

**Oracle® Communications
Policy Management**

Policy Wizard Reference

Release 12.3

E85344 Revision 01

July 2017

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Table of Contents

Chapter 1: About This Guide.....	27
Introduction.....	28
How This Guide is Organized.....	28
Scope and Audience.....	29
Related Publications.....	30
Policy and Protocol Specifications.....	30
Locate Product Documentation on the Oracle Help Center Site.....	31
Customer Training.....	31
My Oracle Support (MOS).....	32
Emergency Response.....	32
 Chapter 2: The Oracle Communications Configuration Management	
Platform Server.....	33
Configuration Management Platform Server.....	34
Overview of Main Tasks.....	34
Specifications for Using the CMP Server.....	35
Logging In.....	35
CMP Interface Overview.....	35
CMP Icons.....	36
Shortcut Selection Keys.....	38
Changing a Password.....	38
 Part I: Using the Policy Wizard.....	40
 Chapter 1: About Policies.....	41
Understanding Policy Rules.....	42
About Creating and Using Policies.....	42
Structure and Evaluation of Policy Rules.....	42
Structure of Policy Rules.....	43
Evaluating Policy Rules.....	45
Activating and Deactivating Policy Rules.....	46
Using Reference Policies.....	47

Modes and the Policy Wizard.....	48
Chapter 2: Managing Policy Rules.....	49
Creating a Policy Rule.....	50
Parameters Within Policy Rules.....	54
Modifying and Deleting a Policy Rule.....	54
Modifying a Policy Rule.....	54
Deleting a Policy Rule.....	55
Chapter 3: Deploying Policies.....	56
About Deploying Policies.....	57
Deploying a Policy.....	59
Changing the Sequence of Deployed Policies on an MPE device.....	60
Removing a Policy from an MPE Device.....	61
Chapter 4: Managing the Policy Library.....	62
Displaying a Policy.....	63
Organizing Policies.....	63
Importing and Exporting Policies, Policy Groups, and Templates.....	64
Chapter 5: Managing Policy Tables.....	65
About Policy Tables.....	66
About Data Matching.....	67
Policy Matching Operations.....	68
Example of Data Matching.....	69
Policy Table Case Study.....	70
Creating a Policy Table.....	75
Viewing Policy Tables.....	77
Associating a Policy Table with a Policy Rule.....	77
Associating a Parameter with a Policy Table Column.....	78
Modifying a Policy Table.....	79
Deleting a Policy Table.....	79
Chapter 6: Managing Policy Groups.....	80
Creating a Policy Group.....	81
Adding a Policy or a Policy Group to a Policy Group.....	81
Displaying Details of All Policies in a Policy Group.....	82

Changing the Sequence of Policies or Policy Groups Within a Policy Group.....	82
Removing a Policy from a Policy Group.....	83
Managing Analytics Data Stream Generation for a Policy Group.....	85
Deleting a Policy Group.....	85
Chapter 7: Managing Policy Templates.....	86
Creating a Policy Template.....	87
Modifying a Policy Template.....	87
Deleting a Policy Template.....	88
Chapter 8: Managing Virtual Policy Tables.....	89
About Virtual Policy Tables.....	90
Virtual Policy Table Case Study.....	90
Creating a Virtual Policy Table.....	92
Modifying Virtual Policy Tables.....	92
Deleting Virtual Policy Tables.....	93
Chapter 9: Managing Policy Checkpoints.....	94
About Policy Checkpoints.....	95
Creating a Policy Checkpoint.....	96
Viewing and Comparing Policy Checkpoints.....	96
Restoring a Policy Checkpoint.....	96
Restoring a Policy Checkpoint to MPE Devices.....	97
Deleting a Policy Checkpoint.....	98
Part II: Configuring Manageable Objects for Use In Policies.....	99
Chapter 1: About Creating Manageable Objects.....	100
Wireless Mode Objects.....	101
Cable Mode Objects.....	101
Wireline Mode Object.....	102
Chapter 2: Managing Application Profiles.....	103
About Application Profiles.....	104
Creating an Application Profile.....	104
Modifying an Application Profile.....	105
Deleting an Application Profile.....	105

Chapter 3: Managing Custom AVPs.....	107
About Custom AVPs.....	108
Creating an AVP.....	109
Modifying an AVP.....	112
Deleting an AVP	113
 Chapter 4: Managing Custom Vendors.....	 114
About Custom Vendors.....	115
Creating a Custom Vendor.....	115
Modifying a Custom Vendor.....	115
Deleting a Custom Vendor.....	116
 Chapter 5: Managing Custom VSAs.....	 117
About Custom VSAs.....	118
Creating a Custom VSA.....	118
Modifying a Custom VSA.....	119
Deleting a Custom VSA.....	120
 Chapter 6: Managing Match Lists.....	 121
About Match Lists.....	122
Creating a Match List.....	122
Modifying a Match List.....	123
Deleting a Match List.....	123
 Chapter 7: Managing Media Profiles.....	 125
About Media Profiles.....	126
Predefined Media Profiles.....	126
Creating a Media Profile.....	128
Modifying a Media Profile.....	129
Deleting a Media Profile.....	129
 Chapter 8: Managing Monitoring Keys.....	 130
About Monitoring Keys.....	131
Creating a Monitoring Key.....	131
Modifying a Monitoring Key.....	132
Deleting a Monitoring Key.....	132

Chapter 9: Managing Notification Servers.....134

About Notification Servers.....	135
Creating a Notification Server.....	135
Enabling Notification on an MPE device.....	136
Viewing a Notification Server.....	136
Modifying a Notification Server.....	137
Associating a Notification Server with an MPE device.....	137
Associating a Notification Server with a Configuration Template.....	138
Removing the Notification Server Association with an MPE device.....	138
Deleting a Notification Server.....	139

Chapter 10: Managing Policy Counter Identifiers.....140

About Policy Counter IDs.....	141
Creating a Policy Counter ID.....	141
Modifying a Policy Counter ID.....	142
Deleting a Policy Counter ID.....	142
Policy Counter ID Groups.....	142
Creating a Policy Counter ID Group.....	143
Adding a Policy Counter ID to a Policy Counter ID Group.....	143
Modifying a Policy Counter ID Group.....	143
Deleting a Policy Counter ID from a Policy Counter ID Group.....	144
Deleting a Policy Counter ID Group.....	144

Chapter 11: Managing Policy Time Periods.....145

About Policy Time Periods.....	146
Creating a Time Period.....	146
Modifying a Time Period.....	148
Deleting a Time Period.....	148
About Time-of-Day Triggers.....	149

Chapter 12: Managing Presence Reporting Area Lists.....150

About Presence Reporting Area Lists.....	151
Presence Reporting Area List Case Study.....	151
Creating a Core Network Pre-Configured Presence Reporting Area List.....	151
Creating a UE-dedicated Presence Reporting Area List.....	152
Area List Type-Value Combinations.....	153
Modifying a Presence Reporting Area List.....	153

Deleting a Presence Reporting Area List.....	154
Chapter 13: Managing Quotas.....	155
About Quotas.....	156
About Quota Plans.....	156
Creating a Plan.....	156
Modifying a Plan.....	160
Deleting a Plan.....	160
Example: Creating and Using a Plan.....	160
About Quota Passes.....	161
Creating a Pass.....	162
Modifying a Pass.....	164
Deleting a Pass.....	165
Creating a Pass Group.....	165
Adding a Pass to a Pass Group.....	165
Modifying a Pass Group.....	166
Removing a Pass from a Pass Group.....	166
Deleting a Pass Group.....	167
Chapter 14: Managing Quota Conventions.....	168
About Quota Conventions.....	169
Creating a Quota Convention.....	169
Modifying a Quota Convention.....	170
Associating a Quota Convention with a Plan.....	171
Deleting a Quota Convention.....	171
Chapter 15: Managing RADIUS CoA Templates.....	172
About RADIUS CoA Templates.....	173
Creating a RADIUS CoA Template.....	173
Modifying a RADIUS CoA Template.....	175
Deleting a RADIUS CoA Template	175
Example of Creating and Using a RADIUS CoA Template.....	176
Chapter 16: Managing Retry Profiles.....	178
About Retry Profiles.....	179
Creating a Retry Profile.....	179
Modifying a Retry Profile.....	180
Deleting a Retry Profile.....	181

Chapter 17: Managing Roaming Profiles.....	182
About Roaming Profiles.....	183
Creating a Roaming Profile.....	183
Modifying a Roaming Profile.....	186
Deleting a Roaming Profile.....	186
 Chapter 18: Managing Service Classes.....	 187
About Service Classes.....	188
Creating a Service Class.....	188
Modifying a Service Class.....	189
Deleting a Service Class.....	190
 Chapter 19: Managing Services and Rating Groups.....	 191
About Services.....	192
Creating a Service.....	192
Modifying a Service.....	192
Deleting a Service.....	193
About Rating Groups.....	193
Creating a Rating Group.....	193
Adding a Service to a Rating Group.....	194
Modifying a Rating Group.....	194
Removing a Service from a Rating Group.....	194
Deleting a Rating Group.....	195
 Chapter 20: Managing Subscriber Keys.....	 196
About Subscriber Keys.....	197
Creating a Subscriber Key.....	197
Modifying a Subscriber Key.....	199
Deleting a Subscriber Key.....	199
 Chapter 21: Managing Traffic Profiles.....	 200
About Traffic Profiles.....	201
About Traffic Profile Variables.....	201
Creating a Wireless Traffic Profile.....	203
Creating a Cable Traffic Profile.....	214
Deploying a Traffic Profile.....	223

Modifying a Traffic Profile.....	223
Deleting a Traffic Profile.....	224
About Traffic Profile Groups.....	224
Creating a Traffic Profile Group.....	224
Adding a Traffic Profile to a Traffic Profile Group.....	225
Modifying a Traffic Profile Group.....	225
Removing a Traffic Profile from a Traffic Profile Group.....	225
Deleting a Traffic Profile Group.....	226

Part III: Writing Policy Rules: Conditions, Actions, and Variables

Reference.....227

Conditions for Writing Policy Rules.....	228
Policy Condition Categories.....	228
Application Conditions.....	229
where <i>AMID</i> is the application manager ID.....	229
where <i>AppType</i> is the application type.....	230
where the application is latency sensitive.....	230
where the application <i>is</i> one of <i>specified name</i>	231
where the application will be using <i>greater than #</i> and <i>less than #</i> bps <i>specified class of</i> bandwidth.....	231
where the application will be using <i>greater than #</i> and <i>less than #</i> <i>downstream</i> sessions.....	232
where the application will be using <i>greater than #</i> and <i>less than #</i> <i>specified class of</i> sessions.....	233
where the application will be using <i>greater than #</i> bps of <i>specified class of</i> bandwidth.....	234
where the application will be using <i>greater than #</i> bps <i>upstream reserved</i> bandwidth.....	234
where the application will be using <i>greater than #</i> bps <i>upstream reserved</i> bandwidth.....	236
where the application will be using <i>greater than #</i> sessions.....	237
where the application will be using <i>greater than #</i> <i>specified class of</i> sessions.....	237
where the application will be using <i>greater than #</i> <i>upstream reserved</i> flows.....	238
where there is no application associated with the request.....	239
Device Usage Conditions.....	239
where the device will be handling <i>greater than #</i> and <i>less than #</i> bps of <i>specified class of</i> bandwidth.....	239
where the device will be handling <i>greater than #</i> and <i>less than #</i> bps of <i>specified class of</i> sessions.....	240

where the device will be handling <i>greater than #</i> and <i>less than #</i> percent of <i>downstream</i> capacity.....	241
where the device will be handling <i>greater than #</i> and <i>less than # specified class</i> of sessions.....	242
where the device will be handling <i>greater than #</i> bps <i>downstream</i> bandwidth.....	243
where the device will be handling <i>greater than #</i> bps of <i>specified class</i> of bandwidth.....	244
where the device will be handling <i>greater than #</i> bps <i>reserved</i> bandwidth in total for <i>specified class</i> of traffic.....	244
where the device will be handling <i>greater than #</i> bps <i>upstream reserved</i> bandwidth.....	246
where the device will be handling <i>greater than #</i> bps <i>upstream reserved</i> bandwidth in total for <i>specified application</i>	247
where the device will be handling <i>greater than # downstream</i> sessions.....	249
where the device will be handling <i>greater than #</i> percent of <i>downstream</i> capacity.....	249
where the device will be handling <i>greater than #</i> percent of <i>reserved</i> capacity for <i>specified class</i> of traffic.....	250
where the device will be handling <i>greater than #</i> percent of <i>upstream reserved</i> capacity.....	251
where the device will be handling <i>greater than #</i> percent of <i>upstream reserved</i> capacity for <i>specified application</i>	252
where the device will be handling <i>greater than # reserved</i> flows in total for <i>specified class</i> of traffic.....	254
where the device will be handling <i>greater than # specified class</i> of sessions.....	255
where the device will be handling <i>greater than # upstream reserved</i> flows.....	256
where the device will be handling <i>greater than # upstream reserved</i> flows in total for <i>specified application</i>	257
Mobility Conditions.....	258
where network initiated requests are <i>supported</i>	258
where the APN <i>matches one of specified APN value(s)</i>	259
where the BSID <i>matches one of specified Bsid value(s)</i>	259
where the Cell Identifier <i>matches one of specified CI value(s)</i>	260
where the cell state is <i>specified</i>	261
where the E-UTRAN Cell Identifier <i>matches one of specified ECI value(s)</i>	261
where the IP address of the Serving Gateway <i>matches one of specified address(es)</i>	262
where the IP address of the Serving PCF <i>matches one of specified address(es)</i>	262
where the IP-CAN type is <i>specified</i>	263
where the Location Area Code <i>matches one of specified LAC value(s)</i>	264

where the mobile session <i>supports</i> sponsored connectivity.....	264
where the MSTimezone DST is <i>configured daylight savings in hours</i>	265
where the MSTimezone offset is <i>configured timezone offset</i>	265
where the RAT type is <i>specified</i>	266
where the Routing Area Code <i>matches one of specified RAC value(s)</i>	267
where the Routing Area Identifier <i>matches one of specified RAI value(s)</i>	267
where the Service Area Code <i>matches one of specified SAC value(s)</i>	268
where the Serving MCC-MNC <i>matches one of specified MCC-MNC value(s)</i>	269
where the subscribed PRA area <i>matches one of specified PRA area(s)</i>	269
where the Tracking Area Code <i>matches one of specified TAC value(s)</i>	270
where the UE is <i>inside/outside</i> subscribed PRA area.....	271
Network Devices Conditions.....	271
where # is the CMTS blade index.....	271
where # is the CMTS channel index.....	272
where the An-Gw status is <i>active</i>	272
where the cable modem IP address is in <i>specified subnet</i>	273
where the cable modem IP address is <i>specified address</i>	273
where the cable modem MAC address is <i>specified address</i>	274
where the device name <i>matches one of specified name(s)</i>	274
where the device type <i>is specified type</i>	275
where the endpoint IP address is in <i>specified subnet</i>	276
where the endpoint IP address is <i>specified address</i>	276
where the network element name <i>matches one of specified name(s)</i>	277
where the network element type <i>is specified type</i>	277
where the network element's description field is equal to <i>specified</i> <i>description(s)</i>	278
where the network element's diameter identity <i>matches one of specified</i> <i>description(s)</i>	279
where the remote MPE is <i>unavailable</i>	279
where the request is not using the cable modem IP address.....	280
where the request is using the cable modem IP address.....	280
where the User Equipment ESN <i>matches one of specified ESN value(s)</i>	281
where the User Equipment IMEISV <i>matches one of specified IMEISV</i> <i>value(s)</i>	281
where the User Equipment MAC <i>matches one of specified MAC value(s)</i>	282
where the User Equipment MEID <i>matches one of specified MEID value(s)</i>	283
Notification Conditions.....	283
where notification from Sh datasource is received for <i>User Profile</i>	284
Policy Context Properties Conditions.....	285
where the policy context property <i>name exists</i>	286
where the policy context property <i>name</i> is numerically <i>equal to value</i>	286

where the policy context property <i>name matches one of `value(s)`</i>	287
where the policy context property <i>name1 matches one of name2</i>	288
Policy Method Conditions.....	288
where evaluate the customized method <i>specified name(s)</i>	289
Policy Counters Conditions.....	289
where a <i>current</i> status <i>exists</i> for Policy Counter IDs <i>select names</i>	289
where the Filter-Ids for Policy Counter ID <i>select name current</i> status match one or more of <i>Filter-Ids to match</i>	290
where the Final-Unit-Action for Policy Counter IDs <i>select names current</i> status matches <i>Final-Unit-Action to match</i>	291
where the Final-Unit-Indication AVP for Policy Counter IDs <i>select names current</i> status <i>exists</i>	292
where the Policy Counter ID <i>select name current</i> status <i>is</i> between <i>value</i> and <i>value</i>	292
where the Policy Counter ID <i>select name current</i> status <i>is</i> contained in Match Lists <i>select lists</i>	293
where the Policy Counter ID <i>select name current</i> status is numerically <i>equal to value</i>	294
where the Policy Counter ID <i>select name current</i> status <i>matches one of specified value(s)</i>	295
where the Policy Counter ID <i>select name</i> status <i>is</i> equal to default status.....	296
where the Policy Counter IDs <i>select names exists</i>	297
where the Sy Session <i>exists</i>	297
Policy SDP Properties Conditions.....	298
where the <i>local</i> codec data is an <i>offer</i>	298
where the <i>local specified SDP property exists</i>	299
where the <i>local specified SDP property</i> is numerically <i>equal to value</i>	301
where the <i>local specified SDP property matches one of value(s)</i>	303
RADIUS Conditions.....	305
where the BNG COA destination port <i>is port number</i>	305
where the RADIUS accounting request is <i>RADIUS Accounting-Start</i>	306
where the RADIUS request <i>contains</i> a TLV / VSA of <i>name or ID</i>	307
where the RADIUS request contains TLV / VSA <i>name or ID</i> whose value <i>is contained in Match List List of TLV / VSA value as string</i>	307
where the RADIUS request contains TLV / VSA <i>name or ID</i> whose value is numerically <i>equal to number</i>	308
where the RADIUS request contains TLV / VSA <i>name or ID</i> whose value <i>matches one of TLV / VSA value as string</i>	309
where the RADIUS request contains VSAs from <i>vendor</i>	310
Request Conditions.....	311
where at least one Filter-ID AVP exists.....	311

where at least one Final-Unit-Action matches <i>Final-Unit-Action to match</i>	311
where at least one Final-Unit-Indication AVP exists.....	312
where at least one flow has media type that matches <i>specified type(s)</i>	312
where at least one flow with media type <i>specified type(s)</i> has one of the statuses <i>specified status(s)</i>	313
where Filter-ID AVP does not exist.....	314
where Final-Unit-Indication AVP does not exist.....	314
where the AF-Application-ID <i>is</i> available.....	314
where the AF-Application-ID matches one of <i>specified value(s)</i>	315
where the AF-Application <i>is</i> one of managed-applications.....	315
where the Application-Service-Provider-Identity matches one of <i>specified</i> <i>Application Service Provider Identity(s)</i>	316
where the bearer usage is <i>General</i>	317
where the Classifier parameters are equal to <i>specified value</i>	317
where the codec name for the flow <i>matches one of specified codec name(s)</i>	318
where the corresponding enforcement session <i>supports</i> feature <i>name</i>	319
where the DPI session is <i>a Gx Lite session</i>	320
where the enforcement session is <i>an IP-CAN session</i>	320
where the event trigger is one of <i>specified trigger(s)</i>	321
where the Filter-Ids in the Final-Unit-Indication AVPs match one or more of <i>Filter-Ids to match</i> and the search type is <i>search type</i>	323
where the flow has <i>greater than #</i> grants per interval.....	323
where the flow is <i>an application flow</i>	324
where the flow media type is one of <i>specified type(s)</i>	325
where the flow media type <i>matches one of user defined media type(s)</i>	325
where the flow media type <i>specified type(s)</i> is one of <i>specified status(s)</i>	326
where the flow packet filter <i>matches one of specified packet filter(s)</i>	327
where the flow usage is one of <i>specified usage(s)</i>	327
where the IP-CAN bearer is <i>the primary bearer</i>	328
where the names of the installed PCC/ADC rules <i>contains one of specified</i> <i>PCC/ADC rule names</i>	328
where the PCC rule being reinstalled <i>contains one of specified rule name(s)</i> and the retry <i>is</i> the final attempt.....	329
where the PCC/ADC rule being reinstalled contains one of <i>specified rule</i> <i>name(s)</i> and the retry <i>is</i> the final attempt.....	330
where the protocol being executed is <i>PCMM</i>	330
where the QoS parameters in the flow are equal to <i>specified value</i>	331
where the QoS upgrade is <i>supported</i>	336
where the quota is <i>requested</i>	337
where the quota usage rating conditions changed trigger is one of <i>specified</i> <i>values</i>	337

where the quota usage reporting reason is one of <i>specified values</i>	338
where the RAN-NAS-Release-Cause is <i>Protocol Type</i> and <i>Cause Type</i>	339
where the reauth is triggered by <i>specified type(s)</i>	340
where the reauth is triggered by subscriber profile update with notification type <i>specified type(s)</i>	340
where the reauth request is triggered by scheduled task containing <i>Service</i> <i>key</i> with <i>action</i>	341
where the reauthorization reason is <i>REASON_REVALIDATION_TIMEOUT</i>	342
where the request AVP Media-Component-Description <i>exists</i>	343
where the request AVP <i>name exists</i>	343
where the request AVP <i>name</i> value <i>contains one of value(s)</i>	344
where the request AVP <i>name</i> value <i>is</i> contained in Match Lists <i>select lists</i>	345
where the request AVP <i>name</i> value is numerically <i>equal to value</i>	346
where the request AVP <i>name</i> value <i>matches one of value(s)</i>	347
where the request Credit Management Status is one of <i>specified type(s)</i>	348
where the request is <i>creating a new flow</i>	348
where the request is <i>creating a new session</i>	349
where the request is for <i>downstream</i> bandwidth.....	350
where the request is for <i>reserved</i> bandwidth.....	350
where the request <i>is</i> for <i>specified class of</i> traffic.....	351
where the request is for <i>upstream</i> bandwidth.....	351
where the request is reporting quota usage using <i>monitoring key</i>	352
where the request is reporting session quota usage.....	353
where the request MPS Identifier <i>matches one of value(s)</i>	353
where the request <i>supports</i> feature <i>name</i>	354
where the requested <i>downstream</i> bandwidth is <i>greater than #</i> and <i>less than #</i> bps.....	354
where the requested GCS Identifier <i>matches one of value(s)</i>	355
where the requested guaranteed <i>downstream</i> bandwidth is <i>greater than #</i> bps.....	356
where the requested guaranteed <i>upstream</i> bandwidth is <i>greater than #</i> bps.....	357
where the requested maximum <i>upstream</i> bandwidth is <i>greater than specified</i> bps.....	358
where the requested media component description reservation priority is one of <i>specified</i>	359
where the requested minimum <i>upstream</i> bandwidth is <i>greater than specified</i> bps.....	360
where the requested QCI is one of <i>specified</i>	361
where the requested quota is one of <i>select quota</i>	362
where the requested rating group is one of <i>select rating group</i>	362

where the requested service class <i>matches one of specified name(s)</i>	363
where the requested services are <i>select service</i>	363
where the requested session reservation priority is one of <i>specified</i>	364
where the requested time limit is <i>greater than #</i> seconds.....	365
where the requested time limit is unlimited (or unspecified).....	365
where the requested <i>upstream</i> APN aggregate maximum bitrate is <i>greater than #</i> bps.....	366
where the requested volume limit is <i>greater than #</i> kilobytes.....	367
where the requested volume limit is unlimited or unspecified.....	368
where the Required-Access-Info <i>matches one of value(s)</i>	368
where the roaming profile for the session is one of Roaming Profile <i>name</i>	369
where the rule report contains one of <i>specified rule name(s)</i> and the final unit action is one of <i>specified values</i> and the rule status is <i>active</i>	369
where the rule report contains one of <i>specified rule name(s)</i> and the rule status is <i>active</i>	370
where the rule report contains one of <i>specified rule name(s)</i> and the rule status is <i>active</i> and the rule failure code is one of <i>specified failure code(s)</i>	371
where the rule report contains one of <i>specified rule name(s)</i> and the rule status is <i>active</i> and the rule failure code is one of <i>specified failure code(s)</i> and the maximum retry count <i>is</i> reached.....	372
where the rule report contains RAN-NAS-Release-Cause and is <i>Protocol Type</i> and <i>Cause Type</i>	374
where the rule report for the flow has status <i>active</i>	374
where the <i>select type</i> is contained in Match Lists <i>select lists</i>	375
where the <i>select type</i> is not contained in Match Lists <i>select lists</i>	376
where the service info status is one of <i>specified</i>	378
where the Service-URN is one of <i>specified value(s)</i>	379
where the session granted quota using <i>monitoring key</i> is valid.....	379
where the session granted session level quota <i>is</i> valid.....	380
where the session is <i>an enforcement session</i>	380
where the SessionClassID is <i>specified value</i>	381
where the specific action is one of <i>specified action(s)</i>	381
where the Sponsor-Identity matches one of <i>specified Sponsor Identity(s)</i>	382
where the TDF-Application-Identifier matches one of <i>specified TDF application id(s)</i>	383
where the user field <i>field</i> is available.....	384
where top-up instance being granted for <i>select type</i> using <i>monitoring key</i> is valid.....	384
State Variables Conditions.....	385
where the <i>scope</i> state variable <i>name + 0 days</i> rounded <i>up</i> with <i>same</i> granularity is <i>after now</i> using <i>configured local time</i>	385

where the <i>scope</i> state variable <i>name exists</i>	388
where the <i>scope</i> state variable <i>name</i> is <i>in</i> the current billing cycle using <i>configured local time</i>	388
where the <i>scope</i> state variable <i>name</i> is numerically <i>equal to value</i>	390
where the <i>scope</i> state variable <i>name</i> is the current mobile country code.....	391
where the <i>scope</i> state variable <i>name matches one of `value(s)`</i>	392
where the <i>scope</i> state variable <i>name</i> value <i>is</i> contained in Match Lists <i>selected</i> <i>lists</i>	393
Time of Day Conditions.....	394
where the current time <i>is</i> between <i>start time</i> and <i>end time</i> using <i>configured</i> <i>local time</i>	394
where the current time <i>is</i> within the <i>specified</i> time period(s).....	395
where today is a week day using <i>configured local time</i>	396
where today is a weekend day using <i>configured local time</i>	396
where today <i>is day</i> using <i>configured local time</i>	397
where today <i>is</i> the <i>specified number(s)</i> th day(s) of <i>Any Month</i> in <i>natural order</i> using <i>configured local time</i>	398
User Conditions.....	399
where at least one of <i>subscriber or pool</i> fields <i>named</i> have been updated.....	399
where the account id <i>matches one of specified id(s)</i>	400
where the account will be handling <i>greater than #</i> and <i>less than #</i> percent of <i>downstream</i> limit.....	401
where the account will be handling <i>greater than #</i> percent of <i>downstream</i> limit.....	401
where the account will be handling <i>greater than #</i> percent of <i>upstream reserved</i> limit.....	402
where the account will be using <i>greater than #</i> and <i>less than #</i> bps <i>downstream</i> bandwidth.....	403
where the account will be using <i>greater than #</i> and <i>less than #</i> <i>downstream</i> sessions.....	404
where the account will be using <i>greater than #</i> bps <i>downstream</i> bandwidth.....	405
where the account will be using <i>greater than #</i> bps of <i>specified class of</i> bandwidth.....	406
where the account will be using <i>greater than #</i> bps <i>reserved</i> bandwidth in total for <i>specified class of</i> traffic.....	406
where the account will be using <i>greater than #</i> bps upstream bandwidth in total for <i>specified application</i>	408
where the account will be using <i>greater than #</i> bps <i>upstream reserved</i> bandwidth.....	409
where the account will be using <i>greater than #</i> <i>downstream</i> sessions.....	410

where the account will be using <i>greater than # reserved</i> flows in total for <i>specified class of</i> traffic.....	411
where the account will be using <i>greater than # specified class of</i> sessions.....	412
where the account will be using <i>greater than #</i> upstream flows in total for <i>specified application</i>	413
where the account will be using <i>greater than # upstream reserved</i> flows.....	414
where the pool type is <i>basic</i>	415
where the <i>subscriber or pool</i> does not have any of the <i>named</i> entitlements.....	416
where the <i>subscriber or pool</i> does not have at least one of the <i>named</i> entitlements.....	416
where the <i>subscriber or pool field + 0 days rounded up</i> with <i>same</i> granularity is <i>after now</i> using <i>configured local time</i>	417
where the <i>subscriber or pool field exists</i>	419
where the <i>subscriber or pool field exists</i> before update.....	420
where the <i>subscriber or pool field</i> is <i>in</i> the current billing cycle using <i>configured</i> <i>local time</i>	421
where the <i>subscriber or pool field</i> is modified via notification.....	422
where the <i>subscriber or pool field</i> is numerically <i>equal to value</i>	423
where the <i>subscriber or pool field matches one of specified value(s)</i>	424
where the <i>subscriber or pool field</i> prior to notification <i>matches one of specified</i> <i>value(s)</i>	425
where the <i>subscriber or pool</i> has all of the <i>named</i> entitlements.....	426
where the <i>subscriber or pool</i> has at least one of the <i>named</i> entitlements.....	426
where the <i>subscriber or pool</i> profile data <i>is</i> available.....	427
where the subscriber profile data <i>expiration timestamp field for day pass in millis</i> is less than <i>hours from expiration</i> hours from expiring.....	428
where the tier <i>is</i> one of <i>specified tier(s)</i>	428
where the tier will be handling <i>greater than #</i> and <i>less than # specified class of</i> sessions.....	429
where the tier will be handling <i>greater than # specified class of</i> sessions.....	430
where the tier will be using <i>greater than #</i> and <i>less than # bps of specified class</i> <i>of</i> bandwidth.....	430
where the tier will be using <i>greater than #</i> bps of <i>specified class of</i> bandwidth.....	431
where the user E.164 phone number <i>matches one of specified number(s)</i>	432
where the user has <i>greater than #</i> of passes named <i>select type</i>	433
where the user has <i>greater than #</i> of rollover units of type <i>unit type</i> for plan <i>plan name</i> and usage <i>usage type</i>	433
where the user has <i>greater than #</i> of top-ups for plan <i>select type</i>	435
where the user IMSI <i>matches one of specified number(s)</i>	436
where the user is a <i>home</i> user.....	436

where the user is using dynamic quota for <i>selected</i>	437
where the user is using <i>greater than #</i> percent and <i>less than #</i> percent <i>select type</i> of dynamic quota for <i>selected</i>	437
where the user is using <i>greater than #</i> percent <i>select type</i> of dynamic quota for <i>selected</i>	439
where the user is using <i>greater than #</i> seconds in total for <i>selected</i> quota.....	440
where the user is using <i>greater than #</i> service-specific units for <i>selected</i> quota.....	441
where the user is using <i>greater than #</i> units of <i>total volume (bytes)</i> for <i>selected</i> quota.....	441
where the user is using <i>greater than specified</i> percent and <i>less than #</i> percent of <i>select type</i> for <i>selected</i> quota.....	443
where the user is using <i>greater than specified</i> percent of <i>select type</i> for <i>selected</i> quota.....	444
where the user NAI <i>matches one of specified id(s)</i>	445
where the user realm <i>matches one of specified realm(s)</i>	446
where the user <i>Service key exists</i>	447
where the user <i>Service key field contains one of specified value(s)</i>	448
where the user <i>Service key field matches one of value(s)</i>	449
where the user <i>Service key field</i> prior to notification <i>matches one of</i> previous value.....	450
where the user <i>Service key</i> is <i>in</i> the activation timeframe using <i>configured local time</i>	450
where the user SIP URI <i>matches one of specified URI(s)</i>	452
where the user will be handling <i>greater than #</i> percent of <i>upstream reserved</i> limit.....	452
where the user will be using <i>greater than #</i> bps <i>reserved</i> bandwidth in total for <i>specified class of</i> traffic.....	453
where the user will be using <i>greater than #</i> bps <i>upstream reserved</i> bandwidth.....	455
where the user will be using <i>greater than #</i> bps <i>upstream reserved</i> bandwidth in total for <i>specified application</i>	456
where the user will be using <i>greater than #</i> <i>upstream reserved</i> flows.....	458
where the user will be using <i>greater than #</i> <i>upstream reserved</i> flows in total for <i>specified application</i>	459
where the User's Tier <i>downstream</i> bandwidth limit is between <i>#</i> bps and <i>#</i> bps.....	460
where the User's Tier <i>downstream</i> bandwidth limit is <i>greater than #</i> bps.....	461
where the User's Tier <i>upstream</i> bandwidth limit is between <i>#</i> bps and <i>#</i> bps.....	462
where the User's Tier <i>upstream</i> bandwidth limit is <i>greater than #</i> bps.....	463

