subsystem removes the existing configuration (any changes that have occurred) of that subsystem and restores the latest applied (active) configuration which includes Monitoring Groups in the case of Integrated Acquisition or Card/Port/Link Mapping and Traffic Classifications (TCs) in the case of Probed Acquisition. Feeder Thresholds, Acquisition subsystem parameters and PDU Dataflow are preserved (but the PDU routes are not preserved). This action also enables the "Apply Changes" banner for that Acquisition subsystem. PDU dataflow routing can be restored either by modifying the Build DFPs on the IXP subsystem in order to re-associate the Dataflow with the DFPs, or by restoring the last applied configuration on the IXP subsystem that contains the Build DFPs (see next note for constraints on restoring IXP).

Complete these steps to cancel changes for a subsystem. Again, if any changes have occurred, you are prompted with this message:

Configuration has occurred on the following Mediation subsystems: MediationSubsystemName, changes must be applied or cancelled.

**Note:** To **Apply Changes** to a subsystem you need to be assigned the role *NSPConfigManager* or *NSPAdministrator*.

1. Select the **Subsystem** that needs to have the changes cancelled.
2. Right-click and select **Cancel Changes** from the pop-up menu.  
Centralized Configuration displays the *configuration changes* that will be applied to the selected Mediation subsystem. At this point, you are prompted if you want to continue, cancel, or undo.
3. Click **Undo**.  
The *last configuration* that was applied to the Mediation subsystem is reloaded.

## Backup and restoring an Mediation Subsystem

Centralized Configuration has a backup/restore function that enables you to backup and archive the Mediation configuration per subsystem. Centralized Configuration also has a option to restore the Mediation configuration from an archived backup. This option enables you to bring the configuration of an Mediation Subsystem to any previously working state.It creates a global auto backup after apply changes in subsystem.

Complete these steps to backup or restore an Mediation Subsystem:

**Note:** To apply changes to a subsystem you need to be assigned the role *NSPConfigManager*.

1. Open the Drop-down of Global backup/restore on Centralized Configuration Home Page.
2. Centralized Configuration displays a table of named archived backups.

BackUp Name	State	User Information	Creation Time
* All	* All	* All	* All
PicConfig_Wed Oct 14 10:36:26 GMT+200 2015	ACTIVE	Auto Created ACTIVE BACKUP during apply changes.	14/10/2015 10:36:32
PicConfig_Wed Oct 14 10:02:40 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	14/10/2015 10:02:47
PicConfig_Wed Oct 14 11:58:25 GMT+530 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	14/10/2015 08:28:59
PicConfig_Wed Oct 14 11:58:01 GMT+530 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	14/10/2015 08:28:35
PicConfig_Tue Oct 13 18:15:03 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	13/10/2015 18:15:09
PicConfig_Tue Oct 13 17:42:31 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	13/10/2015 17:42:36
PicConfig_Tue Oct 13 17:40:29 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	13/10/2015 17:40:34
PicConfig_Tue Oct 13 17:40:14 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	13/10/2015 17:40:19
PicConfig_Tue Oct 13 17:39:47 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	13/10/2015 17:39:52
PicConfig_Tue Oct 13 17:37:53 GMT+200 2015	SYSTEM	Auto Created SYSTEM BACKUP during apply changes.	13/10/2015 17:37:58

Figure 156: Archived List Of Configurations

3. Click **Add**.  
Centralized Configuration automatically names the backup and stores a configuration backup in the Management Application database. Centralized Configuration maintains up to *nine backups* per subsystem.

## Deleting an archived Backup

You can also delete an archived backup file by using the delete function described here.

Complete these steps to delete a backup file:

**Note:** To apply changes or delete a subsystem you need to be assigned the role *NSPConfigManager*.

1. Select the **Archived Version** that you want from the list.
2. Click **Delete**.
3. Click **OK** at the prompt. The *archived backup* is deleted from the list.

## Discovering Frame and Port Position

You use the Discover Frames and Position option if there has been an update to the Mediation subsystem.

Complete these steps to discover the frames and positions for a specific Mediation Subsystem:

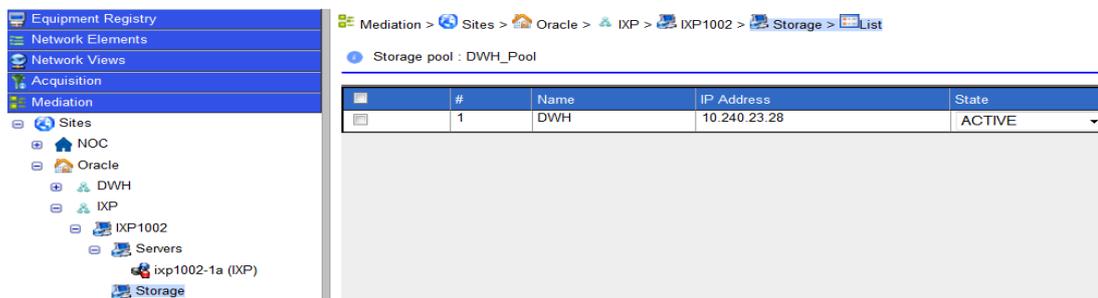

1. Select and right-click on the **Mediation Subsystem** that needs the discovery process.
2. Select **Discover Frames and Positions** from the pop-up menu.  
The discovery process begins. When completed a prompt appears stating, "Discovered Frame \* Position for all hosts under subsystem - name of subsystem."

## Modifying a server Role

Server roles (primary/secondary/ancillary server roles) are designated for each Mediation server by Centralized Configuration the subsystem and applications are discovered. Centralized Configuration assigns primary status only to the server that has 1a designation. Secondary status is designated to the server labeled 1b and ancillary status to the rest if the servers (1c, 1d, 1e, etc.). The order of discovery of the hosts does not matter. If you need to switch a server role, say, switching a primary to secondary, you are automatically directed to *Apply Changes* screen where changes have to be manually activated on the Mediation subsystem.

## About Data Record Storage Servers

Once you have added an Mediation Subsystem in the Equipment Registry, that Mediation Subsystem is visible in the Mediation Perspective. From this perspective you view the storage servers that have been assigned to that subsystem. By selecting **Mediation > Site > Mediation Subsystem > Servers > Storage**. The list of storage servers opens.

The screenshot shows the Mediation Perspective interface. On the left is a navigation tree with 'Mediation' selected, showing a hierarchy: Sites > Oracle > DWH > IXP > IXP1002 > Servers > Storage. The main pane shows the breadcrumb path: Mediation > Sites > Oracle > IXP > IXP1002 > Storage > List. Below the breadcrumb, it says 'Storage pool : DWH\_Pool'. A table with the following data is displayed:

#	Name	IP Address	State
1	DWH	10.240.23.28	ACTIVE

Figure 157: Storage Server Object and List Table

## Changing the State of a Data Record Storage Server

Complete these steps to change the state of an Mediation storage server:

**Note:** If an Mediation storage server is in "Query" state, no configuration actions can be undertaken. All servers must be in "Active" state when sessions are created for queries on such sessions to be successful.

Otherwise, if a query is launched in Troubleshooting on a newly created session, a "Unable to execute query:

ORA-00942: table or view does not exist." will appear.

1. Select **Mediation > Site > Mediation Subsystem > Server > Storage**.  
The storage server list screen opens.
2. Select the **State** from the pull-down menu in the *State column*.

	#	Name	IP Address	State
<input checked="" type="checkbox"/>	1	DWH	10.240.23.28	ACTIVE
				MAINTENANCE
				ACTIVE
				QUERY ONLY

Figure 158: Add Screen

- Click **OK** at the prompt. The *state* is changed.

### Data Recors Storage Pool States

You can manage a Data Record storage pool by managing the state of the server on the specific subsystem. Each state also has an effect on an Management Application. These tables show the states and the effect on specific applications.

State	Description
Active	Normal (default) state. Data being written and read from the server.
Maintenance	This state is designated if there is maintenance being performed on the server, for example, changing disk or upgrading RAM. There is no ability to query or to write any data.
Query Only	This is a transitional state between active and maintenance used for not missing any data. The server will be accessible to be read by applications, such as Mediation DataFeed Export and KPI, to gain their information before the state moves to maintenance.

Table 101: Storage Pool Server States

Values associated with each state.

**Note:** If a Data Record storage server is in "Query" state, no configuration actions can be undertaken. All servers must be in "Active" state when sessions are created for queries on such sessions to be successful. Otherwise, if a query is launched in Troubleshooting on a newly created session, "Unable to execute query: ORA-00942: table or view does not exist." will appear.

Value in Cell	Description
OK	Applications behave normally.
(Warning) Ignore Server	During operation, application will ignore server status and continue to reading, but providing a warning that data could not be accessed from a specific subsystem.
Suspend	Application will suspend any operation and wait until server has restored functionality.
Ignore Server	During operation the application ignores the server (from the storage pool) for reading and provides xDRs from other servers.

Table 102: Values Associated with Each State

Application	Active	Query Only	Maintenance	Down
Troubleshooting	OK	OK	Ignore Server (Warning on prompt)	Ignore Server (Warning on prompt)
Dashboard	OK	OK	Ignore Server (Warning on prompt)	Ignore Server (Warning on Prompt)
Mediation DataFeed	OK	OK	Ignore Server	Suspend
Historical KPI	OK	OK	Ignore Server	Suspend
Scheduled Export	OK	OK	Ignore Server (Show text warning in the exported archive)	Suspend

Table 103: Management Applications Effected by Each State

## Configuring Servers in an Mediation Subsystem

Once you have added an Mediation subsystem in the Equipment Registry, that Mediation subsystem is visible in the Mediation perspective. From this perspective you can perform the following procedures on servers in that Mediation subsystem:

**Note:** The first two topics in the list are to be accomplished first. For example, you create input streams before you create Dataflow Processings. The other topics are used to manage the Dataflow Processings you have created.

- List the servers on a Mediation subsystem
- Monitor storage capacity on a DWH server
- Manage the sessions on that Mediation subsystem
- Manage the external PDU streams on that Mediation subsystem
- Manage input streams on that Mediation subsystem
- Manage the dataflow processings on that Mediation subsystem
- Manage configuration for Q.752 processing on that Mediation subsystem
- Manage the distribution on that Mediation subsystem for load balancing or during server maintenance
- Manage the Mediation Protocol on that Mediation subsystem
- View software information associated with that Mediation subsystem
- Manage the subsystem preferences for that Mediation subsystem

## About Streams

Streams are the connectors that enable PDUs to be routed from Acquisition servers to Mediation servers. The two kinds of streams that can be created on an Mediation subsystem are:

- PDU - that originate from PDU Dataflows, which are created in Mediation Subsystems, these streams serve as the input streams to xDR Build Dataflow.
- xDR - that originate from external Mediation Subsystems, legacy or current, and are connected to an XDR input stream.

**Note:** The XDR input stream name needs to match the stream name of the legacy subsystem.

**Note:** Centralized Configuration supports up to 500 streams (including PDU as well as xDR) per Mediation subsystem. As soon as user crosses 255 streams per Mediation Subsystem, Centralized Configuration places a constraint on each server within the Mediation subsystem that it cannot exceed 127 Streams and shows an error message when changes are applied to the Subsystem.

Every unused stream is counted for each Mediation server for the corresponding Mediation Subsystem. An unused stream means streams that are not used by any Mediation server. Unused

streams are listed in the warning tab when applying changes to the corresponding Mediation subsystem.

For example, one Mediation Subsystem consists of three servers and each server uses 100 streams. If a user has created a Stream that is not used by any process, then Centralized Configuration recognizes this unused Stream as an extra Stream for each server so that each server now have 101 streams.

In addition, all monitoring (system generated) and MFP based streams are also counted for each Mediation server.

Selecting **Site > Mediation Subsystem > Streams** in the object tree shows a list of the streams for that server.

#	Stream Name	Stream Type	User Information
1	K_Diameter_LTE_Gen_Stat_6	xDR	Created by ProTraQ for Diameter_LTE_Stat applied on OCDSR_Diameter_LTE_TDR
2	K_ixp1000AggSessionMonitor_3	xDR	Created by ProTraQ for AggSessionMonitor applied on ixp1000PoolMonitor

Figure 159: Streams List

### Adding a PDU Stream

Input Streams are constructs for grouping Dataflows for the purpose of routing to one or more Mediation Protocols. The grouping is done so that PDUs belonging to a dataflow are routed over a single communication stream to an xDR generator, resulting in optimized data collection resources.

Complete these steps to add a PDU stream:

1. Select **Mediation > Sites > IXP > Subsystem > Streams**.
2. Click **Add** from the tool bar.

Figure 160: Add Streams Screen

3. Type the **Stream Name**.
4. Select the **Stream Type (PDU)**.
5. (Optional) Select whether to **Use RID** or not.
6. Select whether the stream is **critical** or not.

**Note:** The critical field in the stream creation screen is used to indicate the behavior of a given Dataflow Processing when it is fed by multiple input Streams. When the critical box is activated, it designates that the Dataflow Processing will stop processing PDU's/XDRs if any critical input stream stops having traffic. When the field is not selected, it indicates the Dataflow Processing will continue to process data even if some of the streams have no traffic.

7. (Optional) Enter any pertinent **User Information**.
8. Click **Create**. The *stream* is added to the list.

### Adding an xDR Stream

Complete these steps to add an xDR stream from one Mediation subsystem to be used for input to an external Mediation Subsystem:

**Note:** To add an xDR stream there must be more than one Mediation Subsystem available. xDR Streams are created when external Streams, Streams from some other Mediation Subsystem so that xDRs from one Mediation are taken as input on another Mediation, are needed.

1. Select **Mediation > Sites > IXP > Subsystem > Streams**.
2. Click **Add** from the tool bar.
3. Select the **xDR** as the stream type.
4. Select a **Dictionary** that is the type of protocol that the xDR stream contains.
5. (Optional) Select whether the stream is **critical** or not.

**Note:** The critical field in the stream creation screen is used to indicate the behavior of a given Dataflow Processing when it is fed by multiple input streams. When the critical box is activated, it designates that the Dataflow Processing will stop processing PDU's/XDRs if any critical input Stream stops having traffic. When the field is not selected, it indicates the Dataflow Processing will continue to process data even if some of the Streams have no traffic.

6. (Optional) Enter any pertinent **User Information**.
7. Click **Create**. The system creates an external Stream with the same name as on the external Mediation Subsystem.

**Note:** Click **Apply Changes** for the Mediation subsystem for the changes to take effect.

### Modifying a Stream

1. Select **Streams > List**. The *streams* list screen opens.
2. Select the **Stream** to be modified.
3. Click **Modify**. The screen for that *stream* opens shown below.

Figure 161: Stream Modify Screen

4. Make the **necessary modifications**.
5. Click **Modify**. The system is updated and you are returned to the *Streams List* screen with the modifications.

### Deleting a Stream

**Note:** You cannot delete a stream that has Dataflow Processings associated with it. If the Stream does have any dependencies, you will get an error message.

Complete these steps to delete a stream.

1. Select **Streams > List**. The streams list screen opens.
2. Select the **Stream** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The *Stream* is deleted from the list.

### Sync OCDSR Streams

Click on this button to discover all streams available on Integrated OCDSR Monitoring Probes.

## Adding an External PDU Stream

The primary purpose of the external PDU stream function is to configure Mediation to accept PDUs from third party sources.

The menu “External PDU Stream” is presenting the list of third party sources compliant with the running PIC Release. If there is no such source for one specific release, the menu could be not present in the GUI.

Complete these steps to configure an external PDU Stream:

1. Select **Mediation > Sites > IXP > Subsystem > External PDU Streams**.  
The External PDU Stream List screen opens.
2. Click **Add** on the tool bar or in the contextual menu. The *Add* screen opens.

No External PDU Stream available in PIC 10.2.1

## Configuring xDR Dataflow Processings

The most important aspect of Mediation configuration is the creation of xDR Dataflows. An xDR Dataflow is made of interconnected processes referred to as *Dataflow Processings*.

Dataflow Processings are categorized into three types listed in the order that they should be created:

1. Building - this dataflow processing creates or builds xDRs.
2. Operation - this dataflow processing generates statistics and applies filters for data enrichment.
3. Storage - this dataflow processing stores information on the system. For the Storage Type DFP, user can create one of three types of Store DFPs
  - a. Datawarehouse ( Storage in Session)
  - b. DataBroker (Storage in Files on NFS mounted directories for DataBroker (Syniverse))  
Mediation Protocol
  - c. CSV ( Storage in CSV Files with Formatting capabilities)

### About Dataflow Processings

Dataflow Processing is the receiving end from a PDU Stream or PDU Dataflow as configured on the Integrated Acquisition / Probed Acquisition. The Dataflow Processing configuration is used to build an xDR for storage on the Mediation. The configuration is required based on the protocol and type of post-processing prior to storage on the Mediation. Once a Dataflow Processing has been configured,

the Mediation will start receiving MSUs/PDUs from the Integrated Acquisition /Probed Acquisition over the input stream that was created for the Integrated Acquisition /PDU PDU Data Flows.

### About Dataflow Processing Retention Times

Dataflow Processing chains are the normal sequence of processes that correlation goes through until xDRs are stored in the Mediation. Each DFP has a retention period in seconds. The retention time is the duration of PDUs or xDR retention in the chronological sorting list that is used to buffer input to the IxpBuild, IxpOperate and IxpStore processes.

**Note:** The IxpStore process has an additional turning parameter called a flush timeout. The flush timeout is the frequency of the xDR buffer flushing in the IxpStore process, (xDR writing to Oracle), when the maximum size of a buffer is not reached.

Both the retention time and the flush timeout have a direct impact on the time between the transmission (by Acquisition) of the PDU opening a transaction and the writing of the corresponding xDR into the Oracle database. The valid range for these parameters is 0-60 seconds. The default value for these parameters is 5 seconds.

These parameters are specific to each DFP instance so that you can fine tune a DFP according to the protocol type it uses. For example, more retention is needed when the sources come from a pair of mated STP (2 sources) and less retention time is needed when the DFP is using a single IP tap.

Note: If the retention time is too small (depending on the network configuration), there is a possibility of an incorrect correlation. The impact can occur when the retention time is acceptable for *Troubleshooting* performance but unacceptable for creating valid correlation rates.

### Listing xDR Dataflow Processings

To view a list of all the Dataflow Processings on a server, select **Dataflow Processings** in the object tree. The list opens in the Table section shown here.

From this screen, you can perform the basic functions of adding, modifying and deleting a Dataflow Processings. In addition, you are able sort the rows by clicking on a column of interest.

#	Name	Description	Type	Active
1	B_AcquisitionCapacityManagement	Automatically created by system for capacity management	Building	<input checked="" type="checkbox"/>
2	B_MediationCapacityManagement	Automatically created by system for capacity management	Building	<input checked="" type="checkbox"/>
3	BuildMonitor	Automatically created by system for IXP monitoring session BuildMonitor	Storage	<input checked="" type="checkbox"/>
4	BuildThreadMonitor	Automatically created by system for IXP monitoring session BuildThreadMonitor	Storage	<input checked="" type="checkbox"/>
5	ItfStreamMonitor	Automatically created by system for IXP monitoring session ItfStreamMonitor	Storage	<input checked="" type="checkbox"/>
6	MAP_DFP_ARJ	Created by auto assistant	Building	<input checked="" type="checkbox"/>
7	OperateMonitor	Automatically created by system for IXP monitoring session OperateMonitor	Storage	<input checked="" type="checkbox"/>
8	PoolMonitor	Automatically created by system for IXP monitoring session PoolMonitor	Storage	<input checked="" type="checkbox"/>

Figure 162: Dataflow Processings List

Column	Description
Select	This column enables you to select a dataflow processing. Use this column when selecting multiple sessions.
Hide/show columns	This column enables you to select the columns you want to view.
Name	Shows the name of the dataflow processing and enables you to sort dataflow processings by ascending or descending order.
Type	Shows the type of session: Storage Operation

	Building
Input (streams)	Shows the name of the input stream for the dataflow processing.
Output stream	Shows the name of the output stream for the dataflow processing
Active	Is a check box showing whether the dataflow processing is active or not.
Actions	Provides the appropriate actions (modify, delete, etc.) you can perform on the dataflow processing.

Table 104: Dataflow Processings List Table

### About xDR Dataflow Assistant

The xDR Dataflow Assistant option provides a wizard to help you quickly create a Dataflow Processing. It is a convenient way to add large numbers of xDR Dataflows. *The xDR Dataflow Processing Assistant* assists you with creation of an xDR Dataflow, a chain of Mediation Dataflow Processings more efficiently.

The process follows four stages:

- Selecting the input PDU sources
- Selecting the Mediation Protocol
- (Optional) Enriching the xDRs
- Creating or reusing sessions to store xDRs

### About Dataflow Naming Conventions

Depending on the input, the xDR Dataflow created will result in the following types of Dataflow Processings.

- One Build dataflow processing,
- Zero or more Operate dataflow processings,
- Multiple Storage dataflow processings.

All the Dataflow Processings and the intermediate streams are automatically created and named by Centralized Configuration. The table shows examples of naming conventions used by Centralized Configuration.

Dataflow Processing Type	Naming convention
Build dataflow processing	User Input
Operation dataflow processing	< name of the session fed by the main stream>_<dataflow processingId> (mandatory)
Storage dataflow processing	S_<corresponding session name>_<dataflow processingId>
Building dataflow processing output stream	B_<corresponding xDR session name>_<streamId>
Operation dataflow processing main output stream (xDRs)	O_<corresponding xDR session name>_<streamId>
Operation dataflow processing secondary output stream (KPIs)	K_<corresponding KPI session name>_<streamId>

Table 105: Dataflow Processing Naming Conventions

### Creating a Dataflow Processing Using xDR Dataflow Assistant

The most important aspect of Mediation configuration is the creation of xDR Dataflows. An xDR Dataflow is made of interconnected processes referred to as Dataflow processings. Dataflow Processings are categorized into three types listed in the order that they should be created:

- Building - this dataflow processing creates or builds xDRs
- Operation - this dataflow processing generates statistics and applies filters for data enrichment
- Storage - this Dataflow Processing stores information on the system

**Note:** If you do not have licenses to use specific Mediation Protocol, the Mediation Protocol selection screen will not show them.

Configure Dataflow Processings using the xDR Dataflow Assistant.

**Note:** Because Q.752 Processings utilize input streams, you must first create your input streams or PDF Dataflows before you create your Q.752 Processings.

1. Select **Mediation > Sites > IXP > Subsystem** that needs *Dataflow Processings*.
2. Right-click on the **Dataflow Processing**. The *pop-up* menu opens.
3. Right-click on **Dataflow Processings**.
4. Select **xDR Dataflow Assistant** from the pop-up menu.  
The first screen of the wizard opens in the Table section shown here.

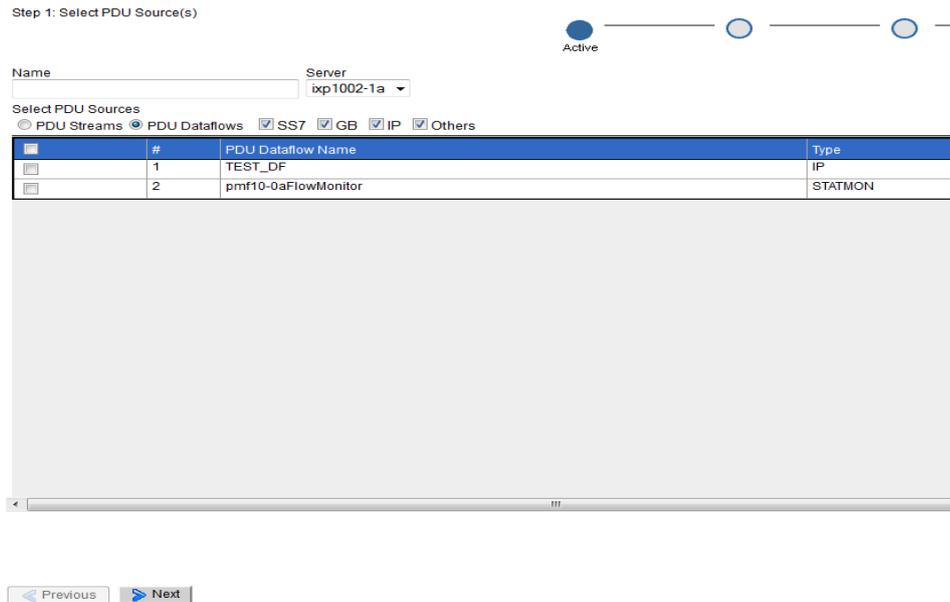

Figure 163: xDR Dataflow Assistant Initial Screen-PDU Sources

5. Type in the **Name** of the **Dataflow Process**.
6. Select the **Server**.

**Note:** Do not use the DWH as the server for the Dataflow Process.

**Note:** If multiple Dataflow processes are created, it is recommended that more than one server be used to facilitate load balancing.

7. Select a **PDU Source** from the table. You can filter by selecting what type of source you want to view/use. Whether it is a Stream or Dataflow and what category (SS7, Gb, IP)
8. Click **Next** to choose a Mediation Protocol shown below.

