

Installation Guide

Oracle[®] Health Sciences Central Coding
Release 3.1

ORACLE[®]

Part Number: E69159-01

Copyright © 2006, 2016, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

This documentation may include references to materials, offerings, or products that were previously offered by Phase Forward Inc. Certain materials, offerings, services, or products may no longer be offered or provided. Oracle and its affiliates cannot be held responsible for any such references should they appear in the text provided.

Access to Oracle Support.....	109
Documentation.....	110

CHAPTER 1

Central Coding overview

In this chapter

Supported coding dictionaries	2
Multilingual data.....	3
Japanese dictionary support	4
Architectural overview	5
Physical configuration options.....	6

Supported coding dictionaries

The Central Coding application supports:

- Using the following industry-standard coding dictionaries.
 - **MedDRA and MedDRA-J**—Medical Dictionary for Regulatory Activities.
 - **WHO-DD (C format)**—World Health Organization Drug Dictionary.

When using WHO-DD you can configure the Central Coding application to autocode to the Trade Name (default) or to the Medicinal Product. With either configuration option, you can report (return) the Trade Name, Preferred Name, and Ingredients to the source application.

- **JDrug**—Data File for Ethical Drugs (Coding Table) from Iyaku-Joho-Kenkyujo, Inc.
- Using multiple standard and custom dictionaries, and using multiple versions of those dictionaries.

For more information, contact Oracle Support.

Multilingual data

The Central Coding application can accept both English and Japanese verbatims (multilingual data).

- When you install the Central Coding application on an English operating system, you can choose whether to use multilingual data.
- When you install the Central Coding application on a Japanese operating system, the installation program assumes that there will be multilingual data.

If you choose to use multilingual data, the Central Coding installation program:

- Loads the Japanese report templates. These reports contain the MS Mincho or MS UI Gothic font so that Japanese text appears correctly in the reports. These reports can contain both Japanese and English data.
- Sets the default date format to YYYY/MON/DD HH24:MI:SS. In an environment with native authentication, you can modify this setting as needed on the System Configuration page.

Note: You cannot perform an upgrade to support the Japanese language.

Japanese dictionary support

The Central Coding application supports:

- English and Japanese versions of the supported operating systems.
This feature does not include localization. The Central Coding user interface is available only in English.
- The MedDRA-J and JDrug (Data File for Ethical Drugs (Coding Table) from Iyaku-Joho-Kenkyujo, Inc.) dictionaries.
The Central Coding application supports data to be coded in any left to right language supported by MedDRA, WHO-DD, or JDrug.
- Sorting and searching of the Japanese character sets.
- Coding algorithms for the Japanese dictionaries.
 - Synonyms and autocoding for Japanese dictionaries are supported.
 - Stopwords for Japanese dictionaries are not supported because they are not used in the Japanese character sets.
- Coding with both Japanese and English dictionaries in the same database and in the same study.

Dictionary types and language packs

A dictionary type file and a Japanese language pack are provided for each supported coding dictionary. For more information, see *About dictionary types and dictionary schemas* (on page 53).

A language pack displays the dictionary level names and additional information labels in the user interface in an alternate language. You install the language pack using the Dictionary Loader tool. For more information, see *Installing the language packs for the Japanese dictionaries* (on page 72).

Architectural overview

The Central Coding software is built on a Microsoft .NET and Oracle Database platform. It uses web services over a network for the transmission of coding requests and responses, and uses Internet Information Services (IIS) to provide its web-based user interface to the coding team, so they can provide coding services through the Internet.

The Central Coding software requires a database server and an application server. This architecture provides for flexibility and scalability, allowing you to configure the web server, application server, and database server layers independently. In all configurations, you access the Central Coding software on the application server through HTTP sessions from Windows clients using Internet Explorer or Mozilla Firefox. Each Central Coding application server runs on a Windows server, which uses the Oracle client with the Oracle Data Provider for .NET interface with an Oracle database server.

- Central Coding and Clintrial integration**—The two applications communicate through a web service that is configured using the Clintrial application. This integration does not require an adapter. For more information, see the *Clintrial Admin and Design* guide.

The Clintrial application initiates all communication to and from the Central Coding application.

- Central Coding and InForm integration**—The Central Coding software uses the InForm Adapter software to control communication between Central Coding servers and InForm studies.

The Central Coding application initiates all communication to and from the InForm application.

Physical configuration options

- **Central Coding and Clintrial integration**—The Clintrial software is installed on a different machine than any of the Central Coding application servers.
- **Central Coding and InForm integration**—The InForm software and the InForm Adapter software are installed on different machines than any of the Central Coding application servers. The InForm Adapter software can be installed on the same machine as the InForm software or on its own machine.

Single application server configurations

- The Central Coding application server and database server running on the same machine.
- The Central Coding application server running on one machine and the database server running on a separate machine.

In a production environment, Oracle recommends running the Central Coding application server and database server on separate machines. This configuration allows more flexibility, scalability, and performance; is easier to manage and troubleshoot; and is easier to expand in the future by adding additional application servers.

Configurations with multiple Central Coding instances

- Multiple Central Coding instances and the database server on the same machine.
- Multiple Central Coding instances on one machine and the database server on a different machine.
- Multiple Central Coding instances on different machines and the database server on a different machine.

This configuration might be practical if, for example, you use the Central Coding application across different geographic regions.

You can configure application servers as logical entities, allowing multiple Central Coding instances to co-exist on the same machine. Central Coding instances can map to either:

- Unique database instances, each of which has its own dictionaries.
- A single database instance that shares dictionaries.

In environments with multiple Central Coding instances, each instance has its own:

- URL
- Job scheduler

Deployment scenarios

About integrating with the Clintrial or InForm application

Note: Central Coding no longer supports WSE web services. Starting with release 3.1, Central Coding communicates through WCF web services only. Because no existing release of the Clintrial software supports WCF web services, Central Coding 3.1 cannot be integrated with the Clintrial software at the time of this release.

Check the *Release Notes* for Clintrial releases after 4.7.4.2 to find out which Clintrial release can be integrated with Central Coding 3.1 and higher.

The Central Coding application supports integration with the InForm application and the Clintrial application at the same time under the following circumstances:

- One of the following is true:
 - The InForm application, Clintrial application, and Central Coding application are behind the same firewall.
 - The InForm application, Clintrial application, and Central Coding application are not behind the same firewall, but a VPN is used between the Central Coding application and the Clintrial application.
- The Clintrial software is installed on a different machine than any of the Central Coding application servers.
- The InForm software and the InForm Adapter software are installed on different machines than any of the Central Coding application servers. The InForm Adapter software can be installed on the same machine as the InForm software or on its own machine.

To determine the hardware and software requirements for using the Central Coding application with another application through the Services Interface (API), consult your Oracle Services representative.

Central Coding and Clintrial application components

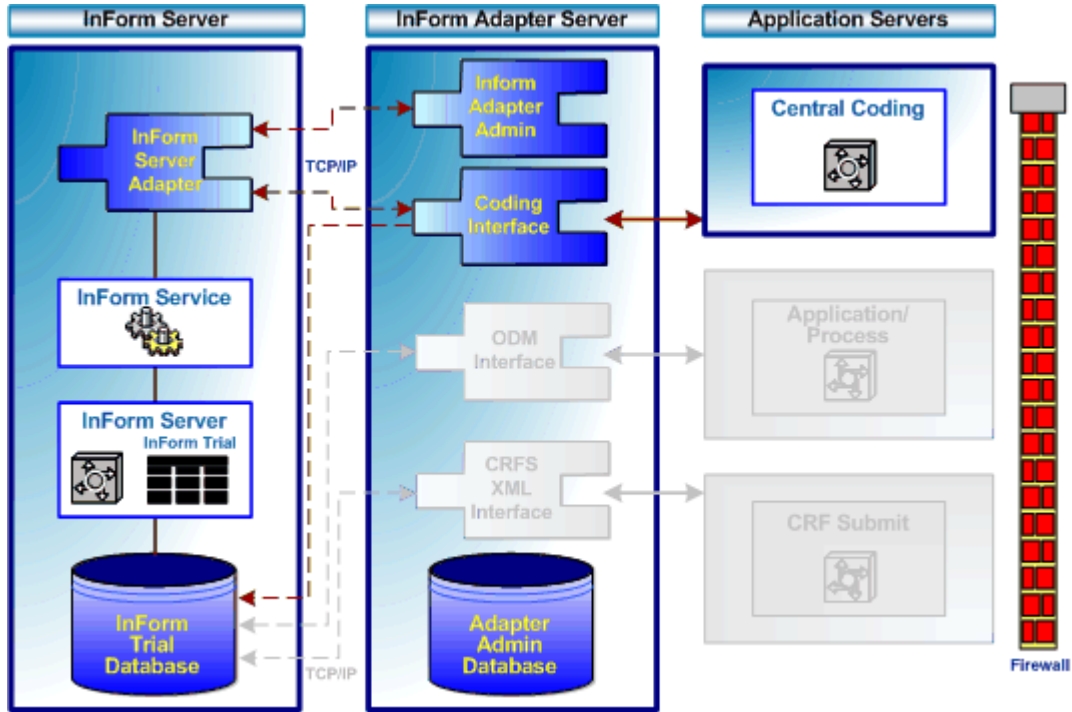

The Central Coding and Clintrial applications must be hosted at the customer site behind the customer firewall.

Central Coding and InForm application components

The Central Coding application components can be deployed with or without enabling security.

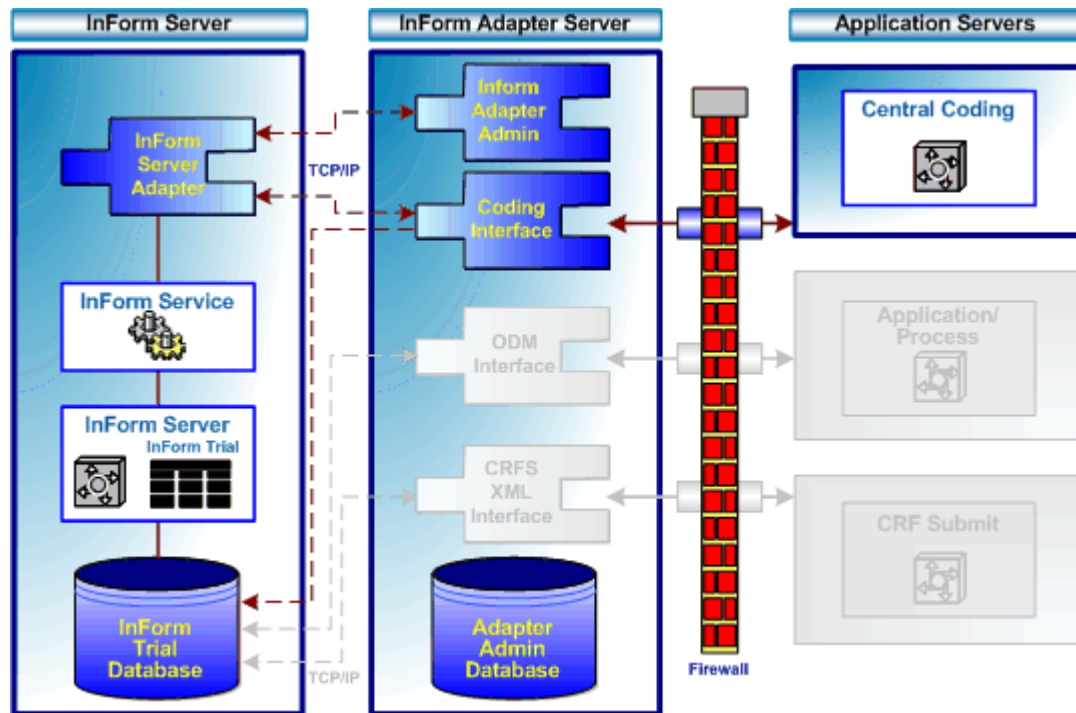

All InForm and Central Coding components behind a firewall

When integrating with the InForm application, the application servers for all the software components in the Central Coding environment can be behind a firewall. This is the typical scenario when Oracle hosts all the applications.

Central Coding server(s) outside a firewall

When integrating with the InForm application, the application servers for the InForm and InForm Adapter software components can be behind a firewall, while the Central Coding server(s) are outside the firewall. This is the typical scenario when Oracle hosts the InForm servers and a customer hosts its own Central Coding application server(s).

CHAPTER 2

Planning the Central Coding installation

In this chapter

About the Central Coding 3.1 release.....	12
Prerequisites.....	13
Overview of the Central Coding installation process	18

About the Central Coding 3.1 release

The Central Coding 3.1 release includes the following components:

- Central Coding 3.1 product.
- Central Coding 3.1 documentation.
- InForm Adapter product and documentation.

Before beginning the installation, check the Oracle Software Delivery Cloud (<https://edelivery.oracle.com>) for the latest patchsets and patches, as well as the accompanying *Release Notes* and *Known Issues* documents, and the latest versions of the documentation.

InForm Adapter product and documentation

To use the Central Coding software with the InForm application, the InForm Adapter software must also be installed and configured. For more information, see the InForm Adapter *Installation Guide*.

Prerequisites

Set the regional language option on the client and application servers—English operating systems only

Before performing a fresh installation on an English operating system, if you want to support both English and Japanese verbatims, you must set the regional language option on the client server(s) and the application server where you install the Central Coding software.

- 1 Select **Start > Settings > Control Panel > Regional and Language options**.

The Regional and Language Options dialog box appears.

- 2 Click the **Languages** tab.
- 3 In the **Supplemental language support** group, select **Install files for East Asian languages**, and click **OK**.

Rename the dictionary file for the JDrug dictionary

The Dictionary Loader tool does not recognize Japanese file names. Therefore, you must rename the JDrug dictionary file so that the Dictionary Loader can recognize the file name and load the dictionary.

- Rename, or copy and rename, the JDrug dictionary file (全件.txt) to **all_cases.txt**.

Note: Make sure that this file is in a local directory with only English names in its path.

For instructions on loading the coding dictionaries, see *Loading and managing the coding dictionaries* (on page 51).

Checklist: Setup tasks for integrating the Central Coding and Clintrial applications

Step	Task	For details, see...
1	Install the Clintrial software.	Clintrial <i>Getting Started</i> guide. Note: The Clintrial software is installed on a different machine than any of the Central Coding application servers.
2	Configure network or Internet access to the Central Coding application server.	Clintrial <i>Getting Started</i> guide.
3	Configure the CC_HOST parameter with the HTTP address of the Central Coding interface.	Clintrial <i>Admin and Design</i> guide. This may be set in the Clintrial Admin module as a System or Protocol parameter.
4	Set the USE_CENTRAL_CODING parameter to Yes for the target protocol.	Clintrial <i>Admin and Design</i> guide. This may be set in the Clintrial Admin module as a System or Protocol parameter.
5	Create a new dictionary definition.	Clintrial <i>Manage, Classify and Lab Loader</i> guide.
6	Define labels for the dictionary definition.	Clintrial <i>Manage, Classify and Lab Loader</i> guide.
7	Select a dictionary definition for an item in a panel.	Clintrial <i>Admin and Design</i> guide.
8	Create a Central Coding encoding target.	Clintrial <i>Manage, Classify and Lab Loader</i> guide.
9	Map the target items with the defined labels.	Clintrial <i>Manage, Classify and Lab Loader</i> guide.
10	Use the Clintrial Manage module to send coding requests (define the delivery schedule) to the Central Coding application.	Clintrial <i>Admin and Design</i> guide.

