1.0 INTRODUCTION

1.1 Purpose and Scope

This document describes how to install the Oracle® Communications Diameter Signal Router Full Address Resolution product also known as “Eagle XG Subscriber Data Server (SDS)” within a customer network. It makes use of the AppWorks 66.0 network installation and is intended to cover the initial network configuration steps for a SDS/Query Server NE for production use as part of the DSR 7.2/7.3 solution.

This document only describes the SDS product SW installation on a Virtualized solution. It does not cover hardware installation, site survey, customer network configuration, IP assignments, customer router configurations, or the configuration of any device outside of the SDS virtual machines.

1.2 References

External (Customer Facing):

- [1] *TEKELEC Acronym Guide*, MS005077, Latest Revision
- [2] *Diameter Signaling Router Cloud Installation Guide*, E64814, Latest Revision
- [3] *DSR IP Network Planning for AT&T Mobility – LTE*, MS006641, Latest Revision

1.3 Acronyms

Acronym	Meaning
CSV	Comma Separated Values
DR	Disaster Recovery
FABR	Full Address Based Resolution
IMI	Internal Management Interface
ISL	Inter-Switch-Link
NE	Network Element
NOAM	Network Operations, Administration & Maintenance
SDS	Subscriber Data Server
SOAM	Systems Operations, Administration & Maintenance
TPD	Tekelec Platform Distribution (Linux OS)
VIP	Virtual IP
XMI	External Management Interface

Table 1 - Acronyms

1.4 Assumptions

This procedure assumes the following;

- The user has reviewed the latest Customer specific DSR Network Planning document [3] and has received assigned values for all requested information related to SDS, Query Server, DP-SOAM and DP installation.
- The user has taken assigned values from the latest Customer specific DSR Network Planning document [3] and used them to compile XML files (See 0) for each SDS and DP-SOAM site's NE prior to attempting to execute this procedure.
- The user conceptually understands DSR topology and SDS network configuration as described in the latest Customer specific DSR Network Planning document [3].
- The user has at least an intermediate skill set with command prompt activities on an Open Systems computing environment such as Linux or TPD.

1.5 XML Files (for installing NE)

The XML files compiled for installation of the each of the SDS and DP-SOAM site's NE must be maintained and accessible for use in Disaster Recovery procedures. The ORACLE Professional Services Engineer (PSE) will provide a copy of the XML files used for installation to the designated Customer Operations POC. **The customer is ultimately responsible for maintaining and providing the XML files to Oracle's Customer Service (US: 1-888-367-8552, Intl: +1-919-460-2150) if needed for use in Disaster Recovery operations.**

1.6 How to use this Document

Although this document is primarily to be used as an initial installation guide, its secondary purpose is to be used as a reference for Disaster Recovery procedures. When executing this document for either purpose, there are a few points which help to ensure that the user understands the author's intent. These points are as follows;

- 1) Before beginning a procedure, completely read the instructional text (it will appear immediately after the Section heading for each procedure) and all associated procedural WARNINGS or NOTES.
- 2) Before execution of a STEP within a procedure, completely read the left and right columns including any STEP specific WARNINGS or NOTES.

If a procedural STEP fails to execute successfully, STOP and contact Oracle's Tekelec Customer Service (US: 1-888-367-8552, Intl: +1-919-460-2150) for assistance before attempting to continue.

2.0 PRE-INSTALLATION SETUP

2.1 Installation Prerequisites

The following items/settings are required in order to perform installation:

- A laptop or desktop computer equipped as follows;
 - Administrative privileges for the OS.
 - An approved web browser.
- TPD “admusr” user password.

2.2 Activity Logging

All activity while connected to the system should be logged using a convention which notates the **Customer Name**, **Site/Node** location, **Server hostname** and the **Date**. All logs should be provided to ORACLE Communications for archiving post installation.

3.0 INSTALLATION OVERVIEW

3.1 Installing SDS on the Customer Network

Installing the SDS product is a task which requires multiple installations of varying types. The user should be aware that this document only covers the necessary configuration required to complete product install. Refer to the online help or contact the Oracle's Tekelec Customer Care Center for assistance with post installation configuration options.

SDS Installation: List of Procedures

In general, unless following a cross reference or otherwise instructed differently, the procedures listed here are meant to be executed in numeric order.

Procedure No :	Title :	Page No :
1	Create SDS Guests (VMware)	10
2	Create SDS Guests (KVM/OpenStack)	11
3	Configuring SDS NOAM Servers A and B	15
4	OAM Pairing	26
5	Query Server Installation	37
6	OAM Installation for DP-SOAM sites (All DP-SOAM sites)	47
7	OAM Pairing for DP-SOAM sites (All DP-SOAM sites)	55
8	DP Installation (All DP-SOAM sites)	63
9	Configuring ComAgent	77

Table 2 - SDS Installation: List of Procedures

4.0 APPLICATION INSTALL

4.1 Create SDS Guests

Procedure 1: Create SDS Guests From OVA (VMware)

Step	Procedure	Result
1. <input type="checkbox"/>	Cloud Client: Add SDS OVA image.	<ol style="list-style-type: none"> 1. Launch the Cloud client of your choice. 2. Add the SDS OVA image to the Cloud catalog or repository. Follow the instructions provided by the Cloud solutions manufacturer.
2. <input type="checkbox"/>	Cloud Client: Create the SDS VM, from the OVA image.	<ol style="list-style-type: none"> 1. Browse the library or repository that you placed the OVA image. 2. Deploy the OVA Image using Cloud Client or the Cloud Web Client. 3. Name the SDS NOAM VM and select the datastore.
3. <input type="checkbox"/>	Cloud Client: Configure resources for the SDS NOAM Server A VM.	<ol style="list-style-type: none"> 1. Configure the SDS NOAM VM per the Appendix C Resource Profile for the SDS NOAM using the Cloud Client or the Cloud Web Client.
4. <input type="checkbox"/>	Cloud Client: Power on SDS NOAM Server A VM.	<ol style="list-style-type: none"> 1. Use the Cloud client or Cloud web client to Power on the SDS NOAM Server A VM.
5. <input type="checkbox"/>	Cloud Client: Configure SDS NOAM Server A.	<ol style="list-style-type: none"> 1. Access the SDS NOAM SERVER A VM console via the Cloud client or Cloud web client. 2. Login as admusr. 3. Set the <ethX> device: 4. Note: Where ethX is the interface associated with the XMI network <pre>\$ sudo netAdm add --device=<ethX> --address=<IP Address in External management Network> --netmask=<Netmask> --onboot=yes --bootproto=none</pre> 5. Add the default route for ethX: <pre>\$ sudo netAdm add --route=default --gateway=<gateway address for the External management network> --device=<ethX></pre> <p>Note: When reconfiguring virtual NICs under VMware, the proper procedure is to remove the UDEV rules file (/etc/udev/rules.d/70-persistent-net.rules), shut down the guest and remove the interfaces. Power on the VM, then add the interfaces one by one, in the desired order of enumeration, each time clicking « OK » to get VMware to instantiate the device.</p>

Procedure 1: Create SDS Guests From OVA (VMware)

Step	Procedure	Result
6. <input type="checkbox"/>	Verify Network connectivity.	1. Ping the default gateway. \$ <code>ping -c3 <gateway address for the External management network></code>
7. <input type="checkbox"/>	<ul style="list-style-type: none"> Repeat these steps 1 - 6 for each server before continuing on to the next procedure. (e.g. NOAM B, Query Server, SOAM A, SOAM B, DPs) 	
THIS PROCEDURE HAS BEEN COMPLETED		

Procedure 2: Create SDS Guests From OVA (KVM/OpenStack)

