

Oracle® Retail Service Backbone

Integration Console Guide

14.0

E49444-01

December 2013

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Value-Added Reseller (VAR) Language

Oracle Retail VAR Applications

The following restrictions and provisions only apply to the programs referred to in this section and licensed to you. You acknowledge that the programs may contain third party software (VAR applications) licensed to Oracle. Depending upon your product and its version number, the VAR applications may include:

- (i) the **MicroStrategy** Components developed and licensed by MicroStrategy Services Corporation (MicroStrategy) of McLean, Virginia to Oracle and imbedded in the MicroStrategy for Oracle Retail Data Warehouse and MicroStrategy for Oracle Retail Planning & Optimization applications.
- (ii) the **Wavelink** component developed and licensed by Wavelink Corporation (Wavelink) of Kirkland, Washington, to Oracle and imbedded in Oracle Retail Mobile Store Inventory Management.
- (iii) the software component known as **Access Via**[™] licensed by Access Via of Seattle, Washington, and imbedded in Oracle Retail Signs and Oracle Retail Labels and Tags.
- (iv) the software component known as **Adobe Flex**[™] licensed by Adobe Systems Incorporated of San Jose, California, and imbedded in Oracle Retail Promotion Planning & Optimization application.

You acknowledge and confirm that Oracle grants you use of only the object code of the VAR Applications. Oracle will not deliver source code to the VAR Applications to you. Notwithstanding any other term or condition of the agreement and this ordering document, you shall not cause or permit alteration of any VAR Applications. For purposes of this section, "alteration" refers to all alterations, translations, upgrades, enhancements, customizations or modifications of all or any portion of the VAR Applications including all

reconfigurations, reassembly or reverse assembly, re-engineering or reverse engineering and recompilations or reverse compilations of the VAR Applications or any derivatives of the VAR Applications. You acknowledge that it shall be a breach of the agreement to utilize the relationship, and/or confidential information of the VAR Applications for purposes of competitive discovery.

The VAR Applications contain trade secrets of Oracle and Oracle's licensors and Customer shall not attempt, cause, or permit the alteration, decompilation, reverse engineering, disassembly or other reduction of the VAR Applications to a human perceivable form. Oracle reserves the right to replace, with functional equivalent software, any of the VAR Applications in future releases of the applicable program.

This documentation is in preproduction status and is intended for demonstration and preliminary use only. It may not be specific to the hardware on which you are using the software. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to this documentation and will not be responsible for any loss, costs, or damages incurred due to the use of this documentation.

The information contained in this document is for informational sharing purposes only and should be considered in your capacity as a customer advisory board member or pursuant to your beta trial agreement only. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described in this document remains at the sole discretion of Oracle.

This document in any form, software or printed matter, contains proprietary information that is the exclusive property of Oracle. Your access to and use of this confidential material is subject to the terms and conditions of your Oracle Software License and Service Agreement, which has been executed and with which you agree to comply. This document and information contained herein may not be disclosed, copied, reproduced, or distributed to anyone outside Oracle without prior written consent of Oracle. This document is not part of your license agreement nor can it be incorporated into any contractual agreement with Oracle or its subsidiaries or affiliates.

Send Us Your Comments

Oracle Retail Service Backbone Integration Console Guide, 14.0

Oracle welcomes customers' comments and suggestions on the quality and usefulness of this document.

Your feedback is important, and helps us to best meet your needs as a user of our products. For example:

- Are the implementation steps correct and complete?
- Did you understand the context of the procedures?
- Did you find any errors in the information?
- Does the structure of the information help you with your tasks?
- Do you need different information or graphics? If so, where, and in what format?
- Are the examples correct? Do you need more examples?

If you find any errors or have any other suggestions for improvement, then please tell us your name, the name of the company who has licensed our products, the title and part number of the documentation and the chapter, section, and page number (if available).

Note: Before sending us your comments, you might like to check that you have the latest version of the document and if any concerns are already addressed. To do this, access the Online Documentation available on the Oracle Technology Network Web site. It contains the most current Documentation Library plus all documents revised or released recently.

Send your comments to us using the electronic mail address: retail-doc_us@oracle.com

Please give your name, address, electronic mail address, and telephone number (optional).

If you need assistance with Oracle software, then please contact your support representative or Oracle Support Services.

If you require training or instruction in using Oracle software, then please contact your Oracle local office and inquire about our Oracle University offerings. A list of Oracle offices is available on our Web site at <http://www.oracle.com>.

Preface

The *Oracle Retail Service Backbone Integration Console Guide* describes the integration and configuration information for Oracle Retail Service Backbone release 14.0.

Audience

This guide is for:

- Systems administration and operations personnel
- Systems analysts
- Integrators and implementers
- Business analysts who need information about Product processes and interfaces

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

<http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

For more information, see the following documents in the Oracle Retail Service Backbone Release 14.0 documentation set:

- *Oracle Retail Service Backbone Developers Guide*
- *Oracle Retail Service Backbone Security Guide*
- *Oracle Retail Service Backbone Implementation Guide*
- *Oracle Retail Service Backbone Installation Guide*
- *Oracle Retail Service Backbone Release Notes*

Customer Support

To contact Oracle Customer Support, access My Oracle Support at the following URL:

<https://support.oracle.com>

When contacting Customer Support, please provide the following:

- Product version and program/module name
- Functional and technical description of the problem (include business impact)
- Detailed step-by-step instructions to re-create
- Exact error message received
- Screen shots of each step you take

Review Patch Documentation

When you install the application for the first time, you install either a base release (for example, 14.0) or a later patch release (for example, 14.0.1). If you are installing the base release and additional patch releases, read the documentation for all releases that have occurred since the base release before you begin installation. Documentation for patch releases can contain critical information related to the base release, as well as information about code changes since the base release.