Checklist: Setup tasks for integrating the Central Coding and InForm applications

Step	Task	For details, see...
1	Install the Central Designer software.	Central Designer <i>Installation Guide</i> .
2	Install the InForm software on a different machine than the Central Coding application server.	InForm <i>Installation Guide</i> . Note: Set up the InForm Adapter to accept data securely.
3	On the InForm application server, install the InForm Adapter software with the Administration, Coding, and Discrepancy Enhanced interfaces.	InForm Adapter <i>Installation Guide</i> . Note: Set up the InForm Adapter to accept data securely.
4	On the InForm application server, install the InForm Server Adapter Interface (ISA).	InForm Adapter <i>Installation Guide</i> .
5	On the InForm Adapter server, register studies with InForm Adapter.	InForm Adapter <i>Installation Guide</i> .
6	Using the Central Designer and InForm applications, set up one or more InForm studies.	Specify mappings and add InForm users for use with the Central Coding application. For integration with the InForm 5.0 release or later, see the InForm <i>Study and Reporting Setup Guide</i> . For integration with releases prior to the InForm 5.0 release, see the InForm <i>Installation and Configuration</i> guide. For more information, see <i>Checklist: Set up InForm studies for use with the Central Coding application</i> (on page 16) and <i>About mapping data for coding with the Central Coding application</i> (on page 17).

Checklist: Set up InForm studies for use with the Central Coding application

Step	Task	Description
1	<p>In the InForm application, specify a valid InForm user whose credentials can be used by the Central Coding application to access the InForm application.</p> <p>Required only if you are using user name/password authentication for communication with the InForm Adapter web services.</p>	<p>Enter the InForm authentication user name and password in the Central Coding application:</p> <ul style="list-style-type: none"> On the System Configuration page (Get/Put Job Options section) to use for all studies. On the [Study Name] Study Information page for any study, to define the user separately for that study. <p>In addition, when you create a new InForm adapter, you must also select the option to Call InForm Adapter Web Services with User Name/Password Authentication on the [Adapter Name] page.</p>
2	<p>In the Central Designer application, create a rule in the InForm application to clear the coding targets (optional).</p>	<p>If the following key items are changed in the InForm application <i>after a verbatim is coded</i>, they will not be updated in the Central Coding application. To get the key items to be updated, you must create a rule in the InForm application to clear the coding targets.</p> <ul style="list-style-type: none"> SubjectInitials SubjectNumber Visit Site Name Site Study <p>Note: The key items <i>are</i> updated in the Central Coding application if the verbatim is <i>not coded</i> in the InForm application.</p>
3	<p>In the Central Designer application, create the coding maps.</p>	<p>Specify mapping definitions for controls that hold verbatim text and controls that hold the coded values assigned by the InForm application.</p> <p>For more information, see the Central Designer <i>InForm Design Guide</i>.</p> <p>Note: Oracle recommends that you do not modify coding maps after coding begins for the study. Doing so can slow the coding process.</p>

About mapping InForm data for coding with the Central Coding application

Use the Central Designer application to specify the InForm mapping definitions for controls that hold verbatim text and controls that hold the coded values. For more information, see the Central Designer *InForm Design Guide*.

- 1 For each form that contains data to be coded, design controls to hold data as entered (verbatim), controls to hold coded data (code targets), items to hold query data (query targets), and if supported by the dictionary, controls to hold additional context information (context items).

Verbatim, code target, query target, and context items must be:

- In the same visit, if the visit is repeating.
 - On the same form, if the form is repeating.
 - In the same itemset, if the coded data appears in an itemset.
 - Different from each other.
- 2 Create a mapping definition that specifies:
 - Each verbatim to be coded.
 - The dictionary used for coding.
 - Each code target to which the Central Coding application returns a coded value.
 - Each context item used to provide additional context data to the Central Coding application.
 - Each applicable verbatim type.
 - Each query target on which to place a query associated with the verbatim. The query target can be the verbatim item, or any other visible, editable item on the form.
 - 3 In a production study, use the Central Coding application to:
 - a Export the verbatim and context data from the InForm application to the Central Coding application.
 - b Code the data.
 - c Import the coded data from the Central Coding application to the InForm application.

Overview of the Central Coding installation process

Note: Before performing the tasks in the table, be sure you have met the requirements listed in the *Prerequisites* (on page 13).

Step	Task	For details, see...
1	Prepare the database and application servers, and the client computers.	<i>Preparing the Central Coding installation</i> (on page 19).
2	Install the Central Coding software.	<i>Installing the Central Coding software</i> (on page 29).
3	Load the coding dictionaries.	<i>Loading and managing the coding dictionaries</i> (on page 51).
4	Configure the Central Coding application.	<i>User Guide</i> .

CHAPTER 3

Preparing the Central Coding installation

In this chapter

Install the Oracle software on the database server.....	20
Create the database and tablespaces	21
Verify the version of ASP.Net on the application server.....	22
Set the ISAPI and CGI restriction settings.....	23
Install a certificate to secure internal communication with the Job Scheduler service.....	24
Enable TLS 1.2.....	26
Configure the web browsers on the client computers	27
Create database user accounts.....	28

Install the Oracle software on the database server

When the database server requirements are met, install the Oracle database software. For more information, see:

- System Requirements in the Central Coding *Release Notes*.
- Oracle installation documentation.

Note: Oracle recommends that you configure both the application server and the database server to use the Coordinated Universal Time (UTC) time zone. In this way you can avoid any confusion in timestamp data in scenarios such as migration to a new database server that uses a different time zone.

Mandatory database parameters

Most of the default Oracle configuration parameters can be used for the Central Coding database. However, the following parameters must be set to the specified values.

Parameter	Value
Database Character Set	AL32UTF8 - Unicode UTF-8 Universal character set
National Character Set	AL16UTF16 - Unicode UTF-16 Universal character set
db_cache_size	80 MB
sga_max_size	1000 MB
sga_target	600 MB (dependent on how much memory is available for Oracle)
pga_aggregate_target	300 MB (dependent on how much memory is available for Oracle)
BLOCK_SIZE	Database: 16k Tablespace: 16k

Note: Your database administrator should dynamically adjust the `sga_target` and `pga_aggregate_target` values using Oracle Enterprise Manager Advisors as the system grows.

Note: Oracle recommends that the Oracle instance registry parameter `ORA_*SID*_AUTOSTART` be set to `True`. This ensures that Oracle is synchronized with the job scheduler, which is an auto-started service.

Create the database and tablespaces

After installing the Oracle software, create the database and tablespaces. The Central Coding application uses the *Coding application* and *Coding platform* tablespaces listed in the following table.

- Note the names of the tablespaces you create.

You need the names when you enter values for the database users during the Central Coding software installation.

Each tablespace has one or more associated database users, which the installation wizard creates when you install a Central Coding application server. For more information, see *Installing a Central Coding application server* (on page 31).

Note: For demonstration purposes in this guide, example names are provided for the recommended tablespaces, and for their associated database users and passwords. The same example name is used for both the user name and password.

The **Central Coding Database User** name and the **Coding Platform Database User** name cannot be the same.

The tablespace and user names are *not* case-sensitive. The passwords are case-sensitive.

- The Coding application tablespace contains the coding dictionary database, which is created by the Dictionary Loader tool. For more information, see *About the Dictionary Loader tool* (on page 55).

Note: All entries used as Oracle database objects (such as user names, passwords, and tablespaces) should follow Oracle recommendations for naming conventions. In addition, Oracle recommends using strong passwords, as described in the *Secure Configuration Guide*.

Tablespace	Size	Contains	Database user(s)
Coding application Example name: CODING	500 MB Auto extend enabled, 10 MB increments.	Central Coding application	<ul style="list-style-type: none"> Central Coding Database User Example name: cca
Coding platform Example name: CCP	100 MB Auto extend enabled, 10 MB increments.	Coding dictionaries	<ul style="list-style-type: none"> Coding Platform Database User Example name: codingplatform Coding Dictionary Database User Example name: codingdictionaries

Verify the version of ASP.Net on the application server

After completing the database installation, verify the version of ASP.Net on the application server. If the correct version of ASP.Net is not being used by the IIS Manager, you cannot view the login page for the Central Coding application.

- 1 Select **Start > Programs > Administrative Tools > Internet Information Services (IIS) Manager**.

The Internet Information Services (IIS) Manager dialog box appears.

- 2 Select the server node > **Sites > Default Web Site**.

- 3 Select **Basic Settings** under Actions.

The Basic Settings dialog box appears.

- 4 Make a note of the Application Pool value and close the dialog box.

- 5 In the Connections pane, select **Application Pools**.

- 6 Make sure the value 4.0 appears in the .NET Framework Version column for the application pool noted during step 4.

Set the ISAPI and CGI restriction settings

After you complete the database installation and verify the version of ASP.NET on the application server, you must set the ISAPI and CGI Restrictions option to allow the use of ASP.NET 4.0 on the machine on which you are installing the Central Coding application.

- 1 Select **Start > All Programs > Administrative Tools > Internet Information Services (IIS) Manager**.

The Internet Information Services (IIS) Manager dialog box appears.

- 2 In the Connections pane, select the local machine on which you are working.

The [Computer Name] Home pane appears.

- 3 In the IIS section, make sure ASP is installed.

- 4 In the IIS section, double-click **ISAPI and CGI Restrictions**.

The ISAPI and CGI Restrictions pane appears.

- 5 Double-click **ASP.NET v4.0.30319**.

The Edit ISAPI or CGI Restriction dialog box appears.

- 6 Select **Allow extension path to execute**.

- 7 Click **OK**.

Install a certificate to secure internal communication with the Job Scheduler service

On each Central Coding application server, an administrator must install the certificate that is used to secure communication with the Job Scheduler service.

- The certificate must be installed to the **LOCAL_MACHINE\MY** store directory and made usable by the user who runs the ASP.NET worker process (by default, NETWORK SERVICE or IIS AppPool\Central Coding New Pool). You must also grant this user Full Control rights to the private key for the certificate.
- The certificate and each certificate in the certification path must be 2048 bits or higher.

To install the certificate:

- 1 Open the Microsoft Management console:
 - a Open a Command Prompt window.
 - b Enter **mmc**.
- 2 Select **File > Add/Remove Snap-in**.
The Add or Remove Snap-ins dialog box appears.
- 3 In the list of available snap-ins, select **Certificates**.
- 4 Click **Add**.
The Add dialog box appears.
- 5 Click **Computer account**.
- 6 Click **Next**.
- 7 Click **Local Computer**.
- 8 Click **Finish**.
- 9 Click **OK**.
- 10 In the Console Root tree of the Microsoft Management console, select **Certificates (Local Computer)**.
- 11 In the Logical Store Name field, right-click the **Personal** folder.
- 12 Select **All Tasks > Import**.
The Certificate Import Wizard appears.
- 13 Click **Next**.
- 14 Click **Browse**, and select the PFX file provided by the certificate vendor.
- 15 At the prompt, enter the password for the PFX file.
- 16 Click **Next** to accept the default options for the remaining dialog boxes.
- 17 Click **Finish**.
The new certificate appears in the displayed list.
- 18 Right-click the certificate, and select **All Tasks > Manage Private Keys**.
- 19 Give full control rights to the users NETWORK SERVICE and IIS AppPool\Central Coding

New Pool.

20 Click **OK**.

Enable TLS 1.2

Oracle recommends that you configure the following security settings on the Central Coding application server:

- Enable TLS 1.2 and higher.
- Disable SSL 2.0, SSL 3.0, TLS 1.0, and TLS 1.1.

If TLS 1.2 is enabled on the InForm Adapter computer or on the address translator (in a load-balanced configuration, for example), you must enable TLS 1.2 on the Central Coding application server:

- In HKLM\SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Protocols, create the following keys and subkeys:

Key	Subkey	Entries
SSL 2.0	Client	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
	Server	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
SSL 3.0	Client	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
	Server	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
TLS 1.0	Client	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
	Server	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
TLS 1.1	Client	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
	Server	<ul style="list-style-type: none"> • DisabledByDefault=1 • Enabled=0
TLS 1.2	Client	<ul style="list-style-type: none"> • DisabledByDefault=0 • Enabled=1
	Server	<ul style="list-style-type: none"> • DisabledByDefault=0 • Enabled=1

- In HKLM\SOFTWARE\Microsoft\.NetFramework\v4.0.30319, create a key called SchUseStrongCrypto with the DWORD value=1.

Configure the web browsers on the client computers

Browser settings for Internet Explorer

Configure the following Internet Explorer settings to access the Central Coding application.

- Configure pop-up blocking to allow pop-ups for the Central Coding website domain.
- Prevent automatic password completion.
- Automatically check for newer versions of stored pages.
- Set the HTTP and TLS options to use HTTP 1.1 and TLS 1.2 and higher.
- Disable the SSL settings.
- Allow META REFRESH.
- Enable active scripting.
- Enable native XMLHTTP support.
- Set up tabbed browsing to launch links in a new tab.

For more information, see the Internet Explorer documentation.

Browser settings for Mozilla Firefox

Configure the following Firefox settings to access the Central Coding application.

- Specify the preferred browser language.
- Configure pop-up blocking to allow pop-ups for the Central Coding website domain.
- Prevent Firefox from using stored passwords.
- Set the security protocol option to use TLS 1.2 and higher.
- Modify security settings to accept cookies.
- Set up tabbed browsing to launch links in a new tab.

For more information, see the Mozilla Firefox documentation.

Create database user accounts

If you are performing a new Central Coding installation, Oracle recommends that a database administrator performs the following steps before the Central Coding application is installed:

- 1 Download the Central Coding 3.1 ZIP file.
- 2 Extract the ZIP contents.
 - To create the **Central Coding Database User** and **Coding Platform Database User**:
 - a Open a Windows command prompt from the CodingDBSetup folder.
 - b Enter the following command:
sqlplus /nolog CodingDBSetup.sql
 - c Enter the user account information when prompted.

During the Central Coding installation, when configuring the two database user accounts, the system administrator can select the options to use existing users, and enter the credentials of the users created during this step.

Note: If you create the **Central Coding Database User** and **Coding Platform Database User** during the installation, you must enter the Oracle SYS account password.

- To create the **Coding Dictionary Database Administrator User**, run **CreateDictAdminUser.sql** located in the CodingDBSetup folder.

In the Dictionary Loader tool, when performing certain operations, such as creating a dictionary repository or a dictionary, the dictionary administrator must enter the credentials of the user you created during this step.

CHAPTER 4

Installing the Central Coding software

In this chapter

Before you begin	30
Interactive installation or upgrade.....	31
Silent installation or upgrade.....	43
Verify the installation	48
Repairing an installation.....	49
Uninstalling a Central Coding application server	50

Before you begin

You can perform either a manual or a silent installation of the Central Coding software.

Before you run the installation, make sure that:

- The database instance is running.
- All clocks are synchronized on the machines where you are installing the Central Coding software and the database server.

The installation program verifies that the clocks are synchronized. If they are not synchronized, an error message appears. Installation cannot continue until the clocks are synchronized.

Note: Oracle recommends that you configure both the application server and the database server to use the Coordinated Universal Time (UTC) time zone. In this way you can avoid any confusion in timestamp data in scenarios such as migration to a new database server that uses a different time zone.

- The ASP.NET state service is started.
- The job scheduler is turned off.

Interactive installation or upgrade

Installing a Central Coding application server

Use this procedure to install an instance of the Central Coding software. After you install one instance of the Central Coding software, you can run the installation program as many times as necessary to install additional instances.