Step	Procedure	Result
1. <input type="checkbox"/>	Preparation	<ol style="list-style-type: none"> Create instance flavors. <ol style="list-style-type: none"> Use the Appendix C Resource Profile values to create flavors for each type of VM. Flavors can be created with the Horizon GUI in the "Admin" section, or with the "nova flavor-create" command line tool. Make the flavor names as informative as possible. As flavors describe resource sizing, a common convention is to use a name like "0406060" where the first two figures (04) represent the number of virtual CPUs, the next two figures (06) might represent the RAM allocation in GB and the final three figures (060) might represent the disk space in GB. If using an Intel 10 Gigabit Ethernet ixgbe driver on the host nodes, please note that the default LRO (Large Receive Offload) option must be disabled on the host command line. Please see the Intel release notes for more details. This action can be performed with the following command. <ol style="list-style-type: none"> \$ <code>sudo ethtool -K <ETH_DEV> lro off</code>

Procedure 2: Create SDS Guests From OVA (KVM/OpenStack)

Step	Procedure	Result
<p>2.</p> <input data-bbox="155 338 201 384" type="checkbox"/>	<p>Add SDS OVA image.</p>	<ol style="list-style-type: none"> 1. Copy the OVA file to the OpenStack control node. <ol style="list-style-type: none"> i. <code>\$ scp SDS-x.x.x.x.ova admusr@node:~</code> 2. Login to the OpenStack control node. <ol style="list-style-type: none"> i. <code>\$ ssh admusr@node</code> 3. In an empty directory unpack the OVA file using "tar" <ol style="list-style-type: none"> i. <code>\$ tar xvf SDS-.x.x.x.x.ova</code> 4. One of the unpacked files will have a ".vmdk" suffix. This is the VM image file that must be imported. <ol style="list-style-type: none"> i. SDS-x.x.x.x-disk1.vmdk 5. Source the OpenStack "admin" user credentials. <ol style="list-style-type: none"> i. <code>\$. keystone_admin</code> 6. Select an informative name for the new image. <ol style="list-style-type: none"> i. "sds-.x.x.x.x-original" 7. Import the image using the "glance" utility from the command line. <ol style="list-style-type: none"> i. <code>\$ glance image-create --name sds-x.x.x.x-original --is-public true --is-protected false --progress --container-format bare --disk-format vmdk --file SDS-x.x.x.x-disk1.vmdk</code> ii. This process will take about 5 minutes, depending on the underlying infrastructure.
<p>3.</p> <input data-bbox="155 1140 201 1186" type="checkbox"/>	<p>Name the new VM instance.</p>	<p>Create an informative name for the new instance: "SDS-NO1". Examine the network interface recommendations at the bottom of the Resource Profile in Appendix C.</p>

Procedure 2: Create SDS Guests From OVA (KVM/OpenStack)

Step	Procedure	Result
<p>4.</p> <input data-bbox="155 338 201 384" type="checkbox"/>	<p>Create and boot the VM instance from the glance image.</p>	<ol style="list-style-type: none"> 1. Get the following configuration values. <ol style="list-style-type: none"> a. The image ID. <ol style="list-style-type: none"> i. <code>\$ glance image-list</code> b. The flavor ID. <ol style="list-style-type: none"> i. <code>\$ nova flavor-list</code> c. The network ID(s) <ol style="list-style-type: none"> i. <code>\$ neutron net-list</code> d. An informative name for the instance. <ol style="list-style-type: none"> i. "SDS-NO1" ii. "SDS-NO2" 2. Create and boot the VM instance. <ol style="list-style-type: none"> a. The instance must be owned by the SDS tenant user, not the admin user. Source the credentials of the SDS tenant user and issue the following command. Use one "--nic" argument for each IP/interface. Note that IPv6 addresses should use the "v6-fixed-ip" argument instead of "v4-fixed-ip". b. <code>\$ nova boot --image <image ID> --flavor <flavor id> --nic net-id=<first network id>,v4-fixed-ip=<first ip address> --nic net-id=<second network id>,v4-fixed-ip=<second ip address> <instance name></code> c. View the newly created instance using the nova tool. <ol style="list-style-type: none"> i. <code>\$ nova list --all-tenants</code> <p>The VM will take approximately 5 minutes to boot and may be accessed through both network interfaces and the Horizon console tool.</p>
<p>5.</p> <input data-bbox="155 1230 201 1276" type="checkbox"/>	<p>Configure VIP (optional).</p>	<ol style="list-style-type: none"> 1. If a NOAM/SOAM VIP is needed, execute the following commands. 2. Find the port id associated with the instances' network interface. <ol style="list-style-type: none"> a. <code>\$ neutron port-list</code> 3. Add the VIP IP address to the address pairs list of the instances network interface port. <ol style="list-style-type: none"> a. <code>\$ neutron port-update <Port ID> --allowed_address_pairs list=true type=dict ip_address=<VIP address to be added></code> <p>If necessary, see Allowed Address Pairs in Appendix E for more information</p>

Procedure 2: Create SDS Guests From OVA (KVM/OpenStack)

Step	Procedure	Result
<p>6.</p> <input data-bbox="154 336 203 388" type="checkbox"/>	<p>Configure instance networking.</p>	<ol style="list-style-type: none"> 1. Log in to the “Horizon” GUI as the SDS tenant user. 2. Go to the Compute/Instances section. 3. Click on the “Name” field of the newly created instance. 4. Select the “Console” tab. 5. Login as the admusr. 6. Select an informative hostname for the new VM instance. <ol style="list-style-type: none"> a. “SDS-NO1”. b. “SDS-SO2”. 7. Use sudo to change the machine hostname from the default value. <ol style="list-style-type: none"> a. Edit /etc/hosts. <ol style="list-style-type: none"> i. Append the hostname to the IPv4 line. <ol style="list-style-type: none"> 1. “127.0.0.1 localhost localhost4 NO1” ii. Append the hostname to the IPv6 line. <ol style="list-style-type: none"> 1. “::1 localhost localhost6 NO1” b. Edit /etc/syconfig/network. <ol style="list-style-type: none"> i. Change the “HOSTNAME=XXXX” line to the new hostname. ii. “HOSTNAME=SDS-NO1” c. Set the hostname on the command line. <ol style="list-style-type: none"> i. <code>\$ sudo hostname SDS-NO1</code> 8. Configure the network interfaces, conforming to the interface-to-network mappings described at the bottom of the Resource Profile in Appendix C. <ol style="list-style-type: none"> a. <code>\$ sudo netAdm add --onboot=yes --device=eth0 --address=<xmi port ip> --netmask=<xmi net mask></code> b. <code>\$ sudo netAdm add --route=default --device=eth0 --gateway=<xmi gateway ip></code> c. Under some circumstances, it may be necessary to configure more interfaces. d. If netAdm fails to create the new interface (ethX) because it already exists in a partially configured state, perform the following actions. <ol style="list-style-type: none"> i. <code>\$ cd /etc/sysconfig/network-scripts</code> ii. <code>\$ sudo mv ifcfg-ethX /tmp</code> <ol style="list-style-type: none"> 1. Keep ifcfg-ethX in /tmp until ethX is working correctly. iii. Re-run the netAdm command. It will create and configure the interface in one action. 9. Reboot the VM. It will take approximately 5 minutes for the VM to complete rebooting. <ol style="list-style-type: none"> a. <code>\$ sudo init 6</code> <p>The new VM should now be accessible via both network and Horizon console.</p>
<p>7.</p> <input data-bbox="154 1848 203 1900" type="checkbox"/>	<p>Verify Network connectivity.</p>	<p>Ping the default gateway.</p> <pre>\$ ping -c3 <gateway address for the External management network></pre>

Procedure 2: Create SDS Guests From OVA (KVM/OpenStack)

Step	Procedure	Result
8. <input type="checkbox"/>		<ul style="list-style-type: none">Repeat these steps 1 - 6 for each server before continuing on to the next procedure. <i>(e.g. NOAM B, Query Server, SOAM A, SOAM B, DPs)</i>
THIS PROCEDURE HAS BEEN COMPLETED		

5.0 CONFIGURATION PROCEDURES

5.1 Configuring SDS NOAM Servers A and B

Assumptions:

- This procedure assumes that the SDS Network Element XML file for the Primary Provisioning SDS site has previously been created, as described in 0.
- This procedure assumes that the Network Element XML files are on the laptop's hard drive.