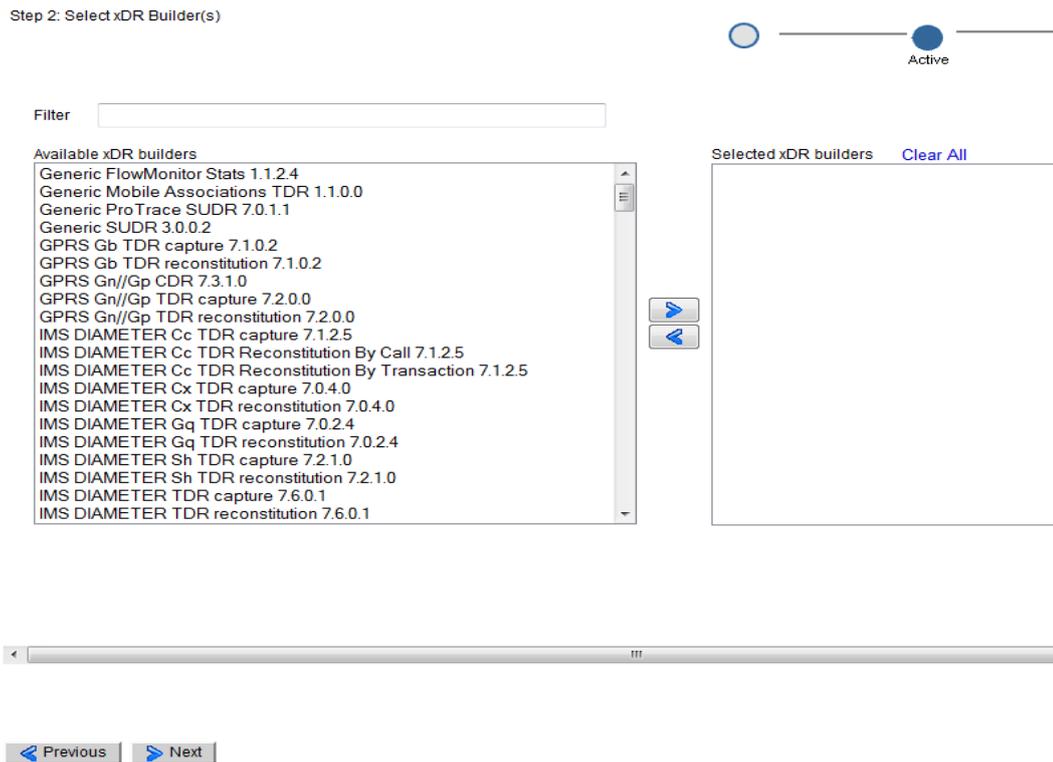

Figure 164: Dataflow Assistant for Mediation Protocol Selection

9. Select one or more **Mediation Protocol** from the four categories (SS7, IP, UMTS/GPRS or Others).

**Note:** You can select multiple Mediation Protocol from one or more of the categories.

10. Click **Next** to open the *Optional Enrichment* screen shown here.

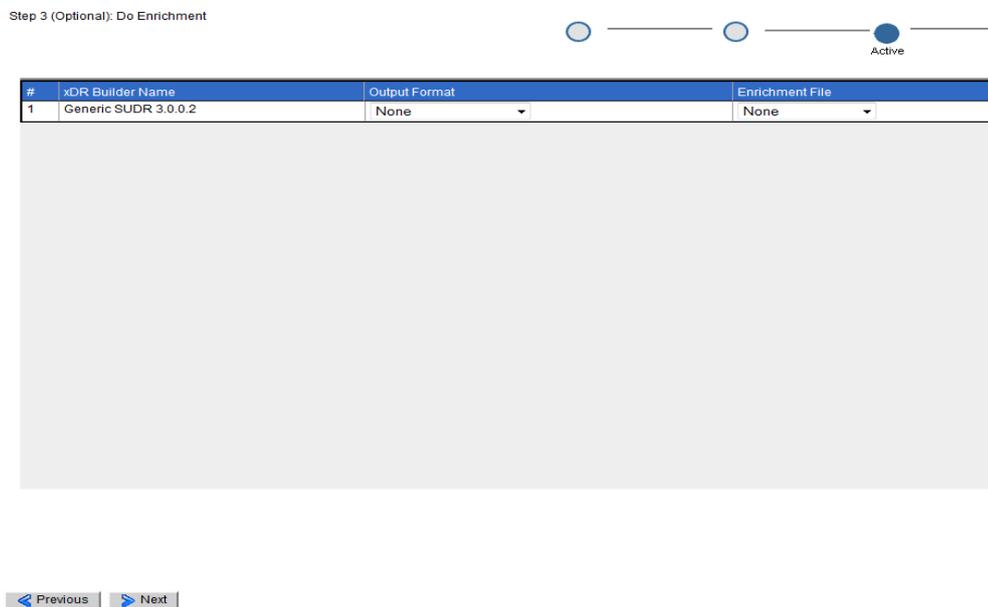

Figure 165: Xdr Assistant - Enrichment Selection

11. (Optional) The Enrichment screen enables you to select specific output format and files to be included into the Dataflow Processing that is to be used in data feed exporting. You can select an existing enrichment dictionary or you can select to upload a new format. On selecting option to upload a new format, there will be an option to either use an existing partial dictionary or upload a new partial dictionary. Partial dictionary will only contain enrichment fields.

To create an enrichment complete these steps:

- a. Select an Mediation Protocol.  
The row is highlighted.
- b. From the Output Format, select an existing enriched dictionary or select option to upload a new format. Tool tip will display the name for base Mediation Protocol dictionary and the partial dictionary for each enriched dictionary in the list.

Step 3 (Optional): Do Enrichment

#	xDR Builder Name	Output Format	Enrichment File
1	Generic SUDR 3.0.0.2	None	None

Figure 166: Select Output Format

- c. On selecting option to upload a new format, a new pop-up window opens displaying the list of partial dictionaries. Existing partial dictionary can be selected or a new partial dictionary can be uploaded.

Step 3 (Optional): Do Enrichment

#	xDR Builder Name	Output Format	Enrichment File
1	Generic SUDR 3.0.0.2	None	None

Select/Upload Partial Dictionary

Partial Dictionaries

none

none

Upload New Partial Format

Cancel Save & Close

Figure 167: Select/Upload Partial Dictionary

- d. On selecting option to "Upload New Partial Format", a new pop-up window opens. A partial dictionary can be uploaded from this window. The uploaded partial dictionary can be selected from the list.

Step 3 (Optional): Do Enrichment

#	xDR Builder Name	Output Format	Enrichment File
1	Generic SUDR 3.0.0.2	None	None

Select/Upload Partial Dictionary

Upload New Partial Dictionary

Dictionary File

Browse... No file selected.

Cancel Save & Close

Figure 168: Upload New Partial Format

- e. The selected partial dictionary is applied to the base Mediation Protocol dictionary to create the complete enriched dictionary. The created enriched dictionary is then selected as Output format.

Figure 169: Created Enriched Dictionary

- f. From the Enrichment select to upload a new file or select none from the pull-down list.
  - g. Repeat steps a-c for each Mediation Protocol.
12. Click Next to configure xDR sessions as shown below.

**Note:** IF session point code feature is enabled then to configure flavor of session refer [Appendix D: Defining and Modifying Flavor \(PC Format\) of Session at Centralized C](#)

Figure 170: xDR Assistant - Configuring Sessions Screen

13. Type in the **Session Name**.
14. Type in the **Life Time** (in hours the default is 72 hours).

**Note:** The Life Time defines how long an xDR is stored. It is a tuning parameter used as a safeguard to conserve disk space and is an important factor in managing your system. After the set amount of time, the xDRs are deleted from the disk. The longer the life time, the longer that disk space is used by the xDRs. It is important to know how much storage you have on your system when setting the Life Time parameter. If the parameter is set too high, then more disk space will be required than is available on the Mediation server. Disk space used per xDR will vary from session to session depending upon the number of columns and enrichment settings.

15. Repeat **steps 11-14** for each Mediation Protocol session.
16. Click **Done**. For changes to take effect, click right-click on the Mediation subsystem that has changed, then select **Apply Changes** from the menu.

## About Managing Dataflow Processings Manually

Once you have created a dataflow processing, you can modify it manually or if you prefer, you can use this manual method if you want to create a specific Dataflow Processing. Dataflow Processings are categorized into three types:

1. Building - this Dataflow Processing creates or builds xDRs.
2. Operation - this Dataflow Processing generates statistics and applies filters.
3. Storage - this Dataflow Processing sends data to the Mediation subsystem.

You can manually add xDR session types using Centralized Configuration.

### Adding an xDR dataflow processing session manually - Build

The building dataflow processing correlates PDUs to create xDRs. This operation is done by one or more Mediation Protocol that create a summary of the values of the signalling.

You can manually add a xDR Dataflow Processing Session by completing these steps:

1. Select **Mediation > Sites > IXP > Subsystem >Dataflow Processings**.
2. Right-click on **Dataflow Processings**.
3. Select **Add** from the pop-up menu. The *Add* screen opens shown here.

Figure 171: Add Screen

4. Type in the **Name** of the Dataflow.
5. (Optional) Type in any **User Information**.
6. Select whether the dataflow is **active** or not.
7. Select the **Server** for the *Dataflow*.
8. (Optional) Select the **Retention Time** for the *Process*.
9. Select **Building**.

(The screen changes to show four more tabs.)

Figure 172: Dataflow Building Screen

10. Click **Next**. The *Input PDUs* tab appears.

**Note:** If you select PDU Dataflows follow steps 11-12. If you select PDU Streams, go to step 13. You can also use both options.

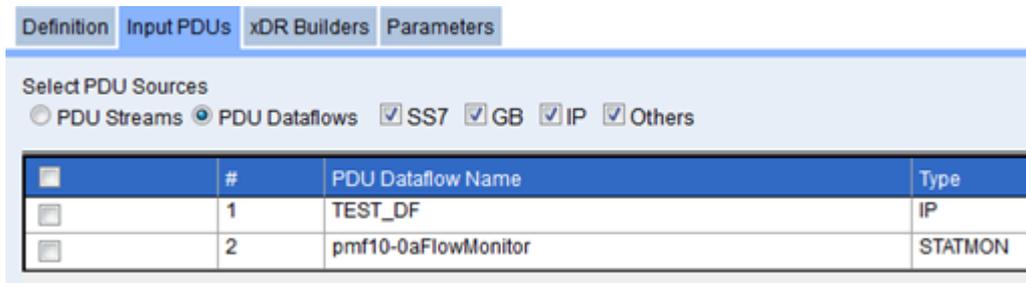

Figure 173: Dataflow Input PDU Tab (PDU Dataflows selected)

11. Select the **Links** you want to use.
12. Select the **PDU Dataflows** you want to use.
13. (For legacy or external PDU streams) Select a **PDU Stream(s)** selection.

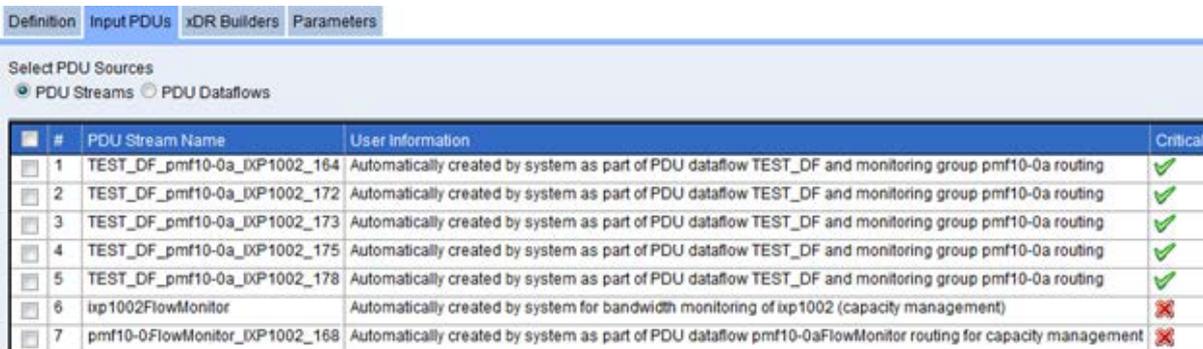

Figure 174: Dataflow Input PDU Tab (PDU Streams selected)

14. Select the **PDU Stream Name(s)** to be used.
15. Click **Next** to open the Mediation Protocol tab.

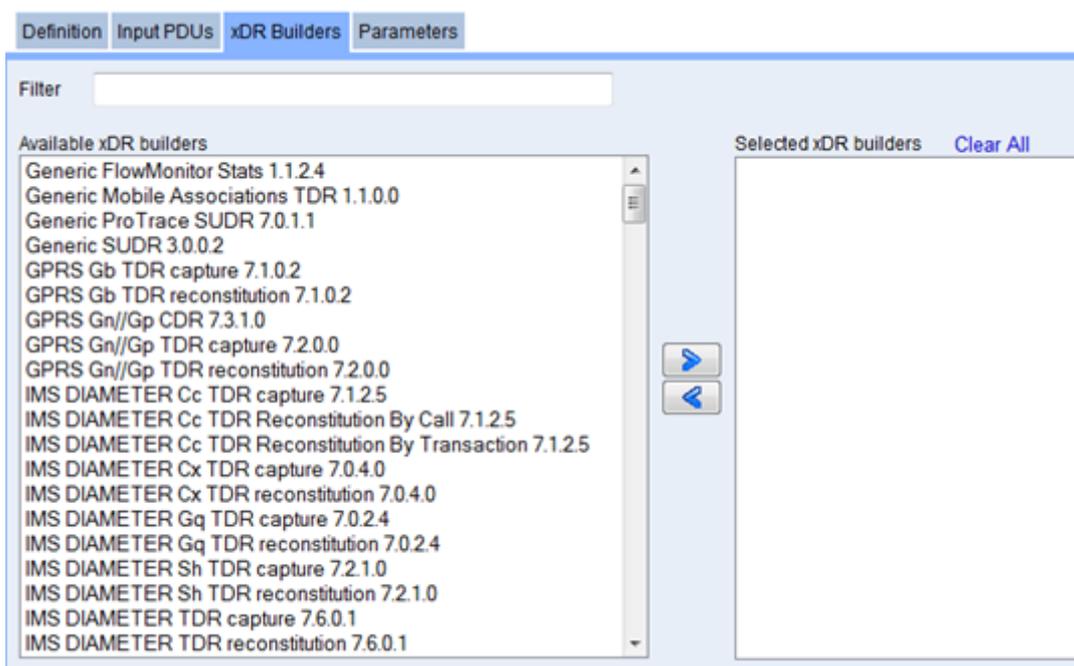

Figure 175: Mediation Protocol Tab

16. Select one or more **Mediation Protocol** from Available list.
17. Click **Next** to open the Parameters tab shown below.

**Note:** Based on previously selected Mediation Protocol, Centralized Configuration displays a series of screens to view and/or change each Mediation Protocol parameter value. Each Mediation Protocol selected has a unique set of parameters. The parameters are initialized with default values. For more information on configuring Mediation Protocol parameters, refer to Appendix B, “Mediation Protocol Parameters,”

Figure 176: Parameters Tab with SS7, GPRS, IP and Misc Mediation Protocol Selected

18. You can **modify** the default values of any parameter.
19. Click **Create**. You must now **Apply Change** to save the changes to the subsystem.

### About Partial xDRs

The Partial xDR feature in Centralized Configuration is utilized by Troubleshooting for processing real-time traces on the SS7 ISUP ANSI, VoIP SIP-T ANSI CDR and VoIP SIP CDR protocols. Using the partial xDR feature you can configure in the build and store process.

**Note:** You must configure partial ANSI ISUP a dSIP-T/SIP xDRs manually using the build process.

**Note:** In addition, in configuring partial ANSI ISUP a dSIP-T/SIP xDRs you must also configure xDR filters so that partial and completed xDRs are written to the proper session.

### Creating a Partial Build xDR for SS7 ISUP ANSI Protocol

Complete these steps to configure a partial build xDR for SS7 ISUP ANSI CDR reconstitution sessions that can be used by Troubleshooting for in-progress traces:

1. Select **Mediation > Site > Subsystem > Server > Dataflow Processing**.  
The *Dataflow Processing* list page opens.
2. Click **Add** from the tool bar. The *Add* screen opens.

The screenshot shows the 'Add Screen' for Dataflow Processing. It features a light blue background with a header containing four tabs: 'Definition', 'Input PDUs', 'xDR Builders', and 'Parameters'. The 'Definition' tab is selected. Below the tabs, there are several input fields and controls:
 

- Name:** An empty text input field.
- User Information:** A large empty text area.
- Active:** A checked checkbox.
- Server:** A dropdown menu showing 'ixp1002-1a'.
- Processing Type:** Three radio buttons: 'Building' (selected), 'Operation', and 'Storage'.
- Retention Time(s):** A text input field containing the number '5'.

Figure 177: Add Screen

3. Type in the **Name** of the Dataflow.
4. (Optional) Type in any **User Information**.
5. Select whether the dataflow is **active** or not.
6. Select the **Server** for the dataflow.
7. (Optional) Select the **Retention Time** for the process
8. Select **Building**.  
(The screen changes to show four more tabs.)

This screenshot shows the 'Dataflow Building Screen', which is identical to Figure 177 but with the 'Name' field populated with the text 'Sample'. The 'Definition' tab remains selected, and all other settings (Active checked, Server: ixp1002-1a, Processing Type: Building, Retention Time: 5) are unchanged.

Figure 178: Dataflow Building Screen

9. Click **Next**. The *Input PDUs* tab appears.

**Note:** If you select *PDU Dataflows* follow steps 11-12. If you select *PDU Streams*, go to step 13. You can also use both options.

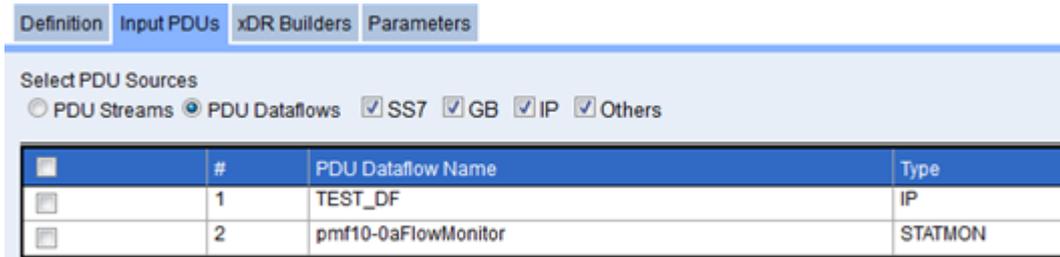

Figure 179: Dataflow Input PDU Tab (PDU Dataflows selected)

10. Select the **Links** you want to use.
11. Select the **PDU Dataflows** you want to use.
12. (For legacy or external PDU streams) Select a **PDU Stream(s)** selection.

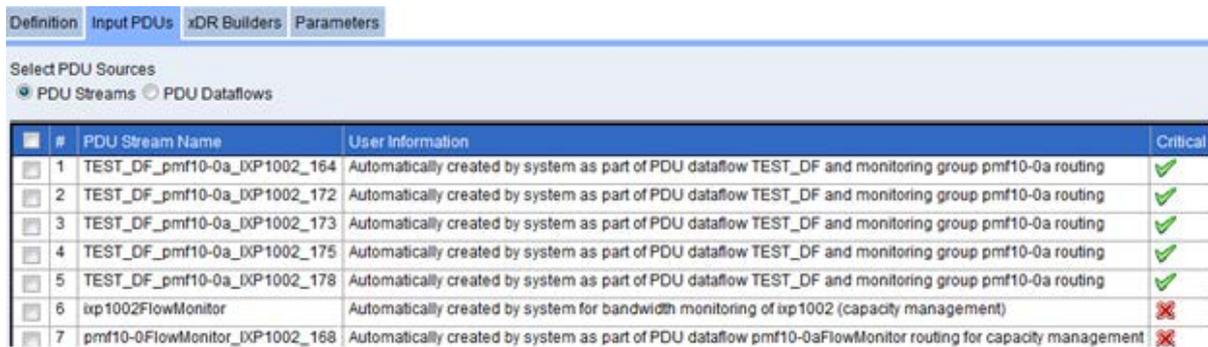

Figure 180: Input PDU Tab (PDU Streams selected if working with external PDU streams)

13. Select the **PDU Stream Name(s)** to be used.
14. Click **Next** to open the Mediation Protocol tab.

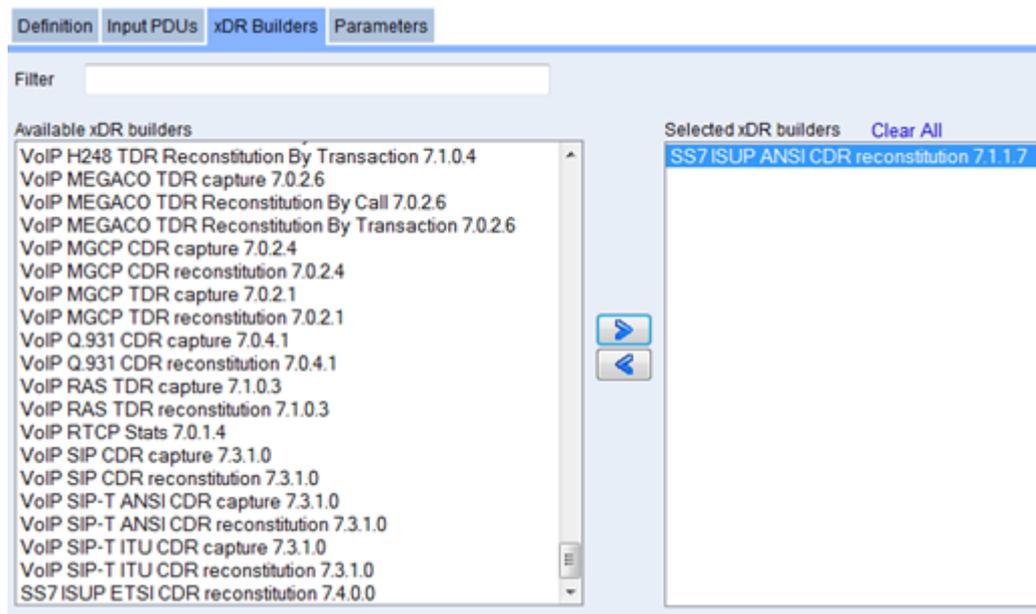

Figure 181: Mediation Protocol Tab

15. Select one or more **SS7 ISUP ANSI CDR Reconstruction** from Available list.
16. Click **Next** to open the Parameters tab shown below.

**Note:** Based on previously selected Mediation Protocol, Centralized Configuration displays a series of screens to view and/or change each Mediation Protocol parameter value. Each Mediation Protocol selected has a unique set of parameters. The parameters are initialized with default values. For more information on configuring Mediation Protocol parameters, refer to Appendix B, “Mediation Protocol Parameters,”

Partial xDR to be sent after Answer	<input checked="" type="checkbox"/>
Partial xDR to be sent after Forward	<input type="checkbox"/>
Partial xDR to be sent after Setup	<input type="checkbox"/>

Figure 182: Parameters Tab Showing SS7 ISUP ANSI CDR Tab

17. Click **Create**. The *partial xDR* is created.

**Apply Changes** to the Mediation subsystem. This partial xDR is now available for in-progress traces used in Troubleshooting

### Creating a Partial xDR for SIP-T/SIP Protocol

Complete these steps to configure a partial build xDR for SS7 SIP-/SIP protocol that can be found in the VoIP SIP-T ANSI CDR reconstitution and VoIP SIP CDR reconstitution sessions used by Troubleshooting for in-progress traces:

1. Select **Mediation > Sites > IXP > Subsystem >Dataflow Processings**.
2. Right-click on **Dataflow Processings**.
3. Select **Add** from the pop-up menu. The *Add* screen opens shown here.

Figure 183: Add Screen

4. Type in the **Name of the Dataflow**.
5. (Optional) Type in any **User Information**.
6. Select whether the dataflow is **active** or not.
7. Select the **Server** for the *Dataflow*.
8. (Optional) Select the **Retention Time** for the process
9. Select **Building**.

(The screen changes to show four more tabs.)

17. Click **Create**. You must now **Apply Change** to save the changes to the subsystem.

## Configuring xDR Filters for Store Dataflow Partial xDRs

Partial xDRs for ANSI ISUP and SIP-T/SIP protocols that have been configured for "Answer" must have specifically configured xDR Filters for store Dataflows to handle partial and final (after call completion) xDRs. Complete these steps to configure an xDR Filter for partial xDR generation:

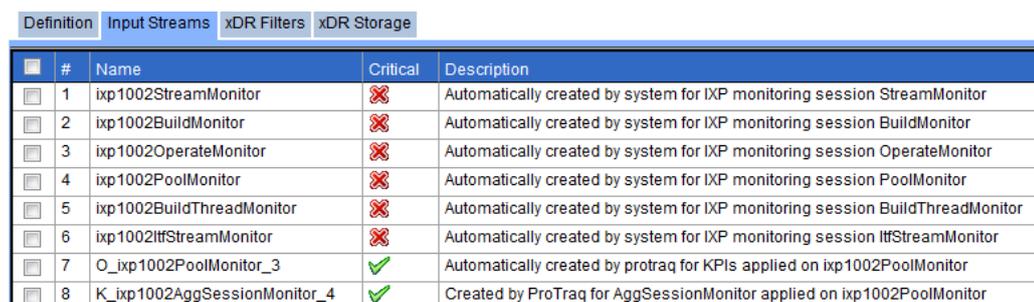

1. Select **Mediation > Sites > IXP > Subsystem > Dataflow Processings**.
2. Right-click on **Dataflow Processings**.
3. Select **Add** from the pop-up menu. The *Add* screen opens.

Definition	Input Streams	xDR Filters	xDR Storage
Name	Sample_storage_dfp		
User Information			
Active	<input checked="" type="checkbox"/>		
Server	ixp1002-1a		
Processing Type	<input type="radio"/> Building <input type="radio"/> Operation <input checked="" type="radio"/> Storage		
Retention Time(s)	5		
Flush Time(s)	5		

Figure 189: Add Screen

4. Enter the **Name of the Dataflow**.
5. (Optional) Enter any **User Information**.
6. Select whether the dataflow is **active** or not.
7. Select the **Server** for the *Dataflow*.
8. Select **Storage** for the *Processing Type*.
9. Enter the **Retention Time(s)** for the *DFP* (Default is 5 sec).
10. Enter the **Flush Time(s)** for the *DFP* (Default is 5 sec).
11. Click **Next**. The list of *Input Steams* appears.

Figure 190: Input Streams Screen

12. Select the **Input Steams** to be used in the dataflow processing.

**Note:** You cannot select Input Streams that belong to different dictionaries. They must all belong to the same dictionary.

13. Click **Next**. The *xDR Filter* screen appears.

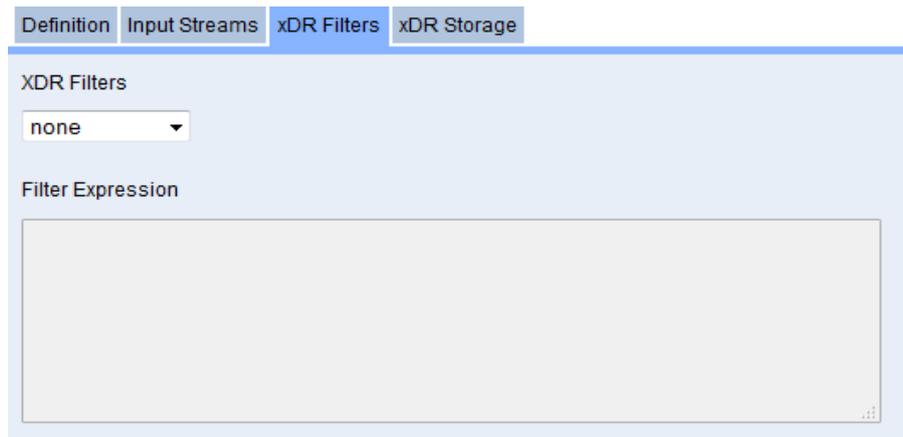

Figure 191: xDR Filter Screen

14. Select **Create Filter** from the drop-down menu. The *Create New xDR Filter* opens.

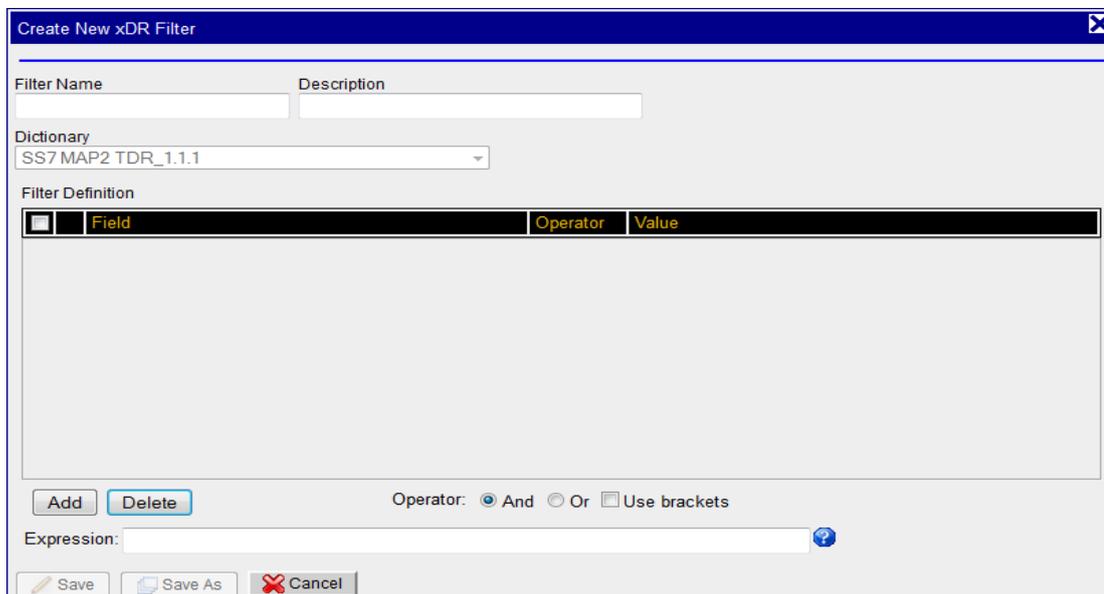

Figure 192: xDR Filter Screen

15. Enter the **Filter Name**. You can also enter a description. The dictionary has already been selected and is grayed out.
16. Click **Add** to add a condition.