Perform this procedure on each application server.

Note: This installation procedure requires that you enter the names of the database tablespaces and their associated database users and passwords. For demonstration purposes in this guide, example names for the tablespaces, users, and passwords are provided in this procedure in the appropriate steps. For more information, see *Create the database and tablespaces* (on page 21).

Caution: All entries used as Oracle database objects (such as user names, passwords, and tablespaces) should follow Oracle recommendations for naming conventions. In addition, Oracle recommends using strong passwords, as described in the Secure Configuration Guide.

Configure application settings

- 1 Locate **setup.exe**.
- 2 Right-click and select **Run as administrator**.
 - If you are installing the Central Coding application for the first time, the Welcome page appears.
 - If you have already installed an instance of the Central Coding application, the Existing Installed Instances Detected page appears.
 - Select **Install a new instance of this application**, and click **Next**.

The Welcome page appears.

- 3 Click **Next**.

The page that appears depends on the operating system.

- If you are performing a fresh installation on a Japanese operating system, the Required System Components page appears. Proceed to step 5.
- If you are performing a fresh installation on an English operating system, the Determine Database Sort page appears.

Use this page to specify the locale, which determines the correct linguistic sorting in the database. The choice affects the language of verbatims that can be supported, the default date format, and which report templates are installed.

- 4 Select the locale.
 - **English**—Sets the default database sort group to English. The English option maps to the Binary Oracle sort value.

Select this option to:

- Support only English verbatims.
- Set the default date format to DD/MON/YYYY HH24:MI:SS.
- Load the English report templates. The reports can contain only English data.
- **European**—Sets the default database sort group to WesternEuropean. The European option supports more character sets than the English option. It maps to the Generic_M Oracle sort value, which generally handles the order of the Latin, Cyrillic, Greek, and other European characters.

Select this option to:

- Support only English verbatims.
- Set the default date format to DD/MON/YYYY HH24:MI:SS.
- Load the English report templates. The reports can contain only English data.
- **Global**—Sets the default database sort group to JapaneseWesternEuropean. The Global option maps to the Japanese_M Oracle sort value.

Select this option:

- If you are using an English operating system and you want to support both English and Japanese verbatims, or if you are using a Japanese operating system.
- To set the default date format to YYYY/MON/DD HH24:MI:SS.
- To load the Japanese report templates. The reports can contain both Japanese and English data.

Note: For the best performance, Oracle recommends that you select **Global** only if you are working with Japanese studies.

- 5 Click **Next**.

The Required System Components page appears. The installation wizard verifies that the server has all the necessary software components, including the operating system, IIS, .NET, and the Oracle client.

If required components are missing or are the wrong version, installation stops. The missing and invalid components are listed on the Required System Components page. You must install them before continuing the installation.

- 6 Click **Yes**.

The Company Information page appears.

- 7 Enter the following information:

- **Company name**—Name of the company licensed to use the software.

The company name may include any characters. This is informational only.

- **Company URL**—URL that is unique to the company.

This is used to define the security domain in inter-product communication. The Company URL:

- Must be in English.
- Must follow the proper URL convention and be in valid URL (ASCII) narrow

characters.

The URL does not need to point to an actual running website or service.

- Should not begin with a protocol designation such as **http://**.

For example, www.oracle.com.

- 8 Click **Next**.

The Authentication Scheme page appears.

- 9 Select **Native Authentication**, and click **Next**.

Note: Trust Authentication is available only for Oracle-hosted installations.

The Select Features page appears.

- 10 Select the features to install. At least one feature must be selected in order to continue with the installation. If you select only the Dictionary Loader tool, the installation program skips to the end of the wizard.

- Central Coding Server.
- Dictionary Loader.

The Dictionary Loader tool must be installed in order to load standard and custom dictionaries. However, the Dictionary Loader tool:

- Does not need to be installed on every machine or on every application server.
- Can be on a different machine from the Central Coding application server(s).
- Can be installed without also installing the Central Coding Server.

If you want to verify whether the Dictionary Loader tool is installed, select **Start Menu > Programs > Phase Forward > Central Coding**. If **Dictionary Loader** appears, it is already installed.

- 11 Click **Next**.

Configure the application instance

On the Application Instance Settings page, you enter the instance name and job scheduler port number. From the instance name, the installer derives the virtual directories and job scheduler service name. The port must be numeric and should designate a port that is currently open and will be reserved for only this service. The installation program attempts to select a port that has not been used by a prior run of the installation.

- 1 Enter the following information:

- **Instance Name**—Unique string identifier for this instance. The Instance Name derives names for the various services.
 - Do not use special characters and make sure that there are no spaces in the name.
 - If you plan to have multiple application servers, consider using a naming convention for the names that allows you to easily identify each instance.
- **TCP port**—Port through which the job scheduler communicates on this Central Coding application server.

- The Central Coding software reserves the range 14000 through 14100 by convention, although it can be any open port.
- Each instance must be assigned a different open port.
- The installation program defaults to a unique number for each instance being installed, starting in the conventional range, but not limited to it.

The following information is automatically populated:

- **Service name**—Job scheduler Windows service name for this Central Coding instance. By default, this is set to Central Coding Job Scheduler.
This must be a unique name across multiple instances so that the services can be distinguished from one another. The installation appends the instance name to the service name.
- **Application URL**—URL for the application server.
- **Application Server**—Name of the virtual directory under which the application is published in IIS.
The installation appends the instance name to this name.
- **Coding Service Virtual Directory**—Unique name for the application server you are creating.
The installation appends the instance name to this name.
- **Platform Service Virtual Directory**—Unique name for the platform you are creating for this application server.
The installation appends the instance name to this name.
- **Job Service Host Name**—Machine name of the host. The default is localhost.

- 2 Click **Next**.

The Choose Destination Location page appears.

- 3 Specify where on the local file system to install the instance of the application.

By default, the installation wizard installs the Central Coding software in C:\Program Files (on 32-bit operating systems) or C:\Program Files (x86) (on 64-bit operating systems) in the \Phase Forward\Central Coding Application folder. However, you can click **Change** and navigate to another location. The folder must not be the same as any other installed instance.

Note: The instructions, paths, and Start Menu navigation in this guide assume you are installing to the default location. Oracle strongly recommends that you install the software to the default directory. If you select a different location, the uninstaller might not remove all related files during the uninstall process.

- 4 Click **Next**.

Configure the Central Coding database user

On the Central Coding Database User page, you create or select an existing user for the Central Coding database. To create a new user, you must enter the connection string and the password for the Oracle SYS user account; the database user and password; and the default tablespace for the Central Coding application.

The installation program detects the Oracle home location, finds all currently configured connection strings, and presents them in a list. Instead of typing in the connection string, you pick it from the list.

Note: If the connection string that you want to use is not in the list, it means the connection has not been set up.

Select or enter the following information for the **Central Coding Database User**, and then click **Next**.

- **Connection string**—TNS name to use when connecting to the database.

Note: To receive the best performance, Oracle recommends that you specify different connection strings for the Central Coding Database User, the Coding Platform Database User, and the Coding Dictionary Database User.

- **Create/Recreate User**—Select to create a new **Central Coding Database User**. Select this option only if a database administrator did not create the user before the installation. For more information, see *Create database user accounts* (on page 28).

If you choose to create a new user, you must also enter data for the default tablespace. If the Create/Recreate User option is selected and an existing user is supplied, that user will be dropped and re-created.

- **SYS User Password**—Password for the Oracle SYS account.
- **Test Connection**—Click to attempt an actual database connection using the selected **Connection string** and **SYS User Password**. You can continue with the installation only after the connection test succeeds.
- **Default tablespace**—Select the name that was created for the Central Coding application.

This list is populated from the database. For the example in this guide, that name is **CODING**. For more information, see *Create the database and tablespaces* (on page 21).

- **Create**—Click to create a new tablespace.

The Create New Default Tablespace dialog box appears. In the **Name** field, enter a name for the tablespace, and click **Create**. The dialog box closes and the name of the newly created tablespace appears in the **Default tablespace** field on the **Central Coding Database User** page.

Note: The tablespace that is created is the default size and in the default location. If you want the tablespace to be a different size or in a different location, you must create the tablespace from the database.

- **User Name**—Oracle user account name.

The Central Coding Database User name and the Coding Platform Database User name cannot be the same.

- **Password, Retype Password**—Password for the Oracle user account.

The password must contain:

- One or more alphabetical (A-Z, a-z) and numeric (0-9) characters.
- At least one non-alphanumeric character.
- One or more upper case (A-Z) and lower case (a-z) characters.
- A minimum of 8 characters.

Note: Do not use Oracle reserved words for the user name or password.

- **Existing User**—Select if the user was created before the installation, or to reuse an existing user. In this case, the database is assumed to be present already, and the specified user is not dropped. You can test a connection with this user before proceeding.
 - **User Name**—Oracle user account name. The list is populated with users from the database.
 - **Password**—Password for the Oracle user account.
 - **Test User**—Click to test the database connection with this user.

Configure the Coding Platform database user

On the Central Coding Platform Database User page, you create or select an existing user for the Central Coding Platform database. To create a new user, you must enter the connection string and the password for the Oracle SYS user account; the database user and password; and the default tablespace for the Central Coding Platform.

Select or enter the following information for the **Coding Platform Database User**, and then click **Next**.

- **Connection string**—The TNS name to use when connecting to the Platform database.
- **Create/Recreate User**—Select to create a new **Coding Platform Database User**. Select this option only if a database administrator did not create the user before the installation. For more information, see *Create database user accounts* (on page 28).

If you choose to create a new user, you must also enter data for the default tablespace. If the Create/Recreate User option is selected and an existing user is supplied, that user will be dropped and re-created.

- **SYS User Password**—The password for the Oracle SYS account.
- **Default tablespace**—Select the name that was created for the Central Coding application. This list is populated from the database. For the example in this guide, that name is **CCP**. For more information, see *Create the database and tablespaces* (on page 21).
- **Create**—Click to create a new tablespace.

The Create New Default Tablespace dialog box appears. In the **Name** field, enter a name for the tablespace and click **Create**. The dialog box closes and the name of the newly created tablespace appears in the **Default tablespace** field.

Note: The tablespace that is created is the default size and in the default location. If you want the tablespace to be a different size or in a different location, you must create the tablespace from the database.

- **User Name**—The Oracle user account (*Example name: codingplatform*).
The Central Coding Database User name and the Coding Platform Database User name cannot be the same.
- **Password, Retype Password**—The password for the Oracle user account.
The password must contain:
 - One or more alphabetical (A-Z, a-z) and numeric (0-9) characters.
 - At least one non-alphanumeric character.
 - One or more upper case (A-Z) and lower case (a-z) characters.
 - A minimum of 8 characters.
- **Existing User**—Select if you created the user before the installation, or to reuse an existing user. In this case, the database is assumed to be present already, and the specified user is not dropped. You can test a connection with this user before proceeding.
 - **User Name**—The Oracle user account name. The list is populated with users from the database.
 - **Password**—The password for the Oracle user account
 - **Test User**—Click to test the database connection with this user.

Create the Coding Dictionary database user

On the Create Coding Dictionary Database User page, you enter the user and password that the Central Coding application will use to connect to the dictionary database. This user is not dropped or created, and does not have to exist at the time of the installation. You create the dictionary database using the Dictionary Loader tool. For more information, see *Setting up the dictionary database* (on page 56).

Enter the following information, and then click **Next**.

- **Connection string**—The TNS name to use when connecting to the dictionary database.

Note: To receive the best performance, Oracle recommends that you specify different connection strings for the Central Coding Database User, the Coding Platform Database User, and the Coding Dictionary Database User.

- **User**—The name of the user account for the dictionaries (*Example name: codingdictionaries*).
- **Password, Retype Password**—The password for the user account for the dictionaries.

The password must contain:

- One or more alphabetical (A-Z, a-z) and numeric (0-9) characters.
- At least one non-alphanumeric character.
- One or more upper case (A-Z) and lower case (a-z) characters.

- A minimum of 8 characters.

Note: Make a note of these values. You must use them when you create the repository for the dictionaries and when you connect to the database. For more information, see *Creating a dictionary repository* (on page 56) and *Creating a connection to the database* (on page 57).

Complete the installation

- 1 On the Create Coding Administrator Account page, enter the following information, and click **Next**.

- **User**—The name of the initial user account for the Central Coding application.
- **Password**—The password for the initial user account.

The password must contain:

- One or more alphabetical (A-Z, a-z) and numeric (0-9) characters.
 - At least one non-alphanumeric character.
 - One or more upper case (A-Z) and lower case (a-z) characters.
 - A minimum of 8 characters.
- **Retype password**—The password for the initial user account.

- 2 Click **Choose Certificate**.

A list of X.509 certificates on the machine appears in a new window.

Note: The certificate is for internal communication only, and must already be installed. For more information, see *Install a certificate to secure internal communication with the Job Scheduler service* (on page 24).

- 3 Select the certificate to use, and click **OK**.

The certificate properties appear on the page.

- 4 Click **Next**.

The Ready to Install the Program page appears.

- 5 Click **Install**.

After the installation completes, the Central Coding Installation Wizard Complete page appears.

- 6 Click **Finish**.

Modifying an existing Central Coding application server installation of the same version

Use this procedure to change the feature(s) of the same version of the software that you installed on an application server. The combination of features includes:

- Central Coding Server.
- Dictionary Loader.

1 Locate **setup.exe**.

2 Right-click and select **Run as administrator**.

The Existing Installed Instances Detected page appears.

3 Select **Maintain or update the instance of this application selected below**.

4 Select the appropriate server, and click **Next**.

The Welcome page appears.

5 Select **Modify**, and click **Next**.

The Select Features page appears.

6 To modify an application server installation, select the features to change:

- Central Coding Server.
- Dictionary Loader.

The Dictionary Loader tool must be installed in order to load standard and custom dictionaries. However, the Dictionary Loader tool:

- Does not need to be installed on every machine or on every application server.
- Can be on a different machine from the Central Coding application server(s).
- Can be installed without also installing the Central Coding Server.

To verify whether the Dictionary Loader tool is installed, from the **Start Menu**, select **Programs > Phase Forward > Central Coding**. If **Dictionary Loader** appears, it is already installed.

7 Select the features to install, deselect the features to uninstall, and click **Next**.

The files are updated and the Maintenance Complete page appears.

8 Click **Finish**.

Performing an in-place upgrade to the Central Coding 3.1 software

Use this procedure to update the Central Coding software to the current version. The installation program verifies the components that are currently installed on your system and prompts you to update the existing application instance.

Note: You can upgrade to the current release from the Central Coding 3.0.3.1 or 3.0.4 releases running on a Microsoft Windows 2008 32-bit operating system. If you are using an earlier version of the Central Coding software, you must first upgrade to the 3.0.3.1 or 3.0.4 release on an English operating system. You cannot perform an upgrade to support the Japanese language. To accommodate multilingual studies, you must do a complete install of the Central Coding software.

