Audience

User's Guide for Oracle Data Visualization Desktop is intended for business users who use Oracle Data Visualization Desktop to upload and query data, analyze data within visualizations, work with their favorite projects, and import and export their projects.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Resources

These related Oracle resources provide more information.
• Oracle Business Analytics Product Information
• Oracle Community Forum
• Oracle Data Visualization Desktop Installation Download
• Oracle Data Visualization Samples
Conventions

Conventions used in this document are described in this topic.

**Text Conventions**

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><strong>italic</strong></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>

**Videos and Images**

Your company can use skins and styles to customize the look of the Oracle Business Intelligence application, dashboards, reports, and other objects. It is possible that the videos and images included in the product documentation look different than the skins and styles your company uses.

Even if your skins and styles are different than those shown in the videos and images, the product behavior and techniques shown and demonstrated are the same.
Get Started with Oracle Data Visualization Desktop

This topic describes the benefits of using Data Visualization Desktop and explains how to get started using the samples provided.

Topics:

- About Oracle Data Visualization Desktop
- Get Started with Samples

About Oracle Data Visualization Desktop

Data Visualization Desktop provides powerful personal data exploration and visualization in a simple per-user desktop download. Data Visualization Desktop is the perfect tool for quick exploration of sample data from multiple sources or for rapid analyses and investigation of your own local data sets.

Data Visualization Desktop makes it easy to visualize your data so you can focus on exploring interesting data patterns. Just upload data files or connect to Oracle Applications or a database, select the elements that you’re interested in, and let Data Visualization Desktop find the best way to visualize it. Choose from a variety of visualizations to look at data in a specific way.

Data Visualization Desktop also gives you a preview of the self-service visualization capabilities included in Oracle Analytics Cloud, Oracle's industrial-strength cloud analytics platform. Oracle Analytics Cloud extends the data exploration and visualization experience by offering secure sharing and collaboration across the enterprise, additional data sources, greater scale, and a full mobile experience including proactive self-learning analytics delivered to your device. Try Data Visualization Desktop for personal analytics and to sample a taste of Oracle’s broader analytics portfolio.

Data Visualization Desktop’s benefits include:

- A personal, single-user desktop application.
- Offline availability.
- Completely private analysis.
- Full control of data source connections.
- Direct access to on-premises data sources.
- Lightweight single-file download.
- No remote server infrastructure.
- No administration tasks.
Get Started with Samples

Use the samples provided to discover all the capabilities of Oracle Data Visualization Desktop, and to learn the best practices.

Because these samples use business functions such as trending, binning, forecasting, and clustering, you can use them as a quick reference when you create your own visualization.

The sample data set is based on Sales Orders data and contains meaningful dimensions, distributions, examples of data wrangling, calculated columns, and more.

You can optionally download the samples during installation. If you didn’t download the samples during installation, then you can still get them by uninstalling and then reinstalling Data Visualization Desktop. Your personal data isn’t deleted if you uninstall and reinstall Data Visualization Desktop.
Explore, Visualize, and Analyze Data

This topic describes the many ways that you can explore and analyze your data.

</tbody>
</table>
Create a Project and Add Data Sets

Projects contain visualizations that help you to analyze your data in a productive and meaningful ways. When you create a project, you add one or more data sets containing the data that you want to visualize and explore. Data sets contain data from Oracle Applications, databases, or uploaded data files such as spreadsheets. You can also add data sets to your existing projects.

You can use the Data Set page to familiarize yourself with all available data sets. Data sets have distinct icons to help you quickly identify them by type.

1. To create a new project, go to the Home Page, click **Create**, then click **Project**. The Add Data Set dialog is displayed.
   - Alternatively, go to the Data page and click **Data Sets**. Select a data set you want to analyze in a project and click **Action menu** or right-click. Select **Create Project**.
   - Alternatively, to open an existing project, on the Home page, click **Navigator**, then select **Projects**. Locate an existing project in the My Folders, Shared Folders, Projects, or Favorites page. You can also locate an existing project by using the Home page search or by browsing the project thumbnails shown on the Home page. Click the project’s **Action menu**, then click **Open**.

2. You can add data to a project using one of the following options:
   - If you’re working with a new project, then in the Add Data Set dialog browse and select the data sources that you want to analyze, then click **Add to Project**.
   - If you’re working with an existing project, then in the Data Elements pane click **Add (+)**, then **Add Data Set** to display the Add Data Set dialog and add a data source.
   - You can also create a new data source based on a file or connection using the Create Data Set dialog, then add it to your projects. See Add Data Sources for Analyzing and Exploring Data.

3. To visualize data from multiple data set in the same project, in the Data Elements pane click **Add**, and then select **Add Data Set**.
   When you’ve multiple data set in a project, click **Data Sets** in the properties pane to change the default data blending options. See **Blend Data that You Added**.

4. Drag the data elements that you want to visualize from the Data Elements pane onto the visualization canvas, and start building your project.
Add Data from Data Sets to Visualization Canvases

There are various ways that you can add data elements such as columns and calculations to your visualizations.

Topics:
- Add Data to Blank Canvases
- About Adding Data to the Visualization Grammar Pane
- About Adding Data to the Visualization Assignment Pane
- Customize Tooltip Data

Add Data to Blank Canvases

You can add data elements directly from the Data Elements pane to a blank canvas.

You must create a project or open an existing project and add one or more data sets to the project before you can add data elements to a blank canvas.

1. Confirm that you’re working in the Visualize canvas.
2. Drag one or more data elements to the blank canvas or between visualizations on the canvas.

A visualization is automatically created and the best visualization type and layout are selected.

For example, if you add time and product attributes and a revenue measure to a blank canvas, the data elements are placed in the best locations and the Line visualization type is selected.

If there are visualizations already on the canvas, then you can drag and drop data elements between them.

About Adding Data to the Visualization Grammar Pane

After you've selected the data sets for your project, you can begin to add data elements such as measures and attributes to visualizations. You can select compatible data elements from the data sets and drop them onto the Visualization Grammar Pane in the Visualize canvas. Based on your selections, visualizations are created on the
canvas. The Visualization Grammar Pane contains sections such as Columns, Rows, Values, and Category.

You must create a project or open an existing project and add one or more data sets to the project before you can add data elements to the Visualization Grammar Pane. You can only drop data elements based on attribute and type onto a specific Visualization Grammar Pane section.

Confirm that you’re working in the Visualize canvas. Use one of the following methods to add data elements to the Visualization Grammar Pane:

- Drag and drop one or more data elements from the Data Elements pane to the Visualization Grammar Pane in the Visualize canvas. The data elements are automatically positioned, and if necessary the visualization changes to optimize its layout.
- Double-click data elements in the Data Elements pane to add them to the Visualize canvas.
- Replace a data element by dragging it from the Data Elements pane and dropping it over an existing data element.
- Swap data elements by dragging a data element already inside the Visualize canvas and dropping it over another data element.
- Reorder data elements in the Visualization Grammar Pane section (for example, Columns, Rows, Values) to optimize the visualization, if you’ve multiple data elements in the Visualization Grammar Pane section.
- Remove a data element by selecting a data element in the Visualization Grammar Pane, and click X.

About Adding Data to the Visualization Assignment Pane

You can use the visualization Assignment pane to help you position data elements in the optimal locations for exploring content.

You must create a project or open an existing project and add one or more data sets to the project before you can add data elements to the visualization Assignment pane.
Confirm that you’re working in the Visualize canvas. Use one of the following methods to add data elements to the Visualization Assignment Pane

- When you drag and drop a data element to a visualization (but not to a specific drop target), you'll see a blue outline around the recommended Assignments (for example Rows, Columns) in the visualization. In addition, you can identify any valid visualization Assignment because you'll see a green plus sign icon appear next to your data element. The sections in the visualization Assignment pane are the same as in the Visualization Grammar Pane.

After you drop data elements into the visualization Assignment pane or when you move your cursor outside of the visualization, the Assignment pane disappears.

- To display the Assignment pane again, on the visualization toolbar, click **Show Assignments**.

You can also do this to keep the visualization Assignment pane in place while you work.
Customize Tooltip Data

You can add data to the tooltips in a visualization.

You can select only measure columns for the Tooltip drop target. Tooltip data isn’t available for certain visualization types such as Table, Correlation Matrix, and List.

1. Confirm that you’re working in the Visualize canvas and select a visualization.
2. Drag and drop one or more measure columns from the Data Elements pane to the Tooltip drop target in the Visualization Grammar Pane.
3. Hover the mouse pointer over the visualization to see the updated tooltip. The tooltip displays the data intersection values at the top and the additional data at the bottom.

Add Advanced Analytics to Visualizations

You can easily apply advanced analytics functions to a project to augment its visualizations. For example, you can use advanced analytics to highlight outliers or overlay trendlines. Advanced analytics are statistical functions that you apply to enhance the data displayed in visualizations. Examples of advanced analytics functions are Clusters, Outliers, and Trend Lines.

The Data Elements pane Analytics area contains standard analytics functions (for example, Clusters and Trend Line). You can use analytics functions as they are, or use them to create your own calculated columns that reference statistical scripts. See Evaluate_Script in Analytics Functions.

Prerequisites

Before you can use analytic functions in Data Visualization:
• Install DVML and related packages ready to be used by Data Visualization Desktop.

For example, on Windows use the Install DVML Start menu option, or on Mac double-click the application Oracle Data Visualization Desktop Install DVML in Finder under Applications or in Launchpad.

• Create a project or visualization to which you can apply one or more analytic functions.

Use Analytic Functions

1. Confirm that you’re working in the Visualize canvas.

2. To display the available advanced analytic functions, click the Analytics icon in the Data Elements pane.

3. To edit the applied advanced analytics in a visualization, highlight the visualization, and in the properties pane click the Analytics icon.

4. To add advanced analytic functions to a visualization, do one of the following:
   • Drag and drop an advanced analytic function (such as Clusters, Outliers, Reference Line) from the Analytics pane to a visualization.
   • Right-click a visualization, and select a advanced analytic function.
   • In the properties pane select the Analytics icon and click Add (+), then select a function such as Add Clusters or Add Outliers.

Add Reference Lines to Visualizations

You can use advanced analytics reference lines to identify the range of data element values in a visualization. To add a Reference line function to a visualization, do the following:

1. Click the Analytics icon in the Data Elements pane.

2. Drag and drop Reference Line into a visualization.

   You can also double-click Reference Line to add it to the currently selected visualization.

3. In the properties pane select Method, and click Line or Band.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Based on the selected Method or Reference functions, a line is displayed in the visualization to highlight the value.</td>
</tr>
</tbody>
</table>

4. If you've selected the Line method, select from the following reference functions:

<table>
<thead>
<tr>
<th>Reference Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average</td>
<td>Average value of the data element added to the visualization.</td>
</tr>
<tr>
<td>Median</td>
<td>Median (middle) value of the data element added to the visualization.</td>
</tr>
<tr>
<td>Minimum</td>
<td>Minimum value (lowest numeric value) of the data element added to the visualization.</td>
</tr>
</tbody>
</table>
### Create Calculated Data Elements in a Data Set

You can create a new data element (typically a measure) to add to your visualization. For example, you can create a new measure called Profit that uses the Revenue and Discount Amount measures.

The calculated data elements are stored in the data set's My Calculations folder and not in the project. In a project with a single data set only one My Calculations folder is available and the new calculated data elements are added to it. In a project with multiple data sets My Calculations folder is available for each set of joined and not-joined data sets. Ensure that you're creating the calculated data elements for the required data set or joined data set. The new calculated data elements are added to the My Calculations folder of the data sets (joined and non-joined) that you create the calculation for.

#### Note:

In the Data Element pane right-click and select **Data Diagram** to see joined and not-joined data sets.

1. In the Visualize canvas navigate to the bottom of the Data Elements pane, right-click My Calculations, and click **Add Calculation** to open the New Calculation dialog.
2. In the expression builder pane, compose and edit an expression. See About Composing Expressions.
3. Click **Validate**.
4. Specify a name, then click **Save**.

### Undo and Redo Edits

You can quickly undo your last action and then redo it if you change your mind. For example, you can try a different visualization type when you don’t like the one you’ve just selected, or you can go back to where you were before you drilled into the data.

The undo and redo options are useful as you experiment with different visualizations. You can undo all the edits you’ve made since you last saved a project. However, in some cases, you can’t undo and then redo an edit. For example, in the Create Data Set page, you’ve selected an analysis from an Oracle Application data source to use as a data set in the project. In the next step, if you use the undo option to remove the data set, you can’t redo this change.

- To undo or redo an edit, go to the toolbar for the project or the data set and click **Undo Last Edit** or **Redo Last Edit**. You can use these options only if you haven’t saved the project since making the changes.

- When you’re working on a new project, click **Menu** on the project toolbar and select **Revert** to undo all changes that you’ve made to the project. If you’re working on an existing project, click **Revert to Saved**.

### Refresh Data in a Project

To see if newer data is available to display in the visualizations of your project, you can refresh the data and the metadata.

- On the project toolbar of the Visualize canvas, click **Menu** and select an option:
  - **Refresh Data** - This action clears the data cache and reruns queries that retrieve the latest data from the data sets.
  - **Refresh Data Set** - This action refreshes the data and any project metadata such as a column name change in the uploaded data set.

### Adjust the Visualization Canvas Layout

You can adjust the look and feel of visualizations on the Visualize canvas to make them more visually attractive.

You can copy a visualization and paste it within or between canvases in a project. You can also duplicate canvases and visualizations to create multiple copies of them. After
copying and pasting or duplicating, you can modify the visualization by changing the data elements, selecting a different visualization type, resizing it, and so on.

Here are the options available to alter or modify the format of the visualization canvas.

<table>
<thead>
<tr>
<th>Option</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Canvas Properties</td>
<td>Project toolbar Menu or right-click a canvas tab</td>
<td>Change the name, layout, width, and height of the canvas in the Canvas Properties dialog. Use the Synchronize Visualizations setting to specify how the visualizations on your canvas interact.</td>
</tr>
<tr>
<td>Add Canvas</td>
<td>Canvas tabs bar</td>
<td>Add a new canvas to the project. You can right-click and drag a canvas to a different position on the canvas tabs bar.</td>
</tr>
<tr>
<td>Rename</td>
<td>Right-click a canvas tab</td>
<td>Rename a selected canvas.</td>
</tr>
<tr>
<td>Duplicate Canvas</td>
<td>Right-click a canvas tab</td>
<td>Add a copy of a selected canvas to the project’s row of canvas tabs.</td>
</tr>
<tr>
<td>Clear Canvas</td>
<td>Right-click a canvas tab</td>
<td>Remove all the visualizations on the canvas.</td>
</tr>
<tr>
<td>Delete Canvas</td>
<td>Right-click a canvas tab</td>
<td>Delete a specific canvas of a project.</td>
</tr>
<tr>
<td>Duplicate Visual</td>
<td>Visualization Menu or right-click a visualization</td>
<td>Add a copy of a selected visualization to the canvas.</td>
</tr>
<tr>
<td>Copy Visual</td>
<td>Visualization Menu or right-click a visualization</td>
<td>Copy a visualization on the canvas.</td>
</tr>
<tr>
<td>Paste Visual</td>
<td>Visualization Menu, or right-click a visualization or blank canvas</td>
<td>Paste a copied visualization into the current canvas or another canvas.</td>
</tr>
<tr>
<td>Delete Visual</td>
<td>Visualization Menu or right-click a visualization</td>
<td>Delete a visualization from the canvas.</td>
</tr>
</tbody>
</table>
### Option Location Description

**Canvas Layout**
Visualization Menu, or right-click a visualization or blank canvas

Select one of the following:
- **Freeform** – If you select Freeform, you can perform the following functions:
  - Click Select All Visualizations to select all the visualizations on a canvas, and then copy them.
  - Select one of the following Order Visualization options: Bring to Front, Bring Forward, Send Backward, or Send to Back to move a visualization on a canvas with multiple visualizations.
  - Rearrange a visualization on the canvas. Drag and drop the visualization to the location (the space between visualizations) where you want it to be placed. The target drop area is displayed with a blue outline.
  - Resize a visualization by dragging its edges to the appropriate dimensions.
- **Autofit** – Auto-arrange or correctly align the visualizations on a canvas with multiple visualizations.

---

## Change Visualization Types

You can change visualization types to best suit the data you’re exploring.

When you create a project and add a visualization, Data Visualization chooses the most appropriate visualization type based on the data elements you selected. After a visualization type is added, dragging additional data elements to it won’t change the visualization type automatically. If you want to use a different visualization type, then you need to select it from the visualization type menu.

1. Confirm that you’re working in the Visualize canvas. Select a visualization on the canvas, and on the visualization toolbar, click **Change Visualization Type**.

2. Select a visualization type. For example, change the visualization type from Pivot to Treemap.
When you change the visualization type, the data elements are moved to matching drop target names. If an equivalent drop target doesn’t exist for the new visualization type, then the data elements are moved to a Visualization Grammar Pane section labeled **Unused**. You can then move them to the Visualization Grammar Pane section you prefer.

### Adjust Visualization Properties

You can change the visualization properties such as legend, type, axis values and labels, data values, and analytics.

1. Go to the Visualize or Narrate canvas and select the visualization whose properties you want to change. In the properties pane, you can see the visualization properties.

   Both common and type-specific properties of data elements or visualization are displayed. The properties you can edit are displayed in tabs and depend on the type of visualization or data element you're handling.

2. In the properties pane tabs, adjust the visualization properties as needed:

<table>
<thead>
<tr>
<th>Properties Pane Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td>Format title, type, legend, selection effect, and customize descriptions.</td>
</tr>
<tr>
<td>Axis</td>
<td>Set horizontal and vertical value axis labels and start and end axis values.</td>
</tr>
<tr>
<td>Data Sets</td>
<td>Override the way the system automatically blends data from two data sets.</td>
</tr>

<td>Add reference lines, trend lines, and bands to display at the minimum or maximum values of a measure included in the visualization.</td>
</tr>
</tbody>
</table>

### Assign Color to Visualize Data

This topic covers how you can work with color to enhance visualizations.

You can work with color to make visualizations more attractive, dynamic, and informative. You can color a series of measure values (for example, Sales or Forecasted Sales) or a series of attribute values (for example, Product and Brand).

The **Visualize** canvas has a Color section in the Visualization Grammar Pane where you can put a measure column, attribute column, or set of attributes columns. Note how the canvas assigns color to the columns that are included in the Color section:

- When a measure is in the Color section, then you can select different measure range types (for example, single color, two color, and three color) and specify advanced measure range options (for example, reverse, number of steps, and midpoint).
- When you’ve one attribute in the Color section, then the stretch palette is used by default. Color palettes contain a set number of colors (for example, 12 colors), and those colors repeat in the visualization. The stretch palette extends the colors in the palette so that each value has a unique color shade.
- If you’ve multiple attributes in the Color section, then the hierarchical palette is used by default, but you can choose to use the stretch palette, instead. The hierarchical palette assigns colors to groups of related values. For example, if the attributes in the Color section are Product and Brand and you’ve selected Hierarchical Palette, then in your visualization, each brand has its own color, and within that color, each product has its own shade.

### Manage Color Settings

Use the Visualize canvas to modify the visualization's color. Your color choices are shared across all visualizations on the canvas, so if you change the series or data point color in one visualization, then it appears on the other visualizations.

### Access Color Options

- To edit color options for the whole project, click **Menu** on the project toolbar and select **Project Properties**, then use the **General** tab to edit the color series or continuous coloring.
• To edit color options for a visualization, highlight the visualization and click **Menu** on the visualization toolbar and select **Color**. The available color options depend on how the measures and attributes are set up in your visualization.

![Visualization Color Options](image)

**Change the Color Palette**

Data Visualization includes several color palettes. Each palette contains 12 colors, but you can use the color stretching option to expand the colors in the visualization.

1. If your project contains multiple visualizations, click the visualization that you want to change the color palette for. Click **Menu** on the visualization toolbar and select **Color**, then select **Manage Assignments**. The Manage Color Assignments dialog is displayed.

2. Locate the **Series Color Palette** and click the color palette that's currently used in the visualization (for example, Default or Alta).

3. From the list, select the color palette that you want to apply to the visualization.

**Manage Color Assignments**

Instead of using the palette’s default colors, you can use the Manage Color Assignments feature to choose specific colors to fine-tune the look of your visualizations.

1. If your project contains multiple visualizations, click the visualization that you want to manage the colors for. Click **Menu** on the visualization toolbar and select **Color**,
then select **Manage Assignments**. The Manage Color Assignments dialog is displayed.

2. If you're working with a measure column, you can do the following:
   - Click the box containing the color assigned to the measure. From the color picker dialog, select the color that you want to assign to the measure. Click **OK**.
   - Specify how you want the color range to be displayed for the measure (for example, reverse the color range, pick a different color range, and specify how many shades you want in the color range).

3. If you're working with an attribute column, then click the box containing the color assignment that you want to change. From the color picker dialog, select the color that you want to assign to the value. Click **OK**.
Reset Colors
You can experiment with visualization colors and then easily revert to the visualization's original colors.

- If your project contains multiple visualizations, click the visualization that you want to reset the colors for. Click Menu on the visualization toolbar and select Color, then select Reset Visualization Colors.

Apply or Remove the Stretch Palette
Color palettes have a set number of colors, and if your visualization contains more values than the number of color values, then the palette colors are repeated. Use the Stretch Palette option to expand the number of colors in the palette. Stretch coloring adds light and dark shades of the palette colors to give each value a unique color. For some visualizations, stretch coloring is used by default.

- If your project contains multiple visualizations, click the visualization that you want to adjust the stretch palette from. Click Menu on the visualization toolbar and select Color, then select Stretch Palette to turn this option on or off.

Apply a Repeat Color Palette
In some cases, you might want to use a repeating color palette in your visualization. If your visualization contains more values than colors in the palette, then the colors are reused and aren't unique.

- In the Visualize canvas, click Color and click Stretch Palette to turn this option off.

Format Numeric Data Properties
You can format numeric data in your visualizations using a wide range of ready-to-use formats. For example, you might change the aggregation type from Sum to Average.

Format Numeric Values of Columns
1. Create or open the project that contains the numeric column whose properties you want to change.
2. In the Data Elements pane, select the column.
3. In the properties pane for the selected column, use the General or Number Format tabs to change the numeric properties.
   - General - Change the column name, data type, treat as (measure or attribute), and aggregation type.
     For example, to change how a number is aggregated, use the Aggregation option.
   - Number Format - Change the default format of a number column.
4. Click Save.

Format Numeric Values of Visualizations
1. Create or open the project that contains the visualization whose properties you want to change.
2. In the Visualize canvas, select the visualization.

3. In the properties pane for the selected visualization, use the **Values** tab to change the numeric properties.

   For example, to change how a number is aggregated, use the **Aggregation Method** option.

4. Click **Save**.

Apply Map Layers and Backgrounds to Enhance Visualizations

You can add and maintain custom map layers to enhance map visualizations.

**Topics:**

- Work with Map Backgrounds
- Enhance Visualizations with Map Backgrounds
- Use Different Map Backgrounds in a Project
- Use Color to Interpret Data Values in Map Visualizations
- Add Custom Map Layers
- Update Custom Map Layers
- Apply Multiple Data Layers on a Single Map Visualization
- Create Heatmap Layers on a Single Map Visualization
- Make Maps Available to Users
- Make Map Backgrounds Available to Users

Work with Map Backgrounds

You can enhance map visualizations in projects by adding and maintaining map backgrounds.

Oracle Data Visualization includes ready-to-use map backgrounds that you can easily apply to a project. You can also add backgrounds from the available list of Web Map Service (WMS) providers such as Google Maps and Baidu Maps. Background maps from these providers offer details and language support (such as city or region name) that certain geographic regions (such as Asian countries) require. You can enhance backgrounds in these ways:

- Modify the background parameters such as map type, format, language and API keys. The parameters are different for each WMS provider.
- Assign or change the default background in a project.
- Reverse the inherited default background settings in a project.

You can add a WMS provider and perform the following types of functions:

- Add the WMS map servers, and make them available as additional map background options.
- Select one or more map backgrounds available from the WMS provider.
- Assign an added WMS provider’s map as the default map background.

Enhance Visualizations with Map Backgrounds

You can use map backgrounds to enhance visualizations in a project.

1. Create or open the project where you want to include a map background.
   Confirm that you’re working in the Visualize canvas.

2. To select a map-related column and render it in a map view, do one of the following:
   - In the Data Elements pane:
     a. Right-click the map-related column.
     b. Click Pick Visualization.
     c. Select Map.
   - In the Data Elements pane:
     a. Drag and drop the map-related column to the blank canvas, or between visualizations on the canvas.
     You can also double-click the column to add it to the canvas.
     b. On the visualization toolbar, click Change Visualization Type.
     c. Select Map.

3. In the properties pane, click Map.

4. Specify the visualization properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zoom Control</td>
<td>Enable or disable zoom control.</td>
</tr>
<tr>
<td>Scale</td>
<td>Select a scale, such as mile.</td>
</tr>
<tr>
<td>Background Map</td>
<td>Select a map background. If you want to see the list of available map backgrounds, click Manage Map Backgrounds to display the Map Background tab.</td>
</tr>
<tr>
<td>Map Layer</td>
<td>Select a layer, such as Asian countries.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can also open the Console page, click Maps, and select the Map Backgrounds tab to see the available backgrounds list.</td>
</tr>
</tbody>
</table>

5. Click Save.

Use Different Map Backgrounds in a Project

As an author you can use different map backgrounds in map visualizations.

Here is an example of how you might use a map background in a project.
1. On the Home page click **Create**, then click **Project**.

2. Select a data set in the Add Data Set dialog.

3. Click **Add to Project**.
   
The Project pane and list of Data Elements is displayed.

4. Select a map-related data element (for example, click **City**), and click **Pick Visualization**.

5. Select **Map** from the list of available visualizations.
   
Data Visualization displays the default map background.

6. In the visualization properties pane, select the **Map** tab.

7. Click the **Background Map** value and select a map from the drop-down list.
   
For example, select Google Maps, and Data Visualization displays Google Maps as the map background.

8. (Optional) Click another value to change the type of map (such as Satellite, Road, Hybrid, or Terrain).

9. (Optional) Click **Manage Map Backgrounds** from the **Background Map** options to display the Map Backgrounds pane.
   
Use this option to maintain the map backgrounds that you want to use.

### Use Color to Interpret Data Values in Map Visualizations

You can use color features to interpret the measure columns and attribute values in projects that include map visualizations.

1. Create or open the project with a map visualization where you want to interpret specific columns and values by color.
   
Confirm that you’re working in the Visualize canvas.

2. Select a measure column or attribute from the project and render it in a map view, doing one of the following:
   
   • In the Data Elements pane, right-click the column or attribute, click **Pick Visualization**, and select **Map**.
   
   • Drag and drop the columns or attributes from the Data Elements pane to the blank canvas or between visualizations on the canvas. You can also double-click the columns or attributes to add them to the canvas.
     
     – On the visualization toolbar, click **Change Visualization Type**. Alternatively, in the Data Elements pane, right-click the column or attribute, and click **Pick Visualization**.
     
     – Select **Map**.

3. Drag and drop one or multiple measure columns or attributes in the following map color sections of the Visualization Grammar Pane:
### Section Description

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color</td>
<td>Change the color for geometries displayed in the corresponding map layer (for example, polygon fill color, bubble color) based on the values.</td>
</tr>
<tr>
<td>Size (Bubble)</td>
<td>Change color bubble size based on the measure column values. To change the size of the color bubble you've to drag and drop measure columns only. The size shows the aggregated measure for a specific geographic location in a map visualization.</td>
</tr>
<tr>
<td>Trellis Columns / Rows</td>
<td>Compare multiple map visualizations based on the column values using filters.</td>
</tr>
</tbody>
</table>

In the map visualization, you can also use the following color features to interpret measure columns and attribute values:

- **Legend** - If the measure column or attribute has multiple values, then the legend is displayed. Legends are grouped by Layer.

- **Tooltip** - Hover the mouse pointer over a color bubble to see the values in a tooltip. If there are multiple values, then a **Plus** (+) symbol is displayed.

## Add Custom Map Layers

You can add custom map layers to use in map visualizations.

You add a custom map layer to Data Visualization using a geometric data file with the .json extension that conforms to GeoJSON schema https://en.wikipedia.org/wiki/GeoJSON. You then use the custom map layer to view geometric map data in a project. For example, you might add a Mexico_States.json file to enable you to visualize geometric data in a map of Mexico States.

When creating a custom map layer, you must select layer keys that correspond with data columns that you want to analyze in a map visualization. For example, if you want to analyze Mexican States data on a map visualization, you might start by adding a custom map layer for Mexican States, and select HASC code layer key from the Mexican_States.json file. Here is an extract from the Mexican_States.json file that shows some of the geometric data for the Baja California state.

```json
{
  "type": "Feature",
  "properties": {
    "adm1_code": "MEX-2706",
    "OBJECTID_1": 745,
    "diss_m": 2706,
    "adm1_cod_1": "MEX-2706",
    "iso_3166_2": "MX-",
    "wikipedia": "",
    "iso_a2": "MX",
    "adm0_sr": 6,
    "name": "Baja California",
    "name_alt": "",
    "name_local": "",
    "type": "Estado",
    "type_en": "State",
    "code_local": "",
    "code_hasc": "MX.BN",
    "note": ""
  }
}
```
If you wanted to use the Mexican_States.json file, the layer keys that you select must match columns that you want to analyze from the Mexican States Data tables. For example, if you know there is a data cell for the Mexican state Baja California then select the corresponding name field in the JSON file to display state names in the Map visualization. When you create a project and select column (such as State, and HASC), then Mexican states are displayed on the map. When you hover the mouse pointer over a state, the HASC code (such as MX BN) for each state is displayed on the map.

1. Open the Console page and click **Maps** to display the Map Layers page.

   The Map Layers page contains a Custom Map Layers section and a System Map Layers section. The Custom Map Layers section displays the custom map layers that you maintain.

   ![Note:]
   You can disable or enable both a System Map Layer and a Custom Map Layer, but you can't add or delete a System Map Layer.

2. To add a custom map layer, click **Add Custom Layer** or drag and drop a JSON file from File Explorer to the Custom Maps area.

3. Browse the Open dialog, and select a JSON file (for example, Mexico_States.json).

   ![Note:]
   Custom layers with Line String geometry type isn't fully supported. The Color (Bubble) and Size (Bubble) fields in map visualization grammar are not applicable in the case of line geometries.

4. Click **Open** to display the Map Layer dialog.

5. Enter a **Name** and an optional **Description**.

6. Select the layer keys that you want to use from the Layer Keys list.

   The layer keys are a set of property attributes for each map feature, such as different codes for each state in Mexico. The layer keys originate from the JSON file. Where possible, select only the layer keys that correspond with your data.

7. Click **Add** to add the selected layer keys to your custom map layer.

   A progress indicator shows that the map layers are being saved, and a success message is displayed when the process is complete and the layer is added.