Improved Process for Oracle Retail Documentation Corrections

To more quickly address critical corrections to Oracle Retail documentation content, Oracle Retail documentation may be republished whenever a critical correction is needed. For critical corrections, the republication of an Oracle Retail document may at times not be attached to a numbered software release; instead, the Oracle Retail document will simply be replaced on the Oracle Technology Network Web site, or, in the case of Data Models, to the applicable My Oracle Support Documentation container where they reside.

This process will prevent delays in making critical corrections available to customers. For the customer, it means that before you begin installation, you must verify that you have the most recent version of the Oracle Retail documentation set. Oracle Retail documentation is available on the Oracle Technology Network at the following URL:

<http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html>

An updated version of the applicable Oracle Retail document is indicated by Oracle part number, as well as print date (month and year). An updated version uses the same part number, with a higher-numbered suffix. For example, part number E123456-02 is an updated version of a document with part number E123456-01.

If a more recent version of a document is available, that version supersedes all previous versions.

Oracle Retail Documentation on the Oracle Technology Network

Documentation is packaged with each Oracle Retail product release. Oracle Retail product documentation is also available on the following Web site:

<http://www.oracle.com/technetwork/documentation/oracle-retail-100266.html>

(Data Model documents are not available through Oracle Technology Network. These documents are packaged with released code, or you can obtain them through My Oracle Support.)

Documentation should be available on this Web site within a month after a product release.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Introduction

This chapter provides an overview of the Retail Integration Console (RIC) product.

Operations Management

Most tools, such as administration consoles similar to the WebLogic Administration Console or the Oracle Service Bus (OSB) Console, are designed to get the product up and running and for general configuration and administration purposes of a single domain. They are not intended as a solution to monitor and manage the entire integration infrastructure (that is, Databases, Hosts, Message Queues, Service Buses, and so on) at once. And, they routinely don't provide any historical metrics or real 24/7 diagnostics.

Infrastructure administrators do not want to be in a situation where a problem occurred an hour ago and they no longer have any information on it because they only have real-time data; both real-time and historical monitoring and diagnostics capabilities are required.

Administrators routinely have to be able to answer the usual question that comes up when everything was running fine one day and fails to perform on the next, which is "what has changed?". Administrators need historical information to refer to at all tiers of the infrastructure including the hosts as well as visibility across the stack including both monitoring and configuration data to answer that question.

In production environments, it becomes extremely difficult to reproduce issues as the load, network, application environment, and overall intermittent behavior of all of the tiers and how it affects the business. Correlating events, both systemic and business errors and coming to a quick conclusion is key to ensuring optimal service levels in a production environment for end-users. That means a full stack 24/7 real-time and historical monitoring solution that can also provide meaningful diagnostics across the entire application system stack.

The Retail Integration Console is designed to provide historical and real-time configurations and metrics 24/7 across all tiers and the Oracle Retail integration infrastructure components, and to provide these in the business context of the Oracle Retail applications.

Infrastructure Product Consoles

The Oracle Retail Integration Console (RIC) participates in the Oracle product set console domain. RIC has been designed to integrate with other Oracle product consoles from a look-and-feel perspective.

RIC is the user interface application designed to provide a unified view of the RTG Integration products within the business context of the Oracle Retail applications.

RIC is architected to understand and leverage the Retail Technology Group (RTG) infrastructure configuration for the OSB and Retail Integration Bus (RIB) products and presents all data in user friendly way in terms of retail and business entities and flows.

For this release RIC is used only for monitoring (in other words, read-only operation).

This chapter describes few concepts relevant to the RIC product.

Integration Flow

In an integrated environment the consumer and provider of computational services are linked through the integration layer. The consumer request can flow through multiple components before it reaches the provider. For the purpose of this document, the flow of request from consumer to provider through the intermediate components is called an integration flow.

Message Family

The retail business objects (RBO) are classified into different categories based on the business function it serves. These are called message families. Examples of message families include Item, ItemLoc, ASNIn and so on.

SLA Alert & Business Alert

In RSB when the message flows through the system, it may encounter conditions that are set to alert the user. Some of the conditions are service level agreement (SLA) conditions like response time. Some of them may be business conditions like an order for more than a certain amount. If the message meets any of the alert conditions, the system generates the corresponding alert. Users or applications interested in the alert can subscribe to alert notifications.

Configuration and Deployment

During the installation of RSB, the configuration changes are made in the deployment property file and then compiled. The compilation process will take the configuration details and adds the appropriate configuration details to the deployment units. Following are some of the configuration elements that affect the behavior of RIC.

Applications in scope: This is a comma separated list of retail application in scope. Information displayed by RIC is limited to these applications.

Service WSDLs: If the services are secured, the install process will need the WSDLs during compilation. Security policy information from the WSDLs are extracted to show in RIC. RIC also has the ability to show the contents of the WSDL or ping the services using the information in the WSDL.

RIB Information: If RIB is installed in the same machine as RSB, then RIC can be configured to display RIB configuration information. The RIB configuration information is gathered during RSB compilation and displayed in RIC.