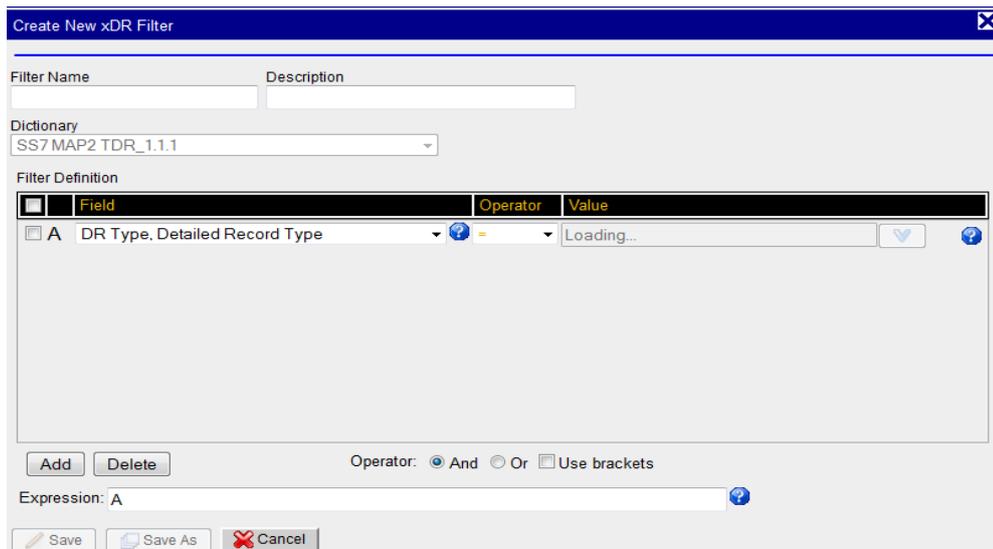

Figure 193: xDR Filter Screen with Condition

17. Select **Detailed Record Type** for field.
18. Select = for the operator.
19. Select **After Answer Partial xDR** for value.
20. Click **Create**. The *filter* is created that allows all types of xDRs including Frame Alone xDRs and Circuit Message to be stored in the *Complete xDR Session* except the ones which are generated as Partial xDRs after Answer message.
21. Select or **Create a Session**. Make sure the session lifetime is 24 hours.

**Note:** To configure flavor of session refer [Appendix D: Defining and Modifying Flavor \(PC Format\) of Session at Centralized C](#)

22. Click **Create** to create the *Storage DFP* with special filter. **Apply Changes** to the Mediation subsystem for them to take effect.

**Note :** xDR Filter are not supported for Statistical Sessions .

### Adding an xDR Dataflow Processing Session Manually - Operation

You can manually add an operation xDR dataflow processing session by completing these steps:

**Note:** Before you create a Operate dataflow process, make sure that you have XdR input streams. These XDR input streams maybe the output of a previously created build dataflow process or a stream from another subsystem.

1. Select **Mediation > Sites > IXP > Subsystem >Dataflow Processings**.
2. Right-click on **Dataflow Processings**.
3. Select **Add** from the pop-up menu. The *Add* screen opens shown here.

The screenshot shows a form with the following fields and values:

- Name:** Sample\_operation\_dfp
- User Information:** (Empty text area)
- Active:**
- Server:** ixp1002-1a
- Processing Type:**
  - Building
  - Operation
  - Storage
- Retention Time(s):** 5

Figure 194: Add Dataflow Processing Screen

4. Type in the **Name** of the *Dataflow*.
5. (Optional) Type in any **User Information**.
6. Select whether the dataflow is **active** or not.
7. Select the **Server** for the dataflow.
8. Select **Operation**.
9. Click **Next**. The screen changes to show the *Input Streams* screen.

Figure 195: IP Streams Screen

10. Select the **Input Streams** you want.

**Note:** What you select will be the outputs of the build data process that have been created.

11. Click **Next**.

The screenshot shows the 'XDR Filters' section with the following elements:

- XDR Filters:** A pull-down menu currently showing 'none'.
- Filter Expression:** A large empty text area for entering a filter expression.

Figure 196: Xdr Filters Screen

12. Select an **xDR Filter** from the pull-down list. The *Filter Expression* is shown in the field below.

**Note:** You can also select Create a new xDR Filter from the pull-down list. See [Creating an xDR Session for a Dataflow Processing](#) for more information.

13. Click **Next**. The *Output Stream* screen opens shown below.

The screenshot shows a navigation bar with tabs: Definition, Input Streams, xDR Filters, Output Stream (selected), Enrichment, and xDR Operation. Below the tabs, the 'Output Stream Name' field is highlighted with a light blue background and contains the text 'Sample\_operation\_dfp\_operate'.

Figure 197: Output Steams Screen

14. (Optional) Modify the **Output Stream Name** from the default name.

15. Click **Next** the *Enrichment* screen opens shown below.

**Note:** This screen is used exclusively for the Mediation xDR static or dynamic enrichment option. The output xDRs from can have extra user-defined fields that are updated by IxpOperate using user-defined mapping tables in \*.fse files, and are used by KPI. However, the new fields must be defined in a dictionary, referred to as an enriched dictionary. The Partial ASCII dictionary files (\*.a7d) having only the user-defined enriched fields are modified manually and can be loaded into Management Application by using the dictionary upload screen. These partial dictionaries can be selected and applied to the base Mediation Protocol dictionary to create the complete enriched dictionary. This created enriched dictionary can be then selected from Output Format list.

The screenshot shows the 'Enrichment' tab selected in the navigation bar. The 'Output Format' dropdown menu is open, showing 'none' as the selected option. Below it, the 'Enrichment File' dropdown is also set to 'none'. To the right of the 'Enrichment File' dropdown is an 'Active' checkbox (which is unchecked) and a plus icon button.

Figure 198: Enrichment Screen

16. (Optional) **Create** an *Enrichment Record*.

- a. **Output Format** - Select an existing enriched dictionary or select option to upload a new format. Tool tip will display the name for base Mediation Protocol dictionary and the partial dictionary for each enriched dictionary in the list.

This screenshot is similar to Figure 198, but the 'Output Format' dropdown menu is open, showing three options: 'none', 'none', and 'Upload New Format'. The 'Upload New Format' option is highlighted in blue.

Figure 199: Output Format List

- b. On selecting option to upload a new format, a new pop-up window opens displaying the list of partial dictionaries. Existing partial dictionary can be selected or a new partial dictionary can be uploaded.

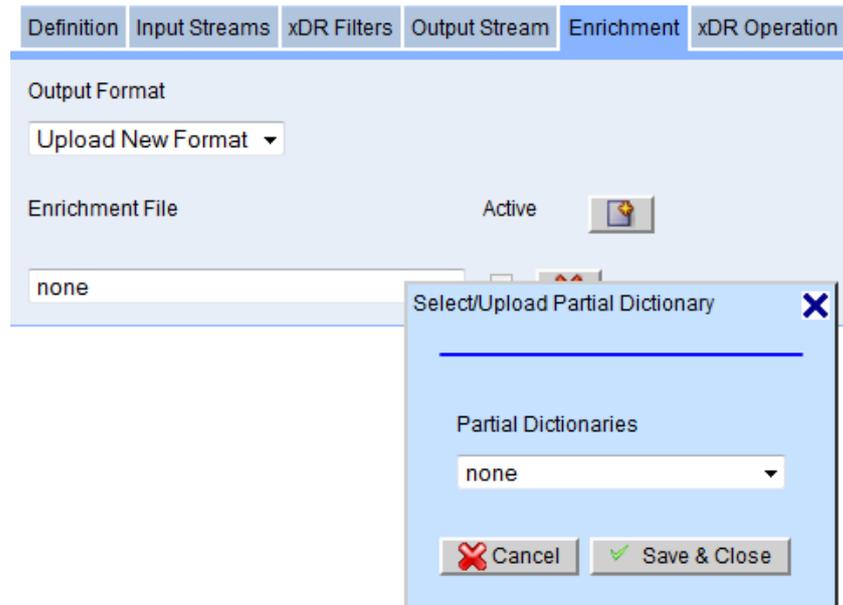

Figure 200: Select/Upload Partial Dictionary

- c. On selecting option to “Upload New Partial Format”, a new pop-up window opens. A partial dictionary can be uploaded from this window. The uploaded partial dictionary can be selected from the list.

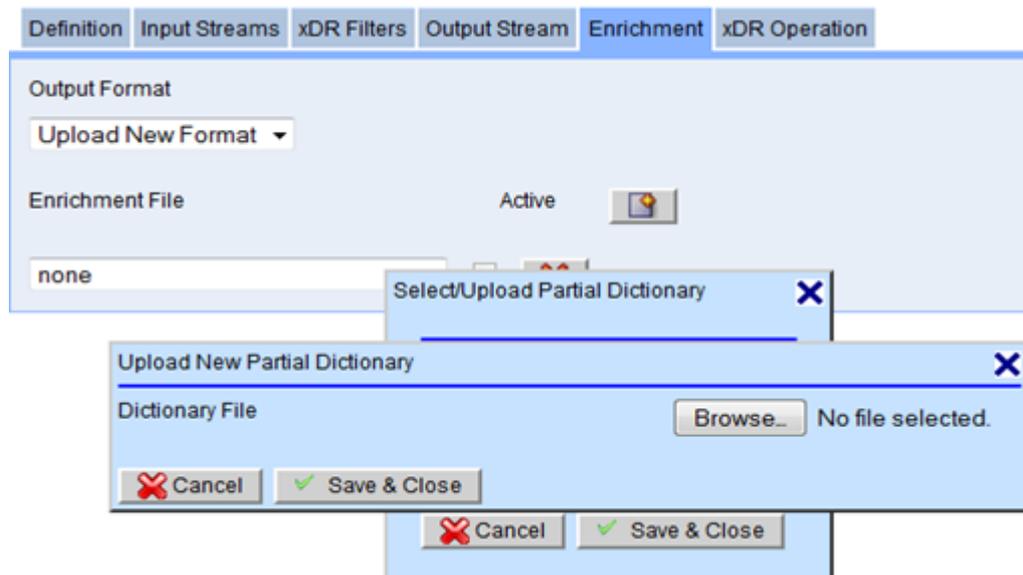

Figure 201: Upload New Partial Dictionary

- d. The selected partial dictionary is applied to the base Mediation Protocol dictionary to create the complete enriched dictionary. The created enriched dictionary is then selected as Output format.

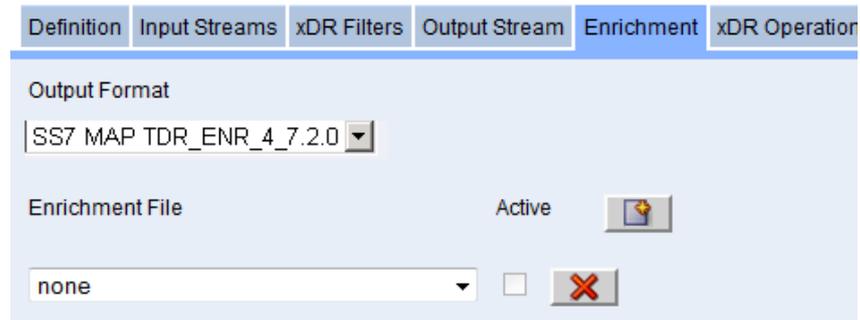

Figure 202: Created Enriched Dictionary

- e. Select an **Enrichment File**.
  - f. (Optional) Select if the enrichment is **Active** or not.  
(*Active* means that the enrichment will happen on this dataflow.)
17. Click **Next**. The *xDR Operation* screen opens shown below.

Figure 203: Xdr Operation Screen

- 18. Select a **link(s)** for the *Operate Dataflow Processings* (not shown here)
- 19. Click **Create**.

**Note:** You must **Apply** these configurations to the Mediation subsystem for these configurations be used in the system.

### Adding an xDR Dataflow Processing Session Manually - Storage

You can manually add a storage xDR dataflow procession session by completing these steps:

1. Select **Mediation > Sites > IXP > Subsystem > Dataflow Processings**.
2. Right-click on **Dataflow Processings**.
3. Select **Add** from the pop-up menu. The *Add* screen opens.

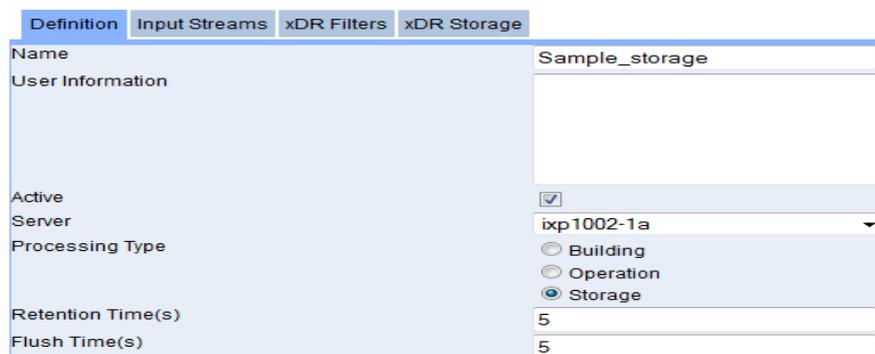

Figure 204: Xdr storage Screen

4. Enter the **Name** of the *Dataflow*.
5. (Optional) Enter any **User Information**.
6. Select whether the dataflow is **active** or not.
7. Select the **Server** for the *Dataflow*.
8. Select **Storage** for the *Processing Type*.
9. Enter the **Retention Time(s)** for the *DFP* (Default is 5 sec).
10. Enter the **Flush Time(s)** for the *DFP* (Default is 5 sec).
11. Click **Next**. The list of *Input Steams* appears.

Select *DataBroker* As the Storage Type in the Storage Type Drop Down. The Default Parameters for DataBroker Storage Feed are loaded.

Definition	Input Streams	xDR Filters	xDR Storage
Storage Type		Data Broker	
Feed Parameters			
File Period	1 minute		
PDU's per file	20000		
Directory	/var/TKLC/ixp/SE/		
File Name Mask	%bD%bM%bY%bH%bm%bS		
Capping	50		

Figure 212: xDR Storage Screen

#### 17. Enter **DataBroker** Parameters

**File Period:** Select File Period value from the List Box. Possible Values are 20 Seconds, 30 seconds, 1 Minute, 5 Minutes, 10 Minutes, 15 Minutes, 1 hour

**PDU's Per File:** This parameter denotes maximum number of PDU's per DataBroker File if File Period is not reached. Default Value is 20000. Possible Values are in Range 1000 – 1000000

**Directory:** This parameter denotes the relative directory on Mediation from the Customer mounted NFS Directory where the files will be generated. Possible values are any valid path String starting with /.

**File Name Mask:** This parameter denotes the file Name Pattern of the DataBroker output file. Default pattern for DataBroker Type Feed is “%bD%bM%bY%bH%bm%bS”. Enter valid file pattern or use the Default File Name Pattern

A file name mask is a text string made of figures, letters, “\_” and “-”; except “%”, no other character is allowed. If a “%” character is encountered, it must be followed by any of:

- “LT”: can only be at the first place; means that the date fields have to be converted to local time zone (as defined in the operating system)
- “bD”: day in the month (2 digits, 01 to 31) of the beginning of the file period
- “bM”: month (2 digits, 01 to 12) of the beginning of the file period
- “bY”: year (4 digits) of the beginning of the file period
- “bH”: hours (2 digits, 00 to 23) of the beginning of the file period
- “bh”: hours (2 digits, 01 to 12) of the beginning of the file period
- “bA”: “AM” or “PM” of the hour of the beginning of the file period
- “bm”: minutes (2 digits, 00 to 59) of the beginning of the file period
- “bS”: seconds (2 digits, 00 to 59) of the beginning of the file period
- “eD”: day in the month (2 digits, 01 to 31) of the end of the file period
- “eM”: month (2 digits, 01 to 12) of the end of the file period
- “eY”: year (4 digits) of the end of the file period
- “eH”: hours (2 digits, 00 to 23) of the end of the file period

- “eh”: hours (2 digits, 01 to 12) of the end of the file period
- “eA”: “AM” or “PM” of the hour of the end of the file period
- “em”: minutes (2 digits, 00 to 59) of the end of the file period
- “eS”: seconds (2 digits, 00 to 59) of the end of the file period

E.g.- With Default File Name Mask (%bD%bM%bY%bH%bm%bS), the file generated on 05<sup>th</sup> October 2012 ( 11:15 am) at could be 05102012111500

**Capping:** This parameter denotes the Output Capping in Mbps. Default Values is 50 and possible Values are in the range 1-999. ( This Field could be left empty )

18. Click **Create**.

The *Storage Dataflow Processing* is created. You are now prompted to **Synchronize** the subsystem to save the changes

### Adding an xDR Dataflow Processing Feed Manually – Storage ( CSV Streaming)

**Note:** To Create This Type of Storage Dataflow Processing CSV license must be enabled otherwise the option to choose this type of Store DFP will not be available in the wizard.

You can manually add a storage xDR dataflow processing ( CSV ) by completing these steps:

1. Select **Mediation > Sites > IXP > Subsystem >Dataflow Processings**.
2. Right-click on **Dataflow Processings**.
3. Select **Add** from the pop-up menu. The *Add* screen opens.

The screenshot shows the 'xDR Storage' configuration screen. It has four tabs: 'Definition', 'Input Streams', 'xDR Filters', and 'xDR Storage'. The 'Definition' tab is active. The fields are as follows:

Name	Storage_xDR_IXP_1
User Information	
Active	<input checked="" type="checkbox"/>
Server	ixp0900-1b
Processing Type	<input type="radio"/> Building <input type="radio"/> Operation <input checked="" type="radio"/> Storage
Retention Time(s)	5
Flush Time(s)	5

Figure 213: xDR Operation Screen

4. Enter the **Name** of the *Dataflow*.
5. (Optional) Enter any **User Information**.
6. Select whether the dataflow is **active** or not.
7. Select the **Server** for the *Dataflow*.
8. Select **Storage** for the *Processing Type*.
9. Enter the **Retention Time(s)** for the *DFP* (Default is 5 sec).
10. Enter the **Flush Time(s)** for the *DFP* (Default is 5 sec).
11. Click **Next**. The list of *Input Steams* appears.

Definition				
Input Streams				
xDR Filters				
xDR Storage				
#	Name	Critical	Description	
1	ixp1002StreamMonitor	✗	Automatically created by system for IXP monitoring session StreamMonitor	
2	ixp1002BuildMonitor	✗	Automatically created by system for IXP monitoring session BuildMonitor	
3	ixp1002OperateMonitor	✗	Automatically created by system for IXP monitoring session OperateMonitor	
4	ixp1002PoolMonitor	✗	Automatically created by system for IXP monitoring session PoolMonitor	
5	ixp1002BuildThreadMonitor	✗	Automatically created by system for IXP monitoring session BuildThreadMonitor	
6	ixp1002IffStreamMonitor	✗	Automatically created by system for IXP monitoring session IffStreamMonitor	
7	O_ixp1002PoolMonitor_3	✓	Automatically created by protraq for KPIs applied on ixp1002PoolMonitor	
8	K_ixp1002AggSessionMonitor_4	✓	Created by ProTraq for AggSessionMonitor applied on ixp1002PoolMonitor	
9	B_sess_session_9	✓	DFP sess_df - xDR builder IMS DIAMETER Cx TDR capture stream output	

Figure 214: Input Streams Screen

12. Select the **Input Steams** to be used in the *Dataflow Processing*.

**Note:** You cannot select *Input Streams* that belong to different dictionaries. They must all belong to the same dictionary.

13. Click **Next**. The *xDR Filter* screen appears.

Figure 215; xDR Filter Screen

14. Select the **xDR Filter** to be applied to the *Dataflow Processing*.

The *Filter Expression* appears in the field at the bottom of the screen.

**Note:** You can also select **Create Filter** from the pull-down list.

15. Click **Next**. The *xDR Storage* screen appears.

Figure 216: xDR Storage Screen

16. **Select** The Storage Type

Select CSV As the Storage Type in the Storage Type Drop Down. Then the parameters for this type of Storage DFP are loaded with default values.

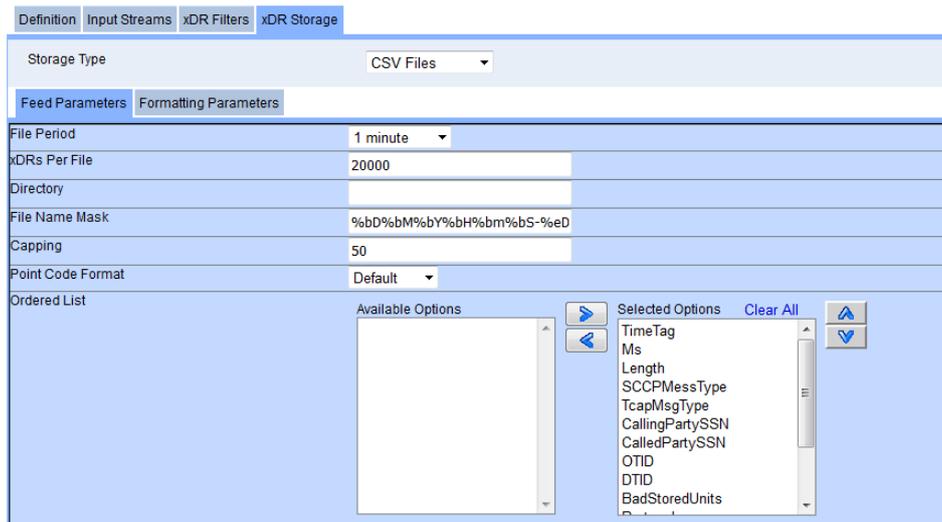

Figure 217: xDR Storage Screen

## 17. Enter the Parameters

### a. Enter Feed Parameters

**File Period:** Select File Period value from the List Box. Possible Values are *20 Seconds, 30 seconds, 1 Minute, 5 Minutes, 10 Minutes, 15 Minutes, 1 hour*

**XDRs Per File:** This parameter denotes maximum number of xDRs per CSV File if File Period is not reached. Default Value is *20000*. Possible Values are in Range *1000 – 1000000*

**Directory:** This parameter denotes the directory relatively to */var/TKLC/ixp/StoreExport* on Mediation server from the Customer mounted NFS Directory where the files will be generated. Possible values are any valid path String starting with */*.

**File Name Mask:** This parameter denotes the file Name Pattern of the CSV output file. Default pattern for CSV Type Feed is *“%bD%bM%bY%bH%bm%bS-%eD%eM%eY%eH%em%eS”*. Enter valid file pattern or use the Default File Name Pattern

A file name mask is a text string made of figures, letters, “\_” and “-”; except “%”, no other character is allowed. If a “%” character is encountered, it must be followed by any of:

- **LT**: can only be at the first place; means that the date fields have to be converted to local time zone (as defined in the operating system)
- **“bD”**: day in the month (2 digits, 01 to 31) of the beginning of the file period
- **“bM”**: month (2 digits, 01 to 12) of the beginning of the file period
- **“bY”**: year (4 digits) of the beginning of the file period
- **“bH”**: hours (2 digits, 00 to 23) of the beginning of the file period
- **“bh”**: hours (2 digits, 01 to 12) of the beginning of the file period
- **“bA”**: “AM” or “PM” of the hour of the beginning of the file period
- **“bm”**: minutes (2 digits, 00 to 59) of the beginning of the file period
- **“bS”**: seconds (2 digits, 00 to 59) of the beginning of the file period

- “eD”: day in the month (2 digits, 01 to 31) of the end of the file period
- “eM”: month (2 digits, 01 to 12) of the end of the file period
- “eY”: year (4 digits) of the end of the file period
- “eH”: hours (2 digits, 00 to 23) of the end of the file period
- “eh”: hours (2 digits, 01 to 12) of the end of the file period
- “eA”: “AM” or “PM” of the hour of the end of the file period
- “em”: minutes (2 digits, 00 to 59) of the end of the file period
- “eS”: seconds (2 digits, 00 to 59) of the end of the file period

E.g.- With Default File Name Mask (%bD%bM%bY%bH%bm%bS-%eD%eM%eY%eH%em%eS), the file generation started at 05th October 2012 ( 11:15 am) and ended on 05th October 2012 ( 11:30 am) at could be 05102012111500-05102012113000

**Capping:** This parameter denotes the Output Capping in Mbps. Default Values is 50 and possible Values are in the range 1-999. ( This Field could be left empty )

**Point Code Format:** This parameter denotes the point code flavor. You can select one of following values *Default, ANSI, ETSI\_I, ETSI\_N, Chinese, Japanese*

**Ordered List:** You can define the ordering of the fields from dictionary. Then the output CSV Files should maintain the order specified in this parameter. Some Dictionary Fields could be deselected while creating Storage DFP. Select and Move the fields using Left Arrow Button from *Selected Options* to *Available Options* if you don't want to keep the fields in output CSV Files.