This procedure requires that the user connects to the SDS GUI prior to configuring the first SDS NOAM Server.

Procedure 3: Configuring SDS NOAM Servers A and B

Step	Procedure	Result
<p>1.</p> <input data-bbox="152 814 198 861" type="checkbox"/>	<p>SDS NOAM Server A:</p> <p>Launch an approved web browser and connect to the SDS NOAM SERVER A XMI IP address.</p> <p>NOTE: <i>If presented with the "security certificate" warning screen shown to the right, choose the following option:</i></p> <p>"Continue to this website (not recommended)".</p>	

Procedure 3: Configuring SDS NOAM Servers A and B

Step	Procedure	Result
<p>2.</p> <p><input type="checkbox"/></p>	<p>SDS NOAM Server A:</p> <p>The user should be presented the login screen shown on the right.</p> <p>Login to the GUI using the default user and password.</p>	

<p>Procedure 3.1 Configuring the Network Element</p>		
<p>3.</p> <p><input type="checkbox"/></p>	<p>SDS NOAM Server A:</p> <p>Select...</p> <p>Main Menu</p> <p>→ Configuration</p> <p>→ Network Elements</p> <p>...as shown on the right.</p>	

Procedure 3.1 Configuring the Network Element

<p>4.</p> <p><input type="checkbox"/></p>	<p>SDS NOAM Server A:</p> <p>From the Configuration / Network Elements screen...</p> <p>Select the “Browse” dialogue button (scroll to bottom left corner of screen).</p>	
<p>5.</p> <p><input type="checkbox"/></p>	<p>SDS NOAM Server A:</p> <p>Note: This step assumes that the xml files were previously prepared, as described in Appendix A.</p> <p>1) Select the location containing the site .xml file.</p> <p>2) Select the .xml file and click the “Open” dialogue button.</p>	
<p>6.</p> <p><input type="checkbox"/></p>	<p>SDS NOAM Server A:</p> <p>Select the “Upload File” dialogue button (bottom left corner of screen).</p>	

Procedure 3.1 Configuring the Network Element

7.

SDS NOAM Server A:

If the values in the .xml file pass validation rules, the user will receive a banner information message showing that the data has been successfully validated and committed to the DB.

NOTE: You may have to left mouse click the **"Info"** banner option in order to see the banner output.

Main Menu: Configuration -> Network Elements

Procedure 3.2 Configuring Services

8.

SDS NOAM Server A:

Select...

Main Menu
 → Configuration
 → Services

...as shown on the right.

1) The user will be presented with the "Services" configuration screen as shown on the right.

2) Select the "Edit" dialogue button.

Name	Intra-NE Network	Inter-NE Network
OAM	Unspecified	Unspecified
Replication	Unspecified	Unspecified
Signaling	Unspecified	Unspecified
HA_Secondary	Unspecified	Unspecified
HA_MP_Secondary	Unspecified	Unspecified
Replication_MP	Unspecified	Unspecified
ComAgent	Unspecified	Unspecified

9.

SDS NOAM Server A:

1) With the exception of "Signaling" which is left "Unspecified", set other services values so that all **Intra-NE Network** traffic is directed across **IMI** and all **Inter-NE Network** traffic is across **XMI**.

2) Select the "Ok" dialogue button.

3) Select the "Ok" popup dialogue button.

Name	Intra-NE Network	Inter-NE Network
OAM	IMI	XMI
Replication	IMI	XMI
Signaling	Unspecified	Unspecified
HA_Secondary	IMI	XMI
HA_MP_Secondary	IMI	XMI
Replication_MP	IMI	XMI
ComAgent	IMI	XMI

OK Apply Cancel

You must restart all Servers to apply any services changes, ComAgent

OK Cancel

Procedure 3.2 Configuring Services

<p>10.</p> <p><input type="checkbox"/></p> <p>SDS NOAM Server A:</p> <p>The user will be presented with the “Services” configuration screen as shown on the right</p>	<table border="1"> <thead> <tr> <th>Name</th> <th>Intra-NE Network</th> <th>Inter-NE Network</th> </tr> </thead> <tbody> <tr> <td>OAM</td> <td>INTERNALIMI</td> <td>INTERNALXMI</td> </tr> <tr> <td>Replication</td> <td>INTERNALIMI</td> <td>INTERNALXMI</td> </tr> <tr> <td>Signaling</td> <td>Unspecified</td> <td>Unspecified</td> </tr> <tr> <td>HA_Secondary</td> <td>INTERNALIMI</td> <td>INTERNALXMI</td> </tr> <tr> <td>HA_MP_Secondary</td> <td>INTERNALIMI</td> <td>INTERNALXMI</td> </tr> <tr> <td>Replication_MP</td> <td>INTERNALIMI</td> <td>INTERNALXMI</td> </tr> <tr> <td>ComAgent</td> <td>INTERNALIMI</td> <td>INTERNALXMI</td> </tr> </tbody> </table>	Name	Intra-NE Network	Inter-NE Network	OAM	INTERNALIMI	INTERNALXMI	Replication	INTERNALIMI	INTERNALXMI	Signaling	Unspecified	Unspecified	HA_Secondary	INTERNALIMI	INTERNALXMI	HA_MP_Secondary	INTERNALIMI	INTERNALXMI	Replication_MP	INTERNALIMI	INTERNALXMI	ComAgent	INTERNALIMI	INTERNALXMI
Name	Intra-NE Network	Inter-NE Network																							
OAM	INTERNALIMI	INTERNALXMI																							
Replication	INTERNALIMI	INTERNALXMI																							
Signaling	Unspecified	Unspecified																							
HA_Secondary	INTERNALIMI	INTERNALXMI																							
HA_MP_Secondary	INTERNALIMI	INTERNALXMI																							
Replication_MP	INTERNALIMI	INTERNALXMI																							
ComAgent	INTERNALIMI	INTERNALXMI																							

Procedure 3.3 Configuring the SDS NOAM Server

<p>11.</p> <p><input type="checkbox"/></p> <p>Note: This step thru the last step of this procedure need to be done for both SDS NOAM Server A and SDS NOAM Server B.</p> <p>SDS NOAM Server A or B:</p> <p>Select...</p> <p>Main Menu → Configuration → Servers</p> <p>...as shown on the right.</p> <p>Select the “Insert” dialogue button.</p>	<table border="1"> <thead> <tr> <th>Hostname</th> <th>Role</th> <th>System ID</th> <th>Server Group</th> <th>Network Element</th> <th>Location</th> <th>Place</th> <th>Details</th> </tr> </thead> <tbody> <tr> <td> </td> </tr> </tbody> </table>	Hostname	Role	System ID	Server Group	Network Element	Location	Place	Details								
Hostname	Role	System ID	Server Group	Network Element	Location	Place	Details										

Procedure 3.3 Configuring the SDS NOAM Server

12.

SDS NOAM Server A or B:

1) Input the assigned "hostname" for the SDS NOAM Server (A or B).

2) Select "NETWORK OAM&P" for the server "Role" from the pull-down menu.

3) Input the assigned hostname again as the "System ID" for the SDS NOAM Server (A or B).

4) Select "SDS Cloud Guest" for the Hardware Profile.

5) Select the Network Element Name for the SDS from the pull-down menu.