Actions for Writing Policy Rules.....	464
Mandatory Policy-Processing Actions.....	465
accept message.....	465
break from policy level.....	465
continue processing message.....	466
reject message.....	466
reject message with code <i>`number`</i>	467
reject message with code <i>`number`</i>	467
reject message with Experimental-Result-Code <i>`number`</i> and Vendor-ID <i>`number`</i>	467
skip to next device.....	468
skip to next flow.....	469
Optional Policy-Processing Actions.....	469
accumulate reported quota usage of <i>selected</i> to <i>selected</i>	469
add custom grouped AVP <i>name</i> and send <i>always</i>	470
add the APP Detection Flow <i>select scope</i> to <i>specified</i> PCC rules.....	470
Advanced: set values for QoS and Charging parameters to <i>specified value</i>	471
apply roaming profile <i>name</i>	473
apply <i>specified profile(s)</i> to all flows in the request.....	474
apply <i>specified profile(s)</i> to request.....	474
apply <i>specified profiles</i> to flow(s) whose media type matches one of <i>specified</i> <i>types</i>	475
apply <i>specified profiles</i> to selected <i>specified types</i> flows in the request.....	476
clear alarm with severity <i>`severity level`</i> , id <i>`unique alarm identifier`</i> and message <i>`message text`</i>	477
disable forwarding to next hop gateway.....	478
disable <i>monitoring key</i>	478
discard next quota usage report in grace period of <i>select-quota</i>	478
discard next quota usage report in grace period of <i>select-quota</i> using <i>monitoring-key</i>	479
enable event messaging for this request.....	480
enable subscription for notification of user profile changes.....	480
<i>enable</i> subtracting usage from <i>select quota</i> for <i>monitoring key</i>	480
<i>enable/disable</i> PRA subscription.....	481
establish traffic detection session using the IP-CAN TDF information.....	482
establish traffic detection session with <i>select network element identity</i>	482
evaluate policy group <i>select policy group</i>	483
evaluate policy <i>select policy</i>	484
evaluate the schedule task on <i>Service</i>	484
fetch Policy Counters <i>default</i> from OCS.....	485
grant <i>#</i> bytes for quota.....	485

grant # of <i>select units</i> for <i>select quota</i>	486
grant # percent in service-specific units for quota.....	487
grant # percent in time for quota.....	487
grant # percent in volume for quota.....	487
grant # percent of <i>select type</i> for BEST OF <i>select quota</i>	488
grant # percent of <i>select type</i> for <i>select quota</i>	489
grant # seconds for quota.....	490
grant # service-specific units for quota.....	490
grant # units of <i>total volume (bytes)</i> for <i>select quota</i>	491
grant # units of <i>total volume (bytes)</i> for <i>select quota</i> using <i>monitoring key</i>	492
grant session time limit to <i>specified</i> percent of <i>select quota</i>	493
grant <i>total volume</i> to <i>Min</i> of # bytes and # percent <i>used</i> for <i>select quota</i>	494
grant <i>total volume</i> to <i>Min</i> of # bytes and # percent <i>used</i> for <i>select quota</i> using <i>monitoring key</i>	495
grant <i>total volume</i> to <i>specified</i> percent <i>used</i> for BEST OF <i>select quota</i>	496
grant <i>total volume</i> to <i>specified</i> percent <i>used</i> for BEST OF <i>select quota</i> using <i>monitoring key</i>	497
grant <i>total volume</i> to <i>specified</i> percent <i>used</i> for <i>select quota</i>	499
grant <i>total volume</i> to <i>specified</i> percent <i>used</i> for <i>select quota</i> using <i>monitoring</i> <i>key</i>	500
install <i>specified</i> ADC rule(s) for <i>select scope</i>	502
install <i>specified</i> ADC rule(s) for <i>select scope</i> active between <i>start time and end</i> <i>time</i>	503
install <i>specified</i> ADC rule(s) for <i>select scope</i> active within <i>Time Period</i>	504
install <i>specified</i> ADC rule(s) for <i>select scope</i> for <i>specified retry profile</i> active between <i>start time and end time</i>	505
install <i>specified</i> ADC rule(s) for <i>select scope</i> for <i>specified retry profile</i> active within <i>Time Period</i>	506
install <i>specified</i> ADC rule(s) for <i>select scope</i> with <i>specified retry profile</i>	507
install <i>specified</i> PCC rule(s) for <i>select scope</i>	508
install <i>specified</i> PCC rule(s) for <i>select scope</i> active between <i>start time and end</i> <i>time</i>	509
install <i>specified</i> PCC rule(s) for <i>select scope</i> active within <i>Time Period</i>	510
install <i>specified</i> PCC rule(s) for <i>select scope</i> for <i>specified retry profile</i> active between <i>start time and end time</i>	511
install <i>specified</i> PCC rule(s) for <i>select scope</i> for <i>specified retry profile</i> active within <i>Time Period</i>	513
install <i>specified</i> PCC rule(s) for <i>select scope</i> with <i>specified retry profile</i>	514
mark request AVP <i>name</i> as failed if exists and send <i>always</i>	515
<i>overwrite</i> Conditional Policy Information with Execution-Time to <i>time</i> and parameters <i>specified</i>	516

overwrite DSCP/TOS field with #.....	518
overwrite SessionClassId with #.....	519
re-authorize all credit control sessions associated with User.....	519
re-authorize all PCEF/TDF sessions associated with <i>select scope</i>	520
release all credit control sessions associated with User.....	520
release all PCEF/TDF sessions associated with <i>select scope</i>	521
release the session.....	521
release the session with cause `ReleaseCause`.....	521
remove ADC rule type(s) <i>select types of rules</i> for <i>select scope</i>	522
remove all policy context properties.....	523
remove all the <i>scope</i> state variables and save <i>always</i>	523
remove custom AVP <i>name</i> from reply <i>always</i>	524
remove <i>default</i> PCC rules of <i>default</i> TDF application IDs for APPLICATION_STOP.....	525
remove PCC rule for the flow.....	526
remove PCC rule type(s) <i>select types of rules</i> for <i>select scope</i>	526
remove policy context property <i>name</i>	527
remove <i>specified</i> ADC rule(s).....	527
remove <i>specified</i> PCC rule(s).....	528
remove the <i>scope</i> state variable <i>name</i> and save <i>always</i>	528
request usage report for <i>monitoring key</i>	529
reset all plan usage.....	530
reset all plan usage with reset type of <i>select reset type</i>	530
reset all subscriber data.....	531
reset <i>select quota</i> reset type of <i>select reset type</i>	531
reset usage for <i>select quota</i>	532
revalidate the session at <i>datetime</i> using <i>configured local time</i>	532
schedule next RAR for resetting usage for <i>select quota</i>	533
send CoA with <i>COA Template</i>	534
send http <i>POST</i> notification to <i>select notification destination</i> with headers <i>headers</i> and content <i>content</i>	534
send http <i>POST</i> notification to url <i>URL</i> with headers <i>headers</i> and content <i>content</i>	536
send notification to syslog with `message text` and severity `severity level`.....	538
send notification to trace log with `message text` and severity `severity level`.....	539
send SMS Alert ` <i>specified</i> ` to user.....	540
send SMS ` <i>specified</i> ` to ` <i>default</i> ` destination address, ` <i>default</i> ` TON and ` <i>default</i> ` NPI from ` <i>default</i> ` source address, ` <i>default</i> ` TON and ` <i>default</i> ` NPI on `now`. Request delivery receipt ` <i>default</i> `.....	541

send SMS <i>`specified`</i> to <i>`default`</i> destination address, <i>`default`</i> TON and <i>`default`</i> NPI from <i>`default`</i> source address, <i>`default`</i> TON and <i>`default`</i> NPI on <i>`Billing Day`</i> . Request delivery receipt <i>`default`</i>	544
send SMS <i>`specified`</i> to <i>`default`</i> destination address, from <i>`default`</i> source address on user billing day. Request delivery receipt <i>`default`</i>	547
send SMS <i>`specified`</i> to <i>`default`</i> destination address, from <i>`default`</i> source address. Request delivery receipt <i>`default`</i>	548
send SMS <i>`specified`</i> to user from <i>`default`</i> source address if exceed <i>`number`</i> <i>`days`</i> for <i>`Identity`</i> . Request delivery receipt <i>`default`</i>	550
send SMS <i>`specified`</i> to user on <i>`now`</i> . Request delivery receipt <i>`default`</i>	551
send SMS <i>`specified`</i> to user on <i>`Billing Day`</i> . Request delivery receipt <i>`default`</i>	553
send SMS <i>`specified`</i> to user. Request delivery receipt <i>`default`</i>	555
send SMTP message with the following <i>text/plain</i> content.....	556
set alarm with severity <i>`severity level`</i> , id <i>`unique alarm identifier`</i> and message <i>`message text`</i>	557
set authorization validity time to # seconds.....	558
set authorization validity time to <i>datetime</i>	559
set authorization validity time to <i>time</i> on <i>day</i> using <i>configured local time</i>	560
set charging server(s) for the IP-CAN/Sd session to <i>specified values</i>	561
set CSG reporting info to <i>select value</i>	561
set custom AVP <i>name</i> value to the policy context property <i>name</i>	562
set custom AVP <i>name</i> value to the user property <i>name</i> and save <i>always</i>	562
set DRMP AVP to <i>DRMP Level</i> in Re-Authorized Request.....	563
set <i>external field</i> to # percent of <i>select type</i> for <i>selected</i> quota.....	564
set <i>external field</i> to <i>`value`</i>	565
set NoOptimization to request.....	566
set policy context property <i>name</i> to the instance name of dynamic quota of <i>selected</i> being used.....	566
set policy context property <i>name</i> to <i>value</i>	567
set Quota Exhaustion Action to <i>specified</i>	567
set session revalidation time to # seconds.....	569
set session revalidation time to Policy Counter ID(s) <i>select name(s)</i>	569
set session revalidation time to <i>time</i> on <i>day</i> using <i>configured local time</i>	570
set <i>specified</i> ARP to <i>value</i>	571
set the <i>scope</i> state variable <i>name</i> to <i>now + 0 days</i> rounded up with <i>same</i> granularity using <i>configured local time</i> and save <i>always</i>	571
set the <i>scope</i> state variable <i>name</i> to <i>now</i> using <i>configured local time</i> and save <i>always</i>	574
set the <i>scope</i> state variable <i>name</i> to property <i>name + multiple of 0 days</i> rounded up with <i>same</i> granularity and save <i>always</i>	575

set the <i>scope</i> state variable <i>name</i> to select traffic profile <i>name</i> and save <i>always</i>	578
set the <i>scope</i> state variable <i>name</i> to ` <i>value</i> ` and save <i>always</i>	579
set the <i>scope</i> state variable <i>name</i> to <i>time plus</i> random value within # seconds and save <i>always</i>	580
set the user property <i>name</i> to <i>Existing or New</i> custom AVP <i>name</i> and send <i>always</i>	583
set threshold to # percent of <i>granted</i> quota for service-specific units.....	584
set threshold to # percent of <i>granted</i> quota for time.....	584
set threshold to # percent of <i>granted</i> quota for volume.....	585
set time limit to # seconds.....	586
set <i>value</i> to <i>Existing or New</i> custom AVP <i>name</i> and send <i>always</i>	586
set volume limit to # kilobytes.....	587
subscribe PRA change for <i>PRA area</i>	588
unsubscribe PRA change.....	588
Policy Rule Variables.....	589
Glossary.....	590

Chapter 1

About This Guide

Topics:

- [Introduction.....28](#)
- [How This Guide is Organized.....28](#)
- [Scope and Audience.....29](#)
- [Related Publications.....30](#)
- [Locate Product Documentation on the Oracle Help Center Site.....31](#)
- [Customer Training.....31](#)
- [My Oracle Support \(MOS\).....32](#)
- [Emergency Response.....32](#)

This chapter contains an overview of the manual, describes how to obtain help, where to find related documentation, and provides other general information.

Introduction

This reference contains information about policies that you can create, deploy, and manage using the Oracle Communications Policy Management Configuration Management Platform (CMP) system in all operating modes. This reference describes the manageable objects you can include in policies, the policy wizard you use to create policies, and the policy conditions, actions, and variables available for your use in writing policy rules.

Conventions

The following conventions are used throughout this guide:

- **Bold text** in procedures indicates icons, buttons, links, or menu items that you can click.
- *Italic text* indicates variables.
- `Monospace text` indicates text displayed on screen or text that you enter exactly as shown.

How This Guide is Organized

The information in this guide is presented in the following order:

- [About This Guide](#) provides general information about the organization of this guide, related documentation, and how to get technical assistance.
- [The Oracle Communications Configuration Management Platform Server](#) provides an overview of policies, policy groups, and the Oracle Communications Policy Management Configuration Management Platform (CMP) system, which lets you create, deploy, and manage policies and the objects that you can refer to or manipulate within them.
- Part I: [Using the Policy Wizard](#) describes how to use the policy wizard to create and manage policies. It contains the following chapters:
 - [About Policies](#) describes how policies are structured and evaluated, as well as how they can be used.
 - [Creating a Policy Rule](#) describes how to create policy rules.
 - [Deploying Policies](#) describes how to manage policy deployment.
 - [Managing the Policy Library](#) describes how to organize and manage your policy library.
 - [Managing Policy Tables](#) describes how to create and manage your library of policy tables.
 - [Managing Policy Groups](#) describes how to create and manage policy groups.
 - [Managing Policy Templates](#) describes how to create and manage policy templates to simplify the creation of multiple policies with similar conditions and actions.
 - [Managing Virtual Policy Tables](#) describes how to create and manage your library of virtual policy tables.
 - [Managing Policy Checkpoints](#) describes the method of saving CMP objects and their configuration, as well as their association, to the CMP database at a specific point in time.
- Part II: [Configuring Manageable Objects for Use In Policies](#) describes how to create and manipulate manageable objects that can be used in policies. It contains the following chapters:

- [About Creating Manageable Objects](#) describes the manageable objects that you can create in wireless, cable, and wireline modes.
- [Managing Application Profiles](#) describes how to create and manage application profiles.
- [Managing Custom AVPs](#) describes how to create and manage custom RADIUS attribute-value pairs (AVPs) in a wireless network.
- [Managing Custom Vendors](#) describes how to create and manage custom RADIUS vendors in a wireless network.
- [Managing Custom VSAs](#) describes how to create and manage custom RADIUS vendor-specific attributes (VSAs) in a wireless network.
- [Managing Match Lists](#) describes how to manage match lists in a wireless network.
- [Managing Media Profiles](#) describes how to create and manage media profiles in a cable network.
- [Managing Monitoring Keys](#) describes how to create and manage monitoring keys in a wireless network.
- [Managing Notification Servers](#) describes how to create and manage notification servers in the CMP system.
- [Managing Policy Counter Identifiers](#) describes how to create and manage policy counter identifiers in a wireless network.
- [Managing Policy Time Periods](#) describes how to create and manage policy time periods in a wireless network.
- [Managing Presence Reporting Area Lists](#) describes how to create and manage Presence Reporting Area lists in a wireless network.
- [Managing Quotas](#) describes how to create and manage Gx and Gy quotas in a wireless network.
- [Managing Quota Conventions](#) describes how to create and manage quota conventions in a wireless network.
- [Managing RADIUS CoA Templates](#) describes how to create, manage, and use RADIUS Change of Authorization (CoA) templates in a wireless network.
- [Managing Retry Profiles](#) describes how to create and manage retry profiles in a wireless network.
- [Managing Roaming Profiles](#) describes how to create and manage roaming profiles.
- [Managing Service Classes](#) describes how to create and manage service classes in a cable network.
- [Managing Services and Rating Groups](#) describes how to create and manage Gy services and rating groups in a wireless network.
- [Managing Subscriber Keys](#) describes how to create and manage RADIUS subscriber keys in a wireless network.
- [Managing Traffic Profiles](#) describes how to create and manage traffic profiles.
- Part III: [Writing Policy Rules: Conditions, Actions, and Variables Reference](#) is a reference that describes the conditions, actions, and variables used when creating policy rules.

Scope and Audience

This document is intended for policy designers, who use the CMP system, particularly the policy wizard and the policy table wizard, to design, create, and deploy policy rules for a carrier network.

Related Publications

For information about additional publications related to this document, refer to the Oracle Help Center site. See [Locate Product Documentation on the Oracle Help Center Site](#) for more information on related product publications.

Policy and Protocol Specifications

The following specifications provide information on cable and wireless protocols:

- PCMM CableLabs specifications:
 - PKT-SP-MM-I05: PacketCable™ Multimedia Specification
 - PKT-SP-DQOS-I12-050812: PacketCable™ Dynamic Quality-of-Service Specification
- Internet Engineering Task Force (IETF) specifications:
 - RADIUS RFCs:
 - RFC 2865: RADIUS
 - RFC 2866: RADIUS Accounting
 - RFC 3576: Dynamic Authorization Extensions to RADIUS
 - Diameter RFCs:
 - RFC 3539: Authentication, Authorization and Accounting (AAA) Transport Profile
 - RFC 3588: Diameter Base Protocol
 - TACACS+ RFC 1492: An Access Control Protocol, Sometimes Called TACACS
 - RFC 3164: The BSD syslog Protocol
- 3rd Generation Partnership Project (3GPP) technical specifications:
 - 3GPP TS 23.003: Numbering, addressing and identification (Release 12)
 - 3GPP TS 23.203: Policy and charging control architecture (Release 13.2)
 - 3GPP TS 26.114: IP Multimedia Subsystem (IMS); Multimedia telephony; Media handling and interaction (Release 13.1.0)
 - 3GPP TS 26.445: Codec for Enhanced Voice Services (EVS); Detailed algorithmic description (Release 13.0.0)
 - 3GPP TS 23.402: Architecture enhancements for non-3GPP accesses (Release 13)

Locate Product Documentation on the Oracle Help Center Site

Oracle Communications customer documentation is available on the web at the Oracle Help Center (OHC) site, <http://docs.oracle.com>. You do not have to register to access these documents. Viewing these files requires Adobe Acrobat Reader, which can be downloaded at <http://www.adobe.com>.

1. Access the Oracle Help Center site at <http://docs.oracle.com>.
2. Click **Industries**.
3. Under the Oracle Communications subheading, click the **Oracle Communications documentation** link.
The Communications Documentation page appears. Most products covered by these documentation sets will appear under the headings “Network Session Delivery and Control Infrastructure” or “Platforms.”
4. Click on your Product and then the Release Number.
A list of the entire documentation set for the selected product and release appears.
5. To download a file to your location, right-click the **PDF** link, select **Save target as** (or similar command based on your browser), and save to a local folder.

Customer Training

Oracle University offers training for service providers and enterprises. Visit our web site to view, and register for, Oracle Communications training:

<http://education.oracle.com/communication>

To obtain contact phone numbers for countries or regions, visit the Oracle University Education web site:

www.oracle.com/education/contacts

My Oracle Support (MOS)

MOS (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support (CAS) can assist you with MOS registration.

Call the CAS main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. When calling, make the selections in the sequence shown below on the Support telephone menu:

1. Select **2** for New Service Request
2. Select **3** for Hardware, Networking and Solaris Operating System Support
3. Select one of the following options:
 - For Technical issues such as creating a new Service Request (SR), Select **1**
 - For Non-technical issues such as registration or assistance with MOS, Select **2**

You will be connected to a live agent who can assist you with MOS registration and opening a support ticket.

MOS is available 24 hours a day, 7 days a week, 365 days a year.

Emergency Response

In the event of a critical service situation, emergency response is offered by the Customer Access Support (CAS) main number at 1-800-223-1711 (toll-free in the US), or by calling the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. The emergency response provides immediate coverage, automatic escalation, and other features to ensure that the critical situation is resolved as rapidly as possible.

A critical situation is defined as a problem with the installed equipment that severely affects service, traffic, or maintenance capabilities, and requires immediate corrective action. Critical situations affect service and/or system operation resulting in one or several of these situations:

- A total system failure that results in loss of all transaction processing capability
- Significant reduction in system capacity or traffic handling capability
- Loss of the system's ability to perform automatic system reconfiguration
- Inability to restart a processor or the system
- Corruption of system databases that requires service affecting corrective actions
- Loss of access for maintenance or recovery operations
- Loss of the system ability to provide any required critical or major trouble notification

Any other problem severely affecting service, capacity / traffic, billing, and maintenance capabilities may be defined as critical by prior discussion and agreement with Oracle.

Chapter 2

The Oracle Communications Configuration Management Platform Server

Topics:

- [Configuration Management Platform Server.....34](#)
- [Overview of Main Tasks.....34](#)
- [Specifications for Using the CMP Server.....35](#)
- [Logging In.....35](#)
- [CMP Interface Overview.....35](#)
- [CMP Icons.....36](#)
- [Shortcut Selection Keys.....38](#)
- [Changing a Password.....38](#)

This chapter provides an overview of the Oracle Communications Policy Management Configuration Management Platform (CMP), which includes a policy wizard to aid in creating policies and manageable objects to which policies can refer.

Configuration Management Platform Server

The Configuration Management Platform (CMP) server provides centralized management and administration of policy rules, policy management devices, associated applications, and manageable objects, all from a single management console. This browser-based management console supports the following features and functions:

- Configuration and management of MPE devices
- Configuration and management of MRA devices
- Configuration and management of Mediation devices
- Configuration of connections to subscriber profile repository (SPR) servers, including Oracle Communications User Data Repository (UDR) and Oracle Communications Enhanced Subscriber Profile Repository (ESPR) systems
- Definition of network elements
- Management and deployment of policy rules
- Management of objects that can be included in policy rules
- Monitoring of individual product subsystem status
- Administration and management of CMP users
- Upgrading the software on policy management devices

Overview of Main Tasks

The main tasks described in this document include:

1. Create manageable objects for your system. Manageable objects are required to support the function of some policy conditions and actions. Create the necessary manageable objects before creating the related policies. See [Configuring Manageable Objects for Use In Policies](#).
2. Create and deploy policy rules on the CMP system. For details, see:
 - a. [Managing Policy Rules](#)
 - b. [Deploying Policies](#)

For details about using conditions, actions, and variables when creating policy rules, see [Writing Policy Rules: Conditions, Actions, and Variables Reference](#).

3. Maintain your policy rules as needed using additional tasks described in Part I of this document.
 - Manage your library of deployed rules. See [Managing the Policy Library](#).
 - Consolidate policy rules with similar structures using policy tables. See [Managing Policy Tables](#).
 - Specify the order in which policy rules are applied during a subscriber request. See [Managing Policy Groups](#).
 - Simplify the creation of multiple similar policy rules. See [Managing Policy Templates](#).
 - Test policy table changes by consolidating multiple similar policy tables using virtual policy tables. See [Managing Virtual Policy Tables](#).
 - Save CMP Records to the CMP database at a specific point in time. See [Managing Policy Checkpoints](#).

Specifications for Using the CMP Server

You interact with the CMP server through a browser-based graphical user interface (GUI). To use the GUI, Oracle recommends the following:

- | | |
|--|--|
| Web Browsers for Wireless and Cable modes | <ul style="list-style-type: none">• Mozilla Firefox® release 31.0 or later• Google Chrome version 40.0 or later |
| Monitor | <ul style="list-style-type: none">• Resolution of 1024 x 768 or greater |

Logging In

The CMP system supports either HTTP or HTTPS access. Access is controlled by a standard username/password login scheme.

Before logging in, you need to know the following:

- The IP address of the CMP system
- Your assigned username
- The account password

Note: The profile **admin** has full access privileges and is the assumed profile used in all procedures described in this document. You cannot delete this user profile, but you should immediately change the password. See the appropriate *CMP User's Guide*.

To log in:

1. Open a Web browser and enter the IP address of the CMP system.
The login page opens.

Note: The title and text on the login page are configurable. See the appropriate *CMP User's Guide* for details.

2. Enter your **Username**.
3. Enter your **Password**.
4. Click **Login**.
The main page opens.

You are logged in.

CMP Interface Overview

You interact with the CMP system through an intuitive and highly portable graphical user interface (GUI) supporting industry-standard Web technologies (for example, SSL, HTTP, HTTPS, IPv4, IPv6, and XML). [Figure 1: Structure of the CMP Interface](#) shows the structure of the CMP interface.

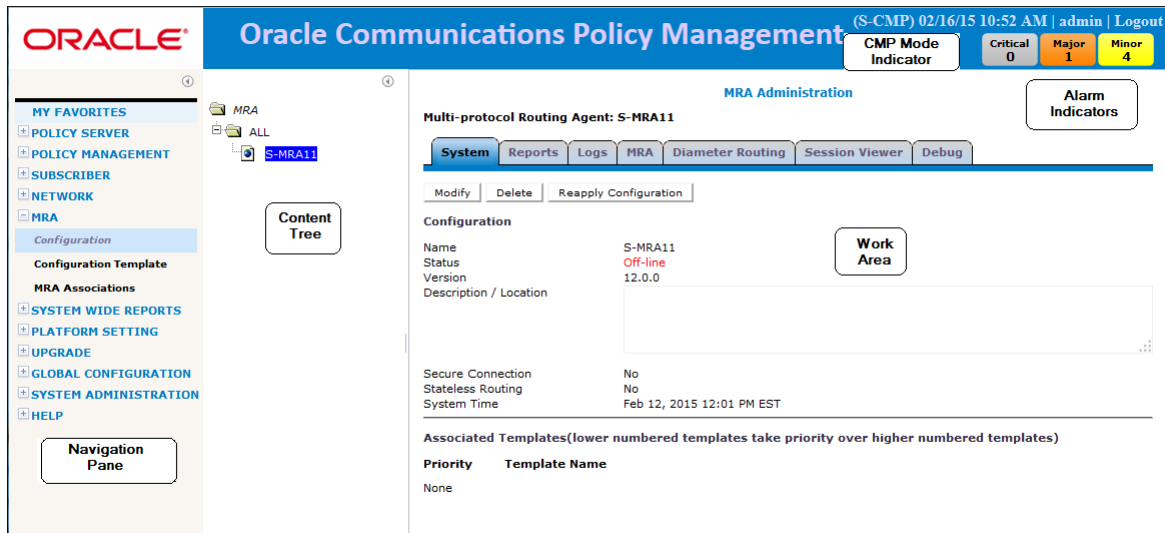

Figure 1: Structure of the CMP Interface

Navigation Pane Provides access to the various available options configured within the CMP system.

You can bookmark options in the Navigation pane by right-clicking the option and selecting **Add to Favorite**. Bookmarked options can be accessed from the **My Favorites** folder at the top of the Navigation pane. Within the My Favorites folder, you can arrange or delete options by right-clicking the option and selecting **Move Up**, **Move Down**, or **Delete from Favorite**.

You can collapse the navigation pane to make more room by clicking the button in the top right corner of the pane. Click the button again to expand the pane.

Content Tree Contains an expandable/collapsible listing of all the defined items for a given selection. For content trees that contain a group labeled **ALL**, you can create customized groups that display on the tree.

Note: The content tree section is not visible with all navigation selections.

You can collapse the content tree to make more room by clicking the button in the top right corner of the pane. Click the button again to expand the tree. You can also resize the content tree relative to the work area.

Work Area Contains information that relates to choices in both the navigation pane and the content tree. This is the area in which you perform all work.

Alarm Indicators Provides visual indicators that show the number of active alarms.

CMP Mode Indicator If you are in a tiered CMP system, this area indicates if you are on a Network Configuration Management Platform (NW-CMP) or a System Configuration Management Platform (S-CMP) server.

CMP Icons

The CMP interface provides the following icons to perform actions or indicate status:

 Add	Use this icon to add an item to a list.
 Calendar	Use this icon to select a date and, in some cases, time.
 Clone	Use this icon to duplicate a selection in a list.
 Critical error	Displays in reports to indicate a critical error during the blade replication process.
 or  Delete	When visible in the work area, selecting the Delete icon deletes an item, removing it from the device. Note: Deleting an item from the ALL folder also deletes the item from any associated group. A delete verification window opens when this icon is selected.
 Details	The binoculars icon displays when there is more details for an item.
 Edit	Use this icon to modify a selection in a list.
 External Connection	When visible in the work area, indicates which server currently has the external connection (the active server).
 Gear	The gear icon displays when a policy references another policy or policy group.
 Hide	When visible in the work area, selecting the hide icon removes the item from the current view but does not delete the item. Note: The item is only hidden during the current session. The item will be visible the next time a user logs into the CMP server.
 Manual	Displays when a field is configured by the user. Hover over this icon to see the name of the device.
 Major error	Displays in reports to indicate a major error during the blade replication process.
 Minor error	Displays in reports to indicate a minor error during the blade replication process.
 or  Up/Down	The up and down arrow icons are displayed when you can change the sequential order of items in a list.
 Left/Right	The left and right arrow icons are displayed when it is possible to move an item from one list to another.
 OK status	Displays in reports to indicate a that the blade replication process completed without error.
 Remove	Removes an item from the group. The item is still listed in the ALL group and any other group that has an association with the item. For example, if you remove MPE device PS_1 from policy server group PS_Group2, PS_1 still displays in the ALL group.
 Selection	This icon occurs in the Policy Wizard. The icon is used to select conditions and actions to add to a policy rule.
 Synch broken	When visible in the Upgrade Manager, indicates that the CMP server does not have current information on a server.

 Template	Displays when a field is configured by template. Hover over this icon to see the name of the template. Click the icon to view the template.
 Virtual Machine	Displays when a Policy Management application is running on a virtual machine (VM).
 View Cart	Displays the list of configurable objects selected for the Export action.

Shortcut Selection Keys

The CMP interface supports the following standard browser techniques for selecting multiple items from a list:

Shift + click	Selects two or more consecutive items. To select consecutive items, select the first item, then press Shift and click the last item to select both items and all items in between.
Control + click	Selects two or more non-consecutive items. To select multiple non-consecutive items, press the Ctrl key as you click each item.

Changing a Password

The Change Password option lets users change their password. This system administration function is available to all users.

Note: The **admin** user can change the password for any user.

If the system administrator has configured your account for password expiration, you will receive a warning when you log in that you must change your password.

Note: To reset the administrator password, contact [My Oracle Support \(MOS\)](#).

To change a password:

1. From the **System Administration** section of the navigation pane, select **Change Password**.
The **Change Password** page opens. If your account is set up with a password expiration period, the expiration date is displayed.
2. Enter your **Current Password**.
3. Enter your **New Password**.
The password is case sensitive. Depending on your system settings, the password must meet the following requirements:
 - Cannot contain the username.
 - Must contain the minimum number of characters (default is six).
 - Must contain characters as specified from the following categories:
 - Must contain at least the specified number of lower case letters.
 - Must contain at least the specified number of upper case letters.

- Must contain at least the specified number of numbers.
- Must contain at least the specified number of symbols.

Note: Consult with your system administrator to obtain the password criteria for your system.

4. Re-enter your new password to **Confirm Password**.

Note: If your new password does not conform to the password strength rules, a validation error message appears that includes valid password criteria. Enter and confirm another password that conforms to the criteria.

5. Click **Change Password**.

Your password is changed.

Part I

Using the Policy Wizard

Topics:

- [*About Policies.....41*](#)
- [*Managing Policy Rules.....49*](#)
- [*Deploying Policies.....56*](#)
- [*Managing the Policy Library.....62*](#)
- [*Managing Policy Tables.....65*](#)
- [*Managing Policy Groups.....80*](#)
- [*Managing Policy Templates.....86*](#)
- [*Managing Virtual Policy Tables.....89*](#)
- [*Managing Policy Checkpoints.....94*](#)

Part I describes how to create and manage policies using the Oracle Communications Policy Management Policy Wizard and lists the rule elements available for your use while creating policy rules.

Chapter 1

About Policies

Topics:

- [Understanding Policy Rules.....42](#)
- [Structure and Evaluation of Policy Rules.....42](#)
- [Modes and the Policy Wizard.....48](#)

Policies dynamically control how an MPE device processes protocol messages as they pass through it. Using these rules, you can define how and when network resources are utilized by subscribers. For example, when the MPE device receives a request to establish a session with a certain quality of service (QoS) level, you can use a policy rule to approve the request as is, to reject the request, or to make changes in the request before it is forwarded to the intended destination as a network element.

This chapter describes how policies are structured and used within the CMP system. To create policy rules or groups, see [Managing Policy Rules](#) or [Managing Policy Groups](#), respectively.

Before reading this chapter, you should have a basic understanding of the CMP interface. For a discussion of the CMP interface and the terminology used to describe it, see [CMP Interface Overview](#).

Understanding Policy Rules

A policy rule is an If-Then statement that has a set of conditions and actions. If the conditions are met, the actions are performed. You create policy rules within the CMP system, using a policy wizard that organizes a large number of conditions and actions to assist you in the construction of policy rules. After you create policy rules, you manually deploy the rules to MPE devices.

You can combine policy rules to provide additional power and flexibility. When there are multiple policy rules, the order in which the policy rules are evaluated can also influence MPE device activity, so the order of evaluation is also configurable through the CMP system. You can also organize policy rules into groups to simplify the management of policy rules. You can cause groups of rules to be executed.

The following are sample scenarios for which you might use policy rules:

- You can modify the contents of protocol messages using policy rules. For example, you could use a policy rule to override the requested bandwidth parameters in a request.
- You can create policy rules that track the use of resources for devices in the network and implement limits on how those resources are used. For example, some cable modems have limits on the number of dynamic flows that they can support. Using policy rules, you can ensure that a cable modem does not exceed this limit.
- Some protocols allow for the provisioning of default Quality of Service (QoS) parameters for subscribers. With these protocols, policy rules can implement subscriber tiers where different subscribers have different bandwidth available.
- You can configure policy rules to monitor the reservation of bandwidth on network elements and notify operators when an element exceeds certain threshold levels.
- In many protocols, the policy server acts as an intermediary between the Application Managers and the QoS enforcement devices. Many of these QoS enforcement devices implement proprietary features that are activated through the use of standard (or non-standard) fields in protocol messages. Using policy rules, you can activate these proprietary features on behalf of the Application Managers, thus allowing them to use these features without modification.

About Creating and Using Policies

To create and use policies you must:

1. Create manageable objects – see [About Creating Manageable Objects](#).
2. Create and manage policy rules that use the objects – see [Creating a Policy Rule](#).
3. Deploy the policy rules – see [Deploying Policies](#).

Structure and Evaluation of Policy Rules

The following topics provide an overview of how policy rules are structured and evaluated.

Note: The conditions, actions, and parameters available for your use in creating policy rules depend on the mode in which the CMP system is operating.

Structure of Policy Rules

Understanding how a policy rule is structured is helpful in understanding other Policy Management concepts. A policy rule is defined in an if-then structure, consisting of a set of conditions that the MPE device compares to information extracted from protocol messages or obtained from subscriber records, and a set of actions that are executed (or not executed) when the conditions match. Many conditions can be tested for existence or non-existence (by optionally selecting the logical operator **NOT** or using, where available, the policy condition operator **is** or **is not**).

Policy Parameters

When you define a policy rule, you select from a list of available conditions and actions. Most of the conditions and actions have parameters (that is, they contain placeholders that may be replaced with specific values to allow you to customize them as needed).

For example, consider the following policy rule, which has one condition and two actions:

```
where the device will be handling greater than 100 upstream reserved flows
apply profile Default Downstream Profile to request
continue processing message
```

The condition, **where the device will be handling...**, allows the following parameters to be specified:

- An operator (*greater than*)
- A value (*100*)
- The flow direction (*upstream*)
- The bandwidth reservation type (*reserved*)

The first action, **apply profile...**, specifies a single parameter that is the name of a traffic profile to be applied to the request. The second action, **continue processing message**, instructs the MPE device to evaluate the remaining rules within the policy rules list (as opposed to immediately accepting or rejecting the request). The conditions and actions that are available for writing policies are discussed later in this section.

Policy Logical Operators

The policy wizard supports creation of rules using an explicit **AND** logical operator that contains a set of conditions. An AND operator must include at least two conditions. The actions are taken if all conditions are evaluated as true. For example, you can use an AND operator to define two conditions as follows:

```
And
  where the request is re-authorizing an existing session
  where the enforcement session is a DPI enforcement session
  .
  .
  .
```

The policy wizard supports creation of rules using an **OR** logical operator that contains a set of conditions. An OR operator must include at least two conditions. The actions are taken if any condition is evaluated as true. For example, you can define the following set of conditions using an OR operator:

```
Or
  where the request is creating a new session
  where the session is an enforcement session
  where the APN matches one of imode.glt2
  where the subscriber profile data is not available
  .
  .
  .
```

The policy wizard supports creation of rules using a **NOT** logical operator that contains a single condition. The actions are taken if the condition is evaluated as false. For example, you can define the following using a NOT operator:

```
Not
  where today is a weekend day using CONFIGURED LOCAL TIME
  .
  .
  .
```

Note: Many conditions also include optional **is** and **is not** parameters. These parameters are functionally equivalent to (that is, synonymous with) using the **NOT** operator, and you are free to use or mix **NOT** with **is** and **is not** as you prefer.

Finally, the policy wizard supports creation of rules using combinations of logical operators. You can nest operators. For example, you can define the following rule:

```
Or
  And
    Not
      where the service info status is one of FINAL_SERVICE_INFORMATION
    where the session is an enforcement session
  where the session is an application session
  Not
    where the session is an application session
  evaluate policy 5555
  reject message
```

The policy wizard validates condition trees.

Parent and Reference Policies

As a result of evaluating conditions, a policy can execute another policy. A policy that calls another policy is called a parent policy, and a policy executed by another policy is called a reference policy. A policy can be both a parent policy and a reference policy. Additionally, you can group policies, and a parent policy can execute all the policies in the group.

Note: Do not nest policies more than five levels deep.

Evaluating Policy Rules

To write policy rules, it is important to understand how they are evaluated by the Policy Rules Engine contained within the MPE device, and how the engine fits into the protocol message processing within the MPE device.

If you look at the policy conditions that are available, you will see that many are not protocol specific. Although you can write protocol-specific policy rules, the Policy Rules Engine does not have any protocol knowledge. Instead, it deals with a set of abstractions that are mapped to the underlying protocol messages that are being processed. This allows the same policy rules to be used across multiple protocols.

When the MPE device receives a protocol message, it performs the initial processing of that message and then determines whether or not the message should be processed by the Policy Rules Engine. Generally, protocol messages that are either requesting bandwidth or modifying previous requests for bandwidth are processed by the Policy Rules Engine. Most other protocol messages are not. For example, a protocol message that releases bandwidth is typically not processed by the Policy Rules Engine because there is no reason to prevent or modify that action.

After a message is identified as a candidate for the policy rules, the MPE device attempts to associate as much information with the request as possible. For example:

- Which network elements will be impacted if the request is allowed to proceed?
- Which subscriber is associated with the request? What services is that subscriber entitled to?
- Which application is associated with the message?
- What time zone is the user equipment located in?

The reason for collecting this information is to make it available to the policy rules. The information that can be associated varies and depends on a number of factors, including:

- The protocol in question and how much information is provided in the protocol message
- The amount of network topology information that has been provisioned into the MPE device
- Whether there are other protocol sessions that can be associated with this message
- Whether there are external data sources configured that the MPE device can use to associate information with the message

When the process of associating information with the request is complete, the MPE device analyzes the information and maps it into several important abstractions that are central to the functioning of the Policy Rules Engine:

1. A list of network devices that the request affects. A network device is any network element, any logical or physical sub-component of a network element, or any other network equipment.
2. A list of flows associated with the request. A flow is a logical grouping of one or more packet filters and associated information such as QoS, charging, or service information. A flow can be in a single direction (either upstream or downstream). A flow can be a collection of bandwidth parameters. Different protocols can have a different number of flows associated with a message.

For example:

- In Cable mode, the PCMM messages have only one flow per request.
 - In Wireless mode, the DQoS messages have one or two flows per request (for each direction).
3. A list of policies associated with the request. This includes policy groups and reference policies called by the parent policy.

After constructing these lists, the Policy Rules Engine applies the policy rules according to the following algorithm:

```

For each network device:
  For each flow that is being created or modified:
    For each policy that is being evaluated:
      Evaluate all policy rules
    End
  End
End

```

A device refers to any device that creates a Gx session, such as a PGW or GGSN; the enforcement device associated with the corresponding Gx IP-CAN session; or any device that creates a Gxx session, such as an HSGW.

It should be clear from this algorithm that a single message can result in multiple policies being evaluated, and a policy rule being evaluated multiple times. This is important to understand to ensure that the policy rules you write operate in the way you intended.

By using parent policies, reference policies, and policy groups, you can control the order of policy execution. For example, assume there are four policies: two parent policies, *policy1* and *policy4*, and two reference policies, *policy2* and *policy3* that are in a policy group, *group1*. The hierarchy is as follows:

```

policy1
  policy2
  policy3
policy4

```

The order of execution can vary, depending on how each policy evaluates and what actions each contains:

- The normal order of execution would be *policy1*, *policy2*, *policy3*, *policy4*.
- If the conditions in *policy1* evaluate to false, the order of execution would be *policy1*, *policy4*.
- if *policy2* includes the mandatory action `break from policy level`, the order of execution would be *policy1*, *policy2*, *policy4*.

If the optional 3GPP-MS-TimeZone AVP is available over the Gx protocol from a PCEF, the MPE device can compute the local time for user equipment, even if the user enters a different time zone or the time offset changes because of Daylight Saving Time.

Note: Policies created using a more recent version of the CMP software may not evaluate and execute as intended on an MPE device running an older version of the MPE software. To ensure that policies are evaluated and executed as intended, update all systems to the same version of the software.

Activating and Deactivating Policy Rules

Rules can be activated and deactivated at specific times by selecting actions that are time-based. The methods by which activation/deactivation times can be defined are:

Time Period	Uses pre-defined time period. At least one time period must be defined to use this option.
Policy Table field	Uses time-related field from a policy table. At least one policy table must be defined, at least one time-related field must be specified in that table, and that table must be selected during the rule definition process to use this option.