- 1 If the Central Coding job scheduler service is running, stop the service.
- 2 Reset IIS, and restart the World Wide Web Publishing Service.
- 3 Back up the coding database (all schema owners defined for the Central Coding application).
Oracle recommends that you run a full export of the Central Coding database.
- 4 Back up the Central Coding installation directory.
This creates backup copies of all CONFIG files and can provide information about the Central Coding configuration before the upgrade.
- 5 Make sure that the Central Coding release 3.0.3.1 or 3.0.4 software is installed.
- 6 Download the Central Coding 3.1 ZIP file.
- 7 Distribute the Central Coding 3.1 ZIP file to every machine where you installed the Central Coding software and extract the ZIP contents.
- 8 Locate **setup.exe**.
- 9 Right-click and select **Run as administrator**.
The Existing Installed Instances Detected page appears.
- 10 Select **Maintain or update the instance of this application selected below**.
When an existing instance is selected, the installation program enters the upgrade mode. Details about the existing instance are read from the instance itself, so that you do not need to supply information again. The installation program:
 - Verifies the updated software prerequisites.
 - Copies over all assemblies and relevant files with the new versions, except for configuration files that have been modified since the previous installation.
 - Updates the configuration and database.
- 11 Select the application server to upgrade, and click **Next**.
The Welcome page appears.
- 12 Click **Next**.
The Required System Components page appears.
- 13 Click **Next**.

The Authentication Scheme page appears.

- 14 Select **Native Authentication**, and click **Next**.

The Setup Status page appears. When the setup is complete, a command prompt window opens that displays the upgrade steps as they occur. When the upgrade is complete, the command prompt window closes and the Central Coding Update Wizard Complete page appears.

The Choose Certificate page appears.

- 15 Click **Choose Certificate**.

A list of X.509 certificates on the machine appears in a new window.

Note: The certificate is for internal communication only, and must already be installed. For more information, see *Install a certificate to secure internal communication with the Job Scheduler service* (on page 24).

- 16 Select the certificate to use, and click **OK**.

The certificate properties appear on the page.

- 17 Click **Finish**.

Note: The upgrade may delete the connections that were defined for the dictionary repository. After the upgrade is complete, you can restore the connections using the previous user information, and the dictionary repository objects will be available again. For more information, see *Creating a connection to the database* (on page 57).

- 18 Clear the browser's cache on your local machine.

In Internet Explorer:

- a Click **Tools > Internet Options**.

The Internet Options dialog box appears.

- b In the **Browsing history** section, click **Delete**.

The Delete Browsing History dialog box appears.

- c In the **Temporary Internet Files** section, click **Delete files**.

In Mozilla Firefox:

- d Click the menu button, and then select **Options**.

- e Select **Advanced > Network**.

- f In the **Cached Web Content** section, click **Clear Now**.

- 19 Optionally, before starting the job scheduler, specify the length of time that you want entries in the job log to remain in the Central Coding database.

The **PhaseForward.Platform.JobScheduler.exe.config** file includes a job entry that manages the size of the job log table in the database for scheduled jobs.

The job runs daily and by default deletes entries that are 45 days old. If you want to keep entries in the job log for a different amount of time you must edit the file. The file is in *<Installation Folder>\CentralCodingServer\CodingWebUI\bin*.

Migrating an existing installation to a new application server

Use this procedure to migrate a Central Coding installation from an older release running on a 32-bit server to the current release running on a 64-bit server:

- 1 Prepare the new server.
For more information, see:
 - System Requirements in the *Release Notes*.
 - ***Preparing the Central Coding installation*** (on page 19).
- 2 Central Coding 3.1 supports Oracle 11.2.0.4 and higher. If necessary, upgrade the Oracle database software, or migrate it to a new database server.
- 3 On the old application server, upgrade the Central Coding application to release 3.1.
- 4 On the old application server, disable all jobs.
- 5 Install the Central Coding application on the new server. During the installation, select the options for using the existing Coding, Platform, and Dictionary Database users. For more information, see ***Installing a Central Coding application server*** (on page 31).
- 6 Make sure jobs are running on the new application server.
- 7 Uninstall the Central Coding application from the old server.

Silent installation or upgrade

Performing a silent installation

After you install one instance of the Central Coding software, you can run the silent installation as many times as necessary to install additional instances. To perform a silent installation of the Central Coding software:

- 1 Modify the response file.
For more information, see *Modifying the response file* (on page 43).
- 2 Run the installation from the command line.
For more information, see *Running the installation* (on page 45).

Modifying the response file

Perform this procedure on each application server.

Note: All entries used as Oracle database objects (such as user names, passwords, and tablespaces) should follow Oracle recommendations for naming conventions. In addition, Oracle recommends using strong passwords, as described in the *Secure Configuration Guide*.

- 1 Copy the Central Coding installation folder to your local machine.
- 2 Locate the **setup.iss** response file.
- 3 Save the **setup.iss** response file with a different name.

Note: Oracle recommends saving the response file with a name that references the Central Coding instance with which it is associated.

- 4 Modify the response file with the following information:

Parameter	Description
svLanguage	Locale: <ul style="list-style-type: none"> • English • European • Global
szCompanyName	Company name.
szCompanyURL	Company URL.
szDir (First)	Base installation directory. This should match the information you specify in the parameter for the Central Coding instance directory.
svAuthChoice	Authentication scheme used. This must be NATIVE for self-hosted installations.

Parameter	Description
instanceName	Instance name.
svPort	TNS port number. This must be an empty port that has not been used by any other software.
szDir (Second)	Directory for the Central Coding instance. This should match the information you specified in the installation directory parameter.
Central Coding Database user parameters	
svDBServer	Database server connection string for the Central Coding Database user.
svOracleSysPassword	Oracle system password. This must be entered only if svCreateUser is TRUE.
svdbUID	Central Coding Database user ID.
svdbPID	Central Coding Database user password.
svDBTablespace	Name of the tablespace for the Central Coding database.
svCreateUser	Controls whether the user specified by svdbUID is created (TRUE), or if an existing user identified by svdbUID will be reused (FALSE).
Platform Database user parameters	
svDBServer	Database server connection string for the Platform Database user.
svOracleSysPassword	Oracle system password. This must be entered only if svCreateUser is TRUE.
svdbUID	Platform Database user ID.
svdbPID	Platform Database user password.
svDBTablespace	Name of the tablespace for the Platform database.
svCreateUser	Controls whether the user specified by svdbUID is created (TRUE), or if an existing user identified by svdbUID will be reused (FALSE).
Dictionary Database user parameters	
svDBServer	Database server connection string for the Dictionary Database user.
svdbUID	Dictionary Database user ID.
svdbPID	Dictionary Database user password.
Certificate parameters	
svCertSubject	Certificate subject.

Parameter	Description
svCertIssuer	Certificate issuer.
svCertName	Certificate name.
svCertExpiration	Certificate expiration date, in the format MM/DD/YYYY H:MM:SS AM/PM.
svCertThumbprint	Certificate thumbprint.

Note: Make sure there are no spaces in the value of the parameter.

Running the installation

- 1 Open a Command Prompt window and navigate to the installation folder on your local machine.
- 2 Run the following command:

```
...setup.exe -s -f1"[Location of response file]\[Response file name]" -f2"[Location of log file]\[Log file name]"
```

In the command syntax:

- **Location of response file**—The directory where the response file you modified exists.
- **Response file name**—The name you gave the response file to use during the silent installation.
- **Location of log file**—The directory where you want the log file to be created.

Note: Make sure the directory exists; otherwise the installation fails.

- **Log file name**—The name to give the log file.

Note: The log file is automatically created during the installation.

- 3 After you run the silent installation, Oracle recommends that you check the log file to ensure that the installation was successful. For more information, see *Checking the log file* (on page 47).

Performing a silent upgrade

Use this procedure to update the Central Coding software to the current version. The installation program verifies the components that are currently installed on your system and prompts you to update the existing application instance.

Note: You can upgrade to the current release from the Central Coding 3.0.3.1 or 3.0.4 releases running on a Microsoft Windows 2008 32-bit operating system. If you are using an earlier version of the Central Coding software, you must first upgrade to the 3.0.3.1 or 3.0.4 release on an English operating system. You cannot perform an upgrade to support the Japanese language. To accommodate multilingual studies, you must do a complete install of the Central Coding software.

- 1 Make sure that the Central Coding release 3.0.3.1 or 3.0.4 software is installed.

- 2 Download the Central Coding 3.1 ZIP file.
- 3 Distribute the Central Coding 3.1 ZIP file to every machine where you installed the Central Coding software and extract the ZIP contents.
- 4 If the Central Coding job scheduler service is running, stop the service.
- 5 Reset IIS, and restart the World Wide Web Publishing Service.
- 6 Back up the coding database (all schema owners defined for the Central Coding application).
Oracle recommends that you run a full export of the Central Coding database.
- 7 Back up the Central Coding installation directory.
This creates backup copies of all CONFIG files and can provide information about the Central Coding configuration before the upgrade.
- 8 Navigate to the installation folder.
- 9 Locate the upgrade.iss response file and open it with any text editor.
 - a Locate the Job Scheduler certificate parameters (svCertSubject, svCertIssuer, svCertName, svCertExpiration, svCertThumbprint) and enter a value for each parameter to match with the value in the authentication certificate.

If the value for a parameter is empty, set its value in the response file to ' ' (a single blank character enclosed in single quotes).
 - b Save and close the file.
- 10 In order to successfully run the silent upgrade, you need to know the GUID for the existing instance of the Central Coding application that you are upgrading. To find this information:
 - a Click **Start > Run**.
The Run dialog box appears.
 - b Enter **regedit**.
The Registry Editor dialog box appears.
 - c Expand the HKEY_LOCAL_MACHINE/SOFTWARE/PHASEFORWARD node.
 - d Locate the instance of the Central Coding application that you are upgrading.
 - e Copy the GUID information into a text file so that you can easily copy and paste it into the command line during the upgrade.
- 11 Open a Command Prompt window and navigate to the installation folder on your local machine.
- 12 Run the following command:

```
...setup.exe -s -ig"[Central Coding instance GUID]" -f1"[Location of upgrade response file]\[Response file name]" -f2"[Location of the log file]\[Log file name]"
```

In the command syntax:

- **Central Coding instance GUID**—GUID for the Central Coding instance to upgrade. The GUID must be enclosed in curly braces, for example {94EFC52F-AAFF-41BD-9A11-7A5FA3FAA763}.
- **Location of response file**—The directory containing the modified upgrade response file.
- **Response file name**—The name of the upgrade response file.

- **Location of log file**—The directory in which to create the upgrade log file.

Note: Make sure the directory exists, otherwise the installation fails.

- **Log file name**—The name to give the upgrade log file.

Note: The upgrade log file is automatically created during the installation.

For example, a silent install upgrade command, that is run from the C:\TEMP folder, might look like the following:

```
C:\TEMP\setup -s -ig"{94EFC52F-AAFF-41BD-9A11-7A5FA3FAA763}" -f1"C:\TEMP\upgrade.iss"
-f2"C:\TEMP\upgrade.log"
```

- 13 Clear the browser's cache on your local machine.
 - a Click **Tools > Internet Options**.
The Internet Options dialog box appears.
 - b In the **Browsing history** section, click **Delete**.
The Delete Browsing History dialog box appears.
 - c In the **Temporary Internet Files** section, click **Delete files**.
- 14 After you run the silent upgrade, Oracle recommends that you check the error log to ensure that the upgrade was successful. For more information, see *Checking the log file* (on page 47).

Checking the log file

- 1 Navigate to the directory in which the response file that you modified exists.
- 2 Open the log file with the name you specified during the installation.
 - For successful installations, the log file includes **ResultCode=0**.
 - For unsuccessful installations, the **ResultCode** field is populated with a number that specifies the type of error that occurred during the installation.

Note: The error codes in the log file are created by InstallShield. If an error occurs during the installation, contact Oracle for details.

Verify the installation

After the application server is created, do the following to verify that the installation was successful:

- Review the **setup log**.

This log contains messages the system generated during the installation. It is available in `<Installation Folder>\CentralCodingServer\Setuplog.txt`.

If the following message appears in **Setuplog.txt** it indicates that the block size of the tablespace for the Central Coding user is not large enough. For more information, see ***Mandatory database parameters*** (on page 20).

```
create index CCA_FLAT_LEVELS_IDX1 on CCA_FLAT_LEVELS (*
ERROR at line 1:
ORA-01450: maximum key length (6398) exceeded
```

- In IIS, verify that **centralcoding<InstanceName>** exists; <InstanceName> is the Instance Name you entered on the Application Instance Settings page during the Central Coding installation.
 - 1 To open IIS, select **Start > Settings > Control Panel > Administrative Tools > Internet Information Services (IIS) Manager**.
 - 2 Double-click the **machine name**, expand **Web Sites > Default Web Sites**, and locate **centralcoding<InstanceName>**.
- Verify that the **Dictionary Loader** tool is installed.

If you selected Dictionary Loader on the Select Features page when you installed the Central Coding software, the Dictionary Loader tool is available from the Start menu. Select **Program Files > Phase Forward > Central Coding > Dictionary Loader**.

Note: For instructions on using the Dictionary Loader tool to load and manage the coding dictionaries, see ***Loading and managing the coding dictionaries*** (on page 51).

Repairing an installation

Use this procedure to re-copy all relevant installation files onto the target machine. This option is useful if the installation files were corrupted.

- 1 Locate **setup.exe**.
- 2 Right-click and select **Run as administrator**.
The Existing Installed Instances Detected page appears.
- 3 Select **Maintain or update the instance of this application selected below**.
- 4 Select the appropriate server, and click **Next**.
The Welcome page appears.
- 5 Select **Repair**, and click **Next**.

Uninstalling a Central Coding application server

Use this procedure to perform a complete uninstall of the Central Coding software.

- 1 Locate **setup.exe**.
- 2 Right-click and select **Run as administrator**.
The Existing Installed Instances Detected page appears.
- 3 Select **Maintain or update the instance of this application selected below**.
- 4 Select the appropriate server, and click **Next**.
The Welcome page appears.
- 5 Select **Remove**, and click **Next**.
A confirmation dialog box appears.
- 6 Click **Yes**.
Messages display as the system removes the Central Coding components. When the process is complete, the Uninstall Complete page appears.
- 7 Select whether to restart the computer now or later, and click **Finish**.
- 8 Remove the Central Coding folder from the Start menu.

CHAPTER 5

Loading and managing the coding dictionaries

In this chapter

About loading and managing the coding dictionaries.....	52
About dictionary types and dictionary schemas.....	53
About the Dictionary Loader tool.....	55
Setting up the dictionary database.....	56
Loading standard dictionaries	60
Loading custom dictionaries	65
Using custom icons in the coding browser.....	71
Installing the language packs for the Japanese dictionaries.....	72
Maintaining the coding dictionaries	73

About loading and managing the coding dictionaries

After you install the Central Coding software, you must load the coding dictionaries on the Central Coding application server.

Note: Coding dictionaries are **not** included as part of the Central Coding installation; you must purchase and install your own coding dictionaries.

About dictionary types and dictionary schemas

A dictionary type is a Central Coding concept that identifies a family of coding dictionaries.

Dictionary types are defined in XML files that contain the metadata for the dictionary levels and the SQL needed to set up the tables in the database. These files also contain the default element configuration settings that control which coding features and information are available to users in the Central Coding user interface.

Dictionary schemas are created from dictionary types. Each dictionary version is loaded into a separate Oracle database schema.

Standard dictionary type XML files

The Central Coding software includes XML files for the standard dictionary types in *<Installation Folder>\DictionaryLoader\Setup*.