### Update Custom Map Layers

You can maintain custom map layers that you’ve added to Data Visualization.

1. Open the Console page and click **Maps** to display the Map Layers page.
The Map Layers page contains a Custom Map Layers section and a System Map Layers section. The Custom Map Layers section displays the custom map layers that you maintain.

2. Right-click the map layer, click **Options**, and then take the appropriate action:
   - To view or make changes to the map layer settings, select **Inspect**. The Map Layer dialog is displayed where you can update the Name, Description, or the Layer Keys used in this layer.
   - To upload the JSON file again, select **Reload**.
   - To save the JSON file locally, select **Download**.
   - To delete the custom map layer, select **Delete**. You can disable or enable a System Map Layer and a Custom Map Layer, but you can’t add or delete a System Map Layer.

3. Click the map layer to enable or disable it. For example, if you want to exclude India States on the map, click the layer to disable it and remove it from searches.

4. To switch from using one map layer to another:
   a. Select the desired columns from the project and select **Map** as the visualization.
   b. In the properties pane, select the **Map** tab to display the map properties.
   c. Click the current **Map Layer** for example Mexican States. This displays a list of available custom map layers that you can choose from.
   d. Click the map layer that you want to use to match your data points.

### Apply Multiple Data Layers on a Single Map Visualization

You can use the data layer feature to display multiple data series (different sets of dimensions and metrics) on a single map visualization in a project. The data layers are overlaid on one another in a single map visualization.

1. Create or open the project where you want to display multiple data layer overlays on a single map visualization. Confirm that you’re working in the Visualize canvas.

2. To select a map-related attribute column and a measure column and render in a map view, do one of the following:
   - In the Data Elements pane:
     a. Right-click the map-related column (for example, State).
     b. Click **Pick Visualization**.
     c. Select **Map**.
     d. Right-click a measure column (for example, Population).
     e. Click **Add to Selected Visualization**.
   - In the Data Elements pane:
     a. Drag and drop the map-related column and measure column to the blank canvas, or between visualizations on the canvas.
     You can also double-click columns to add them to the canvas.
b. On the visualization toolbar, click **Change Visualization Type**.

c. Select **Map**.

The selected column or attribute is displayed as a data layer in the Category (Geography) section of the Visualization Grammar Pane and in the Data Layers tab of the properties pane. Based on the column or attribute values a specific set of dimensions and metrics is displayed on the map visualization.

3. Click **Layer options** in the Visualization Grammar Pane and click **Add Layer**. Alternatively in the Data Layers tab click **Add Layer (+)**. A new data layer, for example Layer 2, is added to the Category (Geography) section and Data Layers tab.

4. Drag and drop an attribute from the Data Elements pane to the Category (Geography) section of the Visualization Grammar Pane. Based on the attribute values the map visualization automatically updates with a different set of dimensions, and it overlays on the previous layer.

5. Repeat step 3 and 4 to add multiple data layers on the map visualization.

   - In the Category (Geography) section of the Visualization Grammar pane, select an attribute and click **X** to remove it from the layer.
   - Click **Layer options** and select the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Layer</td>
<td>Add a new data layer on the map visualization.</td>
</tr>
<tr>
<td>Order Layer</td>
<td>Select one of the following: Bring to Front, Bring Forward, Send Backward, Send to Back to change the order of the overlay layers.</td>
</tr>
<tr>
<td>Hide Layer</td>
<td>Hide a particular layer.</td>
</tr>
<tr>
<td>Delete Layer</td>
<td>Delete a particular layer.</td>
</tr>
<tr>
<td>Manage Layers</td>
<td>Display a specific layer options in the Data Layers tab of the properties pane.</td>
</tr>
</tbody>
</table>

   - In the Data Layers tab of the properties pane, select the option for a specific layer, as described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Select <strong>Auto</strong> or <strong>Custom</strong>. Enter a name if you select <strong>Custom</strong>.</td>
</tr>
<tr>
<td>Map Layer</td>
<td>Select a specific map layer, such as world countries, world cities. Click <strong>Manage Map Layers</strong> to modify the options for the custom map or system map layer on the Console page.</td>
</tr>
<tr>
<td>Layer Type</td>
<td>Select <strong>Polygon</strong>, <strong>Point</strong>, <strong>Heat Map</strong>, or <strong>Line</strong>.</td>
</tr>
<tr>
<td>Transparency</td>
<td>Select the transparency value.</td>
</tr>
<tr>
<td>Show Layer</td>
<td>Move the slider, or toggle the layer icon in the legend, to show or hide a specific layer in the map visualization.</td>
</tr>
<tr>
<td>Reorder Layer</td>
<td>Change the order of a specific layer in the layer series.</td>
</tr>
<tr>
<td>Remove Layer</td>
<td>Remove a selected layer.</td>
</tr>
</tbody>
</table>

   - You can apply a Filter, such as a Range Filter or List Filter, to the map visualization to refine the data shown for the attribute and measure columns in all the data layers in the map. For example, you can select a measure or
attribute for a layer, then apply filter to reduce the amount of data shown, and add the same measure or attribute to the Color section of the Visualization Grammar Pane.

Create Heatmap Layers on a Map Visualization

You can use a heatmap as a data layer type on a map visualization to identify the density or high concentration of point values or metric values associated with the points. For example, you can use a heatmap to identify the high profit stores in a geographic region or country.

You can create two types of heatmap layers:

- **Density heatmap** - Uses only map-related column data (such as latitude and longitude columns). Density heatmap layers show the cumulative sum of a point, where each point carries a specific weight. A point has a radius of influence around it, such that other points that fall in the same area also contribute to the total cumulative result of a point.

- **Metric heatmap** - Uses measure column data in the same layer. For example, if you add a measure column to the Color section of the Visualization Grammar Pane the heat map is updated to show interpolated metric values.

1. Create or open the project where you want to use a heatmap layer on a map visualization. Confirm that you’re working in the Visualize canvas.

2. Create an empty map visualization.

3. Drag and drop attribute columns containing map-related data from the Data Elements pane to the Category (Geography) section of the Visualization Grammar Pane. 

   - If you’re creating a project with a map visualization, in the Data Elements pane, right-click an attribute column and click **Pick Visualization** then select **Map**.

4. Click **Layer options** in the Visualization Grammar Pane and click **Manage Layers**. Alternatively, go to the Data Layers tab of the properties pane.

5. To create a density heatmap, click **Layer Type** and select **Heatmap**.

   You can also add a map data layer, change the layer type to **Heatmap**, then add attribute columns to the Category section of the Visualization Grammar Pane.

6. To create a metric heatmap, drag and drop a metric column from the Data Elements pane to the Color section in the Visualization Grammar Pane. The heatmap visualization changes from density to metric.

7. In the Data Layers tab of the properties pane, specify the options for the heatmap layer:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Select <strong>Auto</strong> or <strong>Custom</strong>. Enter a name if you select <strong>Custom</strong>.</td>
</tr>
<tr>
<td>Map Layer</td>
<td>Select the map layer type, such as world cities, or other point layers.</td>
</tr>
<tr>
<td>Transparency</td>
<td>Select the transparency value.</td>
</tr>
<tr>
<td>Radius</td>
<td>Select the radius value in pixels (px). The radius value is the extent of influence of a measure around a point value on a map.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Color | Select the color type of the heatmap, such as Spectrum Lite, Red-Yellow-Green.
Interpolation | Select the interpolation method, such as Cumulative, Maximum, Minimum, and Average Constant. The default interpolation method is automatically selected based on the aggregation rule of the metric column or value that you’ve selected for the layer.

The heatmap visualization is automatically updated based on the options selected in the Data Layers tab of the properties pane.

Make Maps Available to Users

For visualization projects, administrators make maps available to end users or hide them from end users.

You can include or exclude a map from users.

1. On the Home page, click **Console**.
2. Click **Maps**.
3. Use the **Include** option to make a map layer available to end users or hide it from end users.

You can hide or display custom map and system map layers.

Make Map Backgrounds Available to Users

Oracle provides two pre-configured map backgrounds with Data Visualization. As an administrator, you can add map backgrounds for use in map visualizations.

1. On the Home page, click **Console**, select **Maps**, and click **Map Backgrounds**. A table is displayed listing the currently installed map backgrounds that you can use in a visualization.

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Shows which background map is the default (displays a tick symbol when selected).</td>
</tr>
<tr>
<td>Include</td>
<td>Shows whether a map background is included or excluded as an available option to users (displays a tick symbol when selected).</td>
</tr>
<tr>
<td>Name</td>
<td>Displays the name of the map background.</td>
</tr>
<tr>
<td>Description</td>
<td>Describes the map background. For example, for Oracle Maps the description is &quot;General reference world map from Oracle&quot;.</td>
</tr>
<tr>
<td>Modified</td>
<td>Shows the most recent date that the map background was modified in Data Visualization.</td>
</tr>
</tbody>
</table>

2. To add a background map, click **Add Background**. A list of available map backgrounds is displayed. Oracle Maps are pre-configured and shipped with the product. Additional background maps that you can add are Google Maps and Baidu Maps.
Note:
For third-party map providers (other than Oracle), you must obtain Maps API access keys from the respective provider (for example, Google or Baidu). Those providers may independently charge you based on your usage, as described in their respective terms of agreement.

3. Select a map background from the list.
4. Copy and paste in the appropriate Maps API access key.

Note:
You must sign up with the provider to be able to add and use any of these map types.

- To use the Google Maps tiles, you must obtain a Google Maps API access key from Google. Google prompts you to enter your Maps API access key and, when applicable, your Google “Client ID”. Usage of the tiles must meet the terms of service specified by Google in the Google Developers Site Terms of Service.
- To use the Baidu Maps tiles, you must obtain a Baidu Maps API access key from Baidu. Baidu prompts you to enter your Maps API access key. Usage of the tiles must meet the terms of service specified by Baidu in the Baidu User Agreement.

5. Select a default map type if applicable and enter a helpful description if needed.
6. Click **Add** to include this map in the list of currently available map backgrounds.

Data Visualization displays a message when the map background is successfully added.

Sort and Select Data in Visualization Canvases

While adding filters to visualizations helps you narrow your focus on certain aspects of your data, you can take a variety of other analytic actions to explore your data (for example, drilling, sorting, and selecting). When you take any of these analytic actions, the filters are automatically applied for you.

Select a visualization and click **Menu** or right-click, then select one of the following analytics actions:

- **Use Sort** to sort attributes in a visualization, such as product names from A to Z. If you're working with a table view, then the system always sorts the left column first. In some cases where specific values display in the left column, you can't sort the center column. For example, if the left column is Product and the center column is Product Type, then you can't sort the Product Type column. To work around this issue, swap the positions of the columns and try to sort again.
- **Use Drill** to drill to a data element and drill through hierarchies in data elements, such as drilling to weeks within a quarter. You can also drill asymmetrically using multiple data elements. For example, you can select two separate year members that are columns in a pivot table, and drill into those members to see the details.
• Use **Drill to [Attribute Name]** to directly drill to a specific attribute within a visualization.

• Use **Keep Selected** to keep only the selected members and remove all others from the visualization and its linked visualizations. For example, you can keep only the sales that are generated by a specific sales associate.

• Use **Remove Selected** to remove selected members from the visualization and its linked visualizations. For example, you can remove the Eastern and Western regions from the selection.

• Use **Add Reference Line** to add a reference line to highlight an important fact depicted in the visualization, such as a minimum or maximum value. For example, you can add a reference line across the visualization at the height of the maximum revenue amount.

Replace a Data Set in a Project

You can replace a data set by re-mapping columns used in the data visualization project to columns from a different data set. As part of replacing a data set, you can review and re-map only those columns that are used in the project and replace them with columns of the same data type in the replacement data set. For example, you can replace a test data set with a production data set, or use a project as a template in which you can replace the data but maintain the added structures, visualizations, and calculations.

The **Replace Data Set** option is available only for projects using a single data set. The option isn't available for projects that use multiple data sets.

1. Create or open the Data Visualization project in which you want to replace the data set.

   Confirm that you're working in the **Visualize** canvas.

2. In the Data Elements pane, right-click the data set and select **Replace Data Set**.

3. In the Replace Data Set dialog, perform the following tasks:

   • Select the data set that replaces the existing data set in the project and click **Select**.

   • Review the mapping of the data between the existing and the new data sets in the data-mapping table. The data-mapping table includes all the data elements used in the project’s visualizations, calculations, and filters. The data elements with similar type and names in the two data sets are automatically mapped. In the table, based on data types, the data elements are grouped and sorted alphabetically.

   • In the new data set column, click the drop-down arrow in a cell and select a specific data element to adjust the mapping of the data.

   **Note:**

   – Only data elements of the same type are displayed in the data element selection dialog.

   – You can navigate back to select a different data set.
4. Click **Replace**.

The new data set replaces the existing data set in the project. You see a notification if you've selected a data set that is joined to other data sets in the project. Review and adjust the joins in the project's **Data Diagram**.

In the data-mapping table based on the selection, the data is updated throughout the project. For example, if you map a data element to **None**, the specific data is removed from the visualizations, calculations, and filters.

---

**Remove a Data Set from a Project**

You can remove a data set from a project.

Removing data from a project differs from deleting the data set from Data Visualization.

1. Open your project and in the Data Elements pane, select the data set that you want to remove.

2. Right-click and select **Remove from Project**. A confirmation dialog is displayed.

3. Click **Yes** to remove the data set.

---

**Analyze Your Data Set Using Machine Learning**

Machine learning analyzes the data in your data set to provide insights that enable you to explain the various aspects of that data.

**Topics:**

- **About Using Machine Learning to Discover Data Insights**
- **Add Data Insights to Visualizations**

**About Using Machine Learning to Discover Data Insights**

Machine learning analyzes the data to recognize the patterns and trends in your data set to provide visual insights and enhanced statistical analysis. You can subsequently use these visual insights and statistical analysis in your project visualization canvas to interpret the data in your data set.

Machine learning provides accurate, fast, and powerful data insights because it analyzes and processes technical and statistical complexity and the volume and variety of the date in your data set. Because of machine learning’s accuracy, speed, and scale, it’s cheaper and more powerful than the traditional method of analyzing data.

To discover data insights, you simply select an attribute in your data set. Machine learning provides you with narratives, visual insights, and statistical analyses such as charts. You can select specific charts and include them as visualizations in your project visualization canvas. You manage these visualizations as you do any other visualizations in your project. With machine learning, you don't have to waste time guessing and dropping random data elements on the canvas to create a visualization for data insight.
Before you start, install machine learning on the Windows or Mac machine where you installed Data Visualization Desktop. See How do I install Machine Learning for Desktop?

After you’ve installed machine learning, you can start uncovering insights in your data. See Add Data Insights to Visualizations.

Add Data Insights to Visualizations

You can select specific data insights charts provided by machine learning and add them directly as a visualization in your project’s visualization canvas.

**Note:**
You must install the Data Visualization machine learning component to display the Explain option.

1. Create or open a data visualization project. Confirm that you’re working in the Visualize canvas.

2. In the Data Elements pane, right-click a data element (attribute or measure) and select **Explain <Data Element>** to display the Explain <Data Element> dialog tabs:
   - **Basic Facts about <Data Element>** - Shows the basic distribution of the data element (attribute or measure) values across the data set and its breakdown against each one of the measures in the data set.
   - **Key Drivers of <Data Element>** - Shows data elements (attributes or measures) that are more highly correlated to the outcome for the selected data. The charts showing the distribution of the selected attribute value across each of the correlated attributes values is displayed.
   - **Segments that Explain <Data Element>** - Shows the segments or group in the data set, after examining all the records, that can predict the value of the selected data element. You can select a particular segment or group and then continue to analyze it.
   - **Anomalies of <Data Element>** - Shows the group of anomalies or unusual values in the data set that you can relate to the selected data element (attribute or measure). You can review and select particular group of anomalies.

3. Use the Explain dialog to help you configure your visualizations.
   - When you click a data element (attribute or measure), information for the selected data element is highlighted in the segments below.
   - You can select more than one data element (attribute or measure) at the same time to see results in the segments.
   - You can also sort how the information is displayed in the Segments (High to Low, or Low to High, group by Color, or sort by data element Value).
   - For each Segment in the decision tree, summary rules for the percentage of the data element and other metadata about the section are displayed. For example, a certain Segment might show that a particular percentage of the selected attribute (data element) belongs to a specific group like location.
point, another attribute, or measure. You can then select a specific group, like location, to analyze the selected attribute.

• The Anomalies section finds data points that don’t fit the expected pattern.

4. Click the check mark when you hover the mouse pointer over any of the data insight charts to select a specific chart.

5. Click Add Selected to add the charts you’ve selected as different visualizations in your project’s visualization canvas. You can manage data insight visualizations like any other visualizations you’ve manually created on the canvas.

About Warnings for Data Issues in Visualizations

You see a data warning icon when the full set of data associated with a visualization isn’t rendered or retrieved properly. If the full set of data can’t be rendered or retrieved properly, then the visualization displays as much data as it can as per the fixed limit, and the remaining data or values are truncated or not displayed.

The warning icon (an exclamation mark icon) is displayed in two locations:

• Next to the title of a visualization that has a data issue.

When you hover over the warning icon, you see a message that includes text such as the following:

Data sampling was applied due to the large quantity of data. Please filter your data. The limit of 500 categories was exceeded.

You see the warning icon associated with the visualization until the data issue is resolved. The warning icon is displayed only in the visualization Canvas; it’s not displayed in Presentation Mode or Insights.

• On the Canvas tabs bar if any visualization on the Canvas page has the data warning.

By default, visualization warning icons aren’t displayed: You can show or hide the warning icon beside the title of the visualization by clicking the icon on the Canvas tabs bar. The warning icon is only displayed if a Canvas includes a visualization with a data issue. If a visualization with a data issue is in multiple canvases, you see the icon in all those canvases.
Create and Apply Filters to Visualize Data

This topic describes how you can use filters to find and focus on the data you want to explore.

Topics:
- Typical Workflow to Create and Apply Filters

</tbody>
</table>
About Filters and Filter Types

Filters reduce the amount of data shown in visualizations, canvases, and projects.

The Range, List, Date, and Expression filter types are specific to either a visualization, canvas, or project. Filter types are automatically determined based on the data elements you choose as filters.

- **Range filters** - Generated for data elements that are number data types and that have an aggregation rule set to something other than none. Range filters are applied to data elements that are measures, and that limit data to a range of contiguous values, such as revenue of $100,000 to $500,000. Or you can create a range filter that excludes (as opposed to includes) a contiguous range of values. Such exclusive filters limit data to noncontiguous ranges (for example, revenue less than $100,000 or greater than $500,000). See Apply Range Filters.

- **List filters** - Applied to data elements that are text data types and number data types that aren't aggregatable. See Apply List Filters.

- **Date filters** - Use calendar controls to adjust time or date selections. You can either select a single contiguous range of dates, or you can use a date range filter to exclude dates within the specified range. See Apply Date Filters.

- **Expression filters** - Let you define more complex filters using SQL expressions. See Build Expression Filters.

How Visualizations and Filters Interact

There are several ways that filters can interact with visualizations in a project. For example, filters might interact differently with visualizations depending on the number of data sets, whether the data sets are joined, and what the filters are applied to.

Topics:

- How Data Sets Interact with Filters
- How the Number of Data Sets Interact with Filters

How Data Sets Interact with Filters

Various factors affect the interaction of data sets and filters in projects:

- The number of data sets within a project.
- The data sets that are joined (connected) or not-joined (for a project with multiple data sets).
- The data elements (columns) that are matched between joined data sets.

You can use the Data Diagram in the Prepare canvas of a project to:

- See joined and not-joined data sets.
- Join or connect multiple data sets by matching the data elements in the data sets.
- Disconnect the data sets by removing matched data elements.
How the Number of Data Sets Interact with Filters

You can add filters to the filter bar or to individual visualizations in a project.

<table>
<thead>
<tr>
<th>Single Data Set</th>
<th>Filter Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a filter to the filter bar</td>
<td>It applies to all visualizations in the project.</td>
</tr>
<tr>
<td>Add a filter to a visualization</td>
<td>It is applied after filters on the filter bar are applied.</td>
</tr>
<tr>
<td>Add multiple filters</td>
<td>By default filters restrict each other based on the values that you select.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Multiple Data Sets</th>
<th>Filter Interaction</th>
</tr>
</thead>
</table>
| If you add filters to the filter bar. | • The filters apply to all the visualizations using the joined data sets. For visualizations using the not-joined data sets, you must add a separate filter to each data set.  
• You can't specify data elements of a data set as a filter of other data sets, if the two data sets aren't joined.  
• If a data element of a data set is specified as a filter, but doesn't match the joined data sets, then the filter applies only to the visualization of that particular data set, and does not apply to other visualizations of joined or not-joined data sets.  
• You can select Pin to All Canvases of a filter, to apply a filter to all canvases in the project. |
| If you hover the mouse pointer over a filter name to see the visualization to which the filter is applied. | Any visualizations that don't use the data element of the filter are grayed out. |
| If you add filters to visualizations | • If you specify a filter on an individual visualization, that filter applies to that visualization after the filters on the filter bar are applied.  
• If you select the Use as Filter option and select the data points that are used as a filter in the visualization, then filters are generated in the other visualizations of joined data sets and matched data elements. |

You can use the Limit Values By options to remove or limit how the filters in the filter bar restrict each other.

Synchronize Visualizations in a Project

You can specify whether or not to synchronize Visualizations in a canvas.

You use the Synchronize Visualizations setting to specify how the visualizations on your canvas interact. By default, visualizations are linked for automatic synchronization. You can deselect Synchronize Visualizations to unlink your visualizations and turn automatic synchronization off.

When Synchronize Visualizations is on (selected), then all filters on the filter bar and actions that create filters (such as Drill) apply to:

• All the visualizations in a project with a single data set.  
• All the visualizations of joined data sets with multiple data sets.

If a data element from a data set is specified as a filter but isn't matched with the joined data sets, then the filter only applies to the visualization of the data set that it was specified for.
Note:

- When you hover the mouse pointer over a visualization to see the filters applied to the visualization, any filter that isn’t applied to the visualization is grayed out.
- Any visualization-level filters are applied only to the visualization.
- When Synchronize Visualizations is off (deselected), then analytic actions such as Drill affect the visualization to which you applied the action.

About Automatically Applied Filters

By default, the filters in the filter bar and filter drop target are automatically applied. However, you can turn this behavior off if you want to manually apply the filters.

When the Auto-Apply Filters is selected in the filter bar menu, the selections you make in the filter bar or filter drop target are immediately applied to the visualizations. When Auto-Apply Filters is off or deselected, the selections you make in the filter bar or filter drop target aren’t applied to the canvas until you click the Apply button in the list filter panel.

Create Filters on a Project

You can add filters to limit the data that’s displayed in the visualizations on the canvases in your project.

If your project contains multiple data sets and some aren’t joined, then there are restrictions for how you can use filters. Any visualization that doesn’t use the data element of the filter is grayed out.

Instead of or in addition to adding filters to the project or to an individual canvas, you can add filters to an individual visualization.

1. Click + Add Filter, and select a data element. Alternatively, drag and drop a data element from the Data Elements pane to the filter bar.

   You can’t specify data elements of a data set as a filter of other data sets, if the two data sets aren’t joined.

2. Set the filter values. How you set the values depends upon the data type that you’re filtering.
   - Apply a range filter to filter on columns such as Cost or Quantity Ordered.
   - Apply a list filter to filter on columns such as Product Category or Product Name.
   - Apply a date filter to filters on columns such as Ship Date or Order Date.

3. Optionally, click the filter bar menu or right-click, then select Add Expression Filter.

4. Optionally, click the filter Menu and hover the mouse pointer over the Limit Value By option to specify how the filter interacts with the other filters in the filter bar.

Note the following:
• By default, the **Auto** option causes the filter to limit other related filters in the filter bar.

  For example, if you've filters for Product Category and Product Name, and if you set the Product Category filter to Furniture and Office Supplies, then the options in the Product Name filter value pick list is limited to the product names of furniture and office supplies. You can select **None** to turn this limit functionality off.

• You can specify any individual filter in the filter bar that you don’t want to limit.

  For example, if you have filters for Product Category, Product Sub Category, and Product Name, and in the **Limit Value By** option for the Product Category filter you click Product Sub Category, then the product subcategory filter shows all values and not a list of values limited by what you select for Product Category. However, the values shown for Product Name is limited to what you select for Product Category.

5. Optionally, click the filter bar menu or right-click and select **Auto-Apply Filters**, then click **Off** to turn off the automatic apply. When you turn off the automatic apply, then each filter’s selection displays an **Apply** button that you must click to apply the filter to the visualizations on the canvas.

6. Click the filter bar menu or right-click and select **Pin to All canvases** of a filter to apply a filter to all canvases in the project.

   **Note:**

   You can also go to the filter bar and perform the following steps:

   • Select a filter and right-click, then select **Delete** to remove it from the project.

   • Right-click and select **Clear All Filter Selections** to clear the selection list of all the filters in the filter bar.

   • Right-click and select **Remove All Filters** to remove all the filters in the filter bar.

---

**Create Filters on a Visualization**

You can add filters to limit the data that’s displayed in a specific visualization on the canvas.

If a project contains multiple data sets and some aren’t joined, then there are restrictions for how you can use filters. Any visualization that doesn’t use the data element of the filter is grayed out.

Visualization filters can be automatically created by selecting **Drill** on the visualization’s **Menu** when the **Synchronize Visualizations** option is turned off on the project toolbar **Menu**.

Instead of or in addition to adding filters to an individual visualization, you can add filters to the project or to an individual canvas. Any filters included on the canvas are applied before the filters that you add to an individual visualization.

1. Confirm that you’re working in the Visualize canvas.
2. Select the visualization that you want to add a filter to.

3. Drag and drop one or more data element from the Data Element pane to the Filter drop target in the Visualization Grammar Pane.

![Visualization pane with data elements]

**Note:**
To use data elements of a data set as a filter in the visualization of another data set, you’ve to join both the data set, before using the data elements as filters.

4. Set the filter values. How you set the values depends upon the data type that you’re filtering.
   - To set filters on columns such as Cost or Quantity Ordered, see Apply Range Filters.
   - To set filters on columns such as Product Category or Product Name, see Apply List Filters.
   - To set filters on columns such as Ship Date or Order Date, see Apply Date Filters.

5. (Optional) Click the filter bar menu or right-click and click Auto-Apply Filters, then select Off to turn off automatic apply for all filters on the canvas and within the visualization. When you turn off automatic apply, then each filter’s selection displays an Apply button that you must click to apply the filter to the visualization.

---

### Move Filter Panels

You can move filter panels from the filter bar to a different spot on the canvas.

When you expand filters in the filter bar, it can block your view of the visualization that you’re filtering. Moving the panels makes it easy to specify filter values without having to collapse and reopen the filter selector.

- To detach a filter panel from the filter bar, place the cursor at the top of the filter panel until it changes to a scissors icon, then click it to detach the panel and drag it to another location on the canvas.
Apply Range Filters

You use Range filters for data elements that are number data types and that have an aggregation rule set to something other than none.

Range filters are applied to data elements that are measures. Range filters limit data to a range of contiguous values, such as revenue of $100,000 to $500,000. Or you can create a range filter that excludes (as opposed to includes) a contiguous range of values. Such exclusive filters limit data to two noncontiguous ranges (for example, revenue less than $100,000 or greater than $500,000).

1. In the Visualize canvas, go to the filter bar and click the filter to view the Range list.

2. In the Range list, click By to view the selected list of Attributes. All members that are being filtered have check marks next to their names.

You can also optionally perform any of the following steps:

- In the selected list click a member to remove it from the list of selections. The check mark disappears.
- In the selected list, for any non-selected member that you want to add to the list of selections, click the member. A check mark appears next to the selected member.
- Click the Plus (+) icon, to add member to the selected list. The newly added member is marked as checked.
- Set the range that you want to filter on by moving the sliders in the histogram. The default range is from minimum to maximum, but as you move the sliders, the Start field and End field adjust to the range you set.

3. Click outside of the filter to close the filter panel.
Apply Top Bottom N Filters

You use the Top Bottom N filter to filter a measure to a subset of its largest (or smallest) values.

You apply top or bottom filters to data elements that are measures. When you add a measure to a filter drop target of a visualization, the default filter type is Range, but you can change the filter type to Top Bottom N from the Filter Type menu option.

You can apply a Top Bottom N filter to either a project canvas (it applies to all visualizations in the project), or to a selected visualization. All of the following steps are optional:

1. To apply the Top Bottom N filter to the canvas and all visualizations in the project:
   a. In the Visualize canvas, select a filter in the filter bar.
   b. Click the filter menu or right-click and select Filter Type, then click Top Bottom N. You can only convert a range filter to Top Bottom N filter.

2. To apply the Top Bottom N filter to a specific visualization in the project and update the filtered data on the canvas:
   a. In the Visualize canvas, select the visualization to which you want to apply the filter.
   b. In the Visualization Grammar Pane go to the Filters drop target.
   c. Select a measure, then right-click and select Filter Type, then click Top Bottom N.

3. To change which filter method is applied, Top or Bottom, in the Top Bottom N list, click the Method value.

4. To display a particular number of top or bottom rows, in the Top Bottom N list, click in the Count field and enter the number.

5. To change which columns to group by, in the Top Bottom N list, click in the By field, or to display the available columns that you can select from, click Plus (+).

6. To deselect any member from the list of attributes, in the Attributes list, click the member that you want to deselect.

7. To add a member to the list of attributes, in the Attributes list, click any nonselected member.

8. Click outside of the filter to close the filter panel.

Apply List Filters

List filters are applied to text and non-aggregatable numbers. After you add a list filter, you can change the selected members that it includes and excludes.

1. In the Visualize canvas, go to the filter bar and select a filter to view the Selections list.

2. Locate the member you want to include and click it to add it to the Selections list. Alternatively, use the Search field to find a member you want to add to the filter. Use the wildcards * and ? for searching.

3. Optionally, you can also perform the following steps:
In the Selections list click a member to remove it from the list of selections.

In the Selections list, you can click the eye icon next to a member to cause it to be filtered out but not removed from the selections list.

In the Selections list, you can click the actions icon at the top, and select Exclude Selections to exclude the members in the Selections list.

Click Add All or Remove All at the bottom of the filter panel to add or remove all members to or from the Selections list at one time.

4. Click outside of the filter to close the filter panel.

Apply Date Filters

Date filters use calendar controls to adjust time or date selections. You can select a single contiguous range of dates, or use a date range filter to exclude dates within the specified range.

1. In the Visualize canvas, go to the filter bar and click the filter to view the Calendar Date list.

2. In Start, select the date that begins the range that you want to filter.
   Use the Previous arrow and Next arrow to move backward or forward in time, or use the drop-down lists to change the month or year.

3. In End, select the date that ends the range that you want to filter.

4. Optionally, to start over and select different dates, right-click the filter in the filter bar and select Clear Filter Selections.

5. Click outside of the filter to close the filter panel.

Build Expression Filters

Using expression filters, you can define more complex filters using SQL expressions. Expression filters can reference zero or more data elements.