Absolute time	Uses exact time, or a combination of the time and date, to define rule activation/deactivation. If only a time is specified, the begin/end dates are calculated as the minimum future dates for those times.
Relative time	Uses the number of hours, minutes, or seconds from the current time to start/end. For example, the value 5 with units of hours would state that a rule should activate (or deactivate) 5 hours after this policy condition is processed by the MPE device. Expressions may include policy variables.

Note: If an activation time is not specified, a rule becomes active immediately. If a deactivation time is not specified (or it is in the past), a rule never deactivates.

Caution: If all rules defined in a system have a deactivation time specified, all rules for the session on a PCEF can become deactivated. To prevent this from occurring, the session on the PCEF is set to validated 1 to 30 minutes before the last active rule deactivates.

Using Reference Policies

Multiple policies that share the same conditions can be simplified by including the common conditions in a parent policy and any unique conditions in reference policies. During execution, the common conditions are only evaluated once.

For example, consider the following policies, which apply tiers to session requests. Each policy uses the same conditions, and the Policy Rules Engine evaluates the same conditions up to three times:

```
Bronze Policy
where the request is creating a new session
  and where the flow is an application flow
  and where the AF-Application-ID matches one of voip
  and where the tier is one of Bronze
apply bronze to request
accept message
```

```
Silver Policy
where the request is creating a new session
  and where the flow is an application flow
  and where the AF-Application-ID matches one of voip
  and where the tier is one of Silver
apply silver to request
accept message
```

```
Gold Policy
where the request is creating a new session
  and where the flow is an application flow
  and where the AF-Application-ID matches one of voip
  and where the tier is one of Gold
apply gold to request
accept message
```

The same results can be obtained using a parent policy and the reference policies **Bronze Policy**, **Silver Policy**, and **Gold Policy** contained in a policy group named **Tier Policies**:

```
where the request is creating a new session
  and where the flow is an application flow
  and where the AF-Application-ID matches one of voip
evaluate policy group Tier Policies
```

```
Bronze Policy
where the tier is one of Bronze
apply bronze to request
accept message
```

```
Silver Policy
where the tier is one of Silver
apply silver to request
accept message
```

```
Gold Policy
where the tier is one of Gold
apply gold to request
accept message
```

Modes and the Policy Wizard

The policy wizard varies depending on the mode in which your CMP system is running. The mode configuration affects the following:

- Entire categories of conditions are made available or unavailable.
- Specific conditions and/or actions are made available or unavailable.
- Some conditions have a slightly different phrasing.
- The available values for some parameters vary.

If your policy wizard does not include a category, condition, action, or value documented here, it means that those categories, conditions, or actions are not available in your present CMP mode.

Chapter 2

Managing Policy Rules

Topics:

- [Creating a Policy Rule.....50](#)
- [Parameters Within Policy Rules.....54](#)
- [Modifying and Deleting a Policy Rule.....54](#)

Policy rules are created and saved within the CMP database and then deployed to MPE devices. The CMP system lets you create and modify the details within policy rules and edit the order in which policy rules are applied to a protocol message.

This chapter describes how to create and manage policy rules. For a list of all conditions, actions, and variables available for use in policies, see [Writing Policy Rules: Conditions, Actions, and Variables Reference](#).

Creating a Policy Rule

Policy rules are created and modified using the policy wizard in the CMP system. After the rule is created or modified, the rule is stored in the policy library. The policy wizard guides you step by step to creating a new policy rule. The wizard displays only the options available at each step.

The following procedure describes how to create a new policy rule, using this wireless policy as an example:

```
And
  where the request is creating a new session
  where the session is an application session
  where the APN matches one of imode.glt2
  where the subscriber profile data is not available
set gg to `op`
reject message
```

To create a new policy rule:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the default is **ALL**.
2. From the content tree, select the **ALL** group.
The **Policy Administration** page opens in the work area.
3. Click **Create Policy**.
The **Create Policy** page opens.
4. Select a starting point for the new policy rule:
 - **Blank** — The policy rule is created from the beginning, without any attributes being pre-defined.
 - **Use Template** — The policy rule is created based on a user-defined template that can have policy parameters pre-defined. This template can be modified.
 - **Copy Existing Policy** — The policy rule is created based on an existing policy rule, which you can modify.
5. Click **Next**.
The **Tables** page opens.
6. Specify the tables you want to use in the policy. For more details on associating a table with a policy, see [Associating a Policy Table with a Policy Rule](#).
If no tables are associated with the policy rule, click **Next**.
 - To specify multiple tables, click the selection icon (●) multiple times
 - To move a table so that it is evaluated earlier in the rule, click the up icon (▲)
 - To move a table so that it is evaluated later in the rule, click the down icon (▼)
 - To delete a table, click 🗑️ (trash can icon) located to the left of the table.
7. Click **Next**.
The **Conditions** page opens.
8. Select the policy conditions.
As a condition is selected, it appears in the **Description** area at the bottom of the page.

You can select multiple conditions, enter multiple instances of each condition, change the order of conditions, group conditions logically, or remove conditions:

- To enter multiple instances of a condition, click the selection icon (●) in the Conditions window multiple times.
- To combine a logical group of conditions, click **And** or **Or**, located in the upper right corner of the Description window, and drag the conditions into the container that appears (represented by a folder icon). You can toggle a container between **And** and **Or** by double-clicking on the folder.
- To change the evaluation order of a condition or to include the condition within a logical container, drag and drop the condition within the **Description** area. You cannot drop a container onto itself or one of its sub-containers.
- To negate a condition, change the **is** parameter if present, or click **Not**, located in the upper right corner of the **Description** area, and drag the condition into the container that appears (represented by a folder icon).
- To delete a condition or container from the rule, select the condition and click **Delete**. A confirmation message displays. Click **OK**.

Tip: To add conditions directly to an existing container, select the container first.

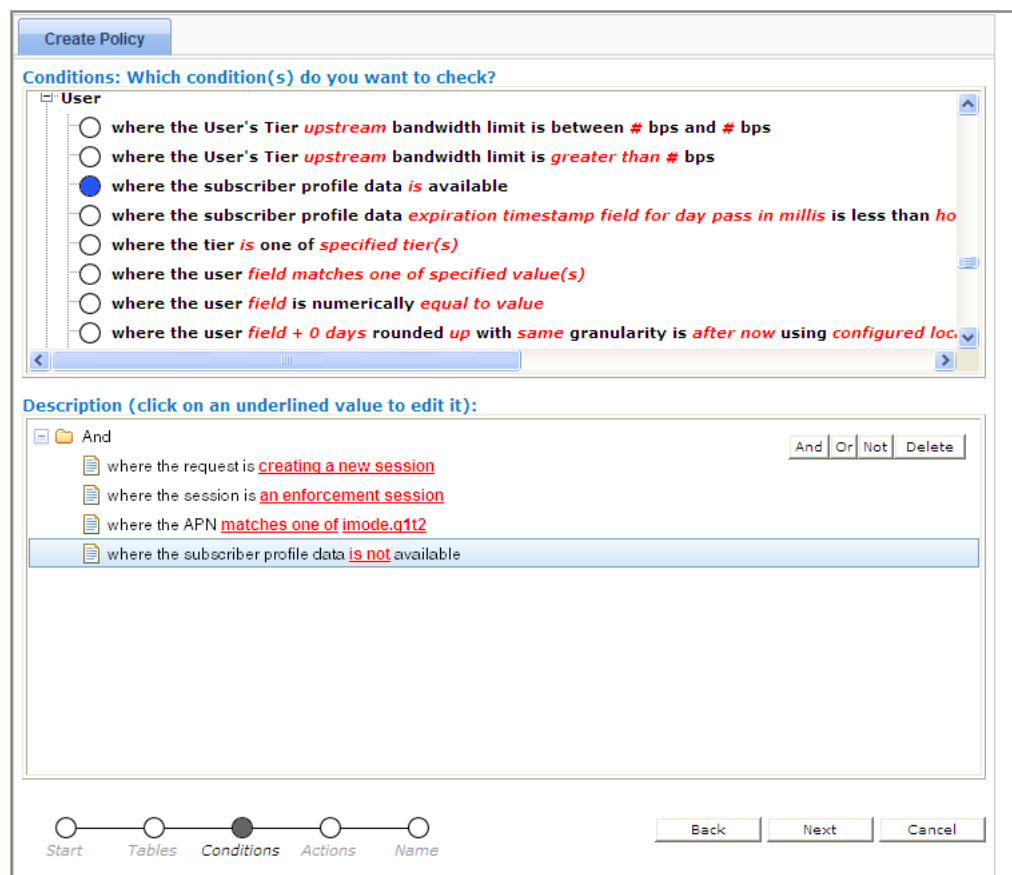

Figure 2: Example of Selected Policy Conditions

9. Configure parameters information. If a policy condition includes a parameter that requires input, it displays red underlined text in the Description area.

- a) Click the red underlined text. A window opens, from which you can do one of the following:
- Select one or more options; for example:

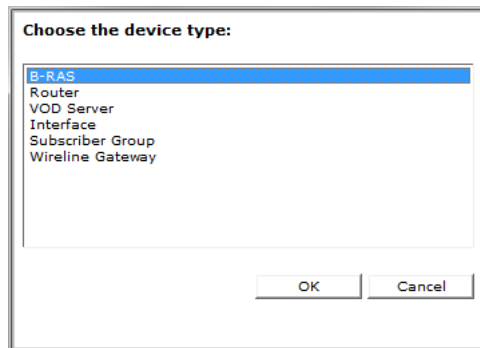

Figure 3: Example of Parameter Option Selections

- Enter a value (such as a traffic bit rate or percentage) for example:

Figure 4: Example of Parameter Value Entry

- b) Click **OK**.

The popup window closes and the input is added to the policy condition.

10. Click Next.

The **Actions** page opens.

11. Select the required action and any optional actions that the MPE device should execute if the policy request matches the defined conditions of the policy rule.

For example:

Create Policy

Actions: What do you want to do with the message?

- ☐ set charging server(s) for the IP-CAN/Sd session to *specified values*
- ☐ set custom AVP *name* value to the policy context property *name*
- ☐ set custom AVP *name* value to the user property *name* and save *always*
- ☒ set *external field* to *`value`*
- ☐ set *external field* to *specified* percent of *select type* for *selected quota*
- ☐ set policy context property *name* to *value*
- ☐ set session revalidation time to *# seconds*
- ☐ set session revalidation time to Policy Counter ID(s) *select name(s)*
- ☐ set session revalidation time to *time on day* using *configured local time*

Description (click on an underlined value to edit it):

where the subscriber profile data is available

set *external field* to *`value`*
accept message

Start Tables Conditions **Actions** Name

Back Next Cancel

Figure 5: Example of Selected Policy Actions

- To enter multiple instances of an action, click the selection icon (●) multiple times
- To move an action so that it is evaluated earlier in the rule, click the up icon (▲)
- To move an action so that it is evaluated later in the rule, click the down icon (▼)
- To delete an action from the rule, click (trash can icon) located to the left of the action.

12. Click Next.

The **Name** page opens.

13. Assign a unique name (uniqueness is not case sensitive) to the new policy rule.

Note: The name can be up to 255 characters long and cannot contain the following characters: < > \ ; & ' " =

14. Click Include in Analytics to generate an analytics data stream for the policy.

See the *Analytics Data Stream Reference* for more information on the Oracle Communications Policy Management Analytics product.

15. Click Finish.

The **Create Policy** page closes.

The policy rule is saved to the policy library in the CMP database.

After a policy rule is created, you must deploy it to MPE devices so it can take effect. Reference policy rules (rules called by parent policy rules) do not need to be deployed because they are deployed automatically when called by a parent rule. See [Using Reference Policies](#).

Parameters Within Policy Rules

When you are defining policy rules, both the conditions and actions may contain parameters. Parameters let you customize the specific situation in which a policy rule will be applied. Some conditions and actions may contain multiple parameters. For example, one possible condition is as follows:

where the device will be handling *greater than 100 upstream reserved* flows

This condition contains four different parameters. The policy wizard displays the parameters using a red font. In this example, *greater than* is a single parameter, as is *100*, *upstream*, and *reserved*.

You can click any parameter to open a pop-up window that lets you specify the value of that parameter. Each parameter has a data type associated with it that determines the values that can be specified: some may be numbers, some may be free-form text, and some may be limited to specific sets of values. For example, the following parameter is limited to a set of text values:

Figure 6: Example of a Parameter Pop-up

If you have many policies with similar structures, you can consolidate them using policy tables that capture the differences. For more information on table-driven policies see [Managing Policy Tables](#). To specify a parameter in a rule that uses a policy table, instead of selecting a value click **Use Policy Table** and then select the table column (field) representing the parameter.

Modifying and Deleting a Policy Rule

Policy rules can be modified and then redeployed to MPE devices. When a policy rule that resides in multiple policy groups is modified, the changes are propagated to the various groups.

Modifying a Policy Rule

To modify a policy rule:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**. The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the **ALL** group. The **Policy Administration** page opens in the work area, listing the available policies.
3. Select the policy rule you want to modify. The **Policy Administration** page displays information about the policy rule.

4. Click **Modify**.

The policy wizard opens in a **Modify Policy** tab.

5. Edit the policy rule information.

See [Creating a Policy Rule](#) for details on the fields within the policy wizard.

6. Click **Finish**.

The policy rule is modified. The modified policy rule is now ready to be added to a policy group (see [Adding a Policy or a Policy Group to a Policy Group](#)) or deployed (see [Deploying a Policy](#)).

Note: Redeployment of a policy rule is automatically performed to those MPE devices where the policy rule was initially deployed.

Deleting a Policy Rule

Policy rules, including policy rules within a policy group, can be removed from an MPE device when they are no longer needed. Because the policy rule still resides in the CMP database, it can be redeployed at a later date if needed. If a policy rule is no longer needed, it can be deleted from the CMP database.

Note: Deleting a policy rule from the CMP database automatically removes the policy rule from all associated MPE devices.

To delete a policy rule:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.

The content tree displays a list of policy library groups; the initial group is **ALL**.

2. From the content tree, select the **ALL** group.

The **Policy Administration** page opens in the work area, displaying the list of defined policies.

3. Delete the policy rule using one of the following methods:

- From the work area, click  (trash can icon), located to the right of the policy rule.
- From the content tree, select the policy rule and click **Delete**.

A confirmation message appears.

4. Click **OK**.

The policy rule is deleted.

To remove a policy rule from an MPE device, see [Removing a Policy from an MPE Device](#).

Chapter 3

Deploying Policies

Topics:

- *About Deploying Policies.....57*
- *Deploying a Policy.....59*
- *Changing the Sequence of Deployed Policies on an MPE device.....60*
- *Removing a Policy from an MPE Device.....61*

This chapter describes how policies are deployed from the CMP database to MPE devices.

About Deploying Policies

Deploying a policy is the act of transferring the policy from the CMP database to an MPE device. After a policy is deployed, the rules defined within the policy are used as decision-making criteria by the MPE device.

Figure 7: Policy Deployment shows how policies P1 through P7 are created in the CMP database and then deployed individually to different MPE devices within the network. Each of the policies is associated individually with the MPE device to which it is deployed. In the example, each policy server (MPE device) displays the policies that have been deployed to it and the order in which they are applied to policy requests, from top to bottom.

Figure 7: Policy Deployment

Figure 8: Policy Group Deployment shows how the same library of policies can be grouped first and then deployed as policy groups. When a policy group is created, the policies are arranged in the order in which they are to be evaluated. Grouping policies makes deployment of multiple policies easier and helps to ensure consistency in how policies are applied to policy requests on different MPE devices.

Figure 8: Policy Group Deployment

When you first create a policy rule, that rule exists only within the CMP database. After the policy rule is deployed, the policy rule is automatically redeployed when you make any changes. Automatic redeployment also applies to policy groups: any change to a policy group triggers automatic redeployment. If a policy group is deployed to one or more MPE devices and you add a new policy rule to the policy group, the rule is automatically deployed to those MPE devices.

Figure 9: Policy Redeployment shows that when a policy (P3) is modified, its associated groups (PG-1 and PG-3) are redeployed automatically.

Figure 9: Policy Redeployment

You do not need to deploy policy rules that are referenced by other deployed policy rules or policy groups. Reference policies are automatically deployed when called by the parent policy.

Deploying a Policy

To deploy a policy:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the policy rule or policy group you want to deploy.
The **Policy Administration** page opens in the work area, displaying either the policy rule details or the list of the policy rules and policy groups contained in the selected policy group.
3. Click **Deploy**.
The policy server tree is displayed, listing all possible target MPE devices and server groups. You can expand the tree view if necessary.
4. Select the target MPE devices or policy server groups.

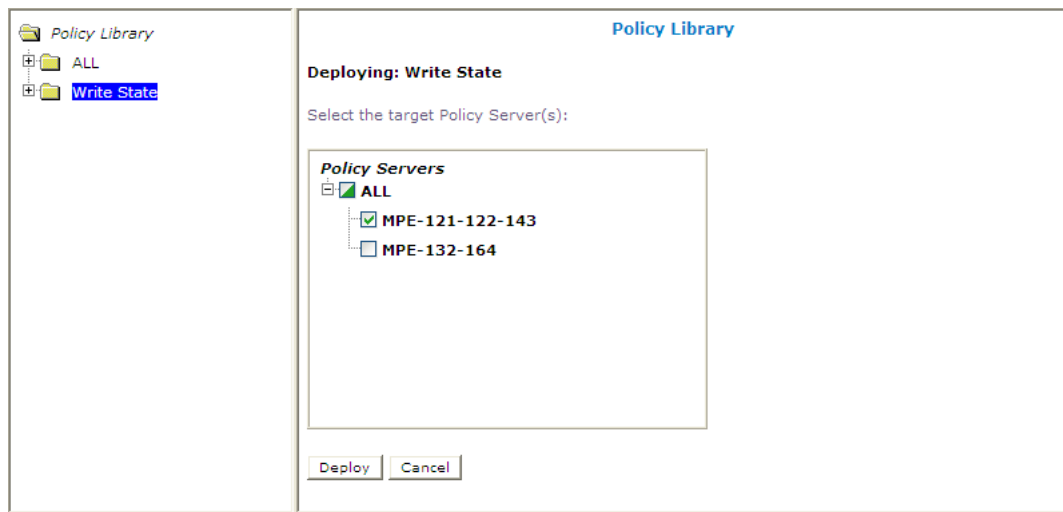

Figure 10: Policy Server Selection Window

An icon indicates whether you have selected some (📌) or all (📌) MPE devices to which to deploy the policy.

5. Click **Deploy.**

A confirmation message appears followed by a list of MPE devices to which the policy was deployed.

The policy information is saved to each selected MPE device.

Changing the Sequence of Deployed Policies on an MPE device

To change the sequential order of policies:

1. From the **Policy Server** section of the navigation pane, select **Configuration**.
The content tree displays a list of policy server groups; the initial group is **ALL**.
2. From the content tree, select the MPE device.
The **Policy Server Administration** page opens in the work area, displaying information about the MPE device.
3. Select the **Policies** tab.
4. Click **Modify**.
The **Manage Policies** page opens in the work area.
5. Use any of the following options to change the sequential positioning of the policies:
 - Use the 📌 (top) and 📌 (bottom) icons, located to the left of policy rules or policy groups. The 📌 (top) icon moves the item it to the top of the list. The 📌 (bottom) icon moves the item it to the bottom of the list.
 - Drag and drop policy rules or policy groups to a different position in the sequence.
 - Change the sequence numbers, located to the left of policy rules or policy groups. Click **Update Order** to refresh the display.
 - Optionally, you can click **Undo** or **Redo** to step back and forth through your changes.
6. Click **Save**.

The sequence of policies is changed on the MPE device. A confirmation message appears in the work area.

Removing a Policy from an MPE Device

To remove a policy from an MPE device:

1. From the **Policy Server** section of the navigation pane, select **Configuration**.
The content tree displays a list of policy server groups; the initial group is **ALL**.
 2. From the content tree, select the MPE device from which you want to remove the policy rule or policy group.
The **Policy Server Administration** page opens in the work area, displaying information about the MPE device.
 3. Select the **Policies** tab.
 4. Click **Modify**.
The **Manage Policies** page opens.
 5. Click  (scissors icon) located to the right of the policy rule or policy group that you want to remove.
The policy is removed from the list.
 6. Repeat step 5 as required.
 7. Click **Save**.
A confirmation message appears.
- The policy is removed from the MPE device.

Chapter 4

Managing the Policy Library

Topics:

- *Displaying a Policy.....63*
- *Organizing Policies.....63*
- *Importing and Exporting Policies, Policy Groups, and Templates.....64*

This chapter describes how to manage your policy library and how to control which policies are deployed and in what order.

Displaying a Policy

To display a policy:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.

If a policy is a parent policy, a gear icon (⚙️) appears next to the policy name in the content tree.
2. From the content tree, select the policy to display.
The **Policy Administration** page opens in the work area, displaying the policy. *Figure 11: Sample Policy Description* shows an example.

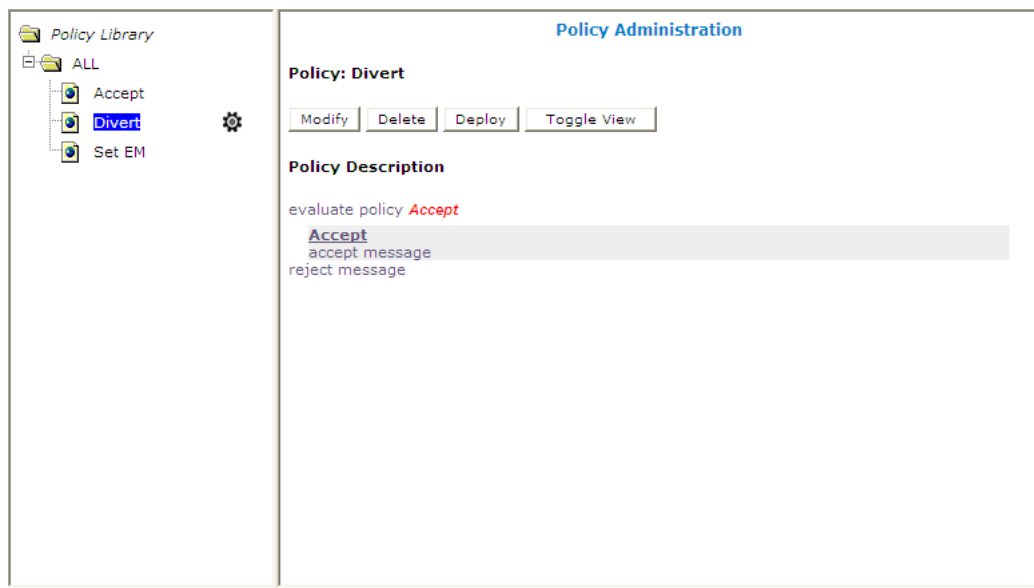

Figure 11: Sample Policy Description

You can choose from two logical views of policy conditions:

- A tree format (shown)
- A Boolean expression format similar to SQL

To switch between views, click **Toggle View**.

If the policy evaluates a policy group, the policies in the group are displayed. Click a policy name to see details of that policy. If a policy in the group is a parent policy, the parent policy's referenced policies are also displayed.

Organizing Policies

The CMP system includes features to simplify the management of multiple policies.

The order in which policies are evaluated is important. The CMP system lets you configure the evaluation order of policies. See [Structure and Evaluation of Policy Rules](#).

The CMP system provides a policy template feature to simplify the creation of multiple policy rules that have similar conditions and actions. After you create a policy template, you can use it to create additional rules. See [Creating a Policy Template](#).

The CMP system also provides a policy rule grouping feature. Policy rules can be organized into groups and the groups can be used to simplify the process of deploying policies to MPE devices. See [Creating a Policy Group](#). Policy rule groups can be executed with a single action. See [Structure and Evaluation of Policy Rules](#).

Policies with similar conditions or actions can be consolidated into tabular form. See [Managing Policy Tables](#).

Importing and Exporting Policies, Policy Groups, and Templates

Policies, policy groups, and templates can be exported from the CMP database for inspection or backup purposes. For more information about importing and exporting, see the *CMP User's Guide*.

Chapter 5

Managing Policy Tables

Topics:

- [About Policy Tables.....66](#)
- [About Data Matching.....67](#)
- [Policy Table Case Study.....70](#)
- [Creating a Policy Table.....75](#)
- [Viewing Policy Tables.....77](#)
- [Associating a Policy Table with a Policy Rule.....77](#)
- [Associating a Parameter with a Policy Table Column.....78](#)
- [Modifying a Policy Table.....79](#)
- [Deleting a Policy Table.....79](#)

This chapter describes how to create, modify, delete, and view policy tables, which are independent objects that you can use to capture differences in policy structures.

You can manage multiple policies with small differences by abstracting the differences into tables. The process of modifying the policies, or creating new, similar policies, then becomes a matter of modifying the policy table, which is simpler and less prone to error.

About Policy Tables

In practical use, many policies are very similar, having only small differences between them. Policy tables are an available option in the policy wizard. A policy table abstracts the differences between related policies.

Using a policy table instead of creating many similar policies makes the tasks of adding new policies, modifying existing sets of policies, and checking consistency among related policies simpler and less prone to error.

Policy tables resemble database tables and contain the following elements:

- Table name
- Table description
- Column definitions

Every column has a definition that contains a name, data type, and indication if the column is a key column. Every entry in the column must have the same data type. Every table must have a key column. Any data associated with a message, including fields (such as a quota or RAT type) and sub-fields (such as a user account ID or tier name), can be used as a key.

- Policy variable (for key columns only)

These are used to obtain the value from the policy context when using the policy table to look up a row.

- Data

The contents of the table cells. (Blank cells are not allowed in a policy table.)

Each row in a policy table can be thought of as a scenario, and each row can replace a policy. Substitutions in policy condition and action parameters can include the values in a specified policy table.

Table 1: Example of a Policy Table shows an example of a simple policy table. The first column lists one or more access point names (APNs) and is the key column. The second column contains a PCC rule that will be installed as part of the execution of a policy. The third column contains one or more PCC rules that will be removed as part of the execution of a policy. The second and third columns must contain names of PCC rules defined as traffic profiles in the CMP database.

Table 1: Example of a Policy Table

APN	Install	Remove
apn1.com	pcc_rule_1	pcc_default_1, pcc_basic
apn2.com	pcc_rule_2	pcc_default_2, pcc_basic
apn3.com, apn4.com	pcc_rule_1	pcc_default_1
apn5.com, apn6.com	pcc_rule_2	pcc_default_2

Figure 12: Defining a Policy Table Key Column shows how to define the key column for this example in the policy wizard using the variable **Request.CalledStationId**.

Figure 12: Defining a Policy Table Key Column

Each policy can have zero or more policy tables. To support the use of multiple policy tables, policies refer to a policy table using an alias. Each policy can use a different alias for the same policy table. For example, a policy table named **PCC rules to install and remove based on APN** can be referred to in a policy as `pccrules`. Policies can use table cells addressed as `table_name.column_name`.

The following policy rule uses the defined policy table. The italicized text represent substitutions. The table references begin with `pccrules`.

```
use table 'PCC rules to install and remove based on APN' called 'pccrules'
where the request is modifying an existing session
  and where the session is a credit control session
  and where the requested quota is one of Bucket Exceeded,OS_no_TV_volume
  and where the quota usage reporting reason is one of validity time expired
  and where the user Custom1 matches one of 101
install pccrules.install PCC rules for flow
remove pccrules.remove PCC rules
send notification to syslog with
`100;{User.MSISDN};{User.AccountId};{User.IMSI};{Session.IMEI};{Date} {Time};
Info GalacTel : You have a new 500 minutes to enjoy your mobile Internet offer.
Beyond that the flow will be reduced.; {Date} {Time};{Date}
{Time};{User.Custom1};{User.BillingDay}` and severity 'Emergency'

accept message
```

The use of policy tables is not required. The decision to use a policy table may arise after you have created a series of production policy rules, if you notice that the policies differ only in a few small ways.

You can also use virtual policy tables to test policy table changes before you deploy the changes on the network. Policy tables that are used by virtual policy tables are subject to additional validations. For information about validations for policy tables used by a virtual policy table, see [About Virtual Policy Tables](#).

About Data Matching

When policy tables are evaluated, values in key column cells are evaluated against information parsed out of messages or retrieved from external data sources and stored in the policy context. For example, fields such as entitlements or multivalued custom fields can be retrieved from a subscriber profile stored in a subscriber profile repository (SPR) system. By default, values are evaluated as single entities, and matches must be exact. However, you can optionally specify that values be treated as a set of delimited values and evaluated as multi-value fields and accept as a match a complete or subset match

of the values within the key column cell. The first row with a successful match is used. You can define up to 50 values within one cell.

Using multi-value keys makes a policy table more flexible and reduces the number of rows needed.

[Policy Matching Operations](#) shows the available matching operations between policy context data and key column cell values. Data matching is case insensitive.

Note: If no delimiter is defined, the data in the key column cell is used as is and not parsed.

[Example of Data Matching](#) provides a simple example of data matching and compares the results from each matching operation.

Policy Matching Operations

Operation	Description and Example
Wildcard	One or more wildcarded values in the key column cell are compared to the values in the policy context data. If there is any match, the row is matched. The asterisk (*) character represents any number of characters, and the period (.) character represents any single character. child*,student*,family..
Policy Context Set Contains All Multiple Valued Key Column	A multi-valued key column cell is compared to multivalued policy context data. If the policy context data is a subset of the key column cell data, the row is matched. gold silver bronze
Multiple Key Column Set Contains Single Value Context	A multivalued key column cell is compared to single-value policy context data. If the policy context data is a subset of the key column cell data, the row is matched. (The policy context data is evaluated as a string and must be included in the key column cell data.) weekday weekend
Multiple Policy Context Set Contains Single Value Key Column	A single-value key column cell is compared to multivalued policy context data. If the key column cell data is a subset of the policy context data, the row is matched. (The key column cell data is evaluated as a string, and must be included in the policy context data.) gold
Key Column Value Set Contains Any Multiple Valued Context	A multivalued key column cell is compared to multivalued policy context data. If any values within the key column cell data match any values of the policy context data, the row is matched. ExampleInc,ExampleInc Plus,ExampleInc Premium,ExampleInc Business
Equivalence	A multivalued key column cell is compared to multivalued policy context data. If the key column cell data matches the policy context data, the row is matched. (The order does not matter.) Gold!EU
Key Column Set Contains All Multiple Valued Policy Context	A multivalued key column cell is compared to multivalued policy context data. If the key column cell data is a subset of the policy context data, the row is matched. Gold!EU!Weekend

Operation	Description and Example
Matchlist	<p>The policy context data is compared to the match list specified in a key column cell. If the policy context data is a subset of the data contained in the match list, the row is matched. This data matching operation is available when the policy variable <i>select-list(s)</i> is selected for Column Type. The Column Type field will be auto-filled as Token List Name and the Matching Operation field will be auto-filled as MatchList. See Managing Match Lists for more information about match lists.</p> <p><code>ent_Match_List1</code></p>

Example of Data Matching

As an example of how matching operations work, consider a policy table with the following multirow key column:

Data.UserLevel
Gold,Silver
Bronze
Gold,Silver,Bronze
GO*,SILVE.

If the delimiter is turned off (not selected), any matching algorithm will compare the policy context value to the entire key column cell. For example, the first row of the column is evaluated as the string `Gold,Silver` and not as two values. If the policy context has a UserLevel of `Bronze`, the second row will match. However, the third row would not match as it would be seen as `Gold,Silver,Bronze` and compared to `Bronze` not an exact match.

Key Column Set Contains All Multiple Valued Policy Context will only return true if the key column cell contains all of the policy context information. For example, if the policy context has a UserLevel of `Silver,Bronze`, the first row of the column will not match, but the third row will.

Policy Context Set Contains All Multiple Valued Key Column is the opposite of the previous matching operation: The policy context information must contain all of the key column cell values. For example, if the policy context has a UserLevel of `Silver,Bronze`, only the second row of the column will match.

Key Column Value Set Contains Any Multiple Valued Context means that if any values in the key column cell and the policy context information are the same, the match is true. For example, if the policy context has a UserLevel of `Silver,Bronze`, every row of the column will match, because each row contains the same information as the Policy Context. (The policy will use the first row matched.)

Equivalence means that all values must be exact. The order does not matter; that is, `Silver,Gold` and `Gold,Silver` are the same. However, all set information must be in both values. For example, if the policy context has a UserLevel of `Silver,Bronze` then it does not match any row in the table because the two sets are never exact. However, if the policy context has a UserLevel of `Silver,Gold,Bronze`, the third row of the column will match, because the order does not matter. (If the delimiter were turned off, the operation would perform a string comparison of `Silver,Gold,Bronze` with `Gold,Silver,Bronze` which is not a match.)

Multiple Key Column Set Contains Single Value Context will give the same results as **Key Column Set Contains All Multiple Valued Policy Context**. However, the policy context is not separated into delimited values.

Multiple Policy Context Set Contains Single Value Key Column will give the same results as **Policy Context Set Contains All Multiple Valued Key Column**. However, the key column cell values are not separated into delimited values, only the policy context (if possible).

Wildcard is the intersection of the policy context with the key column cell values, taking into account wildcards. For example, if the policy context has a `UserLevel` of `Gold` then the first and fourth row of the column will match. The same is true if the policy context has a `UserLevel` of `Silver` instead. However, if the policy context has a `UserLevel` of `GOLDEN` then only the fourth row will match.

Matchlist is not an available data matching operation in this example.

Policy Table Case Study

The following case study is derived and simplified from actual carrier policies and illustrates how a large set of policies can be consolidated using a policy table.

A wireless carrier named Example Inc. offers three monthly data usage plans for its subscribers. The monthly quota levels are 100 MB, 2 GB, and 150 GB. Seven policies are used to capture the business logic for each usage plan, as follows:

- When subscribers near their monthly quota limit, the carrier sends an SMS notification.
- When subscribers reach their monthly quota limit, the carrier sends an SMS notification, sets an additional quota (at an additional price), sets a new warning threshold, and sets a new limit threshold.
- When subscribers reach the additional limit, the carrier sends an SMS notification and throttles additional usage to 64 kbps.

The rules for each usage plan are collected in a policy group: to support the three plans, there are three policy groups. Finally, triggering policies determine which policy group to execute based on the entitlement of the subscriber.

The names the carrier uses for the groups, and the names of the policies each contains, are as follows. The groups are named for the data plans (100_MB, 2_GB, and 100_GB), and the policies are named for the data plans and the actions each policy performs.