Dictionary type XML file	Description
MedDRA_DictionaryType.xml	All versions of MedDRA dictionaries have the dictionary type MedDRA.
MedDRAJ_DictionaryType.xml	All versions of MedDRA-J dictionaries have the dictionary type MedDRAJ.
MedDRAJ_ja-JP.xml	Used by the Dictionary Loader tool to install the language pack for the MedDRA-J dictionary. The language pack displays the dictionary level names and additional information labels in Japanese in the user interface.
WHO-DD_DictionaryType.xml	All versions of WHO-DD dictionaries have the dictionary type WHODD.
JDrug_DictionaryType.xml	All versions of JDrug dictionaries have the dictionary type JDrug. Note: You must rename the dictionary file so that the Dictionary Loader tool can recognize the file name. For more information, see <i>Renaming the dictionary type file for the JDrug dictionary</i> (on page 54).
JDrug_ja-JP.xml	Used by the Dictionary Loader tool to install the language pack for the JDrug dictionary. The language pack displays the dictionary level names and additional information labels in Japanese in the user interface.

Custom dictionary type XML files

For custom dictionaries, you must create the required XML file that defines the dictionary type.

Renaming the dictionary file for the JDrug dictionary

The Dictionary Loader tool does not recognize Japanese file names. Therefore, you must rename the JDrug dictionary file so that the Dictionary Loader can recognize the file name and load the dictionary.

- Rename, or copy and rename, the JDrug dictionary file (全件.txt) to **all_cases.txt**.

Note: Make sure that this file is in a local directory with only English names in its path.

About the Dictionary Loader tool

The Central Coding software includes a stand-alone component, called the Dictionary Loader tool, that you use to manage all functions associated with loading and managing the coding dictionaries. The Dictionary Loader tool can be installed on a machine as part of the Central Coding software installation.

- The Dictionary Loader tool is installed into the Central Coding application directory and added to the Start menu for the Central Coding application.

The Dictionary Loader tool is accessible only from the Central Coding server. You must have server-level access to run the Dictionary Loader tool; you cannot run it from the user interface.

- Dictionaries can be loaded on the same machine as the Central Coding application or on a different machine.

Coding dictionaries are **not** included as part of the Central Coding installation; you must purchase and install your own coding dictionaries.

- All dictionaries can be loaded into a single tablespace, or you can create a separate tablespace for each dictionary.

The instructions in this guide assume that all dictionaries are loaded into one tablespace.

- Dictionaries can be used by multiple application servers.

Launching the Dictionary Loader tool

Use the Dictionary Loader tool for all dictionary installation and maintenance tasks.

- Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

Note: When you upgrade the Central Coding software, information about previously defined connections appears in the **Data Connections** tree. The upgrade may delete the connections that were defined for the dictionary repository. You can restore the connections using the previous user information so that the dictionary repository objects become available again. For more information, see *Creating a connection to the database* (on page 57).

Setting up the dictionary database

Overview of the steps to set up the dictionary database

Note: Setting up the dictionary database is the same for both standard and custom dictionaries.

Step	Task	Description
1	<i>Create a dictionary repository</i> (on page 56).	Use to create a repository in the database to hold the dictionaries associated with a connection. Although you can create multiple repositories, only one repository can be connected at a time.
2	<i>Create a connection to the database</i> (on page 57).	Use to create a connection to the database. Connections are created within repositories. Although you can create multiple connections, only one connection can be active at a time.
3	<i>Connect to the database</i> (on page 58).	Use to connect to an existing database connection.
4	<i>View the dictionaries available for a database connection</i> (on page 58).	Use to view information about the dictionary types that are available for a connection.
5	<i>Import the dictionary type XML file</i> (on page 59).	Use to import the dictionary type XML file for a dictionary.

Creating a dictionary repository

Use this procedure to create a repository in the database to hold the dictionaries associated with a connection. Although you can create multiple repositories, only one repository can be connected at a time.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select **File > New > Dictionary Repository**.

The New Repository dialog box appears.

- 3 Enter the following information:

The values you enter here must match the values you specified during the Central Coding software installation.

- **Oracle Server**—Oracle database server connection string.
- **Schema Owner**—Name of the coding dictionary database user.
 - This must be the same name that was entered for the **Central Coding Dictionary User**

during the Central Coding installation.

- This name is also required when creating a connection to the database.

For more information, see *Creating a connection to the database* (on page 57).

- **Schema Password** and **Confirm Schema Password**—Password for the coding dictionary database user.

This password is also required when connecting to the database. For more information, see *Connecting to the database* (on page 58).

- **Tablespace**—The tablespace for the coding dictionaries.

The example used in this guide is **coding**.

Note: For more information about the Oracle fields, see *Create the database and tablespaces* (on page 21). For instructions on installing the Central Coding software, see *Installing the Central Coding software* (on page 29).

- 4 Click **OK**.

The Enter Dictionary Administrator Credentials page appears.

- 5 Enter the user name and password for the dictionary database administrator, and click **OK**.

A database administrator creates the dictionary database administrator account before the Central Coding installation. For more information, see *Create database user accounts* (on page 28).

Messages appear in a window as the repository is created.

When repository creation is complete:

- A message appears in the Output pane in the Dictionary Loader tool.
- The log for the job is available in *<Installation Folder>\DictionaryLoader\Setup\CreateRepository.log*.

Creating a connection to the database

Connections are created within repositories. Although you can create multiple connections, only one connection can be active at a time.

Note: If a connection is already active, select **File > Disconnect** before beginning this procedure.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 In the **Dictionary Loader** tool, select **File > New > Connection**.

The Connection Information dialog box appears.

- 3 Enter the following information:

- **Connection Name**—Unique name for the connection.
- **Server**—TNS name for the database.
- **User Name**—Name of the coding dictionary database user that was created when the

repository was set up.

This is the name you entered in the **Schema Owner** field in the **New Repository** dialog box. For more information, see *Creating a dictionary repository* (on page 56).

Note: For more information about the Oracle fields, see *Create the database and tablespaces* (on page 21). For instructions on installing the Central Coding software, see *Installing the Central Coding software* (on page 29).

- 4 Click **Save**.

The connection is created. It appears in the Data Connections tree view in the left pane of the Dictionary Loader tool dialog box.

Note: If the connection does not appear in the tree, close the Dictionary Loader tool and open it again.

Connecting to the database

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 In the **Dictionary Loader** tool, select a connection from the **Data Connections** tree view in the left pane.

- 3 Select **File > Connect**.

The Connection Information dialog box appears.

- 4 Enter the password that was created when the repository was set up.

This is the name you entered in the **Schema Password** field in the New Repository dialog box. For more information, see *Creating a dictionary repository* (on page 56).

- 5 Click **Connect**.

When the connection is established:

- A **Dictionaries** node is added to the Data Connections tree for this connection.
Select this node for information about the installed dictionaries.
- A **Types** node is added to the Data Connections tree for this connection.
Select this node for information about the installed dictionary types.

Viewing the dictionary types for a connection

Use this procedure to view information about the dictionary types that are available for a connection.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** tree in the left pane, select the **Types** node for the active connection.

Information about the Dictionary Types for this connection appears in the top pane.

- 4 If the dictionary type file for the coding dictionary you want to load does not appear in the Dictionary Loader tool, you can import the dictionary type.

For more information, see *Importing the dictionary type file* (on page 59).

Importing the dictionary type XML file

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** tree in the left pane, select the **Types** node for the active connection.

Information about the Dictionary Types for this connection appears in the top pane.

- 4 Select **Dictionary Type > Import**.

The Locate Files dialog box appears.

- 5 Browse to the folder that contains the XML file to import.

The Central Coding software includes XML files for the standard dictionary types in *<Installation Folder>\DictionaryLoader\Setup*.

- MedDRA_DictionaryType.xml
- MedDRAJ_DictionaryType.xml
- WHODD_DictionaryType.xml
- JDrug_DictionaryType.xml

Note: If you created a custom dictionary type, browse to the file you created. For more information, see *Creating a new dictionary type for a custom dictionary* (on page 65).

- 6 Select a file and click **Open**.

The full path to the XML file appears in the Location field.

- 7 Click **OK**.

When the import is complete, a message appears in the Output pane and information about the dictionary type appears at the top of the Dictionary Types pane.

Loading standard dictionaries

Overview of the steps to load a standard coding dictionary

Step	Task	Description
1	If you are using a WHO-DD dictionary, determine whether you are using a pre-ICH or ICH format of the dictionary.	For more information, see: <ul style="list-style-type: none"> • <i>About pre-ICH and ICH formats of the WHO-DD dictionary</i> (on page 60). • <i>Loading a pre-ICH version of the WHO-DD dictionary</i> (on page 61).
2	Make sure that the dictionary type for the dictionary that you want to load has been imported.	For more information, see <i>Importing the dictionary type XML file</i> (on page 59).
3	Make sure that the dictionary connection is established.	For more information, see <i>Viewing the dictionaries available for a database connection</i> (on page 61).
4	<i>Generate the schema for a dictionary</i> (on page 62).	The Dictionary Loader tool uses dictionary types to create dictionary schemas.
5	<i>Load the dictionary data</i> (on page 63).	Load dictionary data into the database using the schema that you generated. The dictionary schema must exist before you can load data into it.
6	<i>Activate the dictionary</i> (on page 63).	Dictionaries must be activated to be used for coding.

About pre-ICH and ICH formats of the WHO-DD dictionary

The format of the WHO-DD C dictionary files was changed for compliance with the ICH guidelines for drug dictionaries. The Central Coding application ships with the control files for both the pre-ICH and ICH dictionary formats. You can load either format of the WHO-DD dictionary for use in the Central Coding application.

- **ICH format**—An ICH version of the WHO-DD dictionary is one released in or after March 2006.

The control files for the ICH version of the dictionary are stored in two locations:

- `<Installation Folder>\Dictionary Loader\bin\setup\control files\whodd`
- `<Installation Folder>\Dictionary Loader\bin\setup\control files\whodd\ICH`

The Central Coding application is set up by default to use the ICH version of the WHO-DD dictionary. Therefore, if you want to use this dictionary format, no changes to the control files are required.

- **Pre-ICH format**—A pre-ICH version of the WHO-DD dictionary is one released prior to March 2006.

The control files for the pre-ICH version of the dictionary are stored in:

- *<Installation Folder>*\Dictionary Loader\bin\setup\control files\whodd\Pre-ICH

If you want to use this dictionary format, you must copy the control files to a different directory.

For more information, see *Loading a pre-ICH version of the WHO-DD dictionary* (on page 61).

Loading a pre-ICH version of the WHO-DD dictionary

Note: Use this procedure only if you plan to load a pre-ICH version of the WHO-DD dictionary. A pre-ICH version of the WHO-DD dictionary is one released prior to March 2006.

- 1 Navigate to *<Installation Folder>*\DictionaryLoader\bin\setup\control files\whodd.
- 2 Delete the control files (CTRL) from the **whodd** directory.

The control files for the ICH dictionary format are also stored in *<Installation Folder>*\Dictionary Loader\bin\setup\control files\whodd\ICH so that they are available if you decide to use the ICH dictionary format at a later time.

- 3 Navigate to *<Installation Folder>*\DictionaryLoader\bin\setup\control files\whodd\Pre-ICH and copy the **CTRL** files into the *<Installation Folder>*\DictionaryLoader\bin\setup\control files\whodd directory.

Viewing the dictionaries available for a database connection

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** tree in the left pane, select the **Dictionaries** node for the active connection.

The Dictionaries pane displays one row of information for every dictionary associated with this connection.

Dictionary statuses

Status	Description
DEFINED	The type, version, culture, and schema that hold data for the dictionary are defined. Data is not loaded into the schema.
LOADED	Data is loaded into the schema for the defined dictionary.
ACTIVE	The dictionary is defined, data is loaded into the schema, and the dictionary is available for coding.
INACTIVE	The dictionary is defined and data is loaded into the schema, but the dictionary is not available for coding.
REMOVED	The schema and data associated with the dictionary are deleted.

Generating the schema for the dictionary data

Note: The Dictionary Loader tool uses dictionary types to create dictionary schemas.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 Verify that the dictionary type for the dictionary that you want to create has been imported.
If necessary, import the dictionary type. For more information, see *Importing the dictionary type file* (on page 59).
- 4 In the **Data Connections** tree in the left pane, select the **Dictionaries** node for the active connection.
Information about the Dictionary Types for this connection appears in the top pane.
- 5 Select **File > New > Dictionary**.
The New Dictionary dialog box appears.
- 6 Enter the following information:
 - **Type**—Dictionary type that exists for this connection. Standard dictionary types are WHO-DD and MedDRA. If you imported custom types, they appear in the drop-down list.
 - **Version**—The version of the dictionary. For example, 06Q4 identifies the 2006 Q4 version for WHO-DD; 9.1 identifies the 9.1 version for MedDRA. 30 characters maximum.
 - **Culture**—The culture setting for the dictionary data. For example, en-US. 10 characters maximum.
 - **Punctuation Filter**—The characters that are to be considered as punctuation by the coding algorithm in the step that removes punctuation. OPTIONAL. 100 characters maximum.
 - **Description**—A brief description of the dictionary. OPTIONAL. 200 characters maximum.

- **Owner for Schema**—The unique name for the schema.
 - **Schema Password**—The password for this dictionary schema.
 - **Confirm Schema Password**—The password for this dictionary schema.
 - **Tablespace**—The name of the tablespace that was created for the dictionaries.
- 7 Click **OK**.
- The Enter Dictionary Administrator Credentials page appears.
- 8 Enter the user name and password for the dictionary database administrator, and click **OK**.
- When the dictionary has been created, a message appears in the Output pane and information about the dictionary appears in the Dictionaries list in the top pane in the Dictionary Loader tool.

Loading dictionary data

Use this procedure to Load dictionary data into the database using the schema that you generated. The dictionary schema must exist before you can load data into it. For more information, see *Generating the schema for a dictionary* (on page 62).

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
- The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
- For more information, see *Connecting to the database* (on page 58).
- 3 In the **Data Connections** tree in the left pane, select the **Dictionaries** node for the active connection.
- Information about the Dictionaries for this connection appears in the top pane.
- 4 In the **Dictionaries** pane, select the dictionary to load data into.
 - 5 Select **Dictionary > Load**.
- The Locate Files dialog box appears.
- 6 Enter the following information:
 - **Location**—Browse to the folder that contains the file with the dictionary data to load. Select a directory and click **Open**. The full path to the files appears in the Location field.
 - **Dictionary schema password**—Password for this dictionary schema, which was created when the dictionary was created.
 - 7 Click **OK**.
- The dictionary data loads. Messages appear in the Output pane in the Dictionary Loader tool. When the load is complete, you can check the log file to verify the status of the load operation. The log file is in `<Installation Folder>\DictionaryLoader\Setup\gather_stats_[schemaowner].log`.

Activating the dictionary

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** pane, select a connection.
- 4 Select **Dictionary > Activate**.

The dictionary status changes to ACTIVE. The dictionary is defined, data is loaded into the schema, and the dictionary is available for coding.

Loading custom dictionaries

Overview of the steps to load a custom dictionary

Step	Task	Description
1	<i>Create a custom dictionary definition XML file</i> (on page 65).	Create an XML file that contains the metadata for the dictionary levels and the SQL needed to set up the tables in the database.
2	Create a new dictionary type for a custom dictionary.	For more information, see <i>Creating a new dictionary type for a custom dictionary</i> (on page 65).
3	Import the dictionary type XML file.	For more information, see <i>Importing the dictionary type XML file</i> (on page 59).
4	View the dictionaries available for a database connection.	For more information, see <i>Viewing the dictionaries available for a database connection</i> (on page 58).
5	<i>Generate the schema for a dictionary</i> (on page 62).	The Dictionary Loader tool uses dictionary types to create dictionary schemas.
6	<i>Load dictionary data</i> (on page 63).	Load dictionary data into the database using the schema that you generated. The dictionary schema must exist before you can load data into it.
7	<i>Activate the dictionary</i> (on page 63).	Dictionaries must be activated to be used for coding.
8	<i>Create custom icons for the coding browser</i> (on page 71).	Create custom dictionary icons for use in the coding browser Browse mode.

