

Oracle® Retail Advanced Inventory Planning
Implementation Guide
Release 13.0.2

December 2008

Copyright © 2008, Oracle. All rights reserved.

Primary Author: Barrett Clink

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software—Restricted Rights (June 1987). Oracle Corporation, 500 Oracle Parkway, Redwood City, CA 94065

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

Value-Added Reseller (VAR) Language

Oracle Retail VAR Applications

The following restrictions and provisions only apply to the programs referred to in this section and licensed to you. You acknowledge that the programs may contain third party software (VAR applications) licensed to Oracle. Depending upon your product and its version number, the VAR applications may include:

- (i) the software component known as **ACUMATE** developed and licensed by Lucent Technologies Inc. of Murray Hill, New Jersey, to Oracle and imbedded in the Oracle Retail Predictive Application Server – Enterprise Engine, Oracle Retail Category Management, Oracle Retail Item Planning, Oracle Retail Merchandise Financial Planning, Oracle Retail Advanced Inventory Planning, Oracle Retail Demand Forecasting, Oracle Retail Regular Price Optimization, Oracle Retail Size Profile Optimization, Oracle Retail Replenishment Optimization applications.
- (ii) the **MicroStrategy** Components developed and licensed by MicroStrategy Services Corporation (MicroStrategy) of McLean, Virginia to Oracle and imbedded in the MicroStrategy for Oracle Retail Data Warehouse and MicroStrategy for Oracle Retail Planning & Optimization applications.
- (iii) the **SeeBeyond** component developed and licensed by Sun Microsystems, Inc. (Sun) of Santa Clara, California, to Oracle and imbedded in the Oracle Retail Integration Bus application.
- (iv) the **Wavelink** component developed and licensed by Wavelink Corporation (Wavelink) of Kirkland, Washington, to Oracle and imbedded in Oracle Retail Mobile Store Inventory Management.
- (v) the software component known as **Crystal Enterprise Professional and/or Crystal Reports Professional** licensed by SAP and imbedded in Oracle Retail Store Inventory Management.
- (vi) the software component known as **Access Via™** licensed by Access Via of Seattle, Washington, and imbedded in Oracle Retail Signs and Oracle Retail Labels and Tags.
- (vii) the software component known as **Adobe Flex™** licensed by Adobe Systems Incorporated of San Jose, California, and imbedded in Oracle Retail Promotion Planning & Optimization application.
- (viii) the software component known as **Style Report™** developed and licensed by InetSoft Technology Corp. of Piscataway, New Jersey, to Oracle and imbedded in the Oracle Retail Value Chain Collaboration application.
- (ix) the software component known as **DataBeacon™** developed and licensed by Cognos Incorporated of Ottawa, Ontario, Canada, to Oracle and imbedded in the Oracle Retail Value Chain Collaboration application.

You acknowledge and confirm that Oracle grants you use of only the object code of the VAR Applications. Oracle will not deliver source code to the VAR Applications to you. Notwithstanding any other term or condition of the agreement and this ordering document, you shall not cause or permit alteration of any VAR Applications. For purposes of this section, “alteration” refers to all alterations, translations, upgrades, enhancements, customizations or modifications of all or any portion of the VAR Applications including all reconfigurations, reassembly or reverse assembly, re-engineering or reverse engineering and recompilations or reverse compilations of the VAR Applications or any derivatives of the VAR Applications. You acknowledge that it shall be a breach of the agreement to utilize the relationship, and/or confidential information of the VAR Applications for purposes of competitive discovery.

The VAR Applications contain trade secrets of Oracle and Oracle’s licensors and Customer shall not attempt, cause, or permit the alteration, decompilation, reverse engineering, disassembly or other reduction of the VAR Applications to a human perceivable form. Oracle reserves the right to replace, with functional equivalent software, any of the VAR Applications in future releases of the applicable program.

Preface

The Oracle Retail Advanced Inventory Planning Implementation Guide describes post-installation tasks that need to be performed in order to bring Advance Inventory Planning online and ready for production use.

The Implementation Guide includes some or all of the following sections, depending upon the release:

- System configuration settings for the UNIX and AIP environments
- Interfaces and data mappings between AIP and other systems

Audience

The Implementation Guide is intended for the AIP integrators and implementation staff, as well as the retailer's IT personnel.

The reader should have an in-depth understand the following concepts and applications in order to perform the processes describes in this document:

- UNIX system administration, shell scripts, and job scheduling
- Oracle Retail Integration Bus (RIB)
- Oracle Retail Predictive Application Server (RPAS)
- Oracle Retail Demand Forecasting (RDF)
- Oracle databases
- Performance constraints based on the retailer's infrastructure
- Technical architecture for AIP
- Retailer's hierarchical (SKU/Store/Day) data
- AIP batch processes

Related Documents

For more information, see the following documents in the Oracle Retail Advanced Inventory Planning Release 13.0.2 documentation set:

- *Oracle Retail Advanced Inventory Planning Release Notes*
- *Oracle Retail Advanced Inventory Planning Patch Installation Guide*
- *Oracle Retail Advanced Inventory Planning Data Management Online Online Help*
- *Oracle Retail Advanced Inventory Planning Data Management Online User Guide*
- *Oracle Retail Advanced Inventory Planning Order Management Online Help*
- *Oracle Retail Advanced Inventory Planning Store Replenishment Planning User Guide*
- *Oracle Retail Advanced Inventory Planning Warehouse Replenishment Planning User Guide*
- *Oracle Retail Advanced Inventory Planning Operations Guide*
- *Oracle Retail Advanced Inventory Planning Data Model Volume 1 Oracle Data Model*
- *Oracle Retail Advanced Inventory Planning Data Model Volume 2 Measure Reference Guide*

The following documentation may also be needed when implementing AIP:

- Oracle Retail Integration Bus (RIB) 11.1 or 13.0 documentation, based on type of deployment
- RETL 13.0 documentation
- Oracle Retail Predictive Application Server (RPAS) documentation

Customer Support

- <https://metalink.oracle.com>

When contacting Customer Support, please provide:

- Product version and program/module name.
- Functional and technical description of the problem (include business impact).
- Detailed step-by-step instructions to recreate.
- Exact error message received.
- Screen shots of each step you take.

Review Patch Documentation

If you are installing the application for the first time, you install either a base release (for example, 13.0) or a later patch release (for example, 13.0.2). If you are installing a software version other than the base release, be sure to read the documentation for each patch release (since the base release) before you begin installation. Patch documentation can contain critical information related to the base release and code changes that have been made since the base release.

Oracle Retail Documentation on the Oracle Technology Network

In addition to being packaged with each product release (on the base or patch level), all Oracle Retail documentation is available on the following Web site (with the exception of the Data Model which is only available with the release packaged code):

http://www.oracle.com/technology/documentation/oracle_retail.html

Documentation should be available on this Web site within a month after a product release. Note that documentation is always available with the packaged code on the release date.

Conventions

Navigate: This is a navigate statement. It tells you how to get to the start of the procedure and ends with a screen shot of the starting point and the statement “the Window Name window opens.”

Note: This is a note. It is used to call out information that is important, but not necessarily part of the procedure.

This is a code sample
It is used to display examples of code

[A hyperlink appears like this.](#)

Overview

Once AIP has been installed, you need to configure the system environment variables, create integration files, and configure the system according to the retailer's specifications.

This guide provides information on

- Implementing the AIP solution.
- Customizing AIP for the retailer's environment and needs.
- Integrating AIP with merchandising, forecasting, and other external systems.

For information on compatibility and hardware requirements, refer to the *AIP Installation Guide*.

Note: AIP Java/Oracle, AIP on Oracle, and AIP online are often used interchangeably to refer to those parts of AIP that access the Oracle relational database. This includes the Data Management and Order Management GUI components and a host of UNIX shell scripts and PL/SQL modules.

Pre-Implementation Considerations

Overview

When preparing to implement the Advanced Inventory Planning solution, you must closely explore the retailer's infrastructure, hierarchy data, and other factors that may require customizing the AIP environment through the use of configuration files and settings, custom scripts, and the RPAS Configuration Tool. Prepare your environment and analyze your retail and data needs thoroughly before implementing AIP.

The following list provides some of the issues that the implementation team may need to address prior to implementation:

1. Hierarchy Setup

- Identify the attributes used by the Product, Location and Time hierarchies, as well as their sources and update frequency.
- Define the dimensions within each of the Hierarchies and determine the default spreading settings.
- Define any Alternate Hierarchies and identify the relationship of the required Attributes that drive those Alternates.
- Define User Defined Hierarchies to be used by planners.

The hierarchy setup mentioned above may vary depending on the extent that the Configuration Tool will be used by the application.

2. Measure Settings

The following measure settings need to be addressed during implementation, which can vary depending on the extent that the Configuration Tool will be used by the application.

- Metric/Measure definitions, usage, interaction and calculations.
- Default Label to use when building measure labels
- Default Data Type
- Default NA Value
- Default Base Intersection
- Default Aggregation Method
- Default Spread Method
- Default Base State Read / Write Status at the base level
- Default Agg State Read / Write Status at aggregated levels

3. Setting Custom Wizards

Determine if any custom wizards are required that don't exist in the base application. The use or implementation of wizards can vary depending on the extent that the Configuration Tool will be used by the application.

4. Workbook Templates, Worksheets, Tabs, Formats

Workbooks can be created or refreshed through batch processing. By doing the processing in batch at night, the end users are spared from the wait time associated with each action. The Batch Processing section should outline when each of these operations will take place.

For these default auto workbook builds, the layout, formatting, hierarchies, wizard, tabs, and worksheets must be defined.

Configuring the timing of data loads, refreshes, and purges/deletions of workbooks must be set.

5. Daily and Weekly Batch Processing and scheduling

Configure the system for the following defaults:

- Batch Processes
- Week-ending Processes
- Day Ending Processes
- Data Updates
- Restructures – Adds, Renames, Deletes
- New Year Setup- 53 weeks
- Data Aging/Purging
- Administrative Processes
- Backups

6. Sizing Estimates/Hardware Requirements

A sizing estimate spreadsheet and hardware requirements should be supplied to the client. These factors are dependant on the number of domains, intersection points, number of workbooks, purge and delete strategy, planning horizon, retention of data, etc.

7. Security Access and Viewing

- User Setup/Security

To define Workbook Template Security, the system administrator will grant individual users, or user groups, access to specific workbook templates. Granting access to workbook templates provides users the ability to create, modify, save, and commit workbooks for the assigned workbook templates. Users will typically be assigned to “groups” based on their user application (or solution) role. Users in the same group can be given access to workbook templates that belong to that group alone. Users can be assigned to more than one “group” and granted workbook template access without belonging to the user group that typically uses a specific workbook template. Workbook access is either denied, read only, or full access. Read only access will allow a user to create a workbook for the template, but the user will not be able to edit any values or commit the workbook. The read only workbook can be refreshed.

When users save a workbook, they assign one of three access permissions to the workbook:

- World – Allow any user to open and edit the workbook.
- Group – Allow only those users in their same group to open and edit the workbooks.
- User – Allow no other users to open and edit the workbook.

Note: A user must have access to the workbook template in order to access the workbook, even if the workbook has world access rights.

- Workbook Limits

Another aspect of workbook security is the ability to set limits for the number of workbooks that a user can have saved at any given time. Limits can be set at the following levels:

- User per template
- User Group per template
- Globally per template for all users

The limits are evaluated in the above order, which means that a limit defined at user-template overrides any values defined at group-template or global-template levels. If the above limits are not defined, the default value is one billion. The limits are checked when a user begins the workbook build process. If the user's limit has been reached, an error message appears that informs the user that the workbook build process cannot be completed because the user has reached their limit. The message also informs the user what that limit is. The wizard process then terminates.

8. Data Management Automation

Creation of certain logical constructs in Data Management may be set automatically depending on the setting of certain parameters.

Examine the system parameter configurations and determine which pieces of automation will be turned on. Map out each supplier's "Ship-to" value and each warehouse's "Warehouse Type" that will be needed to effectively automate the supply chain setup for those processes that are enabled.

Note: Keep in mind that the "Warehouse Type" helps define Order Group destinations, Delivery Group destinations, and the default ordering pack size for a SKU into a store and warehouse.

9. Reconciliation

The reconciliation period is set to a day if the method is Reconciliation day-on-day and is set to a review period at source if the method is Reconciliation-over-time. Therefore, it has to be determined which reconciliation method will be selected at SKU level.

You must set a flag to have a SKU reconciled in a constrained scenario.

10. Replenishment Methods

Define the replenishment methods to be used. Rule out replenishment methods that are not applicable.

11. Perishables functionality

Spoilage threshold is calculated using the Acceptable Loss parameter. Acceptable loss is a user-managed parameter in SRP, defined either at the class/store format level or the SKU/store/day level.

Users have the ability to determine when to use expected spoilage via a 'Store use inventory aging flag'. Constraints on the application of inventory aging are as follows

- a. A global limit (in number of days) on or inside which an item with product life can be considered in the expected spoilage calculation.
- b. An expected write-off's user maintained measure.

The first constraint is used as a high limit in number of days for a product life and is called 'Store Inventory Aging Limit.' Product life as entered by a user does not have a limit. The effectiveness of product life needs to be controlled by a User. Therefore a

global limit respective to the product life is necessary and configurable. The second constraint refers to the fact that aging is a calculated number, not an actual number. The user may have an actual number of spoilage that is to be used. A measure (expected write-off's) can be entered by the user and if entered will override any spoilage calculation and be used as the amount to spoil on the given day.

To summarize the user input for expected spoilage:

- The product life of the inventory at the point of receipt into the final selling destination. (SKU/Str/Day)
- The "Store use inventory aging flag" (SKU)
- The global limit for using inventory aging (Scalar)
- Expected write-off's (amount to spoil). (SKU/Str/Day)

12. Shelf capacity

If the Shelf Capacity flag is set to "True," then shelf capacity will be considered when setting boundaries.

13. Substitution and value added functionality

The linked product flag is only used for user review purposes in AIP and indicates whether there is a value added/pre-priced commodity or banded item association with that particular SKU. If there is a value added/pre-priced association, the linked product flag is only True between the promotional start and end dates. This flag will be set within RMS.

Also a Substitution Flag must be set at the SKU level within Data Management, which sets that a SKU is substitutable across Demand Group.

14. User Specified Allocations

You must set the number of days of history required for using USA Indexed.

15. Alerts

Set the days that an alert will be run.

16. Store Reconciliation Matrix configuration

The number of store priorities is configurable; therefore, the Shortage and Stockless Surplus Priority Matrices may grow or shrink. However no screens or workbooks are provided to view and maintain the configuration.

The priority of each boundary, for each store priority, will depend on the number of store priorities defined. The order in which each boundary is met is configurable however no screens or workbooks are provided to view and maintain the configuration.

17. Network Throughput settings

The WRP Network Threshold Maintenance workbook is used to maintain network alert parameters. The WRP Network Threshold Maintenance workbook is available at the global and local domain levels. All measures should reflect the value in the domain during load and refresh times, and all editable measures should be committed to the domain unless otherwise stated.

Building a Production AIP RPAS Domain

Introduction

During the installation of the AIP RPAS batch code (as detailed in the *AIP Installation Guide*, Chapter 8) the installer has the option of creating a sample AIP RPAS domain using the sample hierarchy data provided with the AIP package. This document provides detail to the user on the process for creating an AIP RPAS domain with actual client / production-quality data.

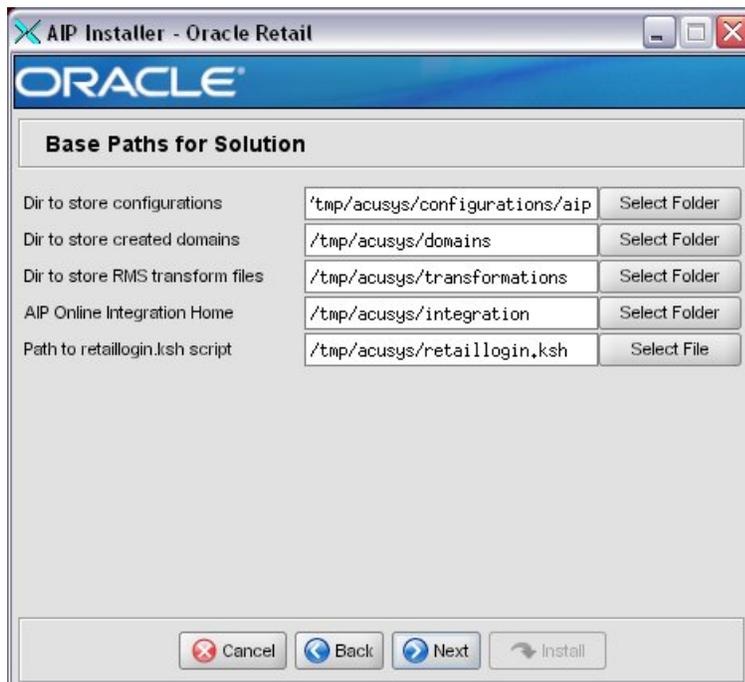

Configuring the AIP Solution

Configure the AIP solution using RPAS Configuration Tools.

Note: This section requires that the RPAS Configuration Tools are installed and working properly on your Windows workstation. For information on installing and troubleshooting RPAS Configuration Tools, refer to the *RPAS Installation Guide*.

AIP is packaged with a base configuration that all implementations must use as a starting point for any customization. This base configuration is stored within various files and directories which are unpacked during installation. In order to modify this configuration the configuration files must be loaded onto a Windows workstation in order to load them into the RPAS Configuration Tools.

For reference purposes, this document will use the variable \$AIP_INSTALL to refer to the directory specified by the AIP Installer location for “Dir to store configurations.”

Base Paths for Solution Screen

In the screen shot above, `/tmp/acusys/configurations/aip` was entered as the directory to store the configurations. For purposes of this document, `$AIP_INSTALL` will refer to this directory.

The table below provides information about the directories inside the `$AIP_INSTALL` directory.

Directory	Contents
<code>\$AIP_INSTALL/configuration/AIP</code>	AIP base XML files generated by and which are customizable by using the RPAS Configuration Tools.
<code>\$AIP_INSTALL/domain_build/AIP/config</code>	AIP default XML files used by the RPAS domain build process.
<code>\$AIP_INSTALL/domain_build/AIP/interface</code>	Directories and files copied into the RPAS domain during domain build process. These files are used by the interface between AIP Oracle and external systems (e.g. RMS, RDF).
<code>\$AIP_INSTALL/input</code>	AIP default/sample hierarchy data files and message strings loaded into the RPAS domain build during domain build process.

Because the RPAS Configuration Tools must run on a Windows workstation, in order to customize the configuration, the `$AIP_INSTALL/configuration/AIP` directory must be accessible from or copied to a Windows PC on a local or network drive.

The AIP solution is configurable to a limited degree. The following describes what you may and may not customize with respect to maintaining the integrity of this release:

- Clients cannot change existing measures or rules, or add rules to existing rule groups. Doing so will result in a non-supported AIP configuration, which will yield unpredictable results during the operation of AIP.
- Clients may add additional measures, rule groups and workbooks. These will not be modified or otherwise touched during the patch installation.
- Clients may customize the domain Hierarchy contained in hierarchy.xml. In order to insert a customized hierarchy.xml into the configuration, the modified (using the RPAS Configuration Tools) hierarchy.xml must be copied to `$AIP_INSTALL/configuration/AIP/hierarchy.xml`. This is where the domain build will be looking for the hierarchy.

Basic instructions for running the RPAS Configuration Tools are as follows:

1. Double-click the `ConfigTools.exe` file in your RPAS Configuration Tools installation directory to launch the RPAS Configuration Tools.
The AIP 13.0 solution consists of one domain structure, AIP.
2. From the **File** menu, select **Open** and navigate to the configuration directory on your local or network drive.
3. Navigate to the `configuration/AIP` directory and select the **AIP.xml** file to open the AIP domain configuration.
4. Perform any configuration tasks that are necessary, save and then close the AIP configuration.
5. Once you are satisfied with the configuration, copy the configuration directory back to `$AIP_INSTALL` before proceeding.

Gather Hierarchy Data

The \$AIP_INSTALL/input directory contains a set of initial hierarchy data files that are loaded into the sample AIP RPAS domain build during the installation. These hierarchy data files contain positions along each dimension in each hierarchy and are suitable for use in creating new AIP RPAS domains to be used as a starting point for production domains. These hierarchy data files are described in the following table.

Hierarchy Data File	Description
bcsk.dat	Baseline/Contingency Stock
clnd.dat	Calendar
dsp.dat	Destination Stocking Point
had.dat	Advertising
hdgr.dat	Delivery Group
hseq.dat	Sequence Number
hspl.dat	Supplier
husa.dat	User Specified Allocation
intv.dat	Interval
loc.dat	Location
ntwg.dat	Network Group
oltc.dat	Order Lead Time
ordg.dat	Order Group
proc.dat	Profile Order Cycle
prod.dat	Product
prof.dat	Profile
ssp.dat	Source Stocking Point
whse.dat	Warehouse

Some of the data provided in the AIP package will be of no use to the client running AIP in a production environment. Therefore the client must gather hierarchy data with specific positions and labels as necessary to support the client's business. The client may wish to perform an examination of each of the sample hierarchy data files provided to see which ones will require in-house client data and which can be used as is. For example, the interval and sequence number hierarchy files are usable without modification. However product hierarchy must be created with in-house data.

If hierarchy data is not yet available in an RPAS loadable format, the client may use the data provided in \$AIP_INSTALL/input for the initial domain build.

Note: The client must build the domain with the BCSK hierarchy even if they are not using this functionality. A core dump will occur if there is a lack of BCSK hierarchy positions in the hierarchy maintenance database (hmaint).

Afterwards, the client must reconfigure the domain using the `reconfigGlobalDomainPartitions` RPAS utility. Refer to the *RPAS Administration Guide* for information on reconfiguring the domain.

Note: In previous versions of AIP the calendar hierarchy could be generated at domain build time. Effective with AIP 12.1, the calendar hierarchy must be loaded as a flat file alongside the other hierarchy files. There is no calendar generator provided with version 12.1 and later versions of RPAS. Therefore this version of AIP does not provide capability to generate a calendar. See “AIP Calendar Hierarchy” for detailed information on file format of calendar hierarchy.

In addition to the hierarchy data listed in the above table, there are two additional files contained in the `$AIP_INSTALL/input` directory. These are non-optional, non-sample, base code files containing message strings, which must co-exist with the hierarchy data. These must be left intact and must not be replaced. During domain creation, these files are loaded into the domain. These message string data files are described in the following table.

Message Strings File	Description
msgs.dat	Message hierarchy Positions
r_mslabel.ovr	Message String Data Overlay

Build the AIP RPAS Global Domain

Some previous versions of AIP allowed for two kinds of RPAS domains. The first was an RPAS simple domain, where all the hierarchy and measure data is contained in one set of databases. The second was an RPAS global domain, where the hierarchy and measure data are partitioned across several sets of databases. In a global domain set, there is one master domain and one or more local domains (or subdomains).

AIP 13.0 only supports RPAS global domains.

The \$AIP_INSTALL/domain_build directory contains files necessary to instruct the build programs how and where to build domains, as well as partitioning information for global domains. Within \$AIP_INSTALL/domain_build, there is one directory, AIP, corresponding to the build instructions for the AIP domain. Within the AIP directory is a config directory, which contains files that must be edited during installation.

The config directory within \$AIP_INSTALL/domain_build/AIP contains one file:

- globaldomainconfig.xml

Inside the globaldomainconfig.xml file are XML tags read by the RPAS domain build program that specify the name, location, and partitioning information for each domain in a global domain structure.

The default settings provided with this installation specify a global domain set with one master domain and two local domains. The default partitioning dimension is subclass (SCLS) and the default partitioning dimensions are set to match the subclasses contained in the sample data files provided in the input.tar file. All of these can be customized according to the needs of the application.

The default globaldomainconfig.xml for AIP is similar to the example below.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<rpas>
  <globaldomain>
    <path>DOMAIN_PATH</path>
    <partitiondim>SCLS</partitiondim>
    <subdomain>
      <subpath>DOMAIN_PATH/lom0</subpath>
    <subpositions>1414_1000_1000,25_110_1204,25_116_438,25_116_439,25_116_440,25_116_4
42,25_119_692,3_564_984,43_813_1458,43_813_516,44_602_1212,44_602_1214,44_602_1215
,48_264_683,48_906_803</subpositions>
    </subdomain>
    <subdomain>
      <subpath>DOMAIN_PATH/lom1</subpath>

    <subpositions>48_906_804,48_906_805,5_503_1401,5_503_1503,5_503_1504,5_530_246,5_5
31_658,5_699_817,66_213_482,66_214_553,66_223_394,66_224_1117,71_710_112,71_710_11
3,71_710_1497,7_562_1108</subpositions>
    </subdomain>
  </globaldomain>
</rpas>
```

If the desired global domain solution for the AIP module contains more than two local domains, copy the <subdomain> ... </subdomain> tag-set as many times as needed, then customize each new copy of the tag-set.

Tip: Each sub-domain (i.e. local domain) must contain at least one position along the partitioning dimension (e.g., SCLS) in the production hierarchy data set, namely, prod.dat. In addition, all the positions along the partitioning dimension in the data set (prod.dat) must be listed in one of the local domains; otherwise, the domain creation will fail. An error will be reported in the build log.

The `<path> ... </path>` and `<subpath> ... </subpath>` tags in the `globaldomainconfig.xml` files must be modified, since they specify the *absolute path* to each component of each global domain. This XML file currently contains `DOMAINPATH` as a placeholder, which you must replace with the actual domain path components.

Tip: If the `globaldomainconfig.xml` file refers to domain directories that already exist, the domain build process below will not overwrite these domains. Rather, they will be skipped. It is essential that the `<path>` and `<subpath>` tags contain paths that do NOT exist.

Example:

```
<path>/u01/acusys/rpas/Domains/aip</path>
<subpath>/u01/acusys/rpas/Domains/aip/lldom0</subpath>
<subpath>/u01/acusys/rpas/Domains/aip/lldom1</subpath>
```

where `/u01/acusys/rpas/Domains/aip` does NOT currently exist.

Note: Before invoking the utility (described below) to create the AIP domain there is one system environment variable clients may wish to consider. This environment variable can be configured to control certain behaviors of the RPAS Configuration Tools utility, `rpasInstall`, which does the majority of the work to build a domain. The variable name is `RIDE_OPTIONS`. Please consult the RPAS documentation for more information about various options that may be configured by customizing the `RIDE_OPTIONS` variable.

Once the various configuration files and hierarchy files are customized, invoke the `build_aip_domains.ksh` script to initiate the AIP domain build process. This script is located in the `$RPAS_HOME/bin` directory. Make sure that this directory is in the `PATH` of the UNIX account running the batch.

The `build_aip_domains.ksh` requires several command line options displayed in the table below.

Option	Option Description	Argument Value
-d	Domain source	<code>\$AIP_INSTALL/domain_build</code>
-c	Configuration	<code>\$AIP_INSTALL/configuration</code>
-i	Input	<code>\$AIP_INSTALL/input</code>
-l	Log file	< any path and filename to an output log file >

Example execution command:

```
build_aip_domains.ksh -d $AIP_INSTALL/domain_build -c $AIP_INSTALL/configuration -
i $AIP_INSTALL/input -l $AIP_INSTALL/aip_build.log
```

If the shell reports that this script is not found, ensure that `$RPAS_HOME/bin` is in the `PATH`, and that the script has its execution UNIX permission enabled, and try again.

This build script internally calls the appropriate RPAS installation programs to perform the following:

- Create an RPAS global domain in the paths/locations specified by the configuration files. If domains already exist in the specified location, they will not be overwritten.
- Register all measures, templates, and rules that were created using the RPAS Configuration Tools in the domain.
- Establish the partitioning mapping according to the partitioning information specified in the `globaldomainconfig.xml` file.
- Verify the domain build process for errors after the installation programs are complete. In the event that errors occurred in the domain build, the user will be alerted and should check the log file to determine the source of the error.

The log file may be scanned for errors by using any text editor or UNIX text search commands. If an error occurs, it will most likely contain the word 'error', so the following command might be useful for detecting if any build errors occurred:

```
grep -i error $AIP_INSTALL/build_logs/*.log
```

Other keywords to search for are "<E", "not found", and "exception".

Note: When viewing or searching through the build log, please consult the AIP Release Notes for this product. The *Release Notes* contain all known issues associated with this release.

Note: Once the domain build has successfully completed, you must preserve the `$AIP_INSTALL` directory. The domain configuration files are automatically copied inside the domain after a successful build. However, the `$AIP_INSTALL` directory will be used for AIP patches.

Move the RPAS Domain (Optional)

RPAS global domains contain internal pointers that specify the disk location of the master and local domains. The master domain must know where the local domains exist on disk, and the local domains must each know where the master domain exists.

After the AIP domain is created, you may move it to a different location. However, the following process must be followed to copy or move the domain components in order to update the newly copied/moved domain component directories.

If the local domain directories are subdirectories of the master domain directory, or if you *want* your local domains to be moved inside the master domain, perform the following:

Use the RPAS `copyDomain` utility. Refer to the *RPAS Administration Guide* for details about this utility. This utility updates the internal pointers between master and sub domains. It converts the pointers between master and local from absolute UNIX paths to relative paths. The master domain refers to local domains by directory name only (e.g. `ldom0`), and the local domains refer to the master domain by `..`.

If the sub domain directories are **not** subdirectories of the master domain, and you wish to preserve this "spread-out" global domain set, but at the same time you wish to move a local domain or the master domain, use the RPAS `moveDomain` utility. This utility will move some or all parts of an RPAS domain by specifying the new paths in an XML file. Refer to the *RPAS Administration Guide* for details about this utility.

Note: Previous versions of AIP contained an `updateGlobalPointers` utility. This utility is deprecated in AIP due to increased functionality in the `copyDomain` and `moveDomain` RPAS utilities.

Configure the RPAS Client to Use the Domain

The RPAS Client must be configured to point to one of the newly created domains. Refer to the *RPAS Installation Guide* for instructions on how to attach the domains to the client. Double-click the `EConfigure.exe` file to define the RPAS Client configuration.

Post Installation Instructions

Refer to other chapters in this *AIP Implementation Guide* and the *AIP Operations Guide* for information on loading data into the domains and for practical use of the AIP batch domains.

System Configuration

Setting Environment Variables

After AIP is installed, you must define the environment variables for the domain paths, integration directory paths, message logging levels, etc. These variables define the environment in which batch scripts are run. These settings do not affect the way in which the business uses AIP to replenish the supply-chain.

The scripts run as part of the nightly batch on both of the AIP platforms, RPAS and Oracle. Both platforms have defined environment variables for configuration.

Configuring AIP RPAS Environment Variables

The following aspects of the RPAS-side batch must be configured so that the `aip_batch.sh` and each batch step script can be run from the command line or from a job scheduler.

Setting RPAS Position Level Security

The position level security for RPAS needs to be modified. Position Level Security allows access control for dimensions on a position-by-position basis. Refer to the RPAS Administration for detail information this feature. To specify the security dimension for a hierarchy, use the RPAS Configuration Tools or `hierarchyMgr` utility. Refer to the *RPAS Configuration Tools User Guide* for more information.

`aip_env_rpas.sh`

The variables displayed in the following table need to be defined properly within `aip_env_rpas.sh`.

It is important to note that the values of the environment variables can be variables themselves depending on the business needs. Such variables may add flexibility for environment maintenance, patch testing, etc. and are used at the discretion of the business.

For example:

If `aip_env_rpas.sh` contains