Table 2: Quotas and Policy Names

Group Name	Policy Name
Quota_100_MB	Quota_100_MB_send_70_percent_SMS
	Quota_100_MB_send_100_percent_SMS
	Quota_100_MB_additional_quota_send_100_percent_SMS
	Quota_100_MB_set_70_percent_volume_threshold
	Quota_100_MB_set_100_percent_volume_threshold
	Quota_100_MB_additional_quota_set_100_percent_volume_threshold

Group Name	Policy Name
	Throttle_64_kbps_100_MB
Quota_2_GB	Quota_2_GB_send_90_percent_SMS
	Quota_2_GB_send_100_percent_SMS
	Quota_2_GB_additional_quota_send_100_percent_SMS
	Quota_2_GB_set_90_percent_volume_threshold
	Quota_2_GB_set_100_percent_volume_threshold
	Quota_2_GB_additional_quota_set_100_percent_volume_threshold
	Throttle_64_kbps_2_GB
Quota_100_GB	Quota_100_GB_send_90_percent_SMS
	Quota_100_GB_send_100_percent_SMS
	Quota_100_GB_additional_quota_send_100_percent_SMS
	Quota_100_GB_set_90_percent_volume_threshold
	Quota_100_GB_set_100_percent_volume_threshold
	Quota_100_GB_additional_quota_set_100_percent_volume_threshold
	Throttle_64_kbps_100_GB

Comparing the triggering policies shows that they differ only in the name of the entitlement to match and the policy group to execute:

- Trigger Policy: Evaluate 3G Volume Quota Group Quota_100_MB

where the **ENTITLEMENTS** is contained in Match Lists **Ent_100MB_Quota**
 evaluate policy group **Quota_100_MB**

- Trigger Policy: Evaluate 3G Volume Quota Group Quota_2_GB

where the **ENTITLEMENTS** is contained in Match Lists **Ent_2GB_Quota**
 evaluate policy group **Quota_2_GB**

- Trigger Policy: Evaluate 3G Volume Quota Group Quota_100_GB

where the **ENTITLEMENTS** is contained in Match Lists **Ent_100GB_Quota**
 evaluate policy group **Quota_100_GB**

Similarly, comparing the corresponding policies in different groups shows that they are mostly the same, with only a few isolated differences:

- Group: Quota 100MB; Policy: Quota 100MB send 70 percent SMS

where the user is using **greater than or equal to 70** percent and **less than 100** percent of **volume** for **DP_QUOTA.100MB** quota

```
And where the event trigger is one of USAGE_THRESHOLD_REACHED
send SMS `You have consumed 70 % of your total quota allotted on Example Inc.`
to user. Request delivery receipt `default`.
send notification to syslog with `SMS
70%;{User.E164};{User.Custom5};{User.Custom6};GOLD;{User.Entitlement};You have
consumed 70 % of your total quota allotted on Example Inc.` and severity `Info`
Advanced: set values for QoS and Charging parameters to
Diameter IP-CAN Session Usage Monitoring  USAGE_MONITORING_ENABLED

continue processing message
```

- Group: Quota 2GB; Policy: Quota 2GB send 90 percent SMS

```
where the user is using greater than or equal to 90 percent and less than 100
percent of volume for DP_QUOTA.2GB quota
And where the event trigger is one of USAGE_THRESHOLD_REACHED
send SMS `You have consumed 90 % of your total quota allotted on Example Inc.`
to user. Request delivery receipt `default`.
send notification to syslog with `SMS
90%;{User.E164};{User.Custom5};{User.Custom6};GOLD;{User.Entitlement};You have
consumed 90 % of your total quota allotted on Example Inc.` and severity `Info`
Advanced: set values for QoS and Charging parameters to
Diameter IP-CAN Session Usage Monitoring  USAGE_MONITORING_ENABLED

continue processing message
```

- Group: Quota 100GB; Policy: Quota 100GB send 90 percent SMS

```
where the user is using greater than or equal to 90 percent and less than 100
percent of volume for DP_QUOTA.100GB quota
And where the event trigger is one of USAGE_THRESHOLD_REACHED
send SMS `You have consumed 90 % of your total quota allotted on Example Inc.`
to user. Request delivery receipt `default`.
send notification to syslog with `SMS
90%;{User.E164};{User.Custom5};{User.Custom6};GOLD;{User.Entitlement};You have
consumed 90 % of your total quota allotted on Example Inc.` and severity `Info`
Advanced: set values for QoS and Charging parameters to
Diameter IP-CAN Session Usage Monitoring  USAGE_MONITORING_ENABLED

continue processing message
```

- Group: Quota 100MB; Policy: Quota 100MB additional quota set 100 percent volume threshold

```
where the user is using greater than or equal to 100 percent of total volume for
DP_QUOTA.100MB quota
And where the user is using less than 100 percent of total volume for
DP_QUOTA_ADDL.3GB quota
remove PCC rule types all for all
install 16Mbps_DL_5.76Mbps_UL PCC rules for flow
grant total volume to 100 percent used for DP_QUOTA_ADDL.3GB
Advanced: set values for QoS and Charging parameters to
Diameter Enforcement Session Event Triggers  REVALIDATION_TIMEOUT,
USAGE_THRESHOLD_REACHED
Diameter IP-CAN Session Usage Monitoring  USAGE_MONITORING_ENABLED

accept message
```

- Group: Quota 2GB; Policy: Quota 2GB additional quota set 100 percent volume threshold

```

where the user is using greater than or equal to 100 percent of total volume for
DP_QUOTA.2GB quota
And where the user is using less than 100 percent of total volume for
DP_QUOTA_ADDL.4GB quota
remove PCC rule types all for all
install 16Mbps_DL_5.76Mbps_UL PCC rules for flow
grant total volume to 100 percent used for DP_QUOTA_ADDL.4GB
Advanced: set values for QoS and Charging parameters to
Diameter Enforcement Session Event Triggers REVALIDATION_TIMEOUT,
USAGE_THRESHOLD_REACHED
Diameter IP-CAN Session Usage Monitoring USAGE_MONITORING_ENABLED

accept message

```

- Group: Quota 100GB; Policy: Quota 100GB additional quota set 100 percent volume threshold

```

where the user is using greater than or equal to 100 percent of total volume for
DP_QUOTA.100GB quota
And where the user is using less than 100 percent of total volume for
DP_QUOTA_ADDL.5GB quota
remove PCC rule types all for all
install 16Mbps_DL_5.76Mbps_UL PCC rules for flow
grant total volume to 100 percent used for DP_QUOTA_ADDL.5GB
Advanced: set values for QoS and Charging parameters to
Diameter Enforcement Session Event Triggers REVALIDATION_TIMEOUT,
USAGE_THRESHOLD_REACHED
Diameter IP-CAN Session Usage Monitoring USAGE_MONITORING_ENABLED

accept message

```

All the differences in the seven policies for the three groups can be tabulated using only six columns and three rows, as follows. Because of the similarities from group to group, these policies are good candidates for using a policy table. These three groups can be replaced by one set of policies using variables for differences and one policy table with three rows. The table's key column, representing the scenarios, is a policy context property. The table column headings become the names of the other variables used in the policies.

Table 3: Differences Between Quotas

Policy Variable Scenario	Base Quota	Additional Quota	Percent Limit	Additional Limit	Grant Quota
100 MB	DP_QUOTA.100MB	DP_QUOTA_ADDL.3GB	70	3 GB	DP_QUOTA_ADDL.3GB
2 GB	DP_QUOTA.2GB	DP_QUOTA_ADDL.4GB	90	4 GB	DP_QUOTA_ADDL.4GB
100 GB	DP_QUOTA.100GB	DP_QUOTA_ADDL.5GB	90	5 GB	DP_QUOTA_ADDL.5GB

The triggering policies are now rewritten to use the policy table and a single policy group, which in this case study is named QUOTA. A policy context property is used as the key to locate the row in the table to use.

- Table-Driven Trigger Policy: Evaluate 3G Volume Quota Group 100 MB

```
where the ENTITLEMENTS is contained in Match Lists Ent_100MB_Quota
set policy context property scenario to 100MB
evaluate policy group QUOTA
```

- Table-Driven Trigger Policy: Evaluate 3G Volume Quota Group 2 GB

```
where the ENTITLEMENTS is contained in Match Lists Ent_2GB_Quota
set policy context property scenario to 2GB
evaluate policy group QUOTA
```

- Table-Driven Trigger Policy: Evaluate 3G Volume Quota Group 100 GB

```
where the ENTITLEMENTS is contained in Match Lists Ent 100GB Quota
set policy context property scenario to 100GB
evaluate policy group QUOTA
```

The policies in the QUOTA group are now rewritten to use the policy table, which in this case study is named Quota_table, and variables. The sample policies shown previously are rewritten as follows:

- Group: QUOTA; Policy: Quota send Warning percent SMS

```
use table Quota_table called table
where the user is using greater than or equal to table.PctLmt percent and less
than 100 percent of volume for table.BaseQuota quota
And where the event trigger is one of USAGE_THRESHOLD_REACHED
send SMS `You have consumed table.PctLmt % of your total quota allotted on Example
Inc.` to user. Request delivery receipt `default`.
send notification to syslog with `SMS
table.PctLmt%;{User.E164};{User.Custom5};{User.Custom6};GOLD;{User.Entitlement};You
have consumed table.PctLmt % of your total quota allotted on Example Inc.` and
severity `Info`
Advanced: set values for QoS and Charging parameters to
Diameter IP-CAN Session Usage Monitoring USAGE_MONITORING_ENABLED
continue processing message
```

Group: QUOTA; Policy: Quota additional quota set 100 percent volume threshold

```
use table Quota_table called table
where the user is using greater than or equal to 100 percent of total volume for
table.BaseQuota quota
And where the user is using less than 100 percent of total volume for
table.AddlLmt quota
remove PCC rule types all for all
install 16Mbps_DL_5.76Mbps_UL PCC rules for flow
grant total volume to 100 percent used for table.AddlQuota
Advanced: set values for QoS and Charging parameters to
Diameter Enforcement Session Event Triggers REVALIDATION_TIMEOUT,
USAGE_THRESHOLD_REACHED
Diameter IP-CAN Session Usage Monitoring USAGE_MONITORING_ENABLED
accept message
```

Creating a Policy Table

When you define a policy table, it must contain at least one key column and one row, and you must populate every cell in the table.

To create a policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.
2. Select the **Policy Tables** sub-group.
The **Policy Table Administration** page opens in the work area.
3. Click **Create Policy Table**.
The **Policy Table Administration** page opens.
4. Enter information as appropriate:
 - a) **Name** (required) — The name you assign to the policy table.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description/Location** (required) — Free-form text that identifies the policy table.
5. To add a column, click **Add Column** (required) — You must define at least one key column.
Enter the following information:
 - **Column Name** (required) — The name you assign to the column. Policies use this name as part of the address of cells in this column. The name can only contain the characters A–Z, a–z, 0–9, space (), and underline (_).
 - **Column Type** (required) — The data type of cells in the column. Click the folder icon; a selection window opens, displaying the Policy Wizard actions and conditions. Locate the condition or action you want to abstract and select the variable to use (displayed in red text); the data type is taken from the variable.
 - **Key** — The policy variable used as a key. If this is a key column, select the check box and either select a policy variable from the list or type the name of the variable you want to use. The policy variable is used to obtain the value from the policy context when using the table to look up a row.
 - **Delimiter** — The character that separates values within a cell. For fields that accept multiple values, specify the delimiter between values. Enter any single ASCII character. The default is a comma (,). If you enter no value, the field is evaluated as a single value.
 - **Matching Operation** — If this is a key column and no delimiter is defined, the default matching operation is **Equivalence**. If the column type is **Token List Name**, the matching operation is **Matchlist**. If a delimiter is defined, select the matching operation:
 - **Wildcard**
 - **Policy Context Set Contains All Multiple Valued Key Column**
 - **Multiple Key Column Set Contains Single Value Context** (default)
 - **Multiple Policy Context Set Contains Single Value Key Column**
 - **Key Column Value Set Contains Any Multiple Valued Context**
 - **Equivalence**
 - **Key Column Set Contains All Multiple Valued Policy Context**
 - **Matchlist** (available when column type is Token List Name)

For information on matching operations see [About Data Matching](#).

- Click **Save**.

The column is created. If no rows exist, a row is created.

6. (Optional) You can add additional rows by doing the following:

- a) Click **Add Row**. A row is added below the current row in the table.
- b) Select a cell in the row. A window opens so you can enter the value for that cell. The data in the cell must match the data type of the column.
- c) Enter the value and click **OK**. You can also enter a comma-separated list of values.

The row is created and appears below the previous row.

7. (Optional) You can manage columns and rows by selecting a column or row and clicking **Operations**, then selecting an operation from the list:

- **Delete Row** — Deletes the table row.
- **Move Row Up** — Moves the table row up.
- **Move Row Down** — Moves the table row down.
- **Delete Column** — Deletes the column in the table.
- **Move Column Left** — Moves the column left in the table.
- **Move Column Right** — Moves the column right in the table.
- **Sort Column** — Sorts the column in the table.
- **UnSort Column** — Reverts the column to its original order.

8. Click **Validate**.

Validation ensures that tables contain a key column, at least one row, and no empty cells. If the table is valid, a confirmation message appears. Click **OK** to close the window.

If the table is invalid, a diagnostic message appears. Correct the table, and click **Validate** again.

The table definition is validated.

9. Click **Save**.

The policy table is validated and is displayed on the **Policy Table Administration** page.

You have created a policy table. You can now use the table in a policy.

Figure 13: Sample Policy Table shows the sample policy table discussed in *Policy Table Case Study*.

Policy Table Administration

Policy Table: Quota_table

Modify Delete

Name: Quota_table
Description: Table for data plan quotas

scenario	BaseQuota	AddQuota	PctLimit	AddLimit	GrantQuota
100MB	DP_QUOTA.100MB	DP_QUOTA_ADDL.3GB	70	3GB	DP_QUOTA_ADDL.3GB
2GB	DP_QUOTA.2GB	DP_QUOTA_ADDL.4GB	90	4GB	DP_QUOTA_ADDL.4GB
100GB	DP_QUOTA.100GB	DP_QUOTA_ADDL.5GB	90	5GB	DP_QUOTA_ADDL.5GB

Figure 13: Sample Policy Table

Viewing Policy Tables

To view a policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.
2. Select the **Policy Tables** sub-group.
The **Policy Table Administration** page opens in the work area.
3. Click the policy table name in the content tree.
The policy table details are displayed in the work area.

Associating a Policy Table with a Policy Rule

To associate a policy table with a new or existing policy rule, the policy table must already be created. See [About Policy Tables](#) for more information on what a policy table is. See [Creating a Policy Table](#) for more information on how to create a policy table. See [Creating a Policy Rule](#) for more information on creating and modifying a policy definition.

To associate a policy table with a policy rule:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays the **All Tables** group.
2. Select the **Policy Tables** sub-group.

The **Policy Table Administration** page opens in the work area.

3. Select the policy you want to associate to a policy table.
The **Policy Administration** page displays information about the policy.
4. Click **Modify**.
The policy wizard opens in a **Modify Policy** tab.
5. At the bottom of the page, click **Tables**.
The **Table Associations** page opens in the **Modify Policy** tab.
6. On the **Table Associations** page, select the association type.
 - use table *policy table* called *specified alias name*
 - use table *policy table* called *specified alias name* returns *unique row*

The policy table option is added to the **Description** section of the page, where you select an existing policy table to use and define an alias name for this policy table, if needed.

7. In the **Description** section of the page, click *policy table*.
The **Policy Table Data** window appears.
8. Select a table, and click **OK**.
9. Click *specified alias name*.
The **Input a Value** window opens.
10. Enter an alias name in the format specified in the window, and click **OK**.
The name describes the purpose of this table in this policy. You can then use the same policy table in multiple policies but define a different purpose each time with the alias name field.
11. If you selected the table association that specifies unique row option, click **unique row** and select an option.
 - **unique row** (default) — First matched row is selected.
 - **multiple rows** — All matches are selected.
12. Repeat these steps to associate another policy table with this policy rule, if needed.
13. If multiple policy tables are associated with this policy rule, use the ▲ (up) icon or ▼ (down) icon to move the table and change the order in which it is evaluated in the rule.
14. At the bottom of the page, click **Name**.
The **Name** page opens on the **Modify Policy** tab.
15. Click **Finish**.

The selected policy tables are associated with this policy definition.

Associating a Parameter with a Policy Table Column

After you have defined a policy table and associated it with a policy rule, you can associate individual rule parameters with columns (fields) defined in the table.

To associate a parameter with a policy table column:

1. In the condition or action, click on the parameter for which you want to use the policy table.
A selection window opens.
2. Click **Use Policy Table**.
A list of policy table fields (columns) opens.

Tip: If no choices are available, no appropriate column is defined.

3. Select the policy table field (column) and click **OK** to use that field, or **Use Input Value** to enter an input value (not use the policy table) instead.
The selection window closes.

When the rule is evaluated, the value of the parameter is replaced by the value in the policy table.

Modifying a Policy Table

To modify a policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.
2. Select the **Policy Tables** sub-group.
The **Policy Table Administration** page opens in the work area.
3. Select the policy table you want to modify.
The **Policy Table Administration** page opens, displaying information about the policy table.
4. Click **Modify**.
The table fields become editable. See [Creating a Policy Table](#) for information about the table fields.
5. Click **Validate**.
The data modified is validated. If the table is valid, a confirmation message displays. Click **OK** to close the window. If invalid, a diagnostic message appears.
6. Click **Save**.

The policy table content is modified. A notification message listing the differences is displayed if the policy table is the default or associated policy table for a virtual policy table, if the policy table structure has been modified, or if the policy table columns contain differences between delimiters, matching operations, or keys.

Deleting a Policy Table

To delete a policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.
2. Select the **Policy Tables** sub-group.
The **Policy Table Administration** page opens in the work area.
3. Delete the policy table using one of the following methods:
 - From the work area, click  (trash can icon) located to the right of the policy table.
 - Open the policy and click **Delete**.

A confirmation message appears.

4. Click **OK**.

The policy table is deleted.

Chapter 6

Managing Policy Groups

Topics:

- *Creating a Policy Group.....81*
- *Adding a Policy or a Policy Group to a Policy Group.....81*
- *Displaying Details of All Policies in a Policy Group.....82*
- *Changing the Sequence of Policies or Policy Groups Within a Policy Group.....82*
- *Removing a Policy from a Policy Group.....83*
- *Managing Analytics Data Stream Generation for a Policy Group.....85*
- *Deleting a Policy Group.....85*

Policy groups are an organizational aid that provide for flexible policy management, deployment, and execution. You save policies to a group in the order in which you want an MPE device to apply them to a policy request. If needed, you can change that order. You can save a policy to multiple policy groups and add a policy to, or remove it from, a policy group at any time. You can also nest policy groups.

This chapter describes how to create, modify, and delete policy groups.

Creating a Policy Group

To create a policy group:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the **ALL** group.
The **Policy Administration** page opens in the work area.
3. Click **Create Group**.
The **Name** field opens in the work area.
4. Enter the name to assign to the new group.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 64 characters.
5. Click **Save**.

The new group information is saved to the CMP database and displayed in the content tree.

Adding a Policy or a Policy Group to a Policy Group

After you create a policy group, you can add policies to the group. You can also add policy groups to a policy group.

Note: Oracle recommends that you nest policy groups only two levels deep.

To add policies or policy groups to a policy group:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the **ALL** group.
The **Policy Administration** page opens in the work area, listing the defined policies and policy groups.
3. Select the policy group to which you want to add the policy or policy group.
The **Policy Administration** page opens in the work area, listing the policies and policy groups currently in the selected group.
4. Click **Modify**.
The **Policy Administration** page opens in the work area.
5. Click **Add**.
A window opens, displaying the policies and policy groups available.
6. (Optional) You can filter the list by selecting one of the following:
 - **Policy** — Displays the policies in the group.
 - **Group** — Displays the policy groups in the group.
 - **All** (default) — Displays both the policies and the policy groups in the group.

7. Select the policy or group to add to this group and click **Add**. Use Shift/click to select multiple policies or policy groups. By default, policies and policy groups are added after the first item in the group; to change the insert position, change the value in the **Location** field.
The policies or policy groups are added to the policy group in the specified location and the window closes.

Note: Policies or policy groups are applied to messages in the order in which they appear in the policy group. You can change the sequential order (see [Changing the Sequence of Deployed Policies on an MPE device](#)).

8. Click **Save**.

The added policies and policy groups are displayed in the policy group tree. You can deploy the policy group. For more information about deploying policies and policy groups, see [Deploying a Policy](#).

Note: If this group had been deployed previously, it is automatically redeployed at this time, ensuring the MPE devices are synchronized with the CMP database.

Displaying Details of All Policies in a Policy Group

To display the details of all policies in a policy group:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the policy group that you want to display.
The **Policy Administration** page opens in the work area, displaying the list of policies and policy groups in the selected group.
3. Click **Show Details**.
The configured policies, including the configured parameters for the policies, are displayed. To switch between views, click **Toggle View**.
4. Click **Cancel**.

The details of all policies in the group appears.

Changing the Sequence of Policies or Policy Groups Within a Policy Group

The sequence in which policies or policy groups appear in a policy group is the order in which they are deployed and applied to policy requests. You can modify the sequence of policies or policy groups, both inside and outside of a policy group.

To change the sequence of the policies or policy groups within a policy group:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the policy group that contains the policies or policy groups that you want to reorder.
The **Policy Administration** page opens in the work area, displaying the list of policies and policy groups in the selected group. They are displayed in sequential order.

3. Click **Modify**.

The **Manage Policies** page opens.

4. Change the sequence of policies or policy groups within the group by doing one of the following:

- Use the  (top) and  (bottom) icons, located to the left of policies or policy groups. The  (top) icon moves the item it to the top of the list. The  (bottom) icon moves the item it to the bottom of the list.
- Drag and drop policies or policy groups to a different position in the sequence.
- Change the sequence numbers, located to the left of policies or policy groups. Click **Update Order** to refresh the display.
- Optionally, you can click **Undo** or **Redo** to step back and forth through your changes.

5. Click **Save**.

The modified policy group is automatically redeployed, ensuring that the MPE devices are resynchronized with the CMP database.

Note: If the policy group has never been deployed, you can now deploy it. For more information about deploying policies and policy groups, see [Deploying a Policy](#).

Removing a Policy from a Policy Group

Removing a policy from a policy group that has been saved to the CMP database removes the policy from only the selected policy group. The policy remains in the **ALL** group, as well as any other group to which it had been added. (To remove a policy from all groups in the Policy Library, see [Removing a Policy from an MPE Device](#).)

To remove a policy from a policy group:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the policy group from which you want to delete a policy.
The **Policy Administration** page opens in the work area, displaying the list of policies and policy groups in the selected group.
3. To remove the policy, from the content tree, select the policy within the policy group.
The profile information for the policy is displayed.

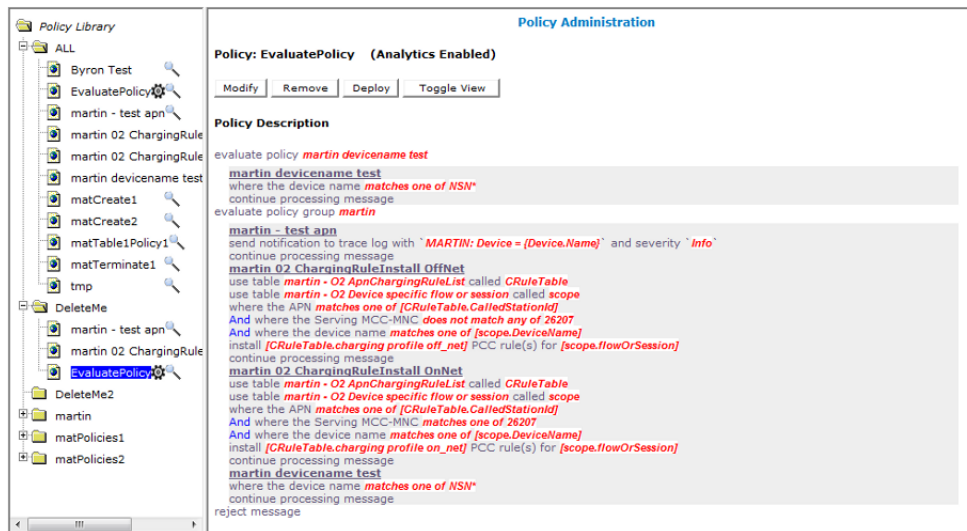

Figure 14: Policy within a Policy Group

4. Click **Remove**.
The selected policy is removed from the policy group.
5. Alternatively, from the content tree, select the policy group and click **Modify**.

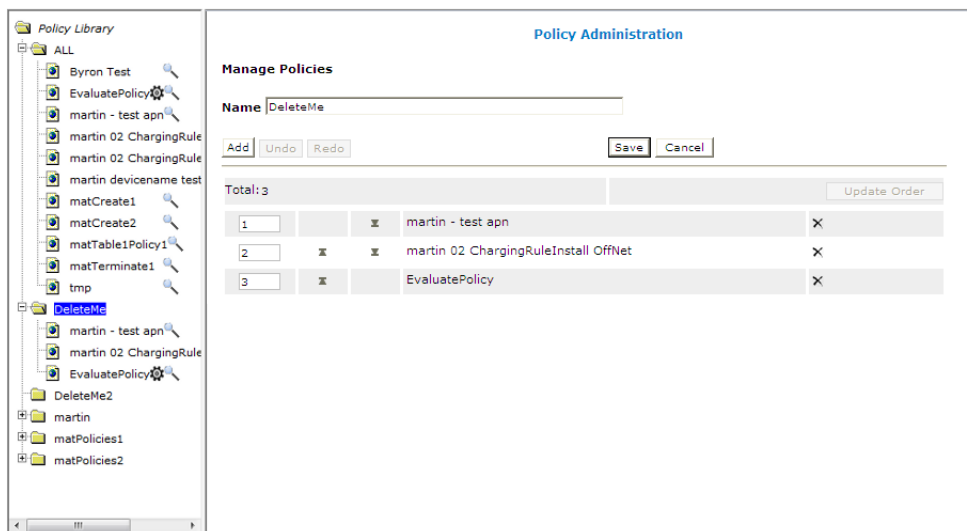

Figure 15: Removing a Policy from a Policy Group

6. Click the remove icon, located to the right of the policy you want to remove.
The selected policy is removed from the policy group.

The modified policy group is automatically redeployed, ensuring that the MPE devices are resynchronized with the CMP database.

Note: If the policy group has never been deployed, you can now deploy it. For more information about deploying policies and policy groups, see [Deploying a Policy](#).

Managing Analytics Data Stream Generation for a Policy Group

You can enable or disable generation of an analytics data stream (ADS) for all policies in a group. See *Analytics Data Stream Reference* for more information on the Oracle Communications Policy Management Analytics product.

Note: To enable or disable ADS generation at a policy group level, you must configure the **Manage Analytic Data** management option to enable the ADS feature. See the appropriate *CMP User's Guide* for more information.

Deleting a Policy Group

Deleting a policy group removes the policy group from all policy groups to which it has been added.

To delete a policy group:

1. From the **Policy Management** section of the navigation pane, select **Policy Library**.
The content tree displays a list of policy library groups; the initial group is **ALL**.
2. From the content tree, select the policy group that you want to delete.
The **Policy Administration** page opens in the work area, displaying the list of policies and policy groups in the selected group.
3. Click **Delete**.
A confirmation message appears.
4. Click **OK**.

The policy group is deleted from the CMP database. Any policy groups that contained the deleted policy group are automatically redeployed, ensuring that the MPE devices are synchronized with the CMP database.

Chapter 7

Managing Policy Templates

Topics:

- [Creating a Policy Template.....87](#)
- [Modifying a Policy Template.....87](#)
- [Deleting a Policy Template.....88](#)

The CMP system lets you create policy templates to simplify the creation of multiple policies with similar conditions and actions. A policy template is similar to a policy, except that some (or all) of the parameters in the conditions and actions are not completely defined. Those parameters are defined later, when you use the policy template to create policy rules.

The policy template wizard is used to create or modify a policy template. This wizard is similar to the policy wizard; however, the policy template wizard allows parameters to be only partially defined. For example, a template may be configured for only policy requests requiring bandwidth above a certain value, but not define the exact bandwidth value. You can then specify a specific bandwidth value when you use the template to create the new policy rule.

This chapter describes how to create, modify, and delete policy templates.

Creating a Policy Template

To create a policy template:

1. From the **Policy Management** section of the navigation pane, select **Template Library**.
The content tree displays the **Template Library** group.
2. From the content tree, select the **Template Library** group.
The **Template Administration** page opens in the work area.
3. Click **Create Template**.
The **Create New Policy Template** window opens.
4. Select the base policy or policy template with which to begin:
 - **Blank** — No policy template attributes are predefined.
 - **Use Template** — Select an existing template with predefined attributes. Modify the template as needed, then save the template with a new template name.
 - **Copy Existing Policy** — Select an existing policy. Modify the policy, then save the policy as a policy template.
5. Edit the policy information from one or more of the policy wizard pages.
See [Creating a Policy Rule](#) for details on the fields within the policy wizard.
6. Click **Finish**.

The policy template is created.

Modifying a Policy Template

Modifying a policy template does not modify previously configured policies.

To modify a policy template:

1. From the **Policy Management** section of the navigation pane, select **Template Library**.
The content tree displays the **Template Library** group.
2. From the content tree, select the **Template Library** group.
The **Template Administration** page opens in the work area, displaying a list of all defined policy templates.
3. Select the template you want to modify.
The **Template Administration** page displays a description of the template.
4. Click **Modify**.
The **Modify Policy** tab opens, showing the last step of the template creation process.
5. Click **Back** to return to the page you want to edit and modify the information.
6. Click **Finish**.

The template is modified.

Deleting a Policy Template

To delete a policy template:

1. From the **Policy Management** section of the navigation pane, select **Template Library**.
The content tree displays the **Template Library** group.
2. From the content tree, select the **Template Library** group.
The **Template Administration** page opens in the work area, displaying a list of all defined policy templates.
3. Delete the policy template using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the policy template.
 - From the content tree, select the template and click **Delete**.

A confirmation message appears.

4. Click **OK**.

The policy template is deleted.

Chapter 8

Managing Virtual Policy Tables

Topics:

- [*About Virtual Policy Tables.....90*](#)
- [*Virtual Policy Table Case Study.....90*](#)
- [*Creating a Virtual Policy Table.....92*](#)
- [*Modifying Virtual Policy Tables.....92*](#)
- [*Deleting Virtual Policy Tables.....93*](#)

This chapter describes how to create, modify, and delete virtual policy tables, which are manageable objects that you can use to deploy policy table data to individual MPE devices. You can test policy table changes on a subset of your network by using configuration templates to associate multiple policy tables to a single virtual policy table.

About Virtual Policy Tables

Virtual policy tables allow you to deploy policy table data to specific MPE devices without affecting the entire network. You can use virtual policy tables to test configurations and changes before you deploy them to the entire network. Unlike policy tables, virtual policy tables do not contain any data except for pointers to policy tables and configuration templates. Virtual policy tables are available in the policy wizard.

A virtual policy table points to one default policy table and may point to one or more associated policy tables that are specified by a configuration template. The default policy table specifies the policy table data that is pushed to MPE devices on the network by default. In the absence of any associated policy tables, a virtual policy table behaves like its' default policy table. You can use a configuration template to associate additional policy tables to the virtual policy table and to specify which MPE devices should use the associated policy table data instead of the default policy table data. For information about using configuration templates, see the appropriate *CMP User's Guide*.

The following validations exist for virtual policy tables:

- A virtual policy table must not share a name with any other policy tables or virtual policy tables.
- A virtual policy table must be deleted before its' default policy table or associated policy tables can be deleted.
- A virtual policy table can only be assigned a new default policy table if the virtual policy table is not used in any policies and if all of the associated policy tables contain at least the columns contained in the new default policy table.
- A virtual policy table can be assigned associated policy tables as long as the associated policy tables contain at least the same column names and types as the default policy table.

The following validations exist for policy table columns when the policy table is either a default or an associated policy table for a virtual policy table:

- A policy table column can be modified in a default policy table if the column is not used in any policies and if the newly modified column is contained in all associated policy tables.
- A policy table column can be removed from a default policy table if the column is not used in any policies.
- A policy table column can be removed from or modified in an associated policy table if the column is not contained in the default policy table for any virtual policy tables to which the policy table is associated.

Virtual Policy Table Case Study

Virtual policy tables allow you to test policy table deployments before you deploy them to the entire network.

A wireless carrier named Example Inc. offers three monthly data usage plans for its subscribers. The monthly quota levels are 100 MB, 2 GB, and 100 GB, and each level corresponds to one row in the policy table. The business logic for each usage plan is captured using one policy table, *Monthly Data Plans*, with six columns and three rows, as shown in the table below. For a detailed explanation of this policy table, see [Policy Table Case Study](#).

Table 4: Monthly Data Plans Policy Table

Policy Variable scenario	Base Quota	Additional Quota	Percent Limit	Additional Limit	Grant Quota
100 MB	DP_QUOTA.100MB	DP_QUOTA_ADDL.3GB	70	3 GB	DP_QUOTA_ADDL.3GB
2 GB	DP_QUOTA.2GB	DP_QUOTA_ADDL.4GB	90	4 GB	DP_QUOTA_ADDL.4GB
100 GB	DP_QUOTA.100GB	DP_QUOTA_ADDL.5GB	90	5 GB	DP_QUOTA_ADDL.5GB

Any changes to the Monthly Data Plans policy table will be deployed to the entire network. To test changes without deploying them to the entire network, Example Inc. creates a virtual policy table, Test Plans, and sets the default policy table for Test Plans to Monthly Data Plans. Without further configuration, changes made to the Monthly Data Plans policy table will be deployed to the entire network as before.

Example Inc. requires an additional monthly data usage plan for its subscribers with a monthly quota level of 150 GB. To test the policies associated with the 150 GB monthly data usage plan, Example Inc. creates a second policy table, Four-tier Data Plans, with the same rows and columns as Monthly Data Plans and an additional row to represent the 150 GB usage plan. The Four-tier Data Plans policy table is associated to the Test Plans virtual policy table using a configuration template.

Table 5: Four-tier Data Plans Policy Table

Policy Variable scenario	Base Quota	Additional Quota	Percent Limit	Additional Limit	Grant Quota
100 MB	DP_QUOTA.100MB	DP_QUOTA_ADDL.3GB	70	3 GB	DP_QUOTA_ADDL.3GB
2 GB	DP_QUOTA.2GB	DP_QUOTA_ADDL.4GB	90	4 GB	DP_QUOTA_ADDL.4GB
100 GB	DP_QUOTA.100GB	DP_QUOTA_ADDL.5GB	90	5 GB	DP_QUOTA_ADDL.5GB
150 GB	DP_QUOTA.150GB	DP_QUOTA_ADDL.6GB	90	6 GB	DP_QUOTA_ADDL.6GB

The Test Plans virtual policy table now has one default policy table, Monthly Data Plans, and one associated policy table, Four-tier Data Plans. The data in the Monthly Data Plans policy table is pushed to all of the MPE devices on the network except when the configuration template specifies that the data in the Four-tier Data Plans policy table should be pushed instead. Example Inc. can now test the new 150 GB monthly data usage plan on a specific MPE devices without affecting the rest of the network.

If the testing is successful, the added row from the Four-tier Data Plans policy table can be added to the Monthly Data Plans policy table and deployed to the entire network. The Four-tier Data Plans policy table can safely be deleted or removed from the Test Plans virtual policy table configuration.

Creating a Virtual Policy Table

To create a virtual policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.
2. Select the **Virtual Policy Tables** sub-group.
The **Virtual Policy Table Administration** page opens in the work area.
3. Click **Create Virtual Policy Table**.
The **Virtual Policy Table Administration** page opens.
4. Enter information as appropriate:
 - a) **Name** (required) — The name you assign to the virtual policy table.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters. The name must not match any existing policy table or virtual policy table names.
 - b) **Default Policy Table** (required) — The policy table to which the virtual policy table points by default.
 - c) **Description/Location** — Free-form text that identifies the virtual policy table.
5. (Optional) To associate the virtual policy table with a configuration template, click **Add**.
The **Add Virtual Policy Table Association** dialog box appears.
6. Select a configuration template and a policy table from the list.
Associated policy table columns must have the same name and type as those in the default policy table.
7. Click **Save**.
The configuration template is associated with the virtual policy table.
8. Click **Save**.

The virtual policy table is created. You can now use the virtual policy table to deploy policy tables to specific MPE devices. If the default and associated policy tables contain different keys, delimiters, or matching operations, a notification message listing the differences is displayed.

When the virtual policy table is created, it is added to the CMP database and pushed to all MPE devices. If the virtual policy table does not have an associated configuration template or if the associated configuration template is not associated with an MPE, the default policy table data for the virtual policy table is pushed to all MPE devices. If there is an associated configuration template and the template is associated with MPE devices, policy table data is pushed to MPE devices as specified in the configuration template.

Modifying Virtual Policy Tables

To modify a virtual policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.

2. Expand the **Virtual Policy Tables** sub-group.
The **Virtual Policy Table Administration** page opens in the work area.
3. Select a virtual policy table.
The **Virtual Policy Table Administration** page displays information about the virtual policy table.
4. Click **Modify**.
The **Virtual Policy Table Administration** becomes editable. See [Creating a Virtual Policy Table](#) for information about configuring a virtual policy table.
5. Click **Save**.

The virtual policy table is modified. If the default and associated policy tables contain different keys, delimiters, or matching operations, a notification message listing the differences is displayed.

Deleting Virtual Policy Tables

To delete a virtual policy table:

1. From the **Policy Management** section of the navigation pane, select **Policy Table Library**.
The content tree displays the **All Tables** group.
2. Select the **Virtual Policy Tables** sub-group.
The **Virtual Policy Table Administration** page opens in the work area.
3. Delete the virtual policy table using one of the following methods:
 - From the work area, click  (trash can icon) located to the right of the virtual policy table.
 - Open the virtual policy table and click **Delete**.A confirmation message displays.
4. Click **OK**.

The virtual policy table is deleted.

Chapter 9

Managing Policy Checkpoints

Topics:

- *About Policy Checkpoints.....95*
- *Creating a Policy Checkpoint.....96*
- *Viewing and Comparing Policy Checkpoints.....96*
- *Restoring a Policy Checkpoint.....96*
- *Restoring a Policy Checkpoint to MPE Devices.....97*
- *Deleting a Policy Checkpoint.....98*

This chapter describes the method of saving CMP objects and their configuration and their association to the CMP database at a specific point in time.

About Policy Checkpoints

A policy checkpoint is a method of saving the records in the CMP database at a specific point in time. The table below details which configurable objects are and are not saved as part of the checkpoint.

Table 6: Record Keeping and Policy Checkpoints

Records saved	Records not saved
<ul style="list-style-type: none"> • policies • policy groups • policy templates • policy tables • policy counter IDs • traffic profiles • traffic profile groups • MPE configuration templates • match lists • retry profiles • applications 	<ul style="list-style-type: none"> • quota profiles • quota conventions • serving gateways/MCC-MNC mappings • charging servers • time periods • customer AVPs • services • rating groups • LI mediation functions

Note: The checkpoint function also saves associations between:

- Virtual MPE templates and real MPE templates
- MPE devices and virtual MPE templates
- Virtual MPE templates and other configuration objects

You can save up to 10 checkpoints.

After a checkpoint is created, you can return to this set of records at any time by restoring the checkpoint.

CAUTION

Caution: When you restore a checkpoint, all existing data is permanently removed.

The checkpoint function is different from the import/export function in the following ways:

- Checkpoints are saved to the CMP database rather than to a file.
- A checkpoint saves all the records mentioned in the preceding table. The import/export feature allows you to select which records to import or export.
- A checkpoint can only be used on a specific CMP system and cannot be migrated to another CMP system.

Creating a Policy Checkpoint

To access this feature, specify a value greater than 0 for the **Allow policy backup and rollback** field on the **System Settings** page. To refresh the menu, log out and log back in. This field also controls the maximum number of checkpoints that can be saved. For information on system settings, see the appropriate *CMP User's Guide*.

Use this procedure to create a new checkpoint. A checkpoint saves policies, policy groups, policy templates, policy tables, traffic profiles, and traffic profile groups; other records are not saved.