**b. Formatting Parameters**

Select This Tab to Specify User Preferences.  
Following Screen appears

The screenshot shows a web-based configuration interface for xDR Storage. At the top, there are tabs for 'Definition', 'Input Streams', 'xDR Filters', and 'xDR Storage', with 'xDR Storage' being the active tab. Below this, there's a 'Storage Type' dropdown menu set to 'CSV Files'. Underneath, there are two sub-tabs: 'Feed Parameters' and 'Formatting Parameters', with 'Formatting Parameters' being selected. Within 'Formatting Parameters', there are several sub-tabs: 'Time', 'Enumeration', 'Point Code', 'CIC', 'CSV', and 'Misc', with 'Time' being the active sub-tab. The 'Time' sub-tab contains a section titled 'Date/Time Formats' with the following fields:
 

- Date Format: dd/MM/yyyy \*
- Time Format: HH:mm:ss \*
- Date and Time Fields: dd/MM/yyyy HH:mm:ss \*
- Duration Fields: hhh:mm:ss.ms
- Time Zone: (GMT +05:00) Antarctica/Mawson

Figure 218: xDR Storage Screen

Specific preferences will be applied while creating the Storage DFP as selected by user in this screen.

**Note:** - All the preferences screen are same as global user preferences and as in previous release except for CSV preference. CSV Preference is provided for CSV type Storage DFP formatting.

Select Time Tab for Time Related preferences. E.g. you can change Date and Time formats, TimeZone etc.

Select Enumeration Tab for providing Mapping. Following mapping are provided

- Translate ENUM values
- Point Code to Node Name
- Link Short Name to Long Name

Select point Code Tab for Point Code related preferences. You can select whether point code format is displayed in Hexadecimal or Decimal Format.

Select CIC tab for CIC Related Preferences. You can select whether this field is displayed in Hexadecimal or Decimal Format.

Select CSV tab for specifying CSV File Related preferences. This TAB look like as below

Figure 219: Formatting Parameters(CSV) Screen

Field Separator :- Select whether the fields in CSV File generated from this DFP are separated by *Tabular* or *Comma* or *Semicolon* Field.

Line Separator :- Select whether the record lines in CSV File should be separated by *CR*, *LF* or *CR/LF*

Compression :- Click CheckBox if CSV Files Need to be compressed in *GZIP* format.

Header :- Input header text that should appear as header in the CSV File Generated.

Footer :- Input Footer text that should appear as footer in the CSV File Generated.

Heading :- Select one of Radio Button to provide any one of Heading in the CSV File.

Quoting ( Heading ) :- Select Either "When Necessary" or "Always" to specify quoting on heading field.

Quoting ( Data ) :- Select Either "When Necessary" or "Always" to specify quoting on Data field.

Empty Value :- Provide the String for Empty Value in CSV Text File.

Select MISC tab for specifying miscellaneous preferences. This TAB look like as below

Figure 220: Formatting Parameters(Misc) Screen

	Field	Description
DUMP		For binary values as well as formatting the binary data. The bytes are represented as hexadecimal values.
	Prefix	Enables you to enter a prefix for the binary values
	Delimiter	Enables you to enter a specific delimiter included for each value.
	Suffix	Enables you to select a suffix for the binary values.
Percent		Enables you to choose between a percent value or a ratio.
	Percent	Select this field if you want the value to be shown as a percentage.
	Ratio	Select this field if you want the value to be shown as a ratio.
	Percent symbol	Default is the "%" sign, but you can select to use another symbol to represent percent.
	Minimum number of decimal places	Sets the minimum number of decimal places shown in the value (default is 0).
	Maximum number of decimal places	Sets the maximum number of decimal places shown in the value (default is 2, range is: 1-1,000,000).

Table 106: Misc Fields Description

18. Click **Create**.

The *Storage Dataflow Processing* is created. You are now prompted to **Synchronize** the subsystem to save the changes.

### Listing Mediation Protocol

The Mediation Protocol information is needed for Mediation configuration. Mediation Protocol perform various functions from correlating to deciphering information in a Mediation Protocol is tracked by Centralized Configuration on a per-subsystem basis. An Mediation Subsystem is assumed to have a single version of a particular Mediation Protocol installed on its servers. In addition, dictionaries used by discovered Mediation Protocol are also retrieved and stored in the system.

Complete the following task to list all the Mediation Protocol in an Mediation subsystem:

- Select **Mediation > Sites > IXP > Subsystem > xDR Builders**. The Mediation Protocol list screen opens shown below.

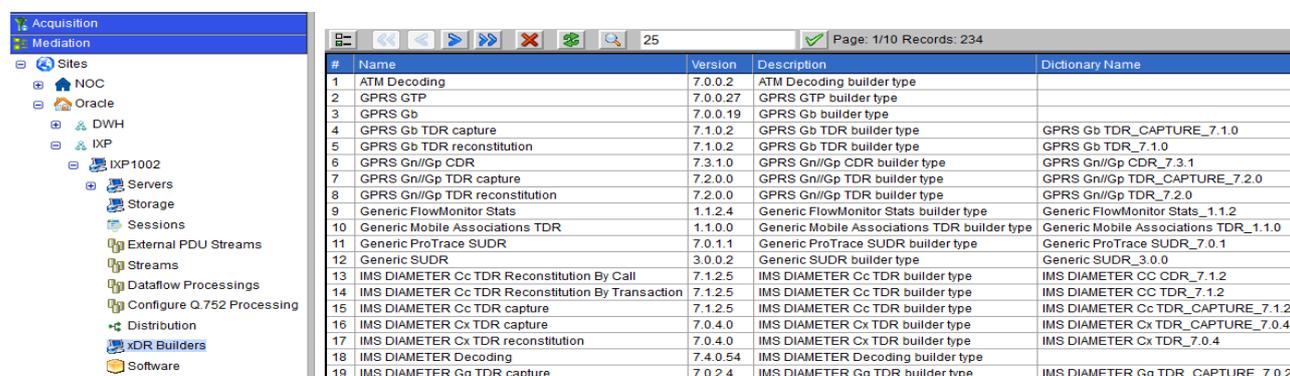

Figure 221: Mediation Protocol List Screen

The following information is provided:

Column	Description
Name	Mediation Protocol Name
Version	Current version of the Mediation Protocol that is stored in the subsystem
Description	Brief description of the Mediation Protocol
Dictionary name	The name of the dictionary associated with the Mediation Protocol

Table 107: Mediation Protocol List Descriptions

### About Sessions

You can click on Sessions in the object tree to view the list of available sessions. In this screen, you can add, modify, or delete *Sessions* on a server.

**Note:** The session name must be unique for each Mediation *Subsystem* or *Data Record Storage server*, but sessions can have identical names if they reside on separate Mediation Subsystems.

### Adding an xDR Session to a Server

Complete these steps to add a session to a server:

1. Select **Mediation > Sites > IXP > Subsystem > Sessions**. The *Sessions* list screen opens.
2. Click **Add**, the *Add Session* screen opens.

Session Name  Lifetime (hours)

Storage

Dictionary

Description

Figure 222: Add Sessions Screen

3. Type a **Session Name**.

**Note:** The *Session Name* must be unique for each Mediation Subsystem or Data Record Storage server, but sessions can have identical names if they reside on separate Mediation Subsystems.

4. Type in the **Lifetime** (number of hours the session exists).
5. Select the **Storage Pool**.
6. Select the **Dictionary** associated with the *Session*.
7. (Optional) Select a **Session Backup** (None, xDR only or xDR and PDU). Default is *None*.
8. (Optional) Type in a **Description**. Shown below is a completed session.
9. Click **Add**.

The *Session* is added to the session list shown below.

Session	Start date	End date	xDR/s	Kbps	Dictionary Type	Format	Dictionary
* All	* All	* All	* All	* All	* All	* All	* All
MAP_SESS_ARJ	04/06/2015 21:36:41	04/06/2015 21:36:41	0	0	RECONSTITUTION	SINGLE	SS7 MAP2 TDR_1.1.1

lbasiss6_Test	-	-	0	0	RECONSTITUTION	SINGLE	LTE DIAMETER S6 TDR_1.3.0

Figure 224: Selected Session For Modification

3. Click **Modify** on the toolbar. The *Session Record* opens.
4. Make the **needed modifications**.

**Note:** IF session point code feature is enabled then to modify flavor of session refer [Appendix D: Defining and Modifying Flavor \(PC Format\) of Session at Centralized C](#)

**Note:** You cannot select another dictionary for the session. To use another dictionary, you must create a new session.

5. Click **Modify**. The *Record* is modified.

## Deleting an xDR Session

Complete these steps to delete an *xDR Session*:

**Note:** You cannot delete a session that is using a *Dataflow Processing*. You must first delete the dataflow processing or modify the *Dataflow Processing* to use another session.

**Note:** You must also **Apply Changes** for any changes in the subsystem to take effect.

1. Select **Mediation > Sites > IXP > Subsystem > Sessions**.  
The *Sessions* list screen opens.
2. Select the **Session** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The *Session* is deleted.

## About Partial xDRs

The Partial xDR feature in Centralized Configuration is utilized by Troubleshooting for processing real-time traces on the SS7 ISUP ANSI, VoIP SIP-T ANSI CDR and VoIP SIP CDR protocols. Using the partial *xDR Feature* you can configure in the build and store process.

**Note:** You must configure partial ANSI ISUP a dSIP-T/SIP xDRs manually using the build process.

**Note:** In addition, in configuring partial ANSI ISUP a dSIP-T/SIP xDRs you must also configure xDR filters so that partial and completed xDRs are written to the proper session.

## Creating an xDR Session for a Dataflow Processing

Complete these steps to create an xDR Session for a dataflow processing. You can create a session for either an Operate or a Storage dataflow processing:

1. In the *xDR Storage* screen, select **Create Session**. The *xDR Storage* screen is shown below.

Figure 225: Create Session Screen

2. Type a **Session Name**.
3. Type in the **Lifetime** (number of hours the session exists).
4. Select the **Storage Pool**.
5. Select the **Dictionary** associated with the *Session*.
6. (Optional) Type in a **Description**. Shown below is a completed session.

**Note:** IF session point code feature is enabled then to configure flavor of session refer [Appendix D: Defining and Modifying Flavor \(PC Format\) of Session at Centralized C](#)

Figure 226: Completed Xdr Session Screen

7. Click Add. The *Session* is created and the *Session Name* shows up in the *Session* field shown below.

Definition	Input Streams	xDR Filters	xDR Storage
Storage Type			Datawarehouse ▾
XDR Sessions			sample ▾

Figure 227: Added Session in Xdr Storage Screen

8. You can now **Create** the *Storage Dataflow Processing*.

### Modifying an xDR session for a dataflow Processing

Complete these steps to modify an xDR session for a Dataflow Processing:

1. Select **Mediation > Sites > IXP > Subsystem > Dataflow Processings**.  
The *Dataflow Processing List* screen opens.
2. Select the **Dataflow Processing** to be modified.
3. Click **Modify**.
4. Make the **necessary modifications**.
5. Click **Modify**.

The *Dataflow Processing* is modified. You must now **Synchronize** the subsystem. See [See About Applying Changes to a Subsystem \(Synchronizing\)](#).

### Deleting an xDR session from a dataflow Processing

1. Select **Mediation > Sites > IXP > Subsystem > Dataflow Processings**.  
The *Dataflow Processing List* screen opens.
2. Select the **Dataflow Processing** to be deleted.

**Note:** You cannot delete a dataflow processing if there are any dependencies on it. You are prompted if there are dependencies belonging to the dataflow processing being deleted.

4. Click **Delete**.
5. Click **OK** at the prompt.

The *Dataflow Processing* is deleted. You must now **Synchronize** the subsystem. [See About Applying Changes to a Subsystem \(Synchronizing\)](#).

## About Q.752 Dataflows

Q.752 Dataflows are a type of dataflow processing (see "[Configuring xDR Dataflow Processings](#)"). A Q.752 Dataflow is created to route Q.752 statistical data from Acquisition to Mediation.

### About configuring Q.752 Dataflows

Configuring Q.752 Dataflows is performed in a specific sequence. Centralized Configuration is set up to enable you to go through this sequence in Wizard fashion through a set of tabs. The procedure for each tab is discussed in proper sequence.

### About managing counter Activation

You route specific Q.752 traffic from the Acquisition subsystem to Mediation by choosing Q.752 counters. These counters are defined by the SS7 standards from Q.752 statistics. Activating and deactivating the counters internally creates the corresponding dataflow build and stores Dataflow Processings and then routes the data to sessions (created automatically). It is important that you choose what input streams to apply the Q.752 Dataflows to. On choosing the input streams you have the option of configuring two parameters:

- No PDU Timeout
- Automatically Clear Alarms

These two parameters are internally applied to the build dataflow processes. You then have the option to apply SSN and linkset filters to the configuration. The filter values are applied to the build dataflow process created internally. When you navigate to the Linkset filters tab, you are presented with a list can choose a set of linksets and apply a pre-created OPC-DPC-SIO filter to the linksets.

When you choose to de-select a counter the associated session is not deleted automatically. You can navigate to the *Sessions* list and delete the session manually. This results in the *Session* also are deleted in the DWH.

### About the Q.752 Dataflow Assistant

The Q.752 Dataflow Assistant option provides a wizard to help you quickly create a Q.752 processing. The process follows five stages:

- Selecting the Q.752 counters
- Selecting the PDU Inputs (Streams and/or Dataflows)
- Configuring the General Parameters
- Selecting (or not) an SSN Filter to be used with the processing
- Selecting the Linkset Filters to be used with the processing

### Using the Q.752 Processing Assistant

**Note:** Because Q.752 Processings utilize input streams, you must first create your input streams or PDF Dataflows before you create your Q.752 Processings.

1. Select **Mediation > Sites > IXP > Subsystem** that needs the Q.752 Processings.
2. Select **Configure Q.752 Processing**.  
The *Q.752 list* screen opens

Counter Activation					
Inputs					
General Parameters

#	PDU Dataflow Name	Type			

Figure 230: Inputs Screen (PDU Dataflows Tab)

8. Select what type of **Dataflow** (SS7 / Q.752).
- Note:** You can select both types of input streams.
9. Select one or more **PDU Dataflows** from the list.
  10. Click **Next**. The *General Parameters* screen appears.

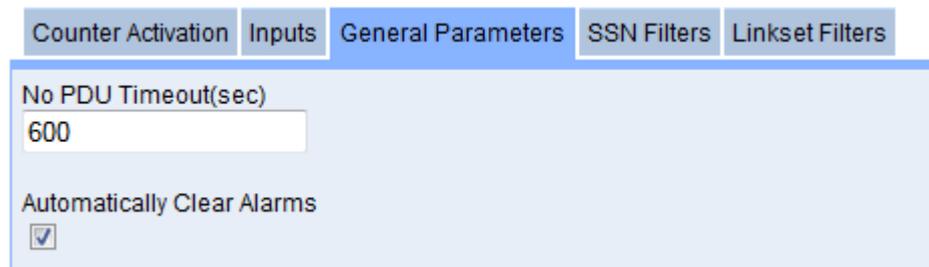

Figure 231: General Parameters Screen

11. Enter the number of sec in the **No PDU Timeout** field (default is 600).
12. (Optional) Select to **automatically clear alarms** after the process has run.
13. Click **Next**. The *SSN Filter* screen appears.

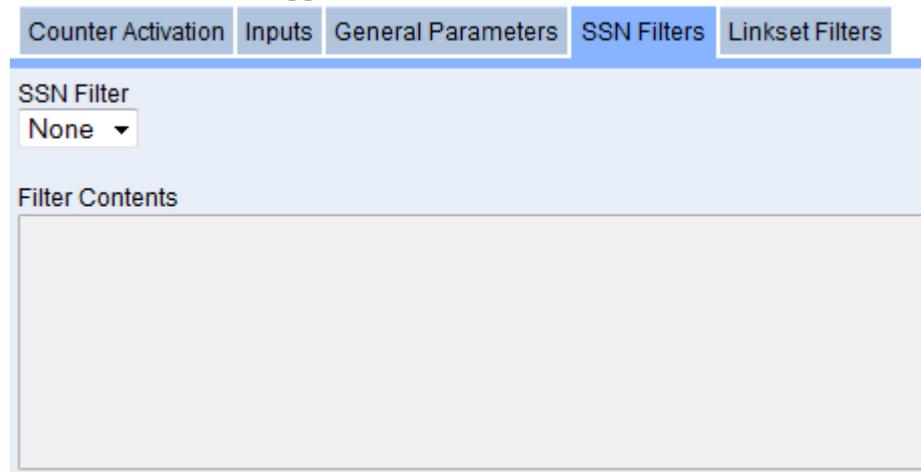

Figure 232: Linkset Filters Tab

14. Select the **SSN Filter** type from the pull-down menu. The content of the *Filter* appears in the Filter Contents field.
15. Click **Next**. The *Linkset Filters* screen appears.

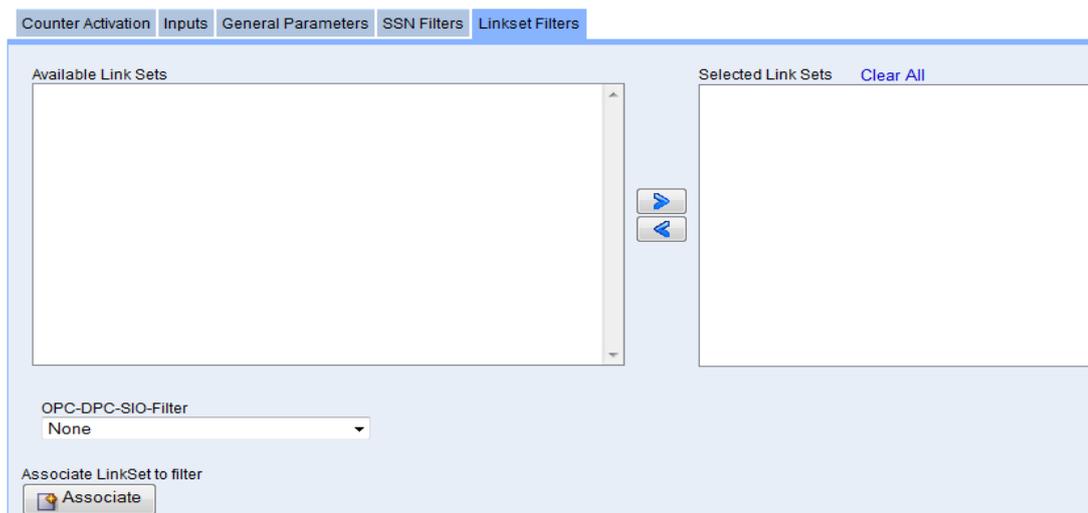

Figure 233: Linkset Filters Tab

1. Select one or more **Available Linksets**.
2. Click right arrow to place them into the **Selected Linksets** field.
3. (Optional-according to the linksets used) Select an **OPC-DPC-SIO Filter**.
4. Click **Finish**. The configured *Q.752 Processing* is saved.

**Note:** Make sure you **Apply Changes** for the changes to be reflected in the Mediation Subsystem.

## About Distributions

The distribution option enables you to move Mediation Dataflow Processing from one server to another for the purpose of load sharing.

Complete these steps to use the Distribution option:

1. Select **Mediation > Sites > IXP > Subsystem > Distribution**.

The *Dataflow Distribution* list screen opens, shown below.

Mediation > Sites > Oracle > IXP > IXP1002 > Distribution > List

Dataflow Processing	Type	Input Stream(s)	Output	Server
MAP_DFP_ARJ	Building	TEST_DF_pmf10-0a_IXP1002_16437	B_MAP_SESS_ARJ_7	ixp1002-1a
B_MediationCapacityManagement	Building	ixp1002FlowMonitor	O_MediationCapacityManagement	ixp1002-1a
B_AcquisitionCapacityManagement	Building	pmf10-0aFlowMonitor_IXP1002_16856	O_AcquisitionCapacityManagement	ixp1002-1a
S6_Test	Building	TEST_DF_pmf10-0a_IXP1002_17870	B_IbasisS6_Test_12	ixp1002-1a
ixp1002PoolMonitor_2	Operation	ixp1002PoolMonitor	O_ixp1002PoolMonitor_3 K_ixp1002AggSessionMonitor_4	ixp1002-1a
StreamMonitor	Storage	ixp1002StreamMonitor	ixp1002StreamMonitor	ixp1002-1a
BuildMonitor	Storage	ixp1002BuildMonitor	ixp1002BuildMonitor	ixp1002-1a

Figure 234: Distribution List

2. Select a different **Server** from the dataflow processing Server column pull-down list.
3. Click **Done**. You are prompted to **Synchronize** to save the changes to the subsystem.

## About Software

The software option enables you to view the applications on each Mediation server. Selecting the software option opens the *Software List* screen shown below:

Mediation > Sites > Oracle > IXP > IXP1002 > Software > List

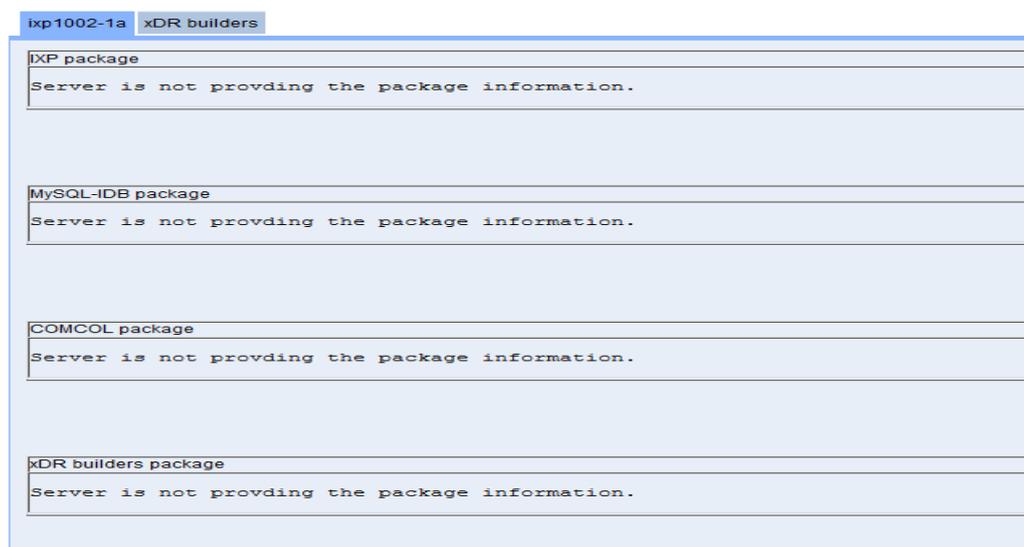

Figure 235: Software List Screen

The *Software List* screen has a tab for each server in the subsystem as well as the Mediation Protocol.

The Mediation *Server* tab lists:

- Mediation Package contents (shown above)
- MySQL-IDB Package contents (shown above)

- COMCOL Package contents (not shown)
- Mediation Protocol Package contents (not shown)

### About Subsystem Preferences

Subsystem references enable you to create preferences with values for the Subsystem.

### Adding a subsystem Preference

Complete these steps to add a subsystem preference:

1. Select **Mediation > Sites > IXP > Subsystem > Subsystem Preferences**.  
The *Subsystem Preferences* screen opens shown below.

Mediation > Sites > Oracle > IXP > IXP1002 > Subsystem Preferences > List

#	Parameter Name	Value	Description
1	Garbage period(s)	60	IXP Parameter holding default value for Garbage period(s). Number of seconds
2	No PDU Timeout(s)	600	IXP Parameter holding default value for No PDU Timeout(s). Number of seconds
3	RetentionTime (Build)	5	Retention Time for Build processes in seconds
4	RetentionTime (Operate)	5	Retention Time for Operate processes in seconds
5	FlushingTimeout (Store)	5	Buffer Flush Timeout for Store processes in seconds
6	RetentionTime (Store)	5	Retention Time for Store processes in seconds

Figure 236: Subsystem Preferences

2. Click **Add**. The *Subsystem Preferences Add* screen opens shown below.

Mediation > Sites > Oracle > IXP > IXP1002 > Subsystem Preferences > List

Name

Value

Description

Figure 237: Subsystem Preferences List Screen

3. Enter the **Name** of the preference.
4. Enter a **Value** (or to reset value click **Reset to Default**).

**Note:** The values can be for:

- Garbage Periods - integer between 0 and 32767.

- No PDU Timeouts - integer between 1 and 32767.
  - RetentionTime (Build) - default is 5.
  - RetentionTime (Operate) - default is 5.
  - RetentionTime (Store) - default is 5.
  - FlushingTime (Store) - default is 5.
5. (Optional) Enter a **Description** of the preference.
  6. Click **Add**. The *Preference* is added to the list.

### Modifying a subsystem Preference

Complete these steps to add a subsystem preference:

1. Select **Mediation > Site > Subsystem > Subsystem Preferences**.  
The *Subsystem Preferences* screen opens.
2. Select the **Preference** that needs to be modified.
3. Make the **necessary modifications**.
4. Click **Modify**. The *Preference* is modified.

### Deleting a Subsystem Preference

Complete these steps to add a subsystem preference:

1. Select **Mediation > Site > Subsystem > Subsystem Preferences**.  
The *Subsystem Preferences* screen opens.
2. Select the **Preference** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The *Record* is deleted.

## Managing Multiple Mediation Subsystems

The Mediation Perspective enables you to manage certain elements globally, (multiple Mediation subsystem within a site or Mediation subsystems within multiple sites). The following elements can be managed globally.

- Q.752 filters - see [About Q.752 Filters](#).
- xDR filters - see [About xDR Filters](#).
- Dictionaries - see [About Dictionaries](#).
- Sessions - see [About Sessions](#).

### About Q.752 Filters

Each Mediation subsystem has the capability to generate Q.752 statistics based on incoming PDU streams. Mediation supports filtering the PDUs using SSN and DPC-OPC-SIO filters. These filters are defined globally. The filters are referenced when configuring Q.752 for any Mediation Subsystem.

Selecting *Q.752 Filters* in the object tree opens its two options:

- SSN Filters
- DPC-OPC-SIO filters.

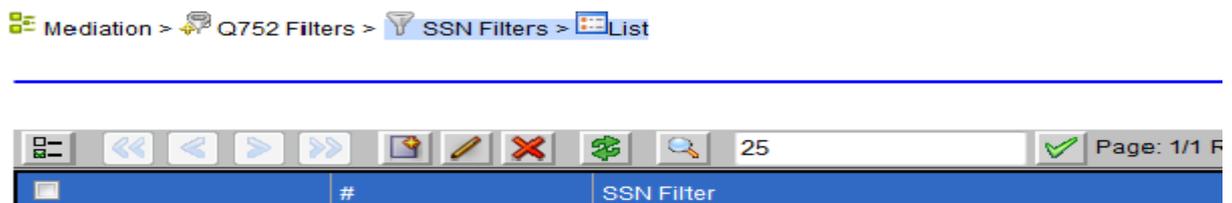

Figure 238: SSN Filters List Screen

### Creating SSN Filters

Complete these steps to add an SSN Filter:

1. Select **Q.752 Filters > SSN Filters > List**.  
The *List* screen opens.
2. Click **Add**. The *Add* screen opens shown below.