RIC Technical Design Overview

The following is an overview of the technical design of RIC product:

- RIC is an ADF UI application.
- When installed (in rsb-home), RIC reads and uses the configurations of RSB (rsb-home) and if available the RIB (RIB-home) configurations.
- RIC uses the WebLogic Diagnostic framework to forward all of the logs pertinent to RSB where RIC is installed (AdminServer).
- All RSB paks are created using the RSE tool. The tool includes instrumentation with OSB configurations.
- The RSB instrumentation is asynchronously writing events to RSB schema.
- RIC uses the RSB service activity schema and OSB instrumentation to present data and data summaries to the UI.
- RIC directly integrates with the RRA/IG through context hyperlinks.

5

Login

RIC login takes the username and password created at compile time using `rsb-compiler.sh -setup-security-credential` script. The username and password information is configured in a secure credential store and is used to configure the web application security.

The RIC login screen is accessed through the URL `http://<host name>:<port>/rsb-admin`

Browser Compatibility: RIC is supported on FireFox v22 and later.

Note: See the *Oracle Retail Service Backbone Installation Guide* for more information on configuring users.

Integration Summary

The Summary page designed to show a one page view of the overall integration infrastructure. This page shows transaction counts by application, service execution success and failure counts by application, average service call response time by application, top problematic interfaces and CPU and memory usage of RSB servers. The summary information is for applications that are in scope and servers for the last 24 hours.

Auto Refresh checkbox, if checked, would poll for data for first six graphs for every 10 seconds and polls for data for the last three graphs (Server Info graphs) for every 5 minutes.

Transaction Counts by Application: A pie graph that shows the total number of transactions for each application for last 24 hours from the database.

Success versus Failure Count by Application: This graph shows the number of successful transactions and the number of failed transaction for each application. The number of success count versus failure count for an application is distinguished by activity_state in database table. If the activity_state value is RESPONSE, it is a successful invocation. If it is ERROR, it is counted as a failure.

Average Response Time by Application: This graph displays the average response time taken by each application to process the requests. The time is shown in seconds.

Top Problematic Interfaces: This table displays the number of faults for each proxy service, along with data about the application that the proxy service belongs to and the time of the most recent transaction failure.

All the data is displayed in descending order showing the proxy service with maximum number of faults first.

Recent Activity: This table shows the list of proxy services with latest invocation time and the total number of requests processed by it. This table is sorted by the last activity time (latest first).

System Alerts and Business Alerts by Application: This bar graph displays SLA alert and business alert count for each application. These alerts are retrieved from OSB console using JMX API.

SLA alerts are automated responses to violations of Service Level Agreements (SLAs). These alerts are displayed on the Oracle Service Bus dashboard. They are generated when the service violates the service level agreement or a predefined condition. Business alerts (Pipeline alerts) can be generated in a message flow whenever you define an alert action under the reporting category in the message flow and the alert condition is met.

Show Server Information: This section contains the information about the server usage.

RSB Server Details: This table displays the list of servers in the RSB cluster (Admin server and managed servers) and their statuses.

CPU Usage for RSB Servers: This graph displays the CPU usage for each server in the RSB cluster.

Memory Usage for RSB Servers: This graph displays the memory usage (Current memory, max memory and free memory) for each server in the cluster.

Integration Flows

All of the RSB and RIB integration flows are displayed in two different tables. The menu on the left side helps to filter the flow entries by App Name, Message Family Name, or Type of flow.

RIB Flow Execution Path for ALL App - Flow Count : 79

Flow ID	Consumer App	Consumer	Decorator	Provider	Provider App	Family Name
1.1	external	external.ASDInPublishing_sq	rb-igs.ASDInPublishing_dec	igs.ASDInPublishing_prv	igs	ASDIn
2.1	external	external.ASDOutPublishing_sq	rb-igs.ASDOutPublishing_dec	igs.ASDOutPublishing_prv	igs	ASDOut
3.1	external	external.CarFarePublishing_sq	rb-igs.CarFarePublishing_dec	igs.CarFarePublishing_prv	igs	CarFare
4.1	external	external.FitFarePublishing_sq	rb-igs.FitFarePublishing_dec	igs.FitFarePublishing_prv	igs	FitFare
5.1	external	external.FullCrdPublishing_sq	rb-igs.FullCrdPublishing_dec	igs.FullCrdPublishing_prv	igs	FullCrd
6.1	external	external.GLCOAPublishing_sq	rb-igs.GLCOAPublishing_dec	igs.GLCOAPublishing_prv	igs	GLCOA

RIB Flow Execution Path for ALL App - Flow Count : 117

Flow ID	Publisher App	Publisher	Subscriber	Subscriber App
1.1	rms	rms.ABcc_job	sm.StockOrder_sub	sm
1.2	rms	rms.ABcc_job	rms.StockOrder_sub	rms
2.1	rms	rms.Banner_job	external.system.Banner_sub	external-system
3.1	rms	rms.DRM_job	rms.DRM_sub	rms
4.1	rms	rms.DRM_job	rms.DRM_sub	rms
4.2	rms	rms.DRM_job	sm.DRM_sub	sm

RSB Flow Execution Path

This table shows the following columns:

- Flow ID: This is a unique ID assigned to each integration flow.
- Consumer Application: The application that consumes the service.
- Consumer: The qualified name of the consumer service.
- Decorator: The name of the decorator service.
- Provider: The qualified name of the provider service.
- Provider Application: The name of the application that provides the service.
- Family Name: The name of the message family of the service.

RIB Flow Execution Path

This table shows the following columns:

- Flow ID: This is a unique ID assigned to each integration flow.
- Publisher Application: The application that publishes the message to a topic.
- Publisher: The qualified name of the publisher topic.
- Subscriber: The qualified name of the subscriber topic.
- Subscriber Application: The application that subscribes to the topic.