Note that the maximum number of checkpoints that can be created is defined on the System Settings page. If you create more than the number defined, the oldest checkpoint is deleted.

To create a new policy checkpoint:

1. From the **Policy Management** section of the navigation pane, select **Policy Checkpoint/Restore**. The **Checkpoint/Restore** page opens.
2. Click **Create a new checkpoint**.
If the maximum number of checkpoints already exists, you are prompted, *n checkpoints already exist, by creating this checkpoint the oldest one will be deleted. Continue?* where *n* indicates the maximum number of checkpoints).
3. Click **OK**.

The checkpoint is created.

Viewing and Comparing Policy Checkpoints

To view/compare policy checkpoints in the CMP database:

1. From the **Policy Management** section of the navigation pane, select **Policy Checkpoint/Restore**. The **Checkpoint/Restore** page opens.
2. Click **Diff** to view a report that compares the selected checkpoint's records to the current CMP records.
3. Click **More Info** to view a list of all required profile names for this checkpoint. These profiles must exist in the system before a checkpoint is restored, otherwise the restore will fail.

Restoring a Policy Checkpoint

CAUTION

Caution: All current records are lost when a restore is performed. Oracle recommends that you save a checkpoint before restoring a previous checkpoint.

Note: Charging servers, customer AVPs, services, LI mediation functions, rating groups, serving gateways/MCC-MNC mappings, and time periods are not saved in checkpoints, so be sure all related profile information exists in the CMP system before restoring. If related profile information is not

available before you do a restore, the restore process will fail. Use the **More Info** link to view all required profile information for a checkpoint.

To restore to a checkpoint in the CMP database without autodeployment to the MPE devices:

1. From the **Policy Management** section of the navigation pane, select **Policy Checkpoint/Restore**. The **Checkpoint/Restore** page opens.
2. Click **Restore**.
3. Select the checkpoint you are restoring.
4. Click **Restore**.
You are prompted, Caution: All current records are lost when a restoration is performed. It is recommended that you save a checkpoint before restoring a previous checkpoint. Are you sure that you want to restore to this Checkpoint?
5. Click **OK**.
A confirmation message appears.
6. Click **OK**.
7. Click **Save**.

A checkpoint report appears, listing which policies and policy groups were restored and which were removed.

Restoring a Policy Checkpoint to MPE Devices

CAUTION

Caution: All current records are lost when a restore is performed. Oracle recommends that you save a checkpoint before restoring a previous checkpoint.

Note: Charging servers, customer AVPs, services, LI mediation functions, rating groups, serving gateways/MCC-MNC mappings, and time periods are not saved in checkpoints, so be sure all related profile information exists in the CMP system before restoring. If related profile information is not available before you do a restore, the restore process will fail. Use the **More Info** link to view all required profile information for a checkpoint.

To restore to a checkpoint in the CMP database and autodeploy to all MPE devices in the system:

1. From the **Policy Management** section of the navigation pane, select **Policy Checkpoint/Restore**. The **Checkpoint/Restore** page opens.
2. Click **Restore**.
3. Select the checkpoint you are restoring.
4. Click **Restore and Deploy**.
You are prompted, Caution: All current records are lost when a restoration is performed. It is recommended that you save a checkpoint before restoring a previous checkpoint. Are you sure that you want to restore to this Checkpoint and deploy it to MPES?
5. Click **OK**.
A confirmation message displays.
6. Click **OK**.

7. Click **Save**.

A checkpoint report appears, listing which policies and policy groups were restored, which were removed, and to which MPE devices the deployment succeeded.

Deleting a Policy Checkpoint

To delete a saved checkpoint from the CMP system:

1. From the **Policy Management** section of the navigation pane, select **Policy Checkpoint/Restore**.
The **Checkpoint/Restore** page opens.
2. Select the checkpoint you are deleting.
3. Click **Delete the selected checkpoint**.
4. Click **OK**.
A confirmation message appears.

The selected checkpoint is deleted from the CMP database.

Part II

Configuring Manageable Objects for Use In Policies

Topics:

- *Managing Subscriber Keys.....196*
- *Managing Traffic Profiles.....200*

Part II describes how to create and manage the manageable objects that are available to be used in policies.

Chapter 1

About Creating Manageable Objects

Topics:

- [Wireless Mode Objects.....101](#)
- [Cable Mode Objects.....101](#)
- [Wireline Mode Object.....102](#)

The manageable object creation tasks you need to perform depend on whether you are operating a cable, wireless, or wireline network and what services and servers exist in your network. You must create an object before you can use it in a policy. You can create the objects in any order, at any time.

The following sections list the manageable objects by operating mode:

- [Wireline Mode Object](#)
- [Wireless Mode Objects](#)
- [Cable Mode Objects](#)

Note: You can also use the administrative **Import / Export** function to quickly and easily import multiple manageable objects. See the appropriate *CMP User's Guide* for detailed information.

After you have created your manageable objects, you are ready to create and manage policy rules. See [Overview of Main Tasks](#) for descriptions of tasks and references to these tasks.

Wireless Mode Objects

The manageable objects for Wireless mode of the CMP system are:

- Create application profiles, which specify protocol information to associate each request with an application. This task is described in [Managing Application Profiles](#).
- Create custom attribute-value pairs (AVPs), which are used to encapsulate protocol-specific information with usage monitoring supported by MPE devices in a wireless network. This task is described in [Managing Custom AVPs](#).
- Create match lists, which create whitelists and blacklists in a wireless network. This task is described in [Managing Match Lists](#).
- Create monitoring keys, which associate quota profiles with policy and charging control (PCC) and application detection control (ADC) rules for usage tracking in a wireless network. This task is described in [Managing Monitoring Keys](#).
- Create policy counter identifiers, which define the name, optional description, and default online charging server (OCS) value for which status can be received from the OCS server in a wireless network. This task is described in [Managing Policy Counter Identifiers](#).
- Create policy time periods, which are used in policy time-of-day conditions in a wireless network. This task is described in [Managing Policy Time Periods](#).
- Create Presence Reporting Area (PRA) lists, which specify areas that can be used in location-specific policies in a wireless network. This task is described in [Managing Presence Reporting Area Lists](#).
- Create quotas, which set a limit on a subscriber's usage in a wireless network. This task is described in [Managing Quotas](#).
- Create quota passes, which comprise rollovers and top-ups, in a wireless network. This task is described in [Managing Quota Conventions](#).
- Create retry profiles, which specify the circumstances under which installation of a PCC rule is retried if the rule is reported to have failed in a wireless network. This task is described in [Managing Retry Profiles](#).
- Create Gy services, which identify a class of traffic, and rating groups, which are collections of services, in a wireless network. This task is described in [Managing Services and Rating Groups](#).
- Create custom vendors, which are used to support new vendors in a RADIUS Change of Authorization (CoA) message. This task is described in [Managing Custom Vendors](#).
- Create custom vendor-specific attributes (VSAs), which are used to encapsulate data specific to a non-standard vendor device. This task is described in [Managing Custom VSAs](#).
- Create RADIUS Change of Authorization (CoA) templates, which are used by MPE devices to respond to RADIUS CoA messages. This task is described in [Managing RADIUS CoA Templates](#).
- Create subscriber keys, which are used to identify subscribers based on information received in RADIUS messages. This task is described in [Managing Subscriber Keys](#).
- Create traffic profiles, which define default settings for protocol messages. This task is described in [Managing Traffic Profiles](#).

Cable Mode Objects

The manageable objects for Cable mode of the CMP system are:

- Create application profiles, which specify protocol information to associate each request with an application. This task is described in [Managing Application Profiles](#).
- Create media profiles, which describe audio and video CODECs supported for Rx-to-PCMM translation in a cable network. This task is described in [Managing Media Profiles](#).
- Create service classes, which correspond to Data-Over-Cable Service Interface Specification (DOCSIS) traffic descriptions defined in cable modem termination systems (CMTSs) in a cable network. This task is described in [Managing Service Classes](#).
- Create custom vendors, which are used to support new vendors in a RADIUS Change of Authorization (CoA) message. This task is described in [Managing Custom Vendors](#).
- Create custom vendor-specific attributes (VSAs), which are used to encapsulate data specific to a non-standard vendor device. This task is described in [Managing Custom VSAs](#).
- Create subscriber keys, which are used to identify subscribers based on information received in RADIUS messages. This task is described in [Managing Subscriber Keys](#).
- Create traffic profiles, which define default settings for protocol messages. This task is described in [Managing Traffic Profiles](#).

Wireline Mode Object

The manageable object for Wireline mode of the CMP system is:

- Create application profiles, which specify protocol information to associate each request with an application. This task is described in [Managing Application Profiles](#).

Chapter 2

Managing Application Profiles

Topics:

- [*About Application Profiles.....104*](#)
- [*Creating an Application Profile.....104*](#)
- [*Modifying an Application Profile.....105*](#)
- [*Deleting an Application Profile.....105*](#)

This chapter describes how to create and manage application profiles within the CMP system.

An application is a service provided to network subscribers for which you want to manage Quality of Service (QoS).

About Application Profiles

An application is a service provided to users of your network for which you want to manage quality of service (QoS). Examples include voice over IP (VoIP) telephony, video on demand (VoD), and gaming. After you have defined an application profile in the CMP database, you can associate it with the MPE devices that will manage that application.

When you offer application services in your network, there are typically many servers in your network that provide that service. These servers are referred to as Application Managers or Application Servers. When these servers are establishing a session that requires quality of service they issue a request to a policy charging and rules function (PCRF). The MPE device provides PCRF for the CMP server.

When defining an application profile in the CMP database, you specify protocol information that is used by MPE devices to identify Application Managers and thus associate each request with its associated application. This lets the MPE device apply policy rules to the request that you have defined for the associated application.

Creating an Application Profile

To create an application profile:

1. From the **Policy Server** section of the navigation pane, select **Applications**.
The content tree displays the **Applications** group.
2. Select the **Applications** group.
The **Application Administration** page opens in the work area.
3. Click **Create Application**.
The **New Application** page opens.
4. Enter the following application profile information:
 - a) **General Configuration:**
 - **Name** — Name assigned to the application. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 250 characters.
 - **Description/Location** (optional) — Free-form text.
 - **Connection IP Addresss** — Enter the IP addresses, in IPv4 or IPv6 format, that are used by Application Managers for this application. To include an address in the connection list, type it and click **Add**; to remove an address from the list, select it and click **Delete**.
 - **Latency Sensitive** — Select this option if the application is latency sensitive.
 - b) **Policy Servers associated with this Application:** select a policy server (MPE device) to associate with this network element.
 - c) **PCMM:**
 - **Application Manager IDs** — Enter the PCMM AMIDs that are used by Application Managers for this application. Click **Add** to define multiple values. To delete an existing value, select it from the list and click **Delete**.

- **Session Class IDs** — Enter the Session Class IDs that are used by each Application Manager for this application. Click **Add** to define multiple values. To delete an existing value, select it from the list and click **Delete**.

d) **Diameter:**

- **Diameter Identity** — Enter the Diameter identity (typically an FQDN) or identities used by application functions for this application. Click **Add** to define multiple values. To delete an existing value, select it from the list and click **Delete**.
- **AF Application ID** — Enter the ID for any application functions associated with the application, (for example, **af-application-id1**).
- **APN Match Lists** — Click **Manage...** to open the **Select Match Lists for APNs**. Select one or more APNs from the **Available** field and move them to the **Selected** field by clicking **-->** (right arrow). To move selected APNs to the available field, click **<--** (left arrow).

5. Click **Save**.

The application profile is created. The profile is stored in the **Applications** group and is available for use in a policy.

Modifying an Application Profile

To modify an application profile:

1. From the **Policy Server** section of the navigation pane, select **Applications**.
The content tree displays the **Applications** group.
2. Select the **Applications** group.
The **Application Administration** page opens in the work area, listing the application profiles.
3. Select the application profile.
The profile is displayed.
4. Click **Modify**.
The **Modify Application** page opens.
5. Modify the application profile information.
See [Creating an Application Profile](#) for a description of the fields on this page.
6. Click **Save**.

The application profile is modified.

Deleting an Application Profile

To delete an application profile:

1. From the **Policy Server** section of the navigation pane, select **Applications**.
The content tree displays the **Applications** group.
2. Select the **Applications** group.
The **Application Administration** page opens in the work area.

3. Delete the application profile using one of the following methods:
 - From the work area, click the  (trash can icon), located to the right of the profile.
 - From the content tree, select the application and click **Delete**. A confirmation message displays.
4. Click **OK**.

The application profile is deleted from the CMP database and all MPE devices.

Chapter 3

Managing Custom AVPs

Topics:

- [*About Custom AVPs.....108*](#)
- [*Creating an AVP.....109*](#)
- [*Modifying an AVP.....112*](#)
- [*Deleting an AVP113*](#)

This chapter describes how to create, modify, and delete custom third-party attribute-value pairs (AVPs) in the CMP system.

In a wireless network, custom AVPs are used to encapsulate protocol-specific data for routing, authentication, authorization, and accounting information.

About Custom AVPs

An attribute-value pair (AVP) is used to encapsulate protocol-specific information with usage monitoring supported by the MPE device. Diameter messages such as RAA, CCA, CCR, and RAR are supported by third-party AVP policy conditions. The supported outgoing Diameter messages set or remove third-party AVPs.

Note: The Diameter messages listed are examples only. There are many messages associated with Diameter.

You can create policy conditions to evaluate the presence of both standard (base) and third-party AVPs in Diameter messages or group AVPs during policy execution. A policy condition can check for the presence of both standard and third-party AVPs in incoming Diameter messages and evaluate their values. A policy action can use standard and third-party AVPs for routing, authentication, authorization, and accounting.

Standard AVPs can be included in third-party AVP conditions and actions. To include a standard (base) AVP in a nonstandard application message, or to use a pre-standard AVP as a standard AVP, define it as a custom AVP.

When defined, custom AVPs are located at the end of a parent Diameter message or group AVP. If the parent AVP is null, the custom AVP is inserted at the root level of the message. For example, a custom AVP definition appears at the end of this Charging-Rule-Install message:

```
Charging-Rule-Install ::= < AVP Header: 1001 >
*[ Charging-Rule-Definition ]
*[ Charging-Rule-Name ]
*[ Charging-Rule-Base-Name ]
[ Bearer-Identifier ]
[ Rule-Activation-Time ]
[ Rule-Deactivation-Time ]
[ Resource-Allocation-Notification ]
[ Charging-Correlation-Indicator ]
*[ customAVP ]
```

A Set or Get SPR user attribute value can be set to the defined third-party AVP in Diameter messages. You can also set or remove defined third-party AVPs during the execution point.

A third-party AVP is identified by a unique identifier in the following format:

```
name:vendorId
```

For example:

Condition	where the request <i>AVP NEW_AVP3:555</i> value is numerically <i>equal to 2012</i>
Parameters	The AVP name and vendor ID. In the example, the vendor ID is 555.
Description	A well-defined AVP custom name is referred to if the vendor ID is not specified.

When entering and sending a new third-party AVP definition to an MPE or MRA device, the definition must include the AVP name, code, vendor ID, data type, and an optional AVP flag.

Validation of the AVP code, Name, and vendor ID prohibits a user from overwriting the existing base AVPs.

These AVP actions include the ability to perform the following:

- Routing
- Authentication
- Authorization
- Accounting

Creating an AVP

To create an AVP:

1. From the **Policy Server** section of the navigation pane, select **Custom AVP Definitions**.
The content tree displays the **Custom AVP Definitions** group.
2. Select the **Custom AVP Definitions** group.
The **AVP Definition Administration** page opens in the work area.
3. Click **Create AVP Definition**.
The **New AVP Definition** page opens.
4. Enter information as appropriate:
 - a) **AVP Name** (required) — The name you assign to the AVP.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description** — Free-form text that identifies the AVP.
Enter up to 250 characters.
 - c) **AVP Code** (required) — A unique numeric value assigned to the new AVP.
 - d) **Vendor Id** — Select a vendor from the vendor list.
To add a vendor to the list, see [Managing Custom Vendors](#).
 - e) **Protect Flag** (optional) — When checked, specifies the protected AVP values.
 - f) **May Encrypt Flag** — The AVP is encrypted if the checkbox is specified.
 - g) **Vendor Specific Flag** — The AVP is vendor specific if the checkbox is specified.
Note: This box is checked automatically if the value of the vendor ID is not 0.
 - h) **AVP Type** (required) — Select the data type from the list:
 - address
 - enumerated
 - float32
 - float64
 - grouped
 - id
 - int32
 - int64
 - ipFilterRule
 - octetString

- time
 - uint32
 - uint64
 - uri
 - utf8String
- i) **Parent AVP** — If the AVP is a member of a grouped AVP, then the parent AVP must be specified. Select one of the following from the list:
- ADC-Rule-Definition:10415
 - ADC-Rule-Install:10415
 - ADC-Rule-Remove:10415
 - ADC-Rule-Report:10415

5. Click **Save**.
 6. If the AVP name matches the name of a standard AVP, a confirmation message displays. Click **OK** to overwrite the existing AVP.

The AVP is created.

Figure 16: Sample AVP Definition shows an example of a base AVP definition defined as a custom AVP for use in a non-standard application message.

The screenshot shows the 'AVP Definition Administration' window. The 'New AVP Definition' section is active. The 'Configuration' fields are as follows:

- AVP Name:** Charging-Characteristics-3GPP
- Description:** (Empty text area)
- AVP Code:** 13
- Vendor Id:** 3GPP (dropdown menu)
- Mandatory Flag:** ☐
- Protect Flag:** ☐
- May Encrypt Flag:** ☒
- Vendor Specific Flag:** ☒
- AVP Type:** utf8String (dropdown menu)
- Parent AVP:** QoS-Information-3GPP2:5535 (dropdown menu)

At the bottom left, there are 'Save' and 'Cancel' buttons.

Figure 16: Sample AVP Definition

Modifying an AVP

To modify an AVP:

1. From the **Policy Server** section of the navigation pane, select **Custom AVP Definitions**.
The **AVP Definition Administration** page opens in the work area, listing the defined AVPs.
2. Select the AVP to modify.
The **AVP Definition Administration** page opens, displaying information about the AVP.
3. Click **Modify**.
The **Modify AVP Definition** page opens.
4. Modify AVP information as required.
For a description of the fields contained on this page, see *Creating an AVP*.
5. Click **Save**.

The AVP is modified.

Deleting an AVP

To delete an AVP:

1. From the **Policy Server** section of the navigation pane, select **Custom AVP Definitions**.
The **AVP Definition Administration** page opens in the work area, listing the defined AVPs.
2. Delete the AVP using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the AVP.
 - From the content tree, select the AVP and click **Delete**.

A confirmation message displays.

3. Click **OK**.

The AVP is deleted.

Chapter 4

Managing Custom Vendors

Topics:

- *About Custom Vendors.....115*
- *Creating a Custom Vendor.....115*
- *Modifying a Custom Vendor.....115*
- *Deleting a Custom Vendor.....116*

This chapter describes how to create, modify, and delete custom vendor definitions in the CMP system.

Custom vendors are used in RADIUS Change of Authorization (CoA) messages.

About Custom Vendors

A custom vendor is used to define a vendor not stored in a RADIUS dictionary that is part of the CMP database. This dictionary includes vendor IDs and text descriptions, and includes standard vendor-specific attributes (VSAs). You can define custom vendors, define VSAs for them, and add them to the dictionary.

Custom VSAs are typically used in a RADIUS Change of Authorization (CoA) message. You can create policy conditions to evaluate the presence of VSAs in RADIUS messages, and to include custom VSAs in RADIUS response messages.

For information on how to create a VSA, see [Managing Custom VSAs](#). For information on how to use a VSA in a RADIUS CoA message, see [Managing RADIUS CoA Templates](#).

Creating a Custom Vendor

To create a custom vendor:

1. From the **Policy Server** section of the navigation pane, select **Custom Vendors**.
The content tree displays the Custom Vendors group.
2. Select the **Custom Vendors** group.
The **Custom Vendor Administration** page opens in the work area.
3. Click **Create Custom Vendor**.
The **Create Custom Vendor** page opens.
4. Enter information as appropriate:
 - a) **Name** (required) — The name you assign to the vendor.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
 - b) **Description** — Free-form text that identifies the vendor.
Enter up to 250 characters.
 - c) **Vendor Id** — Enter the vendor ID.
Enter a positive integer.
5. Click **Save**.

The custom vendor is defined in the RADIUS dictionary and can now be assigned a vendor-specific attribute (VSA) and used in a policy. See [Managing Custom VSAs](#) for more information about VSAs.

Modifying a Custom Vendor

To modify a custom vendor definition:

1. From the **Policy Server** section of the navigation pane, select **Custom Vendors**.

The **Custom Vendor Administration** page opens in the work area, listing the defined custom vendors.

2. Select the custom vendor definition you want to modify.
The **Custom Vendor Administration** page displays information about the vendor.
3. Click **Modify**.
The **Modify Custom Vendor** page opens.
4. Modify vendor information.
For a description of the fields contained on this page, see [Creating a Custom Vendor](#).
5. Click **Save**.

The custom vendor definition is modified.

Deleting a Custom Vendor

You cannot delete a custom vendor definition that is used in a CoA template.

To delete a custom vendor definition:

1. From the **Policy Server** section of the navigation pane, select **Custom Vendors**.
The **Custom Vendor Administration** page opens in the work area, listing the defined custom vendors.
2. Delete the custom vendor using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the vendor.
 - From the content tree, select the vendor and click **Delete**.

A confirmation message displays.

3. Click **OK**.
The vendor is removed from the list.

The custom vendor definition is deleted.

Chapter 5

Managing Custom VSAs

Topics:

- [*About Custom VSAs.....118*](#)
- [*Creating a Custom VSA.....118*](#)
- [*Modifying a Custom VSA.....119*](#)
- [*Deleting a Custom VSA.....120*](#)

This chapter describes how to create, modify, and delete custom vendor-specific attributes (VSAs) in the CMP system.

In a wireless network, custom VSAs are used to carry vendor-specific data.

Note: Managing custom VSAs is a function that is applicable to RADIUS CoA mode only.

About Custom VSAs

A vendor-specific attribute (VSA) is used to encapsulate data specific to a vendor device. A VSA consists of a vendor ID and the attribute value. VSAs are stored in a RADIUS dictionary that is part of the CMP database. The dictionary includes a text description of the VSA and type information, and includes standard VSAs. You can define VSAs and add them to the dictionary.

Custom VSAs are typically used in a RADIUS Change of Authorization (CoA) message. You can create policy conditions to evaluate the presence of VSAs in RADIUS messages, and to include custom VSAs in RADIUS response messages.

For information on how to assign values to VSAs, and then send them in a RADIUS CoA message, see [Managing RADIUS CoA Templates](#).

Note: Custom VSAs is a function that is applicable to RADIUS CoA mode only.

Creating a Custom VSA

Note: Custom VSAs is a function that is applicable to RADIUS CoA mode only.

To create a custom VSA:

1. From the **Policy Server** section of the navigation pane, select **Custom VSA Definitions**.
The content tree displays the **Custom VSA Definitions** group.
2. Select the **Custom VSA Definitions** group.
The **VSA Definition Administration** page opens in the work area.
3. Click **Create VSA Definition**.
The **New VSA Definition** page opens.
4. Enter information as appropriate:
 - a) **Name** (required) — The name you assign to the VSA.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
 - b) **Description** — Free-form text that identifies the VSA.
Enter up to 250 characters.
 - c) **VSA Code** (required) — Enter an integer representing the VSA. The default is 0.
 - d) **Vendor Id** — Select the available vendor from the pulldown list (the vendor is stored and displayed by a vendor ID):
 - IETF (default)
 - 3GPP
 - 3GPP2
 - Camiant
 - Cisco
 - Cisco-BBSM
 - Cisco-VPN3000
 - Cisco-VPN5000

- **Juniper**
 - **Juniper-M-Series**
 - (Any custom vendors appear at the end of the list. For information about custom vendors, see [Managing Custom Vendors](#).)
- e) **VSA Type** (required) — Select the attribute data type from the pulldown list:
- **octets**
 - **ipv6prefix**
 - **text**
 - **ipaddr**
 - **abinary**
 - **integer**
 - **evs**
 - **string**
 - **ifid**
 - **enum**
 - **ipv6addr**
 - **date**
 - **tlv**
- f) **Compound Type** (required) — Select the description of the attribute structure from the pulldown list:
- **Map**
 - **Pair**
 - **Single-Value**
 - **List**
- g) **Field Separator** — If the attribute value has multiple fields, enter the field separator.
- h) **Sub-Field Separator** — If the attribute value has sub-fields, enter the sub-field separator.

5. Click **Save**.

The custom VSA is created. The VSA definition displays on the **VSA Definition Administration** page and is defined in the RADIUS dictionary. The custom VSA can be assigned a value. For more information, see [Managing RADIUS CoA Templates](#).

Modifying a Custom VSA

To modify a custom VSA:

1. From the **Policy Server** section of the navigation pane, select **Custom VSA Definitions**.
The **VSA Definition Administration** page opens in the work area, listing the defined VSAs.
2. Select the VSA to modify.
The **VSA Definition Administration** page displays information about the VSA.
3. Click **Modify**.
The **Modify VSA Definition** page opens.
4. Modify VSA information.

For a description of the fields contained on this page, see [Creating a Custom VSA](#).

5. Click **Save**.

The VSA definition is modified.

Deleting a Custom VSA

You cannot delete a VSA that is used in a CoA template.

To delete a custom VSA:

1. From the **Policy Server** section of the navigation pane, select **Custom VSA Definitions**.
The **VSA Definition Administration** page opens in the work area, listing the defined monitoring keys.
2. Delete the VSA using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the VSA.
 - From the content tree, select the VSA and click **Delete**.

A confirmation message displays.

3. Click **OK**.

The VSA is deleted.

Chapter 6

Managing Match Lists

Topics:

- [*About Match Lists.....122*](#)
- [*Creating a Match List.....122*](#)
- [*Modifying a Match List.....123*](#)
- [*Deleting a Match List.....123*](#)

This chapter describes how to create and manage match lists in the CMP system.

In a wireless network, a match list is a set of defined values that can represent, for example, IDs or Internet addresses. Match lists provide whitelist and blacklist functions in policy rules. Match lists support wildcard matching.

About Match Lists

A match list is a set of values in various categories, including access point names (APNs), subscriber IMSIs, location area codes (LACs), service area codes (SACs), Internet addresses, and user equipment identities. A match list can function as a whitelist (listing items to be included) or a blacklist (listing items to be excluded). By using a match list, you can, for example, apply a policy to all subscribers in a set of LACs, or block access to a list of Internet addresses known to be high risk.

Match lists support wildcards. Using wildcards, a range of values can be specified compactly.

Creating a Match List

To create a match list:

1. From the **Policy Server** section of the navigation pane, select **Match Lists**.
The content tree displays the **Match Lists** group.
2. Select the **Match Lists** group.
The **Match List Administration** page opens in the work area.
3. Click **Create Match List**.
The **New Match List** page opens.
4. Enter the following information:
 - a) **Name** — The name assigned to the match list.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 40 characters.
 - b) **Description/Location** — Free-form text.
 - c) **Type** — Select from the following:
 - **string** (default) — The list consists of strings.
 - **wildcard string** — The list consists of wildcard match patterns that use an asterisk (*) to match zero or more characters or a question mark (?) to match exactly one character.
 - **IPV4 address** — The list consists of IP addresses in IPv4 format.
 - **IPV6 address** — The list consists of IP addresses in IPv6 format.
 - **MCC-MNC** — The list consists of Mobile Country Code-Mobile Network Code pairs.
 - **Location Info** — The list consists of locations (formatted as string, wildcard string, or numeric range) and time periods selected from the time periods list. Time period is optional and the default value is none. For information about creating and managing time periods, see [Managing Policy Time Periods](#).
 - d) **Items** — Type an entry and click **Add**; to remove one or more entries from the list, select them and click **Delete**.
The following match types are available:
 - **APN** (access point name)
 - **User Equipment Identity**
 - **USER IMSI**

- **USER E.164**
- **USER SIP URI**
- **USER NAI**
- **Serving MCC-MNC**
- **Cell Identifier**
- **Location Area Code**
- **Service Area Code**
- **Routing Area Code**
- **Routing Area Identifier**
- **Tracking Area Code**
- **E-UTRAN Cell Identifier**

You can enter a match string combining multiple types (for example, a Location Area Code and a Service Area Code) by separating the types with commas (,); for example, **lac1,sac1**. If you define multiple-type match lists, the types must be in the order shown.

5. Click **Save**.

The match list is defined in the CMP database and can now be used in a policy.

Modifying a Match List

To modify a match list:

1. From the navigation pane, select **Match Lists**.
The content tree displays the **Match Lists** group.
2. From the content tree, select the **Match Lists** group.
The **Match List Administration** page opens, displaying the list of defined match lists.
3. Select the match list you want to modify.
Match list information is displayed.
4. Click **Modify**.
The **Modify Match List** page opens.
5. Modify match list information as required.
You cannot change the type.
6. Click **Save**.

The match list is modified.

Note: You can also use the OSSI XML Interface to import and export match lists. This facilitates bulk changes or record keeping. For more information, see the *OSSI XML Interface Definitions Reference Guide*.

Deleting a Match List

To delete a match list:

1. From the **Policy Server** section of the navigation pane, select **Match Lists**.

The content tree displays the **Match Lists** group.

2. From the content tree, select the **Match Lists** group.
The **Match List Administration** page opens, displaying the list of defined match lists.
3. Delete the match list using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the match list.
 - From the content tree, select the match list and click **Delete**.

A confirmation message displays.

4. Click **OK**.

The match list is deleted.

Chapter 7

Managing Media Profiles

Topics:

- [*About Media Profiles.....126*](#)
- [*Creating a Media Profile.....128*](#)
- [*Modifying a Media Profile.....129*](#)
- [*Deleting a Media Profile.....129*](#)

This chapter defines how to manage media profiles in the CMP system.

In a cable network, a media profile describes a CODEC supported for Rx-to-PCMM translation.

Note: Media Profiles is a function that is applicable to Cable mode only.

About Media Profiles

Note: Media Profiles is a function that is applicable to Cable mode only.

A media profile describes a CODEC supported for Rx-to-PCMM translation. The MPE device includes a predefined set of media profiles, and you can create new RTP (real-time transport protocol) profiles. After you have defined a media profile in the CMP system, it is automatically deployed to MPE devices.

Media profiles are named *codec_name-transport_type-sample_rate*. Media profiles are mapped to CODECs based on the information received in a session description protocol (SDP) message.

In defining a media profile in the CMP system, you specify its name, transport type, sample rate, frame size (in both milliseconds and bytes), and packetization time.

Note: You cannot create media profiles for the UDPTL or UDP transport types.

[Predefined Media Profiles](#) describes the predefined media profiles.

Predefined Media Profiles

The CMP installs a set of Media Profiles. The following tables lists the Predefined media files available.

Table 7: Predefined Media Profiles

CODEC Name	AVT Profile	Frame Length (ms)	Frame Size (bytes)	Bit Rate (kbps)	Sample Rate (kHz)
PCMU	0	0.125	1	64	8
G721	2	0.125	1	64	8
GSM	3	20	33	13.2	8
G723	4	30	24	5.3, 6.3	8
PCMA	8	0.125	1	64	8
G722	9	0.125	1	64	8
G722-48	dynamic	1	6	48	8
G722-56	dynamic	1	7	56	8
G722-64	dynamic	1	8	64	8
G728	15	2.5	5	16	8
G729	18	10	10	8	8
G726-16	dynamic	0.5	1	16	8
G726-24	dynamic	1	3	24	8
G726-32	dynamic	0.25	1	32	8
G726-40	dynamic	1	5	40	8

CODEC Name	AVT Profile	Frame Length (ms)	Frame Size (bytes)	Bit Rate (kbps)	Sample Rate (kHz)
G729D	dynamic	10	8	6.4	8
G729E	dynamic	10	15	11.8	8
GSM-EFR	dynamic	20	31	12.2	8
iLBC	dynamic	20	38	13.33	8

amr-wb/16000	dynamic	20	61		16

Creating a Media Profile

Note: Media Profiles is a function that is applicable to Cable mode only.

To create a media profile:

1. From the **Policy Server** section of the navigation pane, select **Media Profiles**.
The content tree displays the **Media Profiles** group.
2. Select the **Media Profiles** group.
The **Media Profile Administration** page opens in the work area, listing available media profiles.
3. Click **Create Media Profile**.
The **New Media Profile** page opens.
4. Enter the following information:
 - a) **Codec Name** — Unique media subtype assigned to the media profile.
This is defined in the IANA MIME registration for the CODEC. Enter a string of up to 255 characters.
 - b) **Transport Type** — Select from the following:
 - **RTP/AVP** (default) — RTP audio-video profile.
 - **RTP/SAVP** — RTP secure audio-video profile.
 - **RTP/AVPF** — RTP extended audio-video profile with feedback.
 - c) **Payload Number** — The payload number.
Valid payload numbers range from 0 through 127. Enter -1 to indicate an unknown payload number.

Note: You cannot add a CODEC that is predefined with a payload number in the range of 0 to 96.
 - d) **Sample Rate (kHz)** — The sampling rate of the CODEC in KHz.
The valid range is an integer from 1 through 100 KHz.
 - e) **Frame Size in Milliseconds** — The size of one audio frame in milliseconds.
This is the length of time represented by one audio frame. A single RTP packet may contain multiple audio frames. The bitrate is calculated using the frame size in milliseconds, the frame size in bytes, and the packetization time. The valid range is 0 through 100 ms.
 - f) **Frame Size in Bytes** — The size of one audio frame size in bytes.
This is the size represented by one audio frame. A single RTP packet may contain multiple audio frames. The bitrate is calculated using the frame size in milliseconds, the frame size in bytes, and the packetization time. The valid range is 1 through 1,500 bytes.
 - g) **Packetization Time** — The length of time, in milliseconds, represented by the media in a packet.

The bitrate is calculated using the frame size in milliseconds, the frame size in bytes, and the packetization time. The valid range is 1 through 100.

- h) **Always Use Default Ptime** — Select to always use the default packetization time, ignoring the value received in the SDP message.

The default is unchecked.

5. Click **Save**.

The media profile is created.

Modifying a Media Profile

To modify a media profile:

1. From the **Policy Server** section of the navigation pane, select **Media Profiles**.
The content tree opens.
2. From the content tree, select the **Media Profiles** group.
The **Media Profile Administration** page opens, displaying the list of defined media profiles.
3. Select the media profile you want to modify.
The profile information for the media displays.
4. Click **Modify**.
The **Modify Media Profile** page opens.
5. Modify media profile information.
For a description of the fields contained on this page, see [Creating a Media Profile](#).
6. Click **Save**.

The media profile is modified.

Deleting a Media Profile

To delete a media profile:

1. From the **Policy Server** section of the navigation pane, select **Media Profiles**.
The content tree opens.
2. From the content tree, select the **Media Profiles** group.
The **Media Profile Administration** page opens, displaying the list of defined media profiles.
3. Delete the media profile using one of the following methods:
 - From the work area, click  (trash can icon) located to the right of the media profile.
 - From the content tree, select the media profile and click **Delete**.

A confirmation message displays.

4. Click **OK**.

The media profile is deleted.

Managing Monitoring Keys

Topics:

- [*About Monitoring Keys.....131*](#)
- [*Creating a Monitoring Key.....131*](#)
- [*Modifying a Monitoring Key.....132*](#)
- [*Deleting a Monitoring Key.....132*](#)

This chapter describes how to create and manage monitoring keys in the CMP system.

In a wireless network, a monitoring key associates quota profiles with policy and charging control (PCC) and application detection control (ADC) rules for usage tracking.

Note: The actual options you see depend on whether or not your CMP system is configured in wireless Gx mode, wireless Gy mode, or both.

About Monitoring Keys

A monitoring key is a unique string that identifies the quota profile to be used by a policy and charging control (PCC) rule and application detection control (ADC) rule for usage tracking. The monitoring key is associated with the quota profile by selecting a policy action that grants usage to a selected number of quota profiles. You configure monitoring keys through the CMP system.

The PCC Rule Profile is used to populate the Charging Rule Definition attribute-value pair (AVP) and the ADC Rule definition AVP values in a Diameter message when a new rule is installed. Therefore, the monitoring key to be defined in the PCC Rule Profile is specified in the Monitoring Key AVP, which is contained in the Charging Rule Definition or ADC Rule Definition AVP for that particular rule. The monitoring key is supported for Sd messages, and is compatible with both Release 9 and previous releases. When reporting usage to the MPE device, the monitoring key associated with the PCC/ADC Rule is included in a Usage Monitoring AVP, along with the usage accumulated. The usage accumulated is reported for the total volume, uplink volume, or downlink volume.

At the session level, the monitoring key is optional, but is set by the selection of the policy action. These policy actions include the ability to:

- Disable or re-enable usage tracking for specified monitoring keys
- Request a usage report from the PCEF for specified monitoring keys
- Monitor multiple PCC/ADC rules against the same quota
- Monitor usage for a PCC/ADC rule or session level against multiple quotas such as monthly and daily quotas

Note: The granted usage sent to the PCEF/TDF will always be the smallest remaining amount of the quotas, and the re-validation time will always be calculated based on the shortest or closest time in the future for the quotas.