Field	Description
Filter Name	Alphanumeric field for creating an SSN filter name. The name cannot contain spaces.
Enter SSN	Numeric field where an integer is entered between 1-255.
Add filter button	Clicking this button, adds the SSN to the list, you must have a minimum of 1 and a maximum of 10 SSN's.
SSN List	Lists all the SSNs that you created.
Remove from List button	Removes the highlighted SSN from the list.
Reset button	Resets all the fields to their defaults (blank).
Cancel button	Cancels the procedure and returns you to a blank screen.
Create button	Saves the filter to the system and creates a record in the SSN list screen.

Table 108: Add SSN Filter Screen

Figure 239: SSN Filter Add Screen

3. Enter a **Filter Name**.
4. Enter a **SSN** (integer 1-255).
5. Click **Add** to List. The SSN is added to the list.
6. Repeat steps 4 & 5 to add more SSNs.
7. Click **Create**. The *Filter* is added to the SSN List screen shown below.

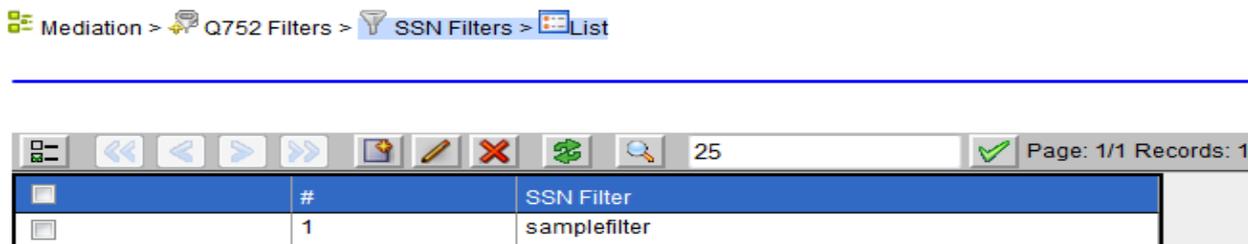

Figure 240: SSN Filter Add Completed

### Modifying an SSN Filter

Complete these steps to modify an SSN from a Filter:

**Note:** If the SSN filter is associated with a Q.752 configuration and the filter is modified, it results in the modification of the Q.752 configuration internally.

1. Select **Q.752 Filters > SSN filters > List**.  
The *List* screen opens.
2. Select the **SSN Filter** to be modified.
3. Click **Modify**.The *Modify* screen opens.
4. Make the **needed modifications**.
5. Click **Modify**.The *Record* is modified.

### Using Remove from List Operation

Complete these steps to remove an SSN from a Filter using the remove from list operation:

1. When the filter record is open, (either in the add mode or modify mode), **highlight** the **SSN** to be removed.
2. Click the **Remove from List** button.
3. Click either **Create** or **Modify** (depending on which mode you are in).  
The *SSN* is removed from the list.

### Deleting a SSN Filter

Complete these steps to delete an SSN from a filter:

**Note:** If the SSN filter is associated with a Q.752 configuration you cannot delete the filter in this location. You have to manually remove the filter by navigating to the Q.752 configuration and setting the SSN Filter to none. You will then have to return to this location to delete the filter.

1. Select **Mediation > Q.752 Filters > SSN Filters > List**.  
The *List* screen opens.
2. Select the **SSN Filter** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt.The *Filter* is deleted.

### Listing OPC-DPC-SIO Filters

1. Select **Mediation >Q.752 filters > OPC-DPC-SIO Filters**.  
The *List* screen opens shown below.

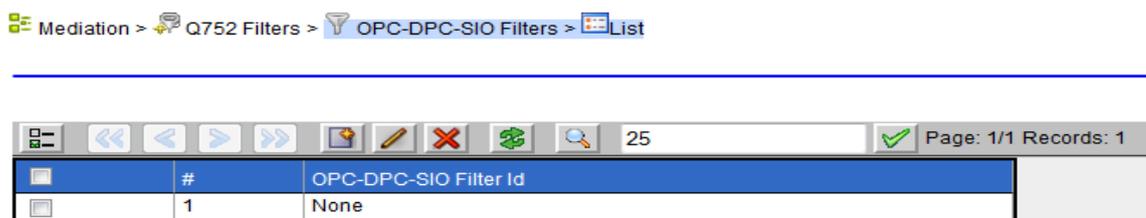

Figure 241: OPC-DPC-SIO Filters List Screen

From this screen you can add new OPC-DPC-SIO filters or manage existing ones.

Field	Description
Filter Name	Alphanumeric field for creating an SSN filter name. The name cannot contain

Field	Description
	spaces.
Select Flavor	Pull-down list that has the different protocol/flavors. You can have multiple flavors in one filter.
OPC	Originating Point Code is entered here in the appropriate format/flavor
DPC	Destination Point Code is entered here in the appropriate format/flavor
SIO	Service Indicator is entered as an integer between 1-1million
Add to list button	Clicking this button, adds the OPC-DPC-SIO combination to the list, you must have a minimum of 1 and a maximum of 5 OPC-DPC-SIO's.
OPC-DPC-SIO List	Lists all the SSNs that you created.
Remove from List button	Removes the highlighted SSN from the list.
Reset button	Resets all the fields to their defaults (blank).
Cancel button	Cancel the procedure and returns you to a blank screen.
Create button	Saves the filter to the system and creates a record in the OPC-DPC-SIO list screen.

Table 109: Add OPC-DPC-SIO Filters Screen

Mediation > Q752 Filters > OPC-DPC-SIO Filters > List

Filter Name

Remove from List

Reset    Cancel    Create

Figure 242: OPC-DPC-SIO Add Screen - Completed

2. Enter a **Filter Name**.
3. Select a **Flavor**.
4. Enter a **OPC** (same format as selected).
5. Enter a **DPC** (same format as selected).
6. Enter a **SIO** (integer between 1-1 million).
7. Click **Add** to List. The *OPC-DPC-SIO* is added to the list.
8. Repeat steps 4 & 5 to add more OPC-DPC-SIOs.
9. Click **Create**. The *Filter* is added to the OPC-DPC-SIO List screen shown below.

#	OPC-DPC-SIO Filter Id
1	None
2	sample

Figure 243: OPC-DPC-SIO Filter Add Completed

### Modifying an OPC-DPC-SIO Filter

Complete these steps to modify an OPC-DPC-SIO from a filter:

**Note:** If the OPC-DPC-SIO filter is associated with a Q.752 configuration and the filter is modified, it results in the modification of the Q.752 configuration internally.

1. Select **Mediation > Q.752 Filters > OPC-DPC-SIO Filters**.  
The *List* screen opens.
2. Select the **OPC-DPC-SIO Filter** to be modified.
3. Click **Modify**. The *Modify* screen opens shown below.
4. Make the **needed modifications**.
5. Click **Modify**. The *Record* is modified.

### Removing an OPC-DPC-SIO number from filter List

Complete these steps to remove an OPC-DPC-SIO from a filter using the remove from list operation:

1. When the filter record is open, (either in the add mode or modify mode), **highlight** the **OPC-DPC-SIO** to be removed.
2. Click the **Remove from List** button.
3. Click either **Create** or **Modify** (depending on which mode you are in).  
The *OPC-DPC-SIO* is removed from the list.

### Deleting an OPC-DPC-SIO Filter

Complete these steps to delete an OPC-DPC-SIO from a filter:

**Note:** If the OPC-DPC-SIO filter is associated with a Q.752 configuration you cannot delete the filter in this location. You have to manually remove the filter by navigating to the Q.752 configuration and setting the OPC-DPC-SIO filter to none. You will then have to return to this location to delete the filter.

1. Select **Mediation > Q.752 Filters > OPC-DPC-SIO Filters**.  
The *List* screen opens.
2. Select the **OPC-DPC-SIO Filter** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The *Filter* is deleted.

### About Dictionaries

Dictionaries describe a session, by providing its column names, titles, syntax, data type, and other information. A dictionary is a text file with an *.a7d* extension that is physically stored on a server. Dictionaries must be present in the Management Application database in order for Management Applications to use them.

In general, an application is not based on the specific content of a dictionary, rather, it can adapt based on the content of a dictionary. Therefore, for an application to be able to do anything with a session, the dictionary for it must reside in the Management Application database. This section describes how to create dictionaries. Dictionaries are specified in ASCII format and a dictionary file extension is *.a7d*.

Below are the four types of dictionaries used in the system -

1. CAPTURE - Represents a protocol dictionary created by a Mediation Protocol.
2. RECONSTITUTION - Represents a protocol dictionary created by a Mediation Protocol.

3. STATISTICS – Represents a KPI dictionary which is automatically created in the system.
4. PARTIAL – Represents a user defined dictionary which is used for enrichment.

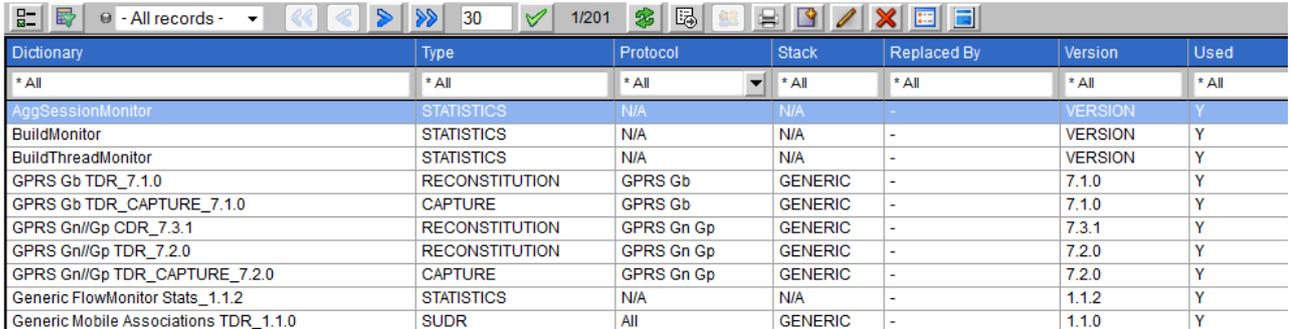

Partial dictionary ASCII file(.a7d) shall contains header like the following:

```
# -----
# Name: ....
# Type: Partial
#-----
```

No stack nor protocol nor builder shall be mentioned in the header. Partial dictionaries are created with the same name as that of the ASCII file(.a7d) name.

Select **Mediation > Dictionaries**. The *Dictionary List* screen opens shown below. From this screen you can add, modify and delete dictionaries.

Mediation > Dictionaries > List

Dictionary	Type	Protocol	Stack	Replaced By	Version	Used
* All	* All	* All	* All	* All	* All	* All
AggSessionMonitor	STATISTICS	N/A	N/A	-	VERSION	Y
BuildMonitor	STATISTICS	N/A	N/A	-	VERSION	Y

Generic Mobile Associations TDR_1.1.0	SUDR	All	GENERIC	-	1.1.0	Y

Figure 244: Dictionary List Screen

## Creating a Dictionary

Dictionaries describe a session, by providing its column names, titles, syntax, data type, and other information. Dictionaries must be present in the Management Application database in order for Management Applications, such as *Troubleshooting* to use them.

Complete these steps to add a dictionary to the system:

1. Select **Mediation > Dictionaries**.
2. Click **Add** on the tool bar. The *Add* screen opens shown below.

Mediation > Dictionaries > List

Dictionary File  
Browse... No file selected.

Cancel Add

Figure 245: Add Dictionary Screen

3. Browse for the **Dictionary File**. (A dictionary is a text file with an a7d extension that is physically present on the Mediation subsystem.)
4. Click **Add**. The *Dictionary* is added to the system.
5. From the host right-click menu, select **Apply Changes** for the changes to take effect.

## Modifying a Dictionary

Complete these steps to modify an existing dictionary file-type reconstitution:

1. Select **Mediation > Dictionaries**.  
The *List* screen opens.
2. Select the **Dictionary** to be modified.
3. Click **Modify**. The *ModifyDictionary* screen opens shown below.

Figure 246: Modify Dictionary - Dictionary Info Tab

4. Select **Dictionary Info** tab.
5. Modify either the **Protocol** or **Stack** information.
6. Select **Dictionary Attribute Info** tab shown below.

	Attribute Name	Short Name	Long Name	Description	Enumeration	Conditionable	Displayable	Mask	Hidden From
1	Line	Line	Line	Line filter name	No	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin
2	SumStoredXdrs	SumStoredXdrs	SumStoredXdrs	Number of stored XDR:	No	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin
3	PoolName	PoolName	PoolName	Name of Storage Pool	No	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin

Figure 247: Modify Dictionary - Dictionary Attribute Info Tab

7. Select the **Attribute(s)** to be modified.  
You can modify the following fields.
  - a. Short Name
  - b. Long Name
  - c. Description
8. Select the following within the **Attribute**:
  - a. If Attribute is to have **Conditions**.
  - b. If Attribute is to be **Displayed**
  - c. If Attribute is to be **Masked**.

(For privacy reasons) If it is to be masked, then complete the following steps:

- Select what part should be masked (**Beginning, End, Hide All**).
  - How many **digits** should be hidden.
9. Repeat steps 7-8 for each attribute.
  10. Click **Modify**. The *Capture Type Dictionary* is modified.

### Enabling or Disabling PDU Decode Hiding for a Dictionary

Records/Page 50 Page 1/1 Total Records: 12					
	Field Name	Displayable	Mask	Hidden From	Digits to Hide
1	Time	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin	0
2	Ms	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin	0
3	FrameType	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin	0
4	Channel	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin	0
5	Length	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Begin	0

Figure 248: PDU Hiding for Dictionaries

Field	Description
Field Name	Name of the field in the dictionary
Displayable	If the field is displayable
Mask	Masking required
Hidden From	Masking to hide from Begin, End or Hide All
Digits to Hide	Number of digits to be masked.

Table 110: PDU Hiding Dictionary Columns

Complete these steps to enable or disable PDU decode hiding for a specific dictionary:

**Note:** The PDU hide option must be enabled to use the PDU decode hide feature. See *Enabling or Disabling PDU Hiding from the Home Page*.

**Note:** The dictionary must be added to the system before the PDU decode hiding feature can be enabled or disabled.

1. Select **Mediation > Dictionaries**.  
The *List* screen opens.
2. Select the **Dictionary** to be modified.
3. Click **Modify** from the tool bar.
4. Select the **Protocol Hiding** tab.
5. Select **Hide** for a specific category.

**Note:** To disable the hide feature, click on the selection field to de-select the hide feature.

6. Click **Modify**.

### Editing Category Titles in a Dictionary

Complete these steps to edit Category Titles for a specific dictionary:

1. Select **Mediation > Dictionaries**.

The *List* screen opens.

2. Select the **Dictionary** to be modified.
3. Click **Modify** from the tool bar.
4. Select the **Protocol Hiding** tab.
5. Select **Hide** for a specific category.

**Note:** To disable the hide feature, click on the selection field to de-select the hide feature.

6. Click **Modify**.

### Enabling and Disabling PDU Summary Hiding

Complete these steps to enable or disable PDU summary hiding:

**Note:** The PDU hide option must be enabled to use the PDU summary hide feature. See Enabling or Disabling PDU Hiding from the Home Page.

1. Select **Mediation**.
2. Select the **PDU Hiding** entry.
3. Select **Mask** for the heading.

**Note:** To disable the hide feature, unselect the Mask field.

4. Select **Hide All** option from the *Hidden From* column drop-down list.
5. Click **Modify**.

### Deleting a Dictionary

**Note:** You cannot delete a dictionary if it is associated with a session. You must first disassociate the session from the dictionary or delete any children of that dictionary.

Complete these steps to delete a dictionary from the system:

1. Select **Mediation > Dictionaries**.  
The *List* screen opens.
2. Select the **Dictionary** to be deleted.
3. Click **Delete**.

**Note:** To delete only one dictionary file, click Delete in the actions column. To delete several dictionary files, select each file and click Delete on the toolbar.

4. Click **OK** at the prompt. The *Dictionary* is deleted from the list.

### Viewing a Dictionary Source

The View Source option enables you to view the dictionary source file (.a7d file) as a text file. To view a Dictionary Source File, complete these steps:

1. Select **Mediation > Dictionaries**.  
The *List* screen opens shown below.

Mediation > Dictionaries > List

Dictionary	Type	Protocol	Stack	Replaced By	Version	Used
* All	* All	* All	* All	* All	* All	* All
AggSessionMonitor	STATISTICS	N/A	N/A	-	VERSION	Y
BuildMonitor	STATISTICS	N/A	N/A	-	VERSION	Y
BuildThreadMonitor	STATISTICS	N/A	N/A	-	VERSION	Y

GPRS Gn//Gp TDR_CAPTURE_7.2.0	CAPTURE	GPRS Gn Gp	GENERIC	-	7.2.0	Y
Generic FlowMonitor Stats_1.1.2	STATISTICS	N/A	N/A	-	1.1.2	Y

Figure 249: Modify Dictionary List Screen

2. Select the **Dictionary Source** you want to view shown above.
3. Click **View Source** from the tool bar.  
The *Source File* opens, shown below.

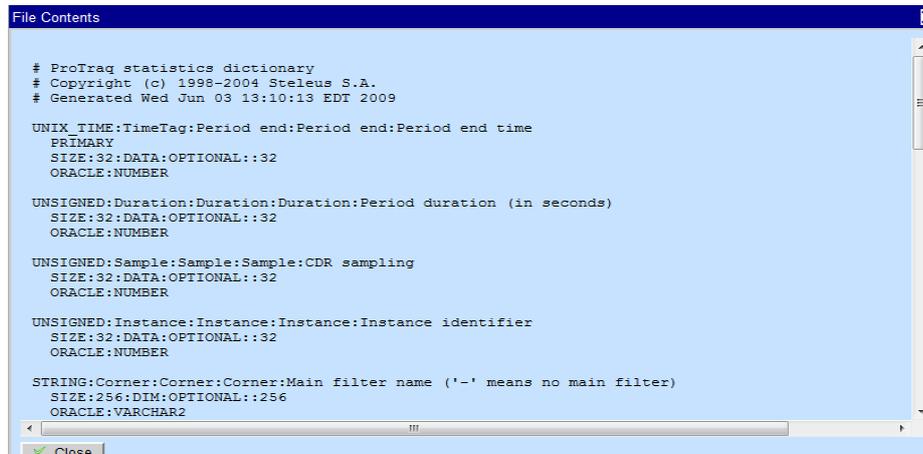

Figure 250: Dictionary List Screen

Click the **Close Icon** at the top right-hand corner of the screen to close the file.

### Listing Unused Dictionaries

The *Discrepancy Report* option enables you to list the dictionaries that are unused after an update. To view the *Discrepancy Report*, complete these steps:

1. Select **Mediation > Dictionaries**.  
The *List* screen opens.
2. Select a **Dictionary** that has been updated.

**Note:** All updated *Dictionaries* will be in bold type.

Dictionary	Type	Protocol	Stack	Replaced By	Version	Used
* All	* All	* All	* All	* All	* All	* All

IMS DIAMETER G4 TDR_7.0.2	RECONSTITUTION	IMS DIAMETER	GENERIC	-	7.0.2	Y

Figure 251: Dictionary List with Unused Dictionary Selected

3. Select the **View Discrepancy Report** button on the tool bar to generate the report (last button on the right). The *Report* screen opens.

The Report shows:

- Basic Information
- Non-ENUM Field(s) Descrepancies
- ENUM Field(s) Descrepancies

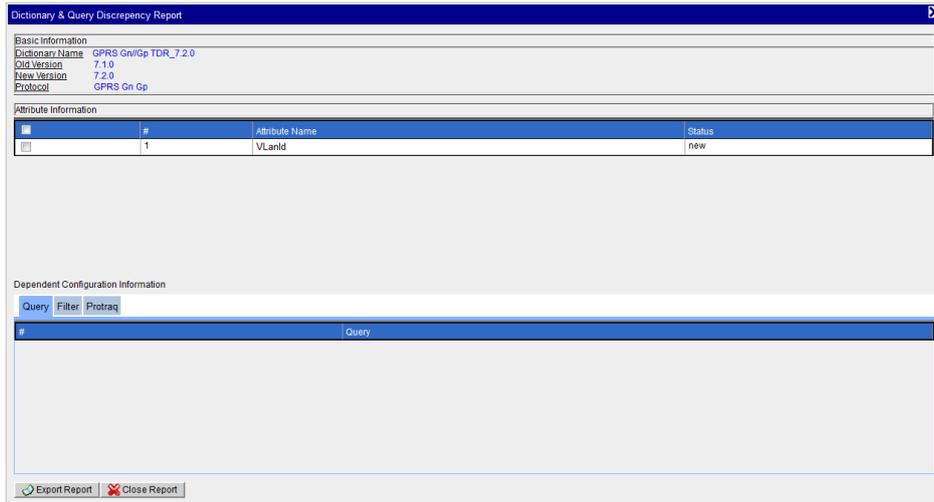

Figure 252: Unused Dictionary Discrepancy Report

4. Click the **Close Report** to close the report.

## About xDR Filters

xDR Filters are treated as global entities. xDR Filters are needed when:

- A subset of the generated xDRs are operated on or stored where xDRs matching a condition can be filtered out.

The figure below shows the xDR Filters List screen.

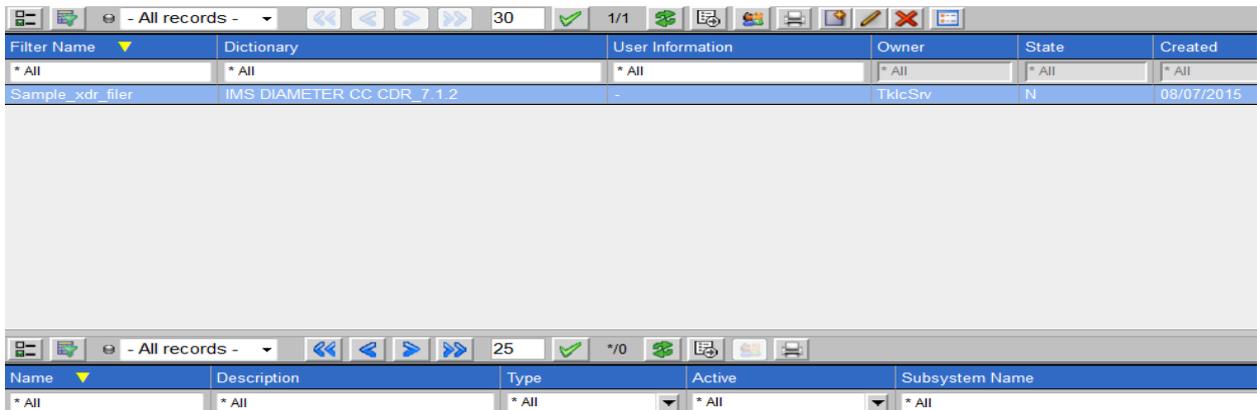

Figure 253: Xdr Filter List Screen

The child window at end of screen shows the information about associated DFPs with xDR Filter selected in master window. Figure below shows the sample screen

Figure 254: Associated DFP List

## Adding xDR Filters

Complete these steps to add an xDR filter.

1. Select **xDR Filters**. The *xDR Filter* List screen opens.

2. Click **Add** (or right click on the xDR Filters object tree).  
The *xDR Filter Add* screen opens show below.

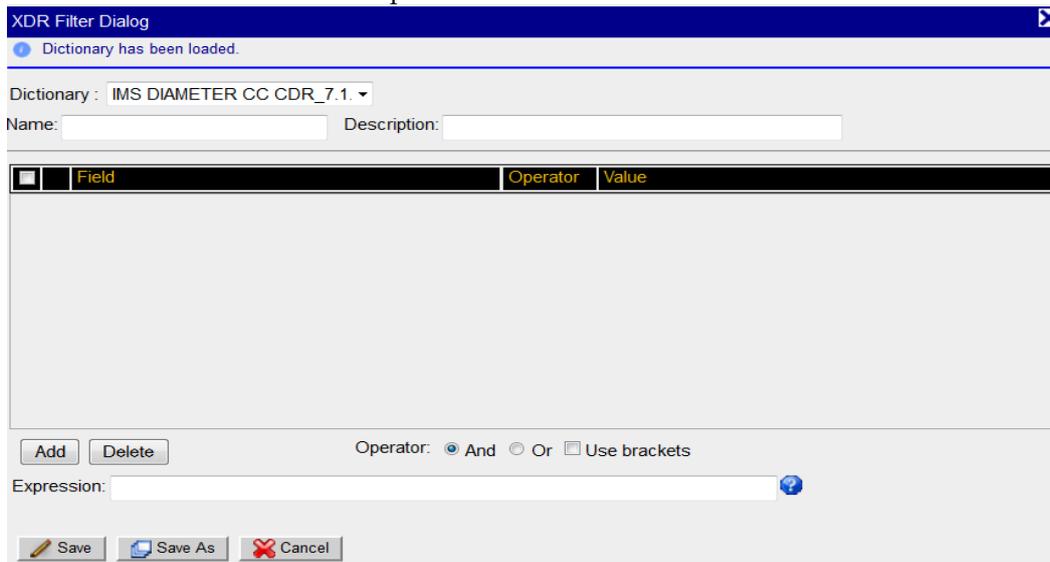

Figure 255: Xdr Filter Add Screen

3. Type in a **Filter Name**.
4. (Optional) Type in a description.
5. Select the **Dictionary** that is associated with the filter.
6. **Create** the Filter.
  - a. Click **Add**.

(not shown in the figure above). The Field Definition fields open shown below.

**Note:** The *Filter* screen provides an automatic operator selection with a default to and. You can choose one of the other two operators if you need them when creating filters with several expressions.

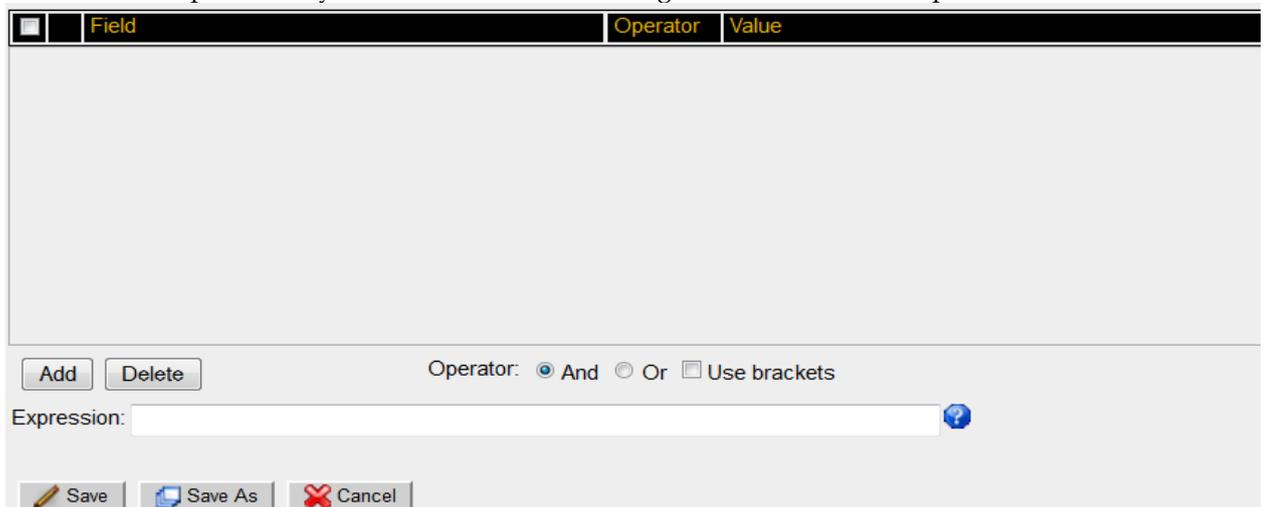

Figure 256: Filter Definition Screen

- b. Select a **Field** from the pull-down list.
- c. Select an **Operator** from the pull-down list.
- d. Select a **Value** from the pull-down list.
- e. Repeat steps b-d to create more expressions.