```
RPAS_INTEGRATION_HOME= "${TEST_RPAS_INTEGRATION_HOME}"
```

`TEST_RPAS_INTEGRATION_HOME` is a client specific environment variable whose value is the correct path to the root integration directory. This and all other such variables must also be defined in order to run the batch.

Finally, the variables below corresponding to directory paths must not contain white space. For example, `AIPDOMAIN` may be defined as `"/files1/aip/AIP1"` but may not be defined as `"/files1/aip/AIP RPAS Domain"`.

Environment Variable	Description
<code>AIPDOMAIN</code>	Fully qualified path of the AIP RPAS global domain. The default value (<code>TEST_AIPDOMAIN</code>) provided at the time of installation is a variable which must also be defined apart of <code>aip_env_rpas.sh</code> if it is to be retained as the value.

Environment Variable	Description
RPAS_INTEGRATION_HOME	Fully qualified path of a readable/writeable directory that serves mainly as a base for other path definitions later in aip_env_rpas.sh. Commonly set equal to AIPDOMAIN. The default value (TEST_RPAS_INTEGRATION_HOME) provided at the time of installation is a variable which must also be defined apart of aip_env_rpas.sh if it is to be retained as the value.
DEFAULT_DOMAIN	Fully qualified path of the AIP RPAS local domain into which any new subclass will be added.
BSA_TEMP_DIR	Fully qualified path of readable/writeable directory where scripts may store temporary files. Valid definition of this variable is required by the BSA common scripts. Note: THIS SHOULD NOT BE SET TO /tmp. Failures may occur due to insufficient temporary workspace.
BSA_LOG_LEVEL	Script logging threshold severity. Only log entries at this or higher severity level will be written to the script logs. Must be one of { PROFILE DEBUG INFORMATION WARNING ERROR }. Valid definition of this variable is required by the BSA common scripts.
BSA_MAX_PARALLEL	Script parallel process fan-out maximum. The number of processes that any given process (script instance) may spawn. Valid definition of this variable is required by the BSA common scripts.
BSA_LOG_HOME	Fully qualified path of readable/writeable directory where script logs will be rooted. Script logs are written into a hierarchy that parallels the script call tree, rooted in a date stamped directory located in this specified directory. Valid definition of this variable is required by the BSA common scripts.
BSA_LOG_TYPE	Integer parameter that specifies the type of script log files to be written. Must equal one of { 0 1 2 3 }. These values are defined as follows: 0 = No logging 1 = Text ".log" files; 2 = XML structured ".xml" file; 3 = Text and XML log files. Valid definition of this variable is required by the BSA common scripts.

Environment Variable	Description
BSA_CONFIG_DIR	Fully qualified path to directory that contains the BSA configuration file <code>bsa_prep_files.config</code> . Valid definition of this variable is required by the BSA common scripts.
BSA_ARCHIVE_DIR	Fully qualified path to directory to which BSA file processing operations will archive files. Valid definition of this variable is required by the BSA common scripts.
RPAS_LOG_LEVEL	RPAS binary logging threshold severity. Only log entries at this or higher severity level will be written to the script logs from binaries that accept a <code>-loglevel</code> argument. Must be one of { PROFILE DEBUG INFORMATION WARNING ERROR }.
RAW_RMS_DATA_DIR	Fully qualified path to directory that contains untransformed RMS output data.
RMS_SCHEMA_DIR	Fully qualified path to the directory that contains the RETL schema files corresponding to the untransformed RMS version 11+ output data.
RMS10_SCHEMA_DIR	Fully qualified path to the directory that contains the RETL schema files corresponding to the untransformed RMS version 10 output data.
AIP_SCHEMA_DIR	Fully qualified path to directory that contains RETL schema files depicting the transformed RMS output data.
RPAS_PAGE_SPLIT_PERCENTAGE	This variable is used to optimize AIP performance. Do not alter this setting without consulting AIP Technical Management.
ORACLE_AIP_PERISHABLE_ON	This UNIX variable is set to yes (<code>ORACLE_AIP_PERISHABLE_ON=yes</code>) when AIP is replenishing perishable products. This setting is case sensitive.

Note: `aip_env_rpas.sh` also includes some Implementation Parameters. See Chapter 6, “AIP RPAS Configurations,” in this *Oracle Retail AIP Implementation Guide*, for details on these parameters.

RPAS TODAY

This value defines ‘TODAY’ for the AIP RPAS environment. It is used to ensure that the replenishment batch can be run for a single calendar day, independent of the actual server date. During a normal production run of the batch, this value should be set by the `VDATE` (virtual date) value exported from AIP Online. This variable can be set for ad hoc procedures, but it should be cleared after the procedure has completed as **this may have an adverse affect on the user workbooks**.

Number of Available File Handles (ULIMIT)

Prior to AIP batch execution the System Administrator should ensure the limit of available file handles (`ulimit -n <number>`) is **above 2000 file handles per process**. Setting `ulimit` less than recommended value may cause AIP batch process to fail. Please exercise caution while setting this system variable. **Do not set this too high, as it can seriously impact performance system-wide.**

Configuring AIP Online Environment Variables

`aip_env_online.sh`

The `aip_env_online.sh` variables in the following table need to be configured for your environment. This information can also be found in the README file provided with the online integration files.

It is important to note that the values of the environment variables can be variables themselves depending on the clients needs. Such variables may add flexibility for environment maintenance, patch testing, etc. and are used at the discretion of the business.

Environment Variable	Description
INTEGRATION_HOME	Fully qualified path to the interface home directory. The default value references <code>TEST_ONL_INTEGRATION_HOME</code> , an externally defined variable. However, the client may assign a hardcoded path to this value at their discretion.
ONL_OUTBOUND_DIR	The default is <code>\${INTEGRATION_HOME}/outbound</code> . This variable defines the directory location where the <code>cron_export.sh</code> script will put the files containing the data exported from AIP Online. If bypassing the RIB the <code>tsf_po_export.sh</code> script will also write the exported transfers and purchase order files to this directory. This must match the <code>ONL_OUTBOUND_DIR</code> defined in <code>aip_env_rpas.sh</code> script, which may reside on a different server.
ONL_INBOUND_DIR	The default is <code>\${INTEGRATION_HOME}/inbound</code> . This variable defines the directory location where <code>cron_import.sh</code> and <code>cron_import_order.sh</code> expect the inbound files from RPAS to be sourced from.
BSA_ARCHIVE_DIR	The default is <code>\${INTEGRATION_HOME}/archive</code> . This variable defines the directory location where <code>cron_import.sh</code> and <code>cron_import_order.sh</code> scripts will send the input data files for archiving.
BSA_LOG_HOME	Fully qualified path of readable/writeable directory where script logs will be rooted. Script logs are written into a hierarchy that parallels the script call tree, rooted in a date stamped directory located in this specified directory. Valid definition of this variable is required by the BSA common scripts. This variable is initially set to <code>\${INTEGRATION_HOME}/logs</code> .
BSA_CONFIG_DIR	Fully qualified path to directory that contains the BSA configuration file <code>bsa_prep_files.config</code> . Valid definition of this variable is required by the BSA common scripts. This variable is initially set to <code>\${INTEGRATION_HOME}/config</code> .

Environment Variable	Description
BSA_TEMP_DIR	Fully qualified path of readable/writeable directory where scripts may store temporary files. Valid definition of this variable is required by the BSA common scripts.
BSA_LOG_LEVEL	Logging severity threshold for batch scripts. Only log entries at this or higher severity level will be written to the script logs from procedures that accept the <code>-loglevel</code> argument. Listed in increasing order of severity, one of the following levels must be selected { PROFILE DEBUG INFORMATION WARNING ERROR }.
BSA_LOG_TYPE	Integer parameter that specifies the type of script log files to be written. Must equal one of { 0 1 2 3 }. These values are defined as follows: 0 = No logging 1 = Text ".log" files 2 = XML structured ".xml" file 3 = Text and XML log files Valid definition of this variable is required by the BSA common scripts.
BSA_MAX_PARALLEL	Script parallel process fan-out maximum. The number of processes that any given process (script instance) may spawn. Valid definition of this variable is required by the BSA common scripts.
DEFAULT_BSA_SQL_CRED_APP	The default is DATABASE. It is used by <code>bsa_sql.sh</code> script to perform a lookup from the <code>config.xml</code> file to connect to the AIP Online database.
RETL_MAX_HEAP_SIZE	The default value is 500M. Raise this limit to improve performance on production systems.
RETL_CONFIG_FILE	File name containing database connection information. This variable is used by RETL scripts. The default value references <code>TEST_RETL_CONFIG_FILE</code> , an externally defined variable. However, the client may assign a hardcoded value at their discretion. In either case, the variable should ultimately point to the fully-qualified path of a RETL configuration file. An example <code>config.xml</code> file is included with AIP.
AIPDOMAIN	Fully qualified path of the AIP RPAS global domain. The default value references <code>TEST_AIPDOMAIN</code> , an externally defined variable. However, the client may assign a hardcoded path to this value at their discretion.
HAVE_WIP	Indicates if WIP is enabled to export and import data. The default value is set to false. WIP will not be implemented for AIP 13.0.
ONL_SCHEMA_OWNER	This variable sets the database schema owner. It is used by the <code>store_source</code> extract. For example, if you are running AIP online extracts as "aipdev130user" but the schema owner is "aipdev130", then regardless of the running database user, <code>ONL_SCHEMA_OWNER</code> should be set to "aipdev130".

Environment Variable	Description
NLS_LANG	This variable defines the character encoding of the RETL import files.
ONL_VDATE_DIR	The directory location of the vdate.int file.

Note: RETL runs within a Java Virtual Machine (JVM). Errors concerning the JVM stack size may be encountered when executing AIP Oracle batch processes. This value represents the amount of memory allocated to a single JVM thread and is defaulted by the JVM. The user may override it by setting the RETL_THREAD_STACK_SIZE variable in `aip_env_online.sh` or in their user profile.

Example:

```
export RETL_THREAD_STACK_SIZE=200000
```

It can also be set in `rfx.conf`, the configuration file for RETL itself. However, modifying `rfx.conf` will affect all users accessing the RETL installation, not just those using AIP. When manipulating the JVM stack size, extreme care should be taken to prevent RETL from using an inordinate amount of the available physical memory.

RETL

Once RETL is installed, the environment variables displayed in the table below should be defined. Verify that these environment variables are properly defined.

Variable	Description
RFX_HOME	The RETL home directory
RFX_TMP	The RETL temp directory
ORACLE_HOME	Oracle installation directory

User Path

When invoking online shell scripts, the user's PATH must include the following directories:

- \$INTEGRATION_HOME
- \$INTEGRATION_HOME/bsa
- \$INTEGRATION_HOME/config
- \$INTEGRATION_HOME/scripts
- \$RFX_HOME
- \$RFX_TMP
- \$ORACLE_HOME

For some variables defined in `aip_env_online.sh`, the value is defaulted to another externally-defined variable. This approach provides flexibility in that multiple users can use a single `aip_env_online.sh` but point to different test directories, domains, or RETL configuration files. It is important to note that the test directories listed in the externally defined variables must also be in the user's PATH. Please refer to the *AIP Installation Guide* for further details on defining variables in the `.profile` file.

Example:

If `aip_env_online.sh` contains

```
INTEGRATION_HOME= "${TEST_ONL_INTEGRATION_HOME} "
```

`TEST_ONL_INTEGRATION_HOME` is an environment variable whose value is the correct path to the root integration directory. The path that is defined for `TEST_ONL_INTEGRATION_HOME` must be in the user's PATH.

Using the Scheduler to Run AIP Batch Processes

This topic provides information about using the Scheduler to run the AIP on RPAS and AIP on Oracle batch processes. The batch processes span both platforms and depend on inputs from the merchandising and forecasting systems.

The following control scripts can be used to execute AIP batch:

- `vdate.sh`
- `aip_t_master.ksh`
- `cron_export.sh`
- `aip_batch.sh`
- `cron_import.sh`
- `cron_import_order.sh`
- `cron_release.sh`
- `cron_post_release.sh`
- `cron_purge.sh`

If the Oracle Retail Integration Bus (RIB) will not be used to communicate the purchase orders and transfers released by the overnight batch, the following script should also be used:

- `tsf_po_export.sh`

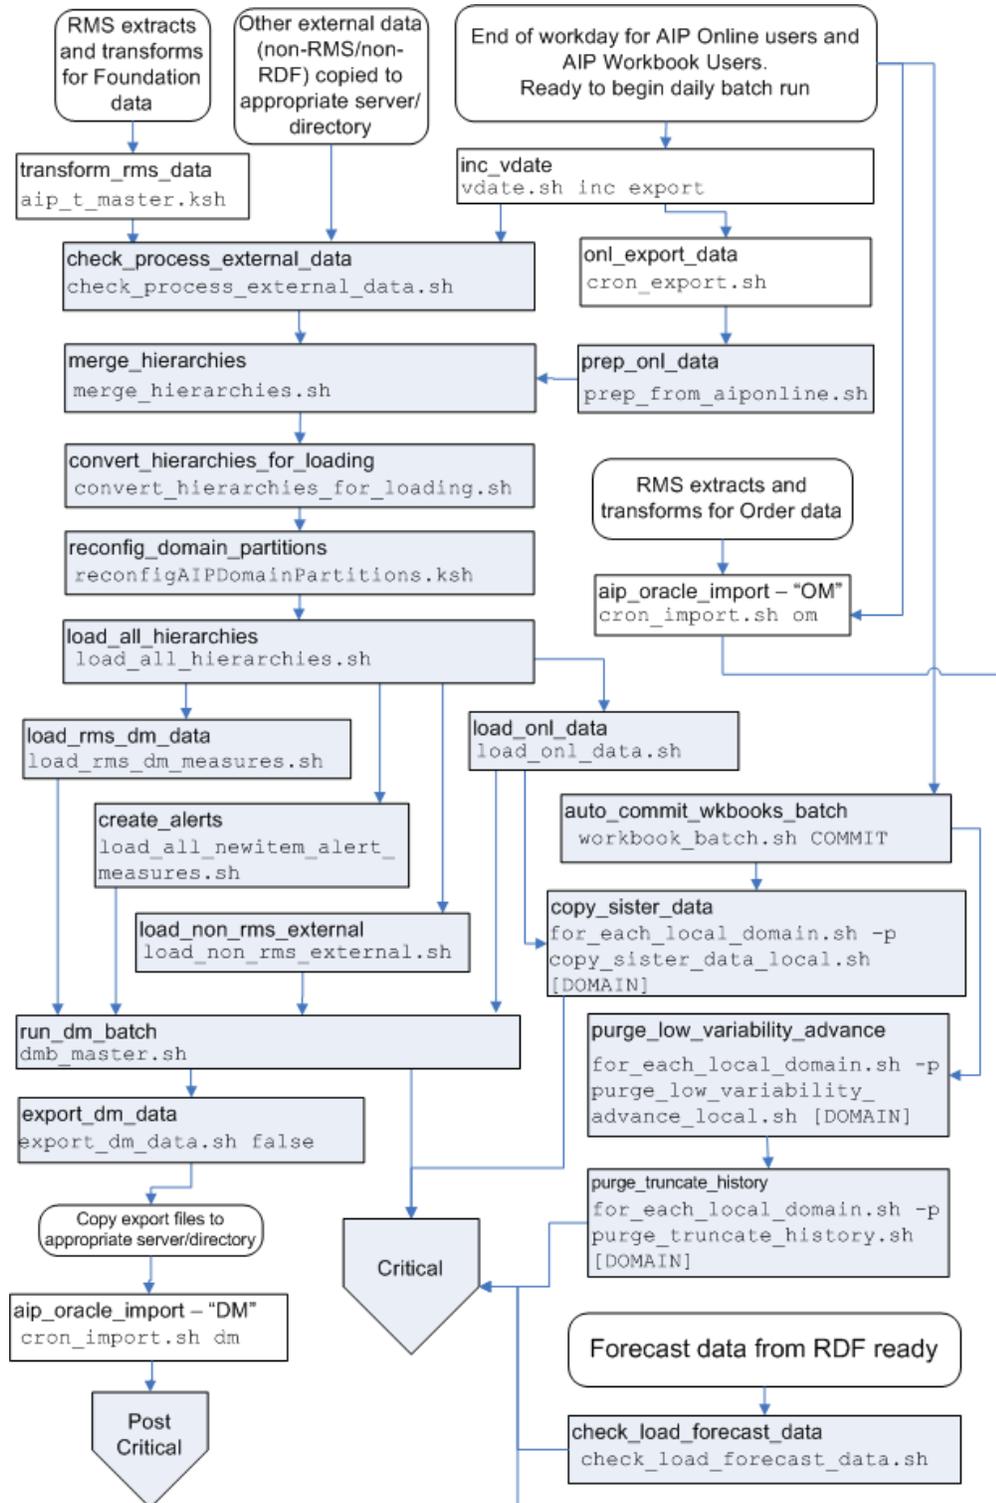

Many of these control scripts accept or require parameters to indicate the specific logic to execute. Therefore you will notice that the control script may be called multiple times with different parameters. Where restart/recovery at the control script level is not sufficiently granular the sub-scripts, called by the top level control script, can be scheduled instead. However the scheduled tasks must carefully consider all tasks executed by the control script, including common environment control.

The following diagram outlines the AIP script/step execution and dependencies. Note that the shaded boxes represent the executable steps of `aip_batch.sh`. The `aip_batch.sh` step name, in bold, can be passed into the script as a parameter or the subscript, listed below the step name, can be scheduled.

Note: AIP does not move data between platforms internally or retrieve files which were generated external to AIP. All data that is input to AIP must be transferred via FTP or copied to the appropriate inbound directory on the AIP server.

Pre-Critical Path Tasks

The diagram and table below provide information about the pre-critical path steps that need to be performed.

Pre-Critical Tasks Process Flow Diagram

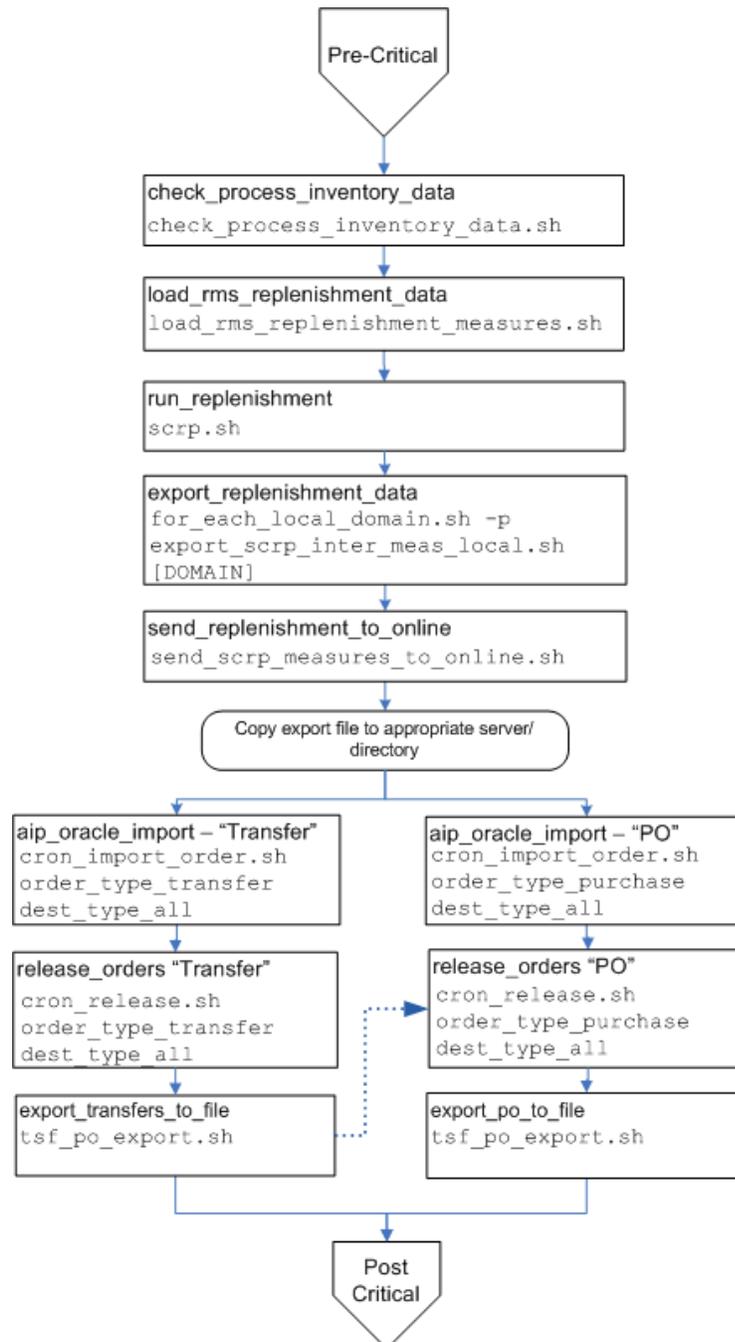

The table below provides information about the script or action performed in the Pre-Critical Tasks process flow diagram.

Script or Action	Parameter(s)	Platform Location
Bring down the online application server and domain daemon to lockout users		Oracle, RPAS
vdate.sh	inc export	Oracle
cron_export.sh		Oracle
Copy/FTP vdate.int file from \${INTEGRATION_HOME}/vdate to \${AIPDOMAIN}/interface/import/meas		RPAS
Copy/FTP AIP Online export files from \${ONL_OUTBOUND_DIR} to \${AIPDOMAIN}/interface/export		RPAS
Copy/FTP RMS data files to \${RAW_RMS_DATA_DIR}. Perform uncompress and un-tar operations.		RPAS
aip_t_master.ksh		RPAS
Copy/FTP all external/custom data files to \${AIPDOMAIN}/interface/config/rms. Perform uncompress and un-tar operations.		RPAS
aip_batch.sh	check_process_external_data	RPAS
aip_batch.sh	prep_onl_data	RPAS
aip_batch.sh	merge_hierarchies	RPAS
aip_batch.sh	convert_hierarchies_for_loading	RPAS
aip_batch.sh	reconfig_domain_partitions	RPAS
aip_batch.sh	load_all_hierarchies	RPAS
aip_batch.sh	load_onl_data	RPAS
aip_batch.sh	load_rms_dm_data	RPAS
aip_batch.sh	create_alerts	RPAS
aip_batch.sh	load_non_rms_external	RPAS
aip_batch.sh	auto_commit_wkbooks_batch	RPAS
aip_batch.sh	run_dm_batch	RPAS
aip_batch.sh	export_dm_data	RPAS
Copy/FTP RPAS export files from \${AIPDOMAIN}/interface/export to \${INTEGRATION_HOME}/data.		Oracle
cron_import.sh	dm	Oracle
Copy or FTP the RDF forecast files to \${INTERFACE_FORECAST_DIR}. Perform uncompress and un-tar operations.		RPAS

Script or Action	Parameter(s)	Platform Location
aip_batch.sh	check_load_forecast_data	RPAS
aip_batch.sh	purge_low_variability_advance	RPAS
aip_batch.sh	purge_truncate_history	RPAS
aip_batch.sh	copy_sister_data	RPAS
Copy/FTP RMS and custom OM data files to \${ONL_INBOUND_DIR}. Perform uncompress and un-tar operations.		Oracle
cron_import.sh	om	Oracle

Critical Path Tasks

The diagram below displays the Critical Path Tasks process flow diagram.

Critical Path Tasks Process Flow Diagram

Note: The release of Purchase Orders can be executed before the release of Transfers; however the release of Transfers and Purchase Orders MUST NOT run in parallel when using the tsf_po_export.sh script to extract the Transfers and/or POs to a flat file.

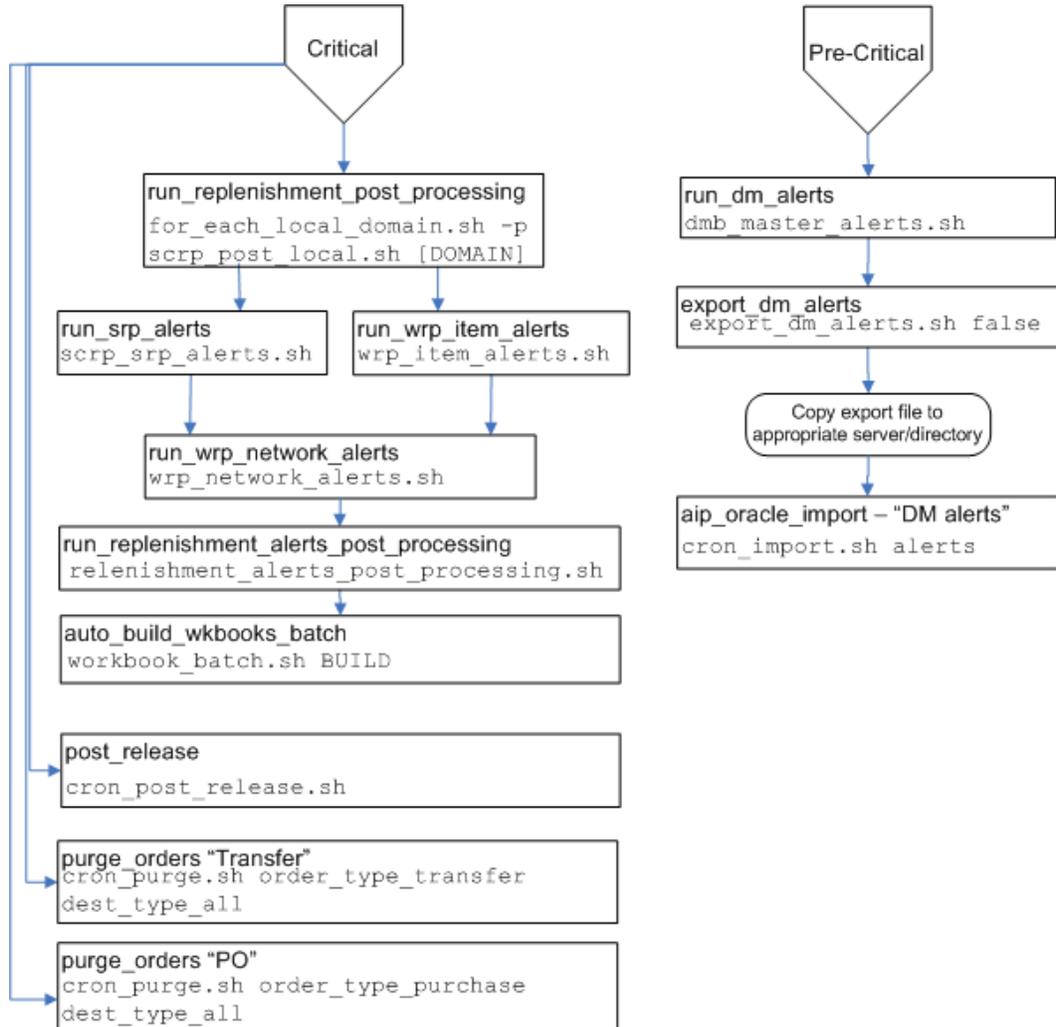

Note: `cron_release` must not be run for a second time until `tsf_po_export.sh` has completed for the previous set.

The table below provides information about the critical path steps that need to be performed.

Script or Action	Parameter(s)	Platform Location
Copy/FTP the RMS inventory position files to \${AIPDOMAIN}/interface/config/rms. Perform uncompress and un-tar operations.		RPAS
<code>aip_batch.sh</code>	<code>check_process_inventory_data</code>	RPAS
<code>aip_batch.sh</code>	<code>load_rms_replenishment_data</code>	RPAS
<code>aip_batch.sh</code>	<code>run_replenishment</code>	RPAS
<code>aip_batch.sh</code>	<code>export_replenishment_data</code>	RPAS
<code>aip_batch.sh</code>	<code>send_replenishment_to_online</code>	RPAS
Copy/FTP RPAS export files from \${AIPDOMAIN}/interface/export to \${INTEGRATION_HOME}/data.		Oracle
<code>cron_import_order.sh</code>	1. <code>order_type</code> 2. <code>dest_type</code> See the details of this script in the <i>AIP Operations Guide</i> for the possible valid values of these 2 parameters.	Oracle
<code>cron_release.sh</code>	1. <code>order_type</code> 2. <code>dest_type</code> See the details of this script in the <i>AIP Operations Guide</i> for the possible valid values of these 2 parameters.	Oracle
<code>tsf_po_export.sh</code> (for RIB bypass)		Oracle
When bypassing the RIB, copy/FTP the AIP purchase order and transfer files from \${ONL_OUTBOUND_DIR} to RMS.		Oracle

Post Critical Path Tasks

The diagram below displays the Post Critical Path Tasks process flow diagram.

Post Critical Path Tasks Process Flow Diagram

The table below provides information about the post-critical path steps that need to be performed.

Script or Action	Parameter(s)	Platform Location
aip_batch.sh	run_replenishment_post_processing	RPAS
aip_batch.sh	run_dm_alerts	RPAS
aip_batch.sh	export_dm_alerts	RPAS
cron_import.sh	alerts	Oracle
Restart the AIP Online application server.		Oracle
aip_batch.sh	run_srp_alerts	RPAS
aip_batch.sh	run_wrp_item_alerts	RPAS

Script or Action	Parameter(s)	Platform Location
aip_batch.sh	run_wrp_network_alerts	RPAS
aip_batch.sh	run_replenishment_alerts_post_processing	RPAS
aip_batch.sh	auto_build_wkbooks_batch	RPAS
Start the AIP RPAS domain daemon.		RPAS
cron_post_release.sh		Oracle
cron_purge.sh	<ol style="list-style-type: none">1. order_type2. dest_type See the details of this script in the <i>AIP Operations Guide</i> for the possible valid values of these 2 parameters.	Oracle

AIP Online Configurations

AIP Online consists of three different but equally important environments: a UNIX-based platform for executing RETL scripts and batch shell scripts; an Oracle database; and an application server for hosting the web-based Java graphical user interface (GUI). Each environment requires specific values, properties, and files to be configured in order to fully implement the AIP Online portion of the solution.

AIP Online UNIX Environment

The batch scripts which execute on the data stored in the Oracle database run on a UNIX-based platform. RETL must be installed and it must be able to access the AIP Oracle database. In order to execute the batch scripts `config.xml`, the integration directories, and any files shared by the Online and RPAS must be setup and operational.

`config.xml`

The RETL interface process, run from a UNIX-based platform, is designed to be fully automated once configured. In addition to the environment variables described above `config.xml` is required when invoking the RETL scripts. This file should be located in the root integration directory on the UNIX server in which the AIP Online application is installed.

This configuration file contains the database connection information required by RETL for performing import and export operations. Refer to the RETL documentation for detailed descriptions of element definitions. There are two operator sections that need to be completed, one for **oraread** and one for **orawrite**. The **oraread** section defines the properties required for all export operations on the database and the **orawrite** section defines these for all import operations. Though both contain similar attributes, it's imperative that each section is defined as needed for the specific Oracle database installation. This information is also dependent on the requirement that all databases can be connected to via a properly defined `tnsnames` file and reachable by SQLPlus.

Example `config.xml` file:

```
<CONFIG>
  <DEFAULTS operator="oraread">
    <PROPERTY name="arraysize" value="5000" />
    <PROPERTY name="hostname" value="mspdev38"/>
    <PROPERTY name="port" value="1524"/>
    <PROPERTY name="dbname" value="DEV029i"/>
    <PROPERTY name="connectstring" value="aiprmsint130user/retek"/>
  </DEFAULTS>
  <DEFAULTS operator="orawrite">
    <PROPERTY name="hostname" value="mspdev38"/>
    <PROPERTY name="port" value="1524"/>
    <PROPERTY name="dbname" value="DEV029i"/>
    <PROPERTY name="dbuserid" value="aiprmsint130user/retek"/>
    <PROPERTY name="method" value="conventional"/>
  </DEFAULTS>
</CONFIG>
```

Integration Directories

The following directories must be created by the system administrator. They are required and will cause errors if absent:

- \$INTEGRATION_HOME/inbound
- \$INTEGRATION_HOME/archive

Shared Files

When the AIP RPAS module is not installed on the same server as the AIP ONLINE module, the shared credential and verification files must be present in both locations.

The following table lists the files and the appropriate location on the UNIX server. Copy the files from the AIP RPAS server location to the AIP ONLINE server. Where the destination directory does not exist, one should be made. All server locations are written in reference to the `aip_env_online.sh` environment variables.

File Name	Location
prep_files.sh	\$INTEGRATION_HOME/scripts/
bsa_prep_files.config	\$INTEGRATION_HOME/config
bsa_archive.sh	\$INTEGRATION_HOME/bsa
bsa_check_for_required_files.sh	\$INTEGRATION_HOME/bsa
bsa_common.sh	\$INTEGRATION_HOME/bsa
bsa_cred.sh	\$INTEGRATION_HOME/bsa
bsa_env.sh	\$INTEGRATION_HOME/bsa
bsa_prep_files.sh	\$INTEGRATION_HOME/bsa
bsa_logger.sh	\$INTEGRATION_HOME/bsa
bsa_para.sh	\$INTEGRATION_HOME/bsa
bsa_sort.sh	\$INTEGRATION_HOME/bsa
bsa_sql.sh	\$INTEGRATION_HOME/bsa
bsa_verify.sh	\$INTEGRATION_HOME/bsa

Importing Configuration Files

The files imported into AIP Online are bundled (in a *.tar file) together into logical groupings based on dependencies and availability within the batch window. Each RETL import file has one, and only one, corresponding script that executes the loading of the file into the database. The execution of all RETL import scripts is controlled by a set of configuration files that list the load scripts to be run, and the order in which they will run. Each configuration file corresponds to one *.tar file.

- The configuration files can be modified to prevent execution of load scripts for files which will never be present (e.g. they are optional files for functionality that will not be used by the business). For example, “Sister Stores” may not be available in the merchandising system to provide to AIP, or purged order numbers may not be available for PO number recycling. The line containing the path to the “_in.sh” load script should be deleted or commented out.
- The configuration files are a command line argument passed to the parent script, process_aiponline_data.sh. A modified configuration file or a specially constructed configuration file can be passed to the parent script to aid the initial, first day import, restart/recovery, or special ad hoc processing.
- The parent script will execute all load files listed in the configuration file passed to it. A warning message will be logged when the load script is executed but the corresponding data file is not present.

The import configuration files are listed in the following table along with any potentially optional load scripts. Optional load scripts are those which are not critical to replenishment processing. They are related to functionality outside of replenishment or provide special information that can be used as an alternative to the standard processing. Settings in both AIP RPAS import/export configuration files and AIP Online import configuration files should reflect the file requirements consistently.

Configuration File	Optional Load Scripts
import_hierarchy.config	
import_dm.config	dm_banded_comm_in.sh dm_is_prepriced_in.sh dm_dir_store_frmt_pksz_in.sh dm_dir_store_pksz_in.sh dm_sis_store_in.sh dm_sis_wh_in.sh dm_store_frmt_pksz_in.sh dm_store_pksz_in.sh dm_value_added_comm_in.sh dm_wh_prom_dates_in.sh
import_dm_alerts.config	
import_store_source.config	
import_wip.config	
import_om.config	om_po_recycling_in.sh

Export Configuration Files

The files exported from AIP Online are bundled (.tar) together into logical groupings based on dependency. Each RETL export file has one, and only one, corresponding script that executes the extraction of the file data from the database. The execution of all RETL extract scripts is controlled by a set of configuration files that list the export scripts to be run, and the order in which they will run.

- The configuration files can be modified to prevent execution of export scripts for files which will never be present (e.g. they are optional files for functionality that will not be used by the current client). For example, if “Sister Stores” are never imported then the copy date never needs to be extracted for AIP on RPAS.

Note: Files that are optional for import may not be optional for export. Some import files are optional because the data *can* be loaded. Alternatively the data can be entered in the DM online application. Regardless of how the data gets into the Oracle database, this data is required by AIP RPAS to run replenishment batch.

- The configuration files are a command line argument passed to the parent script, process_aiponline_data.sh. A modified configuration file or a specially constructed configuration file can be passed to the parent script to aid restart/recovery or special ad hoc processing.

The export configuration files are listed below.

- export_hierarchy.config
- export_dm.config
- export_wip.config
- export_tsf_po.config

Oracle Database

The configurations performed in the Oracle database affect how the business uses AIP. Each setting will be used when performing some action of supply chain setup—either automatically or manually—or order execution and maintenance.

SYSTEM_PARAMETERS

The following table contains the configuration parameters contained in the SYSTEM_PARAMETERS database table, the default value assigned to the parameter, and a description about what the parameters controls. The default parameter values in the table need to be set according to your individual business needs.

Configuration Parameter	Default Value	Description
AIP_VERSION	13.0	The currently installed version of AIP Online.
AUTO_ASSIGN_CASE_WT	N	Indicates whether case weights should be automatically assigned for new SKU/pack size combinations.
AUTO_ASSIGN_OF_SKUS_TO_PROFILES	Y	Indicates whether to automatically assign the SKU of new SKU/supplier combos to profiles.
AUTO_ASSIGN_ORDER_CYCLES	Y	Indicates whether to calculate the store lead time prior to the store opening. If no calculation is performed the profile order cycle and any applicable exceptions will be used.
AUTO_ASSIGN_ORDER_MULTIPLES	Y	Indicates whether order multiples should be automatically assigned for new SKU/pack size combinations.
AUTO_ASSIGN_PALLET_MULT	N	Indicates whether pallet multiples should be automatically assigned for new SKU/pack size combinations.
AUTO_ASSIGN_STACKING_FLAG	N	Indicates whether stacking flag should be automatically assigned for new SKU/pack size combinations.
AUTO_ASSIGN_STORE_FORMAT_PACK_SIZE	Y	Indicates whether to automatically assign a store format pack size for warehouse and supplier sources.
AUTO_CREATION_OF_DELIVERY_GROUP	Y	Indicates whether to automatically create delivery groups for new supplier.
AUTO_CREATION_OF_ORDER_GROUP	Y	Indicates whether to automatically create order groups for new supplier.
AUTO_CREATION_OF_PROFILE	Y	Indicates whether to automatically create profiles for new suppliers.
AUTO_RANGE_BY_SHIP_TO_ONLY	N	Indicates whether to automatically range new SKU packs only to warehouses that match the supplier Ship To value. Otherwise ranges to all valid SKU pack/warehouse combinations.
AUTO_RANGE_DEMAND_GROUP	Y	Indicates whether to automatically range demand group for new SKU.
CONTINUE_ORDER_SENDER_BEAN_FOR_PO	Y	Switch to start/stop polling for purchase orders by order sender bean. Possible values are Y (start) and N (stop).

Configuration Parameter	Default Value	Description
CONTINUE_ORDER_SENDER_BEAN_FOR_TSF	Y	Switch to start/stop polling for transfer orders by order sender bean. Possible values are Y (start) and N (stop).
COPY_SISTER_STORE	Y	Indicates whether to copy sister store to associated new store.
COPY_SISTER_WAREHOUSE	Y	Indicates whether to copy sister warehouse to associated new warehouse.

Configuration Parameter	Default Value	Description
DEFAULT_CASE_WT	1	The default case weight used by the case weight automatic assignment process. This value must be between .1 and 9999.99, inclusive.
DEFAULT_DMG_SIZE	1	The demand group size inserted for all automatically created demand groups. Valid values are 1 (small), 2 (medium), 3 (large), 4 (x-large).
DEFAULT_DMG_TYPE	0	The demand group type inserted for all automatically created demand groups. Valid values are 0 (cases), 1 (merchandising unit).
DEFAULT_PALLET_SETTING_USE_PALLET_HEIGHT	N	Indicates whether to use pallet height in pallet settings for system generated delivery groups.
DEFAULT_PALLET_SETTING_USE_PALLET_WEIGHT	N	Indicates whether to use pallet weight in pallet settings for system generated delivery groups.
DEFAULT_STACKING_FLAG	0	The default stacking flag used by the order multiple automatic assignment process. Valid values are: 0 = Yes, 1 = Same, 2 = No. Note that Same implies that only item A can be stacked on top of item A.
DEFAULT_VEHICLE_FOOTPRINT	22	Indicates the default vehicle footprint for system generated delivery groups.
DEFAULT_VEHICLE_HEIGHT	1	Indicates the default vehicle height for system generated delivery groups.
DEFAULT_VEHICLE_MINIMUM_DROP	0	Indicates the default vehicle minimum drop for system generated delivery groups.
DEFAULT_VEHICLE_WEIGHT_LIMIT	99999	Indicates the default vehicle weight limit for system generated delivery groups.
DLG_OG_VALIDATION_IND	Y	This property indicates whether the validation which checks if there is a delivery group and/or order group assigned for the given demand group, destination, and effective date should execute.
DMG_ASSIGNMENT_METHOD	1	The value 1 indicates that new pack sizes associated with an existing SKU will be assigned to the existing SKU's demand group. The value 2 indicates that each new SKU/pack size will be assigned to a unique demand group.
EXTENDED_PLANNING_HORIZON	7	The number of days beyond the planning horizon for which AIP Online will extract data. This ensures proper order quantities for delivery on the last day of the planning horizon and must match the corresponding AIP RPAS implementation parameter.
GATHER_SCHEMA_STATS	Y	Switch to turn ON/OFF schema analyze option. A value of Y will turn the option ON and N will turn the option OFF.
GATHER_SCHEMA_STATS_ESTIMATE_PERCENT	100	The estimate percent to be used for gathering schema statistics.

Configuration Parameter	Default Value	Description
INVENTORY_TRACKING_LEVEL	EACHES	The level at which inventory is tracked. Valid values are PACKS and EACHES. If the value is EACHES, then the DMG_ASSIGNMENT_METHOD parameter will be overridden and all pack sizes of a SKU will be assigned to the same demand group.
LOG_DEBUG	N	Indicates whether debug messages will be written to DBMS_OUTPUT.
MAX_WALKING_LEAD_TIME	22	Indicates the maximum lead time to use in calculating a walking lead time.
MIN_PLANNING_HORIZON	35	Minimum number of planning days for any SKU. This value is used in SKU planning horizon when there exists no SKU level planning horizon exception or class level planning horizon default.
OFF_SUPPLY_OFFSET	3	The corporate off supply offset value is used to calculate off-supply dates based on off-sale dates imported from the merchandising system. Off-supply dates will be set to: [off-sale date] - OFF_SUPPLY_OFFSET.
ONL_SCHEMA_OWNER	USER	The username of the AIP Online schema owner.
ON_OFF_SUPPLY_OVERWRITE_IND	Y	Indicates whether or not to update the existing on/off supply dates when importing sale dates. A value of Y will update both on/off supply and on/off sale dates. A value of N will update only the on/off sale dates.
ON_SUPPLY_OFFSET	3	The corporate on supply offset value is used to calculate on-supply dates based on on-sale dates imported from the merchandising system. On-supply dates will be set to: [on-sale date] - ON_SUPPLY_OFFSET.
PO_INTERFACE_METHOD	M	Determines whether purchase orders are interfaced to external systems via XML messages (M) or text files (F).
REBUILD_INDEXES_POST_RELEASE	Y	A value of Y (recommended) will rebuild unusable indexes after all orders are released. A value of N will rebuild the indexes during LOAD.
SCHEDULE_EXCEPTION_OFFSET	9	Indicates the number of days after store open that schedule exceptions copied in the sister store process will begin.
SCHEMA_STATS_DEGREE	8	Controls parallelization of function gen_schema_stats.
SEQUENCE_CACHE_BULK_INSERT_VALUE	20	This is the recommended cache value for the sequences while doing bulk insert.
SET_WH_ORD_MULT	1000	Bulk fetch limit for the procedure/function.
SISTER_STORE_OFFSET_WEEKS	12	Indicates the maximum number of weeks before store open that a sister store copy will take place.

Configuration Parameter	Default Value	Description
SISTER_WAREHOUSE_OFFSET_WEEKS	12	Indicates the maximum number of weeks before warehouse open that a sister warehouse copy will take place.
SYSTEM_HIGH_DATE	99991231	The default high date used by the system. Date format is yyyyymmdd.
TABLE_STATS_DEGREE	8	Controls parallelization of function gen_table_stats.
TSF_INTERFACE_METHOD	M	Determines whether transfers are interfaced to external systems via XML messages (M) or text files (F).

Configuration Parameter	Default Value	Description
USE_DBMS_STATS_AUTO_SAMPLE_SIZE	Y	A value of Y (recommended) will use AUTO_SAMPLE_SIZE as estimate_percent in gen stat functions of aip_util package. A value of N will use NULL in gen_table_stats and GATHER_SCHEMA_STATS_ESTIMATE_PERCENT in gen_schema_stats.
VALID_SOURCE_VALIDATION_IND	Y	Indicates whether to execute the validation to determine whether a source is valid. A valid source is one that is currently acting as a destination with a split % against it or where all the commodity pack sizes for the demand group are pending de-ranged.
VDATE	19991231	Used to maintain the same date throughout the batch run. Functions get_vdate, set_vdate, and inc_vdate of the aip_util package are used to retrieve, set, and increment. Date format is YYYYMMDD.
WALKING_LEAD_TIME_OFFSET	45	Indicates the number of days before a store open date to begin calculating a walking lead time for that store.
WIP_IND	N	Indicates if the WIP subsystem is being used. WIP-related extracts will only be performed if this value is Y.

In addition to the parameters listed above there a number of parameters that might be tweaked for performance reasons. These parameters begin with the "BFL" prefix and serve to limit the number of records retrieved at one time when executing a Bulk Fetch. The parameters are specific to a procedure or function.

RESTART_CONTROL

The Oracle RESTART_CONTROL table defines the number of parallel subprocesses that a high data volume process uses in shell script. For example:

- Importing STORE SOURCE data from RPAS into Online
- Exporting STORE SOURCE data from Online to RPAS
- Importing INTO-STORE PURCHASE ORDERS from RPAS to Online
- Importing INTO-STORE Transfers from RPAS to Online

The column NUM_THREADS controls the degree of parallelism while executing the processes defined in column PROGRAM_NAME of this table.

ORDER_NUMBER

The Oracle ORDER_NUMBER table defines the valid range of order numbers for purchase orders and transfers. The range of values should not overlap the range of values allocated to any other system capable of generating orders. Update the ORDER_NUMBER table to reflect the range of purchase order and transfer numbers that are appropriate for AIP.

ORDER_PURGE_PERIOD

The Oracle ORDER_PURGE_PERIOD table defines the number of day an order remains in the system after it has been set to a Closed status. Review the default purge periods inserted in the table at installation time, and update the values for purchase order purging and transfer purging when needed.

ORDER_DEFINITION

In AIP Online orders are held at order detail level (i.e. order line time level). When an order number is generated, it is generated at order header level. The Oracle ORDER_DEFINITION table holds information that specifies how order line items are grouped into to order headers.

The following options are available for defining the level of grouping:

- Source - Indicates if order sources are used in order header roundup.
- SKU - Indicates if SKUs are used in order header roundup.
- Pack Size - Indicates if pack sizes used in order header roundup.
- Destination - Indicates if the order destinations are used in order header roundup.
- Delivery Date - Indicates if delivery dates are used in order header roundup.

In the example below SKU (commodity) and pack size are not used in the order definition. This means that for each order type an order number will be assigned to each unique combination of source, destination, and delivery date. This will result in one to many SKU pack sizes being grouped under a single order number for an order type.

Destination	Order Type	USE SOURCE	USE COMMODITY	USE PACK_SIZE	USEDEST	USE DELIVERY_DATE
Warehouse	Purchase Order	Y	N	N	Y	Y
Store	Purchase Order	Y	N	N	Y	Y
Warehouse	Transfer	Y	N	N	Y	Y
Store	Transfer	Y	N	N	Y	Y

Review the ORDER_DEFINITION table and change the settings if needed.

Note: The only supported configurations for AIP 13.0 are the defaults provided in the table above and “Y” for all columns. These two configurations can be applied per destination/order type. They do not need to be applied uniformly across destination or order type.

Order Cycles

The default order cycles created at implementation time are used by the batch processes that automatically create Profiles and Order Groups. These order cycles can be modified to match your business needs however **they must remain in sync with the same “special default order cycles” created in the RPAS platform.**

Store Order Cycles

Store order cycles are assigned to a profile when it is automatically generated by the batch processes. The following Store Order Cycles exist for these procedures

- Warehouse profiles (PRFWS)

- Direct Profiles (PRFVS).

The following store order cycles are created during installation.

Order Cycle	Sun	Mon	Tues	Wed	Thurs	Fri	Sat
PRFVS		15					
PRFWS	1	1	1	1	1	1	1

Store Order cycles are maintained in two tables, STORE_ORDER_CYCLE and STORE_ORDER_CYCLE_LEAD_TIME.

STORE_ORDER_CYCLE

STORE_ORDER_CYCLE_ID	STORE_ORDER_CYCLE_CODE	STORE_ORDER_CYCLE_NAME	STORE_ORDER_CYCLE_LENGTH
2	PRFVS	New Sup To Store Default OC	7
3	PRFWS	New Sup Warehouse to Store OC	7

STORE_ORDER_CYCLE_LEAD_TIME

STORE_ORDER_CYCLE_ID	STORE_ORDER_CYCLE_SEQ	RELEASE_LEAD_TIME	PLACEMENT_LEAD_TIME
2	1	-1	-1
2	2	15	15
2	3	-1	-1
2	4	-1	-1
2	5	-1	-1
2	6	-1	-1
2	7	-1	-1
3	1	1	1
3	2	1	1
3	3	1	1
3	4	1	1
3	5	1	1
3	6	1	1
3	7	1	1

- The STORE_ORDER_CYCLE_LENGTH is 7; therefore there is one row in the STORE_ORDER_CYCLE_LEAD_TIME table for each of the 7 days in the order cycle. Changing the length of the Store order cycle would require additional rows to be added to the STORE_ORDER_CYCLE_LEAD_TIME table such that the STORE_ORDER_CYCLE_SEQ runs from 1 to n where n is the order cycle length. The ONLY supported lengths are 7, 14, or 28. DO NOT choose a length other than those values.
- A RELEASE_LEAD_TIME or PLACEMENT_LEAD_TIME value of -1 indicates "blank" on the screen or no lead time.

- The `PLACEMENT_LEAD_TIME` value MUST be equal to or greater than the `RELEASE_LEAD_TIME`. Therefore you cannot change one and not the other. The `PLACEMENT_LEAD_TIME` must NOT contain a value other than -1 when the `RELEASE_LEAD_TIME` is -1.

Warehouse Order Cycles

Warehouse order cycles are assigned to an Order Group when it is automatically generated by the batch procedures. The following Warehouse Order Cycles exist for these procedures:

- Warehouse sourced Order Groups (OGWW)
- Supplier sourced Order Groups (OGVW)

The following store order cycles are created during installation.

Order Cycle	Sun	Mon	Tues	Wed	Thurs	Fri	Sat
OGVW		15					
OGWW	1	1	1	1	1	1	1

Warehouse order cycles are maintained in two tables, `ORDER_CYCLE` and `ORDER_CYCLE_LEAD_TIME`.

ORDER_CYCLE

ORDER_CYCLE_ID	ORDER_CYCLE_CODE	ORDER_CYCLE_NAME	ORDER_CYCLE_LENGTH	COLLECTION_LEAD_TIME
1	OGVW	New Supplier Default Order Cycle	7	-1
2	OGWW	New Supplier Whs to Whs Order Cycle	7	-1

ORDER_CYCLE_LEAD_TIME

ORDER_CYCLE_ID	ORDER_CYCLE_SEQ	ORDER_LEAD_TIME
1	1	-1
1	2	15
1	3	-1
1	4	-1
1	5	-1
1	6	-1
1	7	-1
2	1	1
2	2	1
2	3	1
2	4	1

ORDER_CYCLE_ID	ORDER_CYCLE_SEQ	ORDER_LEAD_TIME
2	5	1
2	6	1
2	7	1

- The warehouse order cycle length (ORDER_CYCLE_LENGTH) is 7; therefore there is one row in the ORDER_CYCLE_LEAD_TIME table for each of the 7 days in the order cycle. Changing the length of the warehouse order cycle would require additional rows to be added to the ORDER_CYCLE_LEAD_TIME table such that the ORDER_CYCLE_SEQ runs from 1 to n where n is the order cycle length. The ONLY supported lengths are 7, 14, or 28. DO NOT choose a length other than those values.
- An ORDER_LEAD_TIME value of -1 indicates 'blank' on the screen or no lead time.
- The COLLECTION_LEAD_TIME must be equal to or less than the smallest ORDER_LEAD time for the order cycle. For the existing, unmodified, order cycle OGVW, the COLLECTION_LEAD_TIME can be at most 15. For the existing, unmodified, order cycle OGWW, the COLLECTION_LEAD_TIME can be at most 1.

WH_TYPE_INITIAL_PACK_TYPE

The Oracle WH_TYPE_INITIAL_PACK_TYPE table contains the warehouse type and pack type associations that are used for defaulting warehouse orderable units and order multiples. When the AIP Automated Data Maintenance batch processes run the pack type value defined for the respective process will define which pack size should be used for assignment first. If the pack size associated with the pack type is not valid for a given warehouse of the assigned warehouse type, additional logic in the batch will determine the next valid pack size to use.

The constraints on the table will need to be modified if additional warehouse types are added to the system via the STOCKING_POINT table. The warehouse type describes the destination warehouse type.

The process type identifies the process to which the warehouse type/pack type setting applies – either warehouse orderable units or order multiples.

SUPPLIER

Prior to importing any supplier data, the column constraint on the SHIP_TO column should be modified to match the SHIP_TO values that will be imported from the merchandising system. If additional values are being added, the Ship-to source and destination mappings must also be added to the SHIP_TO_WH_TYPE_SOURCE and SHIP_TO_WH_TYPE_DEST tables.

STOCKING_POINT

Prior to importing any warehouse data, the column constraint on the WH_TYPE column should be modified to match the WH_TYPE values that will be imported from the merchandising system.

SHIP_TO_WH_TYPE_SOURCE

This Oracle table contains the mappings between Supplier SHIP_TO values and the appropriate sources. These values are used when automatically generating Delivery Groups and Order Groups. When the WH_TYPE column is null, the supplier will be used as the source. A non-null WH_TYPE value indicates the warehouse that the supplier ships to is an intermediate warehouse that does not ship directly to the store. When the WH_TYPE is populated, the source of the Delivery Groups and Order Groups created will be Warehouses that match the WH_TYPE.

SHIP_TO_WH_TYPE_DEST

This Oracle table contains the mappings between Supplier sources (SHIP_TO_WH_TYPE_SOURCE) and the destinations. The destinations are used to determine the valid warehouse chambers to assign to the delivery groups and order groups. One SHIP_TO value can map to many sources and destination WH_TYPES.

ALERT_DEFINITION

Every alert is assigned a priority based on the type of the alert. The priority assigned to each alert type can be set in the ALERT_DEFINITION table. The priority setting currently has no bearing on the rest of the system. It is simply a visual indicator of importance and search mechanism for the user.

Note: Updating the alert type priority in the ALERT_DEFINITION table changes the priority of any previously existing alerts corresponding to the alert type being modified

ALERT_DEFINITION_DESC

The Oracle ALERT_DEFINITION_DESC table contains the text of each alert, and the corresponding SHORT_DESC or alert type description. The SHORT_DESC value is displayed to the user as search criteria. You may modify the text of the SHORT_DESC, however, the screen is optimized to display the values provided in the installation. It is not recommended that you modify the LONG_DESC as the correct placement of the data displayed to the user depends on the structure of the LONG_DESC text.

The LONG_DESC and SHORT_DESC can be translated for another LANG and COUNTRY if desired.

ALERT_STATUS_DESC

Each alert that is imported or generated by AIP Automated Data Maintenance batch will be assigned a status. The status is displayed to the user in the DM online screen. The user can then modify the status of the alert by selecting a status option from a drop-down list. The status options displayed in the list and their descriptions are contained in the ALERT_STATUS_DESC table.

Adding a Status

The ALERT_STATUS_CODE indicates the chronological order of the statuses displayed on the screen as well as the code that is saved indicating the alert's current status.

When adding a status:

- The smallest value will be automatically assigned to every new alert.
- The largest value will be considered the final status indicating no more work needs to be completed related to the alert.
- It must be added to every set of LANG/COUNTRY combinations. Therefore, the same set of ALERT_STATUS_CODE values must exist for every LANG and COUNTRY on the table.

AIP Application Server

The following properties files are used to configure the application during implementation. All files are located in <aip app server install location>/config. Review the values in the files for completeness and accuracy. There are additional properties outlined below which must be manipulated when using the RIB with AIP.

db.properties

File Location: <aip app server install location>/config

This file contains configuration values that are related to the system's database. This file tells the DM Online and OM Online application how to connect to the database. After installation, this file should contain the correct information because it is set in the initial run of the AIP Online application. However, it is a good idea to review the values in the files for completeness and accuracy. The following table provides a description of the values contained in the db.properties file.

Configuration Value	Description
common.prop.db	This value defines the database that the system is utilizing. This value is set to Oracle.
common.prop.oracle.sid	This value is an Oracle parameter that defines the database name that the system is utilizing. SID stands for system identifier.
common.prop.oracle.host	This value is an Oracle parameter that refers to the database listener. This value defines the "host:port" that the database listener is using.
common.prop.oracle.schema	This value is an Oracle parameter that defines the schema owner's username. If the username/password defined in common.prop.user is not the schema owner, then this field must also be added and defined in order for the AIP Online Administration screens to function properly.
common.prop.user	This value is an Oracle parameter that defines the username/password of the database. This can be a schema owner or a standard user.
common.prop.poolsize.	This property represents the connection pool size that AIP application uses. This does not include the connections that EJB might establish with the database. Default value of this property is set to 40. The user is allowed to increase this value but not to decrease it.

main.properties

File Location: <aip app server install location>/config

The following table provides a description of the properties contained in the main.properties file. This file is used by the Java enabled applications: DM online, OM, and RIB publication via the OrderSenderBean.

Property	Description
base	This must match the context root of the ear or war file. This is "/" for a production system, or "/test1" for the 1st of several test systems on a single physical computer.
securemode	This is set to "1" to force connections to switch from http (non-secure) to https (secure) upon logon. This value can also be set to "0" to prevent the connection from being switched from non-secure to secure mode.
setfileattr.rcapps.properties	This defines a file to contain color attributes. The default setting is rcapps.properties.

Publishing Purchase Orders and Transfer Data to RMS

You can configure AIP Online to publish Purchase Order and Transfer Data to the Oracle Retail Merchandising System (RMS) via the Oracle Retail Integration Bus (RIB). Perform the following procedure to enable RIB publication.

1. Uncomment the following parameters and change the OFF status of keys to ON status where applicable in the main.properties file to activate the OrderSenderBean, which calls the RIB publication routines:

```
#aip.prop.order.po.export=OFF
#aip.prop.order.tsf.export=OFF

#aip.prop.order.period.count=1
#aip.prop.order.period.start.1=08:00:00
#aip.prop.order.period.end.1=20:00:00
#aip.prop.order.time.interval=00:01:00

#aip.prop.order.po.message.family=XOrder
#aip.prop.order.po.message.type.name=msg_type
#aip.prop.order.po.queue.table.name=PO_MFQUEUE
#aip.prop.order.po.table.id.name=order_no

#aip.prop.order.tsf.message.family=XTsf
#aip.prop.order.tsf.message.type.name=msg_type
#aip.prop.order.tsf.queue.table.name=TSF_MFQUEUE
#aip.prop.order.tsf.table.id.name=tsf_no

#aip.prop.order.max.message.bundle.size=10
#aip.prop.order.max.publishing.count=20
```

2. Save the main.properties file.

3. Have the application server administrator restart the server instance where the `OrderSenderBean` and AIP Online application are deployed.

main.properties Publication Properties

File Location: <aip app server install location>/config

The following table provides a description of the publication properties referenced in the previous topic.

Property	Description
aip.prop.order.po.export	This property must be set to 'ON' to do RIB-based publications Purchase Orders. (PO_MFQUEUE)
aip.prop.order.tsf.export	This property must be set to 'ON' to do RIB-based publications of Transfers (TSF_MFQUEUE)
aip.prop.order.period.count	The number of periods in the day during which the <code>OrderSenderBean</code> will invoke RIB publication. This value must be greater than zero if RIB-based publication is to be used. In addition, at least one of the above two properties must in set to 'ON'.
aip.prop.order.period.start.x	The start time in HH:MM:SS format of period x where x is 1 ... aip.prop.order.period.count.
aip.prop.order.period.end.x	The end time in HH:MM:SS format of period x where x is 1 ... aip.prop.order.period.count.
aip.prop.order.time.interval	The amount of time in HH:MM:SS format between calls to <code>OrderSenderBean.checkAndPublish()</code> function.
aip.prop.order.po.message.family	The purchase order message family name. This value is required by the RIB to ensure proper validation of message payloads. This value should be set to 'XOrder'.
aip.prop.order.po.message.type.name	This value can be used to indicate if the message is a header-create, header-update, detail-create, or detail-update message. Although message types are used to order the <code>OrderSenderBean</code> query, this parameter value is not currently used.
aip.prop.order.po.queue.table.name	The AIP Online table which <code>OrderSenderBean</code> queries to check for Purchase Order related messages awaiting publication. This value should be 'PO_MFQUEUE'.
aip.prop.order.po.table.id.name	This value is used to group functionally related message content. For example, all message content related to purchase order number 123 would be grouped. This value should be 'order_no'.

Property	Description
aip.prop.order.tsf.message.family	The transfer message family name. This value is required by the RIB to ensure proper validation of message payloads. This value should be set to 'XTsf'.
aip.prop.order.tsf.message.type.name	This value can be used to indicate if the message is a header-create, header-update, detail-create, or detail-update message. Although message types are used to order the OrderSenderBean query, this parameter value is not currently used.
aip.prop.order.tsf.queue.table.name	The AIP Online table which OrderSenderBean queries to check for Transfer related messages awaiting publication. This value should be 'TSF_MFQUEUE'.
aip.prop.order.tsf.table.id.name	This value is used to group functionally related message content. For example, all message content related to transfer number 456 would be grouped. This value should be 'tsf_no'.
aip.prop.order.max.message.bundle.size	The maximum number of message bundles to publish per call to OrderSenderBean.checkAndPublish(). The default is 10, but this number should be recalculated by the client based upon on-site performance testing.
aip.prop.order.max.publishing.count	The maximum number of messages per message bundle. For example, multiple Purchase Order header create message can be grouped in one message bundle to improve performance. The default value is 20, but this value should be recalculated by the client based upon on-site performance testing.

rcapps.properties

File Location: <aip app server install location>/config

These properties are applied to the main application login and navigation pages. These property settings do not apply to the pop-up applet screens.

The color properties can be set to any 6 character hexadecimal value and are preceded with the # symbol.

Hexadecimal color property examples:

#0000FF = blue

#FF0000 = red

The files defined for various properties are located off of the following base directory:

< rfp appserver location >/installedApps/<node> /AIPOnlineApp.ear/AIPOnlineWAR.war

Property settings that contain path assignments are appended to the base directory provided above. Use the complete path, base directory plus property path to locate specific files as needed.

Example:

```
apptop.page=/fragments/apptop.jsp
```

apptop.jsp can be found in the following path:

```
< rfp appserver location >/installedApps/<node>/AIPOnlineApp.ear/AIPOnlineWAR.war/fragments
```

The following table provides a description of the properties contained in the rcapps.properties file.

Property	Description
about.width	Width of 'about' windows. Currently, no 'about' windows are supported.
apps.width	Width of application windows.
appbanner.bg	Defines the main background color. This appears as the horizontal banner.
appmenu.bg	Menu banner background color. This appears as the vertical strip on the left side of the page. It is the background for any 'Applications', 'User Console', and 'Administration' menu items.
text.fg	Main text color. This is the text color for the main welcome on the login pages.
applet.codebase	Applet default codebase. The default value is appclasses. This is not expected to ever change.
apppage_top.page	Contains the code content for the upper fragment of the page including the top and left banners. The default value is /fragments/apppage_top.jsp
apptop.page	Defines the standard top banner (normal and compact versions). The default value is /fragments/apptop.jsp.
apptop_about.page	Defines the content of the 'about' page. 'About' pages typically contain version numbers and company information. 'About' pages are not supported by Oracle AIP. The default value is /fragments/apptop_about.jsp.
head.page	Contains the code content getting the configurations and saving them in variables used throughout the page. The default value is /fragments/head.jsp.
appbot.page	Defines the standard bottom banner. The default value is /fragments/appbot.jsp.
apppage_bot.page	Contains the code content for the lower page fragment. The default value is /fragments/apppage_bot.jsp.
securemode.allow	Used to enable securemode. Set to "*" to enable securemode on all clients, or set to "*,!Mac" to enable securemode on all clients except those that are using a Macintosh.

Property	Description
webmeter.allow	Used to display webmeter. Set to "*" to display WebMeter for all clients, or "!Mac" to display WebMeter for all clients except those that are using a Macintosh.
webmeter.page	Defines the file containing code for the WebMeter page. The default is /fragments/webmeter.jsp.

security.properties

File Location: <aip app server install location>/config

This file defines security administration settings for the application.

The following table provides a description of the properties contained in the security.properties file.

Property	Description
trackeradmin.prop.adminhosts	This is a comma delimited list of "host/mask" values that are allowed to access phantasm (the primary administration page).

strings_en.properties

This file provides the displayed text for the screens. Error text originating in the database is not provided in this file and is not accessible for customization. Customizing this file can have an affect on the visual presentation of the screen or popup message. The new text should be of equal or similar character lengths as the modified text.

The file is located in the following server path:

```
<rfp appserver location >/installedApps/<node>
/AIPOnlineApp.ear/rfp.war/appclasses/res/com/rettek/applet/strings_en.properties
```

Config.properties

This file contains configurable settings for Data Management and Order Management that determine how certain screens appear immediately when opened. It also contains settings which allow or prevent certain user activities on the screens.

This file is located in < WAS_HOME >/installedApps/<node>/AIPOnlineApp.ear/AIPOnlineWAR.war/appclasses/res/com/retek/applet.

Data Management Online Settings

The following table provides a description of properties found in the Config.properties file that are used to define Data Management online (DMo) settings.

Property	Description
datamanagement.suppress.pre.save.message	Indicates whether or not to suppress the pre-save message saying that all applicable rows will be updated. This setting currently only applies to the On Supply/Off Supply screen when performing mass updates of SKUs and Stores. The valid values for this property are 0 to display the pre-save message and 1 for do not display the pre-save message.
datamanagement.unit.of.measure.default	Defines the unit of measure (UOM) radio button that is initially selected when displaying DM Online screens containing UOM. Valid values are 0 for cases, or 1 for eaches.
datamanagement.warehouse.type.available	This setting determines whether the warehouse type field is displayed in the DM online application. This should be set to 0 when warehouse types are not defined for warehouses, or set to 1 if warehouse types are assigned to warehouses.
export.launch	When the user exports the Alerts from the DM online application to a savable file, this setting will determine whether the file is opened immediately or not. If set to launch immediately, the user must have a default program for the particular file extension being saved. Two file formats are available, spreadsheet (.xls) or comma delimited (.csv). The default program associated with the file extension is specific per PC and is not an AIP controlled setting. If no program is associated to the file extension, the user may receive an error and the file will not be opened. If an error occurs, the user must manually open the file in the appropriate program. The valid values for this property are 0 for don't launch, and 1 for launch immediately.

Property	Description
export.type.default	When exporting the Alerts from the DM online application to a savable file, the user has the option of saving the data in spreadsheet or comma delimited file format. This property setting is applied to the initial radio button selection that defines the format. This property defines the value selected by default. The user has the option of choosing the other format by selecting the other radio button option. The valid values for this property are 0 for comma-separated file (CSV) or 1 for spreadsheet (XLS).
paginggrid.page.size	This is the default “pagesize” setting applied to all screens with paging. Pages contain a certain number of rows and only the content for one page is displayed at a time. This property defines the number of rows that are displayed in a single page. When setting this value you should consider that the setting is system wide setting, not user specific. The resolution of each user’s screen will affect how many rows are visible without scrolling. Assign a large number to this property may result in the need for some users to scroll down the page to see all of the rows. Setting this property to an arbitrarily large number also negates the benefits of paging, which is used to improve screen rendering time performance and display information in a more usable fashion. This property can be set to any value greater than 0 and less than or equal to 9999999.
paginggrid.<screen name>.page.size	Each screen that uses paging has its own pagesize setting. This setting, when greater than 0, will override the default ‘pagesize’ setting. The same considerations for the default should be applied to the individual screen settings. A value of -1 indicates that the default should be used. The valid values for this property are -1 or any number greater than 0 and less than or equal to 9999999.

Order Management Settings

The following table provides a description of properties found in the config.properties file that are used to define Order Management (OM) settings.

Property	Description
ordermanagement.order.type.default	<p>This setting defines which order type radio button is selected by default. The available options are All, Transfers, or Purchase Orders. This setting applies to all Order Management screens which allow the user to search or select an order type. Valid values for this property are as follows:</p> <ul style="list-style-type: none"> ▪ 0 for All ▪ 1 for Purchase Orders ▪ 2 for Transfers <p>Note: The ordermanagement.viewable.order.type setting takes precedence over this setting. If this setting conflicts with it, the ordermanagement.viewable.order.type will be used instead.</p>
ordermanagement.viewable.order.type	<p>This setting defines which order types users are able to view and possibly manipulate. Users cannot perform any operations on orders types that do not match this setting, nor can they view order types that do not match this setting. This setting applies to all Order Management screens. The valid values for this property are as follows:</p> <ul style="list-style-type: none"> ▪ 0 for All ▪ 1 for Purchase Orders ▪ 2 for Transfers <p>Note: Users may have privileges to the Order Create screen but they will be unable to perform any operations if the ordermanagement.viewable.order.type is not set to All or Purchase Order.</p>
ordermanagement.unit.of.measure.default	<p>Defines the unit of measure (UOM) radio button that is initially selected when displaying OM Online screens containing UOM. Valid values are 0 for cases, or 1 for eaches.</p>
ordermaintenance.order.display.format	<p>This setting defines the display format that is selected by default in the Order Maintenance search criteria pop up. The valid options for this property are 0 for the tree format and 1 for the grid format.</p>
ordermaintenance.expand.all.default	<p>When the search results in the Order Maintenance screen are displayed in a tree format, this setting is used to determine whether the tree should be initially displayed in a collapsed or expanded state. When collapsed, only the header level order information appears. When expanded, all of the SKU-pack sizes and order quantities associated with the order display. Valid values for this property are 0 for collapsed or 1 for expanded.</p>

Property	Description
ordermaintenance.update.quantity.default	<p>In the Order Maintenance screen, the user has the option of viewing the quantity on the order as the total ordered quantity or as the outstanding, un-received order quantity. This setting is used to determine which radio button option will be initially selected on the screen. The valid values for this property are 0 to view the total order quantity, or 1 to view the unreceived order quantity.</p>
ordermaintenance.supplier.tracking.default	<p>When moving the un-received purchase order quantity to a new delivery date and/or destination, the user must specify whether the supplier was the cause of the change or their business. The value that is specified affects the supplier performance tracking. This property defines which drop-down list option should be selected by default. The valid values are as follows:</p> <ul style="list-style-type: none"> ▪ 0 – Always Ask ▪ 1 – Supplier Initiated ▪ 2 – Business Initiated <p>The Always Ask option is recommended if the business will be viewing and using the supplier performance tracking information. This option forces the user to consciously select the appropriate value.</p> <p>If the business will not be using the supplier performance tracking information, then either the Supplier Initiated or Business Initiated option should be selected so that a value is always selected by default. This prevents the user from having to randomly pick one of the two options, as well as prevents the unnecessary popup which appears when the Always Ask option is selected in the drop-down list.</p>
ordermaintenance.view.default	<p>This setting defines which view should be displayed initially in the Order Maintenance Screen—the Standard View or the Extended View. The extended view includes the Supplier Tracking value and the Release Date. The additional columns displayed in the extended view results in each column having a smaller display size. Valid values for this property are 0 for the standard view and 1 for the extended view.</p>
ordermaintenance.allow.move.unreceived	<p>This setting allows the business to prevent users from changing the destination and delivery date of a purchase order. The valid values for this property are 0 to allow changing delivery dates and destinations, or 1 to prohibit changing delivery dates and destinations.</p>

Property	Description
ordermaintenance.move.unreceived.criteria	<p>This setting allows the business to define when it is acceptable to move un-received order quantities to a new delivery date and/or destination.</p> <p>The first option is anytime the order quantity is less than the received quantity. This means that the user can change the order delivery date and/or destination any time the order is released and not fully received.</p> <p>The second option is anytime the order is totally un-received. This means that the user can change the order delivery date and/or destination anytime the order has been released but not yet received against.</p> <p>The valid values for this property are 0 for not fully received or 1 for 0 received quantity.</p>
ordermaintenance.move.allow.destination.change	<p>This setting allows the business to restrict users from changing delivery destinations of their orders. This setting is used in the Order Maintenance Move Unreceived Order Quantity popup. When users are not allowed to change order destinations, they are left with the sole option of changing the delivery date. Valid values for this property are 0 to allow destination changes, or 1 to prevent destination changes.</p>
ordermaintenance.move.require.new.order.number	<p>This setting determines whether or not a new order number is required when moving an order. If a new order number is not required, users are allowed to choose whether to retain the existing order number or generate a new one when moving un-received quantities. Valid values for this property are 0 – Do not require a new order number or 1 – Require a new order number.</p>
ordermaintenance.allow.cancel.unreceived	<p>This setting allows the business to restrict users from fully canceling a Purchase Order. The user can still modify the Purchase Order quantity but they cannot fully cancel the un-received quantity. The valid values for this property are 0 to allow the un-received order quantity to be canceled or 1 to prohibit the cancelling of all un-received order quantity.</p>
ordermaintenance.allow.release.orders	<p>This setting allows the business to prevent users from manually releasing purchase orders in the Order Maintenance screen. Orders that have not been released cannot be modified. Only purchase orders released on their lead time by the batch order release process would be available for modification. The valid values for this property are 0 to allow manual release of orders, or 1 to prevent manual release of orders.</p>

Property	Description
ordermaintenance.allow.edit.quantities	<p>The setting allows the business to prevent users from modifying purchase order quantities. The user will still have the ability to cancel the outstanding unreceived order quantity unless the ordermaintenance.allow.cancel.unreceived property is also set to disallow cancelling unreceived order quantities. Valid values for this property are 0 to allow modification of order quantities, or 1 to prevent modification of order quantities.</p>
ordermaintenance.release.status.default	<p>This setting determines which Release Status radio button is initially selected in the Order Maintenance search criteria popup. The valid values for this property are 0 for all statuses, 1 for Released, or 2 for unreleased.</p>
orderreview.display.quantity.default	<p>This determines which Display Quantity value is initially selected in the Order Review search criteria popup.</p> <p>The first option is total quantity. This displays the summed order quantity in the search results.</p> <p>The second option is unreceived quantity. This will display the total order quantity that is still outstanding or yet to be received. This quantity is calculated as the total order quantity minus the total received quantity.</p> <p>The third option is received quantity. This will display the summed received quantity in the search results.</p> <p>The valid values for this property are 0 for total quantity, 1 for unreceived quantity, and 2 for received quantity.</p>
orderreview.display.zero.values.default	<p>This determines whether the Display Zero Values checkbox is initially checked or unchecked in the Order Review search criteria popup. Choosing to display zero values will result in zeros being displayed in the columns where no quantity is found. Note, however that at least one order must be found for the search criteria and date range in order to have a row displayed in the search results. When choosing to view received or unreceived quantities instead of the order quantity, it will be impossible to distinguish a displayed zero, which means no orders were found for the date range, from a 0 quantity was received or 0 quantity is yet to be received.</p> <p>The valid values for this property are 0 to not initially select the checkbox (do not display zeros) or 1 to initially select the checkbox (display zeros).</p>

AIP RPAS Configurations

The AIP RPAS configurations listed in this section allow the business to manipulate AIP to meet their business needs. The XML files, configuration files, measures, etc. are applied to the replenishment processing to affect the plan that is produced.

shortfallPriorityMatrix.xml

The Shortfall Priority Matrix describes the order in which available inventory is allocated when an inventory shortfall occurs. The matrix is organized across two axes, Destination Types and Boundaries.

The Destination Types are the list of store priorities in the system plus a single entry for warehouses (because warehouses do not have priorities). The list of store priorities is configurable, but the default Destination Types are as follows:

- Super High Priority Stores
- High Priority Stores
- Normal Priority Stores
- All Warehouses

The four Boundaries in the Shortfall Priority Matrix are as follows:

- CORT (Customer Orders over Review Time)
- MSS (Minimum Sales Stock)
- RP (Receipt Point)
- RUTL (Receive Up To Level)

The following is the default Shortfall Priority Matrix.

Default Shortfall Priority Matrix

	CORT	MSS	RP	RUTL
Super High	1	4	5	6
High	2	7	9	11
Normal	3	8	10	12
Warehouse		13	14	15

Note that CORT is not a valid boundary for Warehouses because Warehouses do not deal directly with customers.

The Shortfall Priority Matrix ranking is configurable. The configuration is specified using an XML file, `shortfallPriorityMatrix.xml`, which is formatted as shown below.

```
<reconciliation-priority-matrix>
  <boundary componentName="CustomerOrderOverReviewTime">
    <group id="1" priority="1"/>
    <group id="2" priority="2"/>
    <group id="3" priority="3"/>
  </boundary>
  <boundary componentName="WarehouseMinimumStock">
    <group id="0" priority="13"/>
  </boundary>
```

```

<boundary componentName="MinimumSalesStock">
  <group id="0" priority="13"/>
  <group id="1" priority="4"/>
  <group id="2" priority="7"/>
  <group id="3" priority="8"/>
</boundary>
  <boundary componentName="SupplyChainReceiptPoint">
    <group id="0" priority="14"/>
    <group id="1" priority="5"/>
    <group id="2" priority="9"/>
    <group id="3" priority="10"/>
  </boundary>
    <boundary componentName="SupplyChainReceiptUptoLevel">
      <group id="0" priority="15"/>
      <group id="1" priority="6"/>
      <group id="2" priority="11"/>
      <group id="3" priority="12"/>
    </boundary>

```

Within the XML file, the "group id" corresponds to a destination priority, where "0" is reserved for All Warehouses. The remaining destination priorities should match the store priorities. For example, the default destination priorities are "1" for Super High Priority Stores, "2" for High Priority Stores, "3" for Normal Priority Stores. The "componentName" is the name of a numeric DataContainer which will contain the calculated allocation boundary data.

For each group the allocation boundaries should only be prioritized in the following ascending order: CORT < MSS < RP < RUTL. Since the allocation boundaries are cumulative, undesirable results may be generated if this order is not followed.

It should also be noted that same priority numbers across multiple cells will not be supported in the current release. Each cell within the matrix should be assigned a unique priority number. Not doing so will result in erroneous results.

surplusPriorityMatrix.xml

The Surplus Priority Matrix describes the order in which available inventory is allocated when an inventory surplus occurs. The matrix is organized across two axes, Destination Types and Boundaries. The Destination Types are the same as those in the shortfall version, but the Boundaries are different.

The two Boundaries in the Surplus Priority Matrix are as follows:

- Up To Upper Boundary
- Above Upper Boundary

Default Surplus Priority Matrix

	Up To Upper Boundary	Above Upper Boundary
Super high	1	6
High	2	5
Normal	3	4
Warehouse		7

When stepping through the Surplus Priority Matrix, the 'Upper Boundary' is simply the appropriate Upper Boundary for the SKU and destination type. The 'Lower Boundary' on the other hand is always assumed to be zero. This is because when pushing inventory to destinations, the inventory position of those destinations need not have reached any particular lower boundary, because they may not have ordered anything. Therefore, by treating the lower boundary as zero, it is possible to assess all destinations against the Upper Boundary, regardless of their inventory position.

This matrix is configurable through direct access to the database. However, the rule that must be observed is that for any given Destination Type (consider this a row in the matrix), the boundaries must be addressed in increasing numerical order – there is no point in giving destinations a quantity 'Up to their Upper Boundary' after giving them inventory 'Above their Upper Boundary'. Note that by definition, the 'Above the Upper Boundary' cell has no upper numerical limit, and so as long as there are destinations associated with a particular row to which inventory can be sent, an 'Above Upper Boundary' cell will always exhaust all remaining inventory.

The Surplus Priority Matrix ranking is configurable. The configuration is specified using an XML file, surplusPriorityMatrix.xml, which is formatted as shown below.