- Change a monitoring key for a rule or session level during the middle of a session upon receiving a Credit Control Request (CCR) update message

Creating a Monitoring Key

To create a monitoring key, perform the following steps:

1. From the **Policy Server** section of the navigation pane, select **Monitoring Key**.
The content tree displays the Monitoring Key group.
2. Select the **Monitoring Key** group.
The **Monitoring Key Administration** page opens in the work area.
3. Click **Create Monitoring Key**.
The **New Monitoring Key** page opens.
4. Enter information for the monitoring key:
 - a) **Name** (required) — The name you assign to the monitoring key.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description** — Free-form text that identifies the monitoring key.

Enter up to 250 characters.

- c) **Type** (required) — The level assigned to the monitoring key.
Select **PCC_RULE_LEVEL** value (1), **ADC_RULE_LEVEL** value (2), or **SESSION_LEVEL** from the list.
- d) **Key** — Specifies unique string from all other monitoring keys.
The key can be up to 255 characters long and must not contain backslashes (\), quotation marks ("), semicolons (;), commas (,), or apostrophes (').

5. Click **Save**.

The monitoring key displays on the **Monitoring Key Administration** page. After you define monitoring keys, you can:

- Select them from the PCC Rule Profile when configuring quota profiles
- Use them in policy actions in the Policy Wizard

Modifying a Monitoring Key

To modify a monitoring key:

1. From the **Policy Server** section of the navigation pane, select **Monitoring Key**.
The **Monitoring Key Administration** page opens in the work area, listing the defined monitoring keys.
2. Select the monitoring key you want to modify.
The **Monitoring Key Administration** page displays information about the monitoring key.
3. Click **Modify**.
The **Modify Monitoring Key** page opens.
4. Modify the monitoring key.
For a description of the fields contained on this page, see [Creating a Monitoring Key](#).
5. Click **Save**.

The monitoring key definition is modified.

Deleting a Monitoring Key

To delete a monitoring key:

1. From the **Policy Server** section of the navigation pane, select **Monitoring Key**.
The **Monitoring Key Administration** page opens in the work area, listing the defined monitoring keys.
2. Delete the monitoring key using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the monitoring key.
 - From the content tree, select the monitoring key and click **Delete**.

A confirmation message displays.

3. Click **OK**.

The monitoring key is deleted.

Chapter 9

Managing Notification Servers

Topics:

- *About Notification Servers.....135*
- *Creating a Notification Server.....135*
- *Enabling Notification on an MPE device.....136*
- *Viewing a Notification Server.....136*
- *Modifying a Notification Server.....137*
- *Associating a Notification Server with an MPE device.....137*
- *Associating a Notification Server with a Configuration Template.....138*
- *Removing the Notification Server Association with an MPE device.....138*
- *Deleting a Notification Server.....139*

This chapter describes how to create and manage notification servers in the CMP system.

In a wireless network, a notification server controls event notifications driven by policy actions.

About Notification Servers

A notification server processes event notifications in response to policy actions for HTTP request messages. You configure notification servers through the CMP system with SMPP/XML mode enabled.

A notification server can be associated with one or more MPE devices.

At the session level, the notification server is optional, but is set by the selection of the policy action. These policy actions include the ability to:

- Send notifications using a dynamic URL
- Send notifications using a static URL

The audit log records all notification server actions (create, modify, and delete), policy creation and modification, and associations (policy server and configuration template).

Creating a Notification Server

To create a notification server, the CMP system must have the SMPP/XML mode enabled.

To create a notification server:

1. From the **Policy Server** section of the navigation pane, select **Notification Servers**.
The content tree displays the **Notification Servers** group.
2. Select the **Notification Servers** group.
The **Notification Server Administration** page opens in the work area.
3. Click **Create Notification Server**.
The **New Notification Server** page opens.
4. Enter the **Name** (required) for the notification server.
When you configure policies using notification servers, you will use this name. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 40 characters.
5. Enter a **Description / Location** (optional).
The description is free-form text containing up to 255 characters.
6. Enter the **Destination URL** (required).
Use the FQDN or the IP address in either IPv4 or IPv6 format (for example, *http://10.15.20.190:80*). This parameter can contain up to 255 characters and must be unique. The SMSR creates a persistent connection to this end point.
7. Enter the **Connection Pool [1-5]**.
Identifies the number of persistent connections to this end point (default is 1).
8. **Keep Alive Interval (seconds)**.
Indicates the number of seconds to keep the persistent connection active. The valid range is 0 to 300 seconds. The default is 30.
9. In the **Policy Servers associated with this Notification Server** section, do one of the following:

- Select **ALL** to associate the notification server with all MPE devices.
- Select individual MPE devices.
- Do not select any MPE devices.

10. Click **Save**.

The notification server is created.

After you create a notification server, you can associate it with MPE devices and use it in policy actions in the policy wizard.

Enabling Notification on an MPE device

To enable notification on an MPE device:

1. From the **Policy Server** section of the navigation pane, select **Configuration**.
The content tree displays the **Policy Servers** group.
2. Select the policy server for notification.
The **Policy Server Administration** page opens in the work area.
3. Click **Modify**.
The **Modify Policy Server** page appears.
4. In the **Generic Notification Configuration** section, select **Notification Enabled**.
5. Click **Save**.
The updated **Policy Server** page appears.

The CMP system updates the policy server's configuration to enable notification.

Viewing a Notification Server

To view a notification server:

1. From the **Policy Server** section of the navigation pane, select **Notification Servers**.
The content tree displays the **Notification Servers** group.
2. Select the **Notification Servers** group.
The **Notification Server Administration** page opens in the work area and lists all the notification servers.
3. Select the notification server you want to view.
The **Notification Server** page appears showing the current configuration for the selected server.
4. From this page:
 - Click **Modify** to change the server configuration.
 - Click **Delete** to remove the server from the system.

Modifying a Notification Server

To modify a notification server:

1. From the **Policy Server** section of the navigation pane, select **Notification Servers**.
The content tree displays the **Notification Servers** group.
2. Select the **Notification Servers** group.
The **Notification Server Administration** page opens in the work area and lists all the notification servers.
3. Select the notification server you want to change.
The **Notification Server** page appears showing the current configuration for the selected server.
4. Click **Modify**.
The **Modify Notification Server** page appears.
5. Edit the configuration settings as needed.

Note: If you modify the notification server name and the server is associated with a policy, then the policy is redeployed with the modified name and the following message is displayed: This notification server name has changed. The following policies have been re-deployed: *Policy Name(s)*

The changed notification server configuration is sent to the associated policy servers.

6. Click **Save**.
The updated **Notification Server** page appears.

The notification server configuration is updated and the any associated policies are redeployed.

Associating a Notification Server with an MPE device

To associate a notification server with an MPE device:

1. From the **Policy Server** section of the navigation pane, select **Configuration**.
The content tree displays the **Policy Servers** group.
2. From the listing of policy servers, select the specific MPE device.
The **Policy Server Administration** page appears.
3. Select the **Policy Server** tab.
The **Policy Server** page for the selected device appears.
4. Click **Modify**.
The **Policy Server** page becomes editable.
5. In the section for **Notification Servers**, click **Manage**.
A window displays listing the **Available** notification servers and the **Selected** servers.
6. From the **Available** servers list, select the notification server with which to associate the MPE device.
7. Click --> (right arrow icon).
The selected notification server is added to the **Selected** listing.
8. Click **OK**.

9. Click **Save**.

The association of the MPE device with the notification server is created. If you remove a notification server, the association disappears from the **Notification Servers** listing.

Associating a Notification Server with a Configuration Template

To associate a notification server with a configuration template:

1. From the **Policy Server** section of the navigation pane, select **Configuration Template**.
The content tree displays the **Templates** group.
2. From the listing of templates, select the specific **Configuration Template**.
The **Configuration Template Administration** page appears.
3. Select the **Policy Server** tab.
The **Policy Server** page for the selected template appears.
4. Click **Modify**.
The **Modify Policy Server** page becomes editable.
5. In the section for **Notification Servers**, click **Manage**.
A window appears listing the **Available** notification servers and the **Selected** servers.
6. From the **Available** servers list, select the notification server with which to associate the .
7. Click **-->** (right arrow icon).
The selected notification server is added to the **Selected** listing.
8. Click **OK**.
9. Click **Save**.

The association of the configuration template with the notification server is created. If you remove a notification server, the association disappears from the **Notification Servers** listing.

Removing the Notification Server Association with an MPE device

To remove an association of a notification server with an MPE device:

1. From the **Policy Server** section of the navigation pane, select **Configuration**.
The content tree displays the **Policy Servers** group.
2. From the listing of policy servers, select the specific MPE device.
3. Select the **Policy Server** tab.
The **Policy Server** page for the selected device appears.
4. Click **Modify**.
The **Policy Server** page becomes editable.
5. In the section for **Notification Servers**, click **Manage**.
A list displays the **Available** notification servers and the **Selected** servers.
6. In the **Selected** servers list, select the notification server to remove.
7. Click **<--** (left arrow icon).

The selected notification server is removed from the **Selected** listing and appears in the **Available** listing.

8. Click **OK**.
9. Click **Save**.

The association of the MPE device with the notification server is removed. If you specified a new notification server, the new association appears in the **Notification Servers** listing.

Deleting a Notification Server

Note: You can only delete a notification server that is not associated with any of the following:

- Policy
- Policy table
- Policy server (MPE device)
- Policy server configuration template

See [Removing the Notification Server Association with an MPE device](#) for details on removing an association with an MPE device. See [Modifying a Policy Rule](#) for details on modifying policies.

To delete a notification server:

1. From the **Policy Server** section of the navigation pane, select **Notification Servers**.
The content tree displays the **Notification Servers** group.
2. Select the **Notification Servers** group.
The **Notification Server Administration** page opens in the work area.
3. Delete the server using either of the following methods:
 - From the work area, click the **Delete** icon located to the right of the notification server.
 - From the content pane, select the notification server and click **Delete**.

A message appears asking you to confirm the deletion.
4. Click **OK**.

The notification server is removed from the **Notification Server Administration** page.

Chapter 10

Managing Policy Counter Identifiers

Topics:

- [About Policy Counter IDs.....141](#)
- [Policy Counter ID Groups.....142](#)

This chapter describes how to create and manage policy counter IDs in the CMP system.

In a wireless network, a policy counter ID defines the name, optional description, and default online charging server (OCS) value for which status can be received from the OCS server. Policy counter IDs are used in policies, and grouped together here for ease of management.

About Policy Counter IDs

A policy counter ID defines the name, optional description, and default online charging server (OCS) value for which status can be received from the OCS server. After a policy counter ID is defined, you can use policy counter IDs in policies.

In the Sy reference point, an OCS acts as the server and the MPE device acts as the client. For a subscriber, the MPE device requests status from the OCS for a set of policy counter IDs. If the request is successful, the OCS returns the status information for the subscriber to the MPE device and an Sy session is created for the subscriber. The OCS automatically sets up a subscription for the requested policy counter IDs and then notifies the MPE device of any changes to those values.

The Sy protocol provides for four types of messages between the MPE device and the OCS:

1. For the MPE device to request status for an initial set of policy counter IDs and subscribe for notifications for those policy counter IDs
2. For the MPE device to request an update status and possibly update the policy counter ID subscription
3. For the OCS to notify the MPE device of a status change for a set of policy counter IDs for a subscriber
4. For the MPE device to end the Sy session with the OCS, cancelling all subscriptions associated with that session

You can define policy counter IDs in the CMP database and then refer to them in policies.

Creating a Policy Counter ID

To create a policy counter ID:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays the **Policy Counter ID** group. The default group is **ALL**.
2. Select the **Policy Counter ID** group.
The **Policy Counter ID Administration** page opens in the work area.
3. Click **Create Policy Counter ID**.
The **New Policy Counter ID** page opens.
4. Enter the **Name** (required).
The name assigned to the Policy Counter ID. This is the name you use in policies. The name can be up to 255 characters long and must not contain quotation marks (") or commas (,).
5. Enter the **Identifier** (required).
Free-form text. This is the key between the MPE device and the OCS.
6. Enter a **Description**.
Free-form text.
7. Enter the **Default Status**.
Free-form text. The default status for this policy counter ID.
8. Click **Save**.

The policy counter ID is defined in the CMP database and can be used in a policy.

Modifying a Policy Counter ID

To modify a policy counter ID:

1. From the navigation pane, select **Policy Counter ID**.
The content tree displays the **Policy Counter ID** group.
2. From the content tree, select the **Policy Counter ID** group.
The **Policy Counter ID Administration** page opens, displaying the list of defined Policy Counter IDs.
3. Select the Policy Counter ID you want to modify.
Policy Counter ID information is displayed.
4. Click **Modify**.
The **Policy Counter ID List** page opens.
5. Modify Policy Counter ID information as required.
6. Click **Save**.

The Policy Counter ID is modified.

Note: You can also use the OSSI XML Interface to import and export match lists. This facilitates bulk changes or record keeping. For more information, see the *OSSI XML Interface Definitions Reference Guide*.

Deleting a Policy Counter ID

You cannot delete a policy counter ID that is being used in a deployed policy condition.

To delete a policy counter ID:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays the **Policy Counter ID** group.
2. From the content tree, select the **Policy Counter IDs** group.
The **Policy Counter ID Administration** page opens, displaying the list of defined policy counter IDs.
3. Delete the policy counter ID using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the policy counter ID.
 - From the content tree, select the policy counter ID and click **Delete**.

A confirmation message displays.

4. Click **OK**.

The policy counter ID is deleted.

Policy Counter ID Groups

For organizational purposes, you can aggregate policy counter IDs into groups. After a policy counter ID group is created, it can be populated with individual policy counter IDs. The following subsections describe how to manage policy counter ID groups.

Creating a Policy Counter ID Group

To create a policy counter ID group:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays a list of Policy Counter ID groups; the initial group is **ALL**.
2. From the content tree, select the **ALL** group.
The **Policy Counter ID Administration** page opens in the work area, listing all defined policy counter IDs.
3. Click **Create Group**.
The **Create Group** page opens.
4. Enter the **Name** of the Policy Counter ID group.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 250 characters.
5. (Optional) Enter a **Description** of the Policy Counter ID group.
6. Click **Save**.

The Policy Counter ID group is created.

Adding a Policy Counter ID to a Policy Counter ID Group

To add a policy counter ID to a policy counter ID group:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays a list of policy counter ID groups; the initial group is **ALL**.
2. From the content tree, select the policy counter ID group.
The **Policy Counter ID Administration** page opens in the work area, displaying the contents of the selected policy counter ID group.
3. Click **Add Policy Counter ID**.
The **Add Policy Counter ID** page opens, displaying the policy counter IDs not already part of the group.
4. Select the policy counter ID you to add. Use the Ctrl or Shift keys to select multiple policy counter IDs.
5. Click **Save**.

The policy counter ID is added to the policy counter ID group.

Modifying a Policy Counter ID Group

To modify a policy counter ID group:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays a list of policy counter IDs; the initial group is **ALL**.
2. From the content tree, select the policy counter ID group you want to modify.
The **Policy Counter ID Administration** page opens in the work area.
3. Click **Modify**.
The **Modify Group** page opens.
4. Edit the information.

5. Click **Save**.

The group is modified.

Deleting a Policy Counter ID from a Policy Counter ID Group

Deleting a policy counter ID from a policy counter ID group does not delete the ID. To delete a policy counter ID, see [Deleting a Policy Counter ID](#).

To delete a policy counter ID from a policy counter ID group:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays the list of policy counter ID groups.
2. From the content tree, select the policy counter ID group.
The **Policy Counter ID Administration** page opens in the work area, displaying the contents of the selected policy counter ID group.
3. Click (scissors icon), located to the right of the policy counter ID.
4. Click **Save**.

The policy counter ID is deleted from the group.

Deleting a Policy Counter ID Group

Deleting a policy counter ID group does not delete any policy counter IDs that are associated with the group. Profiles remain in the ALL group. You cannot delete the ALL group.

To delete a policy counter ID group:

1. From the **Policy Server** section of the navigation pane, select **Policy Counter ID**.
The content tree displays the list of policy counter ID groups.
2. From the content tree, select the policy counter ID group.
The **Policy Counter ID Administration** page opens in the work area, displaying the contents of the policy counter ID group.
3. Click **Delete**.
A confirmation message displays.
4. Click **OK** to delete the group.

The policy counter ID group is deleted.

Chapter 11

Managing Policy Time Periods

Topics:

- [*About Policy Time Periods.....146*](#)
- [*Creating a Time Period.....146*](#)
- [*Modifying a Time Period.....148*](#)
- [*Deleting a Time Period.....148*](#)
- [*About Time-of-Day Triggers.....149*](#)

This chapter describes how to create and manage time periods in the CMP system.

In a wireless network, a policy time period is used in policy time-of-day conditions.

Note: Certain functions of policy time periods are not applicable to all releases including the following options:

- Different days of a month
- Specific day and time in a specific year

About Policy Time Periods

You can define a library of time periods to specify in policy time-of-day conditions and associate the time periods with multiple policies. Each time period can have one or more times slots defined. A time slot can be:

- Specific time of day.
- Different days of the week.
- Different days of a month.
- Specific years.
- Specific day and time in a specific year.
- Specific day and time in every year.

For example a single time period can have following time slots defined:

- Every Monday at 2 o'clock
- On the last day of the month
- On every Valentines day
- On May 17, 2016
- The first three days of March, July, and September

Creating a Time Period

Note: Certain functions of policy time periods are not applicable to all releases including the following options:

- Different days of a month
- Specific day and time in a specific year

To create a time period:

1. From the **Policy Server** section of the navigation pane, select **Time Periods**.
The content tree displays the **Time Period Administration** group.
2. From the content tree, select the **Time Period Administration** group.
The **Time Period Administration** page opens in the work area.
3. Click **Create Time Period**.
The **New Time Period** page opens.
4. To configure the general information for the time period, enter the following:
 - a) **Name** (required) — Name of the time period.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
 - b) **Description / Location** — A descriptive phrase.
 - c) **Precedence** (required) — A positive integer.
The lower the number, the higher the precedence. If time periods overlap, the time period with the highest precedence (lowest number) applies.

5. To configure time slots table, use the following table functions:

Note: Certain functions of managing policy time periods are not applicable to all releases including the following options:

- Different days of a month
- Specific day and time in a specific year
- **To add a time slot to the table** — Click **Add**; the **Add Time Slot** window opens. Configure the values as appropriate.

Note: **Start Time** and **End Time** are required. All other values are optional.

1. **Years** — Click **Please Select Years** and select one or more years.
2. **Months of Year** — Select one or more months.
3. **Days of Month** — Click **Please Select Days** and Select one or more days of the month and the direction. To count the days in reverse order (from the last day of the month to the first), select **Reverse**.
4. **Days of Week**—Select one or more week-day.
5. **Start Time**—Select the starting time.
6. **End Time**—Select the ending time.

Note: Time slots cannot overlap. If time slots overlap, a message displays and the slots are not saved. See [Figure 17: Example of Time Slot Overlap](#) for an example of overlapping time slots.

Years	Months	Days	Week-Days	Start Time	End Time
*	Jul,Oct	-1,-2,-3,-4	Mon,Tue,Wed,Thu,Fri	09:40	10:55
2014	*	*	*	10:30	11:45
2014	Feb,Mar	1,2	*	10:30	11:45

Figure 17: Example of Time Slot Overlap

[Table 8: Example of Time Slot Definitions](#) shows how to configure time slots for some example situations.

Table 8: Example of Time Slot Definitions

Time Slot	Year	Month	Day
Every Valentines Day	null	Feb	14
January 10th 2016 only	2016	Jan	10
The first five days in every month for the first half of the year	null	Jan, Feb, Mar, Apr, May, Jun	1, 2, 3, 4, 5
The last five days in every month for the second half of 2015 and 2016	2015, 2016	Jul, Aug, Sep, Oct, Nov, Dec	Select Reverse and 1, 2, 3, 4, 5

- **To clone an attribute in the table** — Select an existing attribute in the table and click **Clone**; the **Clone** window opens with the information for the attribute. Make changes as required.

- **To edit an attribute in the table** — Select the attribute in the table and click **Edit**; the **Edit Response** window opens, displaying the information for the attribute. Make changes as required.
- **To delete an attribute from the table** — Select the attribute in the table and click **Delete**. A confirmation message displays. Click **Delete** to remove the attribute.

6. Click **Save**.

The time period is defined in the CMP database and can be used in a policy time condition.

Modifying a Time Period

To modify a time period:

1. From the **Policy Server** section of the navigation pane, select **Time Periods**.
The content tree displays the **Time Period Administration** group.
2. From the content tree, select the **Time Period Administration** group.
The **Time Period Administration** page opens in the work area.
3. Select a time period.
The **Time Period Administration** page opens.
4. Click **Modify**.
The fields become editable.
5. Modify Time Period information.
For information about the fields, see [Creating a Time Period](#).
6. Click **Save**.
 - a) Click **Save**.

The time period is defined in the CMP database and can now be used in a policy time condition.

Deleting a Time Period

To delete a time period:

1. From the **Policy Server** section of the navigation pane, select **Time Periods**.
The content tree displays the **Time Period Administration** group.
2. From the content tree, select the **Time Period Administration** group.
The **Time Period Administration** page opens in the work area.
3. Select the time period using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the time period.
 - From the content tree, select the time period and click **Delete**.A confirmation message displays.
4. Click **OK**.

The time period is deleted.

About Time-of-Day Triggers

Time-of-day triggers are supported for Diameter Gx sessions. If time-of-day triggers are configured, the MPE device periodically examines policies and provisions the policies to enforcement points, even for connected subscribers.

For example, if a subscriber connects to a network during an off-peak period and continues to use the network into a peak period, the MPE device removes the off-peak policy rule at the enforcement point at the set time and installs the peak policy rule.

The MPE device evaluates policies every 15 minutes, that is on the hour, 15 minutes past the hour, 30 minutes past the hour, and 45 minutes past the hour. If a time period is changed, it can take up to 15 minutes for the change to take effect.

Note: If a time period transition occurs and an MPE device is still updating sessions for the previous period, the MPE device ends the updates in progress and processes the new transition by updating the sessions based on the time periods for the new time period.

Time-of-day triggering must be enabled as part of MPE configuration. For more information, see the appropriate *CMP User's Guide*.

Chapter 12

Managing Presence Reporting Area Lists

Topics:

- [*About Presence Reporting Area Lists.....151*](#)
- [*Presence Reporting Area List Case Study.....151*](#)
- [*Creating a Core Network Pre-Configured Presence Reporting Area List.....151*](#)
- [*Creating a UE-dedicated Presence Reporting Area List.....152*](#)
- [*Modifying a Presence Reporting Area List.....153*](#)
- [*Deleting a Presence Reporting Area List.....154*](#)

This chapter describes how to create and manage Presence Reporting Area (PRA) lists in the CMP system.

In a wireless network, PRA lists are used to apply policies to users within or outside specific areas.

Note: Managing PRA lists is a function that is applicable to 3GPP mode only.

About Presence Reporting Area Lists

A PRA list is a list of areas in which user equipment presence is reported to the PCRF. PRA lists are used to create location-specific policies that are triggered and applied whenever the user equipment either enters or leaves a PRA. PRA list areas can be designated with various types of value, including tracking area identities (TAI), routing area identities (RAI), Macro eNodeB, Home eNodeB, E-UTRAN cell global identities (ECGI), service area identities (SAI), and cell global identities (CGI).

You can create two types of PRA list: Core Network pre-configured and UE-dedicated. A Core Network pre-configured PRA list is defined on the MME/SSGN side and is used by the CMP in policies. Core Network pre-configured PRA lists are used to create area-specific policies that apply to all or many subscribers on a network. A UE-dedicated PRA list is defined either in the CMP or in subscriber profiles. UE-dedicated PRA lists are used to create area-specific policies that apply to small groups of subscribers on a network.

Presence Reporting Area List Case Study

The following case study demonstrates how PRA lists can be used with policies on a wireless network.

A wireless carrier, Example Inc., uses PRA lists to apply policies to user equipment within specific areas. Example Inc. implements PRA lists in three scenarios: managing QoS in busy areas, allowing location sensitive services, and managing QoS in residential areas.

To manage QoS in busy areas, Example Inc. uses the Core Network pre-defined PRA list CN1. Whenever any subscriber on the network enters an area included in CN1, the PCRF receives a notification and applies a policy that reduces QoS for that subscriber until the subscriber leaves the area included in CN1.

To allow location sensitive services, Example Inc. uses the UE-dedicated PRA list UE1 to manage a service that can only be used while roaming. UE1 establishes a home area for a subscriber or small group of subscribers. Whenever a subscriber whose home area is included in UE1 and who pays for the roaming service leaves the area included in UE1, the PCRF receives a notification and applies a policy that enables the roaming service. Whenever the subscriber enters the area included in UE1, the PCRF receives a notification and applies a policy that disables the roaming service.

To manage QoS in residential areas, Example Inc. uses the UE-dedicated PRA list UE2 to establish a home area for a subscriber. Whenever the subscriber enters the home area UE2, the PCRF receives a notification to increase QoS for that subscriber until the subscriber leaves the home area UE2.

Creating a Core Network Pre-Configured Presence Reporting Area List

To create a Core Network pre-configured PRA list:

1. From the **Policy Server** section of the navigation pane, select **Presence Reporting Area Lists**. The content tree displays the **Presence Reporting Area Lists** group.
2. From the content tree, select the **Presence Reporting Area Lists** group.

The **Presence Reporting Area (PRA) List Administration** page opens in the work area.

3. Click **Create PRA List**.

The **New PRA List** page opens.

4. Enter the following information:

- a) **Name** — The unique name assigned to the PRA list.

The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 40 characters.

- b) **Description/Location** (optional) — Free-form text.

- c) **ID** — The unique identifying number of the PRA list. The ID must be a numeric value between 0 and 16777215.

- d) **Type** — Select **Core Network pre-configured**.

5. Click **Save**.

The PRA list is created in the CMP database. You can now use it in a policy.

Creating a UE-dedicated Presence Reporting Area List

To create a UE-dedicated PRA list:

1. From the **Policy Server** section of the navigation pane, select **Presence Reporting Area Lists**.

The content tree displays the **Presence Reporting Area Lists** group.

2. From the content tree, select the **Presence Reporting Area Lists** group.

The **Presence Reporting Area (PRA) List Administration** page opens in the work area.

3. Click **Create PRA List**.

The **New PRA List** page opens.

4. Enter the following information:

- a) **Name** — The unique name assigned to the PRA list.

The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 40 characters.

- b) **Description/Location** (optional) — Free-form text.

- c) **ID** — The unique identifying number of the PRA list. The ID must be a numeric value between 0 and 16777215.

- d) **Type** — Select **UE-dedicated**.

The **Area List** page opens in the work area.

5. From the **Area List** page, click **Add**.

The **Add Area** window opens.

6. Select the type and enter the value.

For valid type-value combinations, see [Area List Type-Value Combinations](#).

The area is added to the **Area List** page.

7. Click **Save**.

The PRA list is created in the CMP database. You can now use it in a policy.

Area List Type-Value Combinations

Type	Value Format
TAI – Tracking Area Identity	MCC , MNC , TAC
RAI – Routing Area Identity	MCC , MNC , LAC , RAC
Macro eNodeB	MCC , MNC , MENB
Home eNodeB	MCC , MNC , HENB
ECGI – E-UTRAN Cell Global Identifier	MCC , MNC , ECI
SAI – Service Area Identity	MCC , MNC , LAC , SAC
CGI – Cell Global Identity	MCC , MNC , LAC , CI

Value	Value Restrictions
MCC – Mobile Country Code	Three decimal digits
MNC – Mobile Network Code	Two or three decimal digits
TAC – Type Allocation Code	A decimal number between 0 and 65535
LAC – Location Area Code	A decimal number between 0 and 65535
RAC – Routing Area Code	A decimal number between 0 and 65535
MENB – Macro eNodeB	A decimal number between 0 and 268435455
HENB – Home eNodeB	A decimal number between 0 and 268435455
SAC – Service Access Code	A decimal number between 0 and 65535
CI – Cell Identity	A decimal number between 0 and 65535

Modifying a Presence Reporting Area List

To modify a PRA list:

1. From the **Policy Server** section of the navigation pane, select **Presence Reporting Area Lists**.
The content tree displays the **Presence Reporting Area Lists** group.
2. From the content tree, select the **Presence Reporting Area Lists** group.
The **Presence Reporting Area (PRA) List Administration** page opens in the work area.
3. Select the PRA list you want to modify.
The PRA list information is displayed.
4. Click **Modify**.
The **Modify PRA List** page opens.
5. Modify PRA list information as required.
For information about the fields, see [Creating a Core Network Pre-Configured Presence Reporting Area List](#) and [Creating a UE-dedicated Presence Reporting Area List](#).
6. Click **Save**.
The PRA list is modified.

Deleting a Presence Reporting Area List

To delete a PRA list:

1. From the **Policy Server** section of the navigation pane, select **Presence Reporting Area Lists**.
The content tree displays the **Presence Reporting Area Lists** group.
2. From the content tree, select the **Presence Reporting Area Lists** group.
The **Presence Reporting Area (PRA) List Administration** page opens in the work area.
3. Delete the PRA list using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the PRA list.
 - From the content tree, select a PRA list and click **Delete**.

A confirmation message appears.

4. Click **OK**.

The PRA list is deleted.

Chapter 13

Managing Quotas

Topics:

- [About Quotas.....156](#)
- [About Quota Plans.....156](#)
- [About Quota Passes.....161](#)

This chapter describes how to create and manage Gx and Gy quotas in the CMP system.

In a wireless network, a quota sets a limit on a subscriber's usage, by any combination of volume (bytes of data), time (seconds of usage), or events (which are service specific). A quota can be applied by a policy rule trigger, or a quota can be applied by default if no policy rule is triggered. Quotas include pass, rollover, and top-up units.

Note: The actual options you see depend on whether or not your CMP system is configured in wireless Gx mode, wireless Gy mode, or both.

About Quotas

A quota specifies restrictions on the amount of data volume, active session time, or service-specific events that a subscriber can consume. A single quota can express limits on any combination of volume, time, or events. Quotas can be associated with a time period during which activity is measured. Using the CMP server, you can define quota profiles. A quota profile specifies default values for quotas and defines how quotas are implemented. There are two types of quota profiles:

- | | |
|-------------|---|
| Plan | For more information about quota plans, see About Quota Plans . |
| Pass | For more information about quota passes, see About Quota Passes . |

About Quota Plans

A quota plan describes a subscriber's basic, recurring service. Plans include policy characteristics such as time and volume limits. These characteristics can be computed automatically or through policy rules. Policy actions grant plans, based on a subscriber's tier or entitlement.

A basic quota refers to the quota associated with a plan and is used to handle recurring, periodic quotas typical of post-paid mobile data plans. The controls on a basic quota can be overridden by passes, rollovers, and top-ups.

Creating a Plan

In Gx mode, the MPE device can track and enforce a subscriber's total IP-CAN session time and volume usage by day, week, or month, or track aggregate volume usage and time per IP-CAN session. In Gy mode, the MPE device can track usage for multiple services based on time, volume, specific event, rollover information, and top-up information.

Note: If the optional 3GPP-MS-TimeZone AVP is enabled, the MPE device can reset the quota based on the user local time. If so, and user equipment enters a different time zone near the end of a quota cycle, the subscriber may find that the quota reset earlier than expected, or the service provider may find that the quota reset later than expected.

To create a plan:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree displays the **Plans** and **Passes** groups.
2. Select the **Plans** group.
The **Plan Administration** page opens in the work area.
3. Click **Create Plan**.
The **New Plan** page opens.
4. Enter the following information:
 - a) **Name** — The name of the plan.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description/Location** — Free-form text.

- c) **Quota Profile Type** — Select whether the plan is assigned to an individual subscriber or a pool of subscribers. Select one of the following:

- **Subscriber** (default)
- **Pool**

Note: If you select **Pool**, items can be added to support the account (Max Leakage Threshold, Dynamic Grant, etc). After the plans are created, the plans are applied to subscribers.

- d) **Enable Dynamic Grant** (optional) — Specifies whether to track grant dynamically for the subscriber. This allows the granted values to be updated by the MPE device to the SPR. If the box is checked, then the configuration is set to true. The default value is false.
- e) **Max Leakage Threshold (MB)** — Maximum amount by which the usage can be exceeded. The default is 0 MB.
- f) **Max Sessions Used For Dynamic Grant**— Number of simultaneous sessions used in the dynamic grant algorithm for granting quota. Enabled when **Enable Dynamic Grant** is selected. The range is 1–2147483647 (Max 32-bit integer). The default is 10 sessions.

Note: Do not enter a value if dynamic grant is not enabled.

- g) **Minimum Grant Size**— The minimum plan amount granted by the MPE device. Enabled when **Enable Dynamic Grant** is selected. The value of the field depends upon the component (time/service-specific/volume) that is being granted by the MPE device:

- time — minimum number of seconds
- service-specific — minimum number of units
- volume (total/input/output) — minimum number of bytes

The default is 0.

Note: The value of the **Minimum Grant Size** field applies to all of the components that are granted by the MPE device. Make sure that the value reflects the minimum amount for all components. A low value could lead to a high number of messages being generated.

- h) **Reset Every** — Enter a value and select an interval from the list to specify how many times and how often the subscriber plan usage counters are reset. The default is 1 Month. Select one of the following intervals:
- **Months** (default) — The plan is reset when the specified number of months is met. To have yearly plans, specify a multiple of 12. For example, 36 months is a 3 year plan.
 - **Weeks** — The **Choose Day** field appears. Weekly quotas are reset at midnight on the day you select from the list. The default day is Sunday.
 - **Days** — The **Hour: Minute** field appears. Enter the hour and minute (in 24-hour format) at which quotas are reset. You must enter a time.
 - **Never** — Go to step [Substep m](#).

Note: You must specify a whole number greater than 0, a valid name in the **Billing Date Effective**, and enable the **DB.User.EnableBillingStartDate** expert setting to use this function. See the appropriate *CMP User's Guide* for more information about expert settings.

- i) **Reset Time Variable** — (Optional) Specify a variable to reset the time for the plan based on any substitutable policy variable in the subscriber profile.
The MPE device uses the variable name and substitutes it to calculate the actual reset time for the plan bucket. The substitutable variable names are the same as the substitutable policy variables, that is, variables that are substituted in policy actions, such as {User.State.Property1}. Curly braces ({}) can be used but are not required.

- For a monthly plan bucket, specify a variable whose value is either a billing day (between 1 and 31) or a time of day (such as 11:02), in which case the billing day is retrieved using the current mechanism (that is, use the subscriber profile; if not set, use the global billing day); or an actual date/time, following the `xsd:dateTime` (similar to custom fields and entity states), specifying the first reset time for the quota bucket. The MPE device manages setting the `nextResetTime` on the quota usage records by computing the closest date/time in the future that is a multiple of a month away from the configured date/time, conserving the time of day.
 - For a weekly plan bucket, specify a variable containing either a time of day, in which case the day of the week is taken from the configured fixed day of the week, or a date/time representing the first reset time. The MPE device computes the next reset time similarly to the monthly bucket, but using multiple of one week instead.
 - For a daily plan bucket, specify a variable containing either a time of day or a date/time. In both cases, the MPE device computes the next reset time based on the time of day.
- j) **Report Offset Limit (minutes)** — The maximum minutes the MPE device add to the rest time for the quota when it calculates the session validation time. The range is 0 to 180.
- k) **Billing Date Effective Name** — Enter the Billing Date Effective name from a subscriber profile to use as the plan start date. This date is used as the start date of the plan and is used to calculate the next reset time. Enable the **DB.User.EnableBillingStartDate** expert setting to use this function. See the appropriate *CMP User's Guide* for more information about expert settings.
- l) **Collect Reset Statistics** — Enables the generation of reset statistics. If the reset frequency is set to **Never**, this field is hidden and the quota is never reset. The default is disabled.
- m) **Initial Total Volume Limit (bytes)** — Gx or Gy mode. Specifies the initial value for total volume units granted by the plan. Select one of the following:
- **None** (default). If you select **None**, then total volume units are not granted.
 - **Specify Variable** and enter a variable.
 - **Specify Limit** and enter a value.
- n) **Initial Upstream Volume Limit (bytes)** — Gx or Gy mode. Specifies the initial value for output volume units granted by the plan. Select one of the following:
- **None** (default). If you select **None**, then output volume units are not granted.
 - **Specify Variable** and enter a variable.
 - **Specify Limit** and enter a value.
- o) **Initial Downstream Volume Limit (bytes)** — Gx or Gy mode. Specifies the initial value for input volume units granted by the plan. Select one of the following:
- **None** (default). If you select **None**, then input volume units are not granted.
 - **Specify Variable** and enter a variable.
 - **Specify Limit** and enter a value.
- p) **Volume Threshold Percentage (%)** — Gy mode only. Enter a threshold percentage.
Below this percentage of volume quota, the charging traffic function must re-authorize.
- q) **Initial Time Limit (seconds)** — Gx or Gy mode. Specifies the initial value for session time units granted by the plan. Select one of the following:
- **None** (default). If you select **None**, then time units are not granted.
 - **Specify Variable** and enter a variable.
 - **Specify Limit** and enter a value.