**Note:** Each expression is labeled A, B, C... with the operator between them. For example, A AND B, B OR C are examples of simple expressions.

7. Click **Create**.

The *Filter* is created and saved to the system shown below.

Filter Name	Dictionary	User Information	Owner	State	Created
* All	* All	* All	* All	* All	* All
Sample_xdr_filter	IMS DIAMETER CC CDR_7.1.2	-	TklcSrv	N	08/07/2015

Figure 257: Added Xdr Filter To List

## Modifying xDR Filters

Complete these steps to modify an xDR Filter:

1. Select **xDR Filters**.  
The *xDR Filter List* screen opens.
2. Select the **xDR Filter** to be modified.
3. Click **Modify** (or right click on the specific xDR Filter object tree). The *xDR Filter Modify* popup opens.
4. Make the **necessary modifications**.
5. Click **Modify**. The *xDR Filter* is modified.

## Deleting xDR Filters

**Note:** You cannot delete an xDR Filter if it is used in a dataflow processing. You must first delete the *Dataflow Processing* or any other dependent object before you can delete the filter.

Complete these steps to delete an xDR Filter:

1. Select **xDR Filters**.  
The *xDR Filter List* screen opens.
2. Select the **xDR Filter** to be deleted.
3. Click **Delete** (or right click on the specific xDR Filter object tree).
4. Click **OK** at the prompt. The *xDR Filter* is deleted from the list.

**Note:** Please refer [Appendix E for behavior during Protocol Upgrade](#)

## About Sessions

The Sessions menu option provides a convenient means of viewing discovered sessions as well as viewing statistical information on a session that is used by the Management Applications such as: *KPI*, *Dashboard* and *Troubleshooting*. Centralized Configuration enables you to create, modify and delete xDR Sessions globally.

**Note:** A Session name must be unique for each Mediation Subsystem or Dataserver, but Sessions can have identical names if they reside on separate Mediation Subsystems.

Selecting the Sessions object from the Object tree opens the xDR Sessions List screen. The Start Date, End Date, xDRs per second, Rate in kbps information is updated every minute by an oracle job running in the background. To display the updated information click refresh button in the session list toolbar. Last Refreshed On label in the session list toolbar displays the time when Refresh button was last clicked.

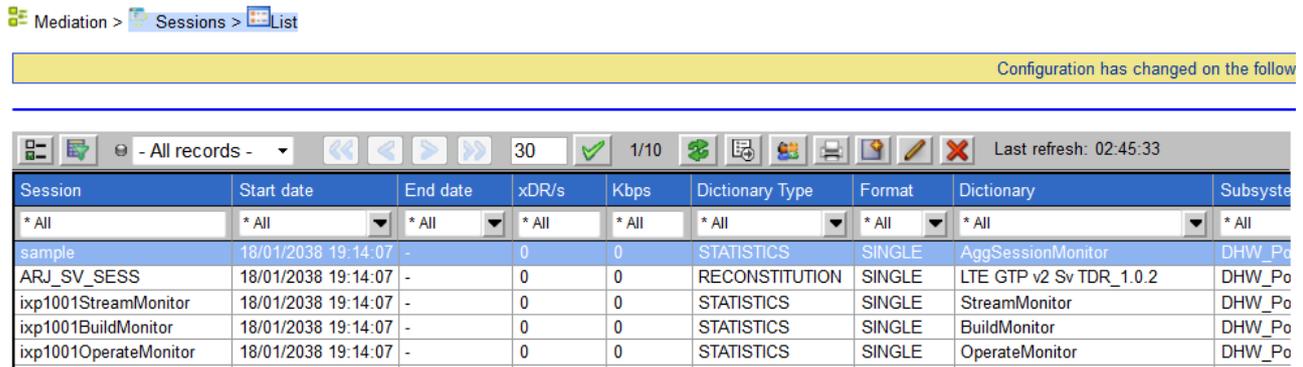

Figure 258: xDR Sessions List Screen

## About xDR Session Table Layout

The *Sessions List* screen is in table format and has the follow information:

Column	Description
Select	Enables you to select one or more sessions
Session	Provides the name of the session
Start Date	The start date and time for the session
End Date	The end date and time for the session
xDRs per Second (xDR/s)	Number of records inserted per second, during the last active full minute
Rate in kbps	Rate in kilobits per second, during the last active full minute
Type <sup>e</sup>	Shows the type of session: <ul style="list-style-type: none"> <li>• Reconstitution</li> <li>• Capture</li> <li>• Statistics</li> <li>• SUDR</li> </ul>
Format	Shows the type of format the session is in.
Dictionary	Shows the name of the dictionary associated with the session
Host	Shows the name of the host that houses the dictionary and the session
Lifetime	Shows how long, in hours, the session is scheduled to run
Sequence ID	Shows if the session is enabled or disabled
User Information	Provides additional information about the session
Owner	Shows the name of the user who created the session
State	Shows the state of the session
Replace by	Shows the name of the user who has altered the session
Created	Shows the data and time the session was created

Table 111: Xdr Table Layout

## Listing xDR Sessions

Complete these steps to list xDR sessions.

1. Select **Mediation > Sessions**
2. Right-click and select **List**. The *List* screen opens.

The *xDR Session* screen tool bar has the following function buttons:

Button/Label	Description
Select Columns	Enables you to select the columns you want to view
First Page	Enables you to go to the first page of a multi-page list of sessions
Previous page	Enables you to go to the previous page of a multi-page list of sessions
Next page	Enables you to go to the next page of a multi-page list of sessions
Last page	Enables you to go to the last page of a multi-page list of sessions
Add	Enables you to add a session
Modify	Enables you to modify a session
Delete	Enables you to delete a session

Button/Label	Description
Refresh	Enables you to refresh a screen to view any changes you have made
Filter sessions	Opens the filter query screen and enables you to search for specific sessions
Permissions	Enables you to set permissions for different users (write, read, execute)
Modify session backup	Enables you to select one or more sessions in order to modify session backup options
Last refresh	Displays the last refresh time of the list

Table 112: xDR Tool Bar

**Note:** Last calculated time shown as a tooltip for Start date, End date, xDR/s, Kbps columns denotes the last update time from Mediation.

### Adding a Protocol-Specific xDR Session

A protocol-specific xDR Session must be created to house the xDRs for that protocol.

Once xDR generation is configured for a Mediation Protocol, xDR Records are stored in a session. A session is associated with a *Dictionary*. The *Dictionary* mechanism is a way of describing the content of the xDR fields. Management Applications, such as *Troubleshooting* use the *Dictionary* to access and display the data making the applications independent of the xDR Record format.

Complete these steps to add a protocol-specific xDR Session:

1. Select **Mediation > Sessions**.  
The *xDR Sessions List* screen opens.
2. Click **Add** from the toolbar. The *Add* screen opens shown below.

Figure 259: xDR Session Add Screen

3. Type a **Session Name**.

**Note:** The session name must be unique for each Mediation subsystem, but sessions can have identical names if they reside on separate Mediation subsystems.

4. Type in the **Lifetime** (number of hours the session exists).

**Note:** It is recommended that the *Lifetime* not be less than 48 hours. Anything less than 48 hours can lead to potential data loss or truncation of last 24 hours due to nightly purges of the system.

**Note:** Adding more than five (5) sessions in one 24 hour period may cause xDR storage degradation. Please consider spacing your session additions over several days to ensure xDR storage performance.

5. Select the **Storage Subsystem**.
6. Select the **Dictionary** associated with the session.
7. (Optional) Type in a **Description**. Shown below is a completed session.
8. Click **Add**.

The *Session* is added to the *Session List* shown below.

Session	Start date	End date	xDR/s	Kbps	Dictionary Type	Format	Dictionary
* All	* All	* All	* All	* All	* All	* All	* All
sample	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	AggSessionMonitor
ARJ_SV_SESS	18/01/2038 19:14:07	-	0	0	RECONSTITUTION	SINGLE	LTE GTP v2 Sv TDR_1.0.2
ixp1001StreamMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	StreamMonitor
ixp1001BuildMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	BuildMonitor
ixp1001OperateMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	OperateMonitor

Figure 260: Completed Session In Session List

### Modifying an xDR Sessions

1. Select **Mediation > Sessions**.  
The *Sessions List* screen opens.
2. Select the **Session** to be modified, shown here.

Session	Start date	End date	xDR/s	Kbps	Dictionary Type	Format	Dictionary
* All	* All	* All	* All	* All	* All	* All	* All
sample	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	AggSessionMonitor
ARJ_SV_SESS	18/01/2038 19:14:07	-	0	0	RECONSTITUTION	SINGLE	LTE GTP v2 Sv TDR_1.0.2
ixp1001StreamMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	StreamMonitor
ixp1001BuildMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	BuildMonitor
ixp1001OperateMonitor	18/01/2038 19:14:07	-	0	0	STATISTICS	SINGLE	OperateMonitor

Figure 261: Selected Session For Modification

3. Click **Modify** on the toolbar.  
The *Session Record* opens, shown below.

Mediation > Sites > Oracle > IXP > IXP10 > Sessions > List

---

**Session Name**

**Lifetime (hours)**

**Storage**

**Dictionary**

**Sequence Id**  
 Enabled

**Description**

Figure 262: Modify Session Screen

4. You can only modify the **Lifetime (hours)**, **Sequence ID** or the **Description** fields.
5. Click **Modify**. The *Record* is modified.

### Deleting xDR Sessions

Complete these steps to delete an xDR session:

**Note:** You cannot delete a *Session* that is using a *Dataflow Processing*. You must first delete the *Dataflow Processing* or modify the *Dataflow Processing* to use another *Session*.

**Note:** Important--When you delete a *Session* on Centralized Configuration, the *Session* also gets deleted in the Mediation database causing all the xDRs stored in the *Session* also to be deleted.

**Note:** If a *Session* is deleted all the system backups will also be deleted from the system.

1. Select **Mediation > Sessions**.  
The *Sessions List* screen opens.
2. Select the **Session** to be deleted.
3. Click **Delete**.
4. Click **OK** at the prompt. The *Session* is deleted.

### Purging Static Sessions

There are times when it is necessary to purge static sessions from the Mediation subsystem by using the `ManageStaticPurge.sh` command.

Complete these steps to purge static xDR sessions from the Mediation subsystem:

1. **Log** into the Oracle database. (`/ManageStaticPurge.sh <connection> <option>`)  
Must use Oracle *user-id* and *password* (`password@db_stirng`).
2. Enter one of the following **command** options:  

```
./ManageStaticPurge.sh
-c# create the job
-r# remove the job
-d# disable the job
-e# enable the job
-m# modify the job: = new job frequency in hours
```
3. **Log Out** of the Oracle database.

### Creating an xDR filter for an existing Session

You can create a Filter for an existing xDR Session using the Filter sessions button on the toolbar shown below.

Session	Start date	End date	xDR/s	Kbps	Dictionary Type	Format	Dictionary
* All	* All	* All	* All	* All	* All	* All	* All
eg_inap_sess	09/10/2015 06:15:24	09/10/2015 08:28:42	0	0	RECONSTITUTION	SINGLE	SS7 INAP TDR_7.3.0
D_isup_etsi_session	12/10/2015 03:10:00	12/10/2015 04:29:27	0	0	RECONSTITUTION	SINGLE	SS7 ISUP ETSI CDR_7.4.0
D_http_session	11/09/2015 03:10:00	11/09/2015 04:41:57	0	0	RECONSTITUTION	SINGLE	IP HTTP TDR_7.4.0
D_dns_session	11/09/2015 03:10:00	11/09/2015 03:10:00	0	0	RECONSTITUTION	SINGLE	IP DNS TDR_7.4.1
Monica_MAP	08/10/2015 04:00:00	14/10/2015 06:00:00	0	0	STATISTICS	SINGLE	17273 Monica_MAP

Figure 263: Xdr Session Filter Icon

Clicking on the button opens the filter screen. For more information, see “[Adding xDR Filters.](#)”

### Mediation Protocol Parameters

Each Build xDR session of a dataflow processing has a set of parameters that are set by default but can be customized for your system. Refer to Appendix B “Mediation Protocol Parameters” for descriptions of Mediation Protocol fields.

### About Enrichment Files

Enrichment files are files with fse extension that enable you to populate xDRs with additional fields. These fields are used by *KPI*.

Selecting the **Enrichment Files** object from the Object tree opens the Enrichment Files List screen.

Figure 264: Enrichment Files List Screen

### Adding Enrichment Files

Complete these steps to add enrichment files:

1. Select **Mediation > Enrichment Files**.  
The *xDR Sessions List* screen opens.
2. Click **Add** from the toolbar. The *Add* screen opens.

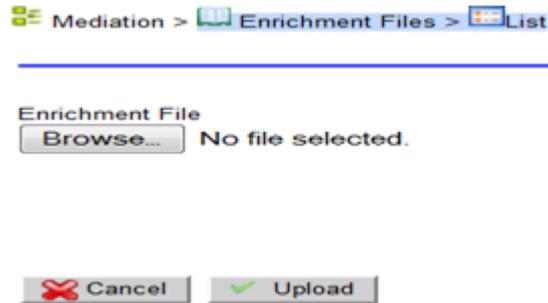

Figure 265: Xdr Session Add Screen

3. Click **Browse...**
4. Locate the file **fse file** in its directory.
5. Click **Upload**. The File is uploaded into the system.

### Deleting Enrichment Files

Complete these steps to delete enrichment files:

**Note:** Before deleting *Enrichment Files*, you must first delete any dependent objects belonging to the *Enrichment File*. You must also **Apply Changes** to the Subsystem before the changes take place.

1. Select **Mediation > Enrichment Files**.  
The *Enrichment Files List* screen opens.
2. Select the **File** to be deleted.
3. Click **Delete** from the tool bar.
4. Click **OK** at the prompt. The *File* is deleted from Centralized Configuration.
5. Click **Upload**. The *File* is uploaded into the system.

### Viewing Enrichment File Source Code

Complete these steps to view enrichment files source code:

1. Select **Mediation > Enrichment Files**.  
The *Enrichment Files List* screen opens.
2. Select the **File** to be viewed.
3. Click **Source** from the tool bar. The *Source* screen opens.

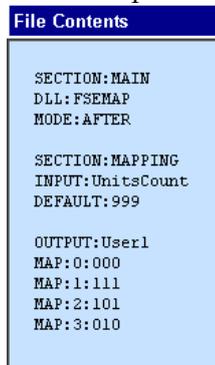

Figure 266: Source Code Screen

4. Click **Close** to close the screen.

## Defining Enrichment file automated update

Complete these steps to define enrichment file automated update SFTP location:

1. Select **Mediation > Enrichment Files**.  
The *Enrichment Files List* screen opens
2. Click on automated update button in list toolbar .  
The *FSE Auto Update Configuration* screen opens.

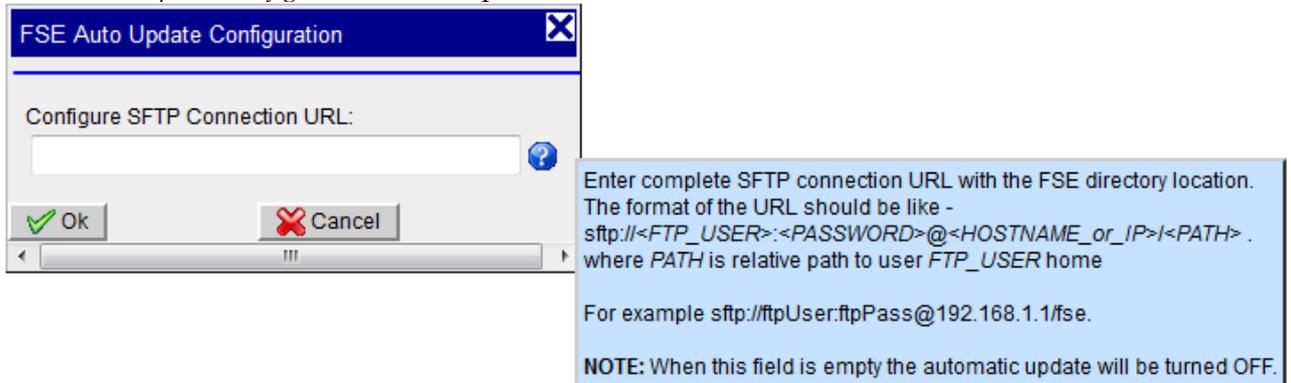

Figure 267: FSE automated update configuration screen

This settings refer to an SFTP location where system can find Enrichment FSE file.

URL should be like `sftp://<USER>:<PASSWORD>@<HOSTNAME_OR_IP>/<PATH>` where

- <USER> is username of SFTP server
- <PASSWORD> is password of SFTP user
- <HOSTNAME\_OR\_IP> is address of SFTP server
- <PATH> is relative path under user home folder in SFTP server

**Note:** Empty string turns off automated update

Management Application scan regularly this folder and its subfolder (every 30 mn) to find files with same name as the those declared. In this case it loads file to replace existing FSE and reapply it automatically to selected session.

3. Click **OK** to validate changes.

**Note:** See [Appendix F for Typical FSE Enrichment file](#)

## Chapter 10: Monitoring Policies

---

### About 3G Monitoring Policies

Centralized Configuration is equipped with Intelligent Data Monitoring (IDM) for 3G. IDM enables customization of the system to fit the amount of system traffic while providing two important parameters for on demand On Demand Up Capture:

- Less data to transfer to Mediation layer for less data to process and store.
- Accurate and efficient traffic monitoring.

Acquisition enhancement provides the capacity to reduce the traffic sent to Mediation by sending all PDUs for on demand or sampled users. This capacity also enables load balancing between multiple Mediation servers that results in more efficient traffic monitoring.

### The Monitoring Policies Screen

The monitoring policies List screen is comprised a tool bar and two tables.

Besides the basic functions of adding, modifying and deleting selected users it has the additional functions:

- Filtering - the Filtering button provides the capacity to filter for specific policies.
- Traffic Classifications - the Show Traffic Classification button shows the classifications for specific policies. The traffic classifications for a specific policy appear on the bottom table.
- Activating and deactivating - the Activate and Deactivate buttons provide the capacity to activate or deactivate specific policies.

The policy (top) table provides the following information:

- Policy Name - name of policy.
- Description - brief description of policy.
- Policy Status - active or not.
- On Demand - on demand is on or off.
- Sampling - sampling is on or off.
- Sampling Ratio - sampling ratio of mobile users.
- Track Statistics - statistics for tracking sampled mobile users.
- Owner - user who created policy.
- State - activated or not.
- Created - date created.

The Traffic Classification (TC) table shows the following information for a selected policy:

- TC Name - shows the name of the TC for associated with the policy.
- Description - shows any pertinent information about the TC.
- Server - shows the server where the TC is located.
- Internet Protocol - shows the protocol constraints for the TC.
- Transport Protocol - shows the type(s) of transport protocol(s) for the TC.
- Application Layer - shows the GTP layer IP address.
- Forwarding - shows what is forwarding (for example, packets and counters).
- Annotations - Any special annotation for the traffic classification.
- Status - shows if the traffic classification is active or not.

### Adding a Monitoring Policy

Prerequisites:

- PDU Filter (VLAN Filter) is created.
- Traffic Classifications are created.
- IP Dataflows are created with load balancing and GTP algorithms.
- Dataflow Processings are created with appropriate Mediation Protocol (Gn/Gp mobile activity, IP HTTP TDR, IP MMS TDR and/or Gn/Gp TDR).

Complete the following steps to add a Monitoring Policy:

1. Select **Monitoring Policies > 3G Policies**.
  2. Click **Add** from the tool bar on the policies table. The *Add Policies* screen opens.
- Note:** Black arrows to the left of the fields signify if the field is expanded or not (Down is expanded).

Field	Description
Name	Alphanumeric field for adding name (limit 25 characters)
Description (Optional)	Text field for adding pertinent information (limit 255 characters)
On Demand	Default = No Check box select if you want to forward the user plane traffic for the mobile devices that are in demand by On Deman Up Capture (See On Deman Up Capture User Guide)
Sampling	Default = No Checkbox select yes to allow IPDR creation for a random sample of mobile users. Probed Acquisition sends FULL control plane and FULL user plane packets for the selected traffic.
What is the percentage of mobile users	Numeric field that enables you to put in a percentage (0-100) that will be sampled (see sampling description)
Forward Statistics	Default = No Check box select "yes" enables IPDR creation for mobile users identified as to track activity statistics for all mobile users that are "on-demand" or sampled Probed Acquisition sends FULL control plane and FULL user plane packets for the selected on-demand users.
GTP-C-TCs	<ul style="list-style-type: none"> <li>• Shows available GTP-C-TCs to be used with the policy. Multiple GTP-C-TCs can be selected</li> <li>• Shows selected GTP-C-TCs for the policy.</li> </ul>
GTP-U-TCs	<ul style="list-style-type: none"> <li>• Shows available GTP-U-TCs to be used with the policy. Multiple GTP-U-TCs can be selected</li> <li>• Shows selected GTP-U-TCs for the policy</li> </ul>

Table 113: Add Policies Screen Field Descriptions

3. Enter the **Name** of the policy.
4. (Optional) Enter a **Description**.
5. If the policy is to be *On Demand*, select **Yes**.
6. If the policy is to have *Sampling* capabilities, select **Yes**.
7. If the policy is to have *Forward Statistics* capabilities, select **Yes**.
8. (Optional) Select **GTP-C-TCs** that will be associated with the Policy.
9. (Optional) Select **GTP-U-TCs** that will be associated with the Policy.
10. Click **Add** to add the Policy to the system.

### Modifying a Monitoring Policy

Complete the following steps to modify a monitoring policy:

1. Select **Monitoring Policies > 3G Policies**.
2. Select the **Policy** to be modified from the *Policy* (top) table.
3. Click **Modify** from the tool bar.
4. Modify the **appropriate values**.
5. Click **Modify**. The database is updated with the change.

### Deleting a Monitoring Policy

Complete these steps to delete a monitoring policy:

1. Select **Monitoring Policies > 3G Policies**.
2. Select the **Policy** to be deleted
3. Click **Delete**.
4. Click **OK** at the prompt. The *Policy* is deleted.

### Activating and Deactivating Monitoring Policies

To activate or deactivate a Monitoring Policy complete these steps:

1. Select **Monitoring Policies > 3G Policies**.
2. Select the **Policy(s)** to be activated or deactivated.
3. Click the **appropriate button (activate/deactivate)** on the tool bar.
4. Click **OK** at the prompt.
5. Click **Apply** to initiate the filtering operation.

## About Filtering Monitoring Policies

In large systems there can be a large number of monitoring policies. Centralized Configuration is equipped with a filtering function, located on the Monitoring Policy tool bar, to filter policies by specific criteria using expressions.

**Note:** The filtering function is applied for immediate use and cannot be saved.

## Filtering Monitoring Policies

Complete the following steps to use the filtering operation:

1. Select **Monitoring Policies > 3G Policies**.
2. Click **Filter Policies** from the tool bar on the policies table. The *IdmPolicies Filter* screen opens.
3. Click **Add**. The screen changes to show the Expression line.

**Note:** The expressions are in alphabetical order beginning with "A." Each expression has selected a field, operator and value fields. Multiple expressions can be used to make the search as specific as possible.

**Note:** When using multiple expressions, choose the appropriate Operator (And, Or, Use Brackets). The Expression field at the bottom of the screen will show all expressions used with their operators.

4. Select the **Field(s)** to be used in the expression.
5. Select the appropriate **Operator** for the expression.
6. Select the appropriate **Value** for the expression.
7. Repeat steps 4-6 in multiple expressions are needed in the filtering operation.
8. Click **Apply** to initiate the filtering operation.

**Note:** Mobiles and Access Points are created "on the fly" and are not saved.

The results of the filtering operation are listed in the policies table screen.

# Appendix A: Configuration Workflows

---

## Provisioning Guide for Configuring Performance Intelligence Center

This outline represents the main steps in configuring a system using Centralized Configuration.

Creating sites (see [Sites](#))

- Discover Legacy subsystems and create destinations if traffic needs to be routed to them.
- Discover Acquisition subsystem (see [About xDR Filters](#) and [Adding a Probed Acquisition Subsystem to a Site](#)).
- Discover Mediation subsystem (see [Site Creation and Discovery Process](#)).
- Discover DWH subsystems (if external DWH is present or else DWH gets discovered as a part of Mediation) see [Site Creation and Discovery Process](#).

**Discovering or manually configuring (for PROBED ACQUISITION) Network Elements** (see [Adding a Probed Acquisition Subsystem to a Site](#) and [Modifying a Probed Acquisition Subsystem Host](#))

**Configure Network Views** (see [Network View Configuration](#))

**Configure Acquisition Subsystem** (see [Acquisition Subsystem](#))

**If configuring an Integrated Acquisition Subsystem:**

- Assign Linksets for Monitoring Groups (see [About Monitoring Groups \(Integrated Acquisition\)](#)).
- Assign Linksets to Network Views (see [Adding an SS7 Linkset to a Link View](#)).
- Create Dataflows (see [About PDU Dataflows](#)).
- Assign Linksets to Dataflows.
- Route Dataflows to Input Streams on Mediation\*/Legacy systems.
- Create and configure Associations (Integrated Acquisition or Probed Acquisition).

**If configuring a Mediation subsystem:**

- Create (route) input streams on that Mediation subsystem.
- Use Dataflow processings (DFP) wizard to create DFPs.

OR

- If creating DFPs manually on that Mediation subsystem, then create them in the following order:
  - Build.
  - Operate.
  - Store.
- Create the distribution on that Mediation Subsystem for load balancing or during server maintenance.
- Create the Sessions on that Mediation Subsystem.
- Manage the Subsystem preferences for that Mediation subsystem see [About Subsystem Preferences](#).

## Setting up Performance Intelligence Center Sites

This procedure must be followed by users who are setting up the System for the first time, adding new Servers or adding new applications on an existing Server.