```
<reconciliation-priority-matrix>
  <boundary componentName="Above Upper Boundary">
    <group id="0" priority="7" method="fair-share" />
    <group id="1" priority="6" method="fair-share" />
    <group id="2" priority="5" method="fair-share" />
    <group id="3" priority="4" method="fair-share" />
  </boundary>
  <boundary componentName="Up To Upper Boundary">
    <group id="1" priority="1" />
    <group id="2" priority="2" />
    <group id="3" priority="3" />
  </boundary>
</reconciliation-priority-matrix>
```

Within the XML file, the "group id" corresponds to a destination priority, where "0" is reserved for All Warehouses. The remaining destination priorities should match the store priorities. For example, the default destination priorities are "1" for Super High Priority Stores, "2" for High Priority Stores, "3" for Normal Priority Stores. The "componentName" is the name of a numeric DataContainer which will contain the calculated allocation boundary data. The "method" currently has only one valid designation ("fair-share") and should not be changed.

For each group the allocation boundaries should only be prioritized in the following ascending order: 'Up To Upper Boundary' < 'Above Upper Boundary'. Since the allocation boundaries are cumulative, undesirable results may be generated if this order is not followed.

It should also be noted that same priority numbers across multiple cells will not be supported in the current release. Each cell within the matrix should be assigned a unique priority number. Not doing so will result in erroneous results.

Measures

aip_env_rpas.sh

In addition to the infrastructure-type environment variables listed in Chapter 4, “System Configuration,” of this *Oracle Retail AIP Implementation Guide*, the `aip_env_rpas.sh` script contains implementation parameters which the business must customize. The values assigned to the variables in the “Implementation Parameters” section of `aip_env_rpas.sh` will be assigned as values to selected AIP RPAS measures during execution of the `set_implementation_parms.sh` script--which is run from `aip_batch.sh` when the ‘first time’ parameter is True. See Chapter 13, “First Day of AIP,” for details on running AIP batch with ‘first time’ parameter set to True.

The following table contains a description of the variables in `aip_env_rpas.sh` which correspond to the Implementation Parameters for AIP RPAS.

Implementation Parameter(s)	Default Value(s)	Description
DEFAULT_PLANNING_HORIZON	35	This variable is used as a default store planning horizon for DM. This parameter will be used to initialize the RPAS measure: <code>dm0_defplnhzn</code> .
POST_PROMOTION_SUBSTITUTION_FLAG	FALSE	The Post Promotion Substitution Flag determines whether promotional items should be substituted after their promotional date. This parameter will be used to initialize the RPAS measure: <code>dmx_pstpmsflg</code> .
SUPPLIER_ORDER_MULTIPLE_ALGORITHM	1	This flag determines whether the user will manually enter ordering parameters for the entire supply chain, or whether the supplier's value for Pallet Multiple and Order Multiple will be spread through the supply chain. If the value is 1, the two parameters listed above must be defined for both supplier to warehouse and warehouse to warehouse combinations of the supply chain. If the value is 0, the two parameters listed above need only be defined for the top tier of the supply chain--supplier to warehouse combinations. An algorithm will run as part of DM Batch to set the values for the inner tiers of the supply chain equal to the value of the top tier. Note that any warehouse to warehouse combinations that are either system generated by DM Automated Maintenance, or user generated will be overwritten in the RPAS measure! This parameter will be used to initialize the RPAS measure: <code>dmx_somalg</code> .

Implementation Parameter(s)	Default Value(s)	Description
SPECIAL_ORDER_CYCLE_ZERO SPECIAL_ORDER_CYCLE_ONE SPECIAL_ORDER_CYCLE_TWO SPECIAL_ORDER_CYCLE_THREE SPECIAL_ORDER_CYCLE_FOUR	"PFOCPRFVS" "PFOCOGVW" "PFOCPRFWS" "PFOCFULLC" "PFOCOGWW"	<p>The dm_x_speocy measure contains 5 values unique Order Cycle identifiers. These order cycles are used by default when automatically generating profiles and order groups. These should not be changed unless the AIP Oracle PL/SQL is customized to use the new Order Cycle codes and the order cycle exists in the AIP Oracle database.</p> <p>The order cycle lengths and lead times are not defined in AIP RPAS at implementation time. The order cycle lengths and lead times are defined in AIP Oracle at implementation time and will be loaded into AIP RPAS before the first full run of DM Batch.</p> <ul style="list-style-type: none"> ▪ PFOCPRFVS - Used when automatically creating a new Supplier Profiles. ▪ PFOCPRFWS - Used when automatically creating new Warehouse Profiles. ▪ PFOCOGVW - Used when the system creates Automated Supplier sourced Order Groups. ▪ PFOCOGWW - Used when the system creates Automated Warehouse sourced Order Groups. ▪ PFOCFULLC - This is an empty order cycle which is used to wipe out all receipt points and lead times. It is used for new Stores which will have a walking lead time calculated prior to the store opening. It can also be assigned as a profile order cycle. <p>These parameters will be used to initialize the RPAS measure: dm_x_speocy.</p>
STORE_ONLY_STRING	STR	<p>This string contains the Supplier Ship-to code that represents 'Stores Only'. This code is used when attempting to automatically set the store source value for a new SKU. Because the Supplier Ship-to values are also sent to AIP on Oracle, the codes and table constraints in both systems must remain consistent.</p> <p>This parameter will be used to initialize the RPAS measure: dm_x_storeonly.</p>

Implementation Parameter(s)	Default Value(s)	Description
CSC_STORE_FORMAT_STRING	SFMT1002	<p>This string contains the store format of the stores which receive their SKUs from the warehouse when the supplier of the SKU can supply both the stores and the warehouses.</p> <p>This setting is used when the batch tries to automatically set the Store Source value for a new SKU. When the selected supplier of the SKU has a Supplier Ship-to value equal to the value in dmxcscdir, this indicates that the supplier can ship to either CSC warehouses or directly to stores. To determine which store source to select (the supplier or warehouse) the store format of each store that the SKU is on-supply at is compared to the store format listed in this measure. If the store's format matches, then the store's default CSC warehouse is saved as the source for the SKU/store. This means that the supplier will provide the SKU to the warehouse and the warehouse will provide the SKU to the store.</p> <p>The selected store format to be saved in this measure must have the prefix 'SFMT' added to it.</p> <p>This parameter will be used to initialize the RPAS measure: dmxcscstrfmt.</p>
CSC_AND_STORE_DIRECT_STRING	CS_ST	<p>This is the supplier ship-to value that indicates the supplier ships to both CSC warehouses and stores. Because the Supplier Ship-to values are also sent to AIP on Oracle, the codes and table constraints in both systems must remain consistent.</p> <p>This parameter will be used to initialize the RPAS measure: dmxcscdir.</p>
WAREHOUSE_TYPE_RDC	CS_RG	<p>The value of this variable is a string that is used to represent warehouses which are Regional Distribution Centers.</p> <p>This parameter will be used to initialize the RPAS measure: IpWhTypRDCI.</p>
WAREHOUSE_TYPE_GSS	XD_GS	<p>The value of this variable is a string that is used to represent warehouses which are Deconsolidation Centers.</p> <p>This parameter will be used to initialize the RPAS measure: IpWhTypGSSI.</p>
WAREHOUSE_TYPE_XDK	XD_RG	<p>The value of this variable is a string that is used to represent warehouses which are Cross docks.</p> <p>This parameter will be used to initialize the RPAS measure: IpWhTypXDKI.</p>

Implementation Parameter(s)	Default Value(s)	Description
AUTOMATIC_WAREHOUSE_PROFILE_CREATION	FALSE	Controls the execution of the automatic warehouse profile creation logic. If set to False, the logic will not execute and warehouse profiles will not be automatically created. The user is responsible for manually creating warehouse profiles. If set to True, one warehouse profile is created for each new supplier. This parameter should be True if AUTOMATIC_WAREHOUSE_PROFILE_ASSIGNMENT is set to 1- 'Supplier'. Otherwise, false. Valid values are TRUE and FALSE
AUTOMATIC_WAREHOUSE_PROFILE_ASSIGNMENT	0	This measure controls the execution of the automatic warehouse profile assignment logic. If set to 2- 'Disabled,' the logic will not execute and the user is responsible for manually assigning new SKUs to warehouse profiles. If set to 1 - 'Supplier,' the system will search for a warehouse profile that was created for one of the SKU's suppliers and assign the new SKU to it. If set to 0 - 'Class,' the system will look for the warehouse profile that has been designated as the default profile for the SKU's class (Class to Profile Assignment) and assign the new SKU to it. This measure should be set to 'Class' or 'Disabled' when AUTOMATIC_WAREHOUSE_PROFILE_CREATION is FALSE.

Modifying Measure Base Intersections Using Configuration Tools

Using the RPAS Configuration Tools, the base intersection of the following measures can be modified.

Note: The data file containing the data must match the configured measure intersection.

Measure	Description	Valid Configuration
IpFctWkPrfD	Week to Day Demand Forecast Percentage Default	All Products/Chain/Day-Of-Week Company/Chain/Day-Of-Week Division/Chain/Day-Of-Week Department/Chain/Day-Of-Week Class/Chain/Day-Of-Week Subclass/Chain/Day-Of-Week
IpFctWkPrfE	Week to Day Demand Forecast Percentage Override	Subclass/Chain/Day-of-Week

Import Configuration Files

Missing data files can corrupt downstream data and cause errors which are difficult to interpret and trace to the root. Therefore, validation of the received import files must be performed prior to running any batch calculations or loading any files with dependencies. A set of configuration files are used to validate that all required files are present before proceeding to load them.

- The configuration files provide a complete list of hierarchy and measure data that can be loaded. If a client chooses to load additional data rather than have the user enter it, they may add the file to the appropriate configuration file so that its presence in the AIP RPAS import directory is validated.
 - The configuration files can be modified to specify whether a file is required or optional.
 - A file is considered required if its presence is essential for the batch run. A missing required file will cause batch to halt. A required file must be present, even if it is zero (0) byte, which indicates that the extracting worked correctly but there was no data to extract.
 - A file is considered optional if the batch will not halt when the file is not present. No zero (0) byte file is required. A file can only be deemed optional if it provides data that is not required by the replenishment batch modules, is not required by AIP Online, and there are no required files that are dependent on it.
 - Additionally, if the same data can be entered in a workbook before the batch run, the loaded data may also be considered optional.
 - Optional files do not have to be loaded, or they may be loaded weekly or less frequently depending on the file/purpose.

The configuration files for validation are listed below:

- earlyfiles.config
- latefiles.config
- forecastdata_from_external.config

After the presence of all required files has been validated a number of files are run through a stocking point prefix-adding script as well as a binary executable called interutil. These processes perform a myriad of formatting tasks including splitting files, adding S, V or W prefixes to Stores, Suppliers, and Warehouses respectively, and transforming RMS-sourced files from RMS SKU to AIP SKU or SKU-pack size. The list of files containing measure data that are reformatted by interutil is determined by a second set of configuration files.

- The configuration files can be modified to prevent interutil from being run for files that are in AIP RPAS loadable format.
- Only files containing measure data are listed in the configuration files. Hierarchy files must be provided in the predetermined format.

Note: The *AIP Operations Guide* and “RMS Integration and Mapping” information provided within this document should be carefully reviewed for file format and file output from interutil before modifying the contents of the configuration files.

The interutil configuration files are listed below:

- dm_rms_measures.config
- srp_rms_measures.config
- wrp_rms_measures.config

The table below provides information about each of the loadable configuration files.

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
Ad (advertisement) Hierarchy	had.txt	Used for viewing Ad information and filtering workbook wizard selections based on Ad information.	Early
Ad/Rollout Notes	ipadrlnntsi.txt	Notes to the Planner about advertisements, new SKU rollout, or any other pertinent information needed for planning. Notes can be entered/changed in workbooks as well.	Early
Banded SKU	dmx_bndprdasc.txt	Used if the client buys merchandise in product weight bands (i.e. turkeys). This file contains the parent child relationship between the SKUs.	Early
Customer Orders	sr0_co_.txt	Contains a total order quantity of a SKU that has been committed to customers. Customer Orders are treated as additional need above and beyond forecasted need.	Early
Daily Forecast	sr0_frclvl1_*.txt	The daily forecast is optional for 3 reasons. 1. Both a daily and weekly forecast are not required. One can be provided and not the other (depending on system configuration). 2. An updated forecast is typically not reproduced daily, and therefore is not required daily. 3. A forecast is not required if using replenishment methods which use historical sales.	Late-precritical
Daily Forecast Standard Deviation	sr0_fcterrlv1.txt	Standard Deviation of the daily forecast.	Late-precritical

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
Daily Sales	sr0_dayslsld.txt	Daily Sales are used in store replenishment to calculate "Today's" Projected Inventory position when a Current Inventory Feed is not available. If daily sales are also unavailable then another calculation alternative is used.	Late-precritical
Daily Short Code Sales	sr0_dyscsls.txt	This value represents the number of units that were sold as a Markdown yesterday. This value is used for calculating High Dissipation alerts.	Late
Default Warehouse	default_wh.txt	Used to automatically assign the STORE SOURCE. If not provided, the Default Warehouse CSC might be used otherwise the store source will not be automatically assigned when the store's source is determined to be the default warehouse (based on the SKU's supplier/ship-to value).	Early
Default Warehouse CSC	default_wh.txt	Used to automatically assign the STORE SOURCE. If not provided, the Default Warehouse might be used. Otherwise the store source will not be automatically assigned when the store's source is determined to be the default CSC warehouse (based on the SKU's supplier/ship-to value).	Early
Direct Supplier Flag	dmx_dirspl.txt	This flag indicates whether the Supplier is able to supply stores directly or not. This prevents the system from allowing certain supply-chain setups.	Early
Discontinuation Date	dmx_dscdt_.txt	Flags SKU-packs as discontinued. Used to automatically de-range SKU-pack sizes and automatically re-assign ordering pack sizes.	Early
Expected Write-off	sr0_expwrtoff.txt	Represents the quantity of stock expected to be thrown out for any reason (spoilage, breakage, etc.) on a given day. Expected Write-offs override calculated expected spoilage.	Early
Historical Lost Sales	sr0_hstls_.txt	Used in Alert Calculations.	Early
Interval Hierarchy	intv.txt	This is used when loading the Poisson Distribution Lookup table. This is required if Poisson will be used as a replenishment method.	Early
Inventory Adjustments	sr0_invdj.txt	This value contains the total of all Inventory Adjustments made yesterday for the SKU at a particular store. This value may be used for resolving alerts. This value can be positive or negative since it represents net adjustments, some of which can be negative (inventory decreases).	Late
Off Sale Dates	dm0_ofseffdt_.txt	Contains Store, SKU, Off Sale Dates. Determines the date that the SKU will no longer be sold at the store. This value is used in determining the off-supply date which determines when AIP will no longer replenish the SKU at the store. If this file value is blank the system will use the SYSTEM_HIGH_DATE (infinity) as the off-sale date.	Early
On Sale Dates	dm0_onseffdt_.txt	Contains Store, SKU, On Sale Dates. Determines when the SKU will be sold at the store. This value is used in determining the on-supply date which determines when AIP will begin to replenish the SKU at the store.	Early

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
Pack Type	dmx_pcktyp.txt	Defines a single pack type for each SKU-pack size. Pack Type is used in the Automation to set Location Orderable Unit, Order Multiple, and store ordering pack sizes (store/store format pack size). Automation will not be able to assign a value if the pack type is not defined for SKU-pack sizes.	Early
Poisson Distribution Table	srx_poidst.txt	Poisson Distribution Table.	Early
Pre-Priced Status	dmx_pprsts.txt	Used to substitute a pre-priced item in place of a standard item during a promotion. The Default status of a SKU is 'False' or 'Not Pre-priced.'	Early
Product Life (shelf life)	sr0_prdlfe.txt	Indicates the number of days a product can sit in the store before is spoils. This value should only be set for short life items that are at high risk of waste due to spoilage.	Late
Promotional Substitution End Date (WH Source)	dm0_pmsstasrc.txt	Used for substituting a promotional item for a standard item during a promotion. Defines the end of the promotional period.	Early
Promotional Substitution Start Date (WH Source)	dm0_pmsendsrc.txt	Used for substituting a promotional item for a standard item during a promotion. Defines the start of the promotional period.	Early
RDF Detail Alert (for Store)	sr0_rdfdtmsk.txt	Optional flag to load into AIP from forecasting system indicating there is an issue resolving in AIP, the planning app, instead of the forecasting app.	Late-precritical
RDF Detail Alert (for Warehouse)	iprdfdtaltv.txt	Optional flag to load into AIP from the forecasting system for resolving in AIP, the planning app, instead of the forecasting app.	Late-precritical
RDF Detail Alert Count	sr0_rdfdtcnt.txt	Count of all RDF Detail alerts generated for a SKU/store.	Late-precritical
Sister Store	sister_store.txt	Defines a 'like store' for a New Store. When the file is provided along with a future store open date the system will copy the supply-chain of the existing store to the new store.	Early
Sister Warehouse	sister_wh.txt	Defines a 'like warehouse' for a New Warehouse. When the file is provided along with a future warehouse open date the system will copy the supply-chain of the existing warehouse to the new warehouse.	Early
SKU Hierarchy (Product Hierarchy)	item.txt	Contains all SKUs that should exist in AIP. All files that contain a SKU intersection are dependent upon this file. SKUs begin to age when not present/loaded from this file. If not yet purged, the age of a SKU is reset if it is later re-loaded.	Early
SKU Retail Price	srx_prdrpr.txt	SKU Retail Price interfaced via an external system or custom RMS.	Early
SPQ Commitment Type Exception	ipcmtmtde.txt	This value can be entered in the workbooks or loaded (one or the other is expected). The SPQ Commitment Type is only needed if Supplier Purchase Quantities will be entered.	Early

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
SPQ Order Commit Quantity	ipodcmti.txt	This is the quantity that has been committed to be ordered/purchased from the supplier in a particular week. The nature of the commitment is defined in the SPQ commitment type. This value can be entered manually in a workbook, or loaded.	Early
Store Ad End Date	ipadendi.txt	Defines the end date of a Store Ad.	Early
Store Ad Start Date	ipadstai.txt	Defines the start date of a Store Ad.	Early
Store Adjusted Sales	sr0_adjsls.txt	May be used in User Specified Allocations for Allocation on Rule Based Index.	Early
Store Ads - Grand Opening	sr0_ad_go_.txt	Determines which SKU/store/day has grand opening ads.	Early
Store Ads - Inserts	sr0_ad_irt.txt	Indicates inserts ads exist for the listed SKU/Store/Day.	Early
Store Ads - Others	sr0_ad_oth.txt	Indicates ads classified as "other" non-standard ads exist for the listed SKU/Store/Day	Early
Store Ads - Run On Press	sr0_ad_rop.txt	Indicates an Ad has been run as a result of extra Press for the listed SKU/Store/Day.	Early
Store Ads (advertisements)	sr0_ad_.txt	Information to be viewed in the Workbooks. Flags whether a SKU/store is included in any ads.	Early
Store Average Weekly Rate of Sale	sr0_avgrosld_.txt	Used to calculate the total Average Weekly Rate of Sales across all stores served by a warehouse. The value is used when the warehouse replenishment method is Factor ARS.	Early
Store Current Inventory	sr0_curinv_1.txt	The quantity of inventory at the store that is available to meet immediate demand.	Late
Store Hierarchy	loc.txt	Contains all Stores that should exist in AIP. All files that contain a Store intersection are dependent upon this file. Stores begin to age when not present/loaded from this file. If not yet purged, the age of a Store is reset if it is later re-loaded.	Early
Store In-transit Quantity	sr0_it_.txt	In Transit quantities represent those orders which have physically shipped to the destination.	Late
Store Known Demand	sr0_knowndemand.txt	Used in place of forecasted demand if loaded.	Early
Store Loaded Safety Stock	sr0_ss_ld_.txt	Safety Stock for Loaded Safety Stock Dynamic replenishment method.	Early
Store On Order Quantity	sr0_oo_.txt	On Order Quantity represents those orders which have been executed, but as of yet there is no information regarding their physical shipment to the destination.	Late
Store Open Date	sister_store.txt	Defines the date that a new store is opening. This date is used along with the Sister Store data to perform a copy of the existing Store's supply-chain to the new store. This value is also used for Walking Store Lead Time automation.	Early

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
Store RALT Default	ipstrraltd.txt	Contains the Default level intersection of Store RATL. See Store RALT Global Default for full explanation. The Default is not required. Default values are needed if the Global Default is not the desired value for a particular combination of product and store.	Early
Store RALT Exception	ipstrralte.txt	Contains the Exception level intersection of Store RATL. See Store RALT Global Default for full explanation. The Exception is not required. Exception values are needed if the Global Default or Default is not the desired value for a particular combination of product and store.	Early
Store RALT Global Default	ipstrraltg.txt	Contains the Receipt-to-Availability Lead Time (RALT) to be applied when replenishing the store(s). RALT is an integer representing the number of days after receipt that an order is available to start meeting demand. RALT should currently be limited to a value of 0 or 1. The global default is a higher level intersection than the default and exception.	Early
Store Replenishment Subtype Code	sr0_rplsubcde.txt	This is for informational purposes only. It provides the planner more detailed information about how the SKU is replenished at the store.	Early
Store Replenishment Type Code	sr0_rplcde.txt	This is for informational purposes only. It provides the planner information about how the SKU is replenished at the store.	Early
Store Trading Days	sr0_tdgday.txt	Used to calculate the In-Scope indicator for Alerts. Typically a day will not be counted or considered during alert calculations if it is not a trading day (e.g. the business is not Open). By default all days are trading days.	Early
Supplier Hierarchy	splr.txt	Contains all Suppliers that should exist in AIP. All files that contain a Supplier intersection are dependent upon this file. Suppliers begin to age when not present/loaded from this file. If not yet purged, the age of a Supplier is reset if it is later re-loaded.	Early
Supplier Ship-to	dmx_shpto.txt	Provides a 'code' that maps the supplier to the types of locations that it ships products to. The ship-to mappings (configured in a table) are used to automatically setup the supply-chain. If missing, Automation will be unable to automatically setup the supply chain for the new Supplier and its new SKUs.	Early
Supplier/SKU-pack size Associations	dmx_prdsplls.txt	Defines which SKU-pack Sizes are available from each Supplier.	Early
Total Store Average Rate of Sales	ipavgrtlsi.txt	Can be calculated by summing the values in sr0_avgrosl_ for each store that is served by the warehouse, or loaded outright. It is used when the warehouse replenishment method is Factor ARS.	Early
Value Added Product Association	dmx_vadprdasc.txt	Used to substitute pre-priced/added value items for standard items during a promotion. This file contains the parent child relationship between the SKUs.	Early

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
Warehouse Current Inventory	wr1_curinv.txt	The quantity of inventory at the warehouse that is available to meet immediate demand. This file is required. A 0-byte 'empty' file may be provided in place of actual values if inventory positions at the warehouse are not available. Replenishment will then fall into the 'contingency' processing for missing warehouse inventory positions.	Late
Warehouse Hierarchy	whse.txt	Contains all stockholding Warehouses that should exist in AIP. All files that contain a Warehouse intersection are dependent upon this file. Warehouses begin to age when not present/loaded from this file. If not yet purged, the age of a Warehouse is reset if it is later re-loaded.	Early
Warehouse Historical Weekly Sales	ipslsi.txt	Historic Weekly Sales are used in the Sales Week Range and Average Weekly Sales replenishment methods. The value will be used when warehouse replenishment method is set to either of these methods.	Early
Warehouse Holdback Quantity	iphldbckqtyi.txt	A quantity of inventory at the warehouse that should be held in reserve.	Early
Warehouse Holding Capacity	ipwhhldpci.txt	Used for Network Group Alert calculations	Early
Warehouse In-transit Qty	wr1_it_.txt	In Transit quantities represent those orders which have physically shipped to the destination. If no on-order quantity exists it is assumed to be 0. This file is required. A 0-byte 'empty' file may be provided if running Store-only replenishment without reconciliation.	Late
Warehouse Loaded Safety Stock	ipldssi.txt	Required if the Loaded Safety Stock replenishment method will be used for warehouse replenishment.	Early
Warehouse On Order Qty	wr1_oo_.txt	On Order Quantity represents those orders which have been executed, but as of yet there is no information regarding their physical shipment to the destination. If no on-order quantity exists it is assumed to be 0. This file is required. A 0-byte 'empty' file may be provided in place of actual values if running Store-only replenishment without reconciliation.	Late
Warehouse Orders in the Well	wr1_ow_.txt	The quantity of previously executed orders in the warehouse which have not yet been satisfied. This quantity is deducted from the current inventory position. If no order-in-the-well quantity exists it is assumed to be 0. This file is required. A 0-byte file may be provided in place of actual values.	Late
Warehouse Replenishment Sub-type Code	iprplstcdi.txt	Information to be viewed in the Workbooks. Indicates how the SKU is replenished at the warehouse.	Early
Warehouse Replenishment Type Code	iprplctdi.txt	Information to be viewed in the Workbooks. Indicates how the SKU is replenished at the warehouse.	Early
Warehouse Total Held Stock	ipttlhlstki.txt	Total quantity of unavailable stock held at the warehouse. This quantity is for informational purposes only. It is assumed to have been subtracted out of the Current Inventory position provided.	Early

Value Name	File Name	Description of Value and Purpose for Loading	Early, Late-precritical, or Late (critical)
Warehouse Type	wh_type.txt	This warehouse attribute is used for virtually all into-warehouse automation. It is also used in the WRP Company Level Inventory Analysis Worksheet which, if used, displays end of week inventory against specific warehouse types. This data should be set to required if into-warehouse Automation is desired.	Early
Waste Adjustments	sr0_wstadj.txt	This value contains the total of all Waste Adjustments made yesterday for the SKU at a particular store. This value may be used for calculating High Dissipation alerts. This value is expected to be negative because waste decreases inventory.	Late
Week to Day Forecast Percentage Default	ipfctwkprfd.txt	Used to spread weekly forecasts to a daily level. This file is needed when using weekly forecasts.	Early
Week to Day Forecast Percentage Exception	ipfctwkprfe.txt	Used to spread weekly forecasts to a daily level. This file is only needed if an exception to the default is needed.	Early
Weekly Base Sales Forecast	sr0_wkbsf_ld.txt	A base line forecast, at the weekly level, that does not include promotions. Used in calculated Presentation Stock.	Late-precritical
Weekly Forecast	sr0_frclv12_*.txt	The weekly forecast is optional for 3 reasons. 1. Both a daily and weekly forecast are not required. One can be provided and not the other (depending on system configuration). 2. An updated forecast is typically not reproduced daily, and is therefore not required daily. 3. A forecast is not required if using replenishment methods which use historical sales.	Late-precritical
Weekly Forecast Standard Deviation	sr0_fcterrlv12.txt	Standard Deviation of the weekly forecast.	Late-precritical

Moving Integration Data Source from RMS to a Non-RMS External System

AIP is configurable to allow some files, whose default source is RMS, to be sourced instead from a Non-RMS External System. The following instructions are the procedure for adjusting the configuration files to support this change of source.

Pre-requisites for Moving the Source Application of an RMS Data Feed

1. The data feed must be one of the *inventory* data feeds that arrives *late* from RMS, as listed in `wrp_rms_measures.config` or `srp_rms_measures.config` file, as well as the `latefiles.config` file. These files are located in the following directory of the domain:
`$AIPDOMAIN/interface/config/external/latefiles.config`
`$AIPDOMAIN/interface/config/rms/srp_rms_measures.config`
`$AIPDOMAIN/interface/config/rms/wrp_rms_measures.config`
2. The data feed must now be formatted in RPAS-loadable format. No processing will be performed to translate RMS SKU to AIP SKU, or to add stocking-point prefixes. However, the data can still be split into multiple pieces (for Store Current Inventory, namely `sr0_curinv`).

Note: For the RPAS measure loadable formats of the inventory data feeds, see "File Format Including Mapping to AIP Measure Format" in Chapter 8 of this Implementation Guide.

3. The data feed is still considered to be a "late" arrival.

Setup

1. Add the data feed to the `measdata_from_external.config` configuration file. It is located in the following directory of the domain:
`$AIPDOMAIN/interface/config/external/measdata_from_external.config`
2. Remove the data feed from `srp_rms_measures.config` or `wrp_rms_measures.config`. Also remove the data feed from `inv_meas_ntier_prefix.config`. These configuration files are located in the following directories of the domain:
`$AIPDOMAIN/interface/config/rms/srp_rms_measures.config`
`$AIPDOMAIN/interface/config/rms/wrp_rms_measures.config`
`$AIPDOMAIN/interface/config/rms/meas/inv_meas_ntier_prefix.config`

Process

1. After the “early files” (as listed in earlyfiles.config) are placed into the domain, run the appropriate aip_batch processes, as normal, to process external data.

Note: process_external_data.sh will not process any file that has been moved from RMS to External source, as the feed is still considered “late.”

Additionally, load_non_rms_external.sh *will not* load the moved feed, as it is not in the \$INTERFACE_EXTERNAL_DIR directory yet.

2. After the “late files” (as listed in latefiles.config) are placed into the domain (in the \$CONFIG_RMS_DIR directory), run the appropriate aip_batch steps, as normal, to process inventory data.

Note: process_inventory_data.sh *will* consolidate the current inventory data feeds as prescribed in the script regardless of whether they are RMS-sourced or non-RMS-sourced.

However, process_inventory_data.sh *will not* process any moved feed by adding stocking point prefixes, or conversion from RMS SKU to AIP SKU/SKU-pack size, as the feed is no longer listed in the appropriate configuration files as in Step 2 of the setup above.

Finally, load_rms_replenishment_measures.sh *will not* load the moved feed, for the same reason.

Note: All non-RMS external late files will be moved and loaded without manual client intervention by way of logic added to process_inventory_data.sh and load_non_rms_files.sh as called by load_rms_replenishment_measures.sh. process_inventory_data.sh will move the files to the correct spot for external processing, and load_non_rms_files.sh will load the files.

AIP Calendar Hierarchy

AIP Calendar Data – clnd.dat

The table below provides information about the AIP clnd.dat file format, which contains AIP calendar hierarchy data.

#	Data Entry	Description	Start	Width	Format	Example
1	DAY	Day	1	9	Dyyyyymmdd	D20040104
2	DAY Label		10	20	mm/dd/yy	01/04/04
3	DOFP	Day of 4 Week Period	30	8	nn	01
4	DOFP Label		38	20	nn	01
5	DOFN	Day of Fortnight	58	8	nn	01
6	DOFN Label		66	20	nn	01
7	DOW	Day of Week	86	8	Day of Week (short) ¹	SUN
8	DOW Label		94	20	Day of Week (long) ²	Sunday
9	DOS	Day of Season	114	8	DOSnn	DOS08
10	DOS Label		122	20	DOS nn	DOS 08
11	WEEK	Week	142	8	Wnn_yyyy	W02_2004
12	WEEK Label		150	20	mm/dd/yy	01/10/04
13	WOS	Week of Season	170	8	WOSnn	WOS02
14	WOS Label		178	20	WOS nn	WOS 02
15	WOY	Week of Year	198	8	WYnn	WY02
16	WOY Label		206	20	Week nn	Week 02
17	UMC1	Week Grouping - 1	226	8	UMC1UNASSIGNED	UMC1UNAS
18	UMC1 Label		234	20	Unassigned	Unassigned
19	MNTH	Month	254	8	Month (short) ³ _yyyy	JAN_2004
20	MNTH Label		262	20	Month (long) ⁴ , FY yyyy	January, FY 2004
21	MOY	Month of Year	282	8	Month (short) ³	JAN
22	MOY Label		290	20	Month (long) ⁴	January
23	QRTR	Quarter	310	8	Qn_yyyy	Q1_2004
24	QRTR Label		318	20	Quarter n, FY yyyy	Quarter 1, FY 2004
25	YEAR	Year	338	8	Ayyyy	A2004
26	YEAR Label		346	20	FYyyyy	FY2004

¹ Day of Week (short): Short form of day-of-week names (“SUN”, “MON”, “TUE”, “WED”, “THR”, “FRI”, “SAT”)

² Day of Week (long): Long form of day-of-week names (“Sunday”, “Monday”, “Tuesday”, “Wednesday”, “Thursday”, “Friday”, “Saturday”)

³ Month (short): Short form of month names (“JAN”, “FEB”, “MAR”, “APR”, “MAY”, “JUN”, “JUL”, “AUG”, “SEP”, “OCT”, “NOV”, “DEC”)

⁴ Month (long): Long form of month names (“January”, “February”, “March”, “April”, “May”, “June”, “July”, “August”, “September”, “October”, “November”, “December”)

Note: The above formats are based on the sample hierarchy data file clnd.dat provided with the AIP package. For the “Label” data entry fields, the suggested formats are customizable.

RMS Integration and Data Mapping

RMS to AIP Data

There are two types of data which RMS is required to provide to AIP:

- Hierarchy data
- Measure data

Hierarchy Data

Overview

The table below displays the hierarchy files that AIP receives from RMS.

	File Name	Description	Source
1	loc.txt	Location Hierarchy	RMS-partial (+)
2	item.txt	Item Hierarchy (Product Hierarchy)	RMS-partial (*)
3	splr.txt	Supplier Hierarchy	RMS
4	whse.txt	Warehouses	RMS-partial (*)

(+) RMS delivers only some fields in the location hierarchy. See below for details.

(*) These hierarchies go through a merge process with AIP Online data prior to being fully loaded into AIP RPAS.

File Format

The Retail Extraction, Transformation, and Loading (RETL) tool provides AIP with the file format displayed in the following table.

Note: Customers who do not have RETL are required to provide files with this same format.

Location Hierarchy File Name: loc.txt

Data Entry	Start	Width	Source
Store	1	20	RMS
Store Description	21	60	RMS
Site	81	20	RMS
Site Description	101	40	RMS
Region	141	20	RMS
Region Description	161	40	RMS
Zone	201	20	RMS
Zone Description	221	40	RMS
Chain	261	20	RMS

Data Entry	Start	Width	Source
Chain Description	281	40	RMS
Company	321	20	RMS
Company Description	341	40	RMS
TV Region	381	4	External
TV Region Description	385	24	External
Weather Region	409	4	External
Weather Region Description	413	24	External
Market Region	437	4	External
Market Region Description	441	24	External
Store Format	465	20	RMS
Store Format Description	485	40	RMS

Note: In the location hierarchy file, if RMS does not provide a field value, the AIP transformation script creates a "0" for the field. RMS can provide a store format; however, it is an optional value in RMS. Store Format is **not** optional in AIP and should be set appropriately in RMS to prevent errors in AIP.

Item Hierarchy (Product Hierarchy) * File Name: item.txt

Data Entry	Start	Width	Source/Comments
AIP SKU	1	20	RMS
Order Multiple	21	4	RMS
Pack Quantity	25	4	RMS
RMS SKU	29	20	RMS
RMS SKU Description	49	60	RMS
Banded Item Indicator	109	1	RMS/banded = 1 Not banded=0
Segment	110	20	RMS
Segment Description	130	60	RMS
Sub-Category	190	20	RMS
Sub-Category Description	210	60	RMS
Category	270	20	RMS
Category Description	290	60	RMS
Super-Category	350	20	RMS
Super-Category Description	370	60	RMS
Business Unit	430	20	RMS

Data Entry	Start	Width	Source/Comments
Business Unit Description	450	60	RMS
Company	510	20	RMS
Company Description	530	60	RMS
SKU Type	590	20	RMS
SKU Type Description	610	100	RMS

The item.txt file maps as follows:

1. The RMS SKU to the AIP SKU.
2. The Pack Quantity and Order Multiple to the AIP SKU-pack size. AIP processing code creates a mapping table (measure) to tie the RMS SKU to the AIP SKU pack size, and uses this mapping method to send data back to RMS using the RMS SKU.

The following logic is applied:

- If the Pack Quantity is Null, then the AIP SKU-pack size equals the AIP SKU Order Multiple.
- If the Pack Quantity is not null, then the AIP SKU pack size equals the AIP SKU Pack Quantity.
- If the item is banded, the RMS SKU equals the AIP SKU.

Mapping Table

The following table is used for mapping the RMS SKU to the AIP SKU pack size. This information is sent in the item.txt file. (See comments above):

Mapping table: (examples)

RMS SKU	Order Multiple	Pack Quantity	AIP SKU Pack Size
300	1	(null)	300_1
302	1	12	300_12
303	6	(null)	300_6

Note: RMS truncates fractional pack sizes before sending the data to AIP as AIP cannot handle fractional pack sizes.

Banded items mapping table: (examples)

RMS SKU	Order Multiple	Pack Quantity	AIP SKU-Pack Size
300	1	(null)	300_1
302	1	12	302_12
303	6	(null)	303_6

Note: RMS handles the setting of banded items in item.txt file.

Supplier hierarchy File name: splr.txt

Data Entry	Start	Width	Source
Supplier	1	20	RMS
Supplier Description	21	40	RMS

Warehouse hierarchy File name: whse.txt

Data Entry	Start	Width	Source
Warehouse Chamber	1	20	DM-Online
Warehouse Chamber Description	21	40	DM-Online
Warehouse	61	20	RMS
Warehouse Description	81	40	RMS

Note: RMS sends warehouse chamber values equal to warehouse values.

Measure Data

Overview

AIP receives the following measure files from RMS:

	File Name	Description	Source
1	dm0_pmsstasrc.txt	Store Promotional Substitution Start Date for Warehouse	RMS
2	dm0_pmsendsrc.txt	Store Promotional Substitution End Date for Warehouse	RMS
3	dmx_dscdt_.txt	Corporate Discontinuation Date	RMS
4	dmx_vadprdesc.txt	Value Added Commodity Association	RMS
5	dmx_prdsplls.txt	Commodity-Supplier Links	RMS
6	dmx_bndprdesc.txt	Banded Item Association	RMS
7	dmx_dirspl.txt	Direct Suppliers	RMS
8	sr0_curinv_[1..n].txt	Store on hand inventory (used to be historical inv)	RMS
9	sr0_it_.txt	Store In transits	RMS
10	sr0_oo_.txt	Store On Orders	RMS
11	sr0_prdlfe.txt	Store Product Life	RMS
12	wr1_curinv.txt	Current WH Inventory (on hand)	RMS
13	wr1_oo_.txt	Warehouse On Orders	RMS
14	wr1_it_.txt	Warehouse In Transits	RMS
15	wr1_ow_.txt	Warehouse Orders in the well	RMS
16	wh_type.txt	Warehouse Type	RMS
17	received_qty.txt	RMS received quantity	RMS*

	File Name	Description	Source
18	closed_order.txt	RMS closed orders	RMS*

Note: The last files, with *, are files coming from RMS to AIP Online and are NOT loaded into AIP RPAS.

Note on File Formats

Two sets of file formats for the data listed above follow in the tables below.

The first set of file format tables (described in the “File Format” topic below”) describes the format the data have after the RMS-AIP Transformation scripts have completed. For more information about the RMS-AIP Transformation process, read the AIP Operations Guide, Chapter 6, “AIP Interfaces and Transformation Scripts.”

The second set of file format tables (“File Format Including Mapping to AIP Measure Format”) describes the mapping between the RMS-AIP Transformation output format and the RPAS measure format. AIP RPAS batch scripts contain logic to transform the data into the RPAS measure loadable format.

When moving an integration data source from RMS to a non-RMS external system, as described in Chapter 6, “AIP RPAS Configurations,” it is assumed that the RMS-AIP Transformation process will *not* be run. Therefore, it is the user’s responsibility to create the data files in the RPAS measure loadable format, as described in the second set of file format tables, below. The “AIP Field”, “Start” and “Width” columns make up the RPAS measure loadable format.

File Format

The Retail Extraction, Transformation, and Loading (RETL) tool provides AIP with the file format displayed in the table below.

Note: Customers who do not have RETL are required to provide files with this same format.

Store Promotional Substitution Start Date for Warehouse Data

File Name: dm0_pmsstasrc.txt

Field Name	Type	Start	Width	Source/Comments
Warehouse	String	1	20	RMS
RMS SKU (Promotional)	String	21	20	AIP will get the Store from store source measure.
Order Multiple	String	41	4	
Store Promotional Substitution Start Date	YYYYMMDD	45	8	

Store Promotional Substitution End Date for Warehouse Data

File Name: dm0_pmsendsrc.txt

Field Name	Type	Start	Width	Source/Comments
Warehouse	String	1	20	RMS
RMS SKU (Promotional)	String	21	20	AIP will get the store value

Field Name	Type	Start	Width	Source/Comments
Order Multiple	String	41	4	from the store source measure.
Store Promotional Substitution End Date	YYYYMMDD	45	8	

Corporate Discontinuation Date Data

File Name: dmx_dscdt.txt

Field Name	Type	Start	Width	Source/Comments
RMS SKU	String	1	20	RMS
Order Multiple	String	21	4	RMS will send today's date. AIP will set the ranging status at all supply locations to pending-deranged as well as initialize the stop-receiving-dates at all warehouses
Corporate Discontinuation Date	YYYYMMDD	25	8	

Value Added Commodity Association

File Name: dmx_vadprdasc.txt

Field Name	Type	Start	Width	Source/Comments
RMS SKU (child)	String	1	20	RMS
Order Multiple	String	21	4	
RMS SKU (parent)	String	25	20	
Order Multiple	String	45	4	

Commodity-Supplier Links

File Name: dmx_prdsplls.txt

Field Name	Type	Start	Width	Source/Comments
Supplier	String	1	20	RMS
RMS SKU	String	21	20	
Order Multiple	String	41	4	
SKU Supplier Links	Boolean	45	1	

Banded Item Association

File Name: dmx_bndprdasc.txt

Field Name	Type	Start	Width	Source/Comments
RMS SKU (child)	String	1	20	RMS
Order Multiple	String	21	4	
RMS SKU (parent)	String	25	20	
Order Multiple	String	45	4	

Direct Suppliers

File Name: dmx_dirspl.txt

Field Name	Type	Start	Width	Source/Comments
Supplier	String	1	20	RMS
Direct Supplier	Boolean	21	1	

Store Current Inventory Data

File Name: sr0_curinv_[1..n].txt

Field Name	Type	Start	Width	Source/Comments
Store	String	1	20	RMS
RMS SKU	String	21	20	Order Multiple value is always one (1).
Store current inventory	Float	41	8	

Note: RMS can also send the Store Current Inventory file in partitions. For example, AIP interface code can handle sr0_curinv_[1..n].txt where *n* is the partition number. The data will always arrive from RMS RETL extract with at least one partition, namely, sr0_curinv_1.txt.

Store In Transits Data

File Name: sr0_it_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS
Store	String	10	20	
RMS SKU	String	30	20	
Order Multiple	String	50	4	
Store In Transits	Float	54	8	

Store On Orders Data

File Name: sr0_oo_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS
Store	String	10	20	RMS will send today's date with sum of all previous # of days values.
RMS SKU	String	30	20	
Order Multiple	String	50	4	
Store On Orders	Float	54	8	

Store Product Life Data

File Name: sr0_prdlfe.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS
RMS SKU	String	10	20	
Order Multiple	String	30	4	
Store Product Life	Float	34	8	

Current Warehouse Inventory Data

File Name: wr1_curinv.txt

Field Name	Type	Start	Width	Source/Comments
Warehouse	String	1	20	RMS
RMS SKU	String	21	20	
Order Multiple	String	41	4	
Current Warehouse Inventory	Float	45	8	

On Orders Data

File Name: wr1_oo_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS
Supplier	String	10	20	RMS will send today's date with sum of all previous # of days values.
Warehouse	String	30	20	
RMS SKU	String	50	20	
Order Multiple	String	70	4	
On Orders	Float	74	8	

In Transit Data

File Name: wr1_it_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS
Supplier	String	10	20	
Warehouse	String	30	20	
RMS SKU	String	50	20	
Order Multiple	String	70	4	
In Transit	Float	74	8	

Orders in the Well Data

File Name: wr1_ow_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS
Warehouse	String	10	20	RMS will send today's date with sum of all pervious # of days values.
RMS SKU	String	30	20	
Order Multiple	String	50	4	
Orders in the Well	Float	54	8	

RMS received quantity Data

File Name: received_qty.txt

Field Name	Type	Start	Width	Source/Comments
Order Number	Integer	1	10	RMS
Order Type	String	11	1	
RMS SKU	String	12	25	
Order Multiple	Integer	37	8	
Pack Quantity	Integer	45	8	
Store	Integer	53	10	
Warehouse	Integer	63	10	
Received Date	Date	73	8	
Quantity	Integer	81	8	

RMS closed orders Data

File Name: closed_order.txt

Field Name	Type	Start	Width	Source/Comments
Order Number	Integer	1	10	RMS
Order Type	String	11	1	

File Format Including Mapping to AIP Measure Format**Store Promotional Substitution Start Date for Warehouse Data**

File Name: dm0_pmsstasrc.txt

RMS Field	Start	Width	AIP Field	Start	Width
Warehouse	1	20	Store	1	20
RMS SKU	21	20	Warehouse	21	20
Order Multiple	41	4	SKU	41	20

Orders in the Well	54	8	Orders in the Well	50	8

Overview

AIP requires the following text files that need to be processed from an external system.

The list of text files that needs to be processed by the merchandising system are:

- Closed POs
- Item Sale
- Item Supplier
- Location Mapping
- Received Qty
- Store Current Inv
- Store Product Life
- Substitute Items
- Supplier
- Warehouse Current Inv
- Warehouse
- Item

In this guide we explain about how to extract the text files from RMS into AIP.

We use shell scripts, RETL scripts and merging and transformation of data from various tables in RMS to get the desired text files.

Note: Implementers can use these below mentioned mapping information steps to extract data from any other Merchandizing system with minimal customization.

RMS-AIP Closed Purchase Orders Mapping

Transformation Overview

No transformation is required for Closed Purchase Orders and Transfers feed. Extract program directly produces file closed_order.dat required by AIP.

Data Element Details

Data Type	Data Element Name	Data Description
N/A This data is not loaded into RPAS. It is loaded directly into an Oracle table.	Closed Purchase Orders	Contains Closed Purchase Orders and Transfers numbers.

Extracting Program Details

Program Type	Shell script wrapper around RETL
Program Name	rmse_aip_cl_po.ksh
Schema File	rmse_aip_cl_po.shcema
Program Frequency	Daily

Data Source and Target Details

Data Source Details		Target Data Details	
Data Origin System	RMS	Target Object Type	Fixed length Text File
Source Table(s)/File(s)	ORDHEAD and TSFHEAD	Target Object Name	closed_order.dat
		Target Load Type	Full

Field Level Mapping – Source

#	Source Table	Source Table Column	Source Field Description	Source Data Type	Field Length
1	ORDHEAD	SUPPLIER	Supplier	Number	(8,0)
	TSFHEAD	FROM_LOC	Warehouse		
2	N/A	N/A	N/A	N/A	N/A

Field Level Mapping – Target

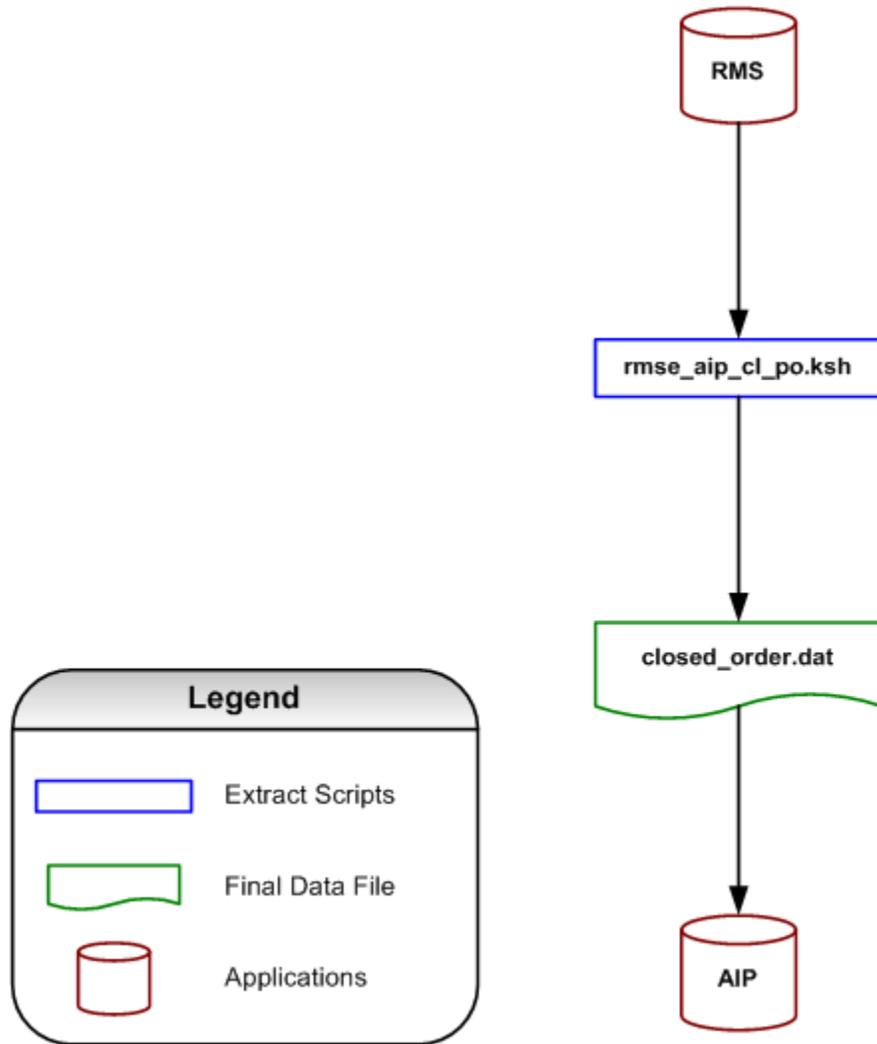

#	Target Data Field Name	Target Field Description	Target Field Data Type	Target Field Length	Condition/Format
1	ORDER_NUMBER	Order Number	int	10	N/A
2	ORDER_TYPE	Order Type	string	1	Hard coded as 'P' for the records from ORDHEAD for POs and 'T' for the records from TSFHEAD for Transfers.

Filtering Conditions