- r) **Inactivity Detection Time (seconds)** — Specifies the interval after which the time measurement will stop for the monitoring key if no packets are received. Select one of the following:
 - **None** (default)
 - **Specify Limit** and enter a value in seconds.
 - s) **Time Threshold Percentage (%)** — Gy mode only. Enter a threshold percentage. Below this percentage of time quota, the charging traffic function must re-authorize.
 - t) **Initial Service Specific Limit (events)** — Gy mode only. Specifies the initial value for service specific units granted by the plan. Select one of the following:
 - **None** (default). If you select **None**, then service specific units are not granted.
 - **Specify Variable** and enter a variable.
 - **Specify Limit** and enter a value.
 - u) **Event Threshold Percentage (%)** — Gy mode only. Enter a threshold percentage. When the event quota drops below this percentage, the charging traffic function must re-authorize. Select one of the following:
 - **None** (default)
 - **Specify Variable** and enter a variable.
 - **Specify Limit** and enter a value.
 - v) **Interim Reporting Interval (seconds)** — Gy mode only. How often the charging traffic function (such as a GGSN) must report quota usage to the MPE device.
 - **None** (default)
 - **Specify Interval** and enter a value.
5. **Quota Exhaustion Action** — Gy mode only. The action the charging traffic function (such as a GGSN) takes when a subscriber reaches the quota grant:
- **N/A** (default) — Take no action.
 - **TERMINATE** — Terminate the subscriber's session.
 - **REDIRECT** — If you select this action, additional configuration fields appear:
 - **Restriction Filters** — Enter a comma-separated list of Diameter IP Filter rules.
 - **Filter ID List** — Enter a comma-separated list of named filters on the charging traffic function.
 - **Redirect Server Type** — Select **IPv4**, **IPv6**, **URL**, or **SIP URI**.
 - **Redirect Server Address** — Enter the server address
 - **RESTRICT ACCESS** — If you select this action, additional configuration fields appear:
 - **Restriction Filters** — Enter a comma-separated list of Diameter IP Filter rules.
 - **Filter ID List** — Enter a comma-separated list of named filters on the charging traffic function.
6. **Quota Convention** — Select the name of a quota convention (see [About Quota Conventions](#)). This selection associates the plan with a rollover or top-up.
- If you do not select a quota convention, then a default quota convention is assumed by the system. There is no rollover in a default quota convention.
7. Click **Save**.

The plan is defined in the CMP database and is displayed in the **Plans** group. The plan can now be used in a policy.

Modifying a Plan

To modify a plan:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree opens, displaying the **Plans** and **Passes** groups.
2. From the content tree, select the **Plans** group.
The **Plan Administration** page opens, displaying the list of defined plans.
3. Select the plan you want to modify.
The work area displays information about the plan.
4. Click **Modify**.
The **Modify Plan** page opens.
5. Modify plan information as required.
For a description of the fields contained on this page, see [Creating a Plan](#).
6. Click **Save**.

The plan is modified.

Deleting a Plan

You cannot delete a plan that is referenced in a policy. Otherwise, to delete a plan:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree opens, displaying the **Plans** and **Passes** groups.
2. From the content tree, select the **Plans** group.
The **Plan Administration** page opens, displaying the list of defined plans.
3. Delete the plan using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the plan.
 - From the content tree, select the plan and click **Delete**.

A confirmation message displays.

4. Click **OK** to delete the plan.

The plan is deleted.

Example: Creating and Using a Plan

An MPE device can grant time, data, or other service-specific units to subscribers. It can also limit grants based on quotas, either against plans or against limited exemptions such as passes, top-ups, and rollovers. The following is a simple wireless Gx example in which a monthly data usage quota is defined, and a policy is written for the MPE device to grant quota upon creation of a new session. The following values are defined and used:

- Plan name: MonthlyDataBasic
- Quota: 5 Gb (5,368,709,120 bytes) monthly

- Quota exhaustion action: Terminate

The policy rule is as follows:

```
where the request is creating a new session
grant total volume to 100 percent used for MonthlyDataBasic
accept message
```

This procedure consists of tasks described elsewhere. The steps must be performed in the order shown.

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**, select the **Plans** folder, and create the plan.
For more information, see [Creating a Plan](#).
The plan is defined in the CMP database.
2. From the **Policy Management** section of the navigation pane, select **Policy Library**, and define the policy.
For more information, see [Creating a Policy Rule](#).
The policy is defined in the CMP database.
3. From the **Policy Management** section of the navigation pane, select **Policy Library**, select the policy, and deploy it.
For more information, see the appropriate *CMP User's Guide*.
The policy is deployed to MPE devices in the Policy Management network.

About Quota Passes

A quota specifies restrictions on the amount of data volume, active session time, or service-specific events that a subscriber can consume. A single quota can express limits on any combination of volume, time, or events. Quotas can be associated with a time period during which activity is measured.

A pass is a one-time override that temporarily replaces or augments a subscriber's default plan or service.

For example, a subscriber who is normally not able to stream video to their device, but wants to view a special event, can purchase a pass that allows streaming.

Multiple passes can be assigned to the same subscriber. These passes are processed using the following criteria:

- The highest priority pass is processed first.
- If priorities are equal, the pass with the earliest expiration date/time is processed first.
- If expiration date/times are equal, the pass with the earliest purchase date/time is processed first.
- If purchase date/times are equal, the passes are processed in alphabetical order of the instance IDs.

The pass that is processed first according to these criteria is referred to as the "best" pass.

Passes can be added to pass groups. Adding a pass to a pass group associates that pass with all other passes in the pass group.

Pass groups can be used to determine pass expiration extension. The expiration date/time value of a new pass can be extended to match an expiration date/time value in the future of any pass in the same pass group.

A pass can belong to only one pass group. If the pass group is deleted, then the group field for each pass in the pass group is set to null. If the name of the pass group is changed, then the group field for each pass in the pass group is set to the new name.

Creating a Pass

To create a pass:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree opens, displaying the **Passes** and **Plans** groups.
2. From the content tree, select the **Passes** group.
The content tree displays a list of passes and groups.
3. From the content tree, select the **ALL** group.
The **Pass Administration** page opens in the work area.
4. Click **Create Pass**.
The **New Pass** page opens.
5. Enter the following information:
 - a) **Name** — The name of the pass or top-up. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description/Location** — Free-form text.
 - c) **Enable Dynamic Grant** (optional) — Specifies whether to track grant dynamically for the subscriber. This will cause the granted values to be updated by the MPE device to the SPR. If the box is checked, then the configuration is set to true. The default value is false.
 - d) **Max Leakage Threshold (MB)** — Maximum amount by which the usage can be exceeded. The default is 0 MB.
 - e) **Max Sessions Used For Dynamic Grant**— Number of simultaneous sessions used in the dynamic grant algorithm for granting quota. Enabled when **Enable Dynamic Grant** is selected. The range is 1–2147483647 (2GB–1). The default is 10 sessions.

Note: Do not enter a value if dynamic grant is not enabled.
 - f) **Minimum Grant Size**— The minimum plan amount granted by the MPE device. Enabled when **Enable Dynamic Grant** is selected. The value of the field depends upon the component (time/service-specific/volume) that is being granted by the MPE device:
 - time — minimum number of seconds
 - service-specific — minimum number of units
 - volume (total/input/output) — minimum number of bytes
 The default is 0.

Note: The value of the **Minimum Grant Size** field applies to all of the components that are granted by the MPE device. Make sure that the value reflects the minimum amount for all components. A low value could lead to a high number of messages being generated.
 - g) **Quota Profile Type** — Select whether the plan is assigned to an individual subscriber or a pool of subscribers. Select one of the following:
 - **Subscriber** (default)
 - **Pool**

Note: If you select **Pool**, items can be added to support the account (Max Leakage Threshold, Dynamic Grant, etc). After the plans are created, the plans are applied to subscribers.

- h) **Priority** — Defines the order of use when a subscriber has multiple instances of a pass. Higher priority passes are used before lower priority passes. A higher number indicates a higher priority. The range is -32768–32767 (max 16-bit short).
- i) **Active Time Period** — The period during which the pass may be used.
- j) **Initial Total Volume Limit (bytes)** — Gx or Gy mode. Specifies the initial value for total volume units granted by the pass. Select one of the following:
 - **None** (default). If you select **None**, then total volume units are not granted.
 - **Specify Limit** and enter a value.
- k) **Initial Upstream Volume Limit (bytes)** — Gx or Gy mode. Specifies the initial value for output volume units granted by the pass. Select one of the following:
 - **None** (default). If you select **None**, then output volume units are not granted.
 - **Specify Limit** and enter a value.
- l) **Initial Downstream Volume Limit (bytes)** — Gx or Gy mode. Specifies the initial value for input volume units granted by the pass. Select one of the following:
 - **None** (default). If you select **None**, then input volume units are not granted.
 - **Specify Limit** and enter a value.
- m) **Initial Time Limit (seconds)** — Gx or Gy mode. Specifies the initial value for session time units granted by the pass. Select one of the following:
 - **None** (default). If you select **None**, then time units are not granted.
 - **Specify Limit** and enter a value.
- n) **Inactivity Detection Time (seconds)** — Specifies the interval after which the time measurement will stop for the monitoring key if no packets are received. Select one of the following:
 - **None** (default)
 - **Specify Limit** and enter a value in seconds.
- o) **Initial Service Specific Limit (events)** — Gy mode only. Specifies the initial value for service specific units granted by the pass. Select one of the following:
 - **None** (default). If you select **None**, then service specific units are not granted.
 - **Specify Limit** and enter a value.
- p) **Interim Reporting Interval (seconds)** — Gy mode only. The number of seconds after which the gateway must revalidate any grant with the MPE. Select one of the following:
 - **None** (default)
 - **Specify Interval** and enter a value.
- q) **Duration** — The period after first use in which the pass must be used or expired.
- r) **Expiration Date Extension Method** — The criteria used for extending an expiration date. Possible values are:
 - **NONE** — The expiration date/time value of this pass cannot be extended or used to extend the expiration date/time values of other passes.

- **Name** — The expiration date/time value of this pass can be used to extend the date/time value of passes in the same pass group.
 - **Group** — The expiration date/time value of this pass can be extended to match the date/time value of any pass in the same pass group.
- s) **Quota Exhaustion Action** — Gy mode only. The action to take when all units in the pass are exhausted.

Possible values are:

- **N/A (default)** — Take no action.
- **TERMINATE** — Terminate the subscriber's session.
- **REDIRECT** — If you select this action, additional configuration fields appear:
 - **Restriction Filters** — Enter a comma-separated list of Diameter IP Filter rules.
 - **Filter ID List** — Enter a comma-separated list of named filters on the charging traffic function.
 - **Redirect Server Type** — Select **IPv4**, **IPv6**, **URL**, or **SIP URI**.
 - **Redirect Server Address** — Enter the server address
- **RESTRICT ACCESS** — If you select this action, additional configuration fields appear:
 - **Restriction Filters** — Enter a comma-separated list of Diameter IP Filter rules.
 - **Filter ID List** — Enter a comma-separated list of named filters on the charging traffic function.

6. Click **Save**.

The pass is defined in the CMP database and is displayed in the **Pass** group. The pass can now be used in a policy.

Modifying a Pass

To modify a pass:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree opens, displaying the **Plans** and **Passes** groups.
2. From the content tree, select **Passes**.
The content tree displays a list of passes and pass groups. The initial group is **ALL**.
3. Select a pass.
The **Pass Administration** page opens in the work area.

Note: If the pass has been added to a pass group, then the pass group name is shown in the **Group** field.

4. Click **Modify**.
The **Modify Pass** page opens.
5. Modify pass information.
For a description of the fields contained on this page, see [Creating a Pass](#).

Note: You cannot edit pass group information from this page. To assign the pass to a different pass group, you must remove the pass from the current pass group (see [Removing a Pass from a Pass Group](#)) and add the pass to a new pass group (see [Adding a Pass to a Pass Group](#)).

6. Click **Save**.

The pass is modified.

Deleting a Pass

To delete a pass:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree opens, displaying the **Plans** and **Passes** groups.
2. From the content tree, select the **Passes** group.
The content tree displays a list of passes and pass groups. The initial group is **ALL**.
3. From the content tree, select the **ALL** group.
The **Pass Administration** page opens in the work area.
4. Delete the pass using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the pass.
 - From the content tree, select the pass and click **Delete**.

A confirmation message displays.

5. Click **OK** to delete the pass.

The pass is deleted.

Creating a Pass Group

To create a pass group:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree displays the **Plans** and **Passes** groups.
2. From the content tree, select the **Passes** group.
The content tree displays a list of passes and pass groups. The initial group is **ALL**.
3. Select the **ALL** group.
The **Pass Administration** page opens in the work area.
4. click **Create Group**.
The **Create Group** page opens in the work area.
5. Enter the following information:
 - a) **Name** — The name of the pass group. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description/Location** — Free-form text.
6. Click **Save**.

The pass group is created.

Adding a Pass to a Pass Group

To add a pass to a pass group:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree displays the **Plans** and **Passes** groups.
2. From the content tree, select the **Passes** group.

The content tree displays a list of passes and pass groups. The initial group is **ALL**.

3. From the content tree, select the pass group where you want to add the pass.
The **Pass Administration** page opens in the work area.

4. Click **Add Pass**.

The **Add Pass** page opens in the work area.

5. Select the pass that you want to add.

Note: Passes can belong to only one pass group.

6. Click **Save**.

A pass is added to the selected pass group. See [Removing a Pass from a Pass Group](#) for instructions on removing a pass from a pass group.

Modifying a Pass Group

To modify a pass group:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree displays the **Plans** and **Passes** groups.
2. From the content tree, select the **Passes** group.
The content tree displays a list of passes and pass groups. The initial group is **ALL**.
3. From the content tree, select the pass group you want to modify.
The **Pass Group Administration** page opens in the work area.
4. Click **Modify**.
The **Modify Group** page opens in the work area.
5. Modify the pass group information.

Note: If you change the name of a pass group, then the **group** field for each pass in the pass group changes to the new name.

6. Click **Save**.

The pass group is modified.

Removing a Pass from a Pass Group

To remove a pass from a pass group:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree displays the **Plans** and **Passes** groups.
2. From the content tree, select the **Passes** group.
The content tree displays a list of pass groups. The initial group is **ALL**.
3. From the content tree, select the pass group that contains the pass you want to remove.
The **Pass Group Administration** page opens in the work area.
4. Click  (scissors icon) located to the right of the pass.

The pass is removed from the pass group.

Deleting a Pass Group

Note: Deleting a pass group resets the group field of each pass in the pass group to null. The passes are not deleted from the system.

To delete a pass group:

1. From the **Policy Server** section of the navigation pane, select **Quota Profiles**.
The content tree displays the **Plans** and **Passes** groups.
2. From the content tree, select **Passes**.
The content tree displays a list of pass groups. The initial group is **ALL**.
3. From the content tree, select the pass group you want to delete.
The **Pass Group Administration** page opens in the work area.
4. Click **Delete**.
A confirmation message displays.
5. Click **OK** to delete the pass group.
The pass group is deleted.

Chapter 14

Managing Quota Conventions

Topics:

- [*About Quota Conventions.....169*](#)
- [*Creating a Quota Convention.....169*](#)
- [*Modifying a Quota Convention.....170*](#)
- [*Associating a Quota Convention with a Plan...171*](#)
- [*Deleting a Quota Convention.....171*](#)

This chapter describes how to manage the usage of rollovers and top-ups using the CMP system.

In a wireless network, a quota convention controls top-ups and rollovers of plans.

Note: The actual options you see depend on whether or not your CMP system is configured in wireless Gx mode, wireless Gy mode, or both.

About Quota Conventions

A quota convention controls top-ups and rollovers of plans.

Caution: If a plan contains more than one type of counter (for example, time and volume), then ALL of the counters for that entire plan must be exhausted before a rollover and/or top-up for either type of counter is activated. Depending on how policy rules are written, this functionality could lead to an unintended effect on the end-user's service. If the intent is to apply separate limits on different units, then separate quotas should be defined and independent top-ups or rollovers may be applied.

Rollover A rollover allows a subscriber to carry forward unused units from one billing cycle to another. For example, if a subscriber is allowed 10 gigabytes of data a month and only uses 9, the remaining gigabyte of data can be saved for use in the next month. Rollover units can accumulate and can be carried across multiple months. You can establish a quota convention that rollover units are consumed after plan units are exhausted, or before.

Top-up A top-up allows a subscriber to obtain additional units for an existing plan. For example, if a plan allows 20 gigabytes of traffic per month, but near the end of the month the subscriber has only 1 gigabyte left, the subscriber can obtain an additional 5 gigabytes. These units are used after the initial units are exhausted and do not roll over.

Multiple top-ups can be present and enforced in the database at the same time and are processed by the MPE device. Multiple top-ups can be assigned to the same subscriber. These top-ups are consumed in the following order:

- The highest priority top-up is consumed first.
- If priorities are equal, the top-up with the earliest expiration date/time is consumed first.
- If expiration date/times are equal, the top-up with the earliest purchase date/time is consumed first.
- If purchase date/times are equal, the top-ups are consumed in alphabetical order of the instance IDs.

The top-up that is processed first according to these criteria is referred to as the best top-up.

You can establish a quota convention that top-up units are consumed after rollover units are exhausted, or before. However, plan units are always consumed before top-up units.

Note: Top-ups are enabled using the **Quota Conventions** option. Top-up information is configured in an SPR database. See the Oracle Communications User Data Repository documentation for more information on the UDR product, and the Oracle Communications Enhanced Subscriber Profile Repository documentation for more information on the ESPR product.

Creating a Quota Convention

To create a quota convention:

1. From the **Policy Server** section of the navigation pane, select **Quota Conventions**.
The content tree displays the **Quota Conventions** group.
2. Select the **Quota Conventions** group.
The **Quota Convention Administration** page opens in the work area.
3. Click **Create Convention**.
The **New Quota Convention** page opens.
4. Enter the following information:
 - a) **Name** — The name of the quota convention. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description/Location** — Free-form text.
 - c) **Rollover usage** — Specifies how rollover units are used with respect to top-up units.
The possible values are:
 - **Default** — Rollover units are used before top-up units unless the highest priority top-up expires in the next 24 hours.
 - **Rollover after Top-up** — Top-up units are used before rollover units.
 - **Rollover before Top-up** — Rollover units are used before top-up units.
 - d) **Interval percentage of the limits (%)** — The maximum percent of the units that can be rolled over during one billing cycle reset. The range is 0.0 – 100.0.
 - e) **Max percentage of the limits (%)** — The maximum percent of the units that can be saved as a rolled limit at any time. The range is 0.0 – 1200.0.
5. Enable one or more of the following options:
 - **Rollover Time Units** — Roll over time.
 - **Rollover Total Volume** — Roll over total volume.
 - **Rollover Input Volume** — Roll over input volume.
 - **Rollover Output Volume** — Roll over output volume.
 - **Rollover Service Specific Units** — Roll over service-specific units.
 - **Discard Rollover on Rollover Calculation** — Rollover units are not saved beyond one cycle.
 - **Consume Rollover before Quota** — Rollover units are used before plan units.

Note: Rollover units can be consumed before plan (quota) units, and top-up units can be consumed before rollover units. However, top-up units cannot be consumed before plan units.

 - **Enable Top-ups** — Enable top-up units.
 - **Aggregate Quota** — Enables the quota usage calculation to be based on the quota plan, top-ups and rollovers. This option does not affect quota passes.
6. Click **Save**.
The quota convention is defined in the CMP database and can be used in a policy.

Modifying a Quota Convention

To modify a quota convention:

1. From the **Policy Server** section of the navigation pane, select **Quota Conventions**.
The content tree opens.

2. From the content tree, select the **Quota Conventions** group.
The **Quota Convention Administration** page opens, displaying the list of defined services.
3. Select the quota convention you want to modify.
The work area displays information about the quota convention.
4. Click **Modify**.
The **Modify Quota Convention** page opens.
5. Modify quota convention information as required.
For a description of the fields contained on this page, see [Creating a Quota Convention](#).
6. Click **Save**.
The quota convention is modified.

Associating a Quota Convention with a Plan

To associate a quota convention with a plan:

1. Create a quota convention. See [Creating a Quota Convention](#).
2. Create a plan or open an existing plan for modification. See [Creating a Plan](#) and [Modifying a Plan](#).
3. In the **Quota Convention** field, select the name of the quota convention you want to associate with the plan.
4. Click **Save** to save your changes.

The quota convention is associated with a plan.

Deleting a Quota Convention

To delete a quota convention:

1. From the **Policy Server** section of the navigation pane, select **Quota Conventions**.
The content tree displays the **Quota Conventions** group.
2. From the content tree, select the **Quota Conventions** group.
The **Quota Convention Administration** page opens, displaying the list of defined quota conventions.
3. Delete the quota convention using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the quota convention.
 - From the content tree, select the quota convention and click **Delete**.

A confirmation message displays.

4. Click **OK**.

The quota convention is deleted.

Chapter 15

Managing RADIUS CoA Templates

Topics:

- [About RADIUS CoA Templates.....173](#)
- [Creating a RADIUS CoA Template.....173](#)
- [Modifying a RADIUS CoA Template.....175](#)
- [Deleting a RADIUS CoA Template175](#)
- [Example of Creating and Using a RADIUS CoA Template.....176](#)

This chapter describes how to create, modify, and delete RADIUS Change of Authorization (CoA) templates.

In a wireless network, the MPE device can function as a RADIUS server by receiving, acknowledging, and responding to RADIUS messages from clients, and generating CoA messages to RADIUS entities.

Note: The actual options you see depend on whether or not your CMP system is configured in RADIUS mode.

About RADIUS CoA Templates

An MPE device can function as a RADIUS server in a wireless network. In this role it can perform the following actions:

- Receive a RADIUS message from a client system, acknowledge it, parse it, and then assemble and send a RADIUS Change of Authorization (CoA) message to some RADIUS client in the network to create, update, or delete services, which in this context are policies expressed using vendor-specific attributes (VSAs) or type-length-value structures (TLVs). Receipt of the message can trigger policy evaluation.
- Receive a subscriber update from an SPR system and then generate a CoA message to update or delete services. The identity of a subscriber is determined by parsing information in RADIUS messages using subscriber keys, which is then correlated with information obtained from the SPR system.
- Generate a CoA message to update or delete services because of the passage of time (keep-alive function).
- Evaluate and apply policies in response to RADIUS messages and supply CoA and other RADIUS messages. For example, the following CoA messages could potentially be processed:
 - 40: Disconnect-Request
 - 41: Disconnect-ACK
 - 42: Disconnect-NAK
 - 43: CoA-Request
 - 44: CoA-ACK
 - 45: CoA-NAK

Each vendor can use different or customized VSAs or TLVs. The CMP database includes a RADIUS dictionary that stores vendor, VSA, and TLV definitions. The dictionary includes standard IETF RADIUS TLVs. However, because RADIUS is an extensible protocol, new vendors, VSAs, and TLVs can appear at any time. You can define custom vendors, VSAs, and TLVs and store them in the RADIUS dictionary. To support efficient assembly of CoA messages, you can define CoA templates that can include both known and custom values. The template can contain VSA and TLV values to be included in the CoA message, or left blank. If left blank, the corresponding values from the request or the session are used. If no value is found, the VSA or TLV is not included in the CoA message.

The CMP system displays RADIUS functions only if the appropriate mode is enabled. Contact My Oracle Support before attempting to change operating modes.

For information about creating custom vendor definitions, see [Managing Custom Vendors](#). For information about creating custom VSAs, see [Managing Custom VSAs](#). For information about subscriber keys, see [Managing Subscriber Keys](#).

Note: The actual options you see depend on whether or not your CMP system is configured in RADIUS mode.

Creating a RADIUS CoA Template

To create a RADIUS CoA template:

Note: The actual options you see depend on whether or not your CMP system is configured in RADIUS mode.

1. From the **Policy Server** section of the navigation pane, select **RADIUS CoA Template**.
The content tree displays the **RADIUS CoA Template** group.
2. Select the **RADIUS CoA Template** group.
The **RADIUS CoA Template Administration** page opens in the work area.
3. Click **Create RADIUS CoA Template**.
The **New RADIUS CoA Template** page opens. You can now define a template by name and assign attributes to include in it.
4. Enter the **Name** you assign to the template.
5. To add an attribute:
 - a) Click **Add**.
The **Add Response** window opens.
 - b) Select the available **Vendor** from the list:
 - IETF (default)
 - 3GPP
 - 3GPP2
 - Camiant
 - Cisco
 - Cisco-BBSM
 - Cisco-VPN3000
 - Cisco-VPN5000
 - Juniper
 - Juniper-M-Series
 - [defined custom vendors]

Note: Any defined custom vendors are displayed at the end of the list. For information, see [Managing Custom Vendors](#)
 - c) Select **TLV/VSA** from the list.
The choices are extensive and are not listed here.

Note: Any defined custom TLVs or VSAs are displayed at the end of the list. For information see [Managing Custom VSAs](#).
 - d) **Default Value** — Enter the default value for the TLV or VSA.
6. (Optional) To add, modify, or delete attributes:
 - Cloning an entry in the table
 1. Select an entry in the table.
 2. Click  **Clone**. The **Clone** window opens with the information for the entry.
 3. Make changes as required.
 4. Click **Save**. The entry is added to the table
 - Editing an entry in the table
 1. Select the entry in the table.
 2. Click  **Edit**. The **Edit Response** window opens, displaying the information for the entry.

3. Make changes as required.
 4. Click **Save**. The entry is updated in the table.
 - Deleting a value from the table
 1. Select the entry in the table.
 2. Click **✗ Delete**. A confirmation message displays.
 3. Click **Delete** to remove the entry. The entry is removed from the table.
 7. Click **Save**.
- The RADIUS CoA template is created.

Modifying a RADIUS CoA Template

To modify a RADIUS CoA template:

1. From the **Policy Server** section of the navigation pane, select **RADIUS CoA Template**.
The **RADIUS CoA Template Administration** page opens in the work area and lists the defined RADIUS CoA templates.
2. Select the template you want to modify.
The **RADIUS CoA Template Administration** page displays information about the template.
3. Click **Modify**.
The **Modify RADIUS CoA Template** page opens.
4. Modify the template information as required.
For a description of the fields contained on this page, see [Creating a RADIUS CoA Template](#).
5. Click **Save**.

The RADIUS CoA template is modified and the changes are deployed to MPE devices.

Deleting a RADIUS CoA Template

To delete a RADIUS CoA template:

1. From the **Policy Server** section of the navigation pane, select **RADIUS CoA Template**.
The **RADIUS CoA Template Administration** page opens in the work area, listing the defined RADIUS CoA templates.
2. Delete the RADIUS CoA template using one of the following methods:
 - From the work area, click  (trash can icon) located to the right of the RADIUS CoA template.
 - From the content tree, select the RADIUS CoA template and click **Delete**.

A confirmation message displays.
3. Click **OK**.

The RADIUS CoA template is deleted.

Example of Creating and Using a RADIUS CoA Template

In response to a RADIUS message such as `Accounting-Start`, an MPE device can use a RADIUS CoA template to send a policy, expressed using VSAs and TLVs, to a BNG device for a specific subscriber. The following is a simple example in which a RADIUS CoA template containing one VSA from a new vendor is defined, and a policy is written for the MPE device to send the RADIUS CoA to a BNG device upon receipt of a RADIUS `Accounting-Start` message. The following values are defined and used:

- Vendor name and ID: EquipTel (3561)
- VSA name: DSLF-Maximum-Interleaving-Delay-Downstream
- VSA code: 141
- VSA type: single-value integer
- CoA Template name: RADIUS CoA Template EquipTel

The policy rule is as follows:

```
where the RADIUS accounting request is RADIUS Accounting-Start
send CoA with RADIUS CoA Template EquipTel
accept message
```

This procedure consists of tasks described elsewhere. The steps must be performed in the order shown.

Note: The actual options you see depend on whether or not your CMP system is configured in RADIUS mode.

1. From the **Policy Server** section of the navigation pane, select **Custom Vendors**, and define the custom vendor.
For more information, see [Creating a Custom Vendor](#).
The custom vendor is defined in the RADIUS dictionary.
2. From the **Policy Server** section of the navigation pane, select **Custom VSA Definitions**, and define the custom vendor.
For more information, see [Creating a Custom VSA](#).
The custom VSA is defined in the RADIUS dictionary.
3. From the **Policy Server** section of the navigation pane, select **RADIUS CoA Template**, and define the RADIUS CoA template.
For more information, see [Creating a RADIUS CoA Template](#).
The RADIUS CoA template is defined in the CMP database.
4. From the **Policy Management** section of the navigation pane, select **Policy Library**, and define the policy.
For more information, see [Creating a Policy Rule](#).
The policy is defined in the CMP database.
5. From the **Policy Management** section of the navigation pane, select **Policy Library**, select the policy, and deploy it.
For more information, see the *CMP Wireless User's Guide*.
The policy is deployed to MPE devices in the Policy Management network.

The RADIUS CoA template is used as follows:

1. After the BNG device successfully authenticates a subscriber, it sends a RADIUS Accounting-Start message to the MPE device.
2. The MPE device fetches the subscriber's profile from an SPR database.
3. The MPE device subscribes to the SPR database for changes to the profile of the subscriber.
4. Based on the subscriber's profile and other conditions, the MPE device determines which policy and charging control (PCC) rule to install, and sends a RADIUS CoA request to install a service on the BNG device. The message includes the custom VSA from the custom vendor, as specified by the RADIUS CoA template.
5. The BNG device installs the service and sends an acknowledgment message to the MPE device.
6. The BNG device periodically sends Interim-Update messages, which the MPE device interprets as keep-alive messages indicating that the BNG device is still operational.

Chapter 16

Managing Retry Profiles

Topics:

- [*About Retry Profiles.....179*](#)
- [*Creating a Retry Profile.....179*](#)
- [*Modifying a Retry Profile.....180*](#)
- [*Deleting a Retry Profile.....181*](#)

This chapter describes how to create and manage retry profiles in the CMP system.

In a wireless network, a retry profile specifies the circumstances under which installation of a policy and charging control (PCC) rule is retried if the rule is reported to have failed.

About Retry Profiles

A retry profile specifies the circumstances under which installation of a Policy and Charging Control (PCC) or an application detection control (ADC) rule is retried if the rule is reported to have failed (for example, because the establishment of a network-initiated bearer failed), as indicated by a Charging-Rule-Report or an ADC-Rule-Report. The retry action consists of repeatedly trying up to a maximum number of retry cycles consisting of several configurable parameters and an exponential back off algorithm to calculate the wait time between successive retry attempts. Generally, each retry cycle would consist of a small number of retry attempts and a relatively large **Back Off Interval** between each retry cycle.

For example, a Charging-Rule-Report reports a failure to establish a dedicated bearer. Using the configured Retry Profile, an attempt is made to establish a dedicated bearer after the **Initial Retry Interval**. Should the attempt fail, another retry attempt is made within the **Maximum Retry Interval** period. Attempts are repeated until the number of attempts reaches the **Maximum Retry Attempts**. This concludes a retry cycle. The next retry cycle begins after the configured time-period **Back Off Interval**.

Note: A retry profile can be applied by a policy rule trigger.

Note: You can define multiple retry profiles, each with different parameter values.

Creating a Retry Profile

To create a retry profile:

1. From the **Policy Server** section of the navigation pane, select **Retry Profile**.
The content tree displays the **Retry Profile** group.
2. Select the **Retry Profile** group.
The **Retry Profile Administration** page opens in the work area and lists any available retry profiles.
3. Click **Create Retry Profile**.
The **New Retry Profile** page opens.
4. Enter the **Name** for the profile.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 255 characters.
5. Enter the **Description/Location**.
Free-form text describing the profile.
6. Select the **Retry Profile Type** from the list:
The available choices are:
 - For Wireless:
PCC Retry Profile and **ADC Retry Profile** (default).
 - For Cable and Wireline:

Best Effort — Transmission opportunities are granted on a first-come, first-served basis. Appropriate for upstream service flows such as Web browsing, email, or instant messaging.

7. Enter the **Maximum Retry Attempt (per Retry Cycle)**.

The maximum number of retry attempts during a retry cycle in the range from 1 to 10. The default is 5.

8. Enter the **Initial Retry Interval**.

The length of time to wait, in seconds, after a reported failure or the end of the Back Off Interval before retrying. Enter a value from 0 to 30 seconds. The default is 10 seconds.

Note: To specify a retry immediately after a reported failure, enter 0.

9. Enter the **Maximum Retry Interval**.

The maximum wait, in seconds, after a reported failure or the end of the Back Off Interval before retrying during a retry cycle. Enter a value from 1 to 180 seconds. The default is 60 seconds.

10. Enter the **Back Off Interval**.

The interval from 1 to 86400 seconds between successive retry cycles. The default is 300 seconds.

11. Enter the **Maximum Retry Cycles**.

The number of retry cycles ranging from 1 to 4. The default value is 1 cycle.

12. **Rule Failure Code**

The upper box lists available rule failure codes. The lower box lists rule failure codes installed in the profile.

Note: The failure codes RESOURCES_LIMITATION and RESOURCE_ALLOCATION_FAILURE are installed by default.

- To add a rule failure code to the profile, select it in the upper box and click **Add**.
- To remove a rule failure code from the profile, select it in the lower box and click **Delete**.

Note: If the total number of retry attempts (**Maximum Retry Attempt** multiplied by the **Maximum Retry Cycles**) exceeds 12, the CMP displays a warning message that the configuration might increase the signaling load in the network and asks if you want to continue with the specified settings.

Note: If the profile does not contain any rule failure codes, the MPE device retries the rule installation regardless of the failure code reported.

13. Click **Save**.

The retry profile is defined in the CMP database and can now be used in a policy.

Modifying a Retry Profile

To modify a retry profile:

1. From the **Policy Server** section of the navigation pane, select **Retry Profile**. The content tree opens.
2. From the content tree, select the **Retry Profile** group.

The **Retry Profile Administration** page opens, displaying the list of defined retry profiles.

3. Select the profile you want to modify.
The profile information is displayed.
4. Click **Modify**.
The **Modify Retry Profile** page opens.
5. Modify profile information.
For a description of the fields contained on this page, see [Creating a Retry Profile](#).
6. Click **Save**.

The retry profile is modified.

Deleting a Retry Profile

To delete a retry profile:

1. From the **Policy Server** section of the navigation pane, select **Retry Profile**.
The content tree opens.
2. From the content tree, select the **Retry Profile** group.
The **Retry Profile Administration** page opens, displaying the list of defined retry profiles.
3. Delete the retry profile using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the retry profile.
 - From the content tree, select the retry profile and click **Delete**.

A confirmation message displays.

4. Click **OK** to delete the retry profile.

The retry profile is deleted.

Note: If the retry profile is used in a policy action, the deletion fails.

Chapter 17

Managing Roaming Profiles

Topics:

- *About Roaming Profiles.....183*
- *Creating a Roaming Profile.....183*
- *Modifying a Roaming Profile.....186*
- *Deleting a Roaming Profile.....186*

This chapter describes how to create and manage roaming profiles in the CMP system.

A roaming profile allows a set of roaming attributes to be defined and then applied to specific subscribers.

About Roaming Profiles

Roaming Profiles are used in conjunction with the S9 interface. The S9 interface allows the PCRF to support LTE roaming services such as Voice over LTE. This is done by establishing S9 and Rx sessions between the Home PCRF (H-PCRF) and the Visiting PCRF (V-PCRF).

Roaming Profiles are used to allow or disallow S9 requests at the H-PCRF, and to validate messages coming from the H-PCRF and going to the V-PCRF. A V-PCRF also uses the roaming profile to decide whether to report UE Time zone and location information to the H-PCRF. You can define up to 50 profiles, each with different parameters.

S9 interface functionality must be turned on before roaming profiles can be used. By default, the PCRF cannot initiate or accept S9 requests. To turn initiate or accept on, modify the S9 settings using the **Policy Server** tab in the Policy Server configuration. If an MRA is deployed in the network, the primary and secondary DEA (or S9 peer) can be configured using the **MRA** tab located in the MRA configuration.

Note: At least one MRA Diameter Routing Peer must be defined to configure the primary/secondary DEA.

Creating a Roaming Profile

To create a roaming profile:

1. From the **Policy Server** section of the navigation pane, select **Roaming Profile**.
The content tree displays the **Roaming Profile** group.
2. Select **Roaming Profile** group.
The **Roaming Profile Administration** page opens in the work area, listing available roaming profiles.
3. Click **Create Roaming Profile**.
The **New Roaming Profile** page opens.
4. On the **Configuration** tab, enter the following information:
 - a) **Name** — Unique name assigned to the roaming profile. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description** — Free-form text describing the profile. A maximum of 255 characters can be entered.
 - c) **S9 Support** — Select the type of S9 interface support allowed for this roaming profile. The available choices are:
 - **None** (default)—S9 support is not allowed.
 - **Both**—S9 support is allowed for subscribers with MCC-MNC for both visiting and home functionalities.
 - **Visiting**—S9 support is allowed for visiting subscribers with MCC-MNC VPCRF functionality.
 - **Home**—S9 support is allowed for home subscribers with MCC-MNC HPCRF functionality.

If **Both** or **Visiting** is selected, the **QoS Validation Parameters** tab becomes available.