For example, you can create the expression filter "Sample Sales"."Base Facts"."Revenue" < "Sample Sales"."Base Facts"."Target Revenue". After applying the filter, you see the items that didn't achieve their target revenue.

You build expressions using the Expression Builder. You can drag and drop data elements to the Expression Builder and then choose operators to apply. Expressions are validated for you before you apply them. See About Composing Expressions.

1. In the Visualize canvas, mouse-over the filter bar at the top of the pane and click Menu, then select Add Expression Filter.

2. In the Expression Filter panel, compose an expression.

3. In the Label field, give the expression a name.

4. Click Validate to check if the syntax is correct.

5. When the expression filter is valid, then click Apply. The expression is applied to the visualizations on the canvas.
Use Other Functions to Visualize Data

This topic describes other functions that you can use to visualize your data.

Topics:

</tr>
<tr>
<td>Search artifacts</td>
<td>Search for projects, visualizations, and columns. Use BI Ask to quickly build visualizations.</td>
<td>Search Data, Projects, and Visualizations</td>
</tr>
</tbody>
</table>
Build Stories

This topic covers how you capture insights and group them into stories.

Topics:

• Capture Insights
• Create Stories
• View Streamlined Content

Capture Insights

As you explore data in visualizations, you can capture memorable information in one or more insights, which build your story. For example, you might notice before and after trends in your data that you’d like to add to a story to present to colleagues.

Using insights, you can take a snapshot of any information that you see in a visualization and keep track of any moments of sudden realization while you work with the data. You can share insights in the form of a story, but you don't have to. Your insights can remain a list of personal moments of realization that you can go back to, and perhaps explore more. You can combine multiple insights in a story. You can also link insights to visualizations using the Interaction property.

Note:

Insights don't take a snapshot of data. They take a snapshot of the project definition at a certain point in time.

1. Display the Narrate pane, and build your story:
   • Use the Search option in the Canvases pane to locate visualizations to include in your story. Right-click each canvas to include and click Add To Story.
   • Click Add Note to annotate your canvases with insights, such as notes or web links.
   • Use the tabs on the properties pane to further refine your story. For example, click Presentation to change the presentation style from compact to film strip.
   • To synchronize your story canvases with your visualizations, display the Visualize pane, click Canvas Settings, then select Synchronize Visualizations. Alternatively, click Canvas Properties and select this option.

2. Continue adding insights to build a story about your data exploration.
   The story builds in the Narrate canvas. Each insight has a tab.

Create Stories

After you begin creating insights within a story, you can cultivate the look and feel of that story. For example, you can rearrange insights, include another insight, or hide an insight title. Each project can have one story comprising multiple pages (canvas).
1. In your project, click **Narrate**.

2. Create the story in the following ways:
   - Add one or more canvases to the story and select a canvas to annotate.
   - To annotate a story with insights, click **Add Note**. You can add text and web links.
   - To change the default configuration settings for a story, use the properties pane on the Canvases panel.
   - To edit an insight, click or hover the mouse pointer over the insight, click the menu icon, and select from the editing options.
   - To include or exclude an insight, right-click the insight and use the **Display** or **Hide** options. To display insights, on the canvas property pane, click **Notes**, then **Show All Notes**.
   - To show or hide insight titles or descriptions, on the canvas property pane, click **General**, and use the **Hide Page** and **Description** options.
   - To rearrange insights, drag and drop them into position on the same canvas.
   - To limit the data displayed in a story, on the canvas property pane, click **Filters**. If no filters are displayed, go back to the Visualize pane and add one or more filters first, then click **Save**.
   - To update filters for a story, on the canvas property pane, click **Filters**, and use the options to hide, reset, or selectively display filters.
   - To rename a story, click the story title and update.
   - To add the same canvas multiple times to a story, right-click a canvas and click **Add to Story**. You can also right-click the canvases at the bottom of the Narrate pane and click **Duplicate**.
   - To display the story at any time click **Present**.
   - To close present mode and return to the **Narrate** pane click **X**.
   - To toggle insights use the **Show Notes** option.

**Note:**

You can modify the content on a canvas for an insight. For example, you can add a trend line, change the chart type, or add a text visualization. After changing an insight, you'll notice that its corresponding wedge (in the Insight pane) or dot (in the Story Navigator) changes from solid blue to hollow. When you select **Update** to apply the changes to the insight, you'll see the wedge or dot return to solid blue.

**View Streamlined Content**

You can use the presentation mode to view a project and its visualizations without the visual clutter of the canvas toolbar and authoring options.

1. On the Narrate toolbar, click **Present**.
   - The project is displayed in presentation mode.
2. To return to the interaction mode, click **X**.
Identify Content with Thumbnails

You can quickly visually identify content on the Home page and within projects by looking at thumbnail representations.

Project thumbnails on the Home page show a miniature visualization of what projects look like when opened. Project thumbnails are regenerated and refreshed when projects are saved. If a project uses a Subject Area data set, then the project is represented with a generic icon instead of a thumbnail.

Manage Custom Plug-ins

You can upload, download, search for, and delete custom plug-ins in Data Visualization. Plug-ins are custom visualization types that you create externally and import into Data Visualization.

For example, you can upload a custom plug-in that provides a visualization type that you can use in projects.

Tutorial

1. Navigate to Console and click Extensions. You use this page to upload, search for, delete, or download a custom plug-in.

2. To upload a custom plug-in, click Upload Extension and perform one of the following actions.
   • Browse to the required plug-in file in your file system, and click Open to select the plug-in.
   • Drag the required plug-in file to the Upload Custom Plugin object.

   Note:

   If the uploaded custom plug-in file name is the same as an existing custom plug-in, then the uploaded file replaces the existing one and is displayed in visualizations.

3. Perform any of the following tasks.
   • If the plug-in provides a visualization type, you can select that type from the list of available types when you create or switch the type of a visualization.
   • To search for a custom plug-in, enter your search criteria in the Search field and click Return to display search results.
   • To delete a custom plug-in, click Options on the custom plug-in and select Delete, and click Yes to delete the custom plug-in.
Note:

If you delete a custom visualization type that’s used in a project, then that project displays an error message in place of the visualization. Either click **Delete** to remove the visualization, or upload the same custom plug-in so that the visualization renders correctly.

- To download a custom plug-in from Data Visualization to your local file system, click **Options** on the custom plug-in and select **Download**.

About Composing Expressions

You can use the Expression window to compose expressions to use in expression filters or in calculations. Expressions that you create for expression filters must be Boolean (that is, they must evaluate to true or false).

While you compose expressions for both expression filters and calculations, the end result is different. A calculation becomes a new data element that you can add to your visualization. An expression filter, on the other hand, appears only in the filter bar and can’t be added as a data element to a visualization. You can create an expression filter from a calculation, but you can’t create a calculation from an expression filter. See **Create Calculated Data Elements** and **Build Expression Filters**.

You can compose an expression in various ways:

- Directly enter text and functions in the Expression window.
- Add data elements from the Data Elements pane (drag and drop, or double-click).
- Add functions from the function panel (drag and drop, or double-click).

See **Expression Editor Reference**.

Use Data Actions to Connect to Canvases and External URLs

A Data Action link can pass context values from Data Visualization as parameters to external URLs or filters to other projects.

When a link navigates to a project, the data context is displayed in the form of canvas scope filters in the filter bar. The links data context may include attributes associated with the selections or cell from which the link was initiated.

Topics:

- **Create Data Actions to Connect Visualization Canvases**
- **Create Data Actions to Connect to External URLs from Visualization Canvases**
- **Apply Data Actions to Visualization Canvases**
Create Data Actions to Connect Visualization Canvases

You can create data actions to navigate to a canvas in the current project or to a canvas in another project.

You can also use data actions to transfer context-related information (for example, an order number) where the link displays details about an order number in another visualization or project.

1. Create or open a project and confirm that you’re working in the Visualize canvas.
2. Click **Menu** on the project toolbar and click **Project Properties**, then select the **Data Actions** tab.
3. Click **Add Action** and enter a name for the new navigation link.
   - You can use only letters and numbers in the navigation link’s name.
   - You can add multiple navigation links.
4. Click the **Type** field and select **Canvas Navigation**.
5. Click the **Anchor To** field and select the columns from the current visualization to associate with this data action. Don’t select measure columns or hidden columns. If you don’t specify a value for the **Anchor To** field, then the data action applies to all data elements in the visualizations.
6. Click the **Project** field and select the project you want to use for the anchor:
   - **Use This Project** - Select if you want to navigate to a canvas in the active project. Columns that you select must be in the current visualization.
   - **Select from Catalog** - Select to browse for and select the project that you want to use.
7. Click the **Canvas Navigation** field and select the canvas that you want to use.
8. Click the **Pass Values** field and select which values you want the data action to pass.
   - **All** - Dynamically determines the intersection of the cell that you click and passes those values to the target.
   - **Anchor Data** - Ensures that the data action is displayed at runtime, but only if the required columns specified in the **Anchor To** field are available in the view context.
   - **None** - Opens the page (URL or canvas) but doesn’t pass any data.
   - **Custom** - Enables you to specify a custom set of columns to pass.
9. Click **OK** to save.
Create Data Actions to Connect to External URLs from Visualization Canvases

You can use data actions to navigate to an external URL from a canvas so that when you select an attribute such as the supplier ID, it displays a specific external website.

1. Create or open a project and confirm that you’re working in the Visualize canvas.
2. Click **Menu** on the project toolbar and click **Project Properties**, then select the **Data Actions** tab.
3. Click **Add Action** and enter a name for the new navigation link.
   - You can use only letters and numbers in the navigation link’s name.
   - You can add multiple navigation links.
4. Click the **Type** field and select **URL Navigation**.
5. Click the **Anchor To** field and select the columns that you want the URL to apply to. Don’t select measure columns or hidden columns. If you don’t specify a value for the **Anchor To** field, then the data action applies to all data elements in the visualizations.
6. Enter a URL address that starts with http: and optionally include notation and parameters.
   
   For example, where `http://www.address.com?<key>{<value>}` is displayed like `www.oracle.com?lob={p3 LOB}&org={D3 Organization}&p1=3.14` Data Visualization displays a list of available matching column names to choose from as you type (for example, `P3 LOB, P3k LOB Key`). The column names that you select here are replaced with values when you pass the URL. So you could select a year, a person, and a department.

   In case of multiple values for a specific data element, for example, `p3 LOB`, the LOB appears multiple times in the URL. `www.oracle.com?lob=value1&lob=value2&org=orgvalue&p1=3.14`
7. Click **OK** to save.
8. In the Canvas, click a cell, or use Ctrl-click to select multiple cells.
9. Right-click and select **Navigate to <URL name>** to display the result.

Selecting the cells determines the parameters to pass.

Apply Data Actions to Visualization Canvases

You can navigate between canvases and to URLs with links created in data actions.

1. Create or open a project. Confirm that you’re working in the Visualize canvas.
2. On the canvas that contains a Data Action link leading to another canvas or URL, perform the following steps:
   a. Right-click a data element, or select multiple elements (using Ctrl-click).
   b. Select **Data Actions** from the menu.
   c. Complete the Project Properties dialog.
The name of the data actions that apply in the current view context are displayed in the context menu.

All the values defined in the **Anchor To** field must be available in the view context in order for a data action to be displayed in the context menu.

Note the following rules on matching data elements passed as values with data elements on the target canvas:

- If the same data element is matched in the target project's canvas, and if the target canvas doesn't have an existing canvas filter for the data element, a new canvas filter is added. If there is an existing canvas filter, it's replaced by the value from the source project's canvas.

- If the expected data set is unavailable but a different data set is available, the match is made by using the column name and data type in the different data set, and the filter is added to that.

- If there are multiple column matches by name and data type, then the filter is added to all those columns in the target project or canvas.

The data action navigates to the target cell or URL that is mapped and filters the data displayed based on the values specified in the Data Actions dialog.

**Note:**

Pass Values context consists of data elements used in the visualization from which the data action is invoked. The Pass Values context doesn't include data elements in the project, canvas, or visualization level filters.

---

**Search Data, Projects, and Visualizations**

This topic describes how you can search for objects, projects, and columns. This topic also describes how you can use BI Ask to create spontaneous visualizations.

**Topics:**

- Index Data for Search and BI Ask
- Visualize Data with BI Ask
- Search for Saved Projects and Visualizations
- Search Tips

**Index Data for Search and BI Ask**

When you search or use BI Ask, the search results are determined by what information has been indexed.

Every two minutes, the system runs a process to index your saved objects, project content, and data set column information. The indexing process also updates the index file to reflect any objects, projects, or data sets that you deleted from your system so that these items are no longer displayed in your search results.

For all data sets, the column metadata is indexed. For example, column name, the data type used in the column, aggregation type, and so on. Column data is indexed for Excel spreadsheet, CSV, and TXT data set columns with 1,000 or fewer distinct rows.
Note that no database column data is indexed and therefore that data isn’t available in your search results.

Visualize Data with BI Ask

Use BI Ask to enter column names into the search field, select them, and quickly see a visualization containing those columns. You can use this functionality to perform impromptu visualizations without having to first build a project.

1. On the Home Page, click the What are you interested in field.

2. Enter your criteria. As you enter the information, the application returns search results in a drop-down list. If you select an item from this drop-down list, then your visualized data is displayed.

• What you select determines the data set for the visualization, and all other criteria that you enter is limited to columns or values in that data set.

The name of the data set you’re choosing from is displayed in the right side of the What are you interested in field. Note the following BI Ask search and visualization example:

8,500,000

• You can search for projects and visualizations or use BI Ask. When you enter your initial search criteria, the drop-down list contains BI Ask results, which are displayed in the Visualize data using section of the drop-down list. Your initial search criteria also builds a search string to find projects and visualizations. That search string is displayed in the Search results containing section of the drop-down list and is flagged with the magnifying glass icon. See Search Tips.
• Excel, CSV, and TXT data set columns with 1,000 or less distinct rows are indexed and available as search results. No database data set data values are indexed and available as search results.

3. Enter additional criteria in the search field, select the item that you want to include, and the application builds your visualization. You can also optionally perform the following steps:
   • Enter the name of the visualization that you want your results to be displayed in. For example, enter scatter to show your data in a scatter plot chart, or enter pie to show your data in a pie chart.
   • Click Change Visualization Type to apply a different visualization to your data.
   • Click Open in Data Visualization to further modify and save the visualization.

4. To clear the search criteria, click the X icon next to your search tags.

Search for Saved Projects and Visualizations

On the Home page you can quickly and easily search for saved objects.

Folders and thumbnails for objects that you’ve recently worked with are displayed on the Home page. Use the search field to locate other content.

Note that in the search field you can also use BI Ask to create spontaneous visualizations.

1. On the Home Page, click the What are you interested in field.

2. Enter your search criteria by typing either keywords or the full name of an object such as a folder or project. As you enter your criteria, the system builds the search string in the drop-down list.

   The drop-down list contains results that match saved objects, but also can contain BI Ask search results. To see object matches (for example, folders or projects), click the row with the magnifying glass icon (located at the top of the drop-down list in the Search results containing section). Note that any BI Ask matches are displayed in the Visualize data using section of the drop-down list and are flagged with different icons.

3. In the Search results containing section of the drop-down list, click the search term that you want to use.

   The objects that match your search are displayed on the Home page.

4. To clear the search criteria, click the X icon next to your search tags.
Search Tips

You must understand how the search functionality works and how to enter valid search criteria.

Wildcard Searches

You can use the asterisk (*) as a wildcard when searching. For example, you can specify *forecast to find all items that contain the word “forecast”. However, using two wildcards to further limit a search returns no results (for example, *forecast*).

Meaningful Keywords

When you search, use meaningful keywords. If you search with keywords such as by, the, and in it returns no results. For example, if you want to enter by in the search field to locate two projects called “Forecasted Monthly Sales by Product Category” and “Forecasted Monthly Sales by Product Name,” then it returns no results.

Items Containing Commas

If you use a comma in your search criteria the search returns no results. For example, if you want to search for quarterly sales equal to $665,399 and enter 665,399 in the search field, then no results are returned. However, entering 655399 does return results.

Date Search

If you want to search for a date attribute, you search using the year-month-date format. Searching with the month/date/year format (for example, 8/6/2016) doesn’t produce any direct matches. Instead, your search results contain entries containing 8 and entries containing 2016.

Searching in Non-English Locales

When you enter criteria in the search field, what displays in the drop-down list of suggestions can differ depending upon your locale setting. For example, if you’re using an English locale and enter sales, then the drop-down list of suggestions contains items named sale and sales. However, if you’re using a non-English locale such as Korean and type sales, then the drop-down list of suggestions contains only items that are named sales and items such as sale aren’t included in the drop-down list of suggestions.

For non-English locales, Oracle suggests that when needed, you search using stem words rather than full words. For example, searching for sale rather than sales returns items containing sale and sales. Or search for custom to see a results list that contains custom, customer, and customers.

Frequency of Indexing

If you create or save a project or create a data set and then immediately try to search for the saved project, project content, or column information, then it’s likely that your search results won’t contain matches for these items. If this happens, then wait a few minutes for the indexing process to run, and retry your search. The system automatically runs the indexing process every two minutes.
Searching for Data Values

All data sets including RPD, Excel, DB, CSV, and TXT data set columns with 1,000 or less distinct rows are indexed and are returned in your search results. Note that database data set data values aren’t indexed and won’t be included in your search results.

Save Your Changes Automatically

You can use the Auto Save option to automatically save your updates to a visualization project without repeatedly clicking Save.

1. Create or open a project. Confirm that you’re working in the Visualize canvas.
2. From the Save menu, select Auto Save.
3. In the Save Project dialog, enter the Name and Description to identify your project.
4. Select the folder where you want to save your project.
5. Click Save.

If no error occurs, a success message is displayed that states that your project is saved and that the Save option is disabled. Any project updates are saved in real-time.

Note:

- If you’ve already saved your project in a specific location, the Save Project dialog isn’t displayed after you click Auto Save. Updates are saved in real-time.
- Suppose that two users are updating the same project and Auto Save is enabled. The Auto Save option is automatically disabled when different types of updates are made to the project. A message is displayed that states that another user has updated the project.
Add Data Sources to Analyze and Explore Data

You can add your own data to visualizations for analysis and exploration.

Topics:
- Typical Workflow to Add Data Sources
- About Data Sources
- Connect to Database Data Sources
- Connect to Oracle Applications Data Sources
- Create Connections to Dropbox
- Create Connections to Google Drive or Google Analytics

- Create Connections to Oracle Talent Acquisition Cloud
- Add a Spreadsheet as a Data Source

Typical Workflow to Add Data Sources

Here are the common tasks for adding data from data sources.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a connection</td>
<td>Create a connection if the data source that you want to use is either Oracle Applications or a database.</td>
<td>Create Oracle Applications Connections Create Database Connections</td>
</tr>
<tr>
<td>Create a data source</td>
<td>Upload data from spreadsheets. Retrieve data from Oracle Applications and databases. Creating a data source from Oracle Applications or a database requires you to create a new connection or use an existing connection.</td>
<td>Add a Spreadsheet as a Data Source Connect to Oracle Applications Data Sources Create Data Sets from Databases</td>
</tr>
</tbody>
</table>
About Data Sources

A data source is any tabular structure. You get to see data source values after you load a file or send a query to a service that returns results (for example, another Oracle Business Intelligence system or a database).

A data source can contain any of the following:

- **Match columns** - These contain values that are found in the match column of another source, which relates this source to the other (for example, Customer ID or Product ID).

- **Attribute columns** - These contain text, dates, or numbers that are required individually and aren’t aggregated (for example, Year, Category Country, Type, or Name).

- **Measure columns** - These contain values that should be aggregated (for example, Revenue or Miles driven).

You can analyze a data source on its own, or you can analyze two or more data sources together, depending on what the data source contains.

**Working with Matching**

If you use multiple sources together, then at least one match column must exist in each source. The requirements for matching are:

- The sources contain common values (for example, Customer ID or Product ID).

- The match must be of the same data type (for example, number with number, date with date, or text with text).

Connect to Database Data Sources

You can create, edit, and delete database connections and use the connections to create data sources from databases.

**Topics**:

- Create Database Connections
- Create Data Sets from Databases
- Edit Database Connections
- Delete Database Connections

Create Database Connections

You can create connections to databases and use those connections to source data in projects.

1. On the Home page, click **Create**, then click **Connection** to display the Create Connection dialog.
2. In the Create Connection dialog, click the icon for the connection type that you want to create a connection for (for example Oracle Database).

3. Enter a name for the connection, and then enter the required connection information, such as host, port, username, password, and service name.

4. (Optional) When you connect to some database types (for example, Oracle Talent Management Cloud), you might have to specify the following authentication options on the Create Connection and Inspect dialogs:
   - **Authentication**
     - Select *Always use these credentials*, so that the login name and password you provide for the connection are always used and users aren’t prompted to log in.
     - Select *Require users to enter their own credentials* when you want to prompt users to enter their own user name and password for the data source. Users required to log in see only the data that they have the permissions, privileges, and role assignments to see.

5. Click **Save**.
   You can now begin creating data sets from the connection.

### Create Data Sets from Databases

After you create database connections, you can use those connections to create data sets.

You must create the database connection before you can create a data set for it.

1. On the Home page click **Create** and click **Data Set** to open the Create Data Set dialog. In the Create Data Set dialog, select **Create Connection** and use the Create Connection dialog to create the connection for your data set.

2. In the Data Set editor, first browse or search for and double-click a schema, and then choose the table that you want to use in the data set. When you double-click to select a table, a list of its columns is displayed.
   You can use breadcrumbs to quickly move back to the table or schema list.

3. In the column list, browse or search for the columns you want to include in the data set. You can use Shift-click or Ctrl-click to select multiple columns. Click **Add Selected** to add the columns you selected, or click **Add All** to include all of the table’s columns in the data source.

   Alternatively, you can select the **Enter SQL** option to view or modify the data source’s SQL statement or to write a SQL statement.
4. You can also optionally perform the following steps:

   • After you’ve selected columns, you can go to the Step editor at the top of the Data Set editor and click the Filter step to add filters to limit the data in the data set. After you’ve added filters, click Get Preview Data to see how the filters limit the data.

   • Go to the Step editor at the top of the Data Set editor and click the last step in the Step editor to specify a description for the data source.

   • Go to the Step editor at the top of the Data Set editor and click the last step in the Step editor and go to the Refresh field to specify how you want to refresh the data in the data source. Note the following information:
     - Select Live if you want the data source to use data from the database directly rather than copying the data into the cache. Typically because database tables are large, they shouldn’t be copied to Data Visualization’s cache.
     - If your table is small, then select Auto and the data is copied into Data Visualization’s cache if possible. If you select Auto, you must refresh the data when it’s stale.

5. Click Add. The View Data Source page is displayed.

6. In the View Data Source page you can optionally view the column properties and specify their formatting. The column type determines the available formatting options.

---

**Edit Database Connections**

You can edit the database connection details.

1. In the Data page, click Connections.

2. Select the connection you want to edit and click Action menu or right-click, then select Inspect.

3. In the Inspect dialog, edit the connection details.

4. Click Save.

If you’re editing an SSL connection to an Oracle Database and you need to use a new cwallet.sso file, in the Client Credentials field, click Select to browse for the cwallet.sso file. Ask your administrator for the location of the cwallet.sso file.

You must provide a unique Connection Name. If a connection with the same name already exists in your system, an error message is displayed. You can’t see or edit the current password for your connection. If you need to change it, you must create a connection that uses the same password.
Delete Database Connections

You can delete a database connection. For example, you must delete a database connection and create a new connection when the database's password has changed.

**Note:**

If the connection contains any data sets, then you must delete the data sets before you can delete the connection.

1. Go to the Data page and select **Connections**.
2. Select the connection that you want to delete and click **Actions menu** or right-click, then click **Delete**.
3. Click **Yes**.

Connect to Oracle Applications Data Sources

You can create Oracle Application data sources that help you visualize, explore, and understand the data in your Oracle Fusion Applications with Oracle Transactional Business Intelligence and Oracle BI EE subject areas and analyses.

Topics:

- Create Oracle Applications Connections
- Compose Data Sets from Subject Areas
- Compose Data Sets from Analyses
- Edit Oracle Applications Connections
- Delete Oracle Applications Connections

Create Oracle Applications Connections

You can create connections to Oracle Applications and use those connections to create data sets.

You use the Oracle Applications connection type to create connections to Oracle Fusion Applications with Oracle Transactional Business Intelligence, and to Oracle BI EE. After you create a connection, you can access and use subject areas and analyses as data sets for your projects.

1. On the Data page or Home page click **Create**, then click **Connection** to display the Create Connection dialog.
2. Click the **Oracle Applications** icon.
3. Enter a name for the new connection enter the Oracle Fusion Applications with Oracle Transactional Business Intelligence or Oracle BI EE URL, then the username, and password.
4. In the **Authentication** field, specify if you want the users to be prompted to log in to access data from the Oracle Applications data source.
• If you select **Always use these credentials**, then the login name and password you provide for the connection is always used and users aren’t prompted to log in.

• If you select **Require users to enter their own credentials**, then users are prompted to enter their user names and passwords to use the data from the Oracle Applications data source. Users required to log in see only the data that they have the permissions, privileges, and role assignments to see.

5. Click **Save**.

You can now create data sets from the connection.

## Compose Data Sets from Subject Areas

You use the Oracle Applications connection type to access the Oracle Fusion Applications with Oracle Transactional Business Intelligence and Oracle BI EE subject areas that you want to use as data sets.

You must create an Oracle Applications connection before you can create a subject area data set.

1. On the Home, Data, or Projects page, click **Create** and click **Data Set**. Click **Connection** and use the Create Connection dialog to specify the details for your data set.

2. In the Data Set editor, choose **Select Columns** to view, browse, and search the available subject areas and their columns that you include in your data set. You can use breadcrumbs to quickly move back through the directories.

3. You can also optionally perform the following steps:

   • In the breadcrumbs click the **Add/Remove Related Subject Areas** option to include or exclude related subject areas. Subject areas are related when they use the same underlying business or logical model.

   • After you’ve selected columns, go to the Step editor at the top of the Data Set editor and click the **Filter** step to add filters to limit the data in the data set. After you’ve added filters, click **Get Preview Data** to see how the filters limit the data.

   • Click **Enter SQL** to display the logical SQL statement of the data source. View or modify the SQL statement in this field.

   **Note:**

   If you edit the data source’s logical SQL statement, then the SQL statement determines the data set and any of the column-based selection or specifications are disregarded.

   • Go to the Step editor at the top of the Data Set editor and click the last step in the Step editor to specify a description for the data set.

4. Before saving the data set, go to the **Name** field and confirm its name. Click **Add**. The Data Set page is displayed.

5. In the Data Set page you can optionally view the column properties and specify their formatting. The column type determines the available formatting options.
Compose Data Sets from Analyses

You can use analyses created in Oracle Fusion Applications with Oracle Transactional Business Intelligence and Oracle BI EE subject areas as data sources.

You must create an Oracle Applications connection before you can create an analysis data set.

1. On the Home page click **Create** and click **Data Set** to open the Create Data Set dialog. In the Create Data Set dialog, select **Create Connection** and use the Create Connection dialog to create the connection for your data set.

2. In the Data Set editor, select the **Select an Analysis** option to view, browse, and search the available analyses to use in your data set.

   You can use breadcrumbs to quickly move back through the directories.

3. Double-click an analysis to use it for your data set. The analysis’ columns are displayed in the Data Set editor.

4. You can also optionally perform the following steps:
   - Click **Enter SQL** to display the SQL Statement of the data set. View or modify the SQL statement in this field.
   - Click a column’s gear icon to modify its attributes, like data type and whether to treat the data as a measure or attribute.
   - Go to the Step editor at the top of the Data Set editor and click the last step in the Step editor to specify a description for the data set.

5. Before saving the data set, go to the **Name** field and confirm its name. Click **Add**. The Data Set page is displayed.

6. In the Data Set page you can optionally view the column properties and specify their formatting. The column type determines the available formatting options.

Edit Oracle Applications Connections

You can edit Oracle Applications connections. For example, you must edit a connection if your system administrator changed the Oracle Applications login credentials.

1. In the Data page, click **Connections**.

2. Locate the connection that you want to edit and click its **Actions menu** icon and select **Edit**.

3. In the Edit Connection dialog, edit the connection details. Note that you can’t see or edit the password that you entered when you created the connection. If you need to change the connection’s password, then you must create a new connection.

4. Click **Save**.
Delete Oracle Applications Connections

You can delete an Oracle Applications connection. For example, if your list of connections contains unused connections, then you can delete them to help you keep your list organized and easy to navigate.

**Note:**

If any data sets use the connection, then you must delete the data sets before you can delete the connection.

1. In the Data page, click **Connections**.
2. To the right of the connection that you want to delete, click **Actions menu**, and then select **Delete**.
3. Click **Yes**.

Create Connections to Dropbox

You can create connections to Dropbox and use those connections to source data in projects.

1. On the Data or Home page, click **Create**, then click **Connection** to display the Create Connection dialog.
2. Browse or search for the Dropbox icon. Click the Dropbox icon.
3. In the Add a New Connection dialog, enter a name for the connection, and then enter the required connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redirect URL</td>
<td>Confirm that the Dropbox application is open and its Settings area is displaying. Copy the URL in the Redirect URL field and paste it into the Dropbox application's OAuth 2 Redirect URIs field and then click Add.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Go to the Dropbox application, locate the App key field, and copy the key value. Go to Data Visualization and paste this value into the Client ID field.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Go to the Dropbox application, locate the App secret field, click Show to reveal the secret, and copy the secret value. Go to Data Visualization and paste this value into the Client Secret field.</td>
</tr>
</tbody>
</table>

4. Click **Authorize**. When prompted by Dropbox to authorize the connection, click **Allow**.

   The Create Connection dialog refreshes and displays the name of the Dropbox account and associated email account.

5. Click **Save**.

   You can now create data sets from the Dropbox connection. See **Add a Spreadsheet from Dropbox or Google Drive**.
Create Connections to Google Drive or Google Analytics

You can create connections to Google Drive or Google Analytics and use those connections to source data in projects.

1. Set up a Data Visualization application in Google, if you haven’t done so already.
   a. Sign into your Google account, and go to the Developer’s Console.
   b. Create a project, then go to the API Manager Developers area of the Google APIs site and click Create app to create and save a Data Visualization application.
   c. Enable the application and create credentials for the application by accessing the Analytics API.
   d. Open the page displaying the credential information, and paste the redirect URL provided by Data Visualization, and copy the Client ID and Client secret.

   Read the Google documentation for more information about how to perform these tasks.

