5.	CREATE	RESOURCES IN CLUSTER SCOPE	30
6.	DEPLOY	APPLICATION TO CLUSTER	33
	6.1.1	Test the application	34

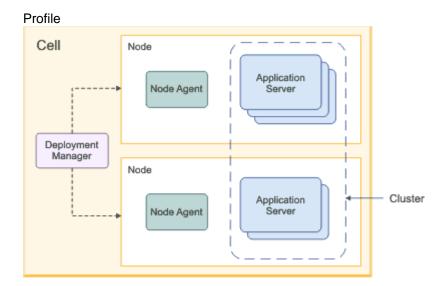

1. Purpose

This document explains steps to create Cluster on Websphere Application Server 8.5 and also setup the proxy.

2. Introduction to Websphere

IBM websphere application server cluster deployment contains the below key elements

- Cell
- Nodes
 - Deployment Manager Node- "DMGR"
 - Node- "NodeXX"
 - Node Agent- "NAXX"
- Profiles
- Cluster
- Cluster Members
- Data Sources

- Cell: A cell is a grouping of nodes into a single administrative domain. In a Network Deployment environment, a cell can consist of multiple nodes (and node groups), which are all administered from a single point, the deployment manager.
- Node: A node is an administrative grouping of application servers for configuration and operational management within one operating system instance
- Node Agent: In distributed server configurations, each node has a node agent that works with the
 deployment manager to manage administration processes. A node agent is created automatically
 when you add (federate) a stand-alone node to a cell.

- Cluster: A cluster is a logical collection of application server processes that provides workload balancing and high availability. Application servers that belong to a cluster are members of that cluster and must all have identical application components deployed on them.
- A profile is a Websphere runtime environment formed by collection of User data and Product files.
 Product Files are shared application binaries for Websphere. User data is set of user customizations for a specific runtime environment.

Prominent profile types are:

- Stand-alone Application Server: An application server environment runs Enterprise Application. Application server is managed from its own administrative console and functions independently from other application server.
- Deployment Manager: A Deployment Manager manages operations for a logical group or cell of other servers. It is the central administration point of a cell that consists of multiple nodes and node groups in a distributed server configuration. The deployment manager uses the node agent to manage the application servers within one node. A deployment manager provides management capability for multiple federated nodes and can manage nodes that span multiple systems and platforms. A node can only be managed by a single deployment manager and must be federated to the cell of that deployment manager.

Note ** Deployment Manager is part of Network Deployment Edition of Websphere.

3. Pre-requisites:

Before proceeding with the cluster setup ensure that the below resources are created

- JDBC Provider
- Datasource
- Queue Connection Factory
- JMS Queue

The instructions for resource creation are available in document <installer>\Docs\WEBSPHERE\Resource_Creation_WAS.doc

- For SSL configuration in Websphere, refer to the document SSL_Configuration_WAS.doc
- For application deployment, refer to document FCUBS_Application_WAS.doc
- For deployment of Gateway applications, refer to document GATEWAY Applications WAS.doc

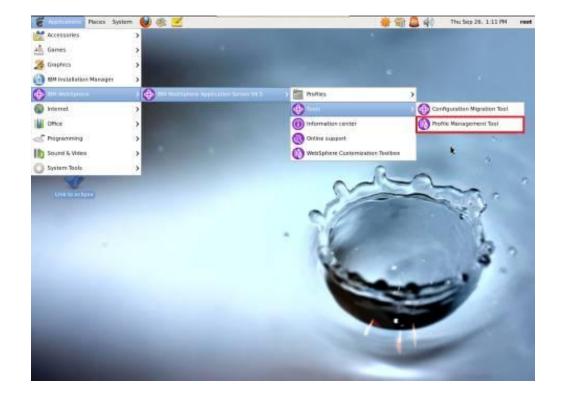

4. Steps involved for Clustering

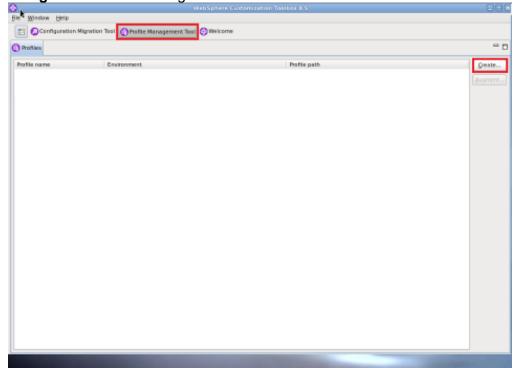

4.1 Create Profile

Go to Profile Management Tool

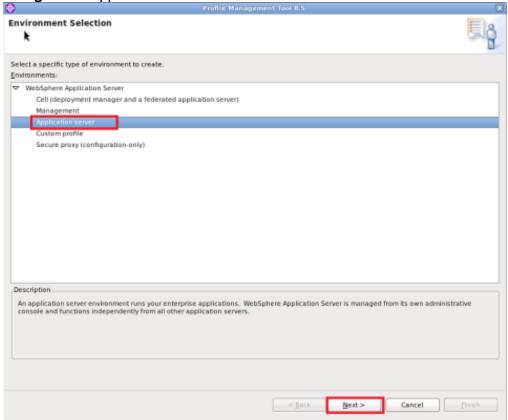

Navigation: IBM WebSphere > IBM WebSphere Application Server V8.5 > Tools > Profile Management Tool