NOTE: After the Network Element Name is selected, the Interfaces fields will be displayed, as seen in step 13.

6) Enter the site location.

NOTE: Location is an optional field.

Main Menu: Configuration -> Servers [Insert]

Thu Oct 08 13:54:27 2015

Adding a new server

Attribute	Value	Description
Hostname	SDS-N01 *	Unique name for the server. [Default = n/a. Range = A 20-character string. Valid characters are alphanumeric and minus sign. Must start with an alphanumeric and end with an alphanumeric.]
Role	NETWORK OAM&P *	Select the function of the server
System ID	SDS-N01	System ID for the NOAMP or SOAM server. [Default = n/a. Range = A 64-character string. Valid value is any text string.]
Hardware Profile	SDS Cloud Guest	Hardware profile of the server
Network Element Name	SDS_NE *	Select the network element
Location	MoVille	Location description [Default = ""]. Range = A 15-character string. Valid value is any text string.]

Procedure 3.3 Configuring the SDS NOAM Server

13.

SDS NOAM Server A or B:

1) Enter the XMI and IMI IP addresses for the SDS NOAM Server.

OpenStack Note: These must be the addresses used during instance booting and networking.

2) Set the XMI and IMI Interfaces to Ethernet interfaces associated with the **XMI and IMI Virtual networks. DO NOT** check the **VLAN** checkboxes.

3) Click the "NTP Servers:" "Add" dialogue button.

4) Enter the NTP Server IP Address for an NTP Server.

5) If you have another NTP Server IP address, repeat (1) and (2) to enter it.

6) Optionally, click the **"Prefer"** checkbox to prefer one NTP Server over the other.

7) Click the "Ok" dialogue button.

Interfaces:		
Network	IP Address	Interface
XMI (10.250.65.0/24)	10.250.65.117	eth0 <input type="checkbox"/> VLAN (3)
IMI (192.168.0.0/24)	192.168.0.1	eth1 <input type="checkbox"/> VLAN (4)

NTP Servers:	
NTP Server IP Address	Prefer
<input type="button" value="Add"/>	
10.250.65.115	<input checked="" type="checkbox"/>
	<input type="button" value="Remove"/>

Procedure 3.4 Applying the SDS NOAM Server Configuration File

Procedure 4.1 Configuring the SDS NOAM Server Group

3. SDS NOAM Server A:
Select...

Main Menu
→ Configuration
→ Server Groups

...as shown on the right.

4. SDS NOAM Server A:

1) The user will be presented with the “Server Groups” configuration screen as shown on the right.

2) Select the “Insert” dialogue button from the bottom left corner of the screen.

NOTE: The user may need to use the vertical scroll-bar in order to make the “Insert” dialogue button visible.

5. SDS NOAM Server A:

The user will be presented with the “Server Groups [Insert]” screen as shown on the right.

NOTE: Leave the “WAN Replication Connection Count” blank (it will default to 1).

Field	Value	Description
Server Group Name	<input type="text"/>	Unique identifier used to label a Server Group. [Default = n/a. Range = A 1-32-character string. Valid characters are alphanumeric and underscore. Must contain at least one alpha and must not start with a digit.]
Level	- Select Level - *	Select one of the Levels supported by the system. [Level A groups contain NOAMP and Query servers. Level B groups are optional and contain SOAM servers. Level C groups contain MP servers.]
Parent	- Select Parent - *	Select an existing Server Group or NONE
Function	- Select Function - *	Select one of the Functions supported by the system
WAN Replication Connection Count	1	Specify the number of TCP connections that will be used by replication over any WAN connection associated with this Server Group. [Default = 1. Range = An integer between 1 and 8.]

THIS PROCEDURE HAS BEEN COMPLETED

5.4 OAM Installation for DP-SOAM sites (All DP-SOAM sites)

Assumptions:

- This procedure assumes that the DP-SOAM Network Element XML file for the DP-SOAM site has previously been created, as described in 0.
- This procedure assumes that the Network Element XML files are on the laptop's hard drive.

This procedure is for installing the DP-SOAM software on the OAM server located at each DSR Signaling Site. The DP-SOAM and DSR OAM servers run in 2 virtual machines.

This procedure assumes that the DSR 7.2/7.3 or later OAM has already been installed in a virtual environment, as described in as described in [2] DSR Cloud Installation Guide.

Procedure 6 Configuring the Network Element (DP-SOAM)		
1.	<p>Active SDS VIP:</p> <p>Launch an approved web browser and connect to the XMI Virtual IP address (VIP) assigned to Active SDS site using "https://"</p>	

Procedure 6 Configuring the Network Element (DP-SOAM)

2.

Active SDS VIP:
 The user should be presented the login screen shown on the right.

Login to the GUI using the default user and password.

3.

Active SDS VIP:
 Select...

Main Menu
 → Configuration
 → Network Elements

...as shown on the right.

Select the "Browse" dialogue button (scroll to bottom left corner of screen).

4.

Active SDS VIP:
Note: This step assumes that the xml files were previously prepared, as described in 0.

1) Select the location containing the site .xml file.

2) Select the .xml file and click the "Open" dialogue button.

Procedure 6 Configuring the Network Element (DP-SOAM)

<p>5.</p> <p><input type="checkbox"/></p>	<p>Active SDS VIP:</p> <p>Select the “Upload File” dialogue button (bottom left corner of screen).</p>	
<p>6.</p> <p><input type="checkbox"/></p>	<p>Active SDS VIP:</p> <p>If the values in the .xml file pass validation rules, the user will receive a banner information message showing that the data has been successfully validated and committed to the DB.</p>	

Procedure 6.1 Configuring the SOAM Server

<p>7.</p> <p><input type="checkbox"/></p> <p>Active SDS VIP:</p> <p>Select...</p> <p>Main Menu</p> <p>→ Configuration</p> <p>→ Servers</p> <p>...as shown on the right.</p> <p>Select the “Insert” dialogue button (bottom left corner of screen).</p>	<p>ORACLE Communications Diameter Signal Router Full Address 5.0.1-50.21.0</p> <p>Connected using VIP to SDS-NO1 (ACTIVE NETWORK OAM&P)</p> <p>Main Menu</p> <ul style="list-style-type: none"> Administration Configuration <ul style="list-style-type: none"> Network Elements Services Resource Domain Servers Server Groups Places Place Associations DSCP Network Alarms & Events Security Log Status & Manage 	<p>Main Menu: Configuration -> Servers</p> <p>Filter</p> <table border="1"> <thead> <tr> <th>Hostname</th> <th>Role</th> <th>System ID</th> </tr> </thead> <tbody> <tr> <td>SDS-NO1</td> <td>Network OAM&P</td> <td>SDS-NO1</td> </tr> <tr> <td>SDS-NO2</td> <td>Network OAM&P</td> <td>SDS-NO2</td> </tr> <tr> <td>SDS-QS1</td> <td>Query Server</td> <td></td> </tr> </tbody> </table> <p>Insert Edit Delete Export Report</p> <p>Insert a new Server and associated Interface(s).</p>	Hostname	Role	System ID	SDS-NO1	Network OAM&P	SDS-NO1	SDS-NO2	Network OAM&P	SDS-NO2	SDS-QS1	Query Server	
Hostname	Role	System ID												
SDS-NO1	Network OAM&P	SDS-NO1												
SDS-NO2	Network OAM&P	SDS-NO2												
SDS-QS1	Query Server													

Procedure 6.1 Configuring the SOAM Server

8.

Active SDS VIP:

- 1) Input the assigned "hostname" for OAM Server.
 - 2) Select "**SYSTEM OAM**" for the Role from the pull-down menu.
 - 3) Input the assigned hostname again as the "**System ID**" for the SO Server (A or B).
 - 4 Select "**SDS Cloud Guest**" for the **Hardware Profile**.
 - 5) Select the **Network Element Name** for the SDS from the pull-down menu.
 - 6) Enter the site location.
- NOTE:** Location is an optional field.