2. On the Data or Home page, click Create, then click Connection to display the Create Connection dialog.

3. Browse or search for the Google Drive or the Google Analytics icon, and then click the icon.

4. In the Add a New Connection dialog, enter a connection name and enter the required connection information as described in this table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redirect URL</td>
<td>Confirm that the Google application is open and its Credentials area is displaying. Copy the URL in the Redirect URL field and paste it into the Google application’s Authorized redirect URIs field.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Go to the Google application’s Credentials area, locate the Client ID field, and copy the key value. Go to Data Visualization and paste this value into the Client ID field.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Go to the Google application’s credential information, locate the Client secret field and copy the secret value. Go to Data Visualization and paste this value into the Client Secret field.</td>
</tr>
</tbody>
</table>

5. Click Authorize.

6. When prompted by Google to authorize the connection, click Allow.

   The Create Connection dialog refreshes and displays the name of the Google account, and its associated email account.

7. Click Save.

   You can now create data sets from the Google Drive or Google Analytics connection. See Add a Spreadsheet from Dropbox or Google Drive.
Create Generic JDBC Connections

You can create generic JDBC connections to databases and use those connections to source data in projects. For example, to connect to databases that aren't listed with the default connection types.

This method enables you to use drivers in a JDBC Jar file to connect to specific databases.

The JDBC driver version must match the database version. A version mismatch can lead to spurious errors during the data load process. Even using an Oracle database, if the version of the JDBC driver doesn’t match that of the database, then you must download the compatible version of the JDBC driver from Oracle’s website and place it in the \lib directory.

1. Confirm that you’ve copied the required JDBC driver’s JAR file into Data Visualization Desktop’s \lib directory.
   
   For example, C:\Program Files\Oracle Data Visualization\lib.

2. On the Data or Home page, click Create, then click Connection to display the Create Connection dialog.

3. In the Create Connection dialog, locate and click the JDBC icon.

4. In the Create Connection dialog, enter the connection criteria:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Connection Name</td>
<td>Any name that uniquely identifies the connection. Avoid using instance-specific names such as host names, because the same connection can be configured against different databases in different environments (for example, development and production).</td>
</tr>
<tr>
<td>URL</td>
<td>The URL for your JDBC data source. See the documentation for the driver, and the JAR file for details on specifying the URL.</td>
</tr>
<tr>
<td>Driver Class Name</td>
<td>The name of the Driver Class. You can find the name in the JAR file, or from wherever you downloaded the JAR file.</td>
</tr>
<tr>
<td>Username</td>
<td>The database username.</td>
</tr>
<tr>
<td>Password</td>
<td>The database user password.</td>
</tr>
</tbody>
</table>

5. Click Save.

You can now create data sets from the connection. See Create Data Sets from Databases.

Note:

If you import a project containing a JDBC connection into a Data Visualization installation where the JDBC driver isn't installed, the import still works. However, the connection doesn’t work when you try to run the project or Data Flow. You must recreate the JDBC connection, and JDBC driver to a suitable data source.
Create Generic ODBC Connections

You can create generic ODBC connections to databases and use those connections to source data in projects. For example, to connect to databases and database versions that aren’t listed with the default connection types.

You can only use generic ODBC connections to connect on Windows systems.

1. Confirm that the appropriate database driver is installed on your computer.

You must have the required database driver installed on your computer to create an ODBC Data Source Name (DSN). If you need to install a database driver, use installation instructions provided by the organization that supplies the database driver.

2. Create the new ODBC data source in Windows.

   a. In Windows, locate and open the ODBC Data Source Administrator dialog.

   b. Click the System DSN tab, and then click Add to display the Create New Data Source dialog.

       Windows uses ODBC DSNs to access the data source and for query execution.

   c. Select the driver appropriate for your data source, and then click Finish.

   d. The remaining configuration steps are specific to the data source you want to configure.

       Refer to the documentation for your data source.

3. Create the generic ODBC data source in Data Visualization.

   a. On the Data or Home page, click Create, then click Connection to display the Create Connection dialog.

   b. In the Create Connection dialog, locate and click the ODBC icon.

   c. In the Create Connection dialog, enter the connection criteria:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Any name that uniquely identifies the connection.</td>
</tr>
<tr>
<td>DSN</td>
<td>The name of the system DSN that you set up on your computer.</td>
</tr>
<tr>
<td>Username</td>
<td>The database username.</td>
</tr>
<tr>
<td>Password</td>
<td>The password for the database user.</td>
</tr>
</tbody>
</table>

   d. Click Save.

You can now create data sets from the connection. See Create Data Sets from Databases.
Note:

If you import a project containing an ODBC connection into a Data Visualization installation where the ODBC DSN doesn't exist, and the ODBC driver isn't installed, the import still works. However, the connection doesn't work when you try to run the project or Data Flow. You must recreate the ODBC connection, and recreate the ODBC DSN, and ODBC driver to a suitable data source.

Create Connections to Oracle Autonomous Data Warehouse Cloud

You can create connections to Oracle Autonomous Data Warehouse Cloud and use those connections to source data in projects.

Tutorial

1. Before you create connections to Oracle Autonomous Data Warehouse Cloud, you must have the client credentials zip file containing the trusted certificates that enable Data Visualization to connect to Oracle Autonomous Data Warehouse Cloud.
   a. Obtain the Client Credentials file from Oracle Autonomous Data Warehouse Cloud Console.
      See Download Client Credentials (Wallets) in Using Oracle Autonomous Data Warehouse Cloud.
      The credentials wallet file secures communication between Oracle Analytics Cloud and Oracle Autonomous Data Warehouse Cloud. The wallet file that you upload must contain SSL certificates, to enable SSL on your Oracle Database Cloud connections.
   b. Unzip the Client Credentials wallet file (for example, wallet_ADWC1.zip) to get the cwallet.sso file.

2. To create a connection to Oracle Autonomous Data Warehouse Cloud:
   a. On the Home page, click Create then click Connection to display the Create Connection dialog.
   b. Click Oracle Autonomous Data Warehouse to display the fields for the connection.
   c. Enter the Connection Name, Description, Host, and Port.
   d. In the Client Credentials field, click Select to browse for the cwallet.sso file.
   e. Enter the Username, Password, and Service Name.
   f. Click Save to create the connection.

You can now create data sets from the connection.
Create Connections to Oracle Big Data Cloud

You can create a connection to access data in Oracle Big Data Cloud Service Compute Edition and use those connections to source data in projects.

You create an Oracle Big Data Cloud Service Compute Edition connection using these steps.

1. Before you can create connections to Oracle Big Data Cloud Service Compute Edition you must ensure that the connections are secure.
   a. Download a certificate and generate a Java Key Store file for the corresponding Oracle Big Data Cloud Service Compute Edition environment.
      See About Accessing Thrift in *Using Oracle Big Data Cloud*.
   b. Place the Java Key Store file in:
      `%AppData%\Local\DVDesktop\components\OBIS\bdcsce`
   c. Restart Data Visualization Desktop.
2. In Data Visualization, click **Create** and then click **Connection** to display the Create Connection dialog.
3. Click **Oracle Big Data Cloud** to display the fields for the connection.
4. Enter a connection name in the **New Connection Name** field.
5. Enter the remaining details as needed.
6. Click **Save** to create the connection.
   You can now create data sets from the connection.

Create Connections to Oracle Essbase

You can connect to Oracle Analytics Cloud – Essbase and Oracle Essbase 11g data sources and visualize the data in your projects and reports.

1. Click **Create**, and then click **Connection**.
2. Click **Oracle Essbase**.
3. For **Connection Name**, enter a name that identifies this connection.
4. For **DSN** (data source name), enter the agent URL for your Oracle Analytics Cloud – Essbase data source.
   Use the format:
   
   `https://fully_qualified_domain_name/essbase/agent`

   For example: `https://my-example.analytics.ocp.oraclecloud.com/essbase/agent`.

   ![Note]
   With this URL, you can connect without having to open any ports or performing additional configuration. Oracle Analytics Cloud – Essbase must have a public IP address and use the default port.
If you want to connect to an Oracle Essbase 11g database, enter the hostname and agent port number on which Oracle Essbase is running. Use the format:

hostname:port

For example: essbase.example.com:1432

The default port is 1432.

**Note:**

Your Essbase administrator must open ports in the range 32000-34000 to allow the connection.

5. For **Username** and **Password**, enter user credentials with access to the Oracle Essbase data source.

6. Select the **Authentication** requirements on this connection.
   - **Always use these credentials**: The username and password you provide for the connection are always used. Users aren't prompted to sign in to access the data available through this connection.
   - **Require users to enter their own credentials**: Users are prompted to enter their own username and password if they want access to this data source. Users see only the data that they have the permissions, privileges, and role assignments to see.
   - **Use the active user's credentials**: Users aren't prompted to sign in to access the data. The same credentials they used to sign in to Oracle Analytics Cloud are also used to access this data source.

7. Click **Save** to create the connection.

Now you can create data sets from the data accessible through this connection.

---

**Create Connections to Oracle Talent Acquisition Cloud**

You can create connections to Oracle Talent Acquisition Cloud (OTAC) to access data for analysis and use those connections to source data in projects.

1. Click **Create** and then click **Connection** to display the Create Connection dialog.
2. Click **Oracle Talent Acquisition Cloud** to display the fields for the connection.
3. Enter your connection name in the **New Connection Name** field.
4. Enter the URL for the Oracle Talent Acquisition Cloud connection.
   
   For example, if the Oracle Talent Acquisition Cloud URL is `https://example.taleo.net`, then the connection URL that you must enter is `https://example.taleo.net/smartorg/Bics.jss`.
5. Enter your username and password in the corresponding fields.
6. Click an **Authentication** option:
   - If you select **Always use these credentials**, then the login name and password you provide for the connection is always used and users aren't prompted to log in.
If you select **Require users to enter their own credentials**, then users are prompted to enter their user names and passwords to use the data from the Oracle Applications data source. Users who are required to log in see only the data that they have the permissions, privileges, and role assignments to see.

7. Click **Save** to create the connection.
   
   You can now create data sets from the connection.

---

**Add a Spreadsheet as a Data Source**

You can add a spreadsheet as a data source. Data Visualization allows you to browse for and upload spreadsheets from a variety of places, such as your computer, Google Drive, and Dropbox.

**Topics:**
- About Adding a Spreadsheet as a Data Set
- Add a Spreadsheet from Your Computer
- Add a Spreadsheet from Excel with the Smart View Plug-In
- Add a Spreadsheet from Windows Explorer
- Add a Spreadsheet from Dropbox or Google Drive

**About Adding a Spreadsheet as a Data Set**

Data source files from a Microsoft Excel spreadsheet file can have the XLSX extension (signifying a Microsoft Office Open XML Workbook file), and the XLS (signifying Excel spreadsheet format). You can also add CSV and TXT files.

Before you can upload a Microsoft Excel file as a data set, you must structure the file in a data-oriented way and it mustn’t contain pivoted data. Note the following rules for Excel tables:

- Tables must start in Row 1 and Column 1 of the Excel file.
- Tables must have a regular layout with no gaps or inline headings. An example of an inline heading is one that repeats itself on every page of a printed report.
- Row 1 must contain the table’s column names. For example, Customer Given Name, Customer Surname, Year, Product Name, Amount Purchased, and so on. In this example:
  - Column 1 has customer given names.
  - Column 2 has customer surnames.
  - Column 3 has year values.
  - Column 4 has product names.
  - Column 5 has the amount each customer purchased for the named product.
- The names in Row 1 must be unique. Note that if there are two columns that hold year values, then you must add a second word to one or both of the column names to make them unique. For example, if you’ve two columns named Year Lease, then you can rename the columns to Year Lease Starts and Year Lease Expires.
• Rows 2 onward are the data for the table, and they can't contain column names.

• Data in a column must be of the same kind because it's often processed together. For example, Amount Purchased must have only numbers (and possibly nulls), enabling it to be summed or averaged. Given Name and Surname must be text as they might be concatenated, and you may need to split dates into their months, quarters, or years.

• Data must be at the same granularity. A table can't contain both aggregations and details for those aggregations. For example, if you've a sales table at the granularity of Customer, Product, and Year, and contains the sum of Amount Purchased for each Product by each Customer by Year. In this case, you wouldn't include Invoice level details or a Daily Summary in the same table, as the sum of Amount Purchased wouldn't be calculated correctly. If you've to analyze at invoice level, day level, and month level, then you can do either of the following:
  – Have a table of invoice details: Invoice Number, Invoice Date, Customer, Product, and Amount Purchased. You can roll these up to day or month or quarter.
  – Have multiple tables, one at each granular level (invoice, day, month, quarter, and year).

Add a Spreadsheet from Your Computer

You can upload an Excel spreadsheet, CSV file, or TXT file data source located on your computer to use as a data set.

Before you add a spreadsheet as a data set, confirm you've done the following:

• Confirm that you've either an Excel spreadsheet in .XLSX or XLS format, or a CSV, or TXT file as the data source used to create a data set.

• For an Excel spreadsheet, ensure that it contains no pivoted data.

• Understand how the spreadsheet needs to be structured for successful import.

Follow these steps to add a spreadsheet from your computer and use it as a data source:

1. On the Home page, click Create, then click Data Set to display the Create Data Set dialog.

2. Click File and browse to select a suitable (unpivoted) XLSX or XLS file, CSV file, or TXT file.

3. Click Open to upload and open the selected spreadsheet in Data Visualization. The Data Set editor is displayed.

4. Make any required changes to Name, Description, or to column attributes.

   If you're uploading a CSV or TXT file, then in the Separated By field, confirm or change the delimiter. If needed, choose Custom and enter the character you want to use as the delimiter. In the CSV or TXT file, a custom delimiter must be one character. The following example uses a pipe (|) as a delimiter: Year|Product|Revenue|Quantity|Target Revenue| Target Quantity.

5. Click Add to save your changes and create the data set.

6. If a data set with the same name already exists:
   • Click Yes if you want to overwrite the existing data set.
Add a Spreadsheet from Excel with the Smart View Plug-In

The Oracle Smart View Plug-In enables you to publish an XLSX or XLS spreadsheet, a CSV, or TXT file from Excel and use it as a data source.

Upon import into Data Visualization and before you add the spreadsheet as a data source, you can modify column attributes, like data type and whether to treat the data as a measure or attribute.

Before you use the Smart View Plug-In, confirm you've done the following:

- Installed the latest version of Oracle Smart View for Office. To find the download, go to Oracle Smart View for Office. After you install Oracle Smart View for Office, be sure to restart all Microsoft Office applications.
- Confirmed that you've either an Excel spreadsheet in .XLSX or .XLS format, a .CSV file, or a .TXT file to use as the data source.
- Understand how the spreadsheet needs to be structured for successful import.

Follow these steps to publish an Excel spreadsheet, CSV, or TXT file to use it as a data source:

1. Open your Excel (.XLSX or XLS) spreadsheet, CSV, or TXT file in Microsoft Excel.
   If you're opening a .TXT file, follow the import steps for example, to specify the delimiter.
2. Click the DV Desktop tab.
3. If you're publishing a .XLSX or XLS file with pivot data, follow these steps:
   a. Select the upper-left numeric data cell, or select an area of data cells that you want to publish.
      Don't include grand totals when you select an area of data cells to publish.
   b. Click Unpivot.
   c. Click OK.
4. If required, format the new sheet content in Excel (for example, edit column heading names).
5. In the DV Desktop tab, click Publish to publish the new sheet.
   If Data Visualization isn't running, it starts automatically. The spreadsheet data is displayed in the Data Set editor.
6. In the Data Set editor, make any required changes to Name, Description, or to column attributes.
   If you're uploading a CSV or TXT file, then in the Separated By field, confirm or change the delimiter. If needed, select Custom and enter the character you want to use as the delimiter. In the CSV or TXT file, a custom delimiter must be one character. The following example uses a pipe (|) as a delimiter: Year|Product|Revenue|Quantity|Target Revenue| Target Quantity.
7. Click Add. If a data set exists with the same name, you're prompted to confirm that you want to overwrite it.
Data Visualization creates and displays a new data set that you can update, re-pivot, or apply changes to as needed.

**Note:**
If you later delete the Excel file created when un-pivoting, the data set created in Data Visualization is no longer linked to the Excel file.

**Add a Spreadsheet from Windows Explorer**

You can add a spreadsheet as a data source from within Windows Explorer.

Before you add a spreadsheet as a data source, do the following:

- Install the latest version of Oracle Smart View for Office. To find the download, go to Oracle Smart View for Office. After you install Oracle Smart View for Office, be sure to restart all Microsoft Office applications.
- Confirm that you've either an Excel spreadsheet in .XLSX or .XLS format or a .CSV file to use as the data source.
- For an Excel spreadsheet, ensure that it contains no pivoted data.
- Understand how the spreadsheet needs to be structured for successful import.

1. Open Windows Explorer and navigate to the spreadsheet file (.XLSX, .XLS, or .CSV) that you want to use as a data source.
2. Right-click the spreadsheet file icon.
3. Click **Open with** from the menu.
4. Select **Oracle DV Desktop**.
   If Data Visualization isn't running, it starts automatically.
5. If a data set with the same name already exists, the Create or Reload Data Set window is displayed.
   - Click **Reload** and click **OK** to overwrite the existing data set with the same name.
     If you choose to reload, you don't need to follow the final step, and the new data set overwrites the existing data set.
   - Click **Create New**, and complete one of the following options:
     - Enter a new name, and click **OK**.
     - To save using an autogenerated data set name, click **OK**.
6. In the Data Set editor make any required changes to the Name, Description, or to column attributes.
   If you’re working with a CSV file, then in the **Separated By** field, confirm or change the delimiter. If needed, select Custom and enter the character you want to use as the delimiter.
7. Click **Add**.
   Your spreadsheet is added as a data set and is available in Data Visualization.
Add a Spreadsheet from Dropbox or Google Drive

If you’re storing spreadsheets in Dropbox or Google Drive you can add a spreadsheet to create a data set.

Before you add a spreadsheet from Dropbox or Google Drive, do the following:

• Confirm that a connection exists. See Create Connections to Dropbox and Create Connections to Google Drive or Google Analytics.
• Confirm that the spreadsheet you want to use is either an Excel spreadsheet in .XLSX or .XLS format, a CSV file, or a TXT file.
• For an Excel spreadsheet, ensure that it contains no pivoted data.
• Understand how the spreadsheet needs to be structured for successful import.

Use the following steps to add a spreadsheet.

1. In the Data page, click Create and click Data Set.
   The Create Data Set dialog is displayed.
2. In the Create Data Set dialog, click the connection to Dropbox or Google Drive.
   The Data Set editor is displayed.
3. In the Data Set editor, search or browse the Dropbox or Google Drive directories and locate the spreadsheet that you want to use.
   You can use breadcrumbs to quickly move back through the directories.
4. Double-click a spreadsheet to select it. When you select a spreadsheet, its columns and data values are displayed.
5. Click Add to create the data set.
Manage Data that You Added

This topic describes the functions available to manage the data that you added from data sources.

Topics:
- Typical Workflow to Manage Added Data
- Manage Data Sets
- Refresh Data that You Added
- Update Details of Data that You Added
- Delete Data Sets from Data Visualization
- Rename a Data Set
- Duplicate Data Sets
- Blend Data that You Added
- About Changing Data Blending
- View and Edit Object Properties

Typical Workflow to Manage Added Data

Here are the common tasks for managing the data added from data sources.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh data</td>
<td>Refresh data in the data set when newer data is available. Or refresh the cache for Oracle Applications and databases if the data is stale.</td>
<td>Refresh Data that You Added</td>
</tr>
<tr>
<td>Update details of added data</td>
<td>Inspect and update the properties of the added data.</td>
<td>Update Details of Data that You Added</td>
</tr>
<tr>
<td>Manage data sets</td>
<td>See the available data sets and examine or update a data set's properties.</td>
<td>Manage Data Sets</td>
</tr>
<tr>
<td>Renaming a data set</td>
<td>Rename a data set listed on the data sets page.</td>
<td>Rename a Data Set</td>
</tr>
<tr>
<td>Duplicate data sets</td>
<td>Duplicate a data set listed on the data sets page.</td>
<td>Duplicate Data Sets</td>
</tr>
<tr>
<td>Blend data</td>
<td>Blend data from one data source with data from another data source.</td>
<td>Blend Data that You Added</td>
</tr>
</tbody>
</table>

About Changing Data Blending
Manage Data Sets

You can modify, update, and delete the data that you added from various data sources to Data Visualization.

You can use the Data Sets page to examine data set properties, change column properties such as the aggregation type, and delete data sets that you no longer need to free up space. Data storage quota and space usage information is displayed, so that you can quickly see how much space is free.

Refresh Data that You Added

After you add data, the data might change, so you must refresh the data from its source.

Note:

Rather than refreshing a data set, you can replace it by loading a new data set with the same name as the existing one. However, replacing a data set can be destructive and is discouraged. Don't replace a data set unless you understand the consequences:

- Replacing a data set breaks projects that use the existing data set if the old column names and data types aren't all present in the new data set.
- Any data wrangling (modified and new columns added in the data stage) is lost and projects using the data set are likely to break.

You can refresh data from all source types: databases, files, and Oracle Applications.

Databases

For databases, the SQL statement is rerun and the data is refreshed.

CSV or TXT

To refresh a CSV or TXT file, you must ensure that it contains the same columns that are already matched with the data source. If the file that you reload is missing some columns, then you'll see an error message that your data reload has failed due to one or more missing columns.

You can refresh a CSV or TXT file that contains new columns, but after refreshing, the new columns are marked as hidden and don't display in the Data Elements pane for existing projects using the data set.

Excel

To refresh a Microsoft Excel file, you must ensure that the newer spreadsheet file contains a sheet with the same name as the original one. In addition, the sheet must contain the same columns that are already matched with the data source. If the Excel file that you reload is missing some columns, then you'll see an error message that your data reload has failed due to one or more missing columns.
You can refresh an Excel file that contains new columns, but after refreshing, the new columns are marked as hidden and don't display in the Data Elements pane for existing projects using the data set. To resolve this issue, use the **Inspect** option of the data set to show the new columns and make them available to existing projects.

**Oracle Applications**

You can reload data and metadata for Oracle Applications data sources, but if the Oracle Applications data source uses logical SQL, reloading data only reruns the statement, and any new columns or refreshed data won't be pulled into the project. Any new columns come into projects as hidden so that existing projects that use the data set aren't affected. To be able to use the new columns in projects, you must unhide them in data sets after you refresh. This behavior is the same for file-based data sources.

To refresh data in a data set:

1. Go to the Data page and select **Data Sets**.
2. Select the data set you want to refresh and click **Actions menu** or right-click, then select **Reload Data**. To refresh data sets in a project:
   - **Data Elements panel** - Select a data set and right-click, then select **Reload Data**.
   - **Visualize and Prepare canvas** - Click **Menu** and select **Refresh Data Sets**. You can also right-click a data set in the data sets tabs bar of the Prepare canvas and select **Reload Data**.
3. If you're reloading a spreadsheet and the file is no longer in the same location or has been deleted, then the Reload Data dialog prompts you to locate and select a new file to reload into the data source.
4. Click **Select File** or drag a file to the Reload Data dialog.
5. A success message is displayed after your data is reloaded successfully.
6. Click **OK**.

The original data is overwritten with new data, which is displayed in visualizations after they are refreshed.

**Update Details of Data that You Added**

After you add data, you can inspect its properties and update details such as the name and description.

1. Go to the Data page and select **Data Sets**.
2. Select the data set whose properties you want to update and click the **Actions menu** or right-click, then select **Inspect**.
3. View the properties in the following tabs and modify them as appropriate:
   - General
   - Data Elements
4. (Optional) Change the Data Access query mode for a database table. The default is **Live** because database tables are typically large and shouldn't be copied to the cache. If your table is small, then select **Automatic Caching** and the data is
copied into the cache if possible. If you select **Automatic Caching**, then you'll have to refresh the data when it's stale.

5. Click **Save**.

**Delete Data Sets from Data Visualization**

You can delete data sets from Data Visualization when you need to free up space on your system.

Deleting a data set permanently removes it and breaks any projects that use the deleted data set. You can't delete subject areas that you've included in projects. Deleting data differs from removing a data set from a project.

1. Go to the Data page and select **Data Sets**.
2. Select the data set you want to delete and click the **Actions Menu** or right-click, then select **Delete**.

**Rename a Data Set**

Renaming a data set helps you to quickly search and identify it in the data set library.

Even if you change the name of a data set, that change doesn't affect the reference for the project; that is, the project using the specific data set continues to work.

1. Go to the Data page and select **Data Sets**.
2. Select a data set and click the **Actions menu** or right-click, then select **Open**.
3. Click **Edit Data Set** on the Results toolbar.
4. Select the last step and go to the **Name** field, then change the value.
5. Click **Save**.

If a data set with the same name already exits in your system, an error message is displayed. Click **Yes** to overwrite the existing data set (with the data set whose name you're changing) or cancel the name change.

**Duplicate Data Sets**

You can duplicate an uploaded data set that is listed in the Data Sets page to help you further curate (organize and integrate from various sources) data in projects.

For example, suppose an accounts team creates a specific preparation of a data set, and a marketing team wants to prepare the same data set but in a different way. The marketing team duplicates the data set for their own purposes.

1. Go to the Data page and select **Data Sets**.
2. Select a data set that you want to duplicate and click the **Actions menu** or right-click, then select **Duplicate**.
Note:

- The duplication happens immediately.
- The default name of the duplicated data set is `<Data set>Copy`.
- If the data set name already exists, the new name is set to `<Data set>Copy#` in sequential order based on available names.
- You can rename the duplicate data set by editing it in the Inspector dialog.
- The user that duplicates the data set becomes the owner of the new data set.
- Any user who can view a data set can also duplicate the data set.
- All properties on the new data set, unless specifically stated, are reset (as if it's a new data set). For example, ACL, certified, indexed, custom-attributes.
- Data preparation changes made on the source are retained in the new data set.
- Conformance rules on the source are retained in the new data set.

Blend Data that You Added

You might have a project where you added multiple data sets. You can blend data from one data set with data from another data set.

Video

For example, Data Set A might contain new dimensions that extend the attributes of Data Set B. Or Data Set B might contain new facts that you can use alongside the measures that already exist in Data Set A.

When you add more than one data set to a project, the system tries to find matches for the data that's added. It automatically matches external dimensions where they share a common name and have a compatible data type with attributes in the existing data set.

Data sets that aren't joined are divided by a line in the Data Elements pane of the project. If the project includes multiple data sets and if any aren't joined, then you'll see restrictions between data elements and visualizations. For example, you can't use the data elements of a data set in the filters, visualizations, or calculations of another data set if they're not joined. If you try to do so, you see an error message. You can match data elements of data sets that aren't joined in the Data Diagram of a project, or you can create individual filters, visualizations, or calculations for each data set.

You can specify how you want the system to blend your data.

1. Add one or multiple data sets to your project. Confirm that you're working in the Prepare canvas.

2. Go to the tabs at the bottom of the Prepare canvas and click Data Diagram. Alternatively, in the Data Elements pane, right-click and select Data Diagram.
3. Click the number along the line that connects the external source to the newly loaded source to display the Connect Sources dialog.

**Note:**
Items that were never explicitly matched together may be matched by the system. For example, Customer.Person_Name is matched to Employee.Name, and Employee.Name is matched to Spouse.Given_Name.

4. In the Connect Sources dialog, make changes as necessary.
   a. To change the match for a column, click the name of each column to select a different column from the data sets.

   **Note:**
   If columns have the same name and same data type, then they’re recognized as a possible match. You can customize this and specify that one column matches another by explicitly selecting it even if its name isn’t the same. You can select only those columns with a matching data type.

   b. Click *Add Another Match*, and then select a column from the data sets to match.

   c. For a measure that you’re uploading for the first time, specify the aggregation type such as *Sum* or *Average*.

   d. Click the X to delete a match.
5. Click **OK** to save the matches.

### About Changing Data Blending

Sometimes Data Visualization omits rows of data that you expect to see in a data set. This happens when your project includes data from two data sets that contain a mixture of attributes and values, and there are match values in one source that don't exist in the other. When this happens, you must specify which data set to use for data blending.

Suppose we have two data sets (Source A and Source B) with slightly different rows, as shown in the following image. Note that Source A doesn't include IN-8 and Source B doesn't include IN-7.

The following results are displayed if you select the **All Rows** data blending option for Source A and select the **Matching Rows** data blending option for Source B. Because IN-7 doesn't exist in Source B, the results contain null Rep and null Bonus.

The following results are displayed if you select the **Matching Rows** data blending option for Source A and select the **All Rows** data blending option for Source B. Because IN-8 doesn't exist in Source A, the results contain null Date and null Revenue.

The visualization for Source A includes Date as an attribute, and Source B includes Rep as an attribute, and the match column is Inv#. Under dimensional rules, you can't
use these attributes with a measure from the opposite table unless you also use the
match column.

There are two settings for blending tables that contain both attributes and measures. These are set independently in each visualization based on what columns are used in the visualization. The settings are **All Rows** and **Matching Rows** and they describe which source rows the system uses when returning data to be visualized.

The system automatically assigns data blending according to the following rules:

- If the visualization contains a match column, then the system sets sources with the match column to **All Rows**.
- If the visualization contains an attribute, then the system sets its source to **All Rows** and sets the other sources to **Matching Rows**.
- If attributes in the visualization come from the same source, then the system sets the source to **All Rows**, and sets the other sources to **Matching Rows**.
- If attributes come from multiple sources, then the system sets the source listed first in the project's elements panel to **All Rows** and sets the other sources to **Matching Rows**.

**Change Data Blending**

You can change data blending in a project with multiple data sets. Data blending specifies which data set takes precedence over the other.

1. Select a visualization on the canvas that uses more than one data set and in the properties pane click **Data Sets**.
2. To change the default blending, click **Data Blending**, and select either **Auto** or **Custom**.
   
   If you choose **Custom**, you can set the blending to either **All Rows** or **Matching Rows**.
   
   - You must assign at least one source to **All Rows**.
   - If both sources are **All Rows**, then the system assumes that the tables are purely dimensional.
   - You can’t assign both sources to **Matching Rows**.

**View and Edit Object Properties**

You can use inspectors to view and edit the properties of standalone objects in the Home, Data, Projects and other top-level pages.

The inspectors show the properties of an object. Based on the object's level, the properties also provide references to other objects, such as lower level objects that are part of the object that you're inspecting and other standalone objects that are referenced or used by that object. For example, a project property provides the list of data sets that are included in the project. The properties of lower level objects aren’t part of the top-level object’s inspector (such as data set properties), so they’re not displayed as part of a project’s properties.

You can inspect the properties of the following objects:

- Projects
1. In the Data page and select **Data Flows**, then locate the data flow whose properties you want to view or edit.

2. Click the data flow’s **Actions menu** and select **Inspect**.

3. In the Inspector dialog, modify the object properties (such as Name and Description).

   Common and type-specific properties are organized in tabs in the Inspector dialog, and the following tabs are displayed:

   - **General** - Lists standard life-cycle properties (such as Name, Description, Created By, and Modified By) that are common to all types of object.
     
     This tab also lists high-level properties (such as Type, File Name, File Size, and Location), depending on the type of object that you’re inspecting.
   
   - **Permissions** - Lists each user’s levels and level of permission.
   