Creating a custom dictionary definition XML file

Use the standard XML files for the MedDRA, MedDRA-J, WHO-DD, and JDrug dictionaries as the basis for your custom XML files. These files are in ...Central Coding Application\DictionaryLoader\Setup.

For the **DictionaryType** element:

- **adaptertype** sub-element must be **Custom**.
- **numlevels** must be greater than 0 and must equal the number of **Level** elements.

Creating a new dictionary type for a custom dictionary

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 Select the **Types** node for the active connection from the **Data Connections** tree in the left pane.

Information about the Dictionary Types for this connection appears in the top pane.

- 4 Select **File > New > New Dictionary Type**.

The New Type dialog box appears.

When working in the grid:

- Note that each row represents one level in the dictionary.
 - Use the buttons to add and remove levels and to change the order of levels for the dictionary type.
 - Create at least one level.
 - Create the same number of terms (one or two) at each level.
- 5 Enter the following information:

- **Type**—The name for the new dictionary type.
- **Description**—A description of the dictionary type. OPTIONAL.
- **Supports Stopwords**—Select if you want to run the algorithm steps that remove stopwords from the text to be coded for dictionaries of this type.
- **Term**—A label for the first term of this level.
- **Additional Information**—A label for each additional level of the dictionary. Separate each additional information item with a pipe (|).
- **Abbreviation**—An abbreviated name to identify this level.

The full name of this level is the label for the first term, concatenated with the label for the second term.

- **Tablename**—The name of the table to create in the schema of a dictionary of this type to hold data for this level.
 - **Filename**—The name of the flat file that contains the data for this level.
 - **Encoding**—The encoding type of the file specified in the Filename field. OPTIONAL.
If not specified, the default encoding type is used.
 - **Delimiter**—The field delimiter used in records in the file specified in the Filename field. OPTIONAL.
If not specified, the default delimiter is used.
- 6 Click **OK**.

The custom dictionary type is added to the Dictionary Types pane in the Dictionary Loader tool.

Importing the dictionary type XML file

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** tree in the left pane, select the **Types** node for the active connection.

Information about the Dictionary Types for this connection appears in the top pane.

- 4 Select **Dictionary Type > Import**.

The Locate Files dialog box appears.

- 5 Browse to the folder that contains the XML file to import.

The Central Coding software includes XML files for the standard dictionary types in *<Installation Folder>\DictionaryLoader\Setup*.

- MedDRA_DictionaryType.xml
- MedDRAJ_DictionaryType.xml
- WHODD_DictionaryType.xml
- JDrug_DictionaryType.xml

Note: If you created a custom dictionary type, browse to the file you created. For more information, see *Creating a new dictionary type for a custom dictionary* (on page 65).

- 6 Select a file and click **Open**.

The full path to the XML file appears in the Location field.

- 7 Click **OK**.

When the import is complete, a message appears in the Output pane and information about the dictionary type appears at the top of the Dictionary Types pane.

Viewing the dictionary types for a connection

Use this procedure to view information about the dictionary types that are available for a connection.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** tree in the left pane, select the **Types** node for the active connection.

Information about the Dictionary Types for this connection appears in the top pane.

- 4 If the dictionary type file for the coding dictionary you want to load does not appear in the Dictionary Loader tool, you can import the dictionary type.

For more information, see *Importing the dictionary type file* (on page 59).

Dictionary statuses

Status	Description
DEFINED	The type, version, culture, and schema that hold data for the dictionary are defined. Data is not loaded into the schema.
LOADED	Data is loaded into the schema for the defined dictionary.
ACTIVE	The dictionary is defined, data is loaded into the schema, and the dictionary is available for coding.
INACTIVE	The dictionary is defined and data is loaded into the schema, but the dictionary is not available for coding.
REMOVED	The schema and data associated with the dictionary are deleted.

Generating the schema for the dictionary data

Note: The Dictionary Loader tool uses dictionary types to create dictionary schemas.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 Verify that the dictionary type for the dictionary that you want to create has been imported.
If necessary, import the dictionary type. For more information, see *Importing the dictionary type file* (on page 59).
- 4 In the **Data Connections** tree in the left pane, select the **Dictionaries** node for the active connection.
Information about the Dictionary Types for this connection appears in the top pane.
- 5 Select **File > New > Dictionary**.
The New Dictionary dialog box appears.
- 6 Enter the following information:
 - **Type**—Dictionary type that exists for this connection. Standard dictionary types are WHO-DD and MedDRA. If you imported custom types, they appear in the drop-down list.
 - **Version**—The version of the dictionary. For example, 06Q4 identifies the 2006 Q4 version for WHO-DD; 9.1 identifies the 9.1 version for MedDRA. 30 characters maximum.
 - **Culture**—The culture setting for the dictionary data. For example, en-US. 10 characters maximum.
 - **Punctuation Filter**—The characters that are to be considered as punctuation by the coding algorithm in the step that removes punctuation. OPTIONAL. 100 characters maximum.
 - **Description**—A brief description of the dictionary. OPTIONAL. 200 characters maximum.

- **Owner for Schema**—The unique name for the schema.
 - **Schema Password**—The password for this dictionary schema.
 - **Confirm Schema Password**—The password for this dictionary schema.
 - **Tablespace**—The name of the tablespace that was created for the dictionaries.
- 7 Click **OK**.
The Enter Dictionary Administrator Credentials page appears.
 - 8 Enter the user name and password for the dictionary database administrator, and click **OK**.
When the dictionary has been created, a message appears in the Output pane and information about the dictionary appears in the Dictionaries list in the top pane in the Dictionary Loader tool.

Loading dictionary data

Use this procedure to Load dictionary data into the database using the schema that you generated. The dictionary schema must exist before you can load data into it. For more information, see *Generating the schema for a dictionary* (on page 62).

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 In the **Data Connections** tree in the left pane, select the **Dictionaries** node for the active connection.
Information about the Dictionaries for this connection appears in the top pane.
- 4 In the **Dictionaries** pane, select the dictionary to load data into.
- 5 Select **Dictionary > Load**.
The Locate Files dialog box appears.
- 6 Enter the following information:
 - **Location**—Browse to the folder that contains the file with the dictionary data to load.
Select a directory and click **Open**. The full path to the files appears in the Location field.
 - **Dictionary schema password**—Password for this dictionary schema, which was created when the dictionary was created.
- 7 Click **OK**.
The dictionary data loads. Messages appear in the Output pane in the Dictionary Loader tool. When the load is complete, you can check the log file to verify the status of the load operation. The log file is in `<Installation Folder>\DictionaryLoader\Setup\gather_stats_[schemaowner].log`.

Activating the dictionary

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** pane, select a connection.
- 4 Select **Dictionary > Activate**.

The dictionary status changes to ACTIVE. The dictionary is defined, data is loaded into the schema, and the dictionary is available for coding.

Using custom icons in the coding browser

The coding browser in the Central Coding application displays icons for the levels of the coding dictionary. When you create a custom dictionary, you must also provide the icons for the coding browser.

To identify the custom dictionary icons to use in the coding browser:

- 1 Copy the graphics for the icons to the Resources folder in the virtual directory where the Central Coding application is running.
- 2 Use the following naming convention for the custom icons:

<dictionary type>_<tablename for the level>.gif

In the previous example:

- **<dictionary type>** is the name of the XML file that defines the dictionary type.
For more information, see *Creating a custom dictionary definition XML file* (on page 65).
- **<tablename for the level>** is the name of the Oracle table, where the data for that level is stored.

For example, if a custom dictionary type XML file is named **CustomTest.xml** and it has three levels named **soc**, **pt**, and **llt**, name the icons for the levels as follows:

- CustomTest_soc.gif
- CustomTest_pt.gif
- CustomTest_llt.gif

Installing the language packs for the Japanese dictionaries

Use this procedure to install the language pack for the MedDRA-J or JDrug dictionary. The language pack displays the dictionary level names and additional information labels in Japanese in the user interface.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Make sure that the dictionary database is set up, that you are connected to the database, and that the dictionary or dictionaries are loaded.

For more information, see *Setting up the dictionary database* (on page 56) and *Loading dictionaries* (on page 51).

- 3 In the **Data Connections** tree in the left pane, select the **Types** node for the active connection.

Information about the Dictionary Types for this connection appears in the top pane.

- 4 Select the **Dictionary Type** for which you want to install the language pack.

- 5 Select **Dictionary Type > Localized Elements**.

The Localized Elements dialog box appears.

- 6 Click **Import**.

The Locate Files dialog box appears.

- 7 Browse to the **<LanguagePack>.xml** file that you want to install.

The Central Coding software includes XML files for the standard dictionary types in *<Installation Folder>\DictionaryLoader\Setup*.

- MedDRA_ja-JP.xml
- JDrug_ja-JP.xml

- 8 Click **OK**.

Maintaining the coding dictionaries

Changing the punctuation filter for a dictionary type

Use this procedure to change the characters in the punctuation filter for a dictionary type. The punctuation filter identifies characters that you want the coding algorithm to consider as punctuation in the step that removes punctuation.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 Select the **Types** node for the active connection from the **Data Connections** tree in the left pane.
Information about the Dictionary Types for this connection appears in the top pane.
- 4 Select a dictionary type.
An arrow appears in the column to the left of the Type column.
- 5 Select **Dictionary > Change Punctuation Filter**.
The Punctuation Filter dialog box appears.
- 6 Add or remove characters as necessary.
- 7 Click **OK**.

Updating a dictionary type and applying the changes to installed dictionaries

Use this procedure to apply changes from a <Dictionary_Type>.xml file to installed dictionaries. For more information, see *About dictionary types* (on page 53).

The <Dictionary_Type>.xml file contains, among other things, the element configuration settings for each dictionary type (MedDRA, MedDRA-J, WHO-DD, JDrug, and custom). These settings control which coding features and information are available to users in the Central Coding user interface. To apply the updated settings to existing coding definitions, you must manually reset your element configuration settings for the coding definitions created before the update and associated with the dictionary. For more information, see the *User Guide*.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 Select the **Types** node for the active connection.
- 4 Select a dictionary type.
- 5 Select **Dictionary Type > Update**.
The Locate Files dialog box appears.
- 6 Browse to the **<Dictionary_Type>.xml** file to use for the update.

The Central Coding software includes XML files for the standard dictionary types in *<Installation Folder>\DictionaryLoader\Setup*.

- MedDRA_DictionaryType.xml
- MedDRAJ_DictionaryType.xml
- WHODD_DictionaryType.xml
- JDrug_DictionaryType.xml

If you are using a custom dictionary type, browse to the file you created. For more information, see *Creating a new dictionary type for a custom dictionary* (on page 65).

- 7 Click **OK**.

The Dictionary Selection Form dialog box appears.

- 8 Select one or more versions of the dictionary.
- 9 Click **OK**.

Converting the WHO-DD dictionary to C format

You can use the Dictionary Loader or the ConvertToC utility to convert the WHO-DD dictionary to the C format.

Using the Dictionary Loader to convert the WHO-DD dictionary to C format

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 In the **Data Connections** tree in the left pane, select the **Dictionaries** node for the active connection.

Information about the dictionaries for this connection appears in the top pane.

- 4 Select the WHO-DD B format dictionary.
- 5 Select **Dictionary > Convert WHODD B to C**.

The Locate File dialog box appears.

- 6 Click **Browse** and locate the folder that contains WHO-DD B format dictionary files.
- 7 Select the directory and click **Open**.

The full path to the files appears in the **Location** field.

Using the ConvertToC utility to convert the WHO-DD dictionary to C format

- 1 Open a Command Prompt window and enter the name of the drive in which the executable file is installed.

By default, the executable file is installed in the same location as the Central Coding application.

- 2 Enter the location of the executable file in the drive that you specified.

- 3 Enter the following syntax for converting the WHO-DD B format dictionary to C format:

ConvertToC [File Path]

In the command syntax:

- **File Path**—Path for the location of the WHO-DD B format dictionary files.

The ConvertToC utility creates a folder called **C** in the folder in which the WHO-DD B format dictionary files are installed.

Deleting a dictionary type

You can delete dictionary types that do not have schemas associated with them. If a dictionary schema that uses this dictionary type exists, you must delete the schema before you can delete the dictionary type. For more information, see *Removing a dictionary schema* (on page 76).

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 In the **Data Connections** tree in the left pane, select the **Types** node for the active connection.
Information about the Dictionary Types for this connection appears in the top pane.
- 4 Select **Dictionary Type > Delete**.
A confirmation dialog box appears.
- 5 Click **Yes**.

Inactivating a dictionary

Inactive dictionaries remain in the list of dictionaries for a connection and can be reactivated if necessary. You must inactivate a dictionary before you can delete it.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.
The Dictionary Loader dialog box appears.
- 2 Select a connection and connect to the database.
For more information, see *Connecting to the database* (on page 58).
- 3 Select the **Dictionaries** node for the active connection.
- 4 Select a dictionary.
- 5 Select **Dictionary > Inactivate**.

The dictionary status changes to INACTIVE. The dictionary is defined and data is loaded into the schema, but the dictionary is not available for coding.

Deleting a connection to the database

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 Select **Connection > Delete**.

Deleted connections remain visible in the Data Connections tree view in the left pane of the Dictionary Loader tool until you close the dialog box.

Removing a dictionary schema

Removing a dictionary removes the dictionary schema and all data. When you remove a dictionary schema, all synonym lists, coding definitions, assignment rules, and requests entered against the dictionary are lost and cannot be retrieved.

Caution: Oracle recommends that you do not remove the dictionary schema or delete a dictionary that has been used for coding. Delete only dictionaries that you have set up but have not coded against.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 Make sure that you have inactivated the dictionary whose dictionary schema you want to remove.

For more information, see *Inactivating a dictionary* (on page 75).

- 4 Select the **Dictionaries** node for the active connection.

- 5 Select a dictionary to remove.

- 6 Select **Dictionary > Remove**.

A confirmation dialog box appears.

- 7 Click **Yes**.

- 8 If prompted, enter the user name and password for the dictionary schema administrator, and click **OK**.

The dictionary remains in the list of Dictionaries. The dictionary status changes to REMOVED.

Note: You must revive this dictionary type before you can use it again to load dictionaries. For more information, see *Reviving a dictionary schema* (on page 76).

Reviving a dictionary schema

Reviving a dictionary schema recreates the schema of a previously removed dictionary. For more information, see *Removing a dictionary schema* (on page 76). After reviving a dictionary schema, you can load data into the dictionary.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 Select the **Dictionaries** node for the active connection.
- 4 Select a dictionary with a status of REMOVED.
- 5 Select **Dictionary > Revive**.

The New Dictionary dialog box appears. The information in most fields is read-only because it already exists in the database.

- 6 Enter the following information.
 - **Schema Password**—The password for this dictionary schema.
 - **Confirm Schema Password**—The password for this dictionary schema.
 - **Tablespace**—The name of the tablespace that was created for the dictionaries.
- 7 Click **OK**.
- 8 If prompted, enter the user name and password for the dictionary database administrator, and click **OK**.

Deleting a dictionary

Deleted dictionaries cannot be revived or reactivated. When you delete a dictionary, all synonym lists, coding definitions, assignment rules, and requests entered against the dictionary become invalid and cannot be retrieved.