When a row in the table (RSB or RIB) is selected, a panel appears below the table and gets populated with detailed information of the selected flow.

RSB Flow Details

When an RSB flow is selected, four additional tabs are displayed.

Configuration tab

The screenshot displays the Oracle Retail Integration Console interface. The main section shows a table titled "RSB Flow Execution Path for ALL App - Row Count: 179". The table has columns for Flow ID, Consumer App, Decorator, Provider, Provider App, and Family Name. Below the table, there is a diagram titled "Message Flow Id: 3.1" showing a sequence of three services: external, decorator, and provider. At the bottom, there are two tables: "Status of the Service" and "Operations and Payload Details".

Flow ID	Consumer App	Decorator	Provider	Provider App	Family Name
1.1	external	external.ASDInPublishing_sq	rb-igs.ASDInPublishing_dec	igs.ASDInPublishing_prv	igs.ASDIn
2.1	external	external.CurRatePublishing_sq	rb-igs.ASDInPublishing_dec	igs.ASDInPublishing_prv	igs.ASDIn
3.1	external	external.CurRatePublishing_sq	rb-igs.CurRatePublishing_dec	igs.CurRatePublishing_prv	igs.CurRate
4.1	external	external.FitTernPublishing_sq	rb-igs.FitTernPublishing_dec	igs.FitTernPublishing_prv	igs.FitTern
5.1	external	external.FullCidPublishing_sq	rb-igs.FullCidPublishing_dec	igs.FullCidPublishing_prv	igs.FullCid
6.1	external	external.GLCOAPublishing_sq	rb-igs.GLCOAPublishing_dec	igs.GLCOAPublishing_prv	igs.GLCOA

Flow ID	Publisher App	Publisher	Subscriber	Subscriber App
1.1	rms	rms.ABtc_job	sim.StockOrder_sub	sim
1.2	rms	rms.ABtc_job	rms.StockOrder_sub	rms
2.1	rms	rms.Banner_job	external.system.Banner_sub	external.system
3.1	rms	rms.DRB_job	rms.DRB_sub	rms
4.1	rms	rms.DRB_job	rms.DRB_sub	rms
4.2	rms	rms.DRB_job	sim.DRB_sub	sim

Service	WSDL URL	WSDL Accessibility
Decorator	http://mspx217.19703/igs-CurRatePublishing-App/Service/DecoratorProxySe	🔗
Edge App	http://mspx217.19810/CurRatePublishing/Bean/CurRatePublishingServiceNet	🔗

Operation Name	InPayload	OutPayload
public/CurRateCreateUsing	CurRateDesc	ServiceObjStatus

This panel displays the diagram of request flow from consumer, decorator service and provider in sequence.

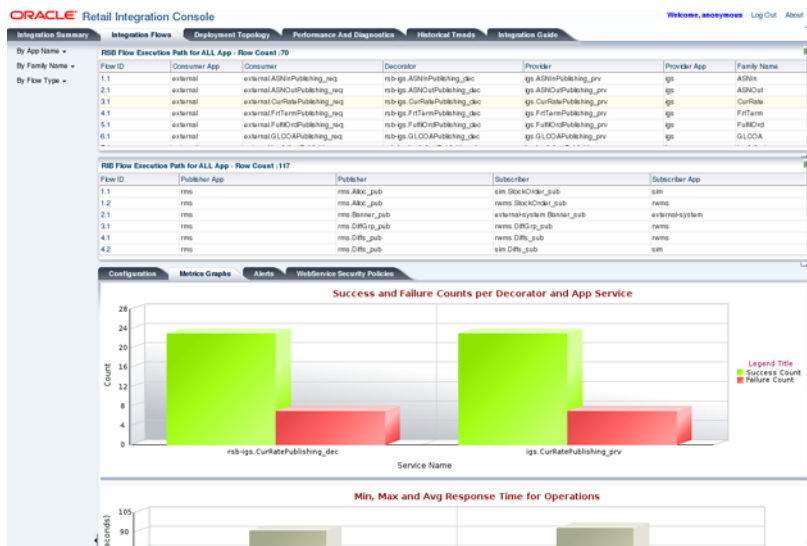

Status of Service

This table displays the type of service, the WSDL URL for the service, and the accessibility status of the WSDL.

Operations and Payloads Details

This table displays the operation names, their respective input payload and output payload Retail Business Object (RBO) types.

Metrics Graphs tab

This table shows three graphs of collected metric information.

Success and Failure counts per Decorator and App service

This graph displays the number of success and failure counts for decorator and Edge App Service.

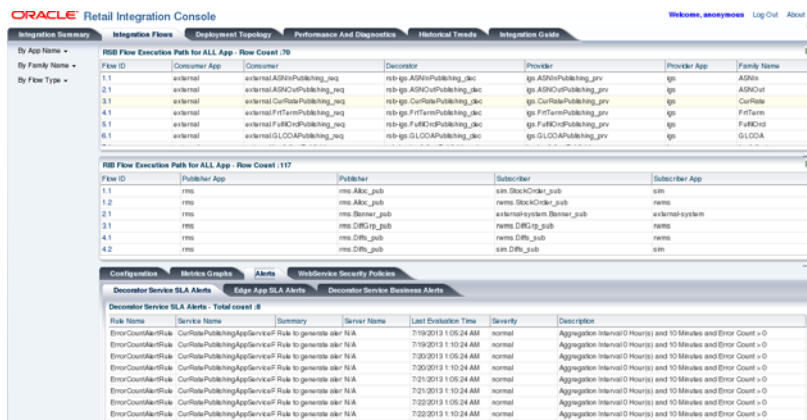

Min, Max, and Average Response Time for Operations

This graph displays the minimum, maximum and average response time taken by Business services to process each request for operations specified.