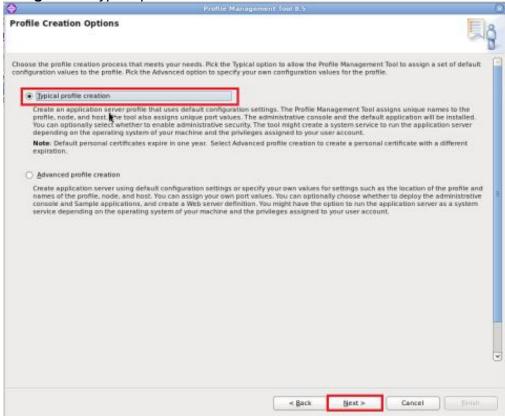

Navigation: Profile *Management Tool* > *Create*

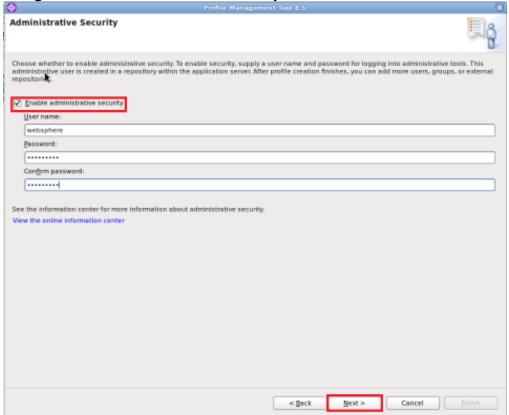

Navigation: Application Server > Next

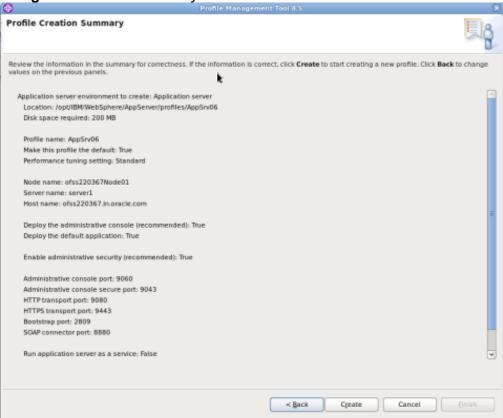

Navigation: Typical profile creation > Next

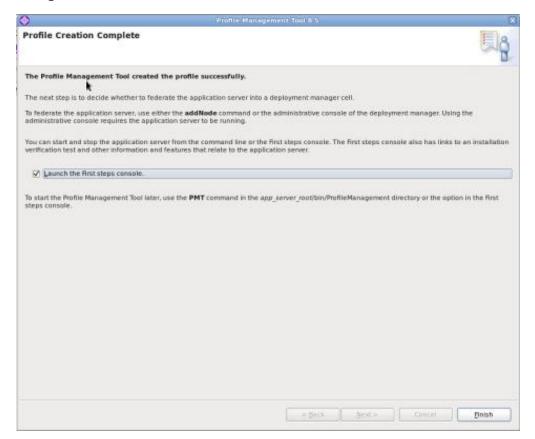

Navigation: Enable administrative security > Next

Navigation: Create Summary

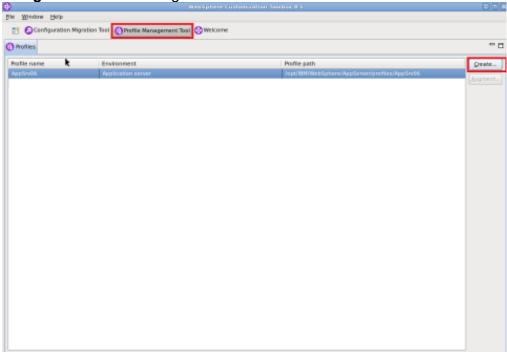

Navigation: Finish

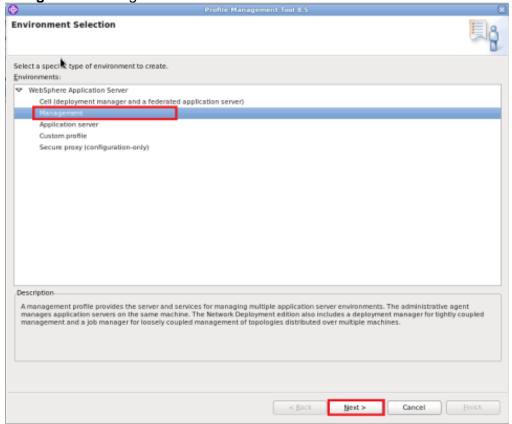

4.1.1 Create Deployment Manager Profile

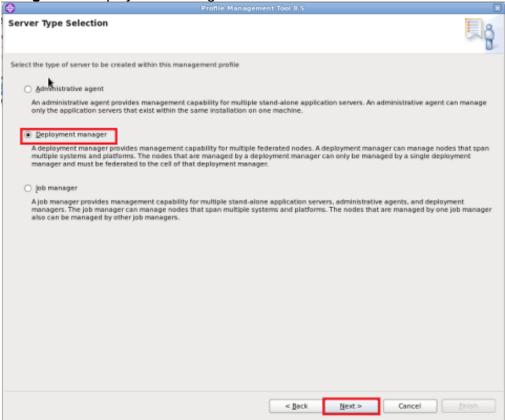

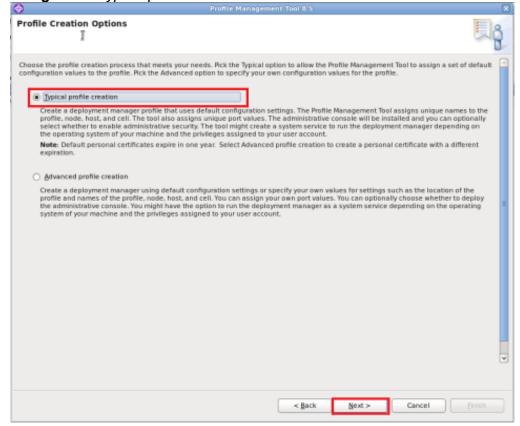

Navigation: Management >Next

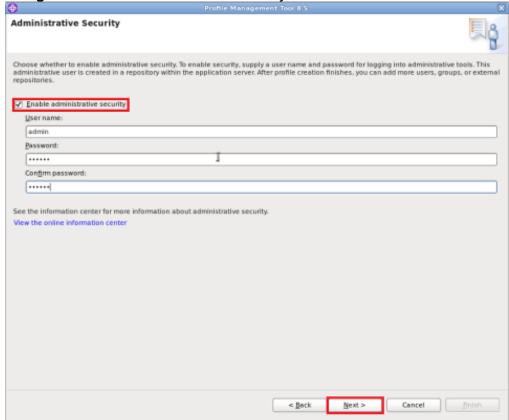

Navigation: Deployment Manager > Next

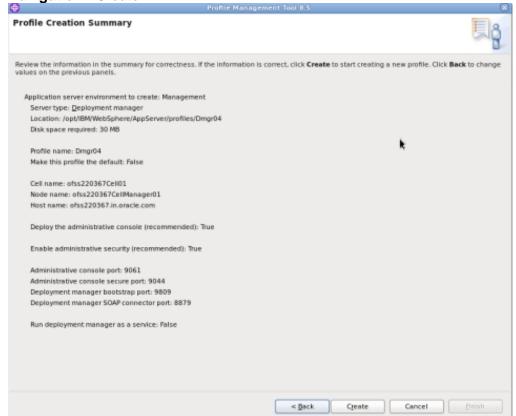