Main Menu: Configuration -> Servers [Insert]

Thu Oct 08 14:21:32 2015

Info

Adding a new server

Attribute	Value	Description
Hostname	SDS-S01 *	Unique name for the server. [Default = n/a. Range = A 20-character string. Valid characters are alphanumeric and minus sign. Must start with an alphanumeric and end with an alphanumeric.]
Role	SYSTEM OAM *	Select the function of the server
System ID		System ID for the NOAMP or SOAM server. [Default = n/a. Range = A 64-character string. Valid value is any text string.]
Hardware Profile	SDS Cloud Guest	Hardware profile of the server
Network Element Name	SDS_NE *	Select the network element
Location	MoVille	Location description [Default = ""]. Range = A 15-character string. Valid value is any text string.]

Procedure 6.1 Configuring the SOAM Server

9.

1) Enter the **XMI IP address** and **IMI IP address** for the **DP-SOAM Server**.

2) Set the **XMI Interface** to “ethX” and do NOT check the **VLAN** box.

3) Set the **IMI Interface** to “ethX” and do NOT check the **VLAN** box.

4) Click the “**NTP Servers:**” “**Add**” dialogue button.

5) Enter the **NTP Server IP Address** for an NTP Server.

6) If you have another **NTP Server IP address**, repeat (1) and (2) to enter it.

7) Optionally, click the “**Prefer**” checkbox to prefer one NTP Server over the other.

8) Click the “**Ok**” dialogue button.

Interfaces:		
Network	IP Address	Interface
XMI (10.250.65.0/24)	10.250.65.120	eth0 <input type="checkbox"/> VLAN (3)
IMI (192.168.65.0/24)	192.168.65.120	eth1 <input type="checkbox"/> VLAN (4)

Info ▾

Field	Value	Description
Server Group Name	SDS_SO *	Unique identifier used to label a Server Group. [Default = n/a. Range = A 1-32-character string. Valid characters are alphanumeric and underscore. Must contain at least one alpha and must not start with a digit.]
Level	B *	Select one of the Levels supported by the system. [Level A groups contain NOAMP and Query servers. Level B groups are optional and contain SOAM servers. Level C groups contain MP servers.]
Parent	SDS_NO *	Select an existing Server Group or NONE
Function	SDS *	Select one of the Functions supported by the system
WAN Replication Connection Count	1	Specify the number of TCP connections that will be used by replication over any WAN connection associated with this Server Group. [Default = 1. Range = An integer between 1 and 8.]

Field	Value	Description
Server Group Name	MP *	Unique identifier used to label a Server Group. [Default = n/a. Range = A 1-32-character string. Valid characters are alphanumeric and underscore. Must contain at least one alpha and must not start with a digit.]
Level	C *	Select one of the Levels supported by the system. [Level A groups contain NOAMP and Query servers. Level B groups are optional and contain SOAM servers. Level C groups contain MP servers.]
Parent	SO *	Select an existing Server Group or NONE
Function	SDS *	Select one of the Functions supported by the system
WAN Replication Connection Count	1	Specify the number of TCP connections that will be used by replication over any WAN connection associated with this Server Group. [Default = 1. Range = An integer between 1 and 8.]

Ok Apply Cancel

Procedure 8.4 Restarting the Database Processor Application (DP)

27.

Active SDS VIP:

1) Using the mouse, select the “**DP**” hostname. The line entry should now be highlighted in **GREEN**.

2) Select the “**Restart**” dialogue button from the bottom left corner of the screen.

3) Click the “**OK**” button on the confirmation dialogue box.

4) The user should be presented with a confirmation message (in the banner area) for the “**DP**” stating: “**Successfully restarted application**”.

NOTE: The user may need to use the vertical scroll-bar in order to make the “**Restart**” dialogue button visible.

Main Menu: Status & Manage -> Server

Filter ▾

Network Element	Server Hostname	Appl State	Alm	DB	Reporting Status	Proc
NO	SDS-NO1	Enabled	Err	Norm	Norm	Norm
NO	SDS-NO2	Enabled	Norm	Norm	Norm	Norm
NO	SDS-QS	Enabled	Norm	Norm	Norm	Norm
SO	SDS-SO2	Enabled	Norm	Norm	Norm	Norm
SO	SDS-SO1	Enabled	Norm	Norm	Norm	Norm
SO	SDS-DP1	Disabled	Warn	Norm	Norm	Man

Stop Restart Reboot NTP Sync Report

Restart selected server(s).

Are you sure you wish to restart application software on the following server(s)?
SDS-DP1

OK Cancel

28.

Active SDS VIP:

Verify that the “**Appl State**” now shows “**Enabled**” and that the “**Alm, DB, Reporting Status & Proc**” status columns all show “**Norm**” for the “**DP**”.

Main Menu: Status & Manage -> Server

Filter ▾ Info ▾

Network Element	Server Hostname	Appl State	Alm	DB	Reporting Status	Proc
NO	SDS-NO1	Enabled	Err	Norm	Norm	Norm
NO	SDS-NO2	Enabled	Norm	Norm	Norm	Norm

5.8 Backups and Disaster Prevention

Procedure 1: Backups and Disaster Prevention

Step	Procedure	Result
1 <input type="checkbox"/>	Backups	The preferred method of backing up cloud system VM instances is by snapshotting. Once the DSR and optional sub-systems are installed and configured, but before adding traffic, use the appropriate cloud tool such as the VMware Manager or the OpenStack Horizon GUI, to take snapshots of critical VM instances. It is particularly important to snapshot the control instances, such as the NOAM and SOAM.

Appendix A. Creating an XML file for Installing SDS Network Elements

SDS Network Elements can be created by using an XML configuration file. The SDS software image (*.iso) contains two examples of XML configuration files for “NO” (Network OAM&P) and “SO” (System OAM) networks. These files are named **SDS_NO_NE.xml** and **SDS_SO_NE.xml** and are stored on the **/usr/TKLC/sds/vlan** directory. The customer is required to create individual XML files for each of their SDS Network Elements. The format for each of these XML files is identical.

Below is an example of the SDS_NO_NE.xml file. The highlighted values are values that the user must update.

NOTE: The **Description** column in this example includes comments for this document only. **Do not include** the Description column in the actual XML file used during installation.

Table 3 - SDS XML SDS Network Element Configuration File (IPv4)

XML File Text	Description
<?xml version="1.0"?>	
<networkelement>	
<name> sds_mrsvnc </name>	Unique identifier used to label a Network Element. [Range = 1-32 character string. Valid characters are alphanumeric and underscore. Must contain at least one alpha and must not start with a digit.]
<ntpserver>	
<ntpserver> 10.250.32.10 </ntpserver>	IP Address of the first NTP server. There must be at least one NTP server IP address defined.
<ntpserver> 10.250.32.51 </ntpserver>	IP Address of second NTP server, if it exists; otherwise, this line must be deleted.
</ntpserver>	
<networks>	
<network>	
<name>XMI</name>	Name of customer external network. Note: Do NOT change this name.
<vlanId> 3 </vlanId>	The VLAN ID to use for this VLAN. [Range = 2-4094.]
<ip> 10.250.55.0 </ip>	The network address of this VLAN [Range = A valid IP address]
<mask> 255.255.255.0 </mask>	Subnetting to apply to servers within this VLAN
<gateway> 10.250.55.1 </gateway>	The gateway router interface address associated with this network [Range = A valid IP address]
<isDefault>>true</isDefault>	Indicates whether this is the network with a default gateway. [Range = true/false]
</network>	
<network>	
<name>IMI</name>	Name of customer internal network. Note: Do NOT change this name.
<vlanId> 4 </vlanId>	The VLAN ID to use for this VLAN. [Range = 2-4094.]
<ip> 169.254.100.0 </ip>	The network address of this VLAN [Range = A valid IP address]
<mask> 255.255.255.0 </mask>	Subnetting to apply to servers within this VLAN
<gateway> 169.254.100.3 </gateway>	The gateway router interface address associated with this network [Range = A valid IP address]
</network>	
</networks>	