Caution: Oracle recommends that you do not remove the dictionary schema or delete a dictionary that has been used for coding. Delete only dictionaries that you have set up but have not coded against.

- 1 Select **Start > Program Files > Phase Forward > Central Coding > Dictionary Loader**.

The Dictionary Loader dialog box appears.

- 2 Select a connection and connect to the database.

For more information, see *Connecting to the database* (on page 58).

- 3 Make sure that you have removed the schema for the dictionary that you want to delete.

For more information, see *Removing a dictionary schema* (on page 76).

- 4 Select the **Dictionaries** node for the active connection.
- 5 Select a dictionary.
- 6 Select **Dictionary > Delete**.

A confirmation dialog box appears.

- 7 Click **Yes**.
- 8 If prompted, enter the user name and password for the dictionary database administrator, and click **OK**.

CHAPTER 6

Setting up coding metadata using the command line

In this chapter

Using the Data Installer	80
Adding adapters and studies using the command line.....	85
Replacing the certificate to secure internal communication with the Job Scheduler service....	89
Selecting a certificate for InForm Adapter authentication.....	90
Setting a web proxy for outgoing calls	91

Using the Data Installer

About the Data Installer

The Central Coding software includes a command line application, called the Data Installer, that you can use to import data instead of entering the data through the user interface, and to export the data.

The Data Installer is installed automatically as part of the Central Coding software installation in *<Installation Folder>*\CentralCodingServer\CodingWebUI\bin.

Oracle recommends that you use the Data Installer to export data from a configured instance of the Central Coding application, and import the data file as is, or edit it and perform an update. Oracle does not recommend creating your own configuration file for import.

You can use the Data Installer to:

- Export and import synonym lists, stopword lists, coding algorithms, and coding definitions.

Note: You cannot update coding definitions. You can replace or update a synonym list.

- Import assignment rules.

Note: You cannot update assignment rules.

- Export and import security data such as users, rights, roles, and workteams from an existing installation to another installation.

Note: Security data cannot be created manually. You must export it and then import it to the new instance.

- Export and import system settings such as the authentication options, application settings and lock management options, and impact analysis options from an existing installation to another installation.

Data Installer modes

The Data Installer has the following modes:

- **Download**—Used to export data from the Central Coding application.

When you export data using the Download mode, an export configuration XML file is created. You can use this file with the Data Installer to import or update data in the Central Coding application.

- **Setup**—Used to import data into the Central Coding application.

To import data in the Central Coding application, you can use the export configuration XML file that is created when you run the Data Installer in Download mode, a manually created XML configuration file, or the sample XML configuration file called **CentralCodingConfigMaster.xml**, which you can edit as needed.

- **Update**—Used to update existing data in the Central Coding application.

To update data in the Central Coding application, you can use the export configuration XML file

that is created when you run the Data Installer in Download mode, a manually created XML configuration file, or the sample XML configuration file called **CentralCodingConfigMaster.xml**, which you can edit as needed.

Note: The sample XML file is installed in the same location as the Data Installer.

Data Installer parameters

Parameter	Description
ApplicationName	Name of the Central Coding application. The application name is located in the PhaseForward.Platform.Config.xml file, which is installed in the same directory as the Data Installer. The default application name is CentralCodingApplication.
Mode	Type of action to perform. The available options are: <ul style="list-style-type: none"> • Download—Export data from the Central Coding application. • Setup—Import data to the Central Coding application. • Update—Update existing data in the Central Coding application. <p>Note: When using the Data Installer in Update mode, make sure that the GUIDs for the data in the update configuration file do not already exist in the Central Coding application. If duplicate GUIDs exist, the Data Installer displays an error message and the update does not complete.</p>
Type	SysConfig.
MasterFile	Path to the master configuration file, called MasterConfig.xml. The master configuration file is installed in the same directory as the Data Installer.
/DISABLESINGLETRANSACTION	Instructs the Data Installer to execute each transaction separately. By default, the Data Installer executes all commands in a single transaction.

Exporting data with the Data Installer

To export data from an instance of the Central Coding application, use the Data Installer in Download mode. You can export synonym lists, stopword lists, coding algorithms, coding definitions, and system settings.

- 1 Specify the data to export:
 - Edit an existing configuration file.
 - Create a configuration file.

Make sure to specify the directory path in which to generate the export files. The directory must exist before you run the Data Installer.

- 2 Open a Command Prompt window and enter the name of the drive in which the Data Installer is installed.

- 3 Enter the location of the Data Installer in the drive you specified:

```
<Installation Folder>\CentralCodingServer\CodingWebUI\bin
```

- 4 Run the utility in Download mode, using the following syntax:

```
PhaseForward.Platform.Installation.DataInstaller.exe [ApplicationName]
[Download] [SysConfig] [MasterFile]
```

In the command syntax:

- **ApplicationName**—Name of the Central Coding application. The application name is located in the **PhaseForward.Platform.Config** config file, which is installed in the same directory as the Data Installer. The default application name is `CentralCodingApplication`.
- **MasterFile**—Path to the master configuration file. The master configuration file is called **MasterConfig.xml**, and is located in the same directory as the Data Installer.

The Data Installer extracts the data and generates the XML files in the directory that you specified in the export configuration file.

Importing data with the Data Installer

To import data into an instance of the Central Coding application, use the Data Installer in Setup mode. You can import users, roles, workteams, assignment rules, synonym lists, stopword lists, coding algorithms, and coding definitions.

Note: You cannot import an object if its GUID is already used in the database into which you are importing. If duplicate GUIDs exist, an error message appears, and the import stops.

- 1 Specify the data to import:
 - Edit an existing configuration file.
 - Create a configuration file.
 - Locate an existing export file.

For more information about the export procedure, see *Exporting data with the Data Installer* (on page 81).

Note: Oracle recommends that you use the Data Installer to export data from a configured instance of the Central Coding application, and import the data file as is, or edit it and perform an update. Oracle does not recommend creating your own configuration file for import.

Make sure to specify the directory path of the file to import.

Note: Data in XML files is case-sensitive.

- 2 Open a Command Prompt window and enter the name of the drive in which the Data Installer is installed.
- 3 Enter the location of the Data Installer in the drive you specified:

```
<Installation Folder>\CentralCodingServer\CodingWebUI\bin
```
- 4 Run the utility in Setup mode, using the following syntax:

```
PhaseForward.Platform.Installation.DataInstaller.exe [ApplicationName]
[Setup] [SysConfig] [MasterFile]
```

In the command syntax:

- **ApplicationName**—Name of the Central Coding application. The application name is located in the **PhaseForward.Platform.Config** config file, which is installed in the same directory as the Data Installer. The default application name is `CentralCodingApplication`.
- **MasterFile**—Path to the master configuration file. The master configuration file is called **MasterConfig.xml**, and is located in the same directory as the Data Installer.

The Data Installer adds the data to the appropriate tables in the target Central Coding database, based on the import data type.

Updating data with the Data Installer

To update existing data in the Central Coding application using the Data Installer, run the utility in Update mode. You can update users, roles, workteams, synonym lists, stopword lists, coding algorithms, and system settings. You cannot update coding definitions or assignment rules.

Note: You cannot import an object if its GUID is already used in the database into which you are importing. If duplicate GUIDs exist, an error message appears, and the import stops.

- 1 Specify the data to update:
 - Edit an existing configuration file.
 - Create a configuration file.
 - Locate an existing export file.

For more information about the export procedure, see *Exporting data with the Data Installer* (on page 81).

Note: Oracle recommends that you use the Data Installer to export data from a configured instance of the Central Coding application, and import the data file as is, or edit it and perform an update. Oracle does not recommend creating your own configuration file for import.

Make sure to specify the directory path of the file to use in the update procedure.

Note: Data in XML files is case-sensitive.

- 2 Open a Command Prompt window and enter the name of the drive in which the Data Installer is installed.
- 3 Enter the location of the Data Installer in the drive you specified:

```
<Installation Folder>\CentralCodingServer\CodingWebUI\bin
```
- 4 Run the utility in Update mode, using the following syntax:

```
PhaseForward.Platform.Installation.DataInstaller.exe [ApplicationName]
[Update] [SysConfig] [MasterFile]
```

In the command syntax:

- **ApplicationName**—Name of the Central Coding application. The application name is located in the **PhaseForward.Platform.Config** config file, which is installed in the same directory as the Data Installer. The default application name is

CentralCodingApplication.

- **MasterFile**—Path to the master configuration file. The master configuration file is called **MasterConfig.xml**, and is located in the same directory as the Data Installer.

The Data Installer adds the data to the appropriate tables in your target Central Coding database, based on the update data type.

Adding adapters and studies using the command line

About adding adapters and studies using the command line

You can add adapters and studies from the user interface, and also through the command line. The following executable files are installed as part of the Central Coding software installation. Run the executable files to install adapters and studies into the Central Coding application.

- **PhaseForward.CentralCoding.SetAdapter.exe**—Installs an adapter to a Central Coding instance.

When you install the adapter using the executable file, you use the available parameters to define Get Requests and Return Codes schedules for the adapter.

For more information, see *Adding an adapter and defining its job schedules using the command line* (on page 85).

- **PhaseForward.CentralCoding.SetStudyGroup.exe**—Creates a study group in a Central Coding instance.

When you create a study group, you use the available parameters to specify the study to add to the group, and the Get Requests and Return Codes schedules for the study.

For more information, see *Adding a study group using the command line* (on page 86).

- **PhaseForward.CentralCoding.SetStudy.exe**—Installs a study to a Central Coding instance.

When you add the study, you use the available parameters to specify which adapter with which to associate the study, and you add the study to Get Requests and Return Codes schedules.

For more information, see *Adding a study to an adapter and job schedules using the command line* (on page 87).

Note: You can add a study to a Get Requests or Return Codes schedule only if the schedule is already defined for the adapter to which you are adding the study.

The files are available in the following location:

Phase Forward[ApplicationName]\CentralCodingServer\CodingWebUI\bin

In the previous location:

ApplicationName—CentralCoding concatenated with the name of your Central Coding instance. For example, CentralCodingUAT.

Note: You must run the executable files in the location in which they were installed.

Adding an adapter and defining its job schedules using the command line

- 1 Open a Command Prompt window and enter the name of the drive in which the executable file is installed.

Note: By default, the executable file is installed in the same location as the Central Coding application.

- 2 Enter the location of the executable file in the drive that you specified:

<Installation Folder>\CentralCodingServer\CodingWebUI\bin

Note: You must run the application from this directory.

- Enter the following command for adding an adapter and defining its job schedules:

PhaseForward.CentralCoding.SetAdapter.exe [AdapterName] [AdapterURL] [GetVerbatimsSchedule] [ReturnCodesSchedule]

In the command syntax:

- **AdapterName**—Name of the adapter to add.
- **AdapterURL**—URL of the adapter to add.
- **GetVerbatimsSchedule**—Rate at which to run the Get Requests job schedule. This parameter corresponds to the Time span configuration setting on the Schedule GetRequests Job page in the user interface.
 - **0**—Indicates that you will run manual Get Requests jobs for the adapter, and the adapter should not be added to a Get Requests schedule.
 - **1**—Set a Get Requests job schedule to run every minute for the adapter.
 - **5**—Set a Get Requests job schedule to run every five minutes for the adapter.
 - **15**—Set a Get Requests job schedule to run every fifteen minutes for the adapter.
 - **30**—Set a Get Requests job schedule to run every thirty minutes for the adapter.

Note: This parameter is optional.

- **ReturnCodesSchedule**—Rate at which to run the Return Codes job schedule. This parameter corresponds to the Time span configuration setting on the Schedule ReturnCodes Job page in the user interface.
 - **0**—Indicates that you will run manual Return Codes jobs for the adapter, and the adapter should not be added to a Return Codes schedule.
 - **1**—Set a Return Codes job schedule to run every minute for the adapter.
 - **5**—Set a Return Codes job schedule to run every five minutes for the adapter.
 - **15**—Set a Return Codes job schedule to run every fifteen minutes for the adapter.
 - **30**—Set a Return Codes job schedule to run every thirty minutes for the adapter.

Note: This parameter is optional.

Adding a study group using the command line

- Open a Command Prompt window and enter the name of the drive in which the executable file is installed.

Note: By default, the executable file is installed in the same location as the Central Coding application.

- 2 Enter the location of the executable file in the drive that you specified:

```
<Installation Folder>\CentralCodingServer\CodingWebUI\bin
```

Note: You must run the application from this directory.

- 3 Enter the following command for adding a study group:

```
PhaseForward.CentralCoding.SetStudyGroup.exe [StudyGroupName]
[AllowAutoQuery] [AllowAutoClose]
```

In the command syntax:

- **StudyGroupName**—Name of the study group to add.
- **AllowAutoQuery**—**Y** or **N**, specifying whether to allow the Central Coding application to duplicate an existing query and apply it to all matching verbatims in the study group that are subsequently entered in the Central Coding application.
- **AllowAutoClose**—**Y** or **N**, specifying whether to allow the Central Coding application to automatically close a query if the verbatim associated with the query is successfully coded and approved.

Adding a study to an adapter and job schedules using the command line

- 1 Open a Command Prompt window and enter the name of the drive in which the executable file is installed.

Note: By default, the executable file is installed in the same location as the Central Coding application.

- 2 Enter the location of the executable file in the drive that you specified:

```
<Installation Folder>\CentralCodingServer\CodingWebUI\bin
```

Note: You must run the application from this directory.

- 3 Enter the following command for adding a study to an adapter and job schedules:

```
PhaseForward.CentralCoding.SetStudy.exe [SourceApplication] [AdapterName]
[StudyName] [StudyURL] [StudyGroupName] [ClientAuditUser] [InForm QueryUser]
[InFormAuthenticationUser] [SupportQuery] [StudyLocked] [GetVerbatimsSchedule]
[ReturnCodesSchedule]
```

In the command syntax:

- **SourceApplication**—The name of the application that is integrated with the Central Coding application.
 - **InForm**
 - **Clintrial**
 - **Other**—Any supported third-party application.
- **AdapterName**—Name of the adapter to which to add the study.
- **StudyName**—Name of the study to add.

- **StudyURL**—URL of the study to add.
- **StudyGroupName**—Name of the study group with which to associate the study.
- **ClientAuditUser**—User name for the audit records that are created in the InForm application to record the codes that are returned by the Central Coding application.
- **InFormQueryUser**—User name used to create and update queries in the InForm application.
- **InFormAuthenticationUser**—User name of an InForm application user created to communicate with the InForm server through web services.
- **SupportQuery**—**Y** or **N**, specifying whether the study supports query management. Available for InForm studies.
- **StudyLocked**—**Y** or **N**, specifying whether to lock the study.
- **GetVerbatimsSchedule**—**Y** or **N**, specifying whether to add the study to the Get Requests schedule for the adapter you specified.

Note: You can only specify **Y** if a Get Requests schedule is already defined for the adapter to which you are adding the study.

- **ReturnCodesSchedule**—**Y** or **N**, specifying whether to add the study to the ReturnCodes schedule for the adapter you specified.

Note: You can only specify **Y** if a Return Codes schedule is already defined for the adapter to which you are adding the study.

Replacing the certificate to secure internal communication with the Job Scheduler service

You select a certificate to secure internal communication with the Job Scheduler service during the Central Coding application server installation.