Navigation: Typical profile creation > Next

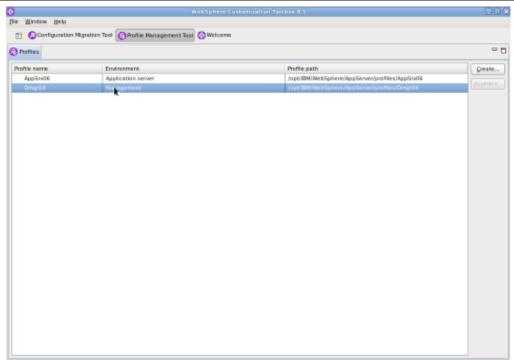

Navigation : Enable administrative security > Next

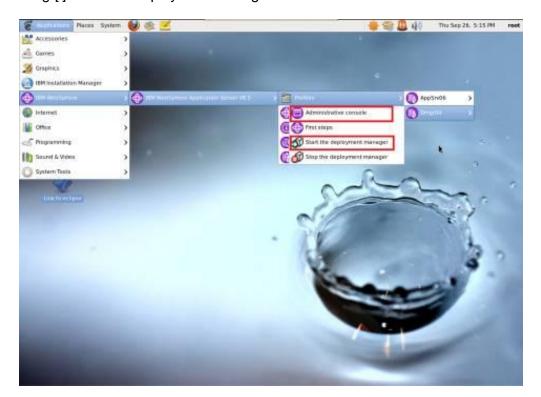

Navigation : Create

Start Deployment Manager & Open Administrative Console

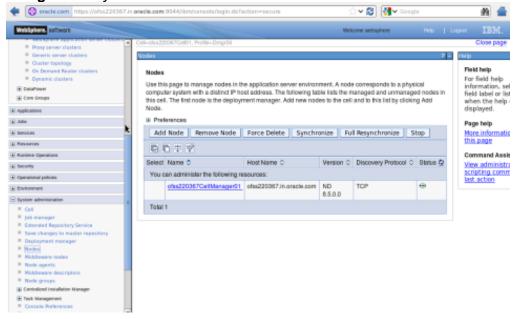

Navigation: IBM WebSphere > IBM WebSphere Application Server V8.5 > Profiles > Dmgr[i]>Start the deployment *manager* > *Administrative console*

Log into Deployment Manger Console

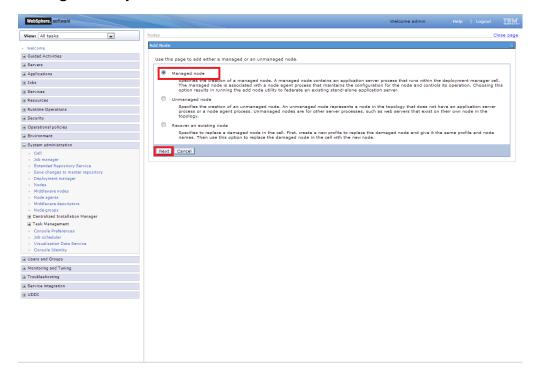

Navigation: System administration > Nodes > Add Node

4.2 Create Node

Navigation: System administration > Nodes > Add Node

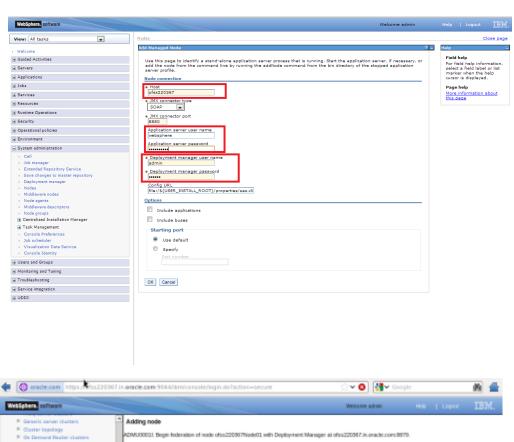

Provide the following field information and Click 'OK'