Success and Failure Count for Operations

This graph displays success and failure count for each operation.

Alerts tab

This tab has 3 additional sub-tabs that display the Decorator Service SLA alerts, Edge App SLA Alerts and Decorator Service Business alerts.

Decorator Service SLA Alerts

These are generated when the decorator service violates the service level agreement or a predefined condition.

Edge App SLA Alerts

These are generated when the edge app service violates the service level agreement or a predefined condition.

Decorator Service Business Alerts

These are generated in a message flow whenever you define an alert action under the reporting category in the message flow and the alert condition is met.

Web Service Security Policies tab

This tab displays a table of the following columns:

Component: The components that are secured in the flow.

Edge Application Service: The retail application in RIB. For example, RMS.

Proxy Service and Business Service: RSB components in OSB.

Consumer: The retail application that is either internal or external.

Name: The names of the components used in the flow.

Policy Type: This is the name of the web service policy configuration. Possible values are:

- PolicyUnsecured
- PolicyA
- PolicyB

Note: The security policies certified by Oracle Retail are:

- Policy A: SSL plus UsernameToken
- Policy B: Message Protection plus UsernameToken

Policy Name: The policy security configuration used to secure the component.

For Policy A, the Policy Name is
Wssp1.2-2007-Https-UsernameToken-Plain.xml.

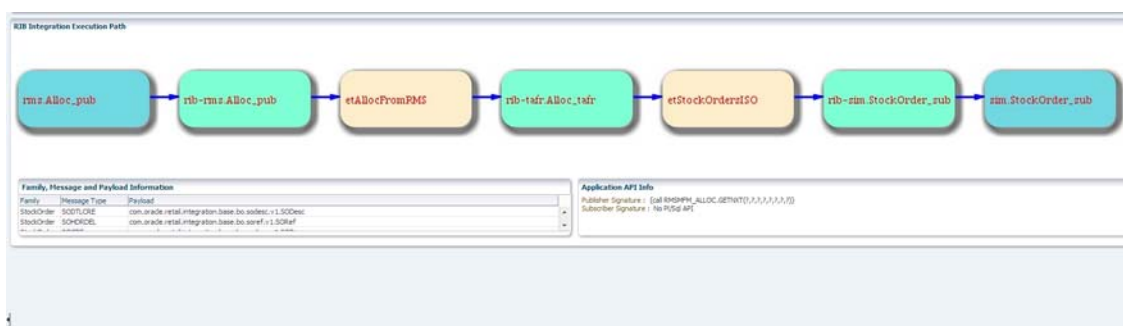

For Policy B, the Policy Name is
Wssp1.2-2007-Wss1.1-UsernameToken-Plain-EncryptedKey-Basic128,
Wssp1.2-2007-EncryptBody and Wssp1.2-2007-SignBody.

Is Certified?: Displays whether the security policy is supported.

Note: See the *Oracle Retail Service Backbone Security Guide* for more details.

RIB Flow Details

When a RIB flow is selected, the following additional panel is displayed.

This panel contains the Flow Diagram, its details and the Family, Message, and Payload information table.

Flow Diagram displays the diagram of request flow from publisher, topic (or TAFR) and subscriber in sequence.

- Publisher is responsible for creating the messages.
- Topic is where the publisher publishes its messages to.
- TAFR is a RIB component that could transform, filter and route the message.
- Subscriber receives the message.

Message Family: Contains information specific to a related set of operations on a business entity or related business entities. For example, Orders message family contains information about purchase order events.

Message Type: A message family may contain multiple message types. Each message type encapsulates the information specific to a business entity within one or more business events. For example, the order message family is published for events such as Delete PO, Create PO.

Payload Information: the Retail Business Object (RBO) type for the Message Type.

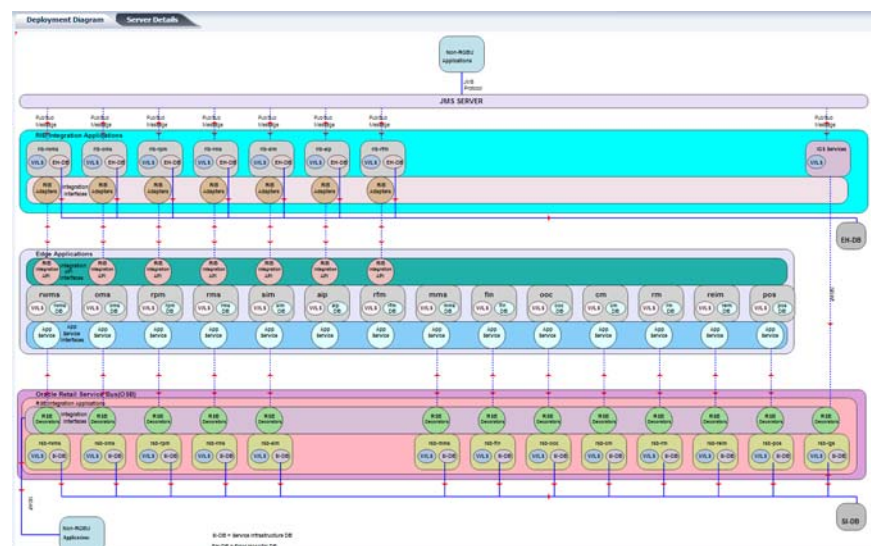

Application API Information: Each PL/SQL based application uses a Message Family Manager specific API for publishing all messages within a specific message family. API is an interface to stored procedure package and wrapper to the staging table and additional business logic surrounding the message publication.