To replace the certificate:

- 1 Install a new certificate. For more information, see *Install a certificate to secure internal communication with the Job Scheduler service* (on page 24).
- 2 Run **UpdateJSCertificate.cmd** (located in *<Installation Folder>\CentralCodingServer\CodingWebUI\bin*) using the following syntax:

```
UpdateJSCertificate.cmd <CertificateName> <CertificateThumbprint>
```

In the previous example:

- **CertificateName**—Name of the new certificate.
- **CertificateThumbprint**—Thumbprint of the new certificate.

Selecting a certificate for InForm Adapter authentication

Certificate authentication can be used in the following cases between Central Coding and InForm Adapter interfaces:

- Adapter Admin—When the Adapter URL starts with https.
- Coding and Discrepancy web services—When you prefer the certificate authentication method to the username/password method, when the Adapter URL starts with https.

To select a certificate, or replace the certificate that is currently in use, run the utility `PhaseForward.Central.Coding.UpdateIACertificate.exe` located in *<Installation Folder>\CentralCodingServer\CodingWebUI\bin*.

Run the utility from the command line with one of the parameters:

- `/?`—Displays command help and exit codes.
- `/s <certificate name> <certificate thumbprint>`—Selects the specified certificate to be used for InForm Adapter authentication.
- `/r`—Removes the certificate that is used for InForm Adapter authentication.

Setting a web proxy for outgoing calls

Central Coding supports proxy servers during web service invocation for outbound calls.

Use `PhaseForwardCentralCodingSetDefaultProxy.exe`, which is installed during the Central Coding software installation, to configure the outbound proxy.

Edit parameters in the following files:

- `web.config`
- `PhaseForward.Platform.JobScheduler.exe.config`
- `PhaseForward.CentralCoding.SetStudy.exe.config`
- `PhaseForward.CentralCoding.SetAdapter.exe.config`

Parameters:

- **ProxyAddress {URL}**—Sets `ProxyAddress` to the specified URL.
- **BypassProxyOnLocal [True | False]**—Sets the `BypassProxyOnLocal` attribute. The default value is **False**.
- **UseDefaultWebProxy [True | False]**—Sets the `UseDefaultWebProxy` attribute. The default value is **False**.
- **REMOVE**—Removes the current proxy settings.
- **DISPLAY**—Displays the current proxy settings.

Exit codes:

- **0**—Success.
- **1**—Command line argument is missing.
- **2**—Invalid command on command line.
- **3**—An exception occurred during processing.

Note: If exit code **3** appears, contact Oracle Support.

CHAPTER 7

Performance reports

In this chapter

About performance reports.....	94
Generating performance reports	95
Performance report descriptions.....	97

About performance reports

The Central Coding software installation includes an executable file that gathers coding data, and a Microsoft Excel spreadsheet template that uses the data to create reports for analysis and troubleshooting assistance. You can produce data for a specified set of studies, for the entire system, or a combination of both options, according to the parameters you set when running the utility.

To produce the performance reports, you must have server-level access. If you do not have access to the Central Coding server for your studies, please contact Oracle for assistance.

Generating performance reports

To generate performance reports:

- 1 Run a script to gather study or system data, which is compiled into a CSV file.
For more information, see *Gathering data for performance reports* (on page 95).
- 2 Create histograms from the data in a Microsoft Excel spreadsheet.
For more information, see *Generating performance reports in Microsoft Excel* (on page 95).

Gathering data for performance reports

- 1 Open a Command Prompt window and enter the name of the drive in which the executable file is installed.

- 2 Enter the location of the executable file in the drive you specified:

```
<Installation Folder>\CentralCodingServer\CodingWebUI\Utilities\UsageCharts
```

- 3 Run **PhaseForward.CentralCoding.CreateUsageCharts.exe**, using the following syntax:

```
PhaseForward.CentralCoding.CreateUsageCharts.exe [dbUser] [UsageType] [csvFileDirectory] [TrialList]
```

In the command syntax:

- **dbUser**—Central Coding Database user ID.
 - **UsageType**—The type of data to compile and display in Microsoft Excel.
 - **DAILYUSAGE**—Produce reports for data from one or more specified studies.
 - **SYSTEMSUMMARY**—Produce reports for data from the entire system.
 - **BOTH**—Produce separate reports for individual studies, and reports for the system as a whole.
 - **csvFileDirectory**—The directory in which you want to store the CSV data file.
 - **TrialList**—For **DAILYUSAGE** or **BOTH** usage type, the list of studies for which to produce the reports.
 - For one study, specify the study name.
 - For more than one study, list the study names in quotation marks, separated by commas (for example, "PFST50, PFSTCardio").
- 4 When prompted for a password, enter the Central Coding Database user password.
The utility produces a CSV file that you open in Microsoft Excel.

Generating performance reports in Microsoft Excel

- 1 Navigate to the Central Coding installation folder.
- 2 Open the **UsageCharts.xlsm** file.

A Microsoft Excel spreadsheet opens.

- 3 Click the **Data** tab.
- 4 In the **Get External Data** section of the ribbon, click **From Text**.

The Import Text File dialog box appears.

- 5 Navigate to the directory you specified for the **csvFileDirectory** parameter.
- 6 Click **Import**.

The Text Import Wizard - Step 1 of 3 dialog box appears.

- 7 Click **Next**.
- 8 Select the **Tab** and **Comma** delimiters, and click **Next**.
- 9 Click **Finish**.

The Import Data dialog box appears.

- 10 Select **Existing worksheet** and specify that you want to put the data in cell A1.
- 11 Click **OK**.

The worksheet is populated with the data from the CSV file.

- 12 Click the **Process Usage Data** button.

Note: You may need to scroll to the right in order to see the button.

It may take several minutes to process the data.

Performance report descriptions

The following table describes daily usage reports:

Tab Name	Report Name	Description
<StudyName>	Daily Tally of <StudyName>'s Verbatim Traffic	For the specified study, the number of verbatims that were received, delivered, undelivered, or deleted each day, from the beginning of the study.
<StudyName>	Total Number of Verbatims in <StudyName> Measured Daily	For the specified study, the total number of verbatims that existed and the total number of verbatims that were delivered each day, from the beginning of the study.

The following table describes System summary reports:

Tab Name	Report Name	Description
Days of Activity	Days of Activity	For each study in the system, the number of days during which preprocessing occurred, verbatims were received, and verbatims were returned to the source application.
Trial Running Days	Trial Running Days	The duration of each study in the system, in days.
Verbatim and Transaction Counts	Verbatim and Transaction Counts	For each study in the system, the number of verbatims that exist, the number of deletions that occurred, the number of times a verbatim was received by the Central Coding application, and the largest number of times a single verbatim was received by the Central Coding application.
Percentage of Activity	Percentage of Activity During Trial Up-Time	For each study in the system, the percentage of time taken for preprocessing, receiving verbatims, and returning verbatims to the source application. Each percentage is calculated based on a 20-hour day, allowing for 4 hours of system inactivity. The number of hours per day is a configurable setting in Microsoft Excel.

Tab Name	Report Name	Description
Verbatim Throughput	Number of Verbatims Processed per Hour over a Day	<p>The maximum and the average number of verbatims processed in one hour. This data is calculated based on a 20-hour day and normalized to one hour.</p> <p>This data is displayed in two graphs. The first graph is organized by system, and the second graph displays the data for each study in the system.</p>
Percentage Autocoded	Percentage of Verbatims Autocoded	For each study in the system, the percentage of verbatims that were autocoded.
Active Trials	Active Trials shown with Median Verbatims Received per Day	The number of studies in the system on any given day, and the corresponding median number of verbatims received on that day.
Verbatim Trial Size	Size of Trial by # of Verbatims	The number of verbatims in each study, and the percent of total verbatims in the system to which it corresponds.
Histograms	Preprocess Median/Active Day	The median number of verbatims that were preprocessed in a day, and the number of studies that fall into each category.
	Preprocess Average/All Days	The average number of verbatims that were preprocessed in a day, and the number of studies that fall into each category.
	Return Median/Active Day	The median number of verbatims that were returned to the source application in a day, and the number of studies that fall into each category.
	Return Average/All Days	The average number of verbatims that were returned to the source application in a day, and the number of studies that fall into each category.
	Receive Median/Active Day	The median number of verbatims that were received in the Central Coding application in a day, and the number of studies that fall into each category.
	Receive Average/All Days	The average number of verbatims that were received in the Central Coding application in a day, and the number of studies that fall into each category.
	Verbatim Trial Size	The number of verbatims in the system, and the number of studies that fall into each category.

CHAPTER 8

Troubleshooting

In this chapter

Analyzing tables and indexes for performance	100
Installation failure due to error accessing product user profile	101
Changing the execution timeout value	102
Changing the transaction timeout value	103
Changing the number of matched terms that display in the coding browser	104
About running statistics on the Central Coding application	105
Cross-product issues	106

Analyzing tables and indexes for performance

Oracle recommends analyzing all tables and indexes for better performance. You should perform this analysis whenever a significant amount of coding data is entered. To help analyze tables and indexes, Oracle recommends that you run the following Oracle database utilities:

- **dbms_utility.analyze_schema**—Run this utility as the Central Coding application schema owner.

This utility updates the Oracle system tables that are used to perform analysis on a schema.

- **dbms_utility.analyze_schema**—Run this utility to update the Oracle system tables for the Central Coding database.

Installation failure due to error accessing product user profile

If an error occurs during installation indicating that the `PRODUCT_USER_PROFILE` table cannot be accessed, run `PUPBLD.SQL` as `SYSTEM` and then start the installation again.

Changing the execution timeout value

The execution timeout value determines the number of seconds the Central Coding application waits to receive information from the InForm application. The Central Coding installation program sets the default value to 900 seconds.

If you consistently receive the **Request timed out** error message, you can change the value for **executionTimeout** in the **web.config** file. The file is available in *<Installation Folder>*\CentralCodingServer\CodingWebUI. The following shows a sample **web.config** file.

```
<httpRuntime executionTimeout="900" maxRequestLength="4096"  
useFullyQualifiedRedirectUrl="false"  
minFreeThreads="8" minLocalRequestFreeThreads="4" appRequestQueueLimit="100"  
enableVersionHeader="true" /> <!-- compilation Attributes:  
tempDirectory="directory"
```

Changing the transaction timeout value

If an error occurs when you are importing a large synonym file or when running the Code and Propagate action, increase the transaction timeout value for the Microsoft Distributed Transaction Coordinator (MS DTC).

- 1 Select **Start > All Programs > Administrative Tools > Component Services**.
- 2 Expand **Component Services**.
- 3 Expand **Computers**.
- 4 Right-click **My Computer** and select **Properties**.
- 5 Click the **Options** tab.
- 6 Set the **Transaction timeout** (seconds) to 300 or more, and click **Apply**.
- 7 Click **OK**.

Changing the number of matched terms that display in the coding browser

In the Coding Browser dialog box—Search mode, the Return All Matches checkbox indicates whether you want all the matched terms found to display in the browser. By default, the coding browser displays 200 matches. This number, and whether this option is available, is set by your administrator.

The CodingPlatform.config file, located in *<Installation Folder>\CentralCodingServer\CodingWebUI\bin\config*, contains the following section (these are the default values the Central Coding application ships with):

```
<CodingBrowserSettings>
  <QuickRowLimit>200</QuickRowLimit>
  <AllowReturnAllMatches>true</AllowReturnAllMatches>
  <HardRowLimit>500</HardRowLimit>
</CodingBrowserSettings>
```

In the file:

- **QuickRowLimit**—The number of matched terms to display in the browser.
The browser displays only the number of terms specified in this setting. It does not allow you to page through the terms in lists.
- **AllowReturnAllMatches**—Determines whether the **Return All Matches** option appears in the browser.

If you change this setting to false, the **Return All Matches** checkbox does not appear in the coding browser, and the number of terms specified in the HardRowLimit display in the browser.

- **HardRowLimit**—The number of matched terms to display in the browser when the **Return All Matches** option does not appear in the browser or if the option is not selected.

If the QuickRowLimit is set to -1, or the **Return All Matches** checkbox is selected, the HardRowLimit determines the maximum number of matches that can be returned.

If HardRowLimit is set to -1, **all** matches will be returned if the QuickRowLimit is -1 or the **Return All Matches** checkbox is selected. Oracle does not recommend setting the HardRowLimit to -1, as there could be thousands of possible returns.

About running statistics on the Central Coding application

Oracle recommends that a database administrator run statistics on a Central Coding application if:

- The performance of the Central Coding application is slow.
- A timeout exception error occurs when running a large get verbatims job.

If the job runs for a long time and a timeout exception error occurs, the **ExceptionMap.xml** file contains an entry that instructs you to ask a database administrator to gather statistics on the Central Coding account.

Oracle recommends that the database administrator monitor the statistics for the account during the day and gather statistics if the statistics start to be out of date and the performance of the application slows down.

Cross-product issues

Extra audit records in the Central Coding application

Issue	Additional audit records in the Central Coding application.
Possible cause	If you change a verbatim in the InForm application that has already been coded, and then change it back to what it was originally, the next time the InForm Adapter Coding interface delivers coding data to the Central Coding application, you will see additional audit records in the Audit History Report in the Central Coding application. This is because although the verbatim is unchanged, it is newer than its targets.
Solution	<p>If you use the InForm Adapter software with the Central Coding application, you must:</p> <ul style="list-style-type: none"> • Create a rule in the InForm software that is applied to every verbatim that clears the verbatim targets whenever the verbatim is changed. • Make sure the rule is case-sensitive. <p>The rule ensures that the verbatim is treated as uncoded when it is delivered to the Central Coding application.</p>

Code map not found—Undeliverable requests

Issue	<p>Codes are not returned to the InForm application and the Code map not found error appears in the Central Coding application for undeliverable requests when:</p> <ul style="list-style-type: none"> • The mappings for the Central Coding application have been updated in the InForm application. • Data that is in the Central Coding application was not delivered prior to the mapping change.
Possible cause	<p>When the Central Coding mappings are updated in the InForm application using the same RefName, the InForm application does not create a new revision for the mappings. Instead, the InForm application creates an entirely new set of mappings with new GUIDs.</p> <p>As a result, when a verbatim is recoded in the Central Coding application after the updated mappings are installed in the InForm application, the request is undeliverable from the Central Coding application.</p> <p>The Code map not found error appears when you view the hover help for a request with a delivery status of Undeliverable (✘) on the Coding Requests, Approvals, or All Requests page in the Central Coding application.</p> <p>For more information, see the <i>User Guide</i>.</p>
Solution	Contact Oracle CAG.

Note: This issue does not affect InForm release 6.1.1 and higher.

Key items not updated

If the following key items are changed in the InForm application *after a verbatim is coded*, they will not be updated in the Central Coding application.

Note: The key items *are* updated in the Central Coding application if the verbatim is *not coded* in the InForm application.

- Subject Initials
- Subject Number
- Visit
- Site Name
- Site
- Study

If you want the key items to be updated, you must create a rule in the InForm application to clear the coding targets.

About the documentation

Where to find the product documentation

The product documentation is available from the following locations:

- **My Oracle Support** (<https://support.oracle.com>)—*Release Notes* and *Known Issues*.
- **Oracle Technology Network** (<http://www.oracle.com/technetwork/documentation/hsgbu-154445.html>)—The most current documentation set, excluding the *Release Notes* and *Known Issues*.

If the software is available for download, the complete documentation set is available from the Oracle Software Delivery Cloud (<https://edelivery.oracle.com>).

All documents may not be updated for every Central Coding release. Therefore, the version numbers for the documents in a release may differ.

Documentation accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.