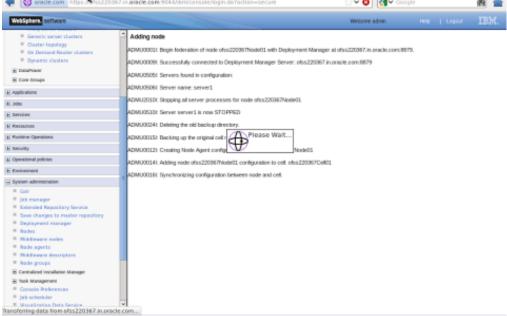

Host : Host Machine with running Application Server

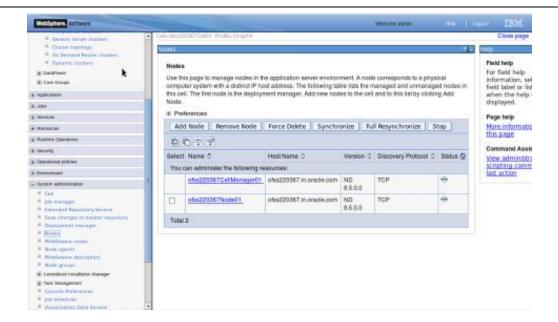

JMX Connector type : SOAP

JMX Connector Port : SOAP_CONNECTOR_ADDRESS of Application Server

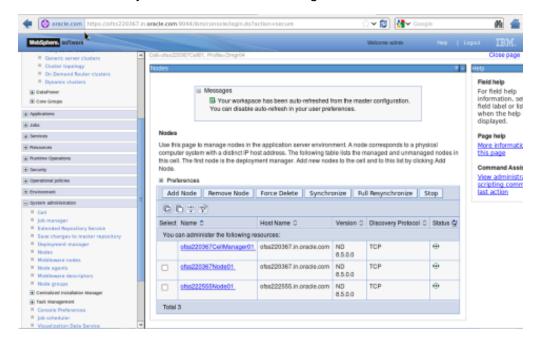

Application server user name : Application server user id : Application server password : Application server password : Deployment manager user id : Deployment manager user id : Deployment manager password

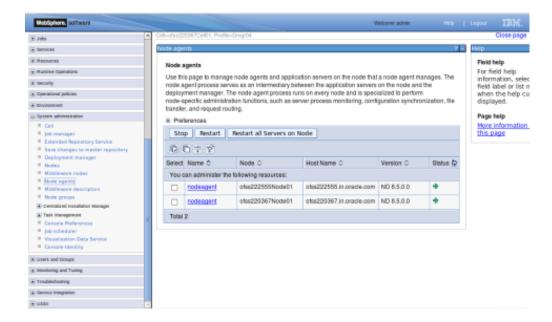

Create necessary number of nodes following same instructions above:

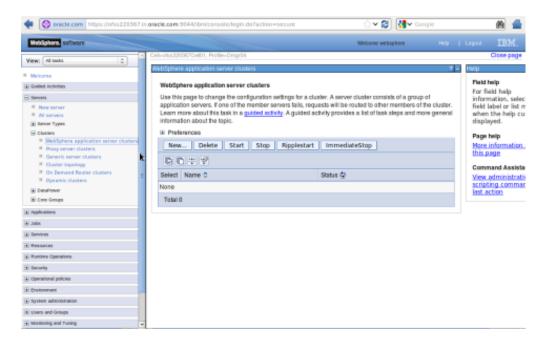

4.2.1 Start Node Agents

Navigation: System administration> Node agents>Restart

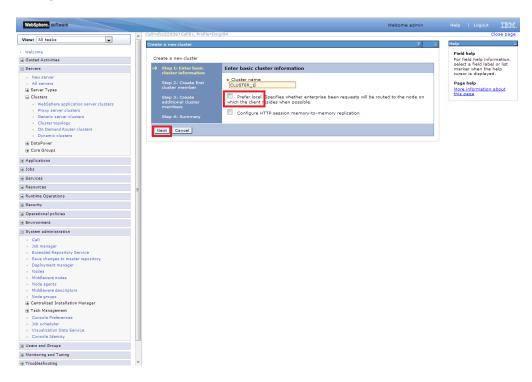

4.3 Create Cluster

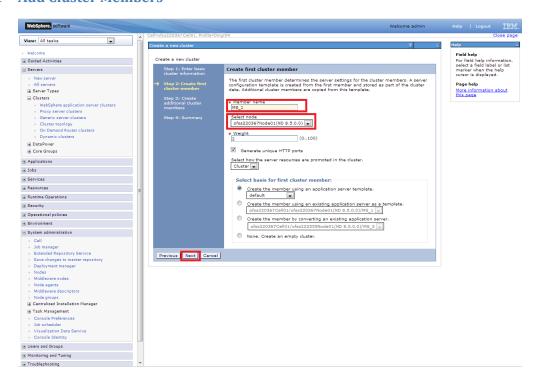

Navigation: Servers>Clusters> WebSphere application server clusters > New

Navigation: Uncheck [Prefer Local] > Next

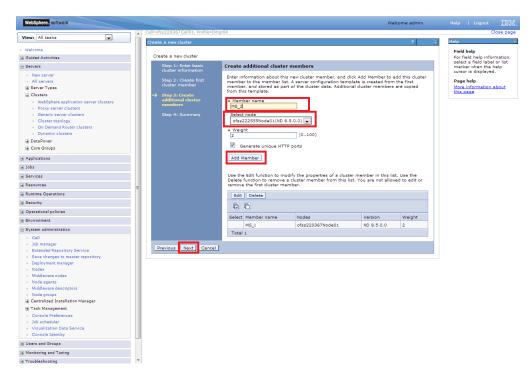

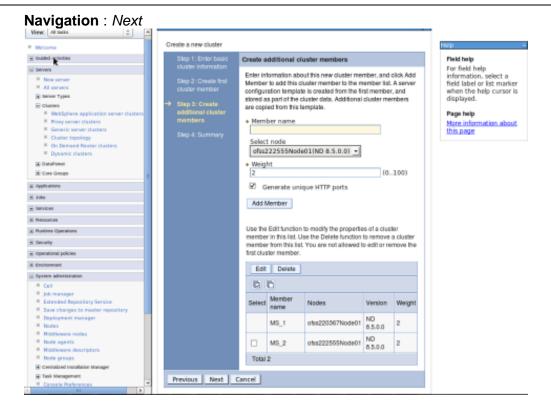

4.3.1 Add Cluster Members

Add required number of cluster members

Navigation : Add Member > Next

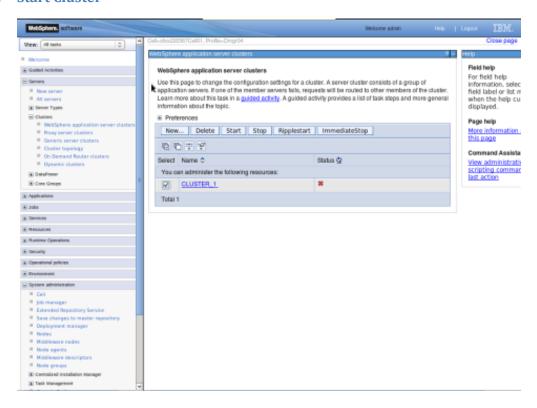

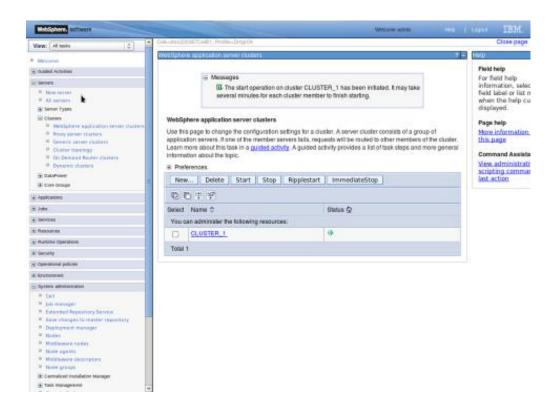

Navigation: Finish

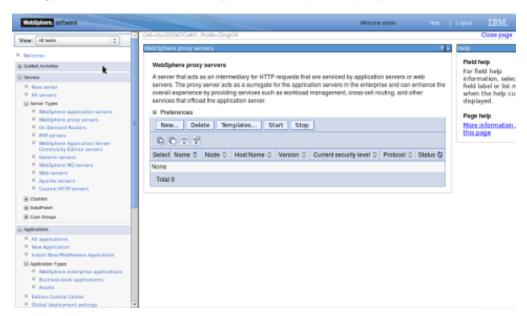

4.3.2 Start Cluster