```
(oh.CLOSE_DATE IS NOT NULL) AND (oh.ORIG_IND='6') AND (oh.CLOSE_DATE >
to_date('${LAST_EXTR_CLOSED_POT_DATE}', 'yyyymmdd'))
```

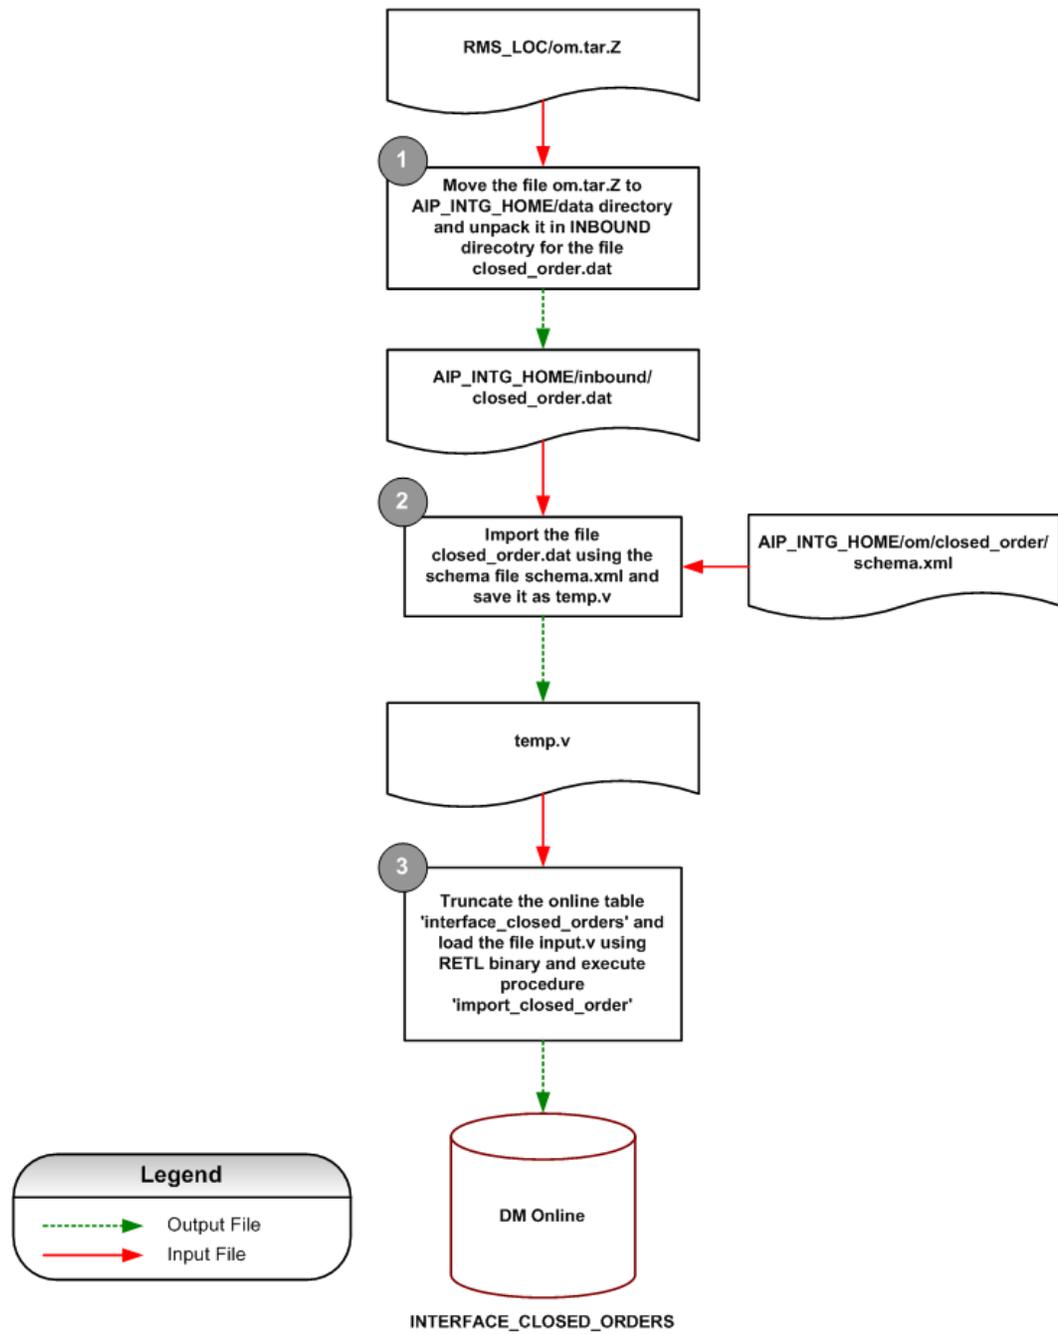

```
(tsf.CLOSE_DATE IS NOT NULL) AND (tsf.TSF_TYPE = 'AIP') AND (tsf.CLOSE_DATE >
to_date('${LAST_EXTR_CLOSED_POT_DATE}', 'yyyymmdd'))
```

Closed Orders Data Flow

Closed Orders Data Flow Diagram

Closed Order – Online Load Process

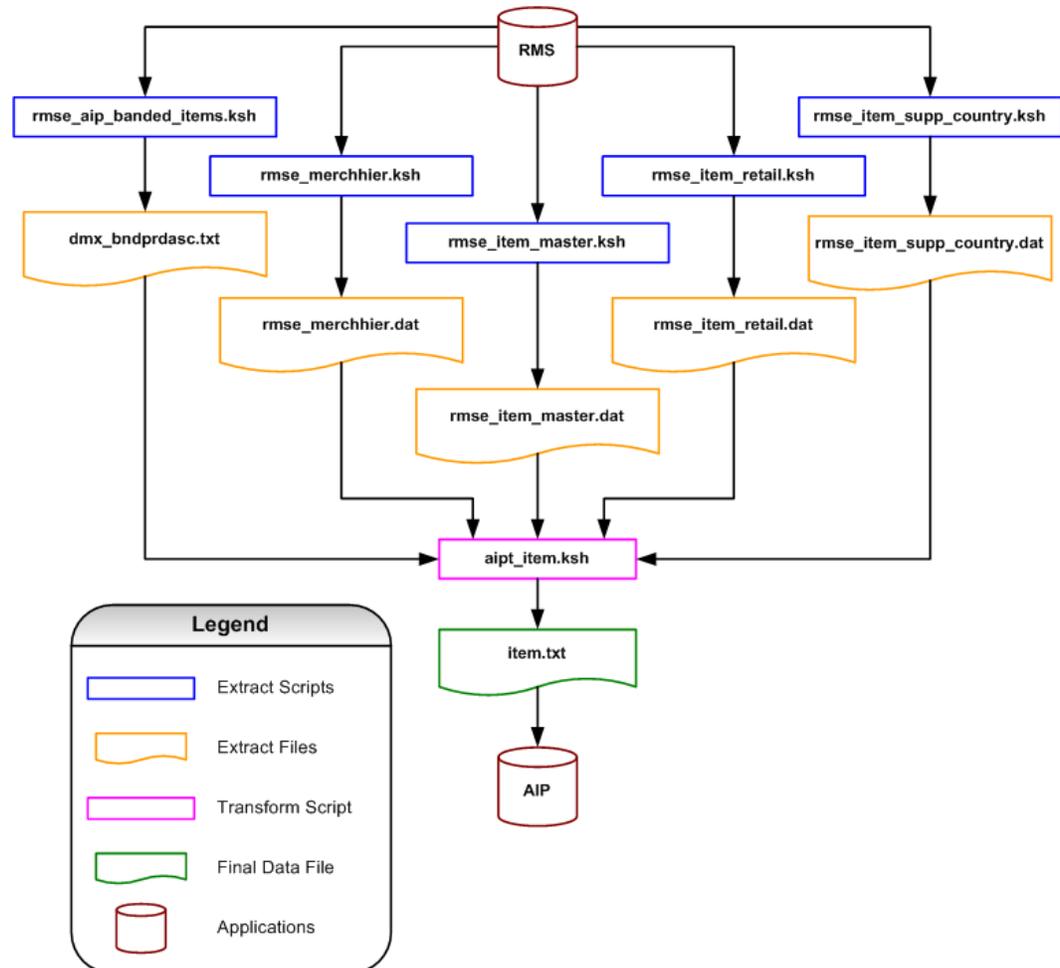

Closed Order – Online Load Process Diagram

RMS-AIP Item Mapping

Transformation Overview

A new AIP transformation program, `aipt_item.ksh`, will first join the item master and item supplier country extracts, followed by merging the result with the item retail extracts, and then join the result to merchandise hierarchy extract and then join the result to banded item extract to produce final item file `item.txt`.

Item Data Flow

Item Data Flow Diagram

Banded Item Extract

Data Element Details

Data Type	Data Element Name	Data Description
Foundation	RMS banded item data	Contains banded items information like promotional items.

Extracting Program Details

Program Type	Shell script wrapper around RETL
Program Name	rmse_aip_banded_items.ksh
Schema File	rmse_aip_dmxbndprdasc.schema
Program Frequency	Daily

Data Source and Target Details

Data Source Details		Target Data Details	
Data Origin System	RMS	Target Object Type	Fixed Length Text File
Source Table(s)/File(s)	ITEM_MASTER V_PACKSKU_QTY ITEM_SUPP_COUNTRY	Target Object Name	dmx_bndprdasc.txt
		Target Load Type	Full

Field Level Mapping – Source

Source Table	Source Table Column	Source Field Description	Source Data Type	Field Length
V_PACKSKU_QTY	PACK_NO	Item	Varchar2	25
ITEM_SUPP_COUNTRY	SUPP_PACK_SIZE	Supplier Pack Size	Number	(12,4)
ITEM_MASTER	ITEM	Item	Varchar2	25
ITEM_SUPP_COUNTRY	SUPP_PACK_SIZE	Supplier Pack Size	Number	(12,4)

Field Level Mapping – Target

Target Data Field Name	Target Field Description	Target Field Data Type	Target Field Length	Condition/Format
PROMOTIONAL_SKU	Promotional Item	String	20	N/A
PROMOTIONAL_ORDER_MULTIPLE	Promotional Order Multiple	int	4	N/A
STANDARD_SKU	Standard SKU	String	20	N/A
STANDARD_ORDER_MULTIPLE	Standard SKU Order Multiple	int	4	N/A

Filtering Conditions

```
im1.BANDED_ITEM_IND = 'Y' AND im1.INVENTORY_IND = 'Y' AND im1.ITEM = vpq.ITEM AND
im1.STATUS = 'A' AND im2.ITEM = vpq.PACK_NO AND im2.STATUS = 'A' AND

RMS-AIP Item Sale Mapping

AIP cannot load the on sale/off sale files that RMS produces. The file is considered to be coming from an external system. The client can simply create a transformation on the RMS files. This custom transformation is needed before these files can be loaded into AIP.

Item Sale Data Flow

Transformation Overview

A custom transformation is required in order for AIP to load dm0_onseffdt.txt and dm0_ofseffdt.txt. The transformation should drop the Order multiple and only retain the single unique on sale date and off sale date for the SKU/Store. This script needs to place the file in the external files inbound directory.

RMS-AIP Item Supplier Mapping

Item Supplier Data Flow

A new RMS extract, `rmse_item_supp_country.ksh`, will produce a data file, `dmx_prdsplls.txt`, containing item, supplier, order multiple and commodity supplier link indicator information. The `rmse_aip_item_supp_country.dat` is also to be used as input file for AIP item transformation, `aip_item.ksh`, to produce `item.txt` file.

Store Current Inventory Mapping

The final output files required by AIP will be created directly by these extracts with all necessary data transformations performed in the extract modules. No separate data transformation modules will be created. The reason that all transformations will be done in the extract modules directly is because some of the mathematical operations needed (such as the MOD function) do not exist in RETL and therefore these must be done during the Oracle SQL SELECT process.

Store Current Inventory Data Flow

The final output files required by AIP will be created directly by these extracts with all necessary data transformations performed in the extract modules. RMS-AIP-Substitute Items Mapping

Substitute Items Data Flow

Transformation Overview

An AIP transformation program, `aipt_sub_items.ksh`, will first join the item master and item substitutes extracts, followed by merging the result with the item supplier country extracts, and the result will be exported as promotional start dates file, promotional end dates file and Valued added commodities file.

RMS-AIP-Warehouse Current Inv Mapping

Warehouse Current Inventory Data Flow

The final output files required by AIP will be created directly by these extracts with all necessary data transformations performed in the extract modules. No separate data transformation modules will be created. The reason that all transformations will be done in the extract modules directly is because some of the mathematical operations needed (such as the MOD function) do not exist in RETL and therefore these must be done during the Oracle SQL SELECT process.

Store Packsize – Online Load Process

Store Packsize Online Load Process Diagram

AIP to RMS Interfaces and Data Mapping

RIB Publications

The Oracle Retail Integration Bus (RIB) is a near real-time data synchronization solution used by AIP for publishing orders to RMS. Order publication begins with the order release batch adding the affected order to the appropriate message family queue staging table and marking each message with a sequence number. AIP publishes two sets of order messages to the RIB, Purchase Orders, and Transfers. RMS subscribes to the RIB messages and inserts the orders into the appropriate RMS Purchase Order and Transfer tables.

AIP Message Flow

A polling operation on the database triggers the message creation. The polling is performed by two threads:

- One for the PO_MFQUEUE staging table
- One for the TSF_MFQUEUE staging table

The polling is controlled by the configuration settings in the main.properties file.

- The order period count defines the number of time intervals that are to be used. An order period count of 0 indicates that no orders will be released. If the order period count is 0, no threads are started.
- The time interval defines the amount of time the threads sleep. A thread will not go to sleep until less than the maximum number of allowable messages is processed in a given call to the publisher (`OrderSenderBean`). Publishing less than the maximum allowable messages indicates that all orders on the staging table (at the time it was queried) have been processed. Any orders added to the staging table afterward will be processed the next time the thread wakes up and the publisher is invoked.
- For each order period count greater than zero, an order period start and order period end must be added to the properties file. When the thread wakes up and the current time falls between the start and end of any of the intervals (up to X intervals where X is the order period count), the thread will call the publication procedure. If desired, various time intervals can be created to manage the publication of orders by forcing the threads to only poll the staging tables between certain time periods.
- The publisher is an Enterprise Java Session Bean named `OrderSenderBean`. The `checkAndPublish` method will query the staging table and the base order table to get the message detail. The publisher will also ensure that messages are published to the RIB in the correct order.
- Once the message payload is built by the `OrderSenderBean`, the RIB message publisher takes the payload and wraps it with an envelope used by the RIB infrastructure.

Purchase Order Messages

The purchase order publication messages are in the XOrder message family. In AIP, this message family processes the staged orders on the PO_MFQUEUE table.

There are four purchase order message types used by AIP:

- XORDERCRE
- XORDERDTLCRE
- XORDERMOD
- XORDERDTLMOD.

All four message types use the XOrderDesc.xsd.

XORDERCRE

This message type indicates that a brand new purchase order is being sent to RMS. The orders are sent to RMS in an 'A'pproved status. This message type is inserted into PO_MFQUEUE in three different circumstances:

1. The purchase order was released by the batch, or you have chosen to release the purchase order in the OM Order Maintenance screen.
2. You have created a new purchase order in the OM Order Create screen.
3. In the OM Order Maintenance screen, you have chosen to move a purchase order delivery date and/or destination and generated a new order number.

XORDERDTLCRE

This message type indicates a new line item is being added to the purchase order after the order was externally communicated. This message type is inserted into PO_MFQUEUE when you have moved the purchase order destination and chosen to retain the existing order number, and the destination does not already exist on the order for that item.

XORDERMOD

This message type indicates that a modification was made to the overall purchase order details (header level information). This message type is inserted into PO_MFQUEUE in the following circumstances:

1. You have moved the purchase order delivery date and chosen to retain the existing order number.
2. You have canceled all ordered quantity of all items on the purchase order. The total order quantity for the entire purchase order is zero. The purchase order is sent to RMS with a 'C'anceled status.

XORDERDTLMOD

This message type indicates that a modification was made to the purchase order line items after the order was externally communicated. This message type is inserted into PO_MFQUEUE when you perform various actions in the OM Order Maintenance screen.

1. You have modified the order quantity of a purchase order that is not "Closed."
2. You have chosen to move a purchase order line item to a new destination and retain the order number. If the "move to" destination already exists on the order, a message will be written to the staging table to increase the quantity at the "move to" location.

Note: Only one message can be inserted for the “move to” destination. This will either be an XORDERDTLCRE if the destination is new or XORDERDTLMOD if the SKU is already being delivered to the “move to” destination.

The order quantity of the “move from” destination must be decremented to equal the received quantity. A message will be staged for the “move from” destination.

Transfer Messages

The transfer publication messages are in the XTsf message family. In AIP, this message family processes the staged orders on the TSF_MFQUEUE table.

There is one transfer message type used by AIP, XTSFCRE, and it uses the XTsfDesc.xsd.

XTSFCRE

This message type indicates that a brand new transfer is being sent to RMS. The transfers are sent to RMS in an ‘A’pproved status. This message type is inserted into TSF_MFQUEUE when the transfer is released by the batch.

AIP to RMS Data

The Order Management application within AIP releases the necessary data to be sent to RMS into staging tables.