   - **Schedules** - Lists schedules for the object (such as Name, Frequency, and Next Start Time of the schedule).
   
   - **Related** - Lists objects that are related, referenced, or used by the object that you’re inspecting. The objects listed depend on the type of object that you’re inspecting.
   
   - **History** - Lists the recent activity for the object.

   **Note:**

   The Inspector dialog also displays other specific tabs (such as Data Elements, Parameters, and Data Flows), depending on the type of object that you’re inspecting.

4. Click **Save**.
Prepare Your Data Set for Analysis

Data preparation involves cleansing, standardizing, and enriching your data set before you analyze the data in a visualization canvas.

Topics

- About Data Preparation
- Data Profiles and Semantic Recommendations
- Accept Enrichment Recommendations
- Transform Data Using Column Menu Options
- Adjust the Column Properties
- Edit the Data Preparation Script

Typical Workflow to Prepare Your Data Set for Analysis

Here are the common tasks for performing data preparation actions in the Prepare canvas.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply enrichment recommendations</td>
<td>Enhance or add information to column data using the enrichment recommendations.</td>
<td>Accept Enrichment Recommendations</td>
</tr>
<tr>
<td>Apply transform recommendations</td>
<td>Modify column data using the transformation recommendations or available options.</td>
<td>Transform Data Using Column Menu Options</td>
</tr>
<tr>
<td>Change column properties</td>
<td>Change the column properties such as data type, number format.</td>
<td>Adjust the Column Properties</td>
</tr>
<tr>
<td>Edit the data preparation script</td>
<td>Select and edit the changes applied to a column.</td>
<td>Edit the Data Preparation Script</td>
</tr>
</tbody>
</table>

About Data Preparation

The data preparation process enables transforming and enriching the data you’re preparing for analysis.

When you create a project and add a data set to it, the data undergoes column level profiling that runs on a representative sample of the data. After profiling the data, you can implement transformation and enrichment recommendations provided for the recognizable columns in the data set. The following types of recommendations are provided to perform single-click transforms and enrichments on the data:

- Global positioning system enrichments such as latitude and longitude for cities or zip codes.
Reference-based enrichments, for example, adding gender using on the person’s first name as the attribute for make the gender decision.

Column concatenations, for example, adding a column with the person’s first and last name.

Part extractions, for example, separating out the house number from the street name in an address.

Semantic extractions, for example, separating out information from a recognized semantic type such as domain from an email address.

Date part extractions, for example, separating out the day of week from a date that uses a month, day, year format to make the data more useful in the visualizations.

Full and partial obfuscation or masking of detected sensitive fields.

Recommendations to delete columns containing detected sensitive fields.

You can use and configure a wide range of data transformations from the column’s Options menu. See Transform Data Using Column Menu Options.

When you transform data, a step is automatically added to the Preparation Script pane. A blue dot indicates that Apply Script has not been executed. After applying the script, you can make additional changes to the data set, or you can create a project, or click Visualize to begin your analysis.

As each transformation and enrichment change is applied to the data, you can review the changes. You can also compare the data changes with the original source data verify that the changes are correct.

The data transformation and enrichment changes that you apply to a data set affects all projects that use the same data set. When you open the project that shares the data set, a message appears indicating that the project uses updated data. You can create a data set from the original source that doesn’t contain the data preparation changes. When you refresh the data in a data set, the preparation script changes are automatically applied to the refreshed data.

Data Profiles and Semantic Recommendations

After creating a data set, the data set undergoes column-level profiling to produce a set of semantic recommendations to repair or enrich your data. These recommendations are based on the system automatically detecting a specific semantic type during the profile step.

There are various categories of semantic types such as geographic locations identified by city names, a specific pattern such as a credit card number or email address, a specific data type such as a date, or a recurring pattern in the data such as a hyphenated phrase.

Topics

• Semantic Type Categories
• Semantic Type Recommendations
• Recognized Pattern-Based Semantic Types
• Based Semantic Types
• Recommended Enrichments
• **Required Thresholds**

**Semantic Type Categories**

Semantic types have categories. These semantic type categories include the following:

- Recognizing geographic locations such as city names.
- Identifying recognizable patterns such as those found with credit cards numbers or email addresses.
- Recurring patterns such as hyphenated phrase data.

**Semantic Type Recommendations**

Recommendations are based on the detection of each type of data such as repair, enhance, or enrich the data set with additional information based on the detected type. For example:

- **Enrichments** - Adding a new column to your data that corresponds to a specific detected type such as a geographic location, for example, adding population data for a city.
- **Column Concatenations** - When two columns are detected in the data set, one containing first names and the other containing last names, the system recommends a concatenating the names into a single column, for example, a `first_name_last_name` column.
- **Semantic Extractions** - When a semantic type is composed of subtypes such as an `us_phone` number that includes the area code, the system recommends extracting the area code into its own column.
- **Part Extraction** - When a generic pattern separator is detected in the data, the system recommends extracting parts of that pattern. For example if the system detects a repeating hyphenation in the data, it recommends extracting the parts into separate columns to potentially make the data more useful for analysis.
- **Date Extractions** - When dates are detected, the system recommends extracting parts of the date that might augment the analysis of the data such as by extracting the day of week from an invoice or purchase date.
- **Full and Partial Obfuscation/Masking** - When sensitive fields are detected such as a credit card number, the system recommends a full or partial masking of the column.
- **Delete** - When sensitive fields are detected such as a credit card number, the system recommends deleting the column to prevent exposing of the sensitive data.

**Recognized Pattern-Based Semantic Types**

This list shows the semantic types that are recognized based on patterns in the data. Recommendations are provided for each of these semantic types:

- Dates (in more than 30 formats)
- US Social Security Numbers (SSN)
- Credit Card Numbers
- Credit Card Attributes (CVV and Expiration Date)
• Email Addresses
• North American Plan Phone Numbers
• First Names (typical first names in the United States)
• Last Names (typical surnames in the United States)
• US Addresses

Based Semantic Types

The list shows the semantic types that are recognized based on pre-loaded reference knowledge provided with the service. Recommendations are provided for each of these semantic types:

• Country names
• Country codes
• State names (Provinces)
• State codes
• County names (Jurisdictions)
• City names (Localized Names)
• Zip codes

Recommended Enrichments

The list shows the recommended enrichments based on the semantic types. Enrichments are determined based on the geographic location hierarchy.

• Country
• Province (State)
• Jurisdiction (County)
• Longitude
• Latitude
• Population
• Elevation (in Meters)
• Time zone
• ISO country codes
• Federal Information Processing Series (FIPS)
• Country name
• Capital
• Continent
• GeoNames ID
• Languages spoken
• Phone country code
• Postal code format
• Postal code pattern
• Phone country code
• Currency name
• Currency abbreviation
• Geographic top-level domain (GeoLTD)
• Square KM

**Required Thresholds**

There are specific thresholds required for the profiling process to make a decision about a specific semantic type. As a general rule, 85% of the data values in the column must meet the criteria for a single semantic type in order for the system to make the classification determination. As a result, a column that might contain 70% first names and 30% “other”, doesn't meet the threshold requirements and therefore no recommendations are made.

**Accept Enrichment Recommendations**

You can use the enrichment recommendations to enhance or add information to the column data.

You can upload or open an existing data set to modify the data using enrichment recommendations. After making the changes to the data set, you can create a project. You can also create a project or open an existing project, add one or more data sets to the project, and then modify the data by using the enrichment recommendations.

If an enrichment recommendation adds information to a column’s data such as enriching a zip code number column with a state name, a new column is added. When you click the check mark next to a recommendation, the change is added to the Preparation script. If you delete or undo the change, the particular recommendation once again appears as an available option in the Recommendation pane.

If you don't apply the preparation script and close the project or the data set, you lose all the data changes you've performed.

1. Open a project, and click **Prepare**. In the Results pane, select a column to enrich. If the enrichment recommendations are available for that column, you see them listed in the Recommendation pane.

2. Click a recommendation to see a preview of the change. To add the change to the Preparation script, click the check mark next to the recommendation.

3. Continue implementing enrichment recommendations on the data set.

4. In the Preparation Script pane, click **Apply Script** to apply the data changes to the entire data set. Click **Save**, enter a name for the projects, and then click **Visualize** to review the data elements.

**Transform Data Using Column Menu Options**

You can use column menu options to modify the data’s format.

You can upload or open an existing data set to transform the data using column menu options. After making the changes to the data set, you can create a project or open an existing project and add the data set to the project.
The data transform changes update the column data using the selected option or add a new column to the data set.

The list of available menu options for a column depends on the type of data in that column.

**Note:**

If you don’t apply the transformation script and close the project or the data set, you lose all the data transform changes you’ve performed.

1. Open a project, and click **Prepare**. In the Results pane, select a column to transform.
2. Click **Options**, and select a transformation option.
3. In the step editor, update the fields to configure the changes. You can review the changes in the data preview table.
4. Click **Add Step** to apply the data changes, close the step editor, and add a step to the Preparation Script pane.
5. Continue implementing data transform changes in the data set.
6. Click **Apply Script** in the Preparation Script pane to apply the data transform changes to the entire data set.
7. (Optional) Click **Save**, and then click **Visualize** to see the transformed columns.

This example shows a Gender column with the data values F, f, M and m. To change the gender column data to use Female and Male, you select the column, select **Options**, and then select **Group**.

In the Group editor, you create a new column, using the name *Gender_Fix*. Create two groups, one for the values that represent women, F, and f, and one group for the values that represent men, M, and m. In the first group, enter *Female* as the group name, then select all of the data values that represent females (f, F). Click the **Add** icon next to **Group** in the editor to add a new group for men. Enter *Men* as the group name. The remaining values in the gender column should represent men, so click **Add All**. To complete the transformation step change, you must click **Add Step** to include the new column and standardized gender groups in the data set.

The Preparation script is updated with the step to add the new column, *Gender_Fix* that uses Female and Male as its values.

### Convert Text Columns to Date or Time Columns

You can convert any text column to a date, time, or timestamp column.

For example, you can convert an attribute text column to a true date column.

1. Open the project or the data set that includes the column you want to convert. Confirm that you’re working in the Prepare canvas.
2. Mouse-over the column that you want to convert.
3. Click **Options**, and select a conversion option (for example, **Convert to Number**, **Convert to Date**).
You can also do this from the Data Sets page when you’re editing a data set.

If you’ve selected Convert to Date, then the Convert to Date/Time dialog is displayed.

4. To further refine the format, select the column, and use the options on the properties pane.

5. If you want to change the Source Format’s default value then click Source Format and select a format. For example, 2017.01.23, 01/23/2017, Mon, Jan 23, 2017, or Mon, Jan 23, 2017 20:00:00.

The Source Format field automatically displays a suggested format based on the input column text. However, if the Source Format field doesn’t display a suggested format (for example, for Sat 03/28 2017 20:10:30:222), then you can enter a custom format.

6. Click Custom if you need to enter your own format into the field at the bottom of the Convert to Date/Time dialog.

The custom format you enter must be in a format recognized by Oracle Business Intelligence before conversion. If you enter a custom format that isn’t recognized, an error message is displayed.

7. The Hide Source Element is selected by default and hides the original source column after conversion. If you deselect this option, the original column is displayed next to the converted column after conversion.

8. Click Convert to convert the text column into a date or time column.

The changes you make apply to all projects using the data source with a modified date or time column.

Adjust the Display Format of Date or Time Columns

You can adjust the display format of a date or a time column by specifying the format and the level of granularity.

For example, you might want to change the format of a transaction date column (which is set by default to show the long date format such as November 1, 2017) to display instead the International Standards Organization (ISO) date format (such as 2017-11-01). You might want to change the level of granularity (for example year, month, week, or day).

1. Open the project or the data set that includes the date and time column that you want to update. If you’re working in a project, then confirm that you’re working in the project’s Prepare canvas.

2. Click the date or time column you want to edit.

For example, click a date in the data elements area of the Data Panel, or click or hover over a date element on the main editing canvas.

3. If you’re working in the main editing canvas, adjust the format by doing one of the following:

   • Click Options, then Extract to display a portion of the date or time (for example, the year or quarter only).

   • Click Options, then Edit to display a Expression Editor that enables you to create complex functions (for example, with operators, aggregates, or conversions).
• In the properties pane, click the **Date/Time Format** tab, and use the options to adjust your dates or times (for example, click **Format** to select from short, medium, or long date formats, or specify your own format by selecting **Custom** and editing the calendar string displayed.

4. If you’re working in the data elements area of the Data Panel, adjust the format by doing one of the following:

   • If you want to display just a portion of a calendar column (for example, the year or quarter only), then select and expand a calendar column and select the part of the date that you want to display in your visualization. For example, to only visualize the year in which orders were taken, you might click Order Date and select Year.

   • In the properties pane, click the **Date/Time Format** tab, and use the options to adjust your dates or times.

5. If you’re working in table view, select the column header and click **Options**, then in the properties pane click Date/Time Format to display or update the format for that column.

### General Custom Format Strings

You can use these strings to create custom time or date formats.

The table shows the general custom format strings and the results that they display. These allow the display of date and time fields in the user's locale.

<table>
<thead>
<tr>
<th>General Format String</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>[FMT:dateShort]</td>
<td>Formats the date in the locale's short date format. You can also type [FMT:date].</td>
</tr>
<tr>
<td>[FMT:dateLong]</td>
<td>Formats the date in the locale's long date format.</td>
</tr>
<tr>
<td>[FMT:dateInput]</td>
<td>Formats the date in a format acceptable for input back into the system.</td>
</tr>
<tr>
<td>[FMT:time]</td>
<td>Formats the time in the locale's time format.</td>
</tr>
<tr>
<td>[FMT:timeHourMin]</td>
<td>Formats the time in the locale's time format but omits the seconds.</td>
</tr>
<tr>
<td>[FMT:timeInput]</td>
<td>Formats the time in a format acceptable for input back into the system.</td>
</tr>
<tr>
<td>[FMT:timeInputHourMin]</td>
<td>Formats the time in a format acceptable for input back into the system, but omits the seconds.</td>
</tr>
<tr>
<td>[FMT:timeStampShort]</td>
<td>Equivalent to typing [FMT:dateShort] [FMT:time]. Formats the date in the locale's short date format and the time in the locale's time format. You can also type [FMT:timeStamp].</td>
</tr>
<tr>
<td>[FMT:timeStampLong]</td>
<td>Equivalent to typing [FMT:dateLong] [FMT:time]. Formats the date in the locale's long date format and the time in the locale's time format.</td>
</tr>
<tr>
<td>[FMT:timeStampInput]</td>
<td>Equivalent to [FMT:dateInput] [FMT:timeInput]. Formats the date and the time in a format acceptable for input back into the system.</td>
</tr>
<tr>
<td>[FMT:timeHour]</td>
<td>Formats the hour field only in the locale's format, such as 8 PM.</td>
</tr>
<tr>
<td>YY or yy</td>
<td>Displays the last two digits of the year, for example 11 for 2011.</td>
</tr>
<tr>
<td>YYY or yyyy</td>
<td>Displays the last three digits of the year, for example, 011 for 2011.</td>
</tr>
<tr>
<td>YYYY or yyyy</td>
<td>Displays the four-digit year, for example, 2011.</td>
</tr>
<tr>
<td>General Format String</td>
<td>Result</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------</td>
</tr>
<tr>
<td>M</td>
<td>Displays the numeric month, for example, 2 for February.</td>
</tr>
<tr>
<td>MM</td>
<td>Displays the numeric month, padded to the left with zero for single-digit months, for example, 02 for February.</td>
</tr>
<tr>
<td>MMM</td>
<td>Displays the abbreviated name of the month in the user's locale, for example, Feb.</td>
</tr>
<tr>
<td>MMMM</td>
<td>Displays the full name of the month in the user's locale, for example, February.</td>
</tr>
<tr>
<td>D or d</td>
<td>Displays the day of the month, for example, 1.</td>
</tr>
<tr>
<td>DD or dd</td>
<td>Displays the day of the month, padded to the left with zero for single-digit days, for example, 01.</td>
</tr>
<tr>
<td>DDD or ddd</td>
<td>Displays the abbreviated name of the day of the week in the user's locale, for example, Thu for Thursday.</td>
</tr>
<tr>
<td>DDDD or dddd</td>
<td>Displays the full name of the day of the week in the user's locale, for example, Thursday.</td>
</tr>
<tr>
<td>DDDDD or ddddd</td>
<td>Displays the first letter of the name of the day of the week in the user's locale, for example, T for Thursday.</td>
</tr>
<tr>
<td>r</td>
<td>Displays the day of year, for example, 1.</td>
</tr>
<tr>
<td>rr</td>
<td>Displays the day of year, padded to the left with zero for single-digit day of year, for example, 01.</td>
</tr>
<tr>
<td>rrr</td>
<td>Displays the day of year, padded to the left with zero for single-digit day of year, for example, 001.</td>
</tr>
<tr>
<td>w</td>
<td>Displays the week of year, for example, 1.</td>
</tr>
<tr>
<td>ww</td>
<td>Displays the week of year, padded to the left with zero for single-digit weeks, for example, 01.</td>
</tr>
<tr>
<td>q</td>
<td>Displays the quarter of year, for example, 4.</td>
</tr>
<tr>
<td>h</td>
<td>Displays the hour in 12-hour time, for example 2.</td>
</tr>
<tr>
<td>H</td>
<td>Displays the hour in 24-hour time, for example, 23.</td>
</tr>
<tr>
<td>hh</td>
<td>Displays the hour in 12-hour time, padded to the left with zero for single-digit hours, for example, 01.</td>
</tr>
<tr>
<td>HH</td>
<td>Displays the hour in 24-hour time, padded to the left with zero for single digit hours, for example, 23.</td>
</tr>
<tr>
<td>m</td>
<td>Displays the minute, for example, 7.</td>
</tr>
<tr>
<td>mm</td>
<td>Displays the minute, padded to the left with zero for single-digit minutes, for example, 07.</td>
</tr>
<tr>
<td>s</td>
<td>Displays the second, for example, 2. You can also include decimals in the string, such as s.# or s.00 (where # means an optional digit, and 0 means a required digit).</td>
</tr>
<tr>
<td>ss</td>
<td>Displays the second, padded to the left with zero for single-digit seconds, for example, 02. You can also include decimals in the string, such as ss.# or ss.00 (where # means an optional digit, and 0 means a required digit).</td>
</tr>
<tr>
<td>S</td>
<td>Displays the millisecond, for example, 2.</td>
</tr>
</tbody>
</table>
### General Format String Result

<table>
<thead>
<tr>
<th>General Format String</th>
<th>Result</th>

<tbody>
<tr>
<td>SS</td>
<td>Displays the millisecond, padded to the left with zero for single-digit milliseconds, for example, 02.</td>
</tr>
<tr>
<td>SSS</td>
<td>Displays the millisecond, padded to the left with zero for single-digit milliseconds, for example, 002.</td>
</tr>
<tr>
<td>t</td>
<td>Displays the first letter of the abbreviation for ante meridiem or post meridiem in the user's locale, for example, a.</td>
</tr>
<tr>
<td>tt</td>
<td>Displays the abbreviation for ante meridiem or post meridiem in the user's locale, for example, pm.</td>
</tr>
<tr>
<td>gg</td>
<td>Displays the era in the user's locale.</td>
</tr>
</tbody>
</table>

#### Create a Bin Column When You Prepare Data

Binning a measure creates a new column based on the value of the measure. You can assign a value to the bin dynamically by creating the number of equal size bins (such as the same number of values in each bin), or by explicitly specifying the range of values for each bin.

You can create a bin column based on a data element.

1. Open a project, and click **Prepare**. In the Results pane, select a column you want to modify using the bin option.
2. Click **Options** for the selected column, and select **Bin**.
3. In the Bin step editor, specify the options for the bin column, as described in the following table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New element name</td>
<td>Change the name of the bin column.</td>
</tr>
<tr>
<td>Number of bins</td>
<td>Click to select a different number from the list.</td>
</tr>
<tr>
<td>Method</td>
<td>Based on your selection in the <strong>Method</strong> field, the range and count of the bins are updated.</td>
</tr>
<tr>
<td></td>
<td>• In the <strong>Manual</strong> method, you can select the boundary (that is, range and count) of each bin. You can also change the default name of each bin.</td>
</tr>
<tr>
<td></td>
<td>• In the <strong>Equal Width</strong> method, the boundary of each bin is the same, but the count differs. Based on your selection in the <strong>Bin Labels</strong> field, the bin column labels are updated.</td>
</tr>
<tr>
<td></td>
<td>• In the <strong>Equal Height</strong> method, the height of each bin is the same or very slightly different but the range is equal.</td>
</tr>
</tbody>
</table>

4. If you select the **Equal Width** method, click to select a dimension (that is, a data element) on which to apply the bin.

4. Click **Add Step** to apply the data changes, close the step editor, and add a step to the Preparation Script pane.
Adjust the Column Properties

You can change the properties of each column in the project’s Prepare canvas.

Column property changes aren’t affected by the data transform changes. For example, if you’ve updated the name of a column after you use a data transform change on the same column, the name of the column is updated automatically.

1. Confirm that you’re working in the Prepare canvas.
   If you’ve added more than one data set to the project, go to the tabs at the bottom of the window and select the data set.

2. In the Results pane or Data Element pane select the column whose properties you want to change.

3. In the properties pane of the selected column, use the General or Number Format tabs to change the properties. For each property change, a step is added to the Preparation Script pane.
   - **General** - Change the column name, data type, treat as (measure or attribute), and aggregation type.
   - **Number Format** - Change the default format of a number column.

4. Click **Apply Script** in the Preparation Script pane to apply the property changes to the entire data set.

Edit the Data Preparation Script

You can edit the data transformation changes added to the Preparation Script.

Both before and after you’ve executed **Apply Script**, you can edit the data transformation steps. If you’re editing the steps after executing **Apply Script**, you must re-apply the script to the entire data set. The updates to the columns are applied only to the data set and not to the visualization. Click **Refresh Data** to update the visualization with the new data.

The edit option is available for only specific transform step. If you don’t save the updates to a step and navigate to another step, a warning message is displayed indicating that you haven’t saved the changes.

1. Open a project, and click **Prepare**. If a project has multiple data sets, select the data set to update.

2. Select a step in the Preparation Script pane, and click the **Edit Transform**

3. In the step editor, update the fields to edit the data transform changes that are applied to the column. You can review the changes in the data preview table.

4. Click **OK** to update the column and close the step editor.

5. Click **Apply Script** in the Preparation Script pane to apply the data transform changes to the entire data set.
Use Machine Learning to Analyze Data

You can use machine learning to make predictions using your existing data.

Before you start, install the machine learning Framework on the Windows or Mac machine on which you’ve installed Data Visualization Desktop. See How Do I Install DVML for Data Visualization Desktop?

Typical Workflow to Analyze Data with Machine Learning

Here are the common tasks for analyzing data with machine learning.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create train models and use them to interpret data</td>
<td>Use scripts to train data models that you add to other data sets to predict trends and patterns in your data.</td>
<td>Create a Train Model for a Data Flow</td>
</tr>
<tr>
<td>Use models to generate data sets</td>
<td>Apply models to generate data sets.</td>
<td>Score a Model</td>
</tr>
<tr>
<td>Add scenarios to a project</td>
<td>Add scenarios to a project to create a blended report.</td>
<td>Add Scenarios to a Project</td>
</tr>
</tbody>
</table>

Create a Train Model for a Data Flow

As a advanced analyst, you can use scripts to train data models that you then add to other sets of data to predict trends and patterns in data.

Scripts define the interface and logic (code) for machine learning tasks. You can use a training task (classification or numeric prediction), for example, to train a model based on known (labelled) data. When the model is built, the same can be used to score unknown data (that is, unlabelled) to generate a data set within a data flow, or to provide a prediction dynamically within a visualization. Machine learning tasks are available as individual step types (for example, Train Binary, Apply Model).

For example, you could train a model on a set of data that includes employee salary information and then apply this model to a set of employee data that doesn't include salary information. Because the model is based on specific factors and is 67% accurate, it can accurately predict how many and which employees in the data set most likely have an annual salary of over $50k per year.
1. In the Data tab, select a data set that you want to use in the data flow. This can be any data set containing data that you want to train model.

2. In the Data Flows tab, click **Create** and select **Data Flow** to display the Add Data Set pane.

3. Select the data set that you want to use to create your train model, and click **Add**. This can be any data set.

4. In the data flow, click the **Plus (+)** symbol. This displays all available data flow step options, including train model types shown as icons across the bottom (for example, Train Numeric Predictions, Train Multi-Classifier).

5. Click the train model type that you want to apply to the data set. For example, Train Binary Classifier is a binary train model (a statistical calculation) that helps predict a binary choice.

6. Select a suitable script from the available scripts for the selected model type (for example, Binary Classification) and click **OK** to confirm. For example, select **CART** for model to build a binary classification train model. The parameters displayed are specific to the script that you select.

7. Refine the field details for the model as required:
   a. If you want to change the script, then click **Model Training Script**.
   b. Click **Target** to select a Data Set column that you want to apply the train model to. For example, you might want to model the Income Level column to predict a person’s income. Consider a loan agent who is interested to offer loans only to those who make more than $50000.
   c. Update the remaining fields with values that are appropriate for the script you selected.

8. Click **Save**, enter a name and description and click **OK** to save the data flow with your choice of parameter values for the current train model script.

9. Click **Save Model**, enter a name and description, and click **Save** to save the model. You can now run the model script like any other data flow.

**Interpret the Effectiveness of the Model**

Once you’ve created a model, you can explore information about it and how it interprets data. You can use that information to modify the model.

When you run a train model data flow, it produces outputs which you can interpret, so that you can refine the model.

1. Click the Navigator icon and select **Machine Learning**. Machine Learning displays the Scripts and Models tabs.

2. To view the train model data flow outputs, display the **Models** tab. This displays all models created.
3. Click the menu icon for a model and select the **Inspect** option.

   This displays three tabs: General, Quality, and Related.

4. **(Optional)** Click **General**.

   This page shows information about the model including:
   - **Predicts** - The name of whatever the model is trying to predict (for example, something about IncomeLevel).
   - **Trained On** - The name of the data set that you're using to train the model.
   - **Script** - The name of the script used in the model.
   - **Class** - The class of script (for example, Binary Classification).

5. **(Optional)** Click **Quality**.

   A portion (configurable) of the training data set is kept aside for validation purposes. When the model is built, it's applied to the validation data set with known labels. A different set of metrics such as Accuracy, Precision, and Recall are calculated based on Actual (Label) and Predicted Values. Information is also shown as a matrix, that you can use to provide quick simple summaries of what is found during validation. For example, a certain percentage (X) of people in the validation data set makes more than $50000, whereas the model predicted Y% of the people making the same.

   The Quality page displays:
   - A list of standard metrics, where the metrics displayed are related to the model selected. Each metric helps you determine how good the model is in terms of its prediction accuracy for the selected Data Set column to which you apply the train model.

     For example, you might model the Income Level column to predict (based on a range of other values for each person), when someone's income level is likely to be greater than $50000.

   - The matrix shows the state of the data used to make the predictions.

     The matrix indicates actual values against predicted values to help you understand if the predicted values are close to the actual values.

   You can use this information to return to the model and make changes if necessary.

6. **(Optional)** Click **Related**.

   Related tab captures data sets emitted by the machine learning scripts when run to build models. The data sets capture specific information related to the script logic, so that advanced users (data scientists) can get more insights into the model built.

   This page shows the training data including:
   - **Training Data** - The data set being used to train the model.
   - **Generated Data** - The data sets created by the script that you use for the training model (for example, obies.CART.train). You may see different data sets if you select another script to train a model.

---

### Score a Model

You can apply a model within a data flow to generate a data set.
1. In the Data tab, select a data set that you want to use in the data flow. This can be any data set containing data that you want to apply your model to.

2. In the Data Flows tab, click Create and select Data Flow to display the Add Data Set pane.

3. Select the data set to which you want to apply the model, and click Add. Select a data set like the one used to create the model.

4. In the data flow, click the Plus (+) symbol.

5. Click Apply Model from the available options.

6. Select a model from the list of available models and click OK to confirm.

7. Select the Output columns that you want generated by this data flow, and update Column Name fields if required.

   The output columns displayed in the Apply Model pane are created as a data set when the data flow runs. The output columns are relevant to the model.

8. In the data flow, click the Plus (+) symbol and select Save Data to add a Save Data step.

9. Click Save, enter a name and description and click OK to save the data flow with the selected model and output.

   You can now run the data flow to create the appropriate output data set columns using the selected model.

**Note:**

Any data set created by scoring data flow can be used within a Data Visualization (project visualization) like any other data sets.

### Add Scenarios to a Project

You can apply scenarios within a project by selecting from a list of available machine learning models, joining the model to the existing data sets within a project, then using the resulting model columns within a visualization. A scenario enables you to add a set of virtual model output columns to create a blended report, which isn't unlike adding data directly to a project to create blended visualization. You can use the predicted values for the subset of the data of interest within a specific visualization. The virtual data set columns don't physically exist, they represent the model outputs and their values are dynamically generated when used in a visualization.

1. Create or open the Data Visualization project in which you want to apply a scenario.

   Confirm that you're working in the Visualize canvas.

2. To add a scenario, do one of the following:
   - Click Add, and select Create Scenario.
   - In the Data Elements pane, right-click the data set and select Create Scenario.
3. In the Create Scenario - Select Model dialog, select the name of the model and click OK.

4. In the Map Your Data to the Model dialog, specify various options:
   - In a project with multiple data set, click **Data Set** to select a data set that you want to map to the model.
   - In the table, click **Select Column** to match a column to a model input.
     Each model has inputs (that is, data elements) that must match corresponding columns from the data set. If the data type (for example, column name) of a model input matches a column, then the input and column are automatically matched. If a model input has a data type that doesn't match any column, you must manually specify the appropriate data element.
     Click **Show all inputs** to display the model inputs and the data elements with which they match. Alternatively, click **Show unmatched inputs** to display the model inputs that aren't matched with a column.

5. Click OK to add the resulting model columns to the Data Elements pane. You can now use the model columns with the data set columns.

6. Drag and drop one or more data set and model columns from the Data Elements pane to drop targets in the Visualize canvas. You can also double-click the columns to add them to the canvas.

You can add one or more scenarios to the same or different data sets. In the Data Elements pane right-click the model, and select one of the following options:
   - **Edit Scenario** - Open the Map Your Data to the Model dialog to edit a scenario.
   - **Reload Data** - Update the model columns after you edit the scenario.
   - **Remove from Project** - Open the Remove Scenario dialog to remove a scenario.
Use Data Flows to Create Curated Data Sets

You can use data flows to produce curated (combined, organized, and integrated) data sets.

<td>Execute data flows to create data sets.</td>
<td>Execute a Data Flow</td>
</tr>
<tr>
<td>Saving output data from a data flow</td>
<td>Before running a data flow, modify or select the database name, attribute or measure, and aggregation rules for each columns of the output data set.</td>
<td>Save Output Data from a Data Flow</td>
</tr>
<tr>
<td>Run a data flow</td>
<td>Run a saved data flow to create data sets or to refresh the data in a data set.</td>
<td>Run a Saved Data Flow</td>
</tr>
</tbody>
</table>

### About Data Flows

Data flows enable you to organize and integrate your data to produce a curated set of data that you use in visualizations.