Note: See the Oracle Retail Integration Bus Implementation Guide for more details.

Deployment Topology

This chapter describes the Deployment tab. This tab has two sub-tabs; **Deployment Diagram** and **Server Details**.

Deployment Diagram

The deployment diagram is dynamically generated based on the RSB and RIB home installation configuration files. The diagram shows the physical and logical relationships among the various application servers, database servers, JMS servers and clusters in the deployment environment. The diagram also shows the software components, RIB integration applications and RSB decorator services, installed on them.

You can click a component in the deployment diagram to view its details in **Server Details** tab.

Server Details

Application Servers - Row Count: 12

App Server ID	Domain Name	Admin Server Host	Admin Server Port	WLS Instance Name	WLS Instance Port
rbp_server1	rbp_domain	map0-217	19701	rbp_server1	19703
rbp_server2	rbp_domain	map0-217	19701	rbp_server2	19705
rb-fm-wls1	rbp_domain	map0-217	19801	rb-fm-server	19808
rb-rms-wls1	rbp_domain	map0-217	19801	rb-rms-server	19807

This tab shows the deployment information and relationships in a tabular form.

The Server Details page contains the following panels:

Application Servers

This panel lists application server details including App server ID, domain in which server instance is created, administrator server host name and port, WebLogic instance name and port.

Database Servers

This panel lists all database instances configured in the system and includes related details such as server ID, application database JDBC URI and the corresponding error hospital JDBC URI.

JMS Servers

This panel lists all the JMS server instances and their ID, and host URL information.

RIB Integration Applications

This panel lists all the RIB applications in scope and the link to administration GUI pages in the deployed environment.

RSB Decorator Services

This panel lists all the service requestors and service providers in scope.

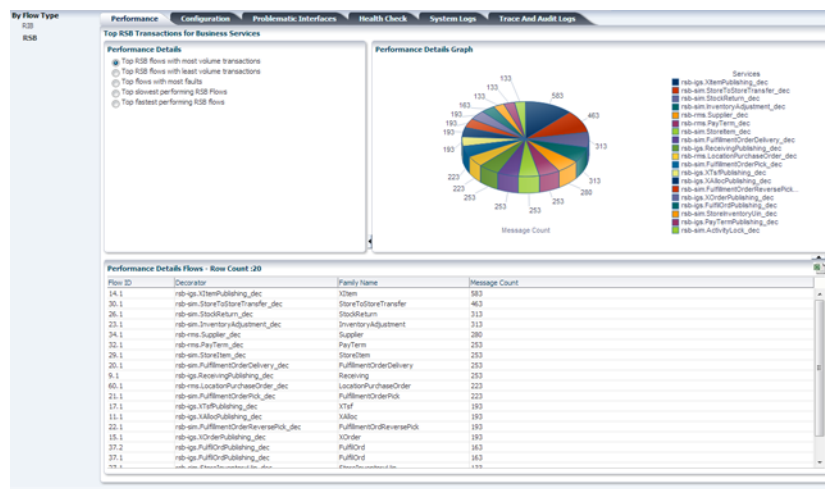

Performance and Diagnostics

Performance and diagnostics page shows performance graphs, configuration files, problematic interfaces and logs in addition to the ability to ping services.

The left hand menu allows choosing between RIB and RSB. Depending on the selection RSB or RIB related pages are displayed. By default we show the RSB Performance page.

In this release RIC does not show Performance, Problematic Interfaces, Health Check, System Logs and Trace and Audit logs for RIB. These pages are available only for RSB.

Performance

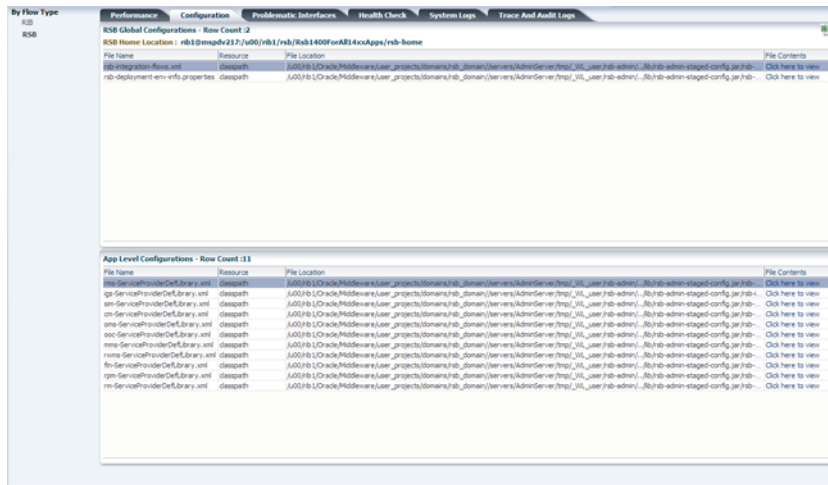

This tab is only for RSB. It contains the performance details for decorator services. Depending on the choice selected, corresponding performance details graph and performance details table are shown.

If all flows have count equal to zero, the table displays all flows. If one flow has message count greater than zero, the table displays only the top 20 flows per choice selected.

Configuration

Configuration tab is slightly different for RSB and RIB.