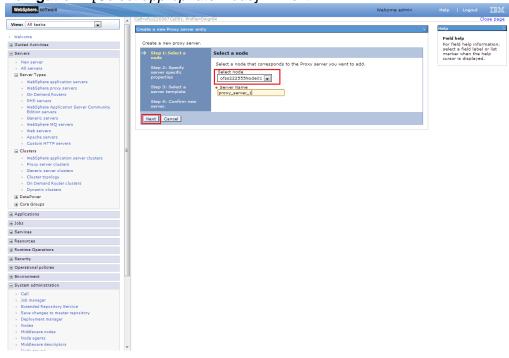

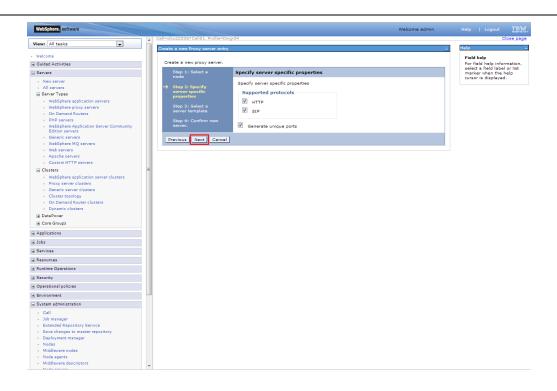

4.4 Create Proxy Server

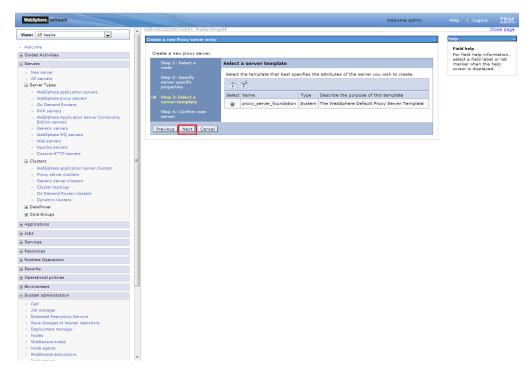

Navigation: Servers > Server Types > WebSphere proxy servers > New

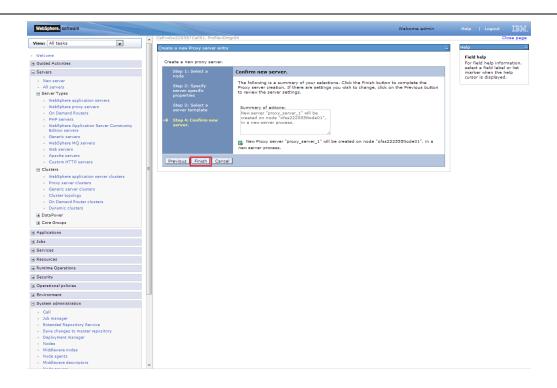

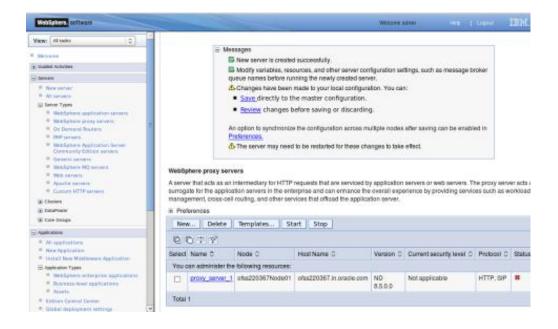

Navigation : [Select appropriate Node] > Next

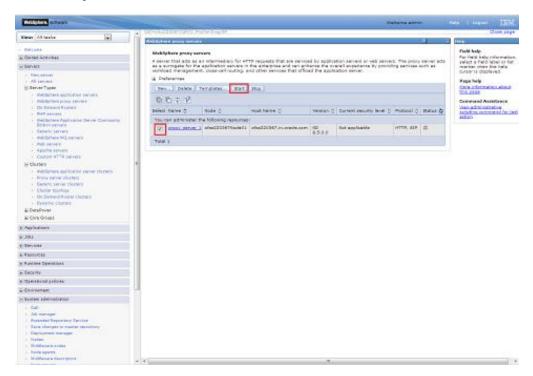

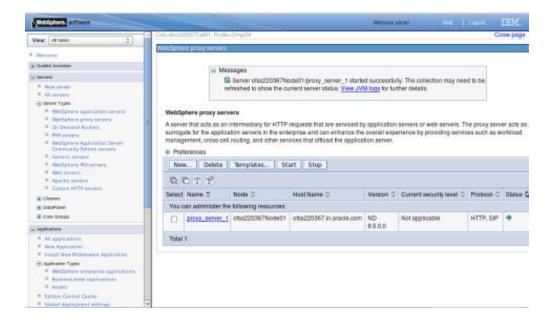

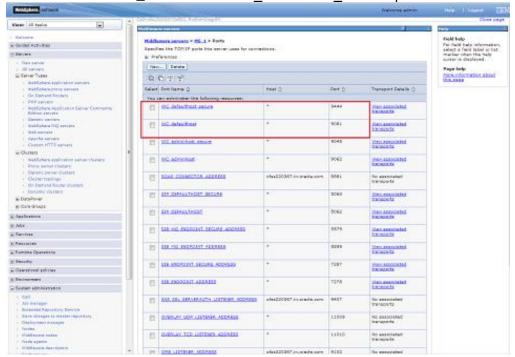

4.4.1 Start Proxy Server

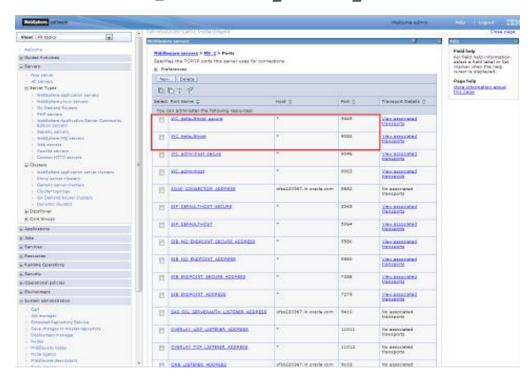

4.5 Configure Virtual Host

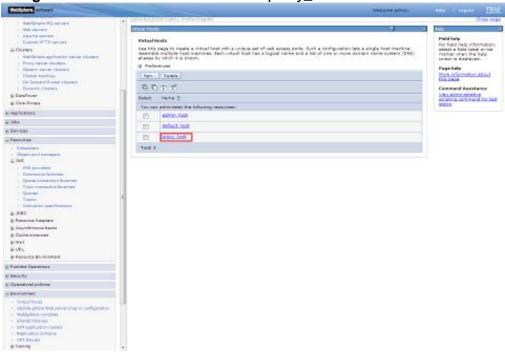

Make a note of "WC_defaulthost"/"WS_defaulthost_secure" for MS2: 9082/9445