You use the Data Visualization's data flow editor to apply transformations, add joins and filters, remove unwanted columns, add new derived measures, add derived columns, and add other operations. The data flow is then run to produce a data set that you can use to create complex visualizations.

See Create a Data Flow and Run a Saved Data Flow.
About Editing a Data Flow

Build your data flow by adding steps to select, limit, and customize your data.

The following image shows the data flow editor.

The data flow editor is a flexible tool, designed to help you create data flows. You can also:

- Select, add, and rename columns
- Add or adjust aggregates
- Add filters
- Create a merge column
- Merge rows
- Create a binning column
- Add a sequence
- Create a group
- Add cumulative values
- Add a time series forecast
- Add a sentiment analysis
- Apply custom scripts
- Customize step names
- Schedule a data flow
- Create an Essbase cube
- Add another data set

You add steps in the workflow diagram pane and specify details for those steps in the Step editor pane.

The following tips should help you to use the Step editor pane:
You can hide or display the Step editor pane by clicking **Step editor** at the bottom of the Data Flow editor.

You can hide or display the Preview data columns pane by clicking **Preview data** at the bottom of the Data Flow editor.

The Preview data columns pane updates automatically as you make changes to the data flow. For example, you could add a Select Columns step, remove some columns, and then add an Aggregate step. While working on the Aggregate step, the Preview data columns pane already shows the columns and data that you just specified in the Select Columns step.

You can specify whether or not to automatically refresh step changes in the Preview data columns pane by clicking **Auto apply**.

You can add another data set and join it to the existing data sets in your data flow by selecting **Add Data** in the Data Flow Steps panel. Joins are created automatically when you add a data set; however, you can edit the join details in the Join dialog.

Oracle Data Visualization validates data flow steps as you add them to or delete them from the data flow.

If you’re adding an expression (in an Add Column step or a Filter step), then you must click **Apply** to finalize the step.

If you add a new step to the workflow diagram without clicking **Apply**, then your expression won’t be applied, and the next step that you add won’t use the correct data.

---

**Create a Data Flow**

You can create a data flow from one or more data sets. With a data flow, you produce a curated data set that you can use to easily and efficiently create meaningful visualizations.

1. On the Home Page, click **Create**, then click **Data Flow** to display the Add Data Set dialog.

2. Select a data source.
   - Click an existing data source to include it in your project, and click **Add**.
   - Click **Create Data Set** to display the Create Data Set dialog, where you can create your own.

3. To add steps to your data flow, in the Data Flow editor, go to the workflow diagram pane and click **Add a step (+)** next to the data set step.

4. In the Add step dialog, select the step that you want to add and provide the required details in the Step editor pane.

5. (Optional) To delete a step from the workflow diagram, click X or right-click the step and select **Delete**. Note that deleting a step might make the other steps in the data flow invalid, as indicated by red X icons displayed for the invalid steps.

6. Click **Save** to save but not run the data flow. Note that you can save a data flow that contains validation errors. When you save a data flow, it’s displayed in the Display pane of the Data page, in the Data Flows area.
When you've finished adding steps to the data flow diagram, you can also execute the data flow without saving it, or save the data flow as a database connection.

Add Filters to a Data Flow

You can use filters to limit the amount of data included in the data flow output. For example, limiting sales revenue data of a column to the years 2010 through 2017.

You can filter a data element by adding the filter step in the Step editor pane.

1. Create or open the data flow that you want to apply a filter to.
2. Click **Add a step (+)**, and select **Filter**.
3. In the Filter pane, select the data element you want to filter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Filter (+)</td>
<td>Select the data element you want to filter, in the Available Data dialog. Alternatively, click <strong>Data Elements</strong> in the Data Panel, and drag and drop a data element to the Filter pane.</td>
</tr>
<tr>
<td>Filter fields</td>
<td>Change the values, data or selection of the filter (for example, maximum and minimum range). Based on the data element, specific filter fields are displayed. You can apply multiple filters to a data element.</td>
</tr>
<tr>
<td>Filter menu icon</td>
<td>Select a function to clear the filter selection and disable or delete a filter.</td>
</tr>
<tr>
<td>Filter pane menu icon</td>
<td>Select a function to clear all filter selections, remove all filters, and auto-apply filters. You can select to add an expression filter.</td>
</tr>
<tr>
<td>Add Expression Filter</td>
<td>Select to add an Expression Filter. Click <strong>f(x)</strong>, select a function type, and then double-click to add a function in the <strong>Expression</strong> field. Click <strong>Apply</strong>.</td>
</tr>
<tr>
<td>Auto-Apply Filters</td>
<td>Select an auto-apply option for the filters, such as Default (On).</td>
</tr>
</tbody>
</table>

4. Click **Save**.

Add Aggregates to a Data Flow

You can group data by applying aggregate functions such as count, sum, and average.

If the data set already contains aggregates, then they're displayed when you add an aggregate step. You can add an aggregate in the Step editor pane.

1. Create or open the data flow that you want to add an aggregate step to.
2. Click **Add a step (+)**, and select **Aggregate**.
3. In the Aggregate pane, to add a column to the aggregate, click **Actions** then click **Aggregate**.
4. To select an aggregate function to apply to an aggregate column, click the arrow in the **Function** field for the selected column and select a value to aggregate by. For example, for the Profit column you could choose Sum.

5. To remove an aggregate from the selected aggregate list, hover the mouse pointer over the aggregate's name, click **Actions**, and click **Group By**.

6. To save your changes, click **Save Data Flow**.

**Merge Columns in a Data Flow**

You can combine two or more columns to display as one. For example, you can merge the street address, street name, state, and ZIP code columns so that they display as one item in the visualizations using the data flow's output.

You create a merged column by adding a merge column step in the Step editor pane.

1. Create or open the data flow that you want to add a merge column to.

2. Click **Add a step (+)**, and select **Merge Columns**.

3. In the Merge Columns pane, specify the options for combining the columns:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New column name</td>
<td>Change the name of the merge column.</td>
</tr>
<tr>
<td>Merge column</td>
<td>Select the first column you want to merge.</td>
</tr>
<tr>
<td>With</td>
<td>Select the second column you want to merge.</td>
</tr>
<tr>
<td>(+) Add Column</td>
<td>Select more columns you want to merge.</td>
</tr>
<tr>
<td>Delimiter</td>
<td>Select a delimiter to separate column names (for example, Space, Comma, Dot, or Custom Delimiter).</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Merge Rows in a Data Flow**

You can merge the rows of two data sets. The result can include all the rows from both data sets, the unique rows from each data set, the overlapping rows from both data sets, or the rows unique to one data set.

Before you merge the rows, do the following:

- Confirm that each data set has the same number of columns.
- Check that the data types of the corresponding columns of the data sets match. For example, column 1 of data set 1 must have the same data type as column 1 of data set 2.

You can add a Merge Rows step in the Step editor pane.

1. Create a data flow and add the data sets you want to merge.

2. Click **Add a step (+)** and select **Merge rows**.

3. Select the option for merging the rows, as described in the following table:
### Create a Bin Column in a Data Flow

Binning a measure creates a new column based on the value of the measure. You can assign a value to the bin dynamically by creating the number of equal size bins (such as the same number of values in each bin), or by explicitly specifying the range of values for each bin.

You can add a Bin step in the Step editor pane.

1. Create or open the data flow in which you want to create a bin column.
2. Click **Add a step (+)**, and select **Bin**.
   
   Alternatively, you can select **Add Columns**, and then click **(+) Column** to select **Bin**.
3. In the Bin pane, click **Select Column**.
4. In the Available Columns dialog, select the data element.
5. In the Bin pane, specify the options for the bin column:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bin</td>
<td>Select a different data element.</td>
</tr>
<tr>
<td>New element name</td>
<td>Change the name of the bin column.</td>
</tr>
<tr>
<td>Number of Bins</td>
<td>Enter a number, or use the arrows to increment or decrement the number of bins.</td>
</tr>
<tr>
<td>Method</td>
<td>Select one of the methods, <strong>Manual</strong>, <strong>Equal Width</strong>, or <strong>Equal Height</strong>.</td>
</tr>
</tbody>
</table>

4. Click **Save**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Histogram</td>
<td>Based on your selection in the Method field, the histogram range (width) and histogram count (height) of the bins are updated.</td>
</tr>
<tr>
<td>View</td>
<td>• In the Manual method, you can move the slider to select the boundary; that is, the histogram range and count. The number of sliders changes based on the histogram count. You can switch to the List view and enter the range manually along with the bin names.</td>
</tr>
<tr>
<td></td>
<td>• In the Equal Width method, the histogram range is divided into intervals of the same size. For equal width binning, the column values are measured, and the range is divided into equal-sized intervals. The edge bins can accommodate very low or very high values in the column.</td>
</tr>
<tr>
<td></td>
<td>• In the Equal Height method, the height of each bin is same or very slightly different but the histogram range is equal. For equal height or frequency binning, the intervals of each bin is based on each interval containing approximately the equal number of elements (that is, records). Equal Height method is preferred specifically for the skewed data.</td>
</tr>
<tr>
<td>List View</td>
<td>If you select the Manual method, you can change the name of the bins, and you can define the range for each bin.</td>
</tr>
</tbody>
</table>

**Note:**
Based on your changes, the data preview (for example, the bin column name) is updated.

6. Click **Save**.

### Create a Sequence of Data Flows

A sequence is a saved sequential list of specified data flows and is useful when you want to run multiple data flows as a single transaction. If any flow within a sequence fails, then all the changes done in the sequence are rolled back.

1. On the Home page click **Create** and select **Sequence**.
2. Drag and drop the data flows and sequences to the Sequence pane.
3. Click the menu icon to move an item up or down in the list, and to remove an item.
4. Click **Save**. When you save a sequence, it’s displayed in the Sequence area of the Data page.
5. Go to the Sequence area of the Data page, select the sequence, and click **Execute Sequence**.
   After you run a sequence, the resulting data sets are displayed in the Data page.
6. Go to the Data page and click Data Sets to see the list of resulting data sets.

### Create a Group in a Data Flow

You can use binning attributes to define groups of attribute values in a data set.

1. Create or open the data flow in which you want to create a group column.
2. Click **Add a step (+)**, and select **Group**.
3. Select the data element in the Available Columns dialog. You can’t select the numbered type data element.

4. Specify the options for the new group column in the Group pane:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>Change the name of a group (for example, Group1).</td>
</tr>
<tr>
<td>Available values list</td>
<td>Select the values you want to include in a group. The selected values are</td>
</tr>
<tr>
<td></td>
<td>displayed in the Selections list. Based on your selection, the histogram is</td>
</tr>
<tr>
<td></td>
<td>updated. The height of the horizontal bar is based on the count of a group</td>
</tr>
<tr>
<td></td>
<td>in the data set.</td>
</tr>
<tr>
<td>Name</td>
<td>Change the name of the new group column.</td>
</tr>
<tr>
<td>Selections</td>
<td>Contains all columns selected for this group.</td>
</tr>
<tr>
<td>(+) Group</td>
<td>Add a new group. You can select a group, and click X to delete it.</td>
</tr>
<tr>
<td>Include Others</td>
<td>Group values that haven’t been added to any of the other groups.</td>
</tr>
<tr>
<td>Add all</td>
<td>Add all the values in the available list to a group.</td>
</tr>
<tr>
<td>Remove all</td>
<td>Remove all the selected values from a group.</td>
</tr>
</tbody>
</table>

**Note:**

Based on your changes, the data preview (for example, the group column name) is updated.

5. Click **Save**.

**Add Cumulative Values to a Data Flow**

You can group data by applying the cumulative aggregate functions such as the moving and running aggregate. A moving aggregate aggregates values over a row and a specific number of preceding rows. A running aggregate aggregates values over all the preceding rows. Because both the moving and running aggregates are based on the preceding rows, the sort order of rows is important. You can specify the order as part of the aggregate.

You can add a Cumulative Value step in the Step editor pane.

1. Create or open the data flow in which you want to add a cumulative value column.

2. Click **Add a step (+)**, and select **Cumulative Value**.

3. In the Cumulative Value pane, specify the cumulative aggregate functions for the new column:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregate</td>
<td>Select a data column.</td>
</tr>
<tr>
<td>Function</td>
<td>Select a function. The available types of function are based on the data column. If the column data type is incompatible with the function,</td>
</tr>
<tr>
<td></td>
<td>an error message is displayed.</td>
</tr>
<tr>
<td>Rows</td>
<td>Select the value. You can edit this field only for specific functions. If the value isn’t a positive integer, an error message is displayed.</td>
</tr>
</tbody>
</table>
Add a Time Series Forecast to a Data Flow

You can calculate additional rows with forecasted values by applying a Time Series Forecast calculation.

A forecast takes a time column and a target column from a given data set and calculates forecasted values for the target column and puts the values in a new column. All additional columns are used to create groups. For example, if an additional column “Department” with values “Sales”, “Finance”, and “IT” is present, the forecasted values of the target column are based on the past values of the given group.

Note that multiple columns with diverse values lead to a large number of groups that affect the precision of the forecast. Select only columns that are relevant to the grouping of the forecast.

1. Create or open the data flow in which you want to add a cumulative value column.
2. Click Add a step (+), and select Time Series Forecast.
3. In the Time Series Forecast pane and Output section, specify an output column for the forecasted value. The column is named “forecasted” by default, and you can rename it.
4. In the Time Series Forecast pane and Parameters section, specify the parameters for the forecast calculation:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Select a data column with historical values.</td>
</tr>
</tbody>
</table>
Add a Sentiment Analysis to a Data Flow

You can detect sentiment for a given text column by applying a sentiment analysis to your data flow.

Sentiment analysis evaluates text based on words and phrases that indicate a positive, neutral, or negative emotion. Based on the outcome of the analysis, a new column contains a “Positive”, “Neutral”, or “Negative” String type result.

1. Create or open the data flow in which you want to add a cumulative value column.
2. Click Add a step (+), and select Analyze Sentiment.
3. In the Analyze Sentiment pane and Output section, specify an output column for the emotion result value. The column is named "emotion" by default, and you can rename it.
4. In the Analyze Sentiment pane and Parameters section, specify the value for Text to Analyze.
   Select a text column with natural language content to analyze.
5. Click Save.

Apply Custom Scripts to a Data Flow

You can apply your own custom scripts to a data flow. Based on the parameters and options you’ve defined in the script, specific types of data sets (such as all the input columns, or only the output columns) can be generated.

You can apply a custom script to a data flow:

1. Create or open the data flow in which you want to apply a custom script.
2. Click Add a step (+), and select Apply Script.
3. In the Select Script dialog, select the custom script, and click OK.
4. In the Apply Script pane, select the values in the displayed fields (such as Outputs, Parameters, and Data Elements).
   If you want to select a different script, click the Script name. Based on the custom script, specific fields and options are displayed.
5. Click Save.

Branch Out a Data Flow into Multiple Connections

You can branch a data flow into multiple connections to downstream nodes, which creates multiple outputs from a data flow. For example, you can create a data flow from a sales transactions data set, then branch and save the data into multiple data
sets based on the region of the sales transaction, such as west and east coast regions.

You add a **Branch** step in the Step editor pane.

1. Create or open the data flow that you want to branch into multiple subsets. Alternatively, create a data flow from a data set you want to branch into multiple subsets.

2. In the Add step dialog, click Add a step (+) and select **Branch**. A **Branch** step and two **Save Data** steps are added to the data flow.

3. In the **Branch into** field of the Branch pane, specify the number of connections or outputs that you want to branch.
   - The **Save Data** steps count is directly related to the number in the **Branch into** field.
   - In the **Branch into** field, the minimum number is two and the maximum is five. You can increase the number of connections or outputs only in the **Branch into** field.
   - You can delete a connection or output. In the Add step dialog, click X or right-click the **Save Data** step and select **Delete**.
   - If you've only two **Save Data** steps and you delete one, you see a warning message indicating that the **Branch** step will also be deleted. Click Yes to delete the **Branch** step. Only one **Save Data** step is added in the data flow.
   - You can't add the following steps after a **Branch** step:
     - **Add Data**
     - **Join**
     - **Merge Rows**

4. Click each **Save Data** step and in the Save Data Set pane, specify the properties for saving the data set nodes:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name and Description</td>
<td>Enter the data set name and description to identify your data set.</td>
</tr>
<tr>
<td>Save data to</td>
<td>Specify the location where you want to store the data set, such as Data Set Storage or Database Connection. If you select Database Connection, specify values for the <strong>Connection</strong>, <strong>Table</strong>, and <strong>When Run</strong> options.</td>
</tr>
<tr>
<td>When Run Prompt to specify Data Set</td>
<td>Select the option and specify the following parameters: Name and Prompt.</td>
</tr>
<tr>
<td>Columns</td>
<td>Specify whether to change a column to a measure or attribute as appropriate. For measures, specify the aggregation type (such as Sum, Average, Minimum, Maximum, or Count).</td>
</tr>
</tbody>
</table>

5. Click **Run Data Flow** to run the data flow. If there's no validation error, you see a completion message. Go to the Data page and select Data Sets to see your resulting data sets in the list.
Alternatively, click **Save** or **Save As**. In the Save Data Flow As dialog, enter a **Name** and **Description** to identify your data flow. On the Data page select Data Flows to see your resulting data flow in the list.

## Apply Incremental Processing to a Data Flow

Use incremental processing to determine the last data processed in the data flow and to process only the newly added data.

1. Select a data element column as an incremental identifier for the data set.
   
   You can select an incremental identifier only for those data sets that are sourced through database connections.
   
   a. Go to the Data page and select **Data Sets**.
   
   b. Select a data set and click the **Actions menu** or right-click, then select **Open**.
   
   c. Click **Edit Data Set** on the Results toolbar.
   
   d. Select the data set node in the diagram. From the **New Data Indicator** list, select a column, then click **Save**.

2. Apply incremental processing to the data flow using the data sets for which you’ve selected the incremental identifier.
   
   a. Create or open the data flow in which you want to apply incremental processing.
   
   b. In the Data Flow editor select the data set.
   
   c. In the Step editor pane, select **Add new data only** to mark the data set as incremental.
   
   d. Click **Save**.

   In a data flow with multiple data sets, you can select only one data set as incremental. If you try to select a second data set as incremental, you see a warning message. Click **Yes** to enable incremental processing for the second data set for which you’ve selected **Add new data only**. Incremental processing is deselected for the first data set.

## Customize the Names and Descriptions of Data Flow Steps

You can rename a data flow step and add or edit the description.

1. Create or open a data flow.
2. Click **Add a step (+)**, and select a step.
3. Click the step name (for example, Merge Columns) in the step pane header.
4. Enter a new name or edit the existing name in the **Name** field, and enter a description if required.
5. To save your changes, click **Enter**, or click outside the header fields.

## Schedule a Data Flow

You can schedule data flow jobs and set properties such as date, frequency, and end time. You can view and edit an existing job that’s scheduled for a data flow.
1. Go to the Data page and select Data Flows.
2. Select the data flow that you want to add to a scheduled job.
3. Click the **Actions menu** or right-click, and select **Schedule**.
4. In the Jobs dialog, specify the properties for a data flow job:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List of scheduled jobs</td>
<td>Select the scheduled job from the table that you want to change the properties for.</td>
</tr>
<tr>
<td>Repeat</td>
<td>Select the scheduled job repeat type (such as monthly repeat).</td>
</tr>
<tr>
<td>End</td>
<td>Select the end date of the scheduled job. If you selected <strong>Never</strong> in the <strong>Repeat</strong> field, then this field doesn't display.</td>
</tr>
<tr>
<td>Frequency</td>
<td>Select the frequency of the scheduled job. If you selected <strong>Custom</strong> in the <strong>Repeat</strong> field, then this field is displayed. You can also select the day of the week that you want to run the job.</td>
</tr>
<tr>
<td>(+) Add Job</td>
<td>Create a new scheduled job.</td>
</tr>
<tr>
<td>Add</td>
<td>Save the newly created scheduled job.</td>
</tr>
<tr>
<td>Update</td>
<td>Save the updates to the scheduled job properties.</td>
</tr>
<tr>
<td>Revert</td>
<td>Click to return to the previously saved properties when editing a scheduled job.</td>
</tr>
</tbody>
</table>

**Create an Essbase Cube in a Data Flow**

You can add single input data from a spreadsheet or database into a data flow to create an Essbase cube.

1. Create or open the data flow in which you want to create an Essbase Cube.
2. Click **Add a step (+)**, and select **Create Essbase Cube**.
3. In the Create Essbase Cube pane, specify the values for creating the Essbase Cube:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Essbase Connection</td>
<td>Click <strong>Select Essbase Connection</strong> to select a connection in the Save Data to Database Connection dialog.</td>
</tr>
<tr>
<td>Application Name</td>
<td>Enter a name of the Essbase application.</td>
</tr>
<tr>
<td>Cube Name</td>
<td>Enter a name of the Essbase cube.</td>
</tr>
</tbody>
</table>

4. Click **Save**.
5. Click **Execute Data Flow**. After you run the data flow, check the resulting data set in the Display pane.
6. Go to the Data page and select **Data Flows** to see your data flow in the list. See **About Using Tabular Data to Create Cubes in Using Oracle Analytics Cloud Essbase**.
Execute a Data Flow

Executing a data flow produces a data set that you can use to create visualizations.

To successfully execute a data flow, it must be free of validation errors.

1. Create or open the data flow that you want to execute and produce a data set from.
2. Click Add a step (+) and select Save Data.
3. In the Save data to pane enter the output data set Name and Description to identify your data set.

**Note:**
Don't change the Save data to field.

4. Click Run Data Flow to execute the data flow. If there is no validation error, a completion message is displayed.

**Note:**
When you execute a data flow without saving it, the data flow isn't saved and isn't displayed in the Data Flows list. Therefore, the data flow isn't available for you to modify or run.

Go to the Data page and select Data Sets to see your resulting data set in the list.

5. Click Save or Save As. In the Save Data Flow As dialog enter a Name and Description to identify your data flow.

Go to the Data page and select Data Flows to see your resulting data flow in the list.

Save Output Data from a Data Flow

You can save various information about a data flow. Before running or executing a data flow, you can select to save details such as the storage location to save the output data from the data flow; the parameters to reuse in the data flow; the name and description for identifying the data set; the data type of each column; and the default aggregation of each column.

1. Create or open the data flow that you want to save with specific values.
2. Click Add a step (+) and select Save Data. Or, if you've already saved the data flow, then click the Save Data step.
   - If you want to rename the data flow step, click the step name.
3. In the Save Data Set pane, enter the Name and Description to identify the data set.
4. Click Save data to list and select a location:
• **Data Set Storage:** Specify whether you want to save the data set locally.

• **Database Connection:** Connect to a database and save the output data from a data flow to a table in that database. The data flow is securely stored in the database, and you can take advantage of its managed backup and recovery facility. You can transform the data source by overwriting it with data from the data flow. The data source and data flow tables must be in the same database and have the same name. To successfully save a data flow to a database, it must have no validation errors.

5. If you've selected **Database Connection**, specify the following options:
   a. Click **Select connection** to display the Save Data to Database Connection dialog.
   b. Select a connection for saving the data flow.
      
      You must create a database connection before you can select one. For example, you can save to an Oracle database, Apache Hive database, Hortonworks Hive database, or Map R Hive database. See Create Database Connections.
   c. Enter a name in the **Table** field. The table name must conform to the naming conventions of the selected database. For example, the name of a table in an Oracle database can't begin with numeric characters.
   d. Click the **When run** list and select to replace existing data or add new data to existing data.

6. Select the **When Run Prompt to specify Data Set** option to apply parameters to the data flow and specify its values.

7. In the Columns table, change or select the database name, the attribute or measure, and the aggregation rules for each column in the output data set:

<table>
<thead>
<tr>
<th>Column name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Treat As</td>
<td>Select how each output column is treated, as an attribute or measure.</td>
</tr>
<tr>
<td>Default Aggregation</td>
<td>Select the aggregation rules for each output column (such as Sum, Average, Minimum, Maximum, Count, or Count Distinct). You can select the aggregation rules if a specific column is treated as a measure in the output data set.</td>
</tr>
<tr>
<td>Database Name</td>
<td>Change the database name of the output columns. You can change the column name if you're saving the output data from a data flow to a database.</td>
</tr>
</tbody>
</table>

8. Click **Save** or **Save As**. In the Save Data Flow As dialog, enter a **Name** and **Description** to identify the data flow.
   a. Go to the Data page and select Data Flows to see your resulting data flow in the list.
   b. If you don’t save the data flow and try to navigate to another page, a Save Changes dialog is displayed that prompts you to save the changes to the data flow.

9. Click **Run Data Flow** to execute the data flow. If there’s no error, you see a completion message and the output data is saved to the data set storage or to the selected database using the table name that you specified.
   a. If you’ve selected data set storage, go to the Data page and select Data Sets to see your output data set in the list.
– Click Actions menu or right-click and select Inspect, to open the data set dialog.

– In the data set dialog, click Data Elements and check the Treat As and Aggregation rules that you’ve selected for each column in the Save Data step.

  • If you select a database to save the output data, go to the table in that database and inspect the output data.

  • If you select a table in the database with the same name, the data in the table is overwritten when you save to the database.

### Run a Saved Data Flow

You can run a saved data flow to create a corresponding data set or to refresh the data in the data set created from the data flow.

You run the data flow manually to create or refresh the corresponding data set. For an existing data set, run the data flow if you know that the columns and data from the data set that was used to build the data flow have changed.

1. In the Data page, go to the Data Flows section, and locate the data flow that you want to run.

2. Click the data flow’s Actions menu and select Run.

**Notes about running data flows:**

• To run a saved data flow, you must specify a Save Data step as its final step. To add this step to the data flow, click the data flow’s Actions menu and select Open. After you've added the step, save the data flow and try to run it again.

• When creating a new database data source, set the database’s query mode to Live. Setting the query mode to Live allows the data flow to access data from the database (versus the data cache) and pushes any expensive operations such as joins to the database. See Manage Data Sets.

• When you update a data flow that uses data from a database source, the data is either cached or live depending on the query mode of the source database.

• Complex data flows take longer to run. While the data flow is running, you can go to and use other parts of the application, and then come back to the Data Flows pane to check the status of the data flow.

• You can cancel a long-running data flow. To do so, go to the Data Flows section, click the data flow’s Action menu and select Cancel.

• If it’s the first time you’ve run the data flow, then a new data set is created and you can find it in the Data Sets section of the Data page. The data set contains the name that you specify on the data flow's Save Data step. If you've run the data flow before, then the resulting data source already exists and its data is refreshed.

### Apply Parameters to a Data Flow

In a data flow, you can add parameters so you can reuse the data flow with a different source data set or use different criteria to process and select data. Parameters help you identify the type of data appropriate for the data flow and if you want to select an
alternative data set when running or scheduling the data flow. You can also apply parameters to modify default values when creating an Essbase Cube.

For example, using a parameter you can:

- Process a new data set that has the same format as the default input data set.
- Process and store different aspects of a large data set based on date range, individual departments, or regions into alternative target data sets.

You can apply parameters for the following steps:

- Add Data
- Save Data
- Create Essbase Cube

In the Step editor pane, specify the values for the parameters:

<table>
<thead>
<tr>
<th>Step Name</th>
<th>Parameter Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Data</td>
<td>1. Select the When Run Prompt to select Data Set option.</td>
</tr>
<tr>
<td></td>
<td>2. Provide the Name and Prompt values for the parameter.</td>
</tr>
<tr>
<td>Save Data</td>
<td>1. Select the When Run Prompt to specify Data Set option.</td>
</tr>
<tr>
<td></td>
<td>2. Provide the Name and Prompt values for the parameter.</td>
</tr>
<tr>
<td>Create Essbase Cube</td>
<td>1. Select the When Run Prompt to specify Data Set option.</td>
</tr>
<tr>
<td></td>
<td>2. Provide the Cube name, Application name, and Prompt value for the parameter.</td>
</tr>
</tbody>
</table>

Modify Parameter Prompts when You Run or Schedule a Data Flow

Parameter prompts are displayed before the job runs, when you run or schedule a data flow with parameter prompts. Prompts allow you to review the default values or settings and to select or define an alternate value or setting.

Run a Data Flow

1. Go to the Data page and click Data Flows to select the data flow with parameter prompts that you want to run.
2. Click the data flow’s Actions menu or right-click and select Run.
3. In the Data Flow Prompt dialog, either use the default values or define alternate values.
   - In the Sources section, click the default Target - existing data set name, then select a new source data set in the Add Data Set dialog. Click Add.
   - In the Targets section, do one of the following
     - Change the default Target - existing data set name.
     - For a data flow with Create Essbase Cube step, change the default Target - Application and Target - Cube names.
4. Click OK.
Schedule a Data Flow

1. Go to the Data page and click Data Flows to select the data flow with parameter prompts that you want to add to a scheduled job.

2. Click the data flow's Actions menu or right-click and select Schedule.

3. In the Parameters section of the Jobs dialog, either use the default values or define alternate values for a data flow job.
   - In the Sources section, click the default Target - existing data set name, then select a new source data set in the Add Data Set dialog. Click Add.
   - In the Targets section, do one of the following:
     - Change the default Target - existing data set name.
     - For a data flow with Create Essbase Cube step, change the default Target - Application and Target - Cube names.
Import and Share

You can import and export projects to share them with other users. You can also share a file of a visualization, canvas, or story that can be used by other users.

Topics:
- Typical Workflow to Import and Share Artifacts
- Import and Share Projects or Folders
- Share Visualizations, Canvases, or Stories

Typical Workflow to Import and Share Artifacts

Here are the common tasks for sharing and importing folders, projects, visualizations, canvases, and stories with other users.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import projects and folders</td>
<td>Import projects and folders as applications.</td>
<td>Import an Application or Project</td>
</tr>
<tr>
<td>Share a folder, project, visualization,</td>
<td>Share a project or folder as an application with users.</td>
<td>Share a Project or Folder as an Application</td>
</tr>
<tr>
<td>canvas, or story</td>
<td>You can also share your project's visualizations, canvases, or stories as a</td>
<td>Share a File of a Visualization, Canvas, or Story</td>
</tr>
<tr>
<td></td>
<td>file.</td>
<td></td>
</tr>
<tr>
<td>Email a folder, project, visualization,</td>
<td>Export data visualization artifacts using email.</td>
<td>Email Projects and Folders</td>
</tr>
<tr>
<td>canvas, or story</td>
<td></td>
<td>Email a File of a Visualization, Canvas, or Story</td>
</tr>
<tr>
<td>Share artifacts with Oracle Analytics</td>
<td>Share data visualization artifacts with other Oracle Analytics Cloud users.</td>
<td>Share a Project or Folder on Oracle Analytics Cloud</td>
</tr>
<tr>
<td>Cloud</td>
<td></td>
<td>Share a File of a Visualization, Canvas, or Story, on OAC</td>
</tr>
</tbody>
</table>

Import and Share Projects or Folders

You can import projects and applications from other users and sources, and export projects to make them available to other users.