RSB

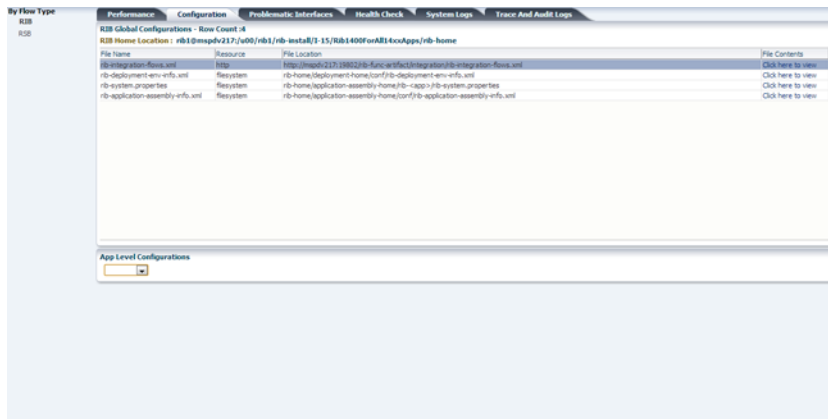

This tab displays the RSB home, where the RSB kernel is located.

RSB Global Configuration: This table displays the global configuration files related to RSB.

Application Level Configurations: This table displays the application specific files for applications that are in scope.

RIB

This tab displays the RIB home, where the RIB kernel is located.

RIB Global Configuration: This table displays the global level files related to RIB.

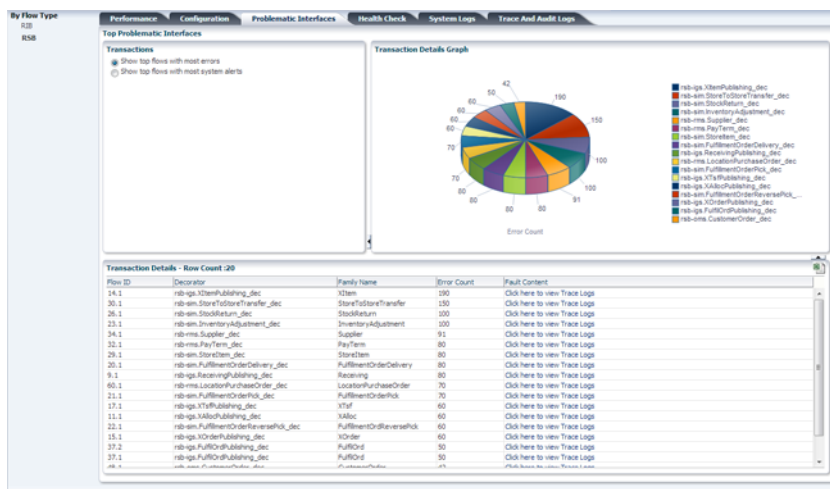

Application Level Configurations: This table displays the application specific files for applications that are in scope.

There is a dropdown that has list of applications in scope. Depending on the app selected, it displays the files specific to that app. By default nothing is selected.

The columns in the tables are filename, resource, location of the file and a hyperlink which, when clicked on, opens a popup that shows the contents of the file.

Problematic Interfaces

This tab is only for RSB. This page shows the flows with most errors or system alerts.

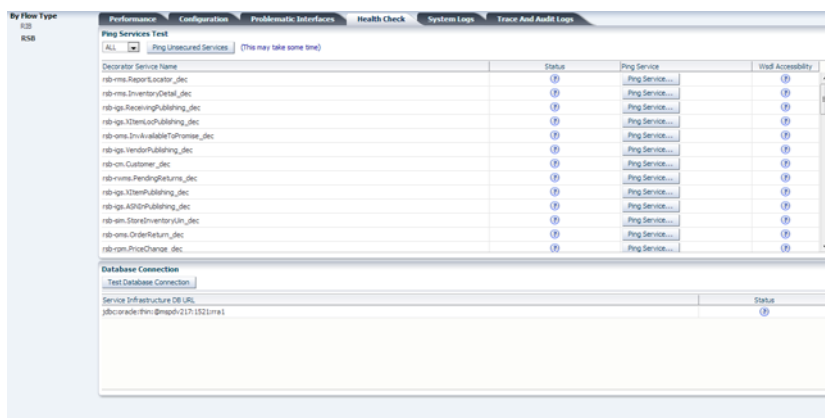

Transactions: Users can choose between two options: top flows with most errors or top flows with most system alerts.

Transaction Details Graph: It shows the errors or system alerts for decorator services in form of pie chart. The services are listed next to the graph.

Transaction Details Table: It shows the columns for flow ID, decorator name, message family name, error count and a link to trace logs. The link takes the user to the Trace and Audit Logs page for the selected decorator.

Health Check

This tab is only for RSB. This tab allows pinging services as well as database connectivity. When a ping operation is called, the service invocation goes through edge app service through decorator and back. The user can also test database connectivity in this page.

Ping Services Test

The page has a drop-down list that contains all the applications that are in scope. The default value is "ALL". By default, the table shows all the decorator services in scope. When we choose an application from the drop-down list, all the services related to that application are displayed.

Ping Unsecured Services: Invokes ping operation for all the services that are not secured.

The table in the page contains the decorator name, Status, Ping Service button and WSDL Accessibility. Initially the statuses of the service and WSDL are shown as unknown. When the Ping Service button is clicked, a popup screen is displayed. The popup has service details including WSDL URL, decorator name, web service policy name and the input message. If the service is secured, it has additional input fields: edge app service user name and password that are needed to ping that service. The statuses are shown as UP or DOWN depending on whether the services are available or not.