Complete these steps (and refer to sections for detailed information), for setting up a System:

1. Create a Site.  
(See [Creating a Node](#)). Now you can add a host.
2. Add a Mediation subsystem (see [Adding an Mediation Subsystem](#)).
3. Add an Integrated Acquisition subsystem (see [Adding an Integrated Acquisition Subsystem to a Site](#)).
4. Add a Probed Acquisition subsystem (see [Adding a Probed Acquisition Subsystem to a Site](#)).

## SS7 Data Acquisition Using Integrated Acquisition

Complete these steps when adding an Integrated Acquisition Subsystem:

1. Create a Site, Hosts and Applications (see [Setting up Sites](#)).
2. Ensure the Eagle is set up to communicate with the Integrated Acquisition (see [About xDR Filters](#)).
3. Discover the Network Elements from the Integrated Acquisition subsystem.  
At the end of this operation, a list showing the discovered Network Elements is displayed. You can also view the Network Elements from either the Home screen (see [Network Elements](#)) or from Network Elements Object Tree Perspective.
4. Distribute the discovered linksets to the Integrated Acquisition Applications that are part of the Subsystem by assigning selected linksets to each Integrated Acquisition Application.

Care must be taken to ensure that traffic is distributed evenly across the available Integrated Acquisition servers. A common practice is to assign one of the Servers as a spare server and not assign any linksets to it.

When one of the active Integrated Acquisition Servers fails, the linksets monitored by the failed server are automatically switched over to the spare Server.

**Note:** Repeat steps 3-4 whenever new linksets have been added to Integrated Acquisition.

## SS7 Data Acquisition Using Probed Acquisition

Complete these steps to set up Probed Acquisition monitoring of an SS7 link:

1. If this is a new Probed Acquisition subsystem, (see [Setting up Sites](#)) for setting up the site, hosts and applications.
2. Create a node for each end of the link to be monitored, if not already created, (see [About Nodes](#)).
3. Create a SS7 signaling point, if it does not already exist, under each node involved with the link to be monitored.
4. Create a linkset for the link to be monitored, if it does not already exist.  
This can be done from either of the two signaling points (see [Creating a Linkset](#)).
5. Create the SS7 link to be monitored, if it does not already exist.
6. Next, create or discover the Probed Acquisition card that will do the monitoring under the Probed Acquisition application if it does not already exist (see [Modifying a Probed Acquisition Subsystem Host](#)).  
Ensure that the card has the correct firmware load, and set the card's attributes appropriately.
7. Select a port on the Probed Acquisition card and activate it (see [Adding IP Port PDU Filters](#)).  
Set the port attributes appropriately.
8. Assign the link to the port (see [Adding an SSN Filter](#)).

## GPRS Network Data Acquisition Using Probed Acquisition

Complete these steps to set up Probed Acquisition monitoring of a Gb link:

1. Create one node to contain the link's SGSN, if it doesn't already exist, (see [Creating a Node](#)).
2. Create a SGSN signaling point, if it doesn't already exist, under the node (see [Creating and associating a Dictionary with a Session](#)).
3. Create the Gb link to be monitored, if it doesn't already exist, (see [Adding a Gb Link](#)).
4. Select a port on the Probed Acquisition card and activate it (see [Adding a Probed Acquisition Subsystem to a Site](#)).  
Set the port attributes appropriately.
5. Assign the Gb link to one or more of the channels belonging to the port (see [About Gb Links](#)).

## IP Network Data Acquisition for Probed Acquisition

Complete these steps to set up Probed Acquisition monitoring of an IP network.

1. Create, or discover, the Probed Acquisition card(s) that will do the monitoring under the Probed Acquisition application, if it doesn't already exist ( see [Modifying a Probed Acquisition Subsystem Host](#)).
2. Create one or more Input streams (see [Adding a PDU Stream](#)).  
Use filtering to discard IP traffic not needed.

## Configuring for 3G Intelligent Data Monitoring (IDM)

Complete these steps to configure a Performance Intelligence Center system to utilize 3G IDM:

1. Create a VLAN PDU Filter from the acquisition perspective.
2. Create a Traffic Classification, (both GTP-C and GTP-U) that will be associated with the Filter.
3. Create an IP Dataflow (acquisition perspective - IP Dataflows) to route the classified GTP PDUs to the Probed Acquisition subsystem.
  - a. Select 2 for the number of destinations.

**Note:** If two or more destinations are used, then the same number of DataFlow Processings must be configured at the mediation level for this IP DF.

- b. Select both GTP options (Algorithms and Destinations).
  - c. Set packet truncation to 0.
4. Associate the GTP-C traffic classification with the IP Dataflow.
  5. Apply Changes to the Probed Acquisition subsystem.
  6. From the mediation perspective, create Dataflow Processings using the xDR Dataflow Assistant. Mediation Protocol to consider are: Gn/GP Mobile Activity, IP HTTP TDR, IP MMS TDR.

**Note:** Gn/GP TDR can be selected if Control Plane xDRs are expected and/or if On-Demand User Plane TDR are expected.

7. Apply Changes to the Mediation subsystem.
8. Create a Monitoring Policy.
9. Create either a mobile or access point "on demand" record in On Demand Up Capture application.

## Routing PDUs to Mediation Protocol

These steps are used to route PDUs from Integrated Acquisition or Probed Acquisition to Mediation or Mediation. When you assign links), linksets, or create IP Streams, the PDUs are collected by the Integrated Acquisition / Probed Acquisition and stored in its local cache. After collection then you need to configure the route for the collected data to the Mediation Protocol for generating xDRs and KPIs.

Complete these steps to route PDUs to Mediation Protocol:

1. Ensure the linksets/links are assigned.
2. Create link-based network view(s) containing the linksets, links and/or IP streams from which PDUs are collected.

**Note:** If you have a large network, it is recommended that you organize the views in a hierarchical manner. Organizing hierarchically enables you to keep track of the routing process.

3. Define any PDU filters that you need to classify PDUs as described in (see [About PDU Filters](#)).
4. Create a PDU data flow by specifying (for creating different types of Dataflows, see [About Managing Dataflow Processings Manually](#)):
  - a. the type of traffic
  - b. optional filters
5. Select the data flow you created and select the list route option (see [About PDU Dataflows](#)).  
The system displays all the Datasources where the PDUs are being collected and cached for that data flow.
6. Assign the routes by specifying one or more Datasources for every data flow (see [About SS7 Q.752 Dataflows](#)).

## Routing PDUs to Mediation Protocol for SigTran

These steps are used to route PDUs from Integrated Acquisition or Probed Acquisition to Mediation. When you assign links, linksets, or create IP Streams, the PDUs are collected by the Integrated Acquisition / Probed Acquisition and stored in its local cache. After collection then you need to configure the route for the collected data to the Mediation Protocol for generating xDRs and KPIs.

Complete these steps to route PDUs to Mediation Protocol:

1. Ensure the linksets/links are assigned.
2. Create link-based network view(s) containing the linksets, links and/or IP streams from which PDUs are collected.

**Note:** If you have a large network, it is recommended that you organize the views in a hierarchical manner. Organizing hierarchically enables you to keep track of the routing process.

3. Define a SigTran PDU filter that you need to classify PDUs as described in (see [About PDU Filters](#)).
4. Create a Traffic Classification (TC) and connect the filter to the TC, see [Adding a Traffic Classification \(Probed Acquisition\)](#).
5. Create a PDU data flow process by specifying (for creating different types of dataflows, see [About Managing Dataflow Processings Manually](#)):
  - a. The type of traffic.
  - b. Optional filters.
6. Select the data flow you created and select the list route option (see [About PDU Dataflows](#)) or traffic classification.

The system displays all the datasources where the PDUs are being collected and cached for that data flow.
7. Assign the routes by specifying one or more datasources for every data flow (see [About SS7 Q.752 Dataflows](#)).

## Points to consider when creating Routes and Data Flows

- A given Mediation input stream cannot receive PDUs coming from more than one Integrated Acquisition server. In addition, the current release of Centralized Configuration only routes data on a subsystem basis. This may cause a problem if two Integrated Acquisition / Probed Acquisition servers on a same subsystem are part of the same data flow. In this situation, you must create separate data flows for each Integrated Acquisition / Probed Acquisition within a subsystem.
- Mediation Protocol cannot handle PDUs that they cannot recognize. For example, if you route ISUP traffic to the LIDB Mediation Protocol, it will fail. Therefore, configure appropriate filtering using the PDU filters.
- An Mediation Protocol running on an Mediation can only handle a limited amount of traffic. To distribute the processing across multiple Mediation servers, you must apply PDU filtering in order to split the traffic. While configuring such a splitting operation, make sure that the Mediation can still correlate the PDUs. For example, you cannot split the ISUP traffic in a such a way that the IAM and the ACM for the same call go to different Mediation Protocols. A number of PDU filters are available to split the traffic properly, and you can use combination filters and raw filters (SS7 only) to design the flows.
- For SS7 networks, RID groups are created and assigned to linksets in order to handle duplicate PDUs. In this situation, while configuring the MSU dataflows, check the option to send the RID ID to the xDR generator.

## Associating Sessions for Link-based Network Views

Since Centralized Configuration does not configure the xDR generation process, it does not have the information about what link-based network views feed into which xDR sessions. Some applications

like *Troubleshooting* need this information for link-based monitoring and protocol analysis. Centralized Configuration provides a way to configure the relationship between Datasources and xDR sessions. Once this information is in the database, applications can find the link-based networks views feeding a given xDR session.

**Note:** This step is optional and is only required if you need to use link-based monitoring and protocol analysis which are needed for applications like Troubleshooting.

1. Follow the procedure for routing PDUs to Mediation (see [Adding a Protocol-Specific xDR Session](#)).
2. Configure the Mediation to generate and store XDR Records based on the PDUs.
3. Using Centralized Configuration, select the Datasources described in [Creating a Dictionary](#).
4. Assign one or more xDR Sessions to the Datasources described in [Creating a Dictionary](#). Check that the information matches the actual Mediation Protocol configuration. Otherwise, applications may not output proper information.
5. Repeat steps 1-5 when there have been changes in PDU Dataflows, routing and xDR Session configurations.

## Configuring Q.752 Processing

All Q.752 data flows are configured using the Q.752 data flow assistant. Each data flow is configured for each subsystem.

## Alarm Configuration

Alarms generated by various Integrated Acquisition and Probed Acquisition modules can be globally enabled or disabled from Centralized Configuration. The alarms can be categorized. Follow these guidelines when configuring alarms.

1. Enable or disable individual alarms originating from the monitored Eagles (see [About SS7 OAM Alarms](#)).
2. Enable or disable individual alarms originating from the Integrated Acquisition and Probed Acquisition servers (see [About SS7 OAM Alarms](#)).
3. Follow the procedure described in [Managing SLOR Thresholds](#) to enable or disable individual Q.752-related alarms and set related alarm thresholds.

## Duplicate IP Packet Suppression Configuration

The duplicate IP packet suppression feature works on the suppression interval, the packet is suppressed if the same packet is received within the suppression interval. This interval “DupIpPktTimeoutMs” is configured from the Centralized Configuration per acquisition system. The duplicate packets are suppressed per traffic classification, the user can enable/disable the Duplicate IP Packet suppression by selecting “Duplicate Suppression”.

**The Duplicate IP Packet Suppression can be configured as follows:**

1. Modify the DupIpPktTimeoutMs in Settings on Acquisition sub-system level. The value can be configured between 0 to 20 ms, with 1ms interval. 0 means suppression off.

#	Parameter Name	Value	Description
1	CountUploadFreq	1	Traffic Classification Counter Upload Frequency
2	DupIpPktTimeoutMs	0	Duplicate Suppression interval (in Milliseconds). Value can be from 0 to 20 msec. 0 means Duplicate suppression is off
3	NoDataAlarmThreshold	5	MSU Feed no activity alarm threshold in minutes. All connections are working, there is simply no activity on the network. Threshold is definable in minutes
4	PDUStorage	0	xMF Parameter holding default value for PDUStorage
5	PDUStorageAssoc	0	PDU Storage for Associations
6	SigtranMonitor	2	SigtranMonitor flag, it can have three possible values [0 = OFF, 1 = ON (only for configured Associations and ASPs), 2 = ON (All)] and the default value is 2.
7	ThresholdKbps	200000	xMF Parameter holding default value for ThresholdKbps
8	UseGTPFilters	1	Enable/Disable GTP post filtering on PMF, it can have two possible values [1 (default) = Enable, 0 = Disable]

Figure 268: Duplicate IP Packet Suppression Configuration

2. Enable the “Duplicate Suppression” while creating the TC. If this is not selected then no duplicate packets will be suppressed for that TC.

Name

Description

Monitoring Policy: n/a    Duplicate Suppression

## Appendix B: Mediation Protocol Parameters

### List of Parameters for Each Mediation Protocol

Each Build *xDR Session* of a *Dataflow Processing* has a set of parameters that are set by default but can be customized for your system.

#### Initial Parameters

Field	Description
Generic Parameters	
No PDU timeout (s)	Defines the duration (in seconds) beyond which an alarm is generated if no PDU has been detected.
Max transaction duration (s)	Defines (in seconds) the maximal accepted duration of a transaction (or communication). When a transaction duration exceeds this value, an xDR is generated (with "timer expiry" or "long call" status), even if the transaction is not really terminated. This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name. It is used only if the garbage period is different from 0. The value of the parameter Max transaction duration may be overloaded by an Mediation Protocol specific parameter for a given transaction type (see the Mediation Protocol user's manual).
Garbage period (s)	Defines the period (in seconds) of activation of the long transaction cleaning (i.e. the generation of xDRs with "timer expiry" status for all the transactions which duration exceeds the max transaction duration). This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name.
Monitored	This check box indicates if the Mediation Protocol is being monitored or not. This check box cannot be selected in this screen.
Specific Parameters	
Send xDRs and frames to the xDR consumer	Select this if you want to send the xDRs and frames to the xDR consumer. The default is selected.
Period of flow trace displaying	Defines the period where the flow trace is displayed. The default is 0.
Maximum authorized frame length acceptable (in KB)	Enables you to enter the max. length of frame length in KBs. Default is 4KB.
ATM layer activation	Select this field if you want the ATM layer to be activated. Default is selected.
Defaults button	Click this button to reset the screen to default values.

Table 114: Initial Step Screen

#### IP Transport Screen

Field	Description
Generic Parameters	
No PDU timeout (s)	Defines the duration (in seconds) beyond which an alarm is generated if no PDU has been detected.
Max transaction duration (s)	Defines (in seconds) the maximal accepted duration of a transaction (or communication). When a transaction duration exceeds this value, an

Field	Description
	xDR is generated (with "timer expiry" or "long call" status), even if the transaction is not really terminated. This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name. It is used only if the garbage period is different from 0. The value of the parameter Max transaction duration may be overloaded by an Mediation Protocol specific parameter for a given transaction type (see the Mediation Protocol user's manual).
Garbage period (s)	Defines the period (in seconds) of activation of the long transaction cleaning (i.e. the generation of xDRs with "timer expiry" status for all the transactions which duration exceeds the max transaction duration). This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name.
Monitored	This check box indicates if the Mediation Protocol is being monitored or not. This check box cannot be selected in this screen.
Specific Parameters	
Run SCTP path naming function	Select this if you want to run the naming function. Default is selected.
Period of subscribed summary displaying(s)	Numerical field where you can enter an integer to show the period length. Default is 0.
List of servers ports known	Select this parameter is you want to determine the Way and set inactivity garbage. In this format: Protocol Name [Ports] (Max inactivity in seconds)
Run IP reassemble function	Select this if you want to run reassemble function. Default is selected.
Max duration of an IP fragmented inactivity	Numerical field where you can enter an integer to show the duration length. Default is 10.
Set SCTP path naming (8 bytes max)	Enter a path name in the field. For example: Path1=[FF01::10.25.23.15-4569][10.25.6.66-4469]
Max PLDs in SCTP retention	Numerical field where you can enter the number of PLDs in retention. For example: (0->retention function deactivated)
IP fragmented max frame limit	Numerical field where you can enter the number of PLDs in retention. For example: (0->No limit)
Max duration of a TCP connection inactivity(s)	A set of numerical fields to entering the following: Connecting - default 60 Connected - default 60 Closing - default 60 Closed - default 10 Established - default 300 You can also add a new item and its value by clicking the plus icon.
Send xDRs and frames to the xDR consumer	Select this if you want to send the xDRs and frames to the xDR consumer. The default is selected.
Always set the way management function	Select this if you want to set the management function for the Mediation Protocol. The default is not selected.
Period of flow trace displaying	Numerical field where you can enter an integer for the display period.
Max PLDs in	Numerical field where you can enter the number of PLDs in retention.

Field	Description
SCTP retention	For example: (0->retention function deactivated) Default is 50.
Max duration of an IP fragmented inactivity(s)	Numerical field where you can enter an integer for the maximum period of inactivity. Default is 10.
Defaults button	Click this button to reset the screen to default values.

Table 115: Initial Transport Screen

## SS7 SCCP Parameters

Field	Description
Generic Parameters	
No PDU timeout (s)	Defines the duration (in seconds) beyond which an alarm is generated if no PDU has been detected.
Max transaction duration (s)	Defines (in seconds) the maximal accepted duration of a transaction (or communication). When a transaction duration exceeds this value, an xDR is generated (with "timer expiry" or "long call" status), even if the transaction is not really terminated. This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name. It is used only if the garbage period is different from 0. The value of the parameter Max transaction duration may be overloaded by an Mediation Protocol specific parameter for a given transaction type (see the Mediation Protocol user's manual).
Garbage period (s)	Defines the period (in seconds) of activation of the long transaction cleaning (i.e. the generation of xDRs with "timer expiry" status for all the transactions which duration exceeds the max transaction duration). This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name.
Monitored	This check box indicates if the Mediation Protocol is being monitored or not. This check box cannot be selected in this screen.
Specific Parameters	
RANAP Routing: Listed Point Codes to Include or Exclude	Pull-down list to select if point codes are: Excluded Included
Filter = Accept source SSN to sink SSN	Enables you to add an source SSN. To add an item, click <b>plus</b> and select the source SSN and sink SSN from the pull-down lists
Period of flow trace displaying (s)	Numerical field to set the period of flow trace displays. Default is 0.
Definition of INAP interfaces = Source SSN to sink SSN for INAP protocol	Similar to the Filter = <i>Accept source SSN to sink SSN</i> field.
Send xDRs and frames to the xDR Consumer	Select this if you want to send the xDRs and frames to the xDR consumer. The default is selected.
SCCP Format	Pull-down list for selecting the SCCP format can be either: ANSI (default) ITU

Field	Description
RANAP Routing: List of Point Codes	Enter text in the alphanumeric field and add or remove point codes to list.
BSSAP Routing: Listed Point Codes to Include or Exclude	Can select to include or exclude listed point codes. (Default is excluded.)
BSSAP Routing: Priority on Point Codes or SSN (default)	Pull-down list to select either: SSN routing is priority rule (default) PC filtering is priority rule
Processed Segmentation	Select is segmentation is processed. Default is selected.
BSSAP Routing: List of Point Codes	Can add or remove routing point codes.
RANAP Routing: Priority on Point Codes or SSN (default)	Pull-down list to select either: SSN routing is priority rule (default) PC filtering is priority rule
Definition of MAP interfaces = Source SSN to sink SSN for MAP protocol	You can add source SSN and sink SSNs. You can remove selected maps by clicking <b>minus</b> .
Trace period	Select if there is to be a trace period. Default is not selected.
Analyze SSN	Select if you want to analyze SSNs. Default is selected.
Default button	Click this to return the screen to its default values.

Table 116: SS7 SCCP Screen

## SS7 SUA Parameters

Field	Description
Generic Parameters	
No PDU timeout (s)	Defines the duration (in seconds) beyond which an alarm is generated if no PDU has been detected.
Max transaction duration (s)	Defines (in seconds) the maximal accepted duration of a transaction (or communication). When a transaction duration exceeds this value, an xDR is generated (with "timer expiry" or "long call" status), even if the transaction is not really terminated. This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name. It is used only if the garbage period is different from 0. The value of the parameter Max transaction duration may be overloaded by an Mediation Protocol specific parameter for a given transaction type (see the Mediation Protocol user's manual).
Garbage period (s)	Defines the period (in seconds) of activation of the long transaction cleaning (i.e. the generation of xDRs with "timer expiry" status for all the transactions which duration exceeds the max transaction duration). This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name.
Monitored	This check box indicates if the Mediation Protocol is being monitored or not. This check box cannot be selected in this screen.
Specific parameters	
Period of flow trace displaying (s)	Numeric field to enter the time for displaying traces. Default is 0.
Filter = Accept	Enables you to add or remove source and sink SSNs.

Field	Description
source SSN to sink SSN	
Definition of INAP interfaces = Source SSN to sink SSN for INAP protocol	Enables you to add, modify or remove INAP source and sink SSNs for INAP protocols. Click <b>plus</b> to add a definition . Click <b>minus</b> to remove a definition. Select alternate source and sink SSNs to modify a definition.
Send xDRs and frames to the xDR consumer	Select this if you want to send the xDRs and frames to the xDR consumer. The default is selected.
Trace period	Select if there is to be a trace period. Default is not selected.
Analyze SSN	Select if you want to analyze SSNs. Default is selected.
Definition of MAP interfaces = Source SSN to sink SSN for MAP protocol	Enables you to add, modify or remove MAP source and sink SSNs for MAP protocols. Click <b>plus</b> to add a definition . Click <b>minus</b> to remove a definition. Select alternate source and sink SSNs to modify a definition.
Defaults button	Click this to return screen to default values.

Table 117: SS7 SUA Screen

## SS7 Transport Parameters

Field	Description
Generic Parameters	
No PDU timeout (s)	Defines (in seconds) the maximal accepted duration of a transaction (or communication). When a transaction duration exceeds this value, an xDR is generated (with "timer expiry" or "long call" status), even if the transaction is not really terminated. This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name. It is used only if the garbage period is different from 0. The value of the parameter Max transaction duration may be overloaded by an Mediation Protocol specific parameter for a given transaction type (see the Mediation Protocol r user's manual).
Max transaction duration (s)	Defines the period (in seconds) of activation of the long transaction cleaning (i.e. the generation of xDRs with "timer expiry" status for all the transactions which duration exceeds the max transaction duration). This parameter is displayed only if "reconstitution" is part of the Mediation Protocol name.
Garbage period (s)	This check box indicates if the Mediation Protocol is being monitored or not. This check box cannot be selected in this screen.
Monitored	Defines the duration (in seconds) beyond which an alarm is generated if no PDU has been detected.
Specific parameters	
Period of flow trace displaying(s)	Numerical field to set the period of flow trace displays. Default is 0.
Send xDRs and frames to the xDR Consumer	Select this if you want to send the xDRs and frames to the xDR consumer. The default is selected.
SIGTRAN MTP3 Point Code Format (ITU: 14 bits, ANSI: 24 bits)	Pull-down list enables you to select between ITU or ANSI. The default is ITU

Table 118: SS7 Transport Screen

## Appendix C: About STC Copy and Fast Copy Effects on Monitoring Groups and Dataflows

---

There is an impact to Monitoring Groups and Dataflows when changing links from STC Copy to Fast Copy and the automatic configuring of the system via the Acquisition discovery process.

It is important to understand how to configure and manage Monitoring Groups and Dataflows when switching between STC Copy and Fast Copy.

### Considerations When Working with STC/Fastcopy

The following is a list of points one should consider when working with the STC/Fastcopy feature:

- Existing STC links that are monitored remain in the same Monitoring Group.
- Monitored links which were part of an Association and are changed back to STC copy will remain in the same Monitoring Group if the linkset belongs to the same Monitoring Group.
- Monitored links that are part of an Association and are changed back to STC copy will switch to the same Monitoring Group as part of the linkset if the linkset belongs to a different Monitoring Group.
- Any un-monitored links which are part of an Association and are changed back to STC Copy will be added to the same Monitoring Group as the linkset.
- The Monitoring Group panel in Centralized Configuration does not show Association as a possible selection to monitor if the Association no longer contains Fast Copy links. However, the linkset(s) will be available as a possible selection.
- Un-monitored links that switch from STC to an Association will be added to the same Monitoring Group as the Association if the Association is monitored.
- The Monitoring Group panel in Centralized Configuration does not show a linkset as a possible selection if all the links in the linkset belong to Association(s). However, the Association(s) will be available as a possible selection.
- If a Monitoring Group no longer contains any links, then the Monitoring Group is automatically deleted.
- If a Dataflow no longer contains any links, then the Dataflow is automatically deleted.
- If the movement of linksets or Associations from one Monitoring Group to another results in removal of all routes in one or more Dataflows, then those Dataflows are deleted automatically. You will then need to create new or modify existing Dataflows in order to re-route the linksets or Associations.
- Dataflows may need to be modified or added in order to accommodate automatic Monitoring Group changes. The routes within the existing Dataflows may be removed automatically, but may need to be added manually by selecting the necessary linksets or Associations.
- The Dataflow Processings and streams will not be modified or removed automatically due to any automatic changes to Dataflows during the STC-FC switching, although you may need to manually modify or remove the Dataflow Processings later.
- Because Associations are included in the calculation of Monitoring Group capacity, it is possible for some of the links that changed from STC to FC to be monitored after the discovery process. For example, the Monitoring Group capacity for a linkset containing 3 M2PA Associations and 12 STC links would equate to 18. Therefore, it is highly recommended that after synchronizing the Integrated Acquisition that the Monitoring Groups, Dataflows and number of Streams should be verified of changes prior to applying changes to the Integrated Acquisition Subsystem. The verification also applies to the load balance on Integrated Acquisition based on Monitoring Groups, Dataflows, and Streams.
- Make sure that you **Apply Changes** in Centralized Configuration when converting STC to Fast Copy or Fast Copy to STC because of the possibility of traffic loss during the Synchronization period up until you have applied all changes to the Subsystem (modifying or removing Dataflows and Monitoring Groups).

## About STC Copy to Fast Copy Interactions

Monitoring Groups and Dataflows are affected when switching one or more links from STC Copy to Fast Copy and vice versa.

It is important to understand how to configure and manage Monitoring Groups and Dataflows when switching between STC Copy to Fast Copy.

### Automatic Monitoring of Un-Monitored Links

In this scenario there are previously discovered network elements configured on the Eagle using STC Copy including two linksets belonging to the same Monitoring Group and a linkset that does not belong to a Monitoring Group. The configuration on the Eagle is changed so that now both linksets contain the same M3UA Association containing several links.

### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the network elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored Links which are now part of an association will remain in same monitoring group.
- Un-Monitored links which are now part of an Association will be added to the same monitoring group as the Association, and the Association is monitored automatically..
- The Monitoring Group panel in Centralized Configuration longer shows a linkset as a possible selection if all the links in the linkset belong to Associations. However, the associations are available as a possible selection.

**Note:** Because associations are included in the calculation for Monitoring Group capacity it is possible that some of the links that changed from STC Copy to Fast Copy to be un-Monitored.

The tables show the associations A1, A2, A3 and A4 are added to the configuration, the link L-13 remains in the same Monitoring Group (MG1) and the un-monitored links (L-21) are added to the same Monitoring Group (MG1). Link L-31 remains in the same Monitoring Group (MG1).