Messages Layout

Purchase Order Header Message Layout

Column Name	Data Type	RIB XML Message Tag	Description/Comments

Purchase Order – Detail Message Layout

Column Name	Data Type	RIB XML Message Tag	Description/Comments
RMS SKU	string	XOrderDtl.item	Uses the RMS SKU mapping table to convert AIP commodity pack size into RMS SKU.
Location	integer	XOrderDtl.location	Globally unique scheduling location identifier
Unit Cost	decimal	xOrderDtl.unit_cost	Not Available
Reference item	string	xOrderDtl.ref_item	
Origin Country Indicator	string	xOrderDtl.origin_conunty_id	
Supplier Pack Size	decimal	XOrderDtl.suppack_size	
Order Quantity	decimal	XOrderDtl.qty_ordered	
Location Type	string	XorderDtl.location_type	Order Destination Type: Store or Warehouse
Cancel Indicator	string	xOrderDtl.cancel_ind	
Reinstate Indicator	string	xOrderDtl.reinstate_ind	

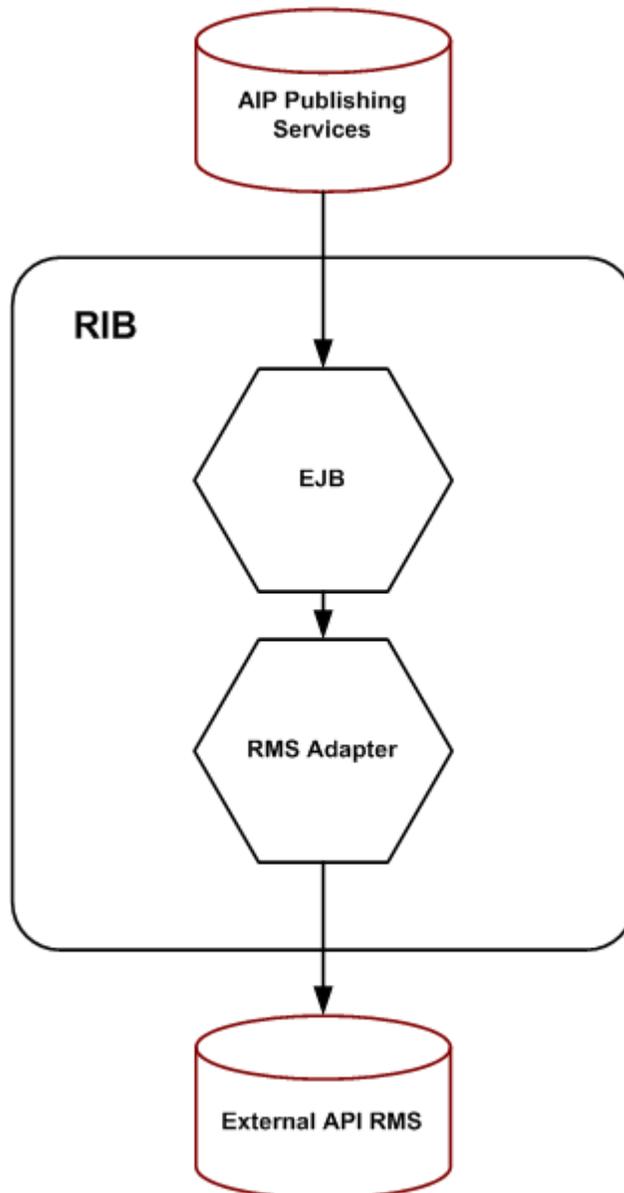

Transfers – Header Message Layout

Column Name	Data Type	RIB XML Message Tag	Description/Comments
Transfer Number	Integer	tsf_no	Pre-defined unique number
From Location Type	String	from_loc_type	
From Location	String	from_loc	
To Location Type	String	to_loc_type	
To Location	String	to_loc	
Delivery Date	Date	delivery_date	
Department	Integer	dept	Not available in AIP.
Routing Code	String	routing_code	Not Available in AIP
Freight Code	String	freight_code	Not Available in AIP
Transfer Type	String	tsf_type	
Transfer Detail	Pointer	XTsfDtl*	See Transfer Create Details.
Transfer Status	String	status	
User ID	String	user_id	
Comments	String	comment_desc	

Transfers – Detail Message Layout

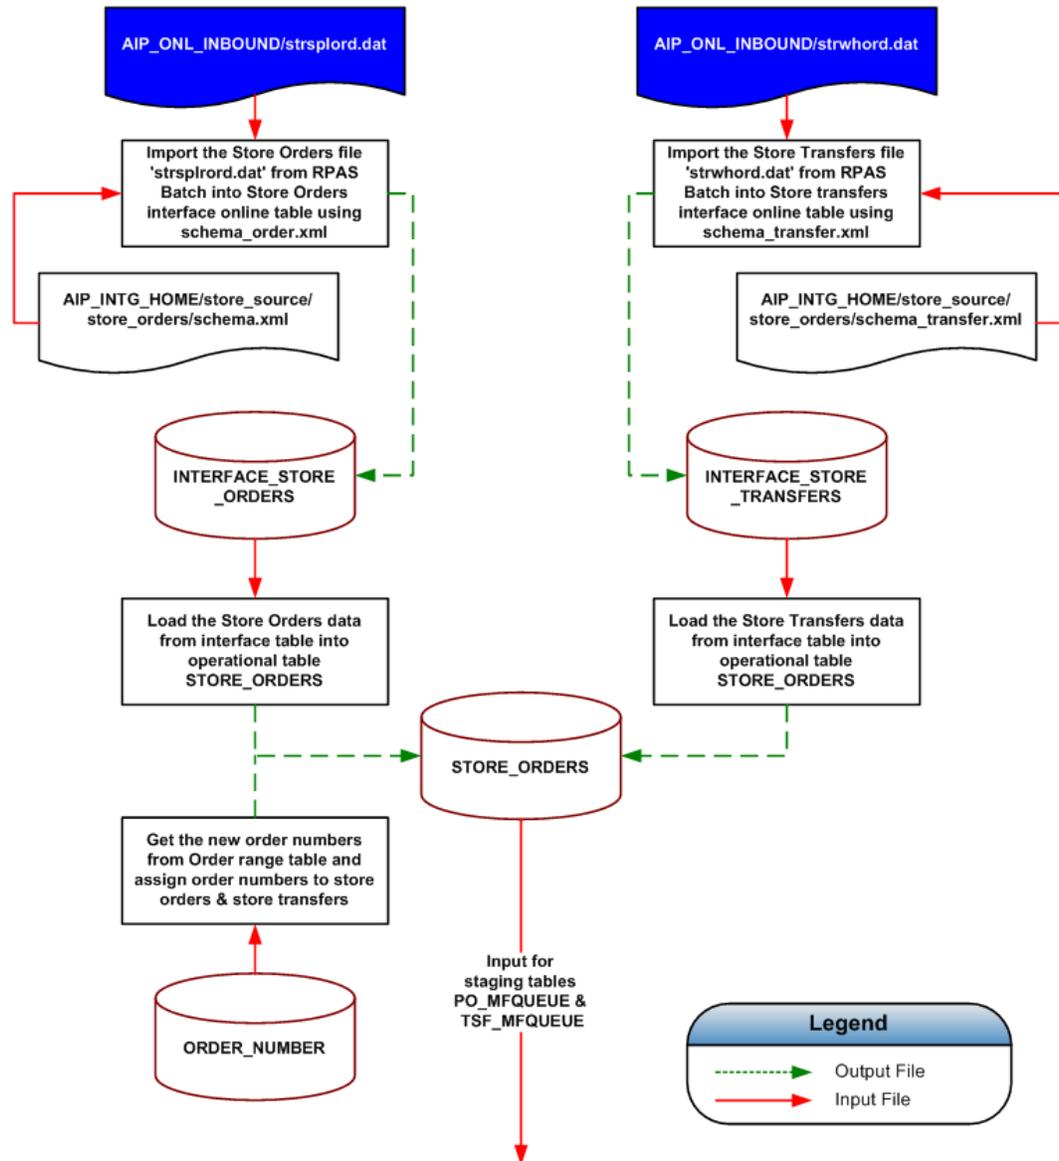

Column Name	Data Type	RIB XML Message Tag	Description/Comments
RMS SKU	string	xTsfDtl.item	
Transfer Quantity	decimal	xTsfDtl.tsf_qty	
Pack Size	decimal	xTsfDtl.supp_pack_size	
Inventory Status	integer	xTsfDtl.inv_status	
Unit Cost	decimal	XTsfDtl.unit_cost

Field Level Mapping – Target

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	order_no	The unique identifier for the order	Varchar2	10	N/A
2	supplier	The identifier of the supplier from which the order will be sourced. This cannot be modified if details exist for the PO.	Varchar2	10	A substring is used to drop the "V" prefix that is appended to all RMS supplier numbers.
3	currency_code	The code of the order's currency.	Varchar2	3	Hardcoded as NULL
4	terms	The sales terms of the order.	Varchar2	15	Hardcoded as NULL
5	not_before_date	The first date that delivery will be accepted.	Date		Select the minimum delivery date from the order line items which are not closed. All order line items which are not closed will have the same delivery date.
6	not_after_date	The last date that delivery will be accepted.	Date		Select the maximum delivery date from the order line items which are not closed. All order line items which are not closed will have the same delivery date.
7	otb_eow_date	The end of week date of the OTB bucket used.	Date		Hardcoded as NULL
8	dept	The department in which are all the items on the order.	Number	4	Hardcoded as NULL
9	status	The code for the status of the order. Valid values are "W" worksheet and 'A' approved for PO creation. It is also possible to modify the status to 'C' closed.	Varchar2	1	The table column has a default of 'A'
10	exchange_rate	The rate of exchange for the PO used between the order and primary currencies.	Number	20	Hardcoded as NULL
11	include_on_ord_ind	Indicates if the order should be included in on-order calculations.	Varchar2	1	Hardcoded as NULL
12	written_date	The date the order was created.	Date		Hardcoded as NULL

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
13	XORDER Detail Records				
	item	An approved, transaction level item	Varchar2	25	N/A
	location	An active store or warehouse	Number	(10,0)	A substring is used to drop the "S" prefix that is appended to all RMS store numbers and to drop the "W" prefix that is appended to all RMS warehouse numbers.
	unit_cost	The cost of the item from the supplier in the order's currency	Number	(20,4)	Hardcoded as NULL
	ref_item	The id of a reference item which can be used instead of using the item field	Varchar2	25	Hardcoded as NULL
	origin_country_id	The identifier of the country from which the item is being sourced	Varchar2	3	Hardcoded as NULL
	supp_pack_size	The supplier pack size for the item on the order	Number	(12,3)	The AIP SKU-pack size is mapped to the RMS Item and Order Multiple.
	qty_ordered	The quantity ordered of item	Number	(12,4)	Non-pack SKUs: store_order.case_volume x commodity_mapping.pack_size·non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume·non_contents_order.quantity
	location_type	The location type of the location	Varchar2	1	S indicates the destination location is a store. W indicates the destination location is a warehouse.
	cancel_ind	Indicates if the detail record's quantity should be cancelled	Varchar2	1	Hardcoded as NULL
	reinstate_ind	Indicates if a detail record which was previously cancelled should be reinstated	Varchar2	1	Hardcoded as NULL

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
14	origin_ind	Indicates where the order originated. Valid values include: 2 - Manual, 6 - AIP generated order, 7, 8.	Varchar2	1	6 is a unique RMS identifier that indicates the PO was created in AIP and is hardcoded

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
15	edi_po_ind	Indicates whether or not the order will be transmitted to the supplier via an Electronic Data Exchange transaction. Valid values are: Y = Submit via EDI, N = Do not use EDI.	Varchar2	1	Hardcoded as NULL
16	pre_mark_ind	This field indicated whether or not a supplier has agreed to break an order into separate boxes so that the boxes can be sent directly to stores.	Varchar2	1	Hardcoded as NULL
17	user_id	Indicates where the order was approved. It will be the user ID of the person approving the order.	Varchar2	30	Hardcoded as NULL
18	comment_desc	Any comments pertaining to the order.	Varchar2	2000	Hardcoded as NULL

3	from_loc	The location number of the from location	Varchar2	10	A substring is used to drop the "W" prefix that is appended to all RMS warehouse numbers.
4	to_loc_type	The location type of the to location	Varchar2	1	S' indicates the destination location is a store. "W" indicates the destination location is a warehouse.
5	to_loc	The location number of the to location	Varchar2	10	A substring is used to drop the "S" prefix that is appended to all RMS store numbers and to drop the "W" prefix that is appended to all RMS warehouse numbers.
6	delivery_date	The earliest date the transfer can be delivered.	Date		N/A
7	dept	The department number associated with the transfer	Number	4	Hardcoded as NULL
8	routing_code	If the freight status is expedite, this is a code indicating more detailed freight info	Varchar2	1	Hardcoded as NULL
9	freight_code	A code indicating the freight status of the transfer (e.g. normal, expedite, etc.).	Varchar2	1	Hardcoded as NULL
10	tsf_type	A code indicating the type of transfer (e.g. store requisition, book transfer, etc.).	Varchar2	6	Hardcoded as "AIP"

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
11	XTSF Detail Record Layout				
	item	The unique identifier of the item being transferred.	Varchar2	25	N/A
	tsf_qty	The total quantity of the item reserved for this transfer at the from location.	Number	(12,4)	Non-pack SKUs: store_order.case_volume x commodity_mapping.pack_size· non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume· non_contents_order.quantity
	supp_pack_size	The supplier pack size for this item/transfer.	Number	(12,4)	The AIP SKU-pack size is mapped to the RMS Item and Order Multiple.
	inv_status	A code indicating the inventory status for this transfer detail; valid values are found on the inv_status_types table.	Number	2	Hardcoded as NULL
	unit_cost	Not mapped to a database field. Sometimes used to calculate retail price.	Number	(20,4)	Hardcoded as NULL
12	status	A code indicating the status of the transfer (e.g. approved, closed, etc.).	Varchar2	1	The transfer will be created in 'Approved' status so hardcoded as 'A'
13	user_id	The user ID of the user who created the transfer.	Varchar2	30	Hardcoded as NULL
14	comment_desc	Comments associated with the transfer.	Varchar2	2000	Hardcoded as NULL

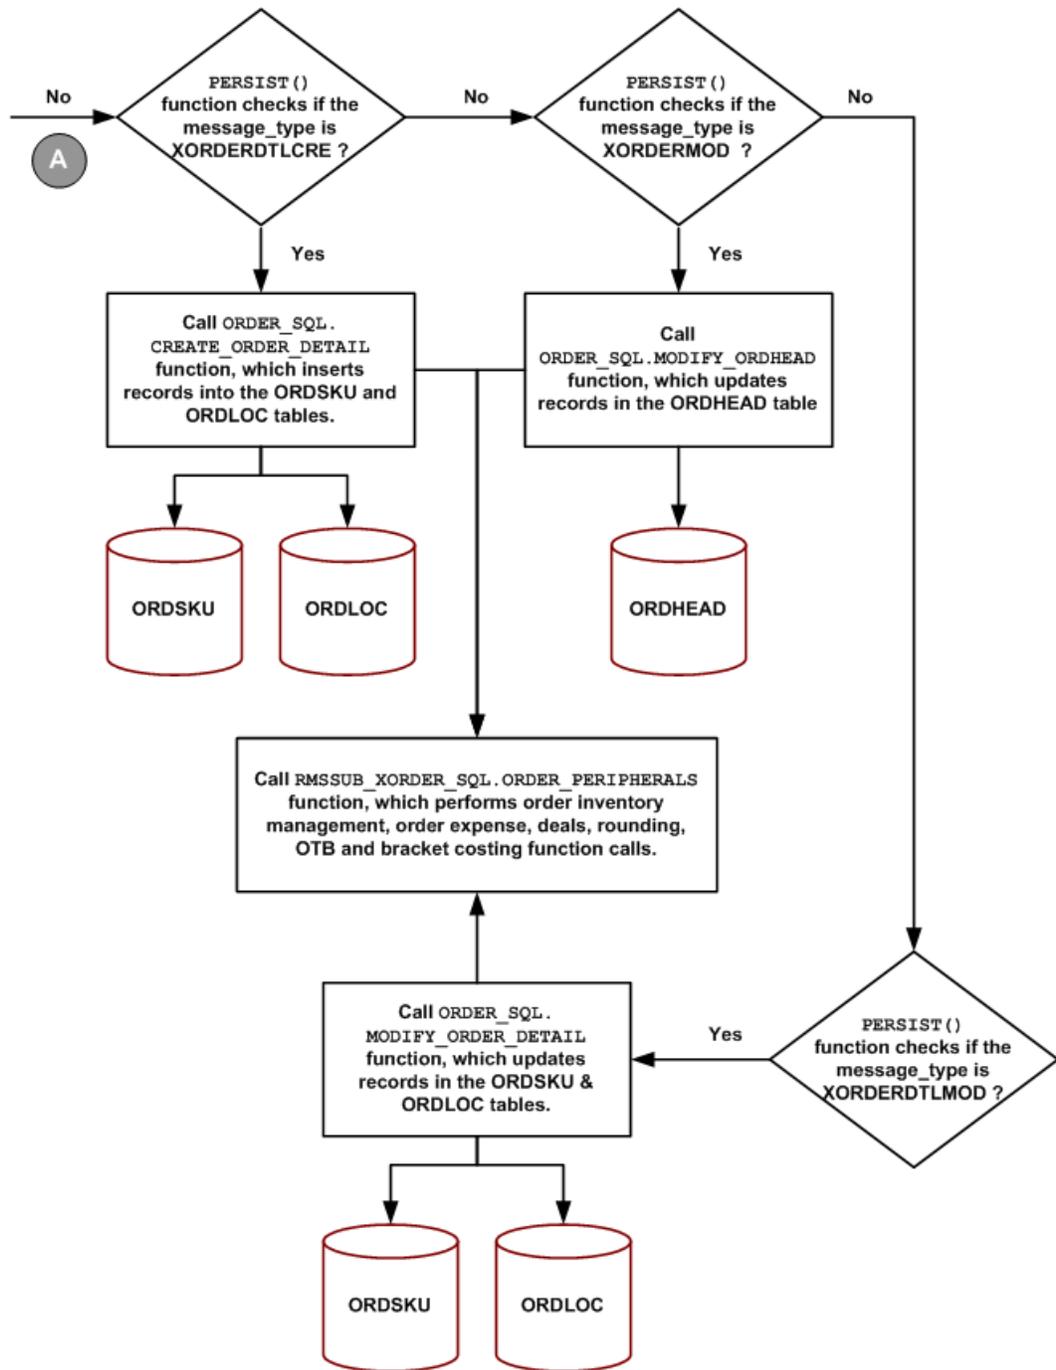

Filtering Conditions

None.

Field Level Mapping – Target

The target table for all data is ORDHEAD.

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	ORDER_NO	The unique identifier for the order	NUMBER	(8,0)	N/A
2	ORDER_TYPE	Order Type	VARCHAR2	3	Hardcode as 'N/B' at destination
3	DEPT		NUMBER	(4,0)	Hardcoded as NULL at Source
4	BUYER		NUMBER	(4,0)	NULL
5	SUPPLIER	The identifier of the supplier from which the order will be sourced. This cannot be modified if details exist for the PO.	NUMBER	(10,0)	A substring is used to drop the "V" prefix that is appended to all RMS supplier numbers.
6	SUPP_ADD_SEQ_NO	Supplier Address Sequence Number	NUMBER	(4,0)	Populated with primary address sequence number for the primary supplier
7	LOC_TYPE	Location Type	VARCHAR2	1	NULL
8	LOCATION	Location Type	NUMBER	(10,0)	NULL
9	PROMOTION	Promotion Number	NUMBER	(10,0)	NULL
10	QC_IND	QC Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
11	WRITTEN_DATE	The date order was created	DATE		Hardcoded as today's Vdate
12	NOT_BEFORE_DATE	The first date that delivery will be accepted.	DATE		If Source value is NULL, then Vdate Else Source Value.
13	NOT_AFTER_DATE	The last date that delivery will be accepted.	DATE		If Source value is NULL, then Vdate Else Source Value.
14	OTB_EOW_DATE	The end of week date of the OTB bucket used.	DATE		Populated with EOW date for the date NOT_AFTER_DATE at destination
15	EARLIEST_SHIP_DATE	Earliest Shipment Date	DATE		Populated as NOT_BEFORE_DATE at destination
16	LATEST_SHIP_DATE	Latest Shipment Date	DATE		Calculated at destination as NOT_BEFORE_DATE + LATEST_SHIP_DAYS from SYSTEM_OPTIONS table

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
17	CLOSE_DATE	Order Close Date	DATE		Hardcoded as NULL
18	TERMS	The sales terms of the order.	VARCHAR2	15	Populated as TERMS of primary supplier from SUPS table
19	FREIGHT_TERMS	The freight terms of the order.	VARCHAR2	30	Populated as FREIGHT_TERMS of primary supplier from SUPS table
20	ORIG_IND	Indicates where the order originated. Valid values include: 2 - Manual, 6 - AIP generated order, 7, 8.	NUMBER	(1,0)	6 is a unique RMS identifier that indicates the PO was created in AIP and is hardcoded at source
21	CUST_ORDER	Customer Order Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
22	PAYMENT_METHOD	Payment Method for the Order	VARCHAR2	6	Populated as PAYMENT_METHOD of primary supplier from SUPS table
23	BACKHAUL_TYPE	Backhaul Type	VARCHAR2	6	NULL
24	BACKHAUL_ALLOWANCE	Backhaul Allowance	NUMBER	(20,4)	NULL
25	SHIP_METHOD	Shipping Method	VARCHAR2	6	Populated as SHIP_METHOD of primary supplier from SUPS table
26	PURCHASE_TYPE	Purchase Type	VARCHAR2	6	NULLLabel column
27	STATUS	The code for the status of the order.	VARCHAR2	1	Source has the status as 'A'
28	ORIG_APPROVAL_DATE	Original Approval Date of the Order	DATE		If Status is Approved, hardcoded as VDATE at destination Else NULL
29	ORIG_APPROVAL_ID	Original Approval User ID	VARCHAR2	30	User ID used to run the batch/adapter
30	SHIP_PAY_METHOD	Shipment Pay Method	VARCHAR2	2	NULL
31	FOB_TRANS_RES	Trans Reserve	VARCHAR2	2	NULL
32	FOB_TRANS_RES_DESC	Trans Reserve Description	VARCHAR2	45	NULL
33	FOB_TITLE_PASS	Title Pass	VARCHAR2	2	Populated as FOB_TITLE_PASS from SYSTEM_OPTIONS table
34	FOB_TITLE_PASS_DESC	Title Pass Description	VARCHAR2	45	NULL
35	EDI_SENT_IND	EDI Sent Indicator	VARCHAR2	1	Hardcoded as 'N' at destination

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
36	EDI_PO_IND	EDI PO Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
37	IMPORT_ORDER_IND	Import Order Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
38	IMPORT_COUNTRY_ID	Imported Country ID	VARCHAR2	3	Populated as BASE_COUNTRY_ID from SYSTEM_OPTIONS table
39	PO_ACK_RECVD_IND	PO Acknowledgement Received Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
40	INCLUDE_ON_ORDER_IND	Indicates if the order should be included in on-order calculations.	VARCHAR2	1	Hardcoded as 'Y' at destination
41	VENDOR_ORDER_NO	Vendor Order Indicator	VARCHAR2	15	NULL
42	EXCHANGE_RATE	The rate of exchange for the PO used between the order and primary currencies.	NUMBER	(20,10)	Populated as Exchange rate for the primary currency and exchange type 'P'
43	FACTORY	Factory	VARCHAR2	10	NULL
44	AGENT	Agent	VARCHAR2	10	NULL
45	DISCHARGE_PORT	Discharge Port	VARCHAR2	5	NULL
46	LADING_PORT	Landing Port	VARCHAR2	5	NULL
47	BILL_TO_ID	Location to be billed	VARCHAR2	5	Populated as BILL_TO_LOC from SYSTEM_OPTIONS table
48	FREIGHT_CONTRACT_NO	Freight Contract Number	VARCHAR2	10	NULL
49	PO_TYPE	PO Type	VARCHAR2	4	NULL
50	PRE_MARK_IND	Pre Mark Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
51	CURRENCY_CODE	Currency Code of the order	VARCHAR2	3	Populated as CURRENCY_CODE of the primary supplier from SUPS table
52	REJECT_CODE	Rejection Code	VARCHAR2	6	NULL
53	CONTRACT_NO	Contract Number	NUMBER	(6,0)	NULL
54	LAST_SENT_REV_NO	Last Sent Review Number	NUMBER	(6,0)	NULL
55	SPLIT_REF_ORDNO	Split Order Reference Number	NUMBER	(8,0)	NULL
56	PICKUP_LOC	Pickup Location	VARCHAR2	45	NULL
57	PICKUP_NO	Pickup Number	VARCHAR2	25	NULL

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
58	PICKUP_DATE	Pickup Date	DATE		If NOT_BEFORE_DATE is not null then NOT_BEFORE_DATE else VDATE
59	APP_DATETIME	Approved Date & Time	DATE		NULL
60	COMMENT_DESC	Comments	VARCHAR2	250	NULL

10	N/A	N/A	N/A	N/A	N/A

Field Level Mapping – Target Order SKU (ORDSKU) Table

The following table displays target attributes for the source data being mapped to the Order SKU table (ORDSKU).

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	ORDER_NO	The unique identifier for the order	NUMBER	(8,0)	N/A
2	ITEM	An approved, transaction level item	VARCHAR2	25	
3	REF_ITEM	The id of a reference item which can be used instead of using the item field.	VARCHAR2	25	Hardcoded as NULL at Source
4	ORIGIN_COUNTRY_ID	The identifier of the country from which the item is being sourced	VARCHAR2	3	Populated as ORIGIN_COUNTRY_ID of the primary supplier & item combination from ITEM_SUPP_COUNTRY table
5	EARLISET_SHIP_DATE	Earliest Shipment Date	DATE		Populated as EARLISET_SHIP_DATE of the header row from ORDHEAD table
6	LATEST_SHIP_DATE	Latest Shipment Date	DATE		Populated as LATEST_SHIP_DATE of the header row from ORDHEAD table
7	SUPP_PACK_SIZE	The supplier pack size for the item on the order	NUMBER	(12,4)	NULL
8	NON_SCALE_IND	Non Scale Indicator	VARCHAR2	1	Hardcoded as "Y" at destination
9	PICKUP_LOC	Pickup Location	VARCHAR2	45	NULL
10	PICKUP_NO	Pickup Number	VARCHAR2	25	NULL

Field Level Mapping – Source for Order Location (ORDLOC) Table

The following table shows source data mapped to the Order Location (ORDLOC) table.

#	Source Table	Source Table Column	Source Field Description	Data Type	Field Length
1	PO_MFQUEUE	ORDER_NUMBER	Order Number	Number	(10,0)
2	COMMODITY_MAPPING	RMS_SKU_NUMBER	RMS SKU	Varchar2	25
3	STORE STOCKING_POINT	STORE_CODE STOCKING_POINT_NUMBER	Store Code Stocking Point Number	Varchar2	20
4	N/A	N/A	N/A	N/A	N/A
5	N/A	N/A	N/A	N/A	N/A
6	STORE_ORDER NON_CONTENTS_ORDER COMMODITY_MAPPING	CASE_VOLUME QUANTITY PACK_SIZE	Case Volume Quantity Pack Size	Number	8

12	N/A	N/A	N/A	N/A	N/A
13	N/A	N/A	N/A	N/A	N/A
14	N/A	N/A	N/A	N/A	N/A
15	N/A	N/A	N/A	N/A	N/A
16	N/A	N/A	N/A	N/A	N/A
17	N/A	N/A	N/A	N/A	N/A
18	N/A	N/A	N/A	N/A	N/A
19	N/A	N/A	N/A	N/A	N/A
20	N/A	N/A	N/A	N/A	N/A
21	N/A	N/A	N/A	N/A	N/A

Field Level Mapping – Target Order Location (ORDLOC) Table

The following table displays source data that is mapped to Order Location table (ORDLOC).

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1 ORDER_NO	The unique identifier for the order	NUMBER	(8,0)	N/A
2 ITEM	An approved, transaction level item	VARCHAR2	25	
3 LOCATION	An active store or warehouse. If multichannel is on, and a warehouse is being order to, a virtual warehouse is expected	NUMBER	(10,0)	A substring is used to drop the "S" prefix that is appended to all RMS store numbers and to drop the "W" prefix that is appended to all RMS warehouse numbers at Source
4 LOC_TYPE	The location type of the location.	VARCHAR2	1	S indicates the destination location is a store at Source W indicates the destination location is a warehouse at Source
5 UNIT_RETAIL	Unit Retail price for item & location combination	NUMBER	(20,4)	Calculated at destination as for non-sellable pack item, build the unit_retail based on component items unit_retail and for non-pack item or sellable pack item, get the unit_retail from item_zone_price
6 QTY_ORDERED	The quantity ordered of item	NUMBER	(12,4)	Non-pack SKUs: store_order.case_volume x commodity_mapping.pack_size·non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume·non_contents_order.quantity
7 QTY_PRESCALED	Quantity Prescaled	NUMBER	(12,4)	Populated same as QTY_ORDERED at destination
8 QTY_RECEIVED	Received Quantity	NUMBER	(12,4)	NULL
9 LAST_RECEIVED	Last Received Quantity	NUMBER	(12,4)	NULL
10 LAST_ROUNDED_QTY	Last Rounded Quantity	NUMBER	(12,4)	NULL
11 LAST_GRP_ROUNDED_QTY	Last GRP Rounded Quantity	NUMBER	(12,4)	NULL
12 QTY_CANCELLED	Quantity Cancelled	NUMBER	(12,4)	NULL
13 CANCEL_CODE	Cancellation Code	VARCHAR2	1	NULL
14 CANCEL_DATE	Cancellation Date	DATE		NULL
15 CANCEL_ID	User ID Cancelled	VARCHAR2	30	NULL

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
16 ORIGINAL_REPL_QTY	Original Replenishment Quantity	NUMBER	(12,4)	NULL
17 UNIT_COST	The cost of the item from the supplier in the order's currency	NUMBER	(20,4)	Populated from ITEM_SUPP_COUNTRY_LOC or ITEM_SUPP_COUNTRY for the combination item/supplier/country/loc.
18 UNIT_COST_INIT	Initial Unit Cost	NUMBER	(20,4)	NULL
19 COST_SOURCE		VARCHAR2	4	Hardcoded as "NORM" at destination
20 NON_SCALE_IND		VARCHAR2	1	Hardcoded as "Y" at destination
21 TSF_PO_LINK_NO		NUMBER	(10,0)	NULL

Filtering Conditions

Field Level Mapping – Target

	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	TSF_NO	Number that uniquely identifies the transfer.	NUMBER	(10,0)	N/A
2	FROM_LOC_TYPE	The location type of the from location.	VARCHAR2	1	Hardcoded as “W” at Source
3	FROM_LOC	The location number of the from location.	NUMBER	(10,0)	A substring is used to drop the “W” prefix that is appended to all RMS warehouse numbers.
4	TO_LOC_TYPE	The location type of the to location.	VARCHAR2	1	Hardcoded as “S” which indicates the destination location is a store “W” indicates the destination location is a warehouse.