Database Connection

Test Database Connection: Checks whether the database is up. Table displays the database URL and status icon.

System Logs

The screenshot shows the 'System Logs' tab in a web application. It features a search panel with the following fields:

- Select a Date and Interval:**
 - Date and Time: Use Current Time, Use Specific Time (8/7/2013 11:35:32 AM)
 - Interval: LAST 10 Mins, LAST 1 HOUR, LAST 12 HOURS, LAST 24 HOURS
- Search Criteria:**
 - Severity:
 - Service Name:
 - Host Name:
 - Managed Server:
- GO:**

Below the search panel is a table with the following columns: TimeStamp, Severity, Sub System, Machine, Server, Log ID, Message. The table is currently empty.

This tab is only for RSB. It displays the system logs retrieved from under `<weblogic-home>/<domain-name>/servers/AdminServer/logs/<domain-name>.log`.

Log Entries - Formatted View

There are two search panels that can be used as search criteria. Fields in the first search panel are mandatory, current time is the default value for the Date and Time field and Last 10 mins is the default value for the Interval field. The second search panel has Severity, Service Name, Host Name, and Managed Server drop-down lists. These are optional fields to filter the result.

When you click **GO**, the table displays the data matching the search criteria.

Log Entries - UnFormatted View

This tab displays the plain text format of the same contents as formatted view except no search criteria can be used here.

Trace and Audit Logs

This tab is only for RSB. There are two search panels that can be used as search criteria. Fields in the first search panel are mandatory, Current Time is the default value for Date and Time and Last 10 Mins is the default value for Interval. The second Search

panel has Severity, Service Name, Host Name and Managed Server drop-down lists. All these dropdowns are optional fields.

The screenshot displays the 'Trace And Audit Logs' section of a management console. It includes a 'Select a Date and Interval' section with radio buttons for 'Use Current Time' and 'Use Specific Time' (set to 8/7/2013 11:36:09 AM), and a list of intervals: 'Last 15 Mins', 'Last 1 Hour', 'Last 12 Hours', and 'Last 24 hours'. Below this is the 'AID Search Criteria' section with three dropdown menus: 'App Name' (with 'Select an App' text), 'Message Family' (with 'Select a Message Family' text), and 'Service Name' (with 'Select a Service' text). A 'GO' button is located below the search criteria. The bottom section is 'RSE Activity Details', which has three tabs: 'Success', 'Failures', and 'Both'. The 'Success' tab is active, showing a table with the following columns: 'Activity ID', 'Application Name', 'Message Family', 'Operation Name', 'Business Service', 'Proxy Service', 'Activity State', 'Request Timestamp', 'Request URL', and 'Response Timestamp'. The table currently displays 'No data to display.'

On click of the GO button, the table displays the data matching the search criteria. There are three tabs in the result panel.

- Success: This tab shows only the success entries
- Failures: This tab displays only failed invocations
- Both: This tab displays both the success and failure logs

Historical Trends

Historical trend displays the trends for the selected application or message family or services for the last 24 hours, last week, last 3 months, or last year.

Left side menu has options 'By App Name', 'By Family Name' and 'By Service'.

- **By App Name:** The trends graphs are shown for all the services that belong to the selected application.
- **By Family Name:** The trends graphs are shown for all the services that belong to the selected message family.
- **By Service:** The user needs to pick the services they want to graph the trend.

On the right hand there are two tabs; Consolidated Trend and Service Level Trend.

By default, the consolidated trend for the first app name in the By App Name menu is shown. When the user wants to select a different app name or Family Name or Service, all the graphs are reset to blank. Then the user will have to click on the GO button to generate the graphs for current selection.

Date field is preselected to current date. If the user wants a previous date they can use the date picker to select the date.

Consolidated Trend

Each graph displays the total count (both successes and failure), success count, and failure count for all services that belong to the selected application, family, or service. The page has 4 graphs that have total count, success count and error count lines.

- Graph 1 displays the last 24 hours trends from the selected date and time.
- Graph 2 displays the last week trends from the selected date and time.
- Graph 3 displays the last month trends from the selected date and time.
- Graph 4 displays the last year trends from the selected date and time.

Consolidated Historical Trends By Service

This is slightly different from the other two options.

It contains a shuttle box with list of available services. User can pick the 5 services they want and click on GO button. Shuttle box only allows 5 services at a time. If more than 5 are picked, It displays a warning message and GO button is disabled.

The graphs are different too; the graph shows total count, success count and error count for each of the selected services.

Service-Level Trend

Service Level Trends shows the trends for each service in the application, family, or service.

It has search criteria, app name or family name that is selected, the date field that has current date by default and a list of radio buttons (24 hours, last week, last month and last year from the date selected). 24 hours is the default selected interval option. Click **GO** after the selection is made. Three different graphs are generated.

- Graph 1 displays total transaction count
- Graph 2 displays total success count
- Graph 3 displays total error count

The time intervals vary depending on the radio button selected. If the user selected for last 7 days, all three graphs (total, success and error) display the trends for the last 7 days for each selected service.

Enterprise Integration Guide

The RIC application has the *Oracle Retail Enterprise Integration Guide* built in, for ease of access. This tab is an entry point to the Integration Guide.

The Integration Guide is the master document that has in-depth information about Oracle Retail Integration Interfaces including RIB, RSL, IGS and RSB. This gives an enterprise view of integration points across different integration patterns. You can find the information on a particular message flow / an application / or an integration pattern.

For detailed information about a particular message flow execution path in the Integration Guide, you can select the flow ID. The control navigates to Flow information in the Integration guide tab.