Topics:
- Import an Application or Project
- Share a Project or Folder as an Application
- Email Projects and Folders
- Share a Project or Folder on Oracle Analytics Cloud
Import an Application or Project

You can import an application or project created and exported by another user, or you can import an application from an external source such as Oracle Fusion Applications.

The import includes everything that you need to use the application or project such as associated data sets, connection string, connection credentials, and stored data.

1. On the Home page, click Projects.
2. On the Projects page click Page Menu, then select Import Project.
3. In the Import dialog, click Select File or drag a project or application file onto the dialog, then click Import.
4. If an object with the same name already exists in your system, then choose to replace the existing object or cancel the import.

Share a Project or Folder as an Application

You can share a project to export it as an application that can be imported and used by other users.

The export produces a .DVA file that includes the items that you specify (such as associated data sets, the connection string and credentials, and stored data).

1. On the Home page, click Projects.
2. On the Projects page select the project or folder that you want to share and click Action Menu, then select Export to open the Export dialog.

3. Click File, then specify the options for sharing the project or folder:
   - Specify the file name.
   - Move the slider to enable the Include Data option to include the data when sharing a project or folder.
   - Move the slider to enable the Connection Credentials option, if you want to include the user name and password of the data source connection with the exported project.

Note:

If you select an empty folder that doesn’t contain a project, you see a notification.
For a project or folder with an Excel, CSV, or TXT data source - Because an Excel, CSV, or TXT data source doesn't use a data connection, clear the Include Connection Credentials option.

For a project or folder with a database data source - If you enable the Connection Credentials option, then the user must provide a valid user name and password to load data into the imported project.

For a project with an Oracle Applications or Oracle Essbase data source - Selecting the Connection Credentials option works if on the connection setup’s Create Connection dialog you specified the Always use this name and password option in the Authentication field.

If you clear the Connection Credentials option or specify the Require users to enter their own username and password option in the Authentication field, then the user must provide a valid user name and password to load data into the imported project.

4. If you selected the Include Data option or the Connection Credentials option, then enter and confirm a password that the user must provide to import the project or folder and decrypt its connection credentials and data.

5. Click Save.

Email Projects and Folders

You can email the .DVA file of a project or folder to enable other users to work with it.

When you start to email the project or folder, you initiate an export process that produces a .DVA file that includes everything that you need to use the project or folder (such as associated data sets, the connection string and credentials, and stored data)

1. On the Home page, click Projects.

2. On the Projects page select the project or folder that you want to share and click Action Menu, then select Export to open the Export dialog.

3. Click Email to open the Email dialog.

4. Move the slider to enable the Include Data option, if you’re sharing a project or folder that uses an Excel data source and you want to include the data with the export.

5. Move the slider to enable the Connection Credentials option, if retrieving the data requires connection credentials. Then enter and confirm the password.
6. If your project or folder includes data from an Oracle Applications or a database data source and the Include Data option is enabled, then you must enter a password that's sent to the database for authentication when the user opens the application and accesses the data. Disable the Include Data option if you don't want to include the password with the project or folder. If you clear this option, then users must enter the password when opening the application to access the data.

7. Click Email.

Your email client opens a new partially composed email with the .DVA file attached.

Note:
When you select the Email option, you don't obtain a file that you can save.

Share a Project or Folder on Oracle Analytics Cloud

You can choose to use Oracle Analytics Cloud to share one or more of your project or folder.

1. On the Home page, click Projects.

2. On the Projects page select the project or folder that you want to share and click Actions menu, then select Export to open the Export dialog.

Note:
If you select an empty folder that doesn't contain a project, you see a notification.

3. Click Cloud, then specify and select the options for sharing the project or folder:
   - Enter the file name and Oracle Analytics Cloud URL such as https://cloud.oracle.com/.
   - Enter your Oracle Analytics Cloud user account credentials.
   - Click the Include Data option to include the data with the project or folder.
   - Click the Connection Credentials option if you want to include the data source connection's user name and password.

4. Click Publish.

The project or folder is shared to the Oracle Analytics Cloud user account you specify and is displayed in Oracle Analytics Cloud with other projects and folders.
Share Visualizations, Canvases, or Stories

You can share visualizations, canvases, or stories to make them available to other users.

Topics:

• Share a File of a Visualization, Canvas, or Story
• Email a File of a Visualization, Canvas, or Story
• Print a Visualization, Canvas, or Story
• Write Visualization Data to a CSV or TXT File
• Share a File of a Visualization, Canvas, or Story on Oracle Analytics Cloud

Share a File of a Visualization, Canvas, or Story

You can share one or more of your project's visualizations, canvases, or stories as a file.

1. Create or open a Data Visualization project.
2. Click the Share icon on the project toolbar, then click File to open the File dialog.
3. In the File dialog, specify and select the options based on the selected format of the file.
   • Powerpoint (pptx), Acrobat (pdf), and Image (png): Specify the file name, and paper size and orientation. Based on the pane, do one of the following:
     – Visualize - Select either to include the active canvas or visualization, or all canvases.
     – Narrate - Select either to include the active page or visualization, or all story pages.
   • Data (csv) - Specify the file name.
   • Package (dva) - Specify the file name. Move the slider to select the Include Data and Connection Credentials options. If you select the Include Data and Connection Credentials options, enter a password to retrieve the packaged data.

   Note:
   You can only select Package (dva) as the file format for sharing a project.

4. Click Save.
5. In Save As dialog, change the file name if you want, making sure to including the file extension, and browse to the location where you want to save the file. Click Save.

Stop Sharing Links
User ProfileShared Links
Email a File of a Visualization, Canvas, or Story

You can choose to email one or more of your project's visualizations, canvases, or stories as a file. You can also email a project as a file.

1. Create or open a Data Visualization project.

2. Click the Share icon on the project toolbar, then click Email to open the Email dialog.

3. In the Email dialog, specify and select the options based on the selected file format that you want to send as an email attachment.
   - **Powerpoint (pptx), Acrobat (pdf), and Image (png):** Specify the file name and paper size and orientation. Based on the pane, do one of the following:
     - **Visualize** - Select either to include the active canvas or visualization, or all canvases.
     - **Narrate** - Select either to include the active page or visualization, or all story pages.
   - **Data (csv):** Specify the file name.
   - **Package (dva):** Specify the file name. Move the slider to select the Include Data and Connection Credentials options. If you select the Include Data and Connection Credentials option, enter a password to retrieve the packaged data.

4. Click Email.

Your email client opens a new partially composed email with the export file attached.

**Note:**
You can only select Package (dva) as the file format for sharing a project.

**Note:**
When you select the Email option, you don't obtain a file that you can save.

Print a Visualization, Canvas, or Story

You can print one or more of your project's visualizations, canvases, or stories.

1. Create or open a Data Visualization project.

2. Click the Share icon on the project toolbar, then click Print to open the Print dialog.

3. In the Print dialog, specify the file name, and paper size and orientation. You also have to select either to include all the open visualization or canvas, or only the active visualization or canvas in the file.
4. Click **Print**. The browser’s print dialog is displayed.

5. Specify other printing preferences such as which printer to use and how many copies to print and click **Print**.

**Write Visualization Data to a CSV or TXT File**

You can write the data from a visualization to a CSV or TXT file. This lets you open and update the visualization data in a compatible application such as Excel.

1. Locate the visualization with data that you want to write to the CSV or TXT format, and click **Share** on the visualization toolbar, and then select **File**, select the Format (for example .CSV) and click **Save**.

   The Save As dialog is displayed.

2. Name the file and browse to the location where you want to save the file. Change the file extension to .txt, if needed. Click **Save**.

**Share a File of a Visualization, Canvas, or Story on Oracle Analytics Cloud**

You can share the visualizations, canvases, and stories that you've created in a project in Data Visualization Desktop with a user of Oracle Analytics Cloud.

1. Create or open a data visualization project.

2. Click the **Share** icon on the project toolbar, then click **Cloud** to open the Oracle Analytics Cloud dialog.

3. In the Oracle Analytics Cloud dialog, specify and select the options.

   • Enter the file name and Oracle Analytics Cloud URL such as https://cloud.oracle.com/.
   
   • Enter your Oracle Analytics Cloud user account credentials.
   
   • Click the **Include Data** option to include the data with the visualizations, canvases, or stories.
   
   • Click the **Connection Credentials** option if you want to include the data source connection’s user name and password.

4. Click **Publish**.

   The project is shared to the Oracle Analytics Cloud user account you specify and is displayed in Oracle Analytics Cloud with other projects.
Frequently Asked Questions

This reference provides answers to frequently asked questions for Oracle Data Visualization Desktop.

Topics:
- FAQs to Install Data Visualization Desktop
- FAQs for Data Visualization Projects and Data Sources

FAQs to Install Data Visualization Desktop

This topic contains common questions about installing Data Visualization Desktop and installing Oracle DVML.

Topics:
- How do I install Machine Learning and Advanced Analytics for Data Visualization Desktop?
- Why can’t I install Data Visualization Desktop on my computer?
- How can I get the most current version of Data Visualization Desktop?

How do I install Machine Learning and Advanced Analytics for Data Visualization Desktop?

Machine learning and advanced analytics are optional components and not automatically installed with Data Visualization. If you want to use the Diagnostics Analytics (Explain), Machine Learning Studio, or advanced analytics functionality, then you must install machine learning.

Follow these steps to install the required version of machine learning on Windows.

1. Click **Install DVML** from the Data Visualization Desktop Windows Start menu. This installation enables machine learning and advanced analytics for the corresponding Data Visualization Desktop installation.

2. Click **Yes** when you see the following message: *Do you want to allow the following program to make changes to this computer?*

   A terminal window is displayed showing the progress of the installation.

3. The installer starts automatically on completion of the download. Follow the displayed instructions to install machine learning to the selected install path.

4. Click **Finish** to close the installer.

5. Click any key when you see the message: *Press any key to continue to closes the terminal window.*
6. If Data Visualization Desktop was running during machine learning installation, then you must restart Data Visualization Desktop before you can use the machine learning functionality.

Follow these steps to install the required version of the Machine Learning Framework on Apple Mac.

1. Double-click the application `Oracle Data Visualization Desktop Configure Python` in Finder under Applications or in Launchpad.

   A terminal window indicates the download progress of the installer.

2. The installer starts automatically on completion of the download. Follow the displayed instructions to install machine learning to the selected install path.
   - To run the installation, you must enter the user name and password for an administrator.
   - Review the license terms and agree.

3. Click Close, when the installation is completed.

   The Machine Learning Framework is installed in `/Library/Frameworks/DVMLruntime.framework`

4. If Data Visualization Desktop was running during machine learning installation, then you must restart Data Visualization Desktop before you can use the machine learning and advanced analytics functionality.

Why can't I install Data Visualization Desktop on my computer?

To successfully install Data Visualization Desktop on your computer, you must have administrator privileges. If you try to install Data Visualization Desktop without administrator privileges, the following error message is displayed: `Error in creating registry key. Permission denied`.

To check to see if you've the required administrator privileges, go to Windows Control Panel and check your user accounts. If you don't have administrator privileges, then see your company's technical support person to help you set up the needed privileges.

How can I get the most current version of Data Visualization Desktop?

If you open Data Visualization Desktop when a newer version is available, a message is displayed, telling you to go to Oracle Technology Network to download the latest version of the Data Visualization Desktop installer.

You can find the current version of the installer on Oracle Technology Network. See Oracle Data Visualization Desktop Installation Download.

FAQs for Data Visualization Projects and Data Sources

This topic identifies and explains common questions about Data Visualization projects and data sources.

Topics

- What data sources are supported?
- What if I'm using a Teradata version different than the one supported by Data Visualization?
What data sources are supported?

You can include data only from specific types and versions of sources. See Supported Data Sources.

What if I’m using a Teradata version different than the one supported by Data Visualization?

If you’re working with a Teradata version different than the one supported by Data Visualization, then you’ve to update the extdriver.paths configuration file before you can successfully build a connection to Teradata. This configuration file is located here: C:\<your directory>\AppData\Local\DVDesktop\extdriver.paths. For example, C:\Users\jsmith\AppData\Local\DVDesktop\extdriver.paths.

When updating the extdriver.paths configuration file, remove the default Teradata version number and replace it with the Teradata version number that you’re using. Make sure that you include \bin in the path. For example if you’re using Teradata 14.10, change C:\Program Files\Teradata\Client\15.10\bin to C:\Program Files\Teradata\Client\14.10\bin.
Troubleshoot

This topic provides troubleshooting tips for Data Visualization Desktop.

Topics

• When I import a project, I get an error stating that the project, data source, or connection already exists
• When I try to build a connection to Teradata, I get an error and the connection is not saved
• I have issues when I try to refresh data for file-based data sources
• I can't refresh data from a MongoDB data source
• Oracle Support needs a file to help me diagnose a technical issue
• I need to find more information about a specific issue

Troubleshoot Data Visualization Issues

This topic describes common problems that you might encounter when working with Data Visualization and explains how to solve them.

When I import a project, I get an error stating that the project, data source, or connection already exists

When you’re trying to import a project, you might receive the following error message:

“There is already a project, data source or connection with the same name as something you’re trying to import. Do you want to continue the import and replace the existing content?”

This error message is displayed because one or more of the components exported with the project is already on your system. When a project is exported, the outputted .DVA file includes the project’s associated data sources and connection string. To resolve this error, you can either click OK to replace the components on your system, or you can click Cancel and go into your system and manually delete the components.

This error message is also displayed when the project you’re trying to import contains no data. When you export a project without data, the project’s and data sources’ metadata are included in the .DVA. To resolve this issue, you can click OK to replace the components on your system, or you can click Cancel and go into your system and manually delete the data source or connection that’s causing the error.

When I try to build a connection to Teradata, I get an error and the connection is not saved

When you’re trying to create a connection to Teradata, you might receive the following error message:
“Failed to save the connection. Cannot create a connection since there are some errors. Please fix them and try again.”

This error message is displayed because the version of Teradata that you’re using is different from the version supported by Data Visualization. To resolve this issue, update the extdriver.paths configuration file. This configuration file is located here: C: \<your directory>\AppData\Local\DVDesktop\extdriver.paths. For example, C:\Users\jsmith\AppData\Local\DVDesktop\extdriver.paths.

To update the extdriver.paths configuration file, remove the default Teradata version number and replace it with the Teradata version number that you're using. Make sure that you include \bin in the path. For example if you're using Teradata 14.10, then change C:\Program Files\Teradata\Client\15.10\bin to C:\Program Files\Teradata\Client\14.10\bin. See What if I'm using a Teradata version different that the one supported by Data Visualization?

I have issues when I try to refresh data for file-based data sources

Keep in mind the following requirements when you refresh data for Microsoft Excel, CSV, or TXT data sources:

- To refresh an Excel file, ensure that the newer spreadsheet file contains a sheet with the same name as the original file you uploaded. If a sheet is missing, then you must fix the file to match the sheets in the original uploaded file.
- If the Excel, CSV, or TXT file that you reload is missing some columns, then you'll get an error stating that your data reload has failed. If this happens, then you must fix the file to match the columns in the original uploaded file.
- If the Excel, CSV, or TXT file you used to create the data source was moved or deleted, then the connection path is crossed out in the Data Source dialog. You can reconnect the data source to its original source file, or connect it to a replacement file, by right-clicking the data source in the Display pane and in the Options menu select Reload Data. You can then browse for and select the file to load.
- If you reloaded an Excel, CSV, or TXT file with new columns, then the new columns are marked as hidden and don’t display in the Data Elements pane for existing projects using the data set. To unhide these columns, click the Hidden option.

Data Visualization requires that Excel spreadsheets have a specific structure. See About Adding a Spreadsheet as a Data Set.

I can’t refresh data from a MongoDB data source

The first time Data Visualization connects to MongoDB, the MongoDB driver creates a cache file. If the MongoDB schema was renamed and you try to reload a MongoDB data source or use the data source in a project, then you might get an error or Data Visualization doesn’t respond.

To correct this error, you need to clear the MongoDB cache. To clear the cache, delete the contents of the following directory: C: \<your directory>\AppData\Local\Progress\DataDirect\MongoDB_Schema. For example, C:\Users\jsmith\AppData\Local\Progress\DataDirect\MongoDB_Schema
Oracle Support needs a file to help me diagnose a technical issue

If you’re working with the Oracle Support team to resolve a specific issue, they may ask you to generate a diagnostic dump file. To generate this file, do the following:

1. Open the command prompt and change the directory to the Data Visualization Desktop installation directory (for example, C:\Program Files\Oracle Data Visualization).
2. Type diagnostic_dump.cmd and then provide a name for the .zip output file (for example, output.zip).
3. Press Enter to execute the command.

You can find the diagnostic output file in your Data Visualization Desktop installation directory.

I need to find more information about a specific issue

The community forum is another great resource that you can use to find out more information about the problem you’re having.

You can find the forum here: Oracle Community Forum.
Accessibility Features and Tips for Data Visualization Desktop

This topic describes accessibility features and information for Data Visualization Desktop.

Topics:
- Start Data Visualization Desktop with Accessibility Features Enabled
- Keyboard Shortcuts for Data Visualization

Start Data Visualization Desktop with Accessibility Features Enabled

You can enable features that make the interface for Data Visualization Desktop more accessible by improving navigation. To enable these features, you must start Data Visualization Desktop from the command line. Open a command window and enter the following:

On Windows:

dvdesktop.exe -sdk

On Mac:

open /Applications/dvdesktop.app --args -sdk

When you run the command, you see Data Visualization Desktop open in a web browser.

Keyboard Shortcuts for Data Visualization

You can use keyboard shortcuts to navigate and to perform actions.

Use these keyboard shortcuts for working with a project in the Visualize Canvas.

<table>
<thead>
<tr>
<th>Task</th>
<th>Keyboard Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save a project with the changes.</td>
<td>Ctrl + S</td>
</tr>
<tr>
<td>Copy the selected items to the clipboard.</td>
<td>Ctrl + C</td>
</tr>
<tr>
<td>Save a newly created project with a specific name.</td>
<td>Ctrl + Shift + S</td>
</tr>
<tr>
<td>Add insights to a project.</td>
<td>Ctrl + I</td>
</tr>
<tr>
<td>Add data columns to a project.</td>
<td>Shift + F10</td>
</tr>
<tr>
<td>Undo the last change.</td>
<td>Ctrl + Z</td>
</tr>
<tr>
<td>Reverse the last undo.</td>
<td>Ctrl + Y</td>
</tr>
</tbody>
</table>
Use these keyboard shortcuts while working on a visualization in the Visualize canvas.

<table>
<thead>
<tr>
<th>Task</th>
<th>Keyboard Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy a visualization to paste it to another canvas.</td>
<td>Ctrl + C</td>
</tr>
<tr>
<td>Paste the visualization in a canvas.</td>
<td>Ctrl + V</td>
</tr>
<tr>
<td>Duplicate a visualization.</td>
<td>Ctrl + D</td>
</tr>
<tr>
<td>Delete a visualization.</td>
<td>Delete key</td>
</tr>
</tbody>
</table>

Use these keyboard shortcuts while working with a filter in the filter panel on the filter bar.

<table>
<thead>
<tr>
<th>Task</th>
<th>Keyboard Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search items in a filter.</td>
<td>Enter key</td>
</tr>
<tr>
<td>Add the search string to the selection list.</td>
<td>Ctrl + Enter</td>
</tr>
</tbody>
</table>

Use these keyboard shortcuts when you want to open, create, or edit artifacts such as data sets, projects, data flows, and sequences in a new tab or window.

<table>
<thead>
<tr>
<th>Task</th>
<th>Keyboard Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open an artifact in a new browser tab.</td>
<td>Ctrl + Click the artifact</td>
</tr>
<tr>
<td>Open an artifact in a new browser window.</td>
<td>Shift + Click the artifact</td>
</tr>
</tbody>
</table>
Data Sources and Data Types Reference

Find out about supported data sources, databases, and data types.

Topics
• Supported Data Sources

**Oracle Applications Connector Support**

Oracle Applications Connector supports several Oracle SaaS Applications. You can also use Oracle Applications Connector to connect to your on-premises Oracle BI.
Enterprise Edition deployments (if patched to an appropriate level) and another Oracle Analytics Cloud service.

Oracle SaaS applications you can connect to:
- Oracle Sales Cloud
- Oracle Financials Cloud
- Oracle Human Capital Management Cloud
- Oracle Supply Chain Cloud
- Oracle Procurement Cloud
- Oracle Project Cloud
- Oracle Loyalty Cloud

Data Visualization Supported and Unsupported Data Types

Read about the data types that Data Visualization supports and doesn't support.

Topics:
- Unsupported Data Types
- Supported Base Data Types
- Supported Data Types by Database

Unsupported Data Types

Some data types aren't supported. You'll see an error message if the data source contains data types that Data Visualization doesn't support.

Supported Base Data Types

When reading from a data source, Data Visualization attempts to map incoming data types to the supported data types.

For example, a database column that contains only date values is formatted as a DATE, a spreadsheet column that contains a mix of numerical and string values is formatted as a VARCHAR, and a data column that contains numerical data with fractional values uses DOUBLE or FLOAT.

In some cases Data Visualization can't convert a source data type. To work around this data type issue, you can manually convert a data column to a supported type by entering SQL commands. In other cases, Data Visualization can't represent binary and complex data types such as BLOB, JSON, and XML.

Data Visualization supports the following base data types:
- **Number Types** — SMALLINT, SMALLUNIT, TINYINT, TINYUNIT, UINT, BIT, FLOAT, INT, NUMERIC, DOUBLE
- **Date Types** — DATE, DATETIME, TIMESTAMP, TIME
- **String Types** — LONGVARCHAR, CHAR, VARCHAR
## Supported Data Types by Database

Data Visualization supports the following data types.

<table>
<thead>
<tr>
<th>Database Type</th>
<th>Supported Data Types</th>
</tr>
</thead>
</table>
| Oracle        | BINARY DOUBLE, BINARY FLOAT  
               | CHAR, NCHAR          
               | CLOB, NCLOB          
               | DATE                
               | FLOAT               
               | NUMBER, NUMBER (p,s),  
               | NVARCHAR2, VARCHAR2  
               | ROWID               
               | TIMESTAMP,  
               | TIMESTAMP WITH LOCAL TIMEZONE,  
               | TIMESTAMP WITH TIMEZONE  |
| DB2           | BIGINT               
               | CHAR, CLOB          
               | DATE, DECFLOAT, DECIMAL, DOUBLE 
               | FLOAT

Data Preparation Reference

This topic describes the set and types of recommendation you can use to perform data transform changes to a data set.

Topics:
- Transform Recommendation Options

Transform Recommendation Options

You can use the following data transform options in the project’s Prepare canvas.

<table>
<thead>
<tr>
<th>Transformation Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit</td>
<td>Edits the current column, you can reformat a source column without creating a second column and by hiding the original column.</td>
</tr>
<tr>
<td>Hide</td>
<td>Hides the column in the Data Elements pane and in the visualizations. If you want to see the hidden columns, click <strong>Hidden columns</strong> (ghost icon) on the page footer. You can then unhide individual columns or unhide all the hidden columns at the same time.</td>
</tr>
<tr>
<td>Group, Conditional Group</td>
<td>Select <strong>Group</strong> to create your own custom groups. For example, you can group States together with custom regions, and you can categorize dollar amounts into groups indicating small, medium, and large.</td>
</tr>
<tr>
<td>Split</td>
<td>Splits a specific column value into parts. For example, you can split a column called, Name, into first and last name.</td>
</tr>
<tr>
<td>Uppercase</td>
<td>Updates the contents of a column with the values in all uppercase letters.</td>
</tr>
<tr>
<td>Lowercase</td>
<td>Updates the contents of a column with the values all in lowercase letters.</td>
</tr>
<tr>
<td>Sentence Case</td>
<td>Updates the contents of a column to make the first letter of the first word of a sentence uppercase.</td>
</tr>
<tr>
<td>Rename</td>
<td>Allows you to change the name of any column.</td>
</tr>
<tr>
<td>Duplicate</td>
<td>Creates a column with identical content of the selected column.</td>
</tr>
<tr>
<td>Convert to Text</td>
<td>Changes the data type of a column to text.</td>
</tr>
<tr>
<td>Replace</td>
<td>Changes specific text in the selected column to any value that you specify. For example, you can change all instances of <strong>Mister</strong> to <strong>Mr.</strong> in the column.</td>
</tr>
<tr>
<td>Create</td>
<td>Creates a column based on a function.</td>
</tr>
<tr>
<td>Convert to Number</td>
<td>Changes the data type of the column to number, which deletes any values that aren’t numbers from the column.</td>
</tr>
<tr>
<td>Convert to Date</td>
<td>Changes the data type of the column to date and deletes any values that aren’t dates from the column.</td>
</tr>
<tr>
<td>Bin</td>
<td>Creates your own custom groups for number ranges. For example, you can create bins for an Age column with age ranges binned into Pre-Teen, Young Adult, Adult, or Senior based on custom requirements.</td>
</tr>
<tr>
<td>Log</td>
<td>Calculates the natural logarithm of an expression.</td>
</tr>
<tr>
<td>Power</td>
<td>Raises the values of a column to the power that you specify. The default power is 2.</td>
</tr>
<tr>
<td>Transformation Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Square Root</td>
<td>Creates a column populated with the square root of the value in the column selected.</td>
</tr>
</tbody>
</table>
Expression Editor Reference

This topic describes the expression elements that you can use in the Expression Editor.

Topics:

• SQL Operators
• Conditional Expressions
• Functions
• Constants
• Types

SQL Operators

SQL operators are used to specify comparisons between expressions.

You can use various types of SQL operators.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BETWEEN</td>
<td>Determines if a value is between two non-inclusive bounds. For example: &quot;COSTS&quot;.&quot;UNIT_COST&quot; BETWEEN 100.0 AND 5000.0 BETWEEN can be preceded with NOT to negate the condition.</td>
</tr>
<tr>
<td>IN</td>
<td>Determines if a value is present in a set of values. For example: &quot;COSTS&quot;.&quot;UNIT_COST&quot; IN(200, 600, 'A')</td>
</tr>
<tr>
<td>IS NULL</td>
<td>Determines if a value is null. For example: &quot;PRODUCTS&quot;.&quot;PROD_NAME&quot; IS NULL</td>
</tr>
<tr>
<td>LIKE</td>
<td>Determines if a value matches all or part of a string. Often used with wildcard characters to indicate any character string match of zero or more characters (%) or any single character match (_). For example: &quot;PRODUCTS&quot;.&quot;PROD_NAME&quot; LIKE 'prod'</td>
</tr>
</tbody>
</table>

Conditional Expressions

You use conditional expressions to create expressions that convert values.

The conditional expressions described in this section are building blocks for creating expressions that convert a value from one form to another.
Note:

- In **CASE** statements, **AND** has precedence over **OR**
- Strings must be in single quotes

<table>
<thead>
<tr>
<th>Expression</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CASE (If)</strong></td>
<td>CASE WHEN score-par &lt; 0 THEN 'Under Par'  WHEN score-par = 0 THEN 'Par'  WHEN score-par = 1 THEN 'Bogey'  WHEN score-par = 2 THEN 'Double Bogey'  ELSE 'Triple Bogey or Worse'  END</td>
<td>Evaluates each <strong>WHEN</strong> condition and if satisfied, assigns the value in the corresponding <strong>THEN</strong> expression. If none of the <strong>WHEN</strong> conditions are satisfied, it assigns the default value specified in the <strong>ELSE</strong> expression. If no <strong>ELSE</strong> expression is specified, the system automatically adds an <strong>ELSE NULL</strong>.</td>
</tr>
<tr>
<td><strong>CASE (Switch)</strong></td>
<td>CASE Score-par  WHEN -5 THEN 'Birdie on Par 6'  WHEN -4 THEN 'Must be Tiger'  WHEN -3 THEN 'Three under par'  WHEN -2 THEN 'Two under par'  WHEN -1 THEN 'Birdie'  WHEN 0 THEN 'Par'  WHEN 1 THEN 'Bogey'  WHEN 2 THEN 'Double Bogey'  ELSE 'Triple Bogey or Worse'  END</td>
<td>Also referred to as <strong>CASE (Lookup)</strong>. The value of the first expression is examined, then the <strong>WHEN</strong> expressions. If the first expression matches any <strong>WHEN</strong> expression, it assigns the value in the corresponding <strong>THEN</strong> expression. If none of the <strong>WHEN</strong> expressions match, it assigns the default value specified in the <strong>ELSE</strong> expression. If no <strong>ELSE</strong> expression is specified, the system automatically adds an <strong>ELSE NULL</strong>. If the first expression matches an expression in multiple <strong>WHEN</strong> clauses, only the expression following the first match is assigned.</td>
</tr>
</tbody>
</table>

Functions

There are various types of functions that you can use in expressions.