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
5 TO_LOC	The location number of the to location.	NUMBER	(10,0)	A substring is used to drop the "S" prefix that is appended to all RMS store numbers and to drop the "W" prefix that is appended to all RMS warehouse numbers.
6 DEPT	The department number associated with the transfer.	NUMBER	(4,0)	Hardcoded as NULL at Source
7 TSF_TYPE	A code indicating the type of transfer (e.g. store requisition, book transfer, etc.).	VARCHAR2	6	Hardcoded as "AIP" at Source
8 STATUS	A code indicating the status of the transfer (e.g. approved, closed, etc.).	VARCHAR2	1	The transfer will be created in 'Approved' status so hardcoded as 'A' at Source
9 FREIGHT_CODE	A code indicating the freight status of the transfer (e.g. normal, expedite, etc.).	VARCHAR2	1	Hardcoded as 'N' at destination
10 ROUTING_CODE	If the freight status is expedite, this is a code indicating more detailed freight info.	VARCHAR2	1	Hardcoded as 'NULL'
11 CREATE_DATE	Transfer Creation Date	DATE		Hardcoded as today's Vdate
12 CREATE_ID	User who created the transfer	VARCHAR2	30	Hardcoded as current logged in User
13 APPROVAL_DATE	Transfer Approval Date	DATE		Hardcoded as today's Vdate
14 APPROVAL_ID	User who approved the transfer	VARCHAR2	30	Hardcoded as current logged in User
15 DELIVERY_DATE	The earliest date the transfer can be delivered.	DATE		N/A
16 CLOSE_DATE		DATE		NULL
17 EXT_REF_NO		VARCHAR2	14	NULL
18 REPL_TSF_APPROVE_IND		VARCHAR2	1	Hardcoded as "N" at destination
19 COMMENT_DESC	Comments associated with the transfer.	VARCHAR2	300	NULL

Field Level Mapping – Target

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1 TSF_NO	Number that uniquely identifies the transfer	Varchar2	(10,0)	The transfer number from header row
2 TSF_SEQ_NO	Transfer Line Item Number	Number	(8,0)	Transfer line item number under the current header row
3 ITEM	The unique identifier of the item being transferred.	Number	25	N/A
4 INV_STATUS	A code indicating the inventory status for this transfer detail; valid values are found on the inv_status_types table	Number	(2,0)	Hardcoded as NULL
5 TSF_QTY	The total quantity of the item reserved for this transfer at the from location.	Number	(12,4)	Non-pack SKUs: store_order.case_volume x commodity_mapping.pack_size· non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume· non_contents_order.quantity
6 FILL_QTY	Fill Quantity	Varchar2	(12,4)	NULL
7 SHIP_QTY	Shipped Quantity	Number	(12,4)	NULL
8 RECEIVED_QTY	Received Quantity	Number	(12,4)	NULL
9 DISTRO_QTY	Distributed Quantity	Number	(12,4)	NULL
10 SELECTED_QTY	Selected Quantity	Number	(12,4)	NULL
11 CANCELLED_QTY	Cancelled Quantity	Varchar2	(12,4)	NULL
12 SUPP_PACK_SIZE	Supplier Pack Size	Number	(12,4)	The AIP SKU-pack size is mapped to the RMS Item and Order Multiple.
13 TSF_PO_LINK_NO	Transfer to PO Link number	Number	(10,0)	NULL
14 MBR_PROCESSED_IND	Member Processed Indicator	Number	1	NULL
15 PUBLISH_IND	Publishing Indicator	Number	1	Hardcoded as “N”

Filtering Conditions

None.

AIP to External System Interfaces

Overview

In addition to the RIB--explained in the previous chapter--AIP provides a second method of communicating Purchase Order and Transfer information to an order procurement system. It is text file based and can be used in place of the RIB for communicating Purchase Orders and Transfers **created and released** in the overnight batch.

Note: This process does not currently support any action take by the User in the Order Management application.

This is the recommended method of integration when large volumes of Purchase Orders and Transfers are expected to be executed each night.

First Day of AIP

Introduction

The phrase “First Day of AIP” encompasses the steps required to initially load the Enterprise and Merchandise data into AIP for setup of the supply-chain, and replenishment parameter definition. The term ‘day’ in this phrase does not necessarily correspond to a single calendar day. The ‘First Day’ process, as defined by this document, and required for the use of AIP, executes the minimal set of steps required to populate an empty database while leveraging the automated supply-chain set up logic.

While this process populates an empty database it is not a ‘conversion’ process that so often occurs when transitioning off of legacy systems. AIP works in tandem with the merchandising system and the execution of this process will build out the database with the initial Enterprise and Merchandise data. This specific process is only executed for the very initial load of the database however maintenance of the Enterprise and Merchandise hierarchy is a constant, ongoing task.

The goal of this process is to ready the database for automated supply-chain setup as well as manual supply-chain setup and replenishment parameter definition. Its success is pertinent to the ability to complete setup and therefore the system’s overall ability to begin replenishment of items.

The following information and procedures are written with the assumption that all AIP components have been properly installed and configured to interact appropriately. See the *Oracle Retail AIP Installation Guide* for details. The necessary environments must exist and be setup as indicated in the *Oracle Retail AIP Implementation Guide*. Also, for more specific instructions and details around the batch process, please reference the *Oracle Retail AIP Operations Guide*.

Overview

The First Day of AIP is little more than the first iteration of the daily AIP batch cycle. It virtually mirrors the cycle but executes only a subset of the daily processes. This document will not only outline the actions to execute the First Day of AIP but will also explain what the process is accomplishing and why. Understanding the goal of the First Day, the reason it is different and how it executes will provide a deeper understanding of the flow of data between AIP and external systems as well as between the two AIP platforms—RPAS and Oracle.

Keeping in mind the goal and purpose of the First Day of AIP will provide the needed insight to clearly understand how the required actions accomplish the goal.

The First Day of AIP Explained

The First Day of AIP has two very clear goals:

- Load the database with Enterprise and Merchandise hierarchy data.
- Enable automated data maintenance to run for the new data being loaded.

Load Data

On a day-to-day basis AIP is synchronized with both the external data coming from the merchandising and forecasting systems and the internal data created on each platform. This must occur on both AIP platforms—RPAS and Oracle. This occurs first in RPAS prior to the replenishment planning calculations. All data required for the replenishment planning calculations are loaded into AIP on the RPAS platform. This means that the data is first extracted out of AIP on Oracle, the merchandising system, forecasting system, etc. for loading into AIP on RPAS. In a daily batch run the RPAS database would be synchronized with

- Enterprise Hierarchy
- Merchandise Hierarchy
- Supply-chain Parameters
- Inventory Positions
- Forecasts
- AIP Supply-chain

Following the data manipulation and replenishment planning on RPAS the plan, hierarchies, and other modified supply chain data is extracted and/or passed from RPAS to the Oracle database. The Oracle database is then synchronized with the latest data passed to, or created by, AIP on RPAS. In a daily batch run the Oracle database would be synchronized with

- Enterprise Hierarchy
- Merchandise Hierarchy
- Supply Chain Parameters
- AIP Supply-chain
- Supply-chain Alerts
- Replenishment Plan
- Order Information (received quantities, closed orders, etc.)

The First Day attempts to follow the same process as the daily batch however only some of the physical supply-chain elements exist, not the complete supply-chain representation. Therefore the first day batch processes must be limited to merely loading the data and setting up the logical connections and replenishment parameters without doing any replenishment planning.

Impact to AIP on RPAS

Since AIP on RPAS is the first part of the AIP application to be synchronized, up to the point of loading the data both the RPAS and Oracle databases are empty with the exception of a minor amount of seed data.

- Where normally there would be data to load from the Oracle database there is none. All logic related to retrieving and loading data from AIP on Oracle will be skipped since there is virtually no data.
- Since the supply-chain is not yet defined in Data Management Online (AIP on Oracle) replenishment will not be run. No replenishment plan is produced.
- Consequently, because replenishment will not be run, all logic related to retrieving and loading the inventory positions and forecasts will not be executed.
- A portion of the automated data maintenance is executed on RPAS. The processes that are triggered by—or identify—new hierarchy elements are executed. The processes that operate on the premise of maintaining existing supply chain data are not executed.

Impact to AIP on Oracle

AIP on Oracle is loaded after AIP on RPAS. The first day load process is quite similar to the daily load process but should account for the fact that the replenishment plan does not exist nor do any past AIP Orders.

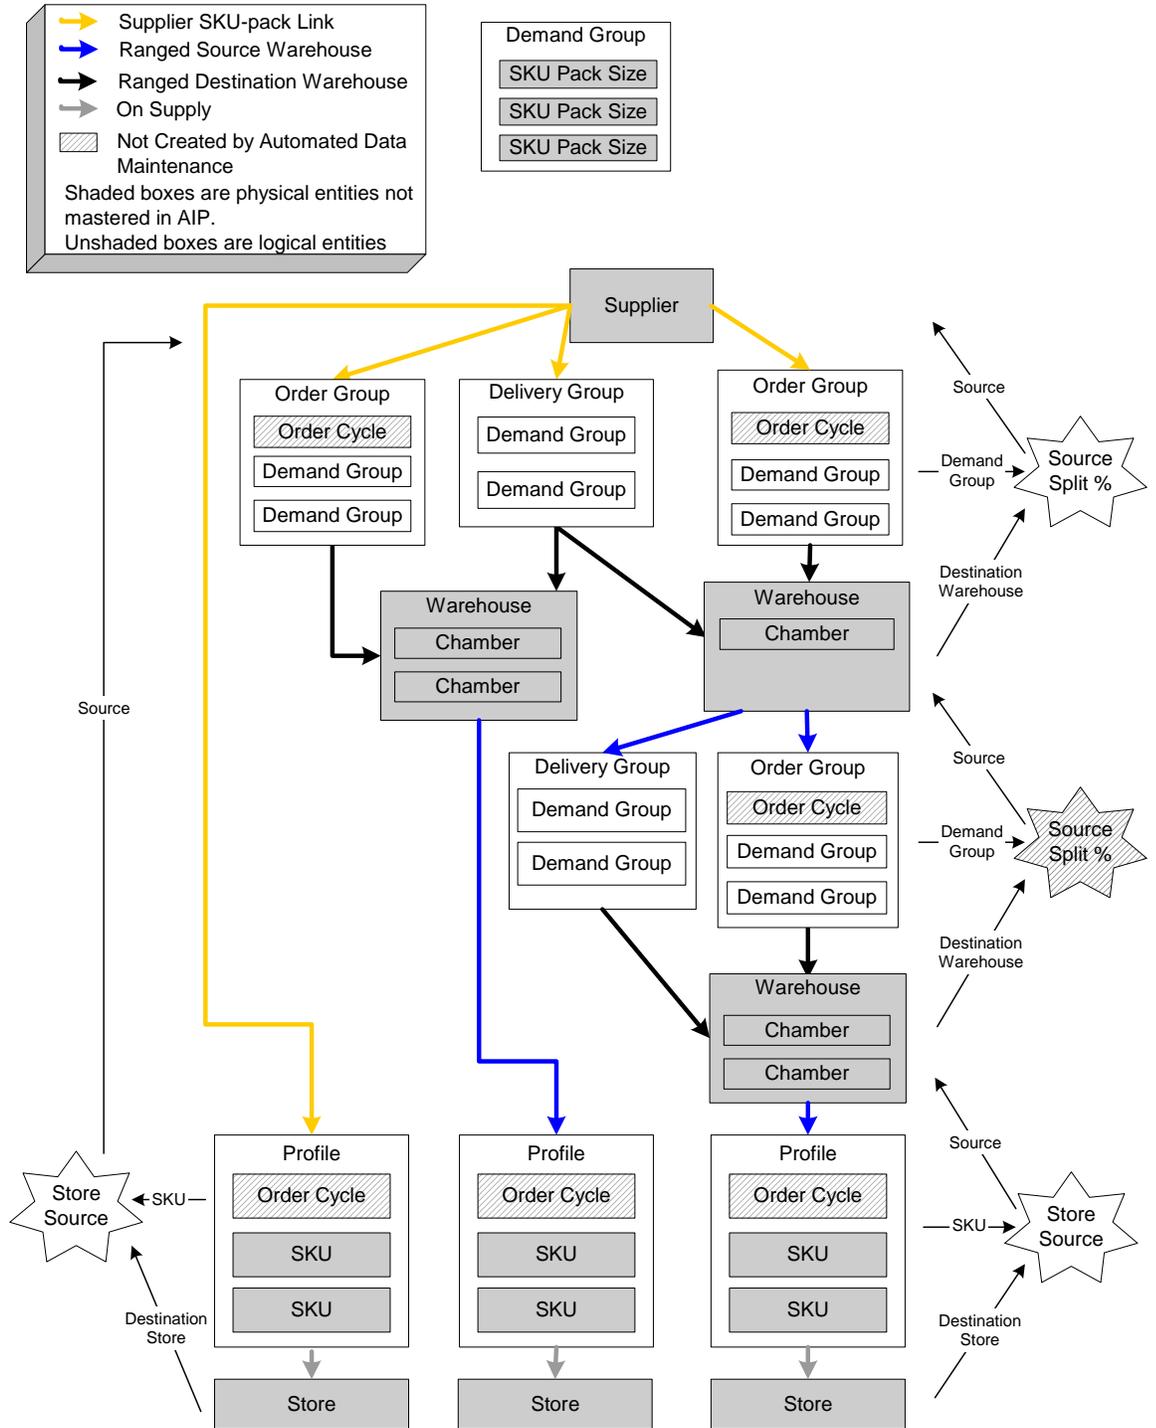

- No received quantities, closed orders, or recycled order numbers are available because no purchase orders or transfers have been executed from AIP.
- No replenishment plan exists to import from AIP on RPAS. Therefore all logic related to retrieving and loading data from AIP on RPAS will be skipped.
- A subset of data setup alerts will be loaded. These alerts pertain to data that is available or created on the first day of AIP.

Note that the export logic is not executed to extract data out of the Oracle database before the first AIP on RPAS load.

Enable Automated Data Maintenance

Automated Data Maintenance constitutes a significant portion of the AIP batch processes that occur on the Oracle platform. It is comprised of a number of processes that not only select default values but also setup a significant portion of the supply chain for new entities—such as suppliers, locations, or items.

The magnitude of these operations—both in terms of saved user effort and the importance of automation—is evident in the diagram below, which provides a detailed outline of the AIP supply chain structure.

AIP Supply Chain Structure Diagram

The AIP supply chain structure diagram lists the physical as well as logical entities of the supply chain which must be defined within AIP. If configured correctly, all logical entities can be created by the Automated Data Maintenance processes with the exception of those noted in the diagram, and the Supplier SKU pack size links.

The diagram provides an easy-to-discern list of needed supply chain elements. For example, by examining this diagram from top to bottom, it can be seen that:

- A source must be connected to a Delivery Group and Order Group for delivery into warehouses and a Profile for delivery into the store.
- The Order Group must be associated with an Order Cycle.
- Demand Groups must be associated with an Order Group and Delivery Group for deliveries from a source to a warehouse-chamber destination.
- Demand Groups must be created for SKU-pack sizes.
- etc.

The diagram illustrates what the First Day of AIP needs to accomplish on the Oracle platform. By fully comprehending each element of the diagram it becomes clear why the first day process should be different for AIP on Oracle and how to maximize the effect of automation while minimizing the amount of extra effort required to enable it.

The full analysis of each element of the diagram is out of the scope of this document however the elements that impact the first day will be examined.

- Order Cycles are required to create Order Groups and Profiles. Order Cycles are not created by Automated Data Maintenance, however default Order Cycles are provided as seed data loaded before the First Day.
- Warehouse chambers are required to create Order Groups, Delivery Groups, and ranged warehouse/SKU-pack sizes. Chambers are not created by Automated Data Maintenance since there is not a single rule-set that will work for all businesses. It is maintained as a manual process. Automated Data Maintenance could do very little setup the first day if the First Day process was not altered to accommodate for this fact.

The First Day of AIP Execution

Prior to executing the steps listed below ensure that all installations and configurations are set according to the *AIP Installation Guide*, *RPAS Installation Guide*, and *AIP Implementation Guide*.

The detailed First Day processes that will be executed for AIP on RPAS can be found in the *AIP Operations Guide*.

The First Day execution steps are quite similar to the daily steps however because it is typically when the most new data is introduced the execution time will likely extend beyond a normal batch window.

The First Day of AIP consists of the following main steps:

1. Virtual Date (Vdate)
 - Sets and synchronizes the virtual/notional date across AIP on Oracle and AIP on RPAS.
2. Build the SRP Implementation Parameters Workbook
 - Customizes implementation parameters required for AIP RPAS batch logic and calculations.
3. First Day of AIP on RPAS Batch
 - Loads RMS hierarchies into AIP RPAS domain

- Calculates new hierarchy element alerts
- Creates specific hierarchy attributes
- Calculates certain supply chain logical concepts for Online
- 4. First Day of AIP on Oracle Import
 - Imports hierarchies into AIP on Oracle
 - Full import of all AIP on RPAS exports
 - Automation creates a significant portion of the logical supply chain structure
- 5. First Day of AIP on Oracle Manual Setup
 - Creation of Warehouse Chambers and assignment of SKU types
- 6. First Day of AIP on Oracle Automation
 - Executes the entire set of Automated Data Maintenance processes to automatically setup the supply chain.
- 7. First Day of AIP on Oracle Import of Non-critical Alerts
 - Imports the non-critical Data Management alerts from AIP RPAS.
- 8. Complete all manual setup of AIP
 - Set AIP on RPAS replenishment defaults and exceptions
 - Set or modify Data Management Online supply chain parameters, defaults, and exceptions.

Step 1: Virtual Date (Vdate)

Step Details

As this is the first time AIP Batch will be run, the Vdate must be set so both AIP on Oracle and AIP on RPAS are in sync. The intention of Vdate is to ensure that the nightly batch processing occurs for a single calendar day and does not need to account for the system date changing calendar days as the clock reaches midnight. Under normal circumstances the Vdate will match SYSDATE when the batch is complete. For the purposes of exporting the data generated by the Automated Data Maintenance processes it is important to set the Vdate to a date that is equal to or greater than the date when all the First Day activities will be completed.

For example, if it is expected that the automation and manual setup will take 2 days to complete for the First Day setup and today is April 1st, 2007, then Vdate should be set to 20070403. This will then allow the Vdate to be set to 20070404 when the first full end-to-end AIP Batch is run.

Step Execution

Run vdate.sh script to set the Vdate in the AIP Oracle database and export the value to a flat file.

```
/aip/oracle> vdate.sh set export 20070101
```

Copy the flat file vdate.int from \${INTEGRATION_HOME}/vdate to \${AIPDOMAIN}/interface/import/meas.

Step 2: Build the SRP Implementation Parameters Workbook

Step Details

Before running the AIP RPAS batch steps using `aip_batch.sh` script as detailed in the following steps, one RPAS workbook must be built and values in the workbook changed as desired. There are RPAS batch steps that depend on the values which can be customized in this workbook.

Most importantly, the RPAS measure “Inventory Tracking Level” (`sr0_invtrklvl`) is queried by batch steps “`check_process_external_data`” and “`check_process_inventory_data`” in order to choose between logic based on packs or eaches processing mode. Therefore the appropriate level must be determined before AIP RPAS batch is executed.

Step Execution

Log in to the SRP workbook. Refer to the *Oracle Retail AIP SRP User Guide* for details on building and modifying the values in this workbook.

Step 3: First Day of AIP on RPAS Batch

Step Details

The goal of the First Day of AIP RPAS batch processing is to load all hierarchy elements into the AIP RPAS domain and perform various supply chain setup activities. This step consists of a subset of the daily AIP RPAS batch script steps. Refer to the *AIP Operations Guide* for a detailed list of the steps. The output of these processes is put into flat files to pass to AIP on Oracle. The flat files are loaded into the Oracle database in the next step. Below are the details of this output.

Hierarchy Files

Product hierarchy	prod.dat
Profile hierarchy	prof.dat
Store hierarchy	loc.dat
Supplier hierarchy	hspl.dat
Warehouse hierarchy	whse.dat

Hierarchy Alerts

New SKU Alert	dmx_newprd.dat
New SKU Packsize Alert	dmx_newpsz.dat
New Store Alert	dm0_new.dat
New Supplier Alert	dm0_newspl.dat
New Warehouse Alert	dm1_new.dat

Attributes

Default Warehouse info for Stores	default_wh.dat
-----------------------------------	----------------

Direct-supply flag	dmx_dirspl.dat
SKU Packsize Pack-type	dmx_pcktyp.dat
SKU Packsize Attribute	item_attribute_type.dat
SKU Packsize Attribute Value	item_attribute.dat
Supplier Ship-to info	dmx_shpto_.dat
Warehouse Type info	wh_type.dat
Warehouse Promotional Start Date	dm0_pmsstasrc.dat
Warehouse Promotional End Date	dm0_pmsendsrc.dat
RMS to AIP SKU Map	dmx_rmsskumap.dat

Supply Chain Logical Links

Home Warehouse	dm1_prfhme.dat
Product-Profile Links	dmx_prdprflks.dat
Product-Supplier Links	dmx_prdspllks.dat
Profile Default Order Cycle	dmx_prfdefocy.dat
Profile Links	dm1_prflks.dat
Off-sale	dm0_ofseffdt_.dat
On-sale	dm0_onseffdt_.dat
Store Source	dm0_src_i.dat

Step Execution

The aip_batch.sh control script has a -f flag that automatically runs all necessary steps (or the start and end flags can be used as well):

```
/aip/rpas> aip_batch.sh -f
```

- OR -

```
/aip/rpas> aip_batch.sh -f -s check_process_external_data \  
-e auto_build_wkbooks_batch
```

Step 4: First Day of AIP on Oracle Import

Step Details

The First Day of AIP on Oracle import is merely a subset of the complete import that is executed on a daily basis. In addition, there is a pause between the execution of the import and the automation tasks that occur afterward. The pause is required to allow the next step, Step 5, to occur.

Below is a list of the files imported in the First Day import.

Hierarchy Import

Description	File name	Import Directory
Product hierarchy	prod.dat	sku_pack
SKU Packsize Pack-type	dmx_pcktyp.dat	sku_pack
SKU Packsize Attribute	item_attribute_value.dat	sku_pack
SKU Packsize Attribute Value	item_attribute.dat	sku_pack
Profile hierarchy	prof.dat	profile
Store hierarchy	loc.dat	store
Default Warehouse for Stores	default_wh.dat	store
Supplier hierarchy	hspl.dat	supplier
Supplier Ship-to info	dmx_shpto_.dat	supplier
Warehouse hierarchy	whse.dat	warehouse
Warehouse Type info	wh_type.dat	warehouse

Data Management Import

Description	File name	Import Directory
New Product Alert	dmx_newprd.dat	alerts
New Packsize Alert	dmx_newpsz.dat	alerts
New Store Alert	dm0_new.dat	alerts
New Supplier Alert	dm0_newspl.dat	alerts
New Warehouse Alert	dm1_new.dat	alerts
Direct-supply flag	dmx_dirspl.dat	direct_suppliers
Direct-to-Store Format Ordering Pack Size	direct_store_format_pack_size.dat	direct_store_format_pack_size
Direct-to-Store Ordering Pack Size	direct_store_pack_size.dat	direct_store_pack_size
Off-sale	dm0_ofseffdt_.dat	on_supply_off_supply
On-sale	dm0_onseffdt_.dat	on_supply_off_supply
WH-to-Store Format Ordering Pack Size	store_format_pack_size.dat	store_format_pack_size
WH-to-Store Ordering Pack Size	store_pack_size.dat	store_pack_size

Description	File name	Import Directory
Store Source	dm0_src_i.dat	store_source
Home Warehouse	dm1_prfhme.dat	home_warehouse
Product-Profile Links	dmx_prdprflks.dat	assigned_commodity
Product-Supplier Links	dmx_prdspllks.dat	commodity_supplier_links
Profile Order Cycle	dmx_prfdefocy.dat	profile_order_cycle
Profile Links	dm1_prflks.dat	valid_warehouse
RMS to AIP SKU Map	dmx_rmsskumap.dat	sku_map
Warehouse Promotional Start Date	dm0_pmsstasrc.dat	warehouse_promotional_dates
Warehouse Promotional End Date	dm0_pmsendsrc.dat	warehouse_promotional_dates

Step Execution

Perform the following procedure.

1. Set the environment variables for the session.

```
/aip/oracle> . aip_common_online.sh
```
2. Prepare the flat files in the import directory

```
/aip/oracle> ${INTEGRATION_HOME}/scripts/prep_files.sh DM_data AIP-ONLINE
```
3. Verify the success of the operation by checking the log files for errors and checking the return value of the last operation.

```
/aip/oracle> echo $?
```
4. Import the hierarchy values and attributes.

```
/aip/oracle> ${INTEGRATION_HOME}/scripts/process_aionline_data.sh -l  
"${INTEGRATION_HOME}/config/import_hierarchy.config"
```
5. Verify the success of the operation by checking the log files for errors and checking the return value of the last operation.

```
/aip/oracle> echo $?
```
6. Import the measure data.

```
/aip/oracle> ${INTEGRATION_HOME}/scripts/process_aionline_data.sh -l  
"${INTEGRATION_HOME}/config/import_dm.config"
```
7. Verify the success of the operation by checking the log files for errors and checking the return value of the last operation.

```
/aip/oracle> echo $?
```

Step 5: First Day of AIP on Oracle Manual Setup

Step Details

In order to achieve the maximum benefit from Automated Data Maintenance the user is required to create warehouse chambers and assign SKU-types to them. These actions occur in the Data Management Online application. Refer to the *Oracle Retail Data Management Online User Guide* or the online Help for details on creating chambers and assigning one or more SKU types.

Step Execution

Log in to Data Management Online. Follow the steps to create one or more chambers for each warehouse. Follow the steps to assign one or more SKU types to each chamber.

Step 6: First Day of AIP on Oracle Automation

Step Details

When configured and executed, Automated Data Maintenance will setup the supply-chain for new Suppliers, new SKU-pack sizes, sister warehouses, and sister stores. The first day this pertains to all suppliers and SKU-pack sizes because all data is new to AIP. None of the 'maintenance' activities will have an effect because all data is new and therefore no invalid relationships exist. Refer to the *Oracle Retail AIP Operations Guide* for a detailed explanation of the processes executed to setup and maintain the supply-chain. Note that sister store and sister warehouse automation do nothing the first day.

Step Execution

Perform the following procedure to execute the process.

1. Execute the automation control script.

```
/aip/oracle> ${INTEGRATION_HOME}/scripts/post_import_wrapper.sh
```
2. Verify the success of the operation by checking the log files and the return value of the last operation.

```
/aip/oracle> echo $?
```

Step 7: First Day of AIP on Oracle Import of Non-critical Alerts

Step Details

The non-critical alerts are informative alerts that identify potential holes in the supply chain. During batch runs subsequent to the First Day these alerts may trigger automated maintenance of certain data in addition to an informative alert visible to the user in Data Management Online.

Step Execution

Perform the following procedure to execute the process.

1. Prepare the flat files in the import directory.

```
/aip/oracle> ${INTEGRATION_HOME}/scripts/prep_files.sh DM_alerts AIP-ONLINE
```
2. Verify the success of the operation by checking the log files for errors and checking the return value of the last operation.

```
/aip/oracle> echo $?
```
3. Import the hierarchy values and attributes.

```
/aip/oracle> ${INTEGRATION_HOME}/scripts/process_aiponline_data.sh -l  
"${INTEGRATION_HOME}/config/import_dm_alerts.config"
```
4. Verify the success of the operation by checking the log files for errors and checking the return value of the last operation. Note that you will likely see warning messages indicating that some files do not exist. This is expected on the first day.

```
/aip/oracle> echo $?
```

Step 8: Manual Setup of AIP

Step Details

Although the Automated Data Maintenance logic creates the majority of the supply chain representation AIP has various other attributes and exceptions that, if they are to be leveraged, must be manually created. The user can also choose to modify the supply chain created by automation.

The Data Management Online attributes and exceptions that are not created by automation include:

- Planning Groups
- Network Groups
- Planning Horizons (Global default is set at implementation time)
- Singles Enabled SKU
- Store Order Cycle Exceptions
- Non-release Dates and Exceptions
- Non-receipt Dates
- Store Receiving Calendar*
- Direct/Warehouse to Store Pack Size Exceptions (can be loaded)
- Warehouse Coupled Flag
- Stockless Indicator Exceptions
- Receipt to Availability Lead Time
- Shifts and Slots*
- Receiving Windows
- Time Balanced Order Source Splits (partially created by automation)*
- Supplier Locks

- Non Delivery Dates and Exceptions

*Required for replenishment

AIP on RPAS replenishment parameters must be set prior to executing the first full AIP batch run in order for a plan to be generated. The parameters define replenishment methods, tolerances, and other attributes required for generating planned orders.

Note that this setup can occur at any point after Step 3, but must be completed prior to executing a full batch cycle which includes replenishment planning.

Step Execution

Log in to the Data Management Online application. Refer to the *Oracle Retail AIP Data Management User Guide* for a detailed description of how to perform each action.

Log in to the SRP and WRP workbooks. Refer to the *Oracle Retail AIP SRP User Guide* and *Oracle Retail AIP WRP User Guide* for details on building workbooks and modifying the Administration Workbooks.