</networkelement>

Appendix C. Resource Profile

VM Name	VM Purpose	vCPUs	RAM (GB)	Storage (GB)	Notes
SDS NOAM	Database Processor for address resolution and subscriber location functions	4	12	125	
SDS SOAM	Database Processor Site (node) Operation, Administration, Maintenance for address resolution and subscriber location functions	4	12	125	
DP	Subscriber Database Processor for address resolution and subscriber location functions.	4	12	125	
Query Server	Allows customers to query FABR subscriber data via a MySQL interface	4	12	125	

VM Name	OAM (XMI)	Local (IMI)	Signaling A (XSI1)	Signaling B (XSI2)	Signaling C (XSI3)	Signaling D (XSI4)	Replication (SBR Rep)
SDS NOAM	eth0	eth1					
SDS SOAM	eth0	eth1					
DP	eth0	eth1					
Query	eth0	eth1					

Note: The Ethernet interfaces define in the table are there as a guideline. Interfaces can be ordered as preferred. I.E. eth1 or eth2 could be associated with XMI if desired.

Appendix D. Common KVM/Openstack Tasks

D.1 Import an OVA File

<p>1 <input type="checkbox"/></p>	<p>Create VM flavors.</p>	<p>Use the Resource Profile values to create flavors for each type of VM. Flavors can be created with the Horizon GUI in the “Admin” section, or with the “nova flavor-create” command line tool. Make the flavor names as informative as possible. As flavors describe resource sizing, a common convention is to use a name like “0406060” where the first two figures (04) represent the number of virtual CPUs, the next two figures (06) might represent the RAM allocation in GB and the final three figures (060) might represent the disk space in GB.</p>
<p>2 <input type="checkbox"/></p>	<p>Unpack and import an image file using the glance utility.</p>	<ol style="list-style-type: none"> 8. Copy the OVA file to the OpenStack control node. <ol style="list-style-type: none"> i. <code>\$ scp SDS-x.x.x.x.ova admusr@node:~</code> 9. Login to the OpenStack control node. <ol style="list-style-type: none"> i. <code>\$ ssh admusr@node</code> 10. In an empty directory unpack the OVA file using “tar” <ol style="list-style-type: none"> i. <code>\$ tar xvf SDS-.x.x.x.x.ova</code> 11. One of the unpacked files will have a “.vmdk” suffix. This is the VM image file that must be imported. <ol style="list-style-type: none"> i. SDS-x.x.x.x-disk1.vmdk 12. Source the OpenStack “admin” user credentials. <ol style="list-style-type: none"> i. <code>\$. keystonerc_admin</code> 13. D.2 Create a Network Port

<p>1 <input type="checkbox"/></p>	<p>Create the network ports for the NO network interfaces.</p>	<ol style="list-style-type: none"> 1. Each network interface on an instance must have an associated network port. <ol style="list-style-type: none"> a. An instance will usually have at least eth0 and eth1 for a public and private network respectively.
---------------------------------------	---	--

		<ul style="list-style-type: none"> b. Some configurations will require more interfaces and corresponding network ports. <ol style="list-style-type: none"> 2. Determine the IP address for the interface. <ol style="list-style-type: none"> a. For eth0, the IP might be 10.x.x.157. b. For eth1, the IP might be 192.168.x.157 3. Identify the neutron network ID associated with each IP/interface using the “neutron” command line tool. <ol style="list-style-type: none"> a. “\$ neutron net-list” 4. Identify the neutron subnet ID associated with each IP/interface using the “neutron” command line tool. <ol style="list-style-type: none"> a. “\$ neutron subnet-list” 5. Create the network port using the “neutron” command line tool, being sure to choose an informative name. Note the use of the subnet ID and the network ID (final argument). <ol style="list-style-type: none"> a. Port names are usually a combination of instance name and network name. <ol style="list-style-type: none"> i. “NO1-xmi” ii. “SO2-imi” iii. “MP5-xsi2” b. The ports must be owned by the DSR tenant user, not the admin user. Either source the credentials of the DSR tenant user or use the DSR tenant user ID as the value for the “—tenant-id” argument. <ol style="list-style-type: none"> i. “\$. keystonec_dsr_user” ii. “\$ keystone user-list” c. <code>\$ neutron port-create --name=NO1-xmi --tenant-id <tenant id> --fixed-ip subnet_id=<subnet id>,ip_address=10.x.x.157 <network id></code> d. <code>\$ neutron port-create --name=NO1-imi --tenant-id <tenant id> --fixed-ip subnet_id=<subnet id>,ip_address=192.168.x.157 <network id></code> e. View your newly created ports using the neutron tool. <ol style="list-style-type: none"> i. “\$ neutron port-list”
--	--	---

D.3 Create and Boot OpenStack Instance

<p>1 □</p>	<p>Create a VM instance from a glance image.</p>	<ol style="list-style-type: none"> 3. Get the following configuration values. <ol style="list-style-type: none"> a. The image ID. <ol style="list-style-type: none"> i. "\$ glance image-list" b. The flavor ID. <ol style="list-style-type: none"> i. "\$ nova flavor-list" c. The port ID(s) <ol style="list-style-type: none"> i. "\$ neutron port-list" d. An informative name for the instance. <ol style="list-style-type: none"> i. "NO1" ii. "SO2" iii. "MP5" 4. Create and boot the VM instance. <ol style="list-style-type: none"> a. The instance must be owned by the DSR tenant user, not the admin user. Source the credentials of the DSR tenant user and issue the following command. b. <pre>\$ nova boot --image <image ID> --flavor <flavor id> --nic port-id=<first port id> --nic port-id=<second port id> InstanceName</pre> c. view the newly created instance using the nova tool. <ol style="list-style-type: none"> i. "\$ nova list --all-tenants" <p>The VM will take approximately 5 minutes to boot. At this point, the VM has no configured network interfaces, and can only be accessed by the "Horizon" console tool.</p>
----------------	---	--

D.4 Configure Networking for OpenStack Instance

<p>1 □</p>	<p>Configure the network interfaces and hostname.</p>	<ol style="list-style-type: none"> 10. Log in to the "Horizon" GUI as the DSR tenant user. 11. Go to the Compute/Instances section. 12. Click on the "Name" field of the newly created instance. 13. Select the "Console" tab. 14. Login as the admusr. 15. Select an informative hostname for the new VM instance. <ol style="list-style-type: none"> a. "NO1". b. "SO2". c. "MP5". 16. Use sudo to change the machine hostname from the default value.
----------------	--	---