Linkset	Link	Monitoring Group	Association

	L-31	MG1	<b>A2, A3, A4</b>
	L-32		

Table 120: After (Impacts Bolded)

### Dataflows Impacted in this Scenario

There is no impact to the SS7 Dataflows for this scenario.

### Inter-monitoring Groups Link Transfer (M3UA)

In this scenario there were previously discovered Network Elements configured on the Eagle using STC including linksets that belong to different Monitoring Groups. The configuration on the Eagle was changed so that now the linkset contains an M3UA Association containing several links. Although this is a separate "Delete" and "Add" operation on the Eagle, it is possible that the operator failed to Synchronize after each operation.

#### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the Network Elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored links which are part of an association remain in same Monitoring Group as the Association.
- Un-monitored links which are part of an Association will be added to the same Monitoring Group.
- The Monitoring Group panel in Centralized Configuration will no longer show a linkset as a possible selection if all the links in the linkset belong to Associations. However, the Associations will be available as a possible selection.

The tables show the Associations A1, A3, A4 and A5 are added to the configuration and the additions of link L-21 is added to the same Monitoring Group MG1. Link L-31 remains in the same Monitoring Group MG2.

Linkset	Link	Monitoring Group	Association
LS1			
	L-11	MG1	
	L-12	MG1	
	L-13	MG1

### Dataflows Impacted in this Scenario

There would not be any impact to the SS7 Dataflows for this example, but if LS2 initially contained only L-21 and if a dataflow was created only with LS2, then after the migration and the synchronization this Dataflow would be deleted as the route involving MG1 would be removed and the Dataflow would become empty.

### Monitoring as Before (M3UA)

In this scenario there were previously discovered Network Elements configured on the Eagle using STC, including Linksets that belong to different Monitoring Groups. The configuration on the Eagle was changed so that now the Linksets contains M2PA Associations for several links.

### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the network elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored Links which are part of an Association will remain in same Monitoring Group.
- Un-Monitored Links which are part of an Association will remain un-monitored.
- The Monitoring Group panel in Centralized Configuration will no longer show a Linkset as a possible selection if all the links in the Linkset belong to Associations. However, The Associations will be available as a possible selection.

The tables show the Associations A1 - A10 is added to the configuration and the links remain in the same Monitoring Group (MG1).

Table 124: After (Impacts Bolded)

#### Dataflows Impacted in this Scenario

There would not be any impact to the SS7 Dataflows for this user case.

#### Inter-monitoring Groups Link Transfer (M2PA)

In this scenario there were previously discovered Network Elements configured on the Eagle using Fast Copy including M2PA Associations that belong to a Monitoring Group. The configuration on the Eagle was changed so that now one of the links is switched to M3UA. Although this is a separate "Delete" and "Add" operation on the Eagle, it is possible that the operator failed to Synchronize after each operation.

#### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the Network Elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored links which are part of an Association remain in same Monitoring Group when the linkset belongs to the same Monitoring Group.
- Monitored STC links will switch to the same Monitoring Group as the Association.
- Un-monitored links that are part of an association are added to the same Monitoring Group as the new Association.

The tables show the Link L-13 is moved to Association A3 and will be added to the same Monitoring Group (MG1).

Linkset	Link	Monitoring Group	Association

Table 126: After (Impacts Bolded)

### Dataflows Impacted in this Scenario

There would potentially be changes to the Dataflow for this scenario assuming the Linkset LS1 is part of an SS7 Dataflow. If the SS7 Dataflow does not contain any STC links after the re-discovery process, then the dataflow would not be removed.

### About Fast Copy to STC Copy Interactions

When moving from Fast Copy back to STC Copy where the current Integrated Acquisition configuration has been previously discovered using Fast Copy, there are two scenarios that can occur when moving from Fast Copy to STC Copy.

**Note:** Associations will NOT be removed automatically; you will have to remove them manually in the Network Elements Perspective.

- Automatic Monitoring of Un-monitored Links (Linkset)
- Inter-monitoring Groups Link Transfer (Linkset)

### Automatic Monitoring of Un-Monitored Links (Linkset)

In this scenario there are previously discovered network elements configured on the Eagle using Fast Copy including a linkset belonging to a Monitoring Group and a linkset that does not belong to a Monitoring Group. The configuration on the Eagle has changed the so that now both linksets are switched back to STC copy and no longer contain the M3UA Association.

#### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the Network Elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored remain in the same Monitoring Group.
- Monitored Links which are now part of an Association will remain in same Monitoring Group.
- Any un-monitored links that are part of a linkset are added to the same Monitoring Group as the Association.
- The Monitoring Group panel in Centralized Configuration no longer shows Association A1 as a possible Association to monitor.

The tables show that Associations A1, A2, A3 and A4 are remove from the configuration, the Link L13, L-21 and L-31 remain in the same Monitoring Group (MG1) and the Un-Monitored Links (L-22, L23 and L-32) are added to the same Monitoring Group (MG1).

Linkset	Link	Monitoring Group	Association

	L-31	MG1	
	L-32	<b>MG1</b>	

Table 128: After (Impacts Bolded)

### Dataflows Impacted in this Scenario

Potentially, there can be changes to the Dataflow for this scenario assuming that Association A1 is part of an IP Dataflow. If the IP Dataflow does not contain any Fast Copy links after the re-discovery process, then the Dataflow would be removed. That is, an IP Dataflow automatically is removed if, after discovery, all the Fast Copy Links belonging to the Dataflow are switched to STC Copy Links. An SS7 Dataflow may need to be modified or added to add STC links

### Inter-monitoring Groups Link Transfer (Linkset)

In this scenario there are previously discovered Network Elements configured on the Eagle using Fast Copy including an Association belonging to a Monitoring Group and a linkset that belongs to a different Monitoring Group. The configuration on the Eagle has changed the so that now both linksets are switched back to STC copy and no longer contain the M3UA Association.

### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the Network Elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored links which were part of an Association remain in same Monitoring Group when the linkset belongs to the same Monitoring Group.
- Monitored links which were part of an Association will switch to the same Monitoring Group as the linkset when the linkset belongs to a different Monitoring Group.
- Any un-monitored links which were part of an Association will be added to the same Monitoring Group as the linkset.
- The Monitoring Group panel in Centralized Configuration will no longer show Association A1 as a possible Association to monitor.

The tables show the Associations A1 and A2 are removed from the configuration, the link L13 will remain in the same Monitoring Group (MG1) and the Lnk L21 will switch to the Monitoring Group (MG2) that has linkset LS2. Link L-32 will be added to Monitoring Group (MG1) that has Linkset LS3.

Linkset	Link	Monitoring Group	Association
LS1			
	L-11	MG1	
	L-12	MG1

	L-22	MG2	
	L-23	MG2	
LS3			
	L-31	MG1	
	L32	<b>MG2</b>	

Table 130: After (Impacts Bolded)

### Dataflows Impacted in this Scenario

Potentially, there can be changes to the Dataflow for this scenario assuming that Association A1 is part of an IP Dataflow. If the IP Dataflow does not contain any Fast Copy links after the re-discovery process, then the Dataflow would be removed. That is, an IP Dataflow is automatically removed after discovery of all the Fast Copy Links belonging to the Dataflow are switched to STC Copy Links.

### About Moving Fast Copy from M3UA to M2PA

When moving from Fast Copy from M3UA to M2PA and vice-versa there are two scenarios that can occur when changing Fast Copy Links. They are:

- Inter-monitoring Groups Link Transfer (M2PA to M3UA)
- Inter-monitoring Groups Link Transfer (M3UA)

### Inter-monitoring Groups Link Transfer (M2PA to M3UA)

In this scenario there are previously discovered network elements configured on the Eagle using Fast Copy, including M2PA Associations belong to a Monitoring Group. The configuration on the Eagle has changed so that one of the Associations is switched to M3UA. Although this is a separate "delete" and "add" operation on the Eagle, it may be possible that the operation failed to Synchronize after each operation.

### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the Network Elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored links which were part of an Association remain in same Monitoring Group.
- Monitored links that are part of changed Association now belong to Monitoring Group of the Association.

The tables show the Association A4 is removed from the configuration; Link L-21 is moved to Association A3 and is added to the same Monitoring Group (MG1).

Linkset	Link	Monitoring Group	Association
LS1			
	L-11	MG1	A1
	L-12	MG1	A2
	L-13	MG1	A3

	L-23	MG2	A5
LS3			
	L-31	MG2	A4
	L-32		

Table 132: After (Impacts Bolded)

### Dataflows Impacted in this Scenario

Potentially, there are changes to the Dataflow for this scenario assuming that Association A4 is part of an IP Dataflow. If the IP Dataflow does not contain any Fast Copy links after the re-discovery process, then the Dataflow is removed. That is, an IP Dataflow is automatically removed if, after discovery, all the Fast Copy Links belonging to the Dataflow are switched to STC Copy Links.

### Inter-monitoring Groups Link Transfer (M2PA)

In this scenario there were previously discovered Network Elements configured on the Eagle using Fast Copy including M2PA Associations that belong to a Monitoring Group. The configuration on the Eagle was changed so that now one of the links is switched to M3UA. Although this is a separate "Delete" and "Add" operation on the Eagle, it is possible that the operator failed to Synchronize after each operation.

### Monitoring Groups Impacted in this Scenario

When the operator re-discovers the Network Elements from the Integrated Acquisition the following changes occur:

- Existing STC links that are monitored will remain in the same Monitoring Group.
- Monitored links which are part of an Association remain in same Monitoring Group when the linkset belongs to the same Monitoring Group.
- Monitored STC links will switch to the same Monitoring Group as the association.
- Un-monitored links that are part of an Association are added to the same Monitoring Group as the new Association.

The tables show the Link L-13 is moved to association A3 and will be added to the same Monitoring Group (MG1).

Linkset	Link	Monitoring Group	Association

Table 134: After (Impacts Bolded)

#### Dataflows Impacted in this Scenario

There would potentially be changes to the Dataflow for this scenario assuming the Linkset LS1 is part of an SS7 Dataflow. If the SS7 Dataflow does not contain any STC links after the re-discovery process, then the Dataflow would not be removed.

# Appendix D: Defining and Modifying Flavor (PC Format) of Session at Centralized Configuration

## Define Flavor (PC Format) of Session

Flavor associated with session can be defined in Centralized Configuration by one of following scenarios:

- Defining flavor while creating session through xDR Data Flow Assistant
- Defining flavor while adding session
- Defining flavor while defining store DFP

### Defining flavor while creating session through xDR DataFlow Assistant

- Login to Centralized Configuration application
- Go to **Mediation > Sites > IXP > Subsystem > DataFlow Processings**
- Define DFP by selecting “xDR DataFlow Assistant” in right click menu.
- Wizard will also ask for flavor if underlying protocol has point code fields.

Step 4: Configure Session(s)

#	xDR Builder Name	Session Name	Life Time(hours)	Point Code Flavor
1	SS7 BICC ETSI CDR reconstitution		72	DEFAULT

Figure 273: Associate flavor while creating session through xDR Data Flow Assistant

### Defining flavor while adding Session through session list

- Login to Centralized Configuration application
- Click on xDR Sessions. This will display of list of sessions
- Click on Add Button on toolbar.
- The wizard will ask for Point Code Flavor only when the dictionary has point code type field. In this case, select the flavor for the session from drop down.

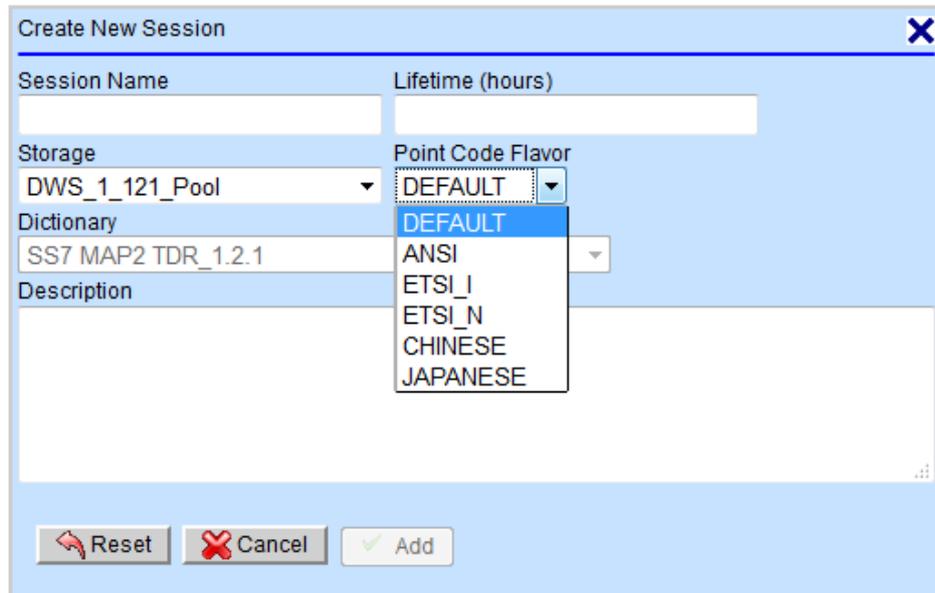

Figure 274: Associating Flavor with Session

### Defining flavor while defining store DFP

- Login to Centralized Configuration application
- Go to **Mediation > Sites > IXP > Subsystem > DataFlow Processings**
- Select “Add” in right click menu and define store DFP
- Define flavor in wizard where it asks for create session

**Note:** The flavor dropdown will come only if underlying protocol has point code fields.

### Modifying Flavor of a xDR Session

To modify PC Format of a session, follow the following steps

- Login to Centralized Configuration application
- Click on xDR Sessions. This will display of list of sessions.
- Click on Modify Button on toolbar.
- Change the flavor for the session by selecting new flavor in drop down and Click OK.

**Note:** The flavor dropdown will come only if underlying protocol has point code fields.

## Appendix E: xDR Filters during Protocol Upgrade

---

During Protocol Upgrade, if all the sessions based on a dictionary are not upgraded then the dictionary is considered as not completely upgraded. In this intermediate state when dictionary is not completely upgraded, there are some limitations on addition and modification of xDR filters as described below.

### Adding xDR Filters

While adding an xDR filter if user selects a dictionary, which has been replaced (upgraded) by dictionary of different version then the creation of xDR filter is not allowed. An error is displayed to user mentioning that "The dictionary:<Dictionary\_Name> has been upgraded. Filter creation using old dictionary is not allowed"

**Note:** Same behavior will be demonstrated if xDR filter is added while creating Dataflow Processing.

### Modifying xDR Filters

While modifying an xDR filter if user selects a dictionary which is not completely upgraded then an error message is displayed to user mentioning "All Sessions are not upgraded for this dictionary. Please upgrade all sessions and then try again."

## Appendix F: FSE Enrichment File Syntax

---

The first step in configuring an xDR Static Enrichment file is the naming process. Static enrichment files must begin with a dollar sign character (\$) and have an extension of fse. The name of the enrichment file determines the processing order in the case of multiple files, as the data server processes the files in alphabetical order.

For example, a file with the name *\$0addfile.fse* will process before a file with the name *\$testfile.fse*.

A static enrichment file must contain three sections:

- Main
- Filter
- Mapping

All of your MAIN sections should look like the following:

```
SECTION:MAIN
VERSION:200
DLL:FSEMAP
MODE:BEFORE
```

It should be noted that each of your filter sections will be a little different, depending on the type and field that the enrichment is changing. The following sample should appear similar to your Filter section:

```
SECTION:FILTER
NAME:Not_International
EXPR:A
COND:A:BNumberNature:<>:International number
```

The mapping section will be different for each enrichment being done. Each file should reflect a different "INPUT" and "OUTPUT" field. The following is an example of a MAPPING section with sample data:

```
SECTION:MAPPING
INPUT:BNumber
OUTPUT:OCNB

MAP:201007:7229
MAP:201032:0138
MAP:201040:9206
MAP:201200:9206
MAP:201202:6630
```

The above statement specifies that for this particular enrichment, we will take the value from the column "BNumber", and if it matches a predefined value, populate a column called "OCNB" with the specified "new" value. In the example above, if the column "BNumber" is populated with a value of "201007", place a value of "7229" in the column called "OCNB".

## Appendix G: PMIA Filter Syntax

Keyword	Example	Protocol	Description
and	host 1.1.1.1 and host 2.2.2.2	NONE	AND logical operator which combines filter expression
called	called ssn 8	NONE	keyword used to precise which field of a route is concerned by the filter. This keyword may be used with 'host', 'net', 'port', 'ssn', 'gtdigit'
calling	calling ssn 8	NONE	keyword used to precise which field of a route is concerned by the filter. This keyword may be used with 'host', 'net', 'port', 'ssn', 'gtdigit'
dst	dst host 1.1.1.1	NONE	keyword used to precise which field of a route is concerned by the filter. This keyword may be used with 'host', 'net', 'port', 'ssn', 'gtdigit'
not	not (host 1.1.1.1)	NONE	NOT logical operator
or	host 1.1.1.1 or host 2.2.2.2	NONE	OR logical operator which combines filter expression
src	src host 1.1.1.1	NONE	keyword used to precise which field of a route is concerned by the filter. This keyword may be used with 'host', 'net', 'port', 'ssn', 'gtdigit'
vlan	vlan not vlan vlan 430 not vlan 430	VLAN	defines filter on a given VLAN identifier (if several VLAN identifier, then filter is applied on the last identifier)
mpls	mpls not mpls mpls 4-8 or mpls 29 not mpls 4-8	MPLS	defines filter on a given MPLS identifier (if several MPLS identifier, then filter is applied on the last identifier)
gre	gre host 1.1.1.1 and gre	IPV4	defines filter on IPv4 'Protocol' (GRE value is 47)
icmp	icmp host 1.1.1.1 and icmp	IPV4	defines filter on IPv4 'Protocol' field (ICMP value is 1)
ip	ip ip and port 53	IPV4	defines filter on ip version 4
ipv4	ipv4 ipv4 and port 53	IPV4	defines filter on ip version 4
ospf	ospf host 1.1.1.1 and ospf	IPV4	defines filter on IPv4 'Protocol' field (OSPF value is 89)
port	port 2906 src port 2906 dst port 2906	IPV4	defines filter on UDP/TCP/SCTP port value
portrange	portrange 53-2399 src portrange 53-2399 dst portrange 53-2399	IPV4	defines filter on UDP/TCP/SCTP port range. The keyword '-' is used to separate lower and higher range values
sctp	sctp host 1.1.1.1 and sctp sctp and port 1010	IPV4	defines filter on IPv4 'Protocol' field (SCTP value is 132)

tcp	tcp host 1.1.1.1 and tcp tcp and port 1010	IPV4	defines filter on IPv4 'Protocol' field (TCP value is 6)
udp	udp host 1.1.1.1 and udp udp and port 1010	IPV4	defines filter on IPv4 'Protocol' (TCP value is 17)
host	host 1.1.1.1 src host 1.1.1.1 dst host 1.1.1.1 host fd0d:deba:d97c:f12::8a:8f1b src host fd0d:deba:d97c:f12::8a:8f1b dst host fd0d:deba:d97c:f12::8a:8f1b	IPV4/IPV6	defines filter on IPv4 address value
net	net 1.1.1.1/28 src net 1.1.1.1/28 dst net 1.1.1.1/28 net fd0d:deba:d97c:f12::8a:8f1b/128 src net fd0d:deba:d97c:f12::8a:8f1b/128 dst net fd0d:deba:d97c:f12::8a:8f1b/128	IPV4/IPV6	defines filter on IPv4 network address range
ipv6	ipv6	IPV6	defines filter on ip version 6
dcppi	dcppi 5 or dcppi 3	SCTP	defines filter on SCTP 'Protocol Payload Identifier' field
m2pa	m2pa(not(dcsi 3 or dcsi 5)) m2pa(not msgclass 1) m2pa(pc 3495) m2pa(opc 3495 and dpc 5806) m2pa(ssn 6 or ssn 7) m2pa(calling ssn 6 or calling ssn 7) m2pa(calling gtdigit (1,4,'336') or calling gtdigit (7,4,'336'))	SCTP	- defines the type of SCTP 'Protocol Payload Identifier' as M2PA (value is 5) - imply ETSI protocol stack: * point code format is 14 bits length * SCCP ETSI protocol
m2paa	m2paa(not(dcsi 3 or dcsi 5)) m2paa(not msgclass 1) m2paa(pc 3495) m2paa(opc 3495 and dpc 5806) m2paa(ssn 6 or ssn 7) m2paa(calling ssn 6 or calling ssn 7) m2paa(calling gtdigit (1,4,'336') or calling gtdigit (7,4,'336'))	SCTP	- defines the type of SCTP 'Protocol Payload Identifier' as M2PA (value is 5) - imply ANSI protocol stack: * point code format is 24 bits length * SCCP ANSI protocol
m2pae	m2pae(not(dcsi 3 or dcsi 5)) m2pae(not msgclass 1) m2pae(pc 3495) m2pae(opc 3495 and dpc 5806) m2pae(ssn 6 or ssn 7) m2pae(calling ssn 6 or calling ssn 7) m2pae(calling gtdigit (1,4,'336') or calling gtdigit (7,4,'336'))	SCTP	- defines the type of SCTP 'Protocol Payload Identifier' as M2PA (value is 5) - imply ETSI protocol stack: * point code format is 14 bits length * SCCP ETSI protocol

m3ua	m3ua(not(dcsi 3 or dcsi 5)) m3ua(not msgclass 1) m3ua(pc 3495) m3ua(opc 3495 and dpc 5806) m3ua(ssn 6 or ssn 7) m3ua(calling ssn 6 or calling ssn 7) m3ua(calling gtdigit (1,4,'336') or calling gtdigit (7,4,'336'))	SCTP	- defines the type of SCTP 'Protocol Payload Identifier' as M3UA (value is 3) - imply ETSI protocol stack: * SCCP ETSI protocol
m3uaa	m3uaa(not(dcsi 3 or dcsi 5)) m3uaa(not msgclass 1) m3uaa(pc 3495) m3uaa(opc 3495 and dpc 5806) m3uaa(ssn 6 or ssn 7) m3uaa(calling ssn 6 or calling ssn 7) m3uaa(calling gtdigit (1,4,'336') or calling gtdigit (7,4,'336'))	SCTP	- defines the type of SCTP 'Protocol Payload Identifier' as M3UA (value is 3) - imply ANSI protocol stack: * SCCP ANSI protocol
gtdigit	m3ua(calling gtdigit '336' or called gtdigit '336')	SCCP	defines filter on SCCP 'Global Title' fields (if 'calling' or 'called' keyword is not precised, then filter matches if Calling or Called GT fields matches the rule)
scctype	m2pa(scctype 2 or scctype 3 or scctype 4)	SCCP	defines filter on SCCP 'Message Type' field
ssn	m3ua(ssn 6 or ssn 7) m3ua(calling ssn 6 or calling ssn 7)	SCCP	defines filter on SCCP 'SubSystem Number' fields (if 'calling' or 'called' keyword is not precised, then filter matches if Calling or Called SSN fields matches the rule)
msgclass	m3ua(not msgclass 1)	M3UA/M2PA	defines filter on M3UA/M2PA 'Message Class' field
msgtype	m2pa(not(msgtype 1) or dcnisi(-1,0) or dcnisi(-1,1) or dcnisi(-1,2))	M3UA/M2PA	defines filter on M3UA/M2PA 'Message Type' field
dcsi	m3ua(not(dcsi 3 or dcsi 5)) m3ua(not msgclass 1) m3ua(pc 3495) m3ua(opc 3495 and dpc 5806) m3ua(ssn 6 or ssn 7) m3ua(calling ssn 6 or calling ssn 7) m3ua(calling gtdigit (1,4,'336') or calling gtdigit (7,4,'336'))	M3UA/MTP3	defines filter on M3UA/MTP3 'Service Indicator' field
dpc	m3ua(opc 3495 and dpc 5806))	M3UA/MTP3	defines filter on M3UA/MTP3 'Destination Point Code' field
opc	m3ua(opc 3495 and dpc 5806))	M3UA/MTP3	defines filter on M3UA/MTP3 'Origin Point Code' field
pc	m3ua(pc 3495)	M3UA/MTP3	defines filter on M3UA/MTP3 'Point Code' fields (Origin or Destination)

insert_rule	insert_rule( opc, dpc, both ) insert_rule(dia_trans)	NONE	insert a context in a table to memorize filter decision taken for this context. This action is used with follow_rule. Use to manage: - Diameter transaction - Sccp connected mode in Sigtran (BSSAP, RANAP)
follow_rule	follow_rule(opc, dpc) follow_rule(dia_trans)	NONE	Verify if a context exist and follow decision taken when context has been inserted
load_share	load_share(dia_sessid,4,0))	NONE	enable load share mechanism on a field. This action is composed of 3 parameters: - field on which load share criteria is applied - number of load shared destinations (range values 2 to16), LS_MAX - current load share destination (0 to LS_MAX-1)
dia_appid	sctp(dia_appid 16777251) tcp(dia_appid 16777251)	TCP/DIAMETER SCTP/DIAMETER	defines filter on Diameter 'Application Identifier' fields
dia_sessid	sctp(dia_sessid) tcp(dia_sessid) sctp(load_share(dia_sessid,4,0)) tcp(load_share(dia_sessid,16,5))	TCP/DIAMETER SCTP/DIAMETER	defines filter on the presence of Diameter 'Session Identifier' fields. Support load_share mechanism.
dia_trans	sctp((dia_sessid and insert_rule(dia_trans)) or follow_rule(dia_trans))  tcp((dia_sessid and insert_rule(dia_trans)) or follow_rule(dia_trans))	TCP/DIAMETER SCTP/DIAMETER	Support insert_rule and follow_rule mechanism
gtppresence	gtppresence not(gtppresence)	UDP/GTP	define a filter on UDP port values (default port values are 2152, 3386, 2123)
gtpcontrol	gtpcontrol not(gtpcontrol)	UDP/GTP	define a filter on GTP (GPRS Tunneling Protocol) 'Message Type' field (Message Type is different to 0xff)
gtpversion	gtpversion 2	UDP/GTP	define a filter on GTP (GPRS Tunneling Protocol) 'Version' field
gtp	gtp(ip) gtp(host 1.1.1.1) gtp(port 25)	UDP/GTP/IPV4	define a filter inside the GTP tunnel. All IPV4/IPV6 filters can be used inside the GTP tunnel.

## Appendix H: My Oracle Support

---

MOS (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support (CAS) can assist you with MOS registration.

Call the CAS main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>.

When calling, make the selections in the sequence shown below on the Support telephone menu:

1. Select 2 for New Service Request
2. Select 3 for Hardware, Networking and Solaris Operating System Support
3. Select 2 for Non-technical issue

You will be connected to a live agent who can assist you with MOS registration and provide Support Identifiers. Simply mention you are a Tekelec Customer new to MOS.

MOS is available 24 hours a day, 7 days a week.