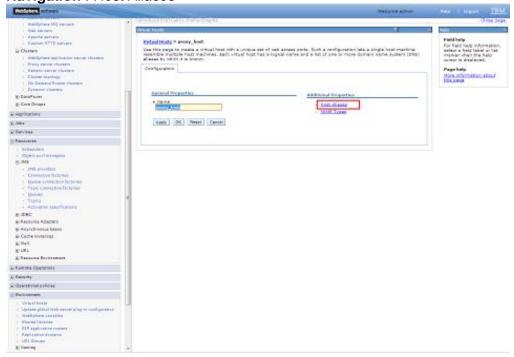

4.5.1 Virtual Host Setup

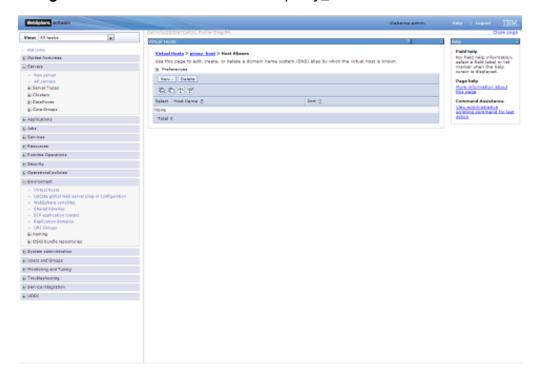

Navigation: Environment>Virtual hosts>proxy_host

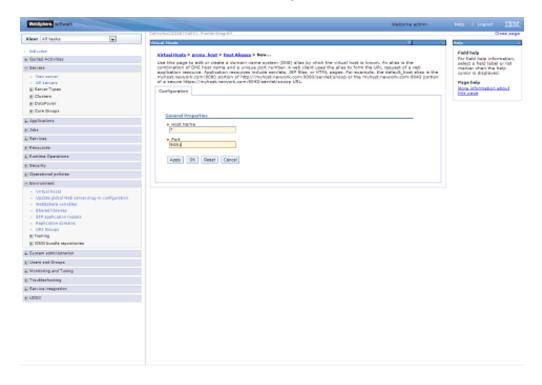

Navigation: Host Aliases

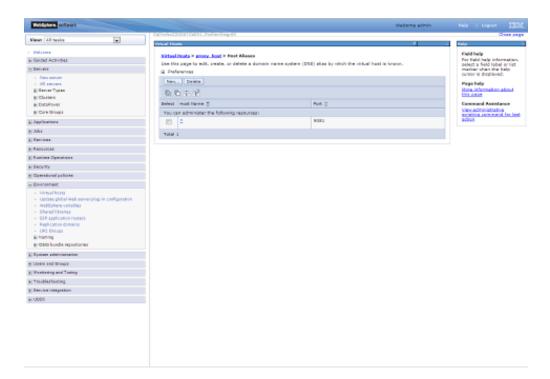

Navigation: Environment>Virtual hosts>proxy_host>Host Aliases > New

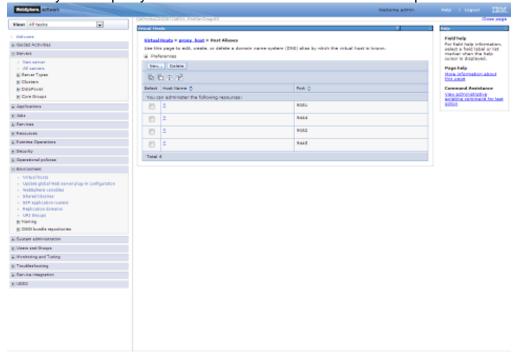

Create New Alias for default port in managed server <<9081>>:

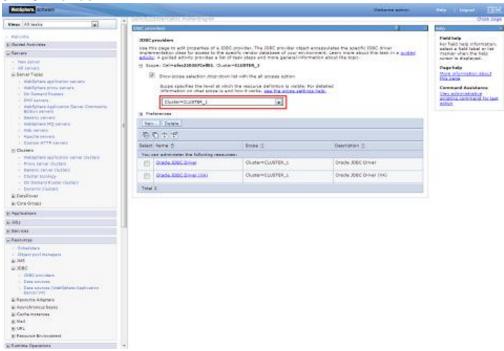

Similarly create proxy alias for all cluster related server default ports

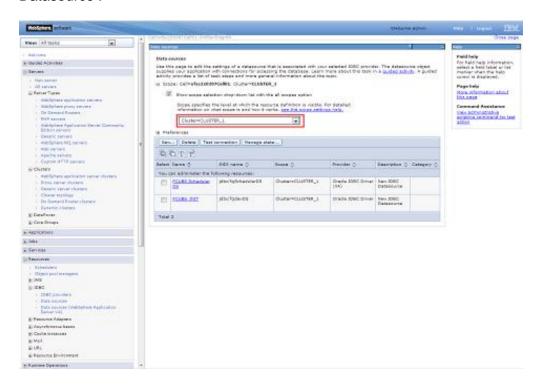

5. Create Resources in Cluster Scope

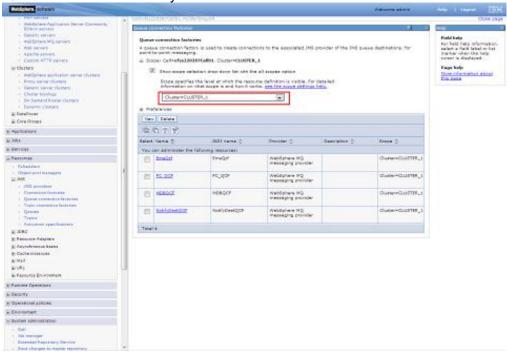

JDBC Provider:

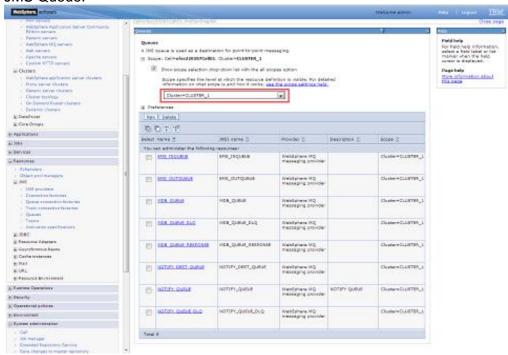

Datasource:

Queue Connection Factory

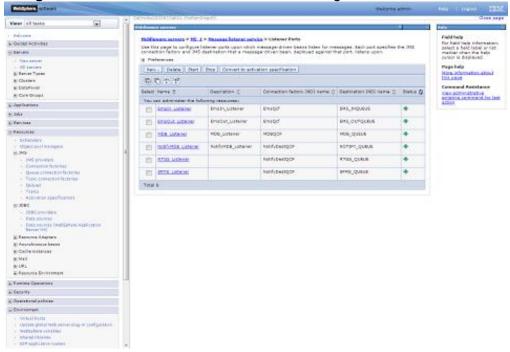

JMS Queue:

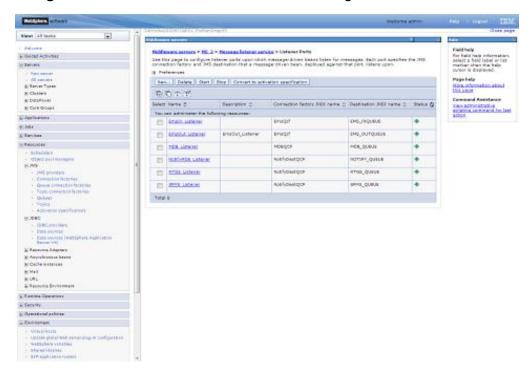

Create Message Listeners for individual Servers in Cluster

Navigation: Middleware servers > MS_1 > Message listener service > Listener Ports

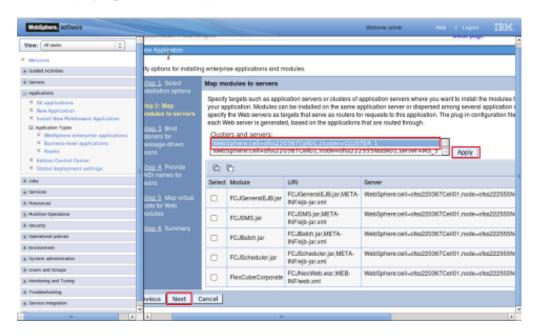

Navigation: Middleware servers > MS_2 > Message listener service > Listener Ports

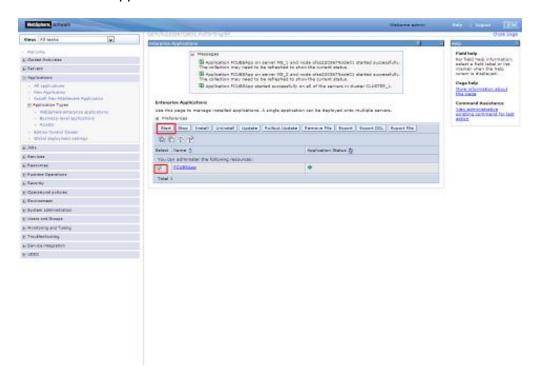

6. Deploy Application to Cluster

While deploying ensure the application is installed to Cluster

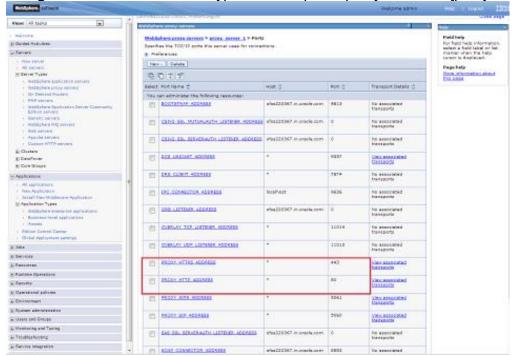

Start FCUBS application

6.1.1 Test the application

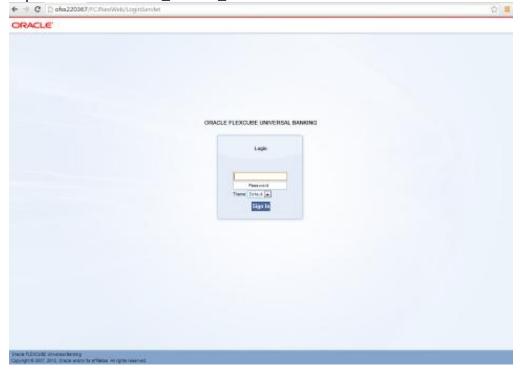

Make a note of the ports PROXY_HTTPS_ADDRESS/PROXY_HTTP_ADDRESS to access the application.

Navigation: Servers > Server Types > WebSphere proxy servers > [proxy_server_1] > Ports

Launch Application:

URL: http://<host>:<PROXY_HTTP_ADDRESS>/FCJNeoWeb or https://<host>:<PROXY_HTTPS_ADDRESS>/FCJNeoWeb