		<ul style="list-style-type: none"> a. Edit /etc/hosts. <ul style="list-style-type: none"> i. Append the hostname to the IPv4 line. <ul style="list-style-type: none"> 1. "127.0.0.1 localhost localhost4 NO1" ii. Append the hostname to the IPv6 line. <ul style="list-style-type: none"> 1. ":::1 localhost localhost6 NO1" b. Edit /etc/sysconfig/hostname. <ul style="list-style-type: none"> i. Change the "HOSTNAME=XXXX" line to the new hostname. ii. "HOSTNAME=NO1" c. Set the hostname on the command line. <ul style="list-style-type: none"> i. "\$ sudo hostname NO1" <p>17. Configure the network interfaces, conforming to the interface-to-network mappings described at the bottom of the Resource Profile in Appendix C.</p> <ul style="list-style-type: none"> a. "\$ sudo netAdm add --onboot=yes --device=eth0 --address=<xmi port ip> --netmask=<xmi net mask>" b. "\$ sudo netAdm add --onboot=yes --device=eth1 --address=<imi port ip> --netmask=<imi net mask>" c. "\$ sudo netAdm add --route=default --device=eth0 --gateway=<xmi gateway ip>" d. Under some circumstances, it may be necessary to configure more interfaces. e. If netAdm fails to create the new interface (ethX) because it already exists in a partially configured state, perform the following actions. <ul style="list-style-type: none"> i. \$ cd /etc/sysconfig/network-scripts ii. \$ sudo mv ifcfg-ethX /tmp <ul style="list-style-type: none"> 1. Keep ifcfg-ethX in /tmp until ethX is working correctly. iii. Re-run the netAdm command. It will create and configure the interface in one action. <p>18. Reboot the VM. It will take approximately 5 minutes for the VM to complete booting.</p> <ul style="list-style-type: none"> a. "\$ sudo init 6" <p>The new VM should now be accessible via both network and Horizon console.</p>
--	--	--

Appendix E. Application VIP Failover Options (OpenStack)

E.1 Application VIP Failover Options

Within an OpenStack cloud environment there are several options for allowing applications to manage their own virtual IP (VIP) addresses as is traditionally done in telecommunications applications. This document describes two of those options:

- Allowed address pairs
- Disable port security

Each of these options is covered in the major sub-sections that follow. The last major sub-section discusses how to utilize application managed virtual IP addresses within an OpenStack VM instance.

Both of these options effectively work around the default OpenStack Networking (Neutron) service anti-spoofing rules that ensure that a VM instance cannot send packets out a network interface with a source IP address different from the IP address Neutron has associated with the interface. In the Neutron data model, the logical notion of networks, sub-networks and network interfaces are realized as networks, subnets, and ports as shown in the following figure:

Figure 1 - Neutron High-Level Data Model

Note how a port in the Neutron data model maps to at most one VM instance where internal to the VM instance, the port will be represented as an available network device such as eth0. VM instances can have multiple network interfaces in which case there will be multiple Neutron ports associated with the VM instance, each with different MAC and IP addresses.

Each Neutron port by default has one MAC Address and one IPv4 or IPv6 address associated with it. The IP address associated with a port can be assigned in two ways:

- Automatically by Neutron when creating a port to fulfill an OpenStack Compute (Nova) service request to associate a network interface with a VM instance to be instantiated OR
- Manually by a cloud administrator when creating or updating a Neutron port

The anti-spoofing rules are enforced at the Neutron port level by ensuring that the source IP address of outgoing packets matches the IP address Neutron has associated with the corresponding port assigned to the VM instance. By default if the

source IP address in the outgoing packet does not match the IP address associated with the corresponding Neutron port then the packet is dropped.

These anti-spoofing rules clearly create a complication for the use of application managed virtual IP addresses since Neutron is not going to know about the VIPs being applied by the application to VM instance network interfaces without some interaction between the application (or a higher level management element) and Neutron. Which is why the two options in this document either fully disable the port security measures within Neutron, including the anti-spoofing rules, or expand the set of allowable source IP addresses to include the VIPs that may be used by the application running within a VM instance.

Note that for both of the options described in the following sub-sections, there is a particular Neutron service extension or feature that must be enabled for the option to work. For one option (allowed address pairs) the required Neutron extension is enabled in most default deployments whereas for the other option (allow port security to be disabled) it is not.

Within this document when describing how to utilize either of these two options there will be example command line operations that interact with the OpenStack Neutron service via its command line utility, simply named `neutron`. However, be aware that all of the operations performed using the `neutron` command line utility can also be performed through the Neutron REST APIs, see the [Networking v2.0 API documentation](#) for more information.

E.2 Allowed Address Pairs

This section describes an option that extends the set of source IP addresses that can be used in packets being sent out a VM instance's network interface (which maps to a Neutron port). This option utilizes a Neutron capability, called the allowed-address-pairs extension, which allows an entity (cloud administrator, management element, etc.) to define additional IP addresses to be associated with a Neutron port. In this way if an application within the VM instance sends an outgoing packet with one of those additional IP addresses, the Neutron anti-spoofing rules enforcement logic will not drop those packets. The Neutron allowed-address-pairs extension is available starting with the OpenStack Havana release.

The three sub-sections that follow describe the OpenStack configuration requirements for this option, how to utilize this option after a VM instance has already booted, and how to utilize this option before a VM instance has booted.

E.3 OpenStack Configuration Requirements

The Neutron allowed-address-pairs extension needs to be enabled for this option to work. For most OpenStack cloud deployments this extension should be enabled by default but to check, run the following command (after sourcing the appropriate user credentials file):

```
# neutron ext-list
+-----+-----+
| alias          | name          |
+-----+-----+
| security-group | security-group |
| l3_agent_scheduler | L3 Agent Scheduler |
| net-mtu        | Network MTU   |
| ext-gw-mode    | Neutron L3 Configurable external gateway mode |
| binding        | Port Binding  |
| provider       | Provider Network |
| agent          | agent         |
| quotas         | Quota management support |
| subnet_allocation | Subnet Allocation |
| dhcp_agent_scheduler | DHCP Agent Scheduler |
| l3-ha          | HA Router extension |
```

multi-provider	Multi Provider Network	
external-net	Neutron external network	
router	Neutron L3 Router	
allowed-address-pairs	Allowed Address Pairs	
extraroute	Neutron Extra Route	
extra_dhcp_opt	Neutron Extra DHCP opts	
dvr	Distributed Virtual Router	
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+		

The allowed-address-pairs extension should appear in the list of extensions as shown in the bold line above.

E.4 After a VM instance has been booted: Allowed Address Pairs

If a VM instance has already been booted, i.e. instantiated, and you need to associate one or more additional IP addresses with the Neutron port assigned to the VM instance then you need to execute a command of the following form:

```
# neutron port-update <Port ID> --allowed_address_pairs list=true type=dict ip_address=<VIP address to be added>
```

where the bolded items have the following meaning:

- <Port ID>

Identifies the ID of the port within Neutron which can be determined by listing the ports, `neutron port-list`, or if the port is named then the port ID can be obtained directly in the above command with a sequence like “\$(neutron port-show -f value -F id <Port Name>)” to replace the <Port ID> placeholder.

- <VIP address to be added>

Identifies the IP address, a virtual IP address in this case, that should additionally be associated with the port where this can be a single IP address, e.g. 10.133.97.135/32, or a range of IP addresses as indicated by a value such as 10.133.97.128/30.

So for example if you wanted to indicate to Neutron that the allowed addresses for a port should include the range of addresses between 10.133.97.136 to 10.133.97.139 and the port had an ID of 8a440d3f-4e5c-4ba2-9e5e-7fc942111277 then you would enter the following command:

```
# neutron port-update 8a440d3f-4e5c-4ba2-9e5e-7fc942111277 --allowed_address_pairs list=true type=dict ip_address=10.133.97.136/30
```

E.5 Before a VM instance has been booted: Allowed Address Pairs

If you want to associate additional allowed IP addresses with a port before it is associated with a VM instance then you will need to first create the port and then associate one or more ports with a VM instance when it is booted. The command to create a new port with defined allowed address pairs is of the following form:

```
# neutron port-create --name <Port Name> --fixed-ip subnet-id=$(neutron subnet-show -f value -F id <Subnet name>),ip_address=<Target IP address> $(neutron net-show -f value -F id <Network name>) --allowed_address_pairs list=true type=dict ip_address=<VIP address to be added>
```

where the bolded items have the following meaning:

- <Port Name>

This is effectively a string alias for the port that is useful when trying to locate the ID for the port but the “--name **<Port Name>**” portion of the command is completely optional.

- <Subnet name>

The name of the subnet to which the port should be added.