Topics:

- Aggregate Functions
- Analytics Functions
- Calendar Functions
- Conversion Functions
- Display Functions
- Mathematical Functions
- String Functions
- System Functions
- Time Series Functions
## Aggregate Functions

Aggregate functions perform operations on multiple values to create summary results.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avg</td>
<td>Avg(Sales)</td>
<td>Calculates the average (mean) of a numeric set of values.</td>
</tr>
<tr>
<td>Bin</td>
<td>Bin(UnitPrice BY ProductName)</td>
<td>Selects any numeric attribute from a dimension, fact table, or measure containing data values and places them into a discrete number of bins. This function is treated like a new dimension attribute for purposes such as aggregation, filtering, and drilling.</td>
</tr>
<tr>
<td>Count</td>
<td>Count(Products)</td>
<td>Determines the number of items with a non-null value.</td>
</tr>
<tr>
<td>First</td>
<td>First(Sales)</td>
<td>Selects the first non-null returned value of the expression argument. The First function operates at the most detailed level specified in your explicitly defined dimension.</td>
</tr>
<tr>
<td>Last</td>
<td>Last(Sales)</td>
<td>Selects the last non-null returned value of the expression.</td>
</tr>
<tr>
<td>Max</td>
<td>Max(Revenue)</td>
<td>Calculates the maximum value (highest numeric value) of the rows satisfying the numeric expression argument.</td>
</tr>
<tr>
<td>Median</td>
<td>Median(Sales)</td>
<td>Calculates the median (middle) value of the rows satisfying the numeric expression argument. When there are an even number of rows, the median is the mean of the two middle rows. This function always returns a double.</td>
</tr>
<tr>
<td>Min</td>
<td>Min(Revenue)</td>
<td>Calculates the minimum value (lowest numeric value) of the rows satisfying the numeric expression argument.</td>
</tr>
<tr>
<td>StdDev</td>
<td>StdDev(Sales)</td>
<td>Returns the standard deviation for a set of values. The return type is always a double.</td>
</tr>
<tr>
<td>StdDev_Pop</td>
<td>StdDev_Pop(Sales)</td>
<td>Returns the standard deviation for a set of values using the computational formula for population variance and standard deviation.</td>
</tr>
<tr>
<td>Sum</td>
<td>Sum(Revenue)</td>
<td>Calculates the sum obtained by adding up all values satisfying the numeric expression argument.</td>
</tr>
</tbody>
</table>

## Analytics Functions

Analytics functions allow you to explore data using models such as trendline and cluster.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trendline</td>
<td>TRENDLINE(revenue, (calendar_year, calendar_quarter, calendar_month) BY (product), 'LINEAR', 'VALUE')</td>
<td>Fits a linear or exponential model and returns the fitted values or model. The numeric_expr represents the Y value for the trend and the series (time columns) represent the X value.</td>
</tr>
<tr>
<td>Function</td>
<td>Example</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cluster</td>
<td>CLUSTER((product, company), (billed_quantity, revenue), 'clusterName', 'algorithm=k-means;numClusters=%1;maxIter=%2;useRandomSeed=FALSE;enablePartitioning=TRUE', 5, 10)</td>
<td>Collects a set of records into groups based on one or more input expressions using K-Means or Hierarchical Clustering.</td>
</tr>
<tr>
<td>Outlier</td>
<td>OUTLIER((product, company), (billed_quantity, revenue), 'isOutlier', 'algorithm=kmeans')</td>
<td>This function classifies a record as Outlier based on one or more input expressions using K-Means or Hierarchical Clustering or Multi-Variate Outlier detection Algorithms.</td>
</tr>
<tr>
<td>Regr</td>
<td>REGR(revenue, (discount_amount), (product_type, brand), 'fitted', '')</td>
<td>Fits a linear model and returns the fitted values or model. This function can be used to fit a linear curve on two measures.</td>
</tr>
<tr>
<td>Evaluate_Script</td>
<td>EVALUATE_SCRIPT('filerepo://obiee.Outliers.xml', 'isOutlier', 'algorithm=kmeans;id=%1;arg1=%2;arg2=%3;useRandomSeed=False;', customer_number, expected_revenue, customer_age)</td>
<td>Executes a Python script as specified in the script_file_path, passing in one or more columns or literal expressions as input. The output of the function is determined by the output_column_name.</td>
</tr>
</tbody>
</table>

### Calendar Functions

Calendar functions manipulate data of the data types DATE and DATETIME based on a calendar year.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current_Date</td>
<td>Current_Date</td>
<td>Returns the current date.</td>
</tr>
<tr>
<td>Current_Time</td>
<td>Current_Time(3)</td>
<td>Returns the current time to the specified number of digits of precision, for example: HH:MM:SS.SSS If no argument is specified, the function returns the default precision.</td>
</tr>
<tr>
<td>Current_TimeStamp</td>
<td>Current_TimeStamp(3)</td>
<td>Returns the current date/timestamp to the specified number of digits of precision.</td>
</tr>
<tr>
<td>DayName</td>
<td>DayName(Order_Date)</td>
<td>Returns the name of the day of the week for a specified date expression.</td>
</tr>
<tr>
<td>DayOfMonth</td>
<td>DayOfMonth(Order_Date)</td>
<td>Returns the number corresponding to the day of the month for a specified date expression.</td>
</tr>
<tr>
<td>DayOfWeek</td>
<td>DayOfWeek(Order_Date)</td>
<td>Returns a number between 1 and 7 corresponding to the day of the week for a specified date expression. For example, 1 always corresponds to Sunday, 2 corresponds to Monday, and so on through to Saturday which returns 7.</td>
</tr>
<tr>
<td>DayOfYear</td>
<td>DayOfYear(Order_Date)</td>
<td>Returns the number (between 1 and 366) corresponding to the day of the year for a specified date expression.</td>
</tr>
<tr>
<td>Day_of_Quarter</td>
<td>Day_of_Quarter(Order_Date)</td>
<td>Returns a number (between 1 and 92) corresponding to the day of the quarter for the specified date expression.</td>
</tr>
<tr>
<td>Function</td>
<td>Example</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hour</td>
<td>Hour(Order_Time)</td>
<td>Returns a number (between 0 and 23) corresponding to the hour for a specified time expression. For example, 0 corresponds to 12 a.m. and 23 corresponds to 11 p.m.</td>
</tr>
<tr>
<td>Minute</td>
<td>Minute(Order_Time)</td>
<td>Returns a number (between 0 and 59) corresponding to the minute for a specified time expression.</td>
</tr>
<tr>
<td>Month</td>
<td>Month(Order_Time)</td>
<td>Returns the number (between 1 and 12) corresponding to the month for a specified date expression.</td>
</tr>
<tr>
<td>MonthName</td>
<td>MonthName(Order_Time)</td>
<td>Returns the name of the month for a specified date expression.</td>
</tr>
<tr>
<td>Month_Of_Quarter</td>
<td>Month_Of_Quarter(Order_Date)</td>
<td>Returns the number (between 1 and 3) corresponding to the month in the quarter for a specified date expression.</td>
</tr>
<tr>
<td>Now</td>
<td>Now()</td>
<td>Returns the current timestamp. The Now function is equivalent to the Current_Timestamp function.</td>
</tr>
<tr>
<td>Quarter_Of_Year</td>
<td>Quarter_Of_Year(Order_Date)</td>
<td>Returns the number (between 1 and 4) corresponding to the quarter of the year for a specified date expression.</td>
</tr>
<tr>
<td>Second</td>
<td>Second(Order_Time)</td>
<td>Returns the number (between 0 and 59) corresponding to the seconds for a specified time expression.</td>
</tr>
<tr>
<td>TimeStampAdd</td>
<td>TimeStampAdd(SQL_TSI_MONTH, 12,Time.&quot;Order Date&quot;)</td>
<td>Adds a specified number of intervals to a timestamp, and returns a single timestamp. Interval options are: SQL_TSI_SECOND, SQL_TSI_MINUTE, SQL_TSI_HOUR, SQL_TSI_DAY, SQL_TSI_WEEK, SQL_TSI_MONTH, SQL_TSI_QUARTER, SQL_TSI_YEAR</td>
</tr>
<tr>
<td>TimeStampDiff</td>
<td>TimeStampDiff(SQL_TSI_MONTH, Time.&quot;Order Date&quot;, CURRENT_DATE)</td>
<td>Returns the total number of specified intervals between two timestamps. Use the same intervals as TimeStampAdd.</td>
</tr>
<tr>
<td>Week_Of_Quarter</td>
<td>Week_Of_Quarter(Order_Date)</td>
<td>Returns a number (between 1 and 13) corresponding to the week of the quarter for the specified date expression.</td>
</tr>
<tr>
<td>Week_Of_Year</td>
<td>Week_Of_Year(Order_Date)</td>
<td>Returns a number (between 1 and 53) corresponding to the week of the year for the specified date expression.</td>
</tr>
<tr>
<td>Year</td>
<td>Year(Order_Date)</td>
<td>Returns the year for the specified date expression.</td>
</tr>
</tbody>
</table>

**Conversion Functions**

Conversion functions convert a value from one form to another.
<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cast</td>
<td><code>Cast(hiredate AS CHAR(40)) FROM employee</code></td>
<td>Changes the data type of an expression or a null literal to another data type. For example, you can cast a customer_name (a data type of Char or Varchar) or birthdate (a datetime literal).</td>
</tr>
<tr>
<td>IfNull</td>
<td><code>IfNull(Sales, 0)</code></td>
<td>Tests if an expression evaluates to a null value, and if it does, assigns the specified value to the expression.</td>
</tr>
<tr>
<td>IndexCol</td>
<td><code>SELECT IndexCol(VALUEOF (NQ_SESSION.GEOGRAPHY_LEVEL), Country, State, City), Revenue FROM Sales</code></td>
<td>Uses external information to return the appropriate column for the signed-in user to see.</td>
</tr>
<tr>
<td>NullIf</td>
<td><code>SELECT e.last_name, NULLIF(e.job_id, j.job_id) *Old Job ID* FROM employees e, job_history j WHERE e.employee_id = j.employee_id ORDER BY last_name, *Old Job ID*;</code></td>
<td>Compares two expressions. If they're equal, then the function returns null. If they're not equal, then the function returns the first expression. You can't specify the literal NULL for the first expression.</td>
</tr>
<tr>
<td>To_DateTime</td>
<td><code>SELECT To_DateTime ('2009-03-01:01:00', 'yyyy-mm-dd hh:mi:ss') FROM sales</code></td>
<td>Converts string literals of dateTime format to a DateTime data type.</td>
</tr>
</tbody>
</table>

**Display Functions**

Display functions operate on the result set of a query.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BottomN</td>
<td><code>BottomN(Sales, 10)</code></td>
<td>Returns the n lowest values of expression, ranked from lowest to highest.</td>
</tr>
<tr>
<td>Filter</td>
<td><code>Filter(Sales USING Product = 'widget')</code></td>
<td>Computes the expression using the given preaggregate filter.</td>
</tr>
<tr>
<td>Mavg</td>
<td><code>Mavg(Sales, 10)</code></td>
<td>Calculates a moving average (mean) for the last n rows of data in the result set, inclusive of the current row.</td>
</tr>
<tr>
<td>Msum</td>
<td><code>SELECT Month, Revenue, Msum(Revenue, 3) as 3_MO_SUM FROM Sales</code></td>
<td>Calculates a moving sum for the last n rows of data, inclusive of the current row. The sum for the first row is equal to the numeric expression for the first row. The sum for the second row is calculated by taking the sum of the first two rows of data, and so on. When the nth row is reached, the sum is calculated based on the last n rows of data.</td>
</tr>
<tr>
<td>NTile</td>
<td><code>Ntile(Sales, 100)</code></td>
<td>Determines the rank of a value in terms of a user-specified range. It returns integers to represent any range of ranks. The example shows a range from 1 to 100, with the lowest sale = 1 and the highest sale = 100.</td>
</tr>
<tr>
<td>Percentile</td>
<td><code>Percentile(Sales)</code></td>
<td>Calculates a percent rank for each value satisfying the numeric expression argument. The percentile rank ranges are from 0 (1st percentile) to 1 (100th percentile), inclusive.</td>
</tr>
</tbody>
</table>
### Mathematical Functions

The mathematical functions described in this section perform mathematical operations.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abs</td>
<td>Abs(Profit)</td>
<td>Calculates the absolute value of a numeric expression.</td>
</tr>
<tr>
<td>Acos</td>
<td>Acos(1)</td>
<td>Calculates the arc cosine of a numeric expression.</td>
</tr>
<tr>
<td>Asin</td>
<td>Asin(1)</td>
<td>Calculates the arc sine of a numeric expression.</td>
</tr>
<tr>
<td>Atan</td>
<td>Atan(1)</td>
<td>Calculates the arc tangent of a numeric expression.</td>
</tr>
<tr>
<td>Atan2</td>
<td>Atan2(1, 2)</td>
<td>Calculates the arc tangent of $y/x$, where $y$ is the first numeric expression and $x$ is the second numeric expression.</td>
</tr>
<tr>
<td>Ceiling</td>
<td>Ceiling(Profit)</td>
<td>Rounds a non-integer numeric expression to the next highest integer. If the numeric expression evaluates to an integer, the CEILING function returns that integer.</td>
</tr>
<tr>
<td>Cos</td>
<td>Cos(1)</td>
<td>Calculates the cosine of a numeric expression.</td>
</tr>
<tr>
<td>Cot</td>
<td>Cot(1)</td>
<td>Calculates the cotangent of a numeric expression.</td>
</tr>
<tr>
<td>Degrees</td>
<td>Degrees(1)</td>
<td>Converts an expression from radians to degrees.</td>
</tr>
<tr>
<td>Exp</td>
<td>Exp(4)</td>
<td>Sends the value to the power specified. Calculates $e$ raised to the $n$-th power, where $e$ is the base of the natural logarithm.</td>
</tr>
<tr>
<td>ExtractBit</td>
<td>Int ExtractBit(1, 5)</td>
<td>Retrieves a bit at a particular position in an integer. It returns an integer of either 0 or 1 corresponding to the position of the bit.</td>
</tr>
<tr>
<td>Function</td>
<td>Example</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Floor</td>
<td>Floor(Profit)</td>
<td>Rounds a non-integer numeric expression to the next lowest integer. If the numeric expression evaluates to an integer, the FLOOR function returns that integer.</td>
</tr>
<tr>
<td>Log</td>
<td>Log(1)</td>
<td>Calculates the natural logarithm of an expression.</td>
</tr>
<tr>
<td>Log10</td>
<td>Log10(1)</td>
<td>Calculates the base 10 logarithm of an expression.</td>
</tr>
<tr>
<td>Mod</td>
<td>Mod(10, 3)</td>
<td>Divides the first numeric expression by the second numeric expression and returns the remainder portion of the quotient.</td>
</tr>
<tr>
<td>Pi</td>
<td>Pi()</td>
<td>Returns the constant value of pi.</td>
</tr>
<tr>
<td>Power</td>
<td>Power(Profit, 2)</td>
<td>Takes the first numeric expression and raises it to the power specified in the second numeric expression.</td>
</tr>
<tr>
<td>Radians</td>
<td>Radians(30)</td>
<td>Converts an expression from degrees to radians.</td>
</tr>
<tr>
<td>Rand</td>
<td>Rand()</td>
<td>Returns a pseudo-random number between 0 and 1.</td>
</tr>
<tr>
<td>RandFromSeed</td>
<td>Rand(2)</td>
<td>Returns a pseudo-random number based on a seed value. For a given seed value, the same set of random numbers are generated.</td>
</tr>
<tr>
<td>Round</td>
<td>Round(2.166000, 2)</td>
<td>Rounds a numeric expression to n digits of precision.</td>
</tr>
<tr>
<td>Sign</td>
<td>Sign(Profit)</td>
<td>This function returns the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 if the numeric expression evaluates to a positive number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• -1 if the numeric expression evaluates to a negative number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 if the numeric expression evaluates to zero</td>
</tr>
<tr>
<td>Sin</td>
<td>Sin(1)</td>
<td>Calculates the sine of a numeric expression.</td>
</tr>
<tr>
<td>Sqrt</td>
<td>Sqrt(7)</td>
<td>Calculates the square root of the numeric expression argument. The numeric expression must evaluate to a nonnegative number.</td>
</tr>
<tr>
<td>Tan</td>
<td>Tan(1)</td>
<td>Calculates the tangent of a numeric expression.</td>
</tr>
<tr>
<td>Truncate</td>
<td>Truncate(45.12345, 2)</td>
<td>Truncates a decimal number to return a specified number of places from the decimal point.</td>
</tr>
</tbody>
</table>

**String Functions**

String functions perform various character manipulations. They operate on character strings.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ascii</td>
<td>Ascii('a')</td>
<td>Converts a single character string to its corresponding ASCII code, between 0 and 255. If the character expression evaluates to multiple characters, the ASCII code corresponding to the first character in the expression is returned.</td>
</tr>
<tr>
<td>Bit_Length</td>
<td>Bit_Length('abcdef')</td>
<td>Returns the length, in bits, of a specified string. Each Unicode character is 2 bytes in length (equal to 16 bits).</td>
</tr>
<tr>
<td>Char</td>
<td>Char(35)</td>
<td>Converts a numeric value between 0 and 255 to the character value corresponding to the ASCII code.</td>
</tr>
<tr>
<td>Function</td>
<td>Example</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Char_Length</td>
<td><code>Char_Length(Customer_Name)</code></td>
<td>Returns the length, in number of characters, of a specified string. Leading and trailing blanks aren't counted in the length of the string.</td>
</tr>
<tr>
<td>Concat</td>
<td><code>SELECT DISTINCT Concat ('abc', 'def') FROM employee</code></td>
<td>Concatenates two character strings.</td>
</tr>
<tr>
<td>Insert</td>
<td><code>SELECT Insert('123456', 2, 3, 'abcd') FROM table</code></td>
<td>Inserts a specified character string into a specified location in another character string.</td>
</tr>
<tr>
<td>Left</td>
<td><code>SELECT Left('123456', 3) FROM table</code></td>
<td>Returns a specified number of characters from the left of a string.</td>
</tr>
<tr>
<td>Length</td>
<td><code>Length(Customer_Name)</code></td>
<td>Returns the length, in number of characters, of a specified string. The length is returned excluding any trailing blank characters.</td>
</tr>
<tr>
<td>Locate</td>
<td><code>Locate('d', 'abcdef')</code></td>
<td>Returns the numeric position of a character string in another character string. If the character string isn't found in the string being searched, the function returns a value of 0.</td>
</tr>
<tr>
<td>LocateN</td>
<td><code>Locate('d', 'abcdef', 3)</code></td>
<td>Like Locate, returns the numeric position of a character string in another character string. LocateN includes an integer argument that enables you to specify a starting position to begin the search.</td>
</tr>
<tr>
<td>Lower</td>
<td><code>Lower(Customer_Name)</code></td>
<td>Converts a character string to lowercase.</td>
</tr>
<tr>
<td>Octet_Length</td>
<td><code>Octet_Length('abcdef')</code></td>
<td>Returns the number of bytes of a specified string.</td>
</tr>
<tr>
<td>Position</td>
<td><code>Position('d', 'abcdef')</code></td>
<td>Returns the numeric position of <code>strExpr1</code> in a character expression. If <code>strExpr1</code> isn't found, the function returns 0.</td>
</tr>
<tr>
<td>Repeat</td>
<td><code>Repeat('abc', 4)</code></td>
<td>Repeats a specified expression n times.</td>
</tr>
<tr>
<td>Replace</td>
<td><code>Replace('abcd1234', '123', 'zz')</code></td>
<td>Replaces one or more characters from a specified character expression with one or more other characters.</td>
</tr>
<tr>
<td>Right</td>
<td><code>SELECT Right('123456', 3) FROM table</code></td>
<td>Returns a specified number of characters from the right of a string.</td>
</tr>
<tr>
<td>Space</td>
<td><code>Space(2)</code></td>
<td>Inserts blank spaces.</td>
</tr>
<tr>
<td>Substring</td>
<td><code>Substring('abcdef' FROM 2)</code></td>
<td>Creates a new string starting from a fixed number of characters into the original string.</td>
</tr>
<tr>
<td>SubstringN</td>
<td><code>Substring('abcdef' FROM 2 FOR 3)</code></td>
<td>Like Substring, creates a new string starting from a fixed number of characters into the original string. SubstringN includes an integer argument that enables you to specify the length of the new string, in number of characters.</td>
</tr>
<tr>
<td>TrimBoth</td>
<td><code>Trim(BOTH '_' FROM '_abcdef_')</code></td>
<td>Strips specified leading and trailing characters from a character string.</td>
</tr>
<tr>
<td>TrimLeading</td>
<td><code>Trim(LEADING '_' FROM '_abcdef')</code></td>
<td>Strips specified leading characters from a character string.</td>
</tr>
<tr>
<td>TrimTrailing</td>
<td><code>Trim(TRAILING '_' FROM 'abcdef_')</code></td>
<td>Strips specified trailing characters from a character string.</td>
</tr>
<tr>
<td>Upper</td>
<td><code>Upper(Customer_Name)</code></td>
<td>Converts a character string to uppercase.</td>
</tr>
</tbody>
</table>
System Functions

The `USER` system function returns values relating to the session.
It returns the user name you signed in with.

Time Series Functions

Time series functions are aggregate functions that operate on time dimensions.
The time dimension members must be at or below the level of the function. Because of
this, one or more columns that uniquely identify members at or below the given level
must be projected in the query.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Periodrolling</td>
<td><code>SELECT Month_ID, Periodrolling (monthly_sales, -1, 1)</code></td>
<td>Computes the aggregate of a measure over the period starting ( x ) units of time and ending ( y ) units of time from the current time. For example, <code>PERIODROLLING</code> can compute sales for a period that starts at a quarter before and ends at a quarter after the current quarter.</td>
</tr>
<tr>
<td>Forecast</td>
<td><code>FORECAST(numeric_expr, ([series]), output_column_name, options, [runtime_binded_options])</code></td>
<td>Creates a time-series model of the specified measure over the series using either Exponential Smoothing or ARMIA and outputs a forecast for a set of periods as specified by <code>numPeriods</code>.</td>
</tr>
</tbody>
</table>

Constants

You can use constants in expressions.

Available constants include Date, Time, and Timestamp.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td><code>DATE [2014-04-09]</code></td>
<td>Inserts a specific date.</td>
</tr>
<tr>
<td>Time</td>
<td><code>TIME [12:00:00]</code></td>
<td>Inserts a specific time.</td>
</tr>
<tr>
<td>TimeStamp</td>
<td><code>TIMESTAMP [2014-04-09 12:00:00]</code></td>
<td>Inserts a specific timestamp.</td>
</tr>
</tbody>
</table>

Types

You can use data types, such as `CHAR`, `INT`, and `NUMERIC` in expressions.

For example, you use types when creating `CAST` expressions that change the data type of an expression or a null literal to another data type.
This topic describes the software development kit (SDK) that you can use to develop and deploy visualization plug-ins to your Data Visualization installation.

Topics:

• About the Oracle Data Visualization SDK
• Create the Visualization Plug-in Development Environment
• Create a Skeleton Visualization Plug-in
• Create a Skeleton Skin or Unclassified Plug-in
• Develop a Visualization Plug-in
• Run in SDK Mode and Test the Plug-in
• Validate the Visualization Plug-in
• Build, Package, and Deploy the Visualization Plug-in
• Delete Plug-ins from the Development Environment

About the Oracle Data Visualization SDK

The Oracle Data Visualization SDK provides a development environment where you can create and develop custom visualization plug-ins and deploy them to your Data Visualization installation.

Scripts

Your installation of Oracle Data Visualization includes the scripts that you use to create a development environment and create skeleton visualization plug-ins. The scripts are located in this directory: `<your_installation_directory>/tools/bin`

For example, C:\Program Files\Oracle Data Visualization Desktop\tools\bin

Note the following script names and descriptions:

• **bicreatenv** - Run this script to create the development environment where you develop your plug-ins.
• **bicreateplugin** - Run this script to create a skeleton visualization to quickly get started on developing your custom plug-in.
• **bideleteplugin** - Run this script to delete a plug-in from your development environment.
• **bivalidate** - Run this script with the `gradlew validate` command to call the `bivalidate` script. The bivalidate script validates whether the JSON configuration files are properly formatted and contain appropriate visualization configuration.
Other Resources

These resources help you develop your custom visualization plug-ins:

- **circlePack sample** - The circlePack sample is included in your development environment. You can deploy and use this sample immediately. However, the sample is designed for you to use with the provided tutorial to learn how to develop a visualization plug-in. You can also copy the sample and use it as a template for the visualization plug-ins that you want to create.

  The circlePack sample is located in `<your_development_directory>/src\sampleviz\sample-circlepack`.

  For example, `C:\OracleDVDev\src\sampleviz\sample-circlepack`

- **Other visualization plug-in samples** - You can download plug-in examples from the Oracle Data Visualization Download Page.

- **Tutorial** - The tutorial contains information and instructions to help you understand how to create a robust visualization plug-in. This tutorial provides step-by-step instructions for modifying the circlePack sample included in your plug-in development environment.

  ![Tutorial]

- **JS API documentation** - This documentation contains JavaScript reference information that you need to develop a visualization plug-in. See Data Visualization SDK JavaScript Reference.

---

Create the Visualization Plug-in Development Environment

You need to set the PATH environment variable and create the development environment before you can create visualization plug-ins.

1. Using the command prompt, create an empty development directory. For example, `C:\OracleDVDev`.

2. Set the PATH environment variable. For example,
   ```
   set DVDESKTOP_SDK_HOME="C:\Program Files\Oracle Data Visualization Desktop"
   set PLUGIN_DEV_DIR=C:\OracleDVDev
   REM add tools\bin to path:
   set PATH=%DVDESKTOP_SDK_HOME%\tools\bin;%PATH%
   ```

3. Run the **bicreateenv** script included in your installation to create the development environment in the empty directory. For example,
   ```
   cd C:\OracleDVDev
   bicreateenv
   ```

   For information about the options available for running this script, see the script's command-line help. For example,
   ```
   C:\OracleDVDev>bicreateenv -help
   ```

   The complete development environment, including build.gradle and gradlew, is created in the directory that you specified.

4. (Optional) If you're working behind a web proxy, then you need to set gradle.properties to point to your proxy. The gradle.properties are located in your
development environment, for example C:\OracleDVDev \gradle.properties.

Use the following example to set your gradle.properties:

systemProp.https.proxyHost=www-proxy.somecompany.com
systemProp.https.proxyPort=80
systemProp.https.nonProxyHosts=*.somecompany.com|*.companyaltname.com

Create a Skeleton Visualization Plug-in

After you create a skeleton visualization plug-in in your development environment, you then develop it into a robust visualization plug-in and deploy it to your Data Visualization environment.

1. Run the bicreateplugin script included in your installation to create a skeleton visualization. Use the following syntax:

bicreateplugin viz -<subType> -<id> -<name>

• <subType> is the type of visualization that you want to create. Your choices are:

  – basic - Use this option to create a visualization that doesn’t use any data from Data Visualization or use any data model mapping. This is like the Image and Text visualization types delivered with Data Visualization. For example, you can use this visualization type to show an image or some text that’s coded into the plug-in or from a configuration. You can use this type of visualization to improve formatting.

  – dataviz - This type renders data from data sources registered with Oracle Data Visualization into a chart or table or some other representation on the screen. It also respond to marking events from other visualizations on the same canvas and publish interaction events to affect other visualizations on the same canvas.

  – embeddableDataviz - This type renders data from data sources registered with Oracle Data Visualization into the cells of a trellis visualization. It also responds to marking events from other visualizations on the same canvas and publish interaction events to affect other visualizations on the same canvas.

• <id> is your domain and the name that you want to give the visualization directory and components in your development environment. For example, com-company.basicviz.

• <name> is the name of the visualization plug-in that you test, deploy, and use in Data Visualization projects.

For example to create a basic visualization, name its development directory com-company-basicviz, and name the visualization plug-in helloViz, enter and run the following command:

C:\OracleDevDir>bicreateplugin viz -subType basic -id com.company.basicviz -name helloViz

2. (Optional) Open the script's command-line help for information about the options available for running this script. For example, C:\OracleDVDev> bicreateplugin -help

When you run the bicreateplugin -viz command for the first time, the system creates the customviz directory in the following location.

<your_development_environment>\src\customviz
All custom visualization development directories that you create are added to this directory.

For example, `C:\OracleDVDev\src\customviz\com-company-basicviz`

## Create a Skeleton Skin or Unclassified Plug-in

The `bicreateplugin -unclassified` command creates an empty plug-in with plugin.xml, localization bundles, and is a starting point for other Oracle Data Visualization plug-ins. The `bicreateplugin -skin` command creates a skeleton skin plug-in.

1. Run the `createplugin` script included in your installation to create a skeleton plug-in. Use one of the following syntaxes:

   ```
bicreateplugin -skin -<id>
bicreateplugin -unclassified -<id>
   ```

   • `<id>` is your domain and the name that you want to give the visualization. For example, `com-company.newskin`

   For example, to create a skin plug-in, enter and run the following command:

   ```
   C:\OracleDevDir>bicreateplugin skin -id com.company.newskin
   ```

## Develop a Visualization Plug-in

After you create the skeleton visualization plug-in, you can use resources provided by Oracle to help you develop your plug-in.

The directories for dataviz and embeddableDataviz types include the `datamodelhandler.js` file, which contains the physical-to-logical data mapping format. This file also tells Data Visualization how to render itself on the screen and pass user interactions to the server.

- Use the tutorial to learn how to perform development tasks such as implement data mapping.

  ![Tutorial](tutorial.png)

- Use the .JS API documentation to learn how to add dependencies. See Data Visualization SDK JavaScript Reference.

## Run in SDK Mode and Test the Plug-in

You can run Oracle Data Visualization in SDK mode from your browser when you’re developing your visualization plug-in or when you want to test your visualization plug-in.

1. Execute the `gradlew run` command. For example, `C:\OracleDevDir>gradlew run`

   After you run the command, note the following results:

   - Data Visualization opens in SDK mode in your default browser. Use the browser’s JavaScript debugger to test and debug the application.

   - The visualization that you created is available in the Visualizations pane of Data Visualization.
A system tray is displayed in the operating system's toolbar and includes three links: Launch Browser, which you use to launch or relaunch your default browser to display Data Visualization; Copy URL to Clipboard, which you can use to copy the URL and paste it into a different browser; and Shutdown, which you use to shut down the development browser.

2. Test your visualization by dragging and dropping it to a project's canvas and adding data elements.

3. If necessary, continue developing the visualization plug-in. When working in SDK mode in the browser, you can update the .JS definition and refresh the browser to see your changes.

Validate the Visualization Plug-in

After you've tested your visualization plug-in and before you can package and deploy it, you must validate it.

1. Run the gradlew validate command. For example,
   
   cd C:\OracleDVDev
   .\gradlew validate

   This step validates whether the JSON configuration files are properly formatted and contain appropriate visualization configuration. If the validation discovers any errors, then the system displays error messages.

2. To check for errors in the JavaScript source files, use your browser's development tools.

Build, Package, and Deploy the Visualization Plug-in

After you validate the visualization plug-in, you've to build and package it, and then copy the resulting distributions into your Data Visualization installation directory.

The build and package process runs for all of the visualizations in your development directory, and each plug-in is contained in its own zip file. There's no way to build and package specific visualizations. If you want to exclude visualizations from the build and package process, then you've to move the visualizations that you want to exclude out of your development directory, or delete them from the directory before you perform the build. See Delete Plug-ins from the Development Environment.

1. Run the gradlew build command. For example,
   
   cd C:\OracleDVDev
   .\gradlew clean build

   A build directory is added to your development environment. For example, C:\OracleDVDev\build\distributions. This directory contains a zip file for each visualization. The zip file's name is the one that you gave the visualization when you created its skeleton. For example, basicviz.zip.

2. Copy the zip files to your Data Visualization installation directory. For example, %localappdata%\DVDesktop\plugins.
Delete Plug-ins from the Development Environment

You can use the `bideleteplugin` script provided with Data Visualization to delete the unneeded plug-ins from your development environment.

The build and package process includes all of the visualizations contained in your development directory. There is no way to build and package specific visualizations. To exclude any unwanted visualizations from the build, you can delete them before you perform the build and package process.

1. If you want to delete a visualization plug-in, then run the `bideleteplugin` command, using the following syntax:
   ```
cd C:\your_development_directory
bideleteplugin viz -id <name_of_your_domain>.<name_of_viz_plugin>
   ```

2. If you want to delete an unclassified plug-in, then run the `bideleteplugin` command, using the following syntax:
   ```
cd C:\your_development_directory
bideleteplugin unclassified -id <name_of_your_domain>.<name_of_unclassified_plugin>
   ```

3. If you want to delete a skin plug-in, then run the `bideleteplugin` command, using the following syntax:
   ```
cd C:\your_development_directory
bideleteplugin skin -id <name_of_your_domain>.<name_of_skin_plugin>
   ```