- <Target IP address>

The unique IP address to be associated with the port.

- <Network Name>

The name of the network with which the port should be associated.

- <VIP address to be added>

This parameter value has the same meaning as described in the previous section.

So for example if you wanted to indicate to Neutron that a new port should have an IP address of 10.133.97.133 on the ‘ext-subnet’ subnet with a single allowed address pair, 10.133.97.134, then you would enter a command similar to the following:

```
# neutron port-create -name foo --fixed-ip subnet-id=$(neutron subnet-show -f value -F id ext-subnet),ip_address=10.133.97.133 $(neutron net-show -f value -F id ext-net) --allowed_address_pairs list=true type=dict ip_address=10.133.97.134/32
```

Once the port or ports with the additional allowed addresses have been created, when you boot the VM instance use a nova boot command similar to the following:

```
# nova boot --flavor m1.xlarge --image testVMimage --nic port-id=$(neutron port-show -f value -F id <Port Name>) testvm3
```

where the flavor, image, and VM instance name values will need to be replaced by values appropriate for your VM. If the port to be associated with the VM instance is not named then you will need to obtain the port's ID using the neutron port-list command and replace the “\$(neutron port-show -f value -F id <Port Name>)” sequence in the above command with the port's ID value.

E.6 Disable Port Security

This section describes an option that rather than extending the set of source IP addresses that are associated with a Neutron port, as is done with the `allowed-address-pairs` extension, simply disables the Neutron anti-spoofing filter rules for a given port. This option allows all IP packets originating from the VM instance to be propagated no matter whether the source IP address in the packet matches the IP address associated with the Neutron port or not. This option relies upon the Neutron `port_security` extension that is available starting with the OpenStack Kilo release.

The three sub-sections that follow describe the OpenStack configuration requirements for this option, how to utilize this option after a VM instance has already booted, and how to utilize this option before a VM instance has booted.

OpenStack Configuration Requirements

The Neutron `port_security` extension needs to be enabled for this method to work. For the procedure to enable the `port_security` extension see:

[ML2 Port Security Extension Wiki page](#)

NOTE: Enabling the `port_security` extension when there are already existing networks within the OpenStack cloud will cause all network related requests into Neutron to fail due to a [known bug in Neutron](#). There is a fix identified for this bug that will be part of the Liberty release and is scheduled to be backported to the Kilo 2015.1.2 release. In the mean time, **this option is only non-disruptive when working with a new cloud deployment where the cloud administrator can enable this feature before any networks and VM instances that use those networks are created.** The `port_security` extension can be enabled in an already deployed OpenStack cloud but all existing networks, subnets, ports, etc. will need to be deleted before enabling the `port_security` extension. This typically means that all VM instances will also need to be deleted as well but a knowledgeable cloud administrator **may** be able to do the following to limit the disruption of enabling the `port_security` extension:

- Record the current IP address assignments for all VM instances,
- Remove the network interfaces from any existing VM instances,
- Delete the Neutron resources,
- Enable the `port_security` extension,
- Re-create the previously defined Neutron resources (networks, subnets, ports, etc.), and then
- Re-add the appropriate network interfaces to the VMs.

Depending on the number of VM instances running in the cloud, this procedure may or may not be practical.

E.7 After a VM instance has been booted: Port Security

If you need to disable port security for a port after it has already been associated with a VM instance then you will need to execute one or both of the following commands to utilize the `port_security` option. First if the VM instance with which the existing port is associated has any associated security groups (run `nova list-secgroup <VM instance name>` to check) then you will first need to run a command of the following form for each of the security group(s) associated with the VM instance:

```
# nova remove-secgroup <VM instance name> <Security group name>
```

where the bolded item has the following meaning:

- **<VM instance name>**
Identifies the name of the VM instance for which the identified security group name should be deleted.
- **<Security group name>**

Identifies the name of the security group that should be removed from the VM instance.

So for example if you wanted to remove the default security group from a VM instance named 'testvm4' then you would enter a command similar to the following:

```
# nova remove-secgroup testvm4 default
```

Once any security groups associated with VM instance to which the Neutron port is assigned have been removed then the Neutron port(s) associated with the target VM instance will need to be updated to disable port security on those ports. The command to disable port security for a specific Neutron port is of the form:

```
# neutron port-update <Port ID> -- port-security-enabled=false
```

where the bolded item has the following meaning:

- <Port ID>

Identifies the ID of the port within Neutron which can be determined by listing the ports, `neutron port-list`, or if the port is named then the port ID can be obtained directly in the above command with a sequence such as “\$(neutron port-show -f value -F id <Port Name>)”.

So for example if you wanted to indicate to Neutron that port security should be disabled for a port with an ID of 6d48b5f2-d185-4768-b5a4-c0d1d8075e41 then you would enter the following command:

```
# neutron port-update 6d48b5f2-d185-4768-b5a4-c0d1d8075e41 --port-security-enabled=false
```

If the port-update command succeeds, within the VM instance with which the 6d48b5f2-d185-4768-b5a4-c0d1d8075e41 port is associated, application managed VIPs can now be added to the network interface within the VM instance associated with the port and network traffic using that VIP address should now propagate.

E.8 Before a VM instance has been booted: Port Security

If you want to disable port security for a port before it is associated with a VM instance then you will need to first create the port at which time you can specify that port security should be disabled. The command to create a new port with port security disabled is of the following form:

```
# neutron port-create --name <Port Name> --port-security-enabled=false --fixed-ip subnet-id=$(neutron subnet-show -f value -F id <Subnet name>),ip_address=<Target IP address>
$(neutron net-show -f value -F id <Network name>)
```

where the bolded items have the following meaning:

- <Port Name>

This is effectively a string alias for the port that is useful when trying to locate the ID for the port but the “--name <Port Name>” portion of the command is completely optional.

- <Subnet name>

The name of the subnet to which the port should be added.

- <Target IP address>

The unique IP address to be associated with the port.

- <Network Name>

The name of the network with which the port should be associated.

So for example if you wanted to indicate to Neutron that a new port should have port security disabled and an IP address of 10.133.97.133 on the 'ext-subnet' subnet then you would enter a command similar to the following:

```
# neutron port-create -name foo --port-security-enabled=false --fixed-ip subnet-
id=$(neutron subnet-show -f value -F id ext-subnet),ip_address=10.133.97.133 $(neutron net-
show -f value -F id ext-net)
```

Once the port or ports with port security disabled have been created, when you boot the VM instance you will need to execute a command similar to the following:

```
# nova boot --flavor m1.xlarge --image testVMimage --nic port-id=$(neutron port-show -f
value -F id <Port Name>) testvm3
```

where the flavor, image, and VM instance name values will need to be replaced by values appropriate for your VM. If the port to be associated with the VM instance is not named then you will need to obtain the port's ID using the neutron port-list command and replace the "\$ (neutron port-show -f value -F id <Port Name>)" sequence in the above command with the port's ID value.

E.9 Managing Application Virtual IP Addresses within VM instances

Once either of the previously described options is in place to enable applications to manage their own virtual IP addresses, there should be no modifications required to how the application already manages its VIPs in a non-virtualized configuration. There are many ways that an application can add or remove virtual IP addresses but as a reference point, here are some example command line operations to add a virtual IP address of 10.133.97.136 to the eth0 network interface within a VM and then send four gratuitous ARP packets to refresh the ARP caches of any neighboring nodes:

```
# ip address add 10.133.97.136/23 broadcast 10.133.97.27.355 dev eth0 scope global
```

```
# arping -c 4 -U -I eth0 10.133.97.136
```

As the creation of virtual IP addresses typically coincides with when an application is assigned an active role, the above operations would be performed both when an application instance first receives an initial active HA role or when an application instance transitions from a standby HA role to the active HA role.