- d) **Report over S9** — Select the content to be reported using the S9 interface. The available content is **User Location** and **Timezone**. Both choices are unchecked (not reported) by default. This option is enabled only when S9 support is either **Visiting** or **Both**.
5. If the **QoS Validation Parameters** tab is available, enter the following information:
- Uplink Aggregated Guaranteed Bitrate (bps)** — Enter the maximum uplink guaranteed bitrate to be allowed for a PDN connection across all GBR (Guaranteed Bit Rate) bearers.
Integer value in the inclusive range of 0 to 9,223,372,036,854,775,807 (without commas), that is, 0 to $2^{63}-1$. If this field is left blank, no validation is performed.
 - Downlink Aggregated Guaranteed Bitrate (bps)** — Enter the maximum downlink guaranteed bitrate to be allowed for a PDN connection across all GBR (Guaranteed Bit Rate) bearers.
Integer value in the inclusive range of 0 to 9,223,372,036,854,775,807 (without commas), that is, 0 to $2^{63}-1$. If this field is left blank, no validation is performed.
 - Uplink Aggregated Maximum Bitrate (bps) for Guaranteed Bitrate Bearers** — Enter the maximum uplink bitrate to be allowed for a PDN connection across all GBR (Guaranteed Bit Rate) bearers.
Integer value in the inclusive range of 0 to 9,223,372,036,854,775,807 (without commas), that is, 0 to $2^{63}-1$. If this field is left blank, no validation is performed.
 - Downlink Aggregated Maximum Bitrate (bps) for Guaranteed Bitrate Bearers** — Enter the maximum downlink bitrate to be allowed for a PDN connection across all GBR (Guaranteed Bit Rate) bearers.
Integer value in the inclusive range of 0 to 9,223,372,036,854,775,807 (without commas), that is, 0 to $2^{63}-1$. If this field is left blank, no validation is performed.
 - Uplink APN Aggregate Maximum Bitrate (bps)** — Specify the maximum aggregate bitrate associated with a specific access point (APN) for the uplink direction.
Integer value in the inclusive range of 0 to 9,223,372,036,854,775,807 (without commas), that is, 0 to $2^{63}-1$. If this field is left blank, no validation is performed.
 - Downlink APN Aggregate Maximum Bitrate (bps)** — Specify the maximum aggregate bitrate associated with a specific access point (APN) for the downlink direction.
Integer value in the inclusive range of 0 to 9,223,372,036,854,775,807 (without commas), that is, 0 to $2^{63}-1$. If this field is left blank, no validation is performed.
 - Acceptable Default EPS Bearer QoS** Under this heading are the following variables:
 - QoS Class Identifiers** — Check mark one or more QoS class identifiers (QCI) to be associated with this roaming profile or enter a value between 1 and 254 in the **Others** field and click **Add**. This identifies the set of Default EPS Bearer QCI values that are acceptable at the VPCRF. When one or more values is selected, the VPCRF function validates the QCI value from the Default-EPS-Bearer-QOS AVP, sent by the HPCRF against the configured set of values in the roaming profile. If no identifier is check marked, the default is 9. The options are:
 - 1 (Conversation Speech)
 - 2 (Conversational)
 - 3 (Streaming Speech)
 - 4 (Streaming)
 - 5 (Interactive with priority 1 signaling)
 - 6 (Interactive with priority 1)
 - 7 (Interactive with priority 2)

- **8 (Interactive with priority 3)**
- **9 (Background)** (default)
- **65 (MC-PTT)**
- **66 (PTT Voice)**
- **69 (MC-PTT Signaling)**
- **70 (MC Data)**

Note: QCI values between 1 and 254 are supported. Values other than 1-9, 65, 66, 69, and 70 are undefined.

- **ARP Priority Level (Comma Separated Values)** — This field identifies the set of Default EPS Bearer ARP Priority values that are acceptable at the VPCRF. The VPCRF function validates the ARP Priority value from the Default-EPS-Bearer-QOS AVP, sent by the HPCRF against the configured set of values in the roaming profile. When limited resources are encountered, the Allocation and Retention Priority (ARP) priority level tells the system to either accept or reject an establishment or modification of bearer request.

Enter one or more priority values separated by a comma. Note that the VPCRF checks to see if the incoming message from the HPCRF contains the Default-EPS-Bearer-Qos AVP. If it does, the ARP Priority Level in that AVP is added to the list of selected values allowed by the roaming profile. Valid priority level values are 1 through 9. Default value is none (or empty).

- **ARP Preemption Capability** — This field configures whether preemption capability is enabled or disabled in the PCC action profile. Preemption aids in call admission control and lets the gateway accommodate higher priority bearers over lower priority bearers (for example, when resources are unusually limited or for emergency services), based on the ARP Priority Level and ARP Preemption Vulnerability. Options from the pulldown menu are **BOTH**, **PREEMPTION_CAPABILITY_ENABLED**, and **PREEMPTION_CAPABILITY_DISABLED**. The default value is **BOTH**. Note that the VPCRF checks to see if the incoming message from the HPCRF contains the Default-EPS-Bearer-Qos AVP. If it does, the ARP Preemption Capability in that AVP overrides any value selected here.
- **ARP Preemption Vulnerability** — This field identifies the Default EPS Bearer ARP Preemption Vulnerability values that are acceptable at the VPCRF. The VPCRF function validates the ARP Preemption Vulnerability value from the Default-EPS-Bearer-QOS AVP, sent by the HPCRF against the configured value in the roaming profile. Options from the pulldown menu are **Both**, **Preemption_vulnerability_enabled**, and **Preemption_vulnerability_disabled**. Default value is **Both**. Note that the VPCRF checks to see if the incoming message from the HPCRF contains the Default-EPS-Bearer-Qos AVP. If it does, the ARP Preemption Vulnerability in that AVP overrides any value selected here.

6. On the **Associated MCC-MNC Lists** tab, highlight the match lists in the **Available** column and click the right arrow (>>) button to move them to the **Associated** column.

See [Managing Match Lists](#) for information on creating a match list.

7. Click **Save**.

The roaming profile is defined in the CMP database and can now be used in a policy.

Modifying a Roaming Profile

To modify a roaming profile:

1. From the **Policy Server** section of the navigation pane, select **Roaming Profile**.
The content tree opens.
2. From the content tree, select the **Roaming Profile** group.
The **Roaming Profile Administration** page opens, displaying the list of defined roaming profiles.
3. Select the profile you want to modify.
Profile information is displayed.
4. Click **Modify**.
The **Modify Roaming Profile** page opens.
5. Modify profile information as required.
For a description of the fields contained on this page, see [Creating a Roaming Profile](#).
6. When you finish, click **Save** (or **Cancel** to abandon your changes).

The roaming profile is modified.

Deleting a Roaming Profile

Note: A roaming profile cannot be deleted if any policy is referencing it.

To delete a roaming profile:

1. From the **Policy Server** section of the navigation pane, select **Roaming Profile**.
The content tree opens.
2. From the content tree, select the **Roaming Profile** group.
The Roaming Profile Administration page opens, displaying the list of defined roaming profiles.
3. Delete the roaming profile using one of the following methods:
 - From the work area, click  (trash can icon) located to the right of the roaming profile.
 - From the content tree, select the roaming profile and click **Delete**.

A confirmation message displays.

4. Click **OK**.

The roaming profile is deleted.

Chapter 18

Managing Service Classes

Topics:

- [*About Service Classes.....188*](#)
- [*Creating a Service Class.....188*](#)
- [*Modifying a Service Class.....189*](#)
- [*Deleting a Service Class.....190*](#)

This chapter defines how to create and manage service classes in the CMP system.

In a cable network, a service class corresponds to a DOCSIS traffic description defined in a cable modem termination system (CMTS).

Note: Service Classes is a function that is applicable to Cable mode only.

About Service Classes

A service class corresponds to a DOCSIS traffic description defined in a cable modem termination system (CMTS). You can define service classes using the CMP system, load them using the OSSI/XML interface, or discover them using the SNMP interface.

Note: Service Classes is a function that is applicable to Cable mode only.

Creating a Service Class

Note: Service Classes is a function that is applicable to Cable mode only.

To create a service class:

1. From the **Policy Server** section of the navigation pane, select **Service Classes**.
The content tree displays the **Service Classes** group.
2. Select the **Service Classes** group.
The **Service Class Administration** page opens in the work area, listing available service classes.
3. Click **Create Service Class**.
The **New Service Class** page opens.
4. Enter the following information:
 - a) **Name** — The name assigned to the service class.
 - b) **Scheduling Type** — Select from the following:
 - **Downstream** (default) — Defined through a similar set of QoS parameters that are associated with the best-effort scheduling type on upstream service flows. Appropriate for all downstream service flows.
 - **Best Effort** — Transmission opportunities are granted on a first-come, first-served basis. Appropriate for upstream service flows such as Web browsing, e-mail, or instant messaging.
 - **Non Real Time Polling** — Cable modems are polled at a fixed interval for queued data. Appropriate for upstream service flows that require high throughput, and traffic that requires variable-sized data grants on a regular basis, such as high-bandwidth FTP.
 - **Real Time Polling** — Cable modems are polled at a fixed but short interval for queued data. Appropriate for upstream service flows of real-time traffic that generate variable-sized data packets on a periodic basis and have inflexible latency and throughput requirements, such as MPEG video.
 - **Unsolicited Grant Service** — A fixed-size grant is offered to service flows at fixed intervals without additional polling or interaction. Appropriate for upstream service flows of real-time traffic that generate fixed-size data packets on a periodic basis, such as VoIP.
 - **Unsolicited Grant Service with Activity Detect** — When there is activity, the CMTS sends unsolicited fixed grants at fixed intervals to the cable modem. When there is no activity, the CMTS sends unicast poll requests to the cable modem to conserve unused bandwidth. Appropriate for upstream service flows that include silence suppression.
 - c) **Maximum Traffic Rate (bps)** — The maximum sustained rate, in bits per second, at which traffic can operate over the service flow.
Enter an integer between 0 and 4294967295.

This field applies to the **Downstream**, **Best Effort**, **Non Real Time Polling**, and **Real Time Polling** scheduling types.

- d) **Minimum Reserved Rate (bps)** — The guaranteed minimum rate, in bits per second, that is reserved for the service flow.

Enter an integer between 0 and 4294967295.

This field applies to the **Downstream**, **Best Effort**, **Non Real Time Polling**, and **Real Time Polling** scheduling types.

- e) **Unsolicited Grant Size (bytes)** — The size, in bytes, of the individual data grants provided to the service flow.

Enter an integer between 0 and 65535.

This field applies to the **Unsolicited Grant Service** and **Unsolicited Grant Service with Activity Detect** scheduling types.

- f) **Nominal Grant Interval (usecs)** — The nominal interval, in microseconds, between successive unsolicited data grant opportunities for this service flow.

Enter an integer between 0 and 4294967295.

This field applies to the **Unsolicited Grant Service** and **Unsolicited Grant Service with Activity Detect** scheduling types.

- g) **Grants per Interval** — The actual number of data grants given to the service flow during each nominal grant interval.

Enter an integer between 0 and 127.

This field applies to the **Unsolicited Grant Service** and **Unsolicited Grant Service with Activity Detect** scheduling types.

5. Click **Save**.

The service class is defined in the CMP database and can now be used in a policy.

Modifying a Service Class

To modify a service class:

1. From the **Policy Server** section of the navigation pane, select **Service Classes**.
The content tree opens.
2. From the content tree, select the **Service Classes** group.
The **Service Class Administration** page opens, displaying the list of defined service classes.
3. Select the service class.
Service class information is displayed.
4. Click **Modify**.
The **Modify Service Class** page opens.
5. Modify service class information.
For a description of the fields contained on this page, see [Creating a Service Class](#).
6. Click **Save**.

The service class is modified.

Deleting a Service Class

To delete a service class:

1. From the **Policy Server** section of the navigation pane, select **Service Classes**.
The content tree opens.
2. From the content tree, select the **Service Classes** group.
The **Service Class Administration** page opens displaying the list of defined service classes.
3. Delete the service class using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the service class.
 - From the content tree, select the service class and click **Delete**.

A confirmation message displays.

4. Click **OK** to delete the service class.

The service class is deleted.

Chapter 19

Managing Services and Rating Groups

Topics:

- [About Services.....192](#)
- [About Rating Groups.....193](#)

This chapter describes how to create and manage Gy services and rating groups in the CMP system.

About Services

In a wireless network, a service is an identification of a class of traffic:

- Voice
- Peer-to-peer
- Multimedia

You can apply a quota or a rating group (but not both) to a service.

For organizational purposes, you can associate services into rating groups. This is a convenient way of allowing multiple services to share the same quota.

Note: The actual options you see depend on whether or not your CMP system is configured in wireless Gx mode, wireless Gy mode, or both. For information on defining quotas, see [Managing Quotas](#).

Creating a Service

Note: Services is a function that is applicable to Gy interfacing mode only.

To create a service:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.
The content tree displays the **Services & Rating Groups** group.
2. Select the **Services & Rating Groups** group.
The **Service Administration** page opens in the work area.
3. Click **Create Service**.
The **New Service** page opens.
4. Enter the following information:
 - a) **Name** (required) — The name assigned to the service. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
 - b) **Description/Location** — Free-form text.
 - c) **Service Identifier** — A unique numeric identifier.
 - d) **Rating Group** — Select **None** (default) or one of the rating groups defined in the CMP database.
 - e) **Quota** — Select **None** (default) or one of the quotas defined in the CMP database.
5. Click **Save**.

The service is created.

Modifying a Service

To modify a service:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.
The content tree opens.
2. From the content tree, select the **Services** group.
The **Service Administration** page opens, displaying the list of defined services.
3. Select the service you want to modify.

The work area displays information about the service.

4. Click **Modify**.

The **Modify Service** page opens.

5. Modify service information as required.

For a description of the fields contained on this page, see [Creating a Service](#).

6. Click **Save**.

The service is modified.

Deleting a Service

To delete a service:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.

The content tree opens.

2. From the content tree, select the **Services** group.

The **Service Administration** page opens, displaying the list of defined services.

3. Delete the service using one of the following methods:

- From the work area, click  (trash can icon), located to the right of the service.
- From the content tree, select the service and click **Delete**.

A conformation message displays.

4. Click **OK** to delete the service.

The service is deleted.

About Rating Groups

For organizational purposes, you can combine services into rating groups. Quotas apply to all the services in a rating group. After a rating group is created, you can populate it with services.

Note: Rating groups are applicable in the Gy interfacing mode only.

Creating a Rating Group

Note: Rating groups is a function that is applicable to Gy interfacing mode only.

To create a rating group:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.

The content tree displays the **Services & Rating Groups** group.

2. Select the **Services & Rating Groups** group.

The **Service Administration** page opens in the work area.

3. Click **Create Rating Group**.

The **Create Rating Group** page opens.

4. Enter the following information:

- a) **Name** (required) — The name assigned to the rating group. The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_). The maximum length is 255 characters.
- b) **Description/Location** — Free-form text.
- c) **Rating Group Identifier** — A unique numeric identifier.
- d) **Quota** — Select **None** (default) or one of the quotas defined in the CMP.

5. Click **Save**.

The rating group is created and stored in the **Services & Rating Groups** folder.

Adding a Service to a Rating Group

To add a service to a rating group:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.
The content tree displays the **Services & Rating Groups** group.
2. In the content tree, select the rating group to which you want to add a service.
The **Rating Group Administration** page opens in the work area.
3. Click **Add Service**.
The **Add Service** page opens, displaying the services not already part of the group.
4. Select the service you want to add; use the Ctrl or Shift keys to select multiple services.
5. Click **Save**.

The service is added to the selected rating group.

Modifying a Rating Group

You cannot rename a rating group that is referenced in a policy. Otherwise, to modify a rating group:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.
The content tree displays the **Services & Rating Groups** group.
2. In the content tree, select the rating group you want to modify.
The **Rating Group Administration** page opens displaying the information about the rating group.
3. Click **Modify**.
The **Modify Rating Group** page opens.
4. Make changes. For information about the fields on this page, see [Creating a Rating Group](#).
5. Click **Save**.

The rating group is modified.

Removing a Service from a Rating Group

Removing a service from a rating group does not delete the service. To delete a service, see [Deleting a Service](#).

To remove a service from a rating group:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**.
The content tree displays the **Services & Rating Groups** group.

2. In the content tree, select the rating group from which you want to remove the service. The work area displays information about the rating group.
3. Remove the service using one of the following methods:
 - On the **Rating Group Administration** page, click the Remove icon, located to the right to the service you want to remove. The service is removed from the rating group immediately; there is no confirmation message.
 - From the content tree, select the service in the rating group; the **Service Administration** page opens, displaying information about the service. Click **Delete**. A confirmation message displays. Click **OK**.

The service is removed from the rating group.

Deleting a Rating Group

Deleting a rating group does not delete any services associated with the deleted group; services remain in the **Services & Rating Groups** group. You cannot delete the **Services & Rating Groups** group. You cannot delete a rating group that is referenced in a policy. Otherwise, to delete a rating group:

1. From the **Policy Server** section of the navigation pane, select **Services & Rating Groups**. The content tree displays the **Services & Rating Groups** group.
2. From the content tree, select the rating group you want to delete. The **Rating Group Administration** page opens in the work area, displaying the contents of the selected rating group.
3. Click **Delete**. A confirmation message displays.
4. Click **OK**.

The rating group is deleted.

Chapter 20

Managing Subscriber Keys

Topics:

- [*About Subscriber Keys.....197*](#)
- [*Creating a Subscriber Key.....197*](#)
- [*Modifying a Subscriber Key.....199*](#)
- [*Deleting a Subscriber Key.....199*](#)

This chapter describes how to create and manage subscriber keys in the CMP system.

In a wireless network, a subscriber key associates subscriber IDs with RADIUS messages for RADIUS accounting purposes.

Note: The actual options you see depend on whether or not your CMP system is configured for RADIUS CoA mode.

About Subscriber Keys

Note: Subscriber keys is a function that is applicable to RADIUS mode only. For more information on RADIUS configuration, see *CMP Wireless User's Guide*.

An MPE device must create a data session to track the life cycle of the request and process of any subsequent Interim-Update messages or a RADIUS Accounting-Stop message, when a RADIUS Accounting-Start message is received from:

- An AAA server or from a broadband network gateway (BNG) system
- A RADIUS Interim-Update message is received for an unknown session

To create this session, the MPE device determines a subscriber ID from the RADIUS message using subscriber keys. You configure subscriber keys using the CMP system. Subscriber keys are associated with individual BNG systems.

The subscriber key is a combination of specified type-length values (TLVs) or vendor-specific attributes (VSAs) found in the RADIUS message. The order in which the attribute values are combined is defined in the CMP system. After the subscriber key is computed, the key is matched against the subscribers defined on the MPE device:

- If no match is found, the MPE device initiates an SPR database lookup:
 - If the lookup succeeds, the request is parsed for creating a list of VSAs to be included in a RADIUS Change of Authorization (CoA) message and sent to the BNG system.
 - If the lookup fails and if the RADIUS configuration value **Validate User** is set to **true**, the request is rejected.
- If a match is found, the MPE device creates a dummy user instance to store necessary information for later use.

For more information on CoA messages, see [Managing RADIUS CoA Templates](#).

Creating a Subscriber Key

Note: Subscriber keys is a function that is applicable to RADIUS CoA mode only.

To create a subscriber key:

1. From the **Policy Server** section of the navigation pane, select **Subscriber Keys**.
The content tree displays the **Subscriber Keys** group.
2. Select the **Subscriber Keys** group.
The **Subscriber Keys Administration** page opens in the work area.
3. Click **Create Subscriber Key**.
The **New Subscriber Key** page opens.
4. Enter the **Name** you assign to the subscriber key.
Enter a string.
5. Add a subscriber key.
 - a) Click **Add**. The **Add Subscriber Key Field** window opens.

TLVs and VSAs are concatenated in the order in which you define them here.

b) **Vendor** — Select the available vendor from the list:

- **IETF** (default)
- **3GPP**
- **3GPP2**
- **Camiant**
- **Cisco**
- **Cisco-BBSM**
- **Cisco-VPN3000**
- **Cisco-VPN5000**
- **Juniper**
- **Juniper-M-Series**
- Any defined custom vendors are displayed at the end of the list; for more information, see [Managing Custom Vendors](#)

c) **TLV/VSA** — Select the TLV or VSA from the list.

The choices are extensive and are not listed here. Any defined custom TLVs or VSAs are displayed at the end of the list; for more information, see [Managing Custom VSAs](#).

d) **Delimiter** — Enter the delimiter between fields used by the vendor.

e) Click **Save**.

6. (Optional) Add, modify, or delete subscriber keys.

- Cloning an entry in the table
 1. Select an entry in the table.
 2. Click  **Clone**. The **Clone** window opens with the information for the entry.
 3. Make changes as required.
 4. Click **Save**. The entry is added to the table
- Editing an entry in the table
 1. Select the entry in the table.
 2. Click  **Edit**. The **Edit Response** window opens, displaying the information for the entry.
 3. Make changes as required.
 4. Click **Save**. The entry is updated in the table.
- Deleting a value from the table
 1. Select the entry in the table.
 2. Click  **Delete**. A confirmation message displays.
 3. Click **Delete** to remove the entry. The entry is removed from the table.

7. Click **Save**.

The subscriber key is displayed in the **Subscriber Keys Administration** page. After you define subscriber keys, they can be matched against subscribers currently known in the system.

Modifying a Subscriber Key

1. From the **Policy Server** section of the navigation pane, select **Subscriber Keys**.
The **Subscriber Keys Administration** page opens in the work area, listing the defined subscriber keys.
2. Select the subscriber key you want to modify.
The **Subscriber Keys Administration** page displays information about the subscriber key.
3. Click **Modify**.
The **Modify Subscriber Key** page opens.
4. Modify subscriber key information.
For a description of the fields contained on this page, see [Creating a Subscriber Key](#).
5. Click **Save**.
The subscriber key definition is modified.

Deleting a Subscriber Key

1. From the **Policy Server** section of the navigation pane, select **Subscriber Keys**.
The **Subscriber Keys Administration** page opens in the work area, listing the defined subscriber keys.
2. Delete the subscriber key using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the subscriber key.
 - From the content tree, select the subscriber key and click **Delete**.A confirmation message displays.
3. Click **OK**.
The subscriber key is deleted.

Chapter 21

Managing Traffic Profiles

Topics:

- [About Traffic Profiles.....201](#)
- [About Traffic Profile Groups.....224](#)

This chapter defines how to create and manage traffic profiles in the CMP system.

A traffic profile is a set of values defined for parameters that are used in protocol messages within an MPE device.

About Traffic Profiles

A traffic profile is a set of values defined for parameters that are used in protocol messages within the MPE device. Typically, these traffic profile values are used to define the Quality of Service (QoS) for sessions that are managed by those protocol messages. You can use traffic profiles to implement policy and charging control (PCC) rules.

Traffic profiles are used in the MPE device under several situations. For example:

- They define default settings for protocol messages (see the appropriate *CMP User's Guide*).
- They modify protocol messages, thus modifying the QoS for sessions managed by those messages (see [Creating a Policy Rule](#)).

A traffic profile can be applied by a policy rule trigger or by default if no policy rule is triggered.

Each traffic profile has a type associated with it. Since each protocol supports different parameters for controlling QoS settings, the available MPE parameters depend on the underlying protocol. Therefore, each profile type is associated with a single protocol, but a single protocol can support multiple profile types.

You can create multiple traffic profiles of the same type, as the values of the parameters for each profile determine the actual QoS that is associated with that profile. For example, one possible set of traffic profiles is as follows:

Default	Default predefined profile
P2P	Profile for peer-to-peer traffic
RATE_LIMIT_128K	profile to limit download rate to 128 Kbps
RATE_LIMIT_64K	Profile to limit download rate to 64 Kbps

To manage traffic profiles, see:

- [Creating a Wireless Traffic Profile](#)
- [Creating a Cable Traffic Profile](#)
- [Modifying a Traffic Profile](#)
- [Deleting a Traffic Profile](#)

About Traffic Profile Variables

You can configure individual fields in a traffic profile as variables. Traffic profile variables are evaluated when the policy executes the traffic profile that contains it. Traffic profile variables let you reuse traffic profiles for a range of situations without having to create additional profiles that might differ only in a few ways, or add traffic profiles to policy tables. Traffic profile variables are available for the following profile types:

- ADC Rule
- Diameter QoS
- PCC Profile
- PCC Rule

To use variables in a traffic profile, select the **Enable Dynamic Override** check box when creating or editing the profile. This displays fields in which you can enter variables for one or more profile values.

A variable supersedes any defined static value. If a variable is not available when it is evaluated, the static value is used and the existing traffic profiles continue to work as before. If neither a variable nor a static value is available, the parameter is ignored and the associated AVP is not included under the Charging-Rule-Definition AVP.

You can include the following classes of traffic profile variables:

Substitution variables	Predefined variables available during policy rule execution within an MPE device to allow for substitution of these variables for contextual information. For example, <i>{Time}</i> is replaced by the time value when a policy rule that references it is evaluated.
Policy table variables	Variables that reference a policy table column.
Policy evaluation variables	Variables that exist only for the lifetime of a policy evaluation cycle (that is, the process of evaluating all the policies for a single request or context).
Session state variables	State variables that have a value that is saved only while the session they are associated with is valid. After the session is terminated, session state variables no longer have a value and are no longer available for use in policies.
Subscriber local state variables	State variables that exist locally on the MPE device and have a value while the associated subscriber has at least one session on that device. After the last session is terminated, subscriber local state variables no longer have a value and are no longer available for use in policies.
Subscriber remote state variables	State variables that exist remotely in an SPR database and have a value while the associated subscriber exists in that database. Using subscriber remote state variables requires that an SPR or HSS database is configured and capable of storing these variables.

See [Example Traffic Profile Variables](#) for examples of traffic profile variables.

Example Traffic Profile Variables

The examples provided in this section represent each class of traffic profile variables:

Substitution Variable	<i>{Session.APNAggregateMaxBitrateUplink}</i> Replaced with the <i>APNAggregateMaxBitrateUplink</i> value currently saved in the session.
Policy Table Variable	<i>{PolicyTable.pccrule.GuaranteedBitrateUplink}</i> The policy table named pccrule is evaluated by looking at the <i>GuaranteedBitrateUplink</i> column in this table.
Policy Evaluation Variable	<i>{Policy.Variable.Uplink}</i> Replaced with the value of the policy variable named Uplink retrieved from the current policy evaluation cycle.
Session State Variable	<i>{Session.State.Uplink}</i> Replaced with the value of the state variable named Uplink retrieved from the session.
Subscriber Local State Variable	<i>{User.LocalState.Uplink}</i>

	Replaced with the value of the state variable named Uplink retrieved from the local user object on the MPE device.
Subscriber Remote State Variable	<code>{User.State.Uplink}</code> Replaced with the value of the state variable named Uplink retrieved from the SPR database.

Creating a Wireless Traffic Profile

To create a traffic profile in Wireless mode:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. Select the **Traffic Profiles** group.
The **Traffic Profile Administration** page opens in the work area and lists available traffic profiles.
3. Click **Create Traffic Profile**.
The **New Traffic Profile** page opens.
4. Enter the **Name** for the traffic profile.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 255 characters.
5. Select the **Traffic Profile Type** from the list.
The types of traffic profiles available depend on the mode in which the CMP system is operating. Wireless Mode contains the following traffic profile types:
 - **ADC Rule** (default) — an application detection control rule.
 - **Diameter QoS** — a policy and charging control rule.
 - **PCC Profile** — a policy and charging control profile.
 - **PCC Rule** — a policy and charging control rule.
 - **PCC Rule Extension** — a policy and charging control rule extension.

Note: PCC Extensions mode must be enabled to see this profile type.

 - **Predefined ADC Rule** — a predefined ADC rule residing on the PCEF.
 - **Predefined ADC Rule Base** — a predefined group of ADC rules residing on the PCEF.
 - **Predefined PCC Rule** — a predefined PCC rule residing on the PCEF.
 - **Predefined PCC Rule Base** — a predefined group of PCC rules residing on the PCEF.
 - **Service Control Engine (SCE) Profile** — a predefined policy on the SCE.

Note: SCE-Gx mode must be enabled to see this profile type.
6. Select to **Enable Dynamic Override** (available for ADC Rule, Diameter QoS, PCC Profile, and PCC Rule profiles).
If you select this option, **Dynamic Value** fields appear enabling you to enter configuration parameters. You can enter variables for the configuration parameters. Variable names must be enclosed in curly braces ({}). For more information about dynamic overrides, see [About Traffic Profile Variables](#).
7. Enter the parameters for the selected **Traffic Profile Type**.
For example, in Wireless mode, if you choose **Diameter QoS** as the **Traffic Profile Type**, the page displays the fields described in [Diameter QoS Traffic Profile Configuration Parameters](#).

The following list details the configuration parameters for traffic profile types:

- [ADC Rule Traffic Profile Configuration Parameters](#)
- [Diameter QoS Traffic Profile Configuration Parameters](#)
- [PCC Profile Traffic Profile Configuration Parameters](#)
- [PCC Rule Traffic Profile Configuration Parameters](#)
- [Predefined PCC Rule Extension Traffic Profile Configuration Parameters](#)
- [Predefined ADC Rule Traffic Profile Configuration Parameters](#)
- [Predefined ADC Rule Base Traffic Profile Configuration Parameters](#)
- [Predefined PCC Rule Traffic Profile Configuration Parameters](#)
- [Predefined PCC Rule Base Traffic Profile Configuration Parameters](#)
- [SCE Profile Traffic Profile Configuration Parameters](#)

8. Click **Save**.

The traffic profile is defined in the CMP database and can now be used in a policy.

ADC Rule Traffic Profile Configuration Parameters

Parameter	Description
Rule Name	Uniquely identifies the ADC rule. Used to reference an ADC rule in communication between the MPE device and a PCEF within one IP-CAN session.
Uplink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for uplinks (user equipment to network).
Downlink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for downlinks (network to user equipment).
Monitoring Key	Select a monitoring key that may apply to the ADC rule. For more information on monitoring keys, see Managing Monitoring Keys . The default is N/A .
Flow Status	Indicates whether the application traffic is enabled or disabled in either the uplink or downlink direction. Select from the following: <ul style="list-style-type: none"> • N/A (default) • ENABLED_UPLINK • ENABLED_DOWNLINK • ENABLED • DISABLED
TDF Application Identifier	Identifies the traffic that belongs to the application to which the rule applies.
TDF Redirect Support	Indicates whether the application traffic should be redirected to another controlled address. Select from the following: <ul style="list-style-type: none"> • N/A (default) • REDIRECTION_DISABLED • REDIRECTION_ENABLED

Parameter	Description
TDF Redirect Address Type	Specifies the format for the redirect address. Select from the following: <ul style="list-style-type: none"> • N/A (default) • IPv4 • IPv6 • URL • SIP_URI
TDF Redirect Server Address	The address of the TDF redirect server in the specified address type.
Mute Notification	Used to disable application detection notifications from the TDF device. Select from the following: <ul style="list-style-type: none"> • N/A (default) • MUTE_REQUIRED
Service Identifier	Credit-control service identifier associated with the traffic defined by this rule. Only applicable if online charging is enabled.
Rating Group	Credit-control rating group associated with the traffic defined by this profile. Only applicable if online charging is enabled.
Reporting Level	Select from the following: <ul style="list-style-type: none"> • N/A (default) • SERVICE_IDENTIFIER_LEVEL • RATING_GROUP_LEVEL
Online Charging	Specifies whether or not online charging is enabled in this profile. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DISABLE_ONLINE • ENABLE_ONLINE
Offline Charging	Specifies whether or not offline charging is enabled in this profile. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DISABLE_OFFLINE • ENABLE_OFFLINE
Metering Method	Defines how service data-flow traffic is metered for offline charging. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DURATION • VOLUME • DURATION_VOLUME • EVENT

Parameter	Description
	Note: Event-based charging is only applicable to predefined PCC rules using a service data-flow filter and any PCC rule (predefined and dynamic) using an application detection identifier.
Precedence	Precedence value of the profile. The lower the precedence, the higher the priority.

Diameter QoS Traffic Profile Configuration Parameters

Parameter	Description
QoS Class Identifier	<p>Identifies the QoS class. Enter a value between 1 and 254 or select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • 1 = Conversational speech • 2 = Conversational • 3 = Streaming speech • 4 = Streaming • 5 = Interactive with priority 1 signalling • 6 = Interactive with priority 1 • 7 = Interactive with priority 2 • 8 = Interactive with priority 3 • 9 = Background • 65 = MC-PTT Voice • 66 = PTT Voice • 69 = MC-PTT Signaling • 70 = MC Data <p>Note: QCI values between 1 and 254 are supported. Values other than 1-9, 65, 66, 69, and 70 are undefined.</p>
Uplink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for uplinks (user equipment to network).
Downlink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for downlinks (network to user equipment).
Uplink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for uplinks (user equipment to network). Only applicable if the QoS class identifier is between 1 and 4.
Downlink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for downlinks (network to user equipment). Only applicable if the QoS class identifier is between 1 and 4.
ARP Priority Level	Allocation and Retention Priority level of the service flows associated with this Diameter profile. Specify 1 (highest) to 15 (lowest).
ARP Preemption Capability	<p>Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_CAPABILITY_ENABLED

Parameter	Description
ARP Preemption Vulnerability	<ul style="list-style-type: none"> • PREEMPTION_CAPABILITY_DISABLED <p>Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_VULNERABILITY_ENABLED • PREEMPTION_VULNERABILITY_DISABLED
Resource Allocation Notification	<p>Indicates that the allocation of resources for the related PCC rules will be confirmed. Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • ENABLE_NOTIFICATION

PCC Profile Traffic Profile Configuration Parameters

Parameter	Description
QoS Class Identifier	<p>Identifies the QoS class. Enter a value between 1 and 254 or select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • 1 = Conversational speech • 2 = Conversational • 3 = Streaming speech • 4 = Streaming • 5 = Interactive with priority 1 signalling • 6 = Interactive with priority 1 • 7 = Interactive with priority 2 • 8 = Interactive with priority 3 • 9 = Background • 65 = MC-PTT Voice • 66 = PTT Voice • 69 = MC-PTT Signaling • 70 = MC Data <p>Note: QCI values between 1 and 254 are supported. Values other than 1-9, 65, 66, 69, and 70 are undefined.</p>
Uplink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for uplinks (user equipment to network).
Downlink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for downlinks (network to user equipment).
Uplink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for uplinks (user equipment to network). Only applicable if the QoS class identifier is between 1 and 4 .
Downlink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for downlinks (network to user equipment). Only applicable if the QoS class identifier is between 1 and 4 .

Parameter	Description
ARP Priority Level	Allocation and Retention Priority level of the service flows associated with this Diameter profile. Specify 1 (highest) to 15 (lowest).
ARP Preemption Capability	Select from the following: <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_CAPABILITY_ENABLED • PREEMPTION_CAPABILITY_DISABLED
ARP Preemption Vulnerability	Select from the following: <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_VULNERABILITY_ENABLED • PREEMPTION_VULNERABILITY_DISABLED
Monitoring Key	Select a monitoring key that may apply to the PCC profile. For more information on monitoring keys, see Managing Monitoring Keys . The default is N/A.
Service Identifier	Credit-control service identifier associated with the traffic defined by this rule. Only applicable if online charging is enabled.
Rating Group	Credit-control rating group associated with the traffic defined by this profile. Only applicable if online charging is enabled.
Reporting Level	Select from the following: <ul style="list-style-type: none"> • N/A (default) • SERVICE_IDENTIFIER_LEVEL • RATING_GROUP_LEVEL • SPONSORED_CONNECTIVITY_LEVEL
Online Charging	Specifies whether or not online charging is enabled in this profile. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DISABLE_ONLINE • ENABLE_ONLINE
Offline Charging	Specifies whether or not offline charging is enabled in this profile. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DISABLE_OFFLINE • ENABLE_OFFLINE
Metering Method	Defines how service data-flow traffic is metered for offline charging. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DURATION • VOLUME • DURATION_VOLUME • EVENT

Parameter	Description
	<p>Note: Event-based charging is only applicable to predefined PCC rules using a service data-flow filter and any PCC rule (predefined and dynamic) using an application detection identifier.</p>
Flow Status	<p>Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • ENABLED_UPLINK • ENABLED_DOWNLINK • ENABLED • DISABLED
Precedence	<p>Precedence value of the profile. The lower the precedence, the higher the priority.</p>
Resource Allocation Notification	<p>Indicates that the allocation of resources for the related PCC rules will be confirmed. Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • ENABLE_NOTIFICATION
Required Access Info	<p>Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • USER_LOCATION — the subscriber's location • MS_TIME_ZONE — the mobile subscriber's time zone • USER_LOCATION and MS_TIME_ZONE — the (mobile) subscriber's location and time zone <p>If this field is not set, the device uses the values sent in AF requests; otherwise, it uses the values set here.</p>
Sponsor Identity	<p>Name identifying a connectivity sponsor.</p>
Application Service Provider Identity	<p>Name identifying an application service provider.</p>
Flow Descriptions	<p>IP flows associated with this profile. A comma-separated list of Diameter IP Filter rules following the format specified in RFC 3588 section 4.3. Used in the following cases:</p> <ul style="list-style-type: none"> • An old traffic profile is imported, and the flow description is not an empty string. • An upgrade from an older version is in process and the existing traffic profile flow description is not an empty string. <p>For all other cases, the Use Flow Informations fields indicate the IP flows.</p>
Use Flow Informations	<p>IP flow description, TOS traffic class, TOS traffic class mask, and flow direction information associated with the profile. Multiple Flow Informations can be added to the same traffic profile. This field is used instead of the Flow Descriptions field.</p> <p>Note: If the Flow Descriptions field is populated, then the Use Flow Informations field cannot be used.</p>

Parameter	Description
	Click Add next to the Use Flow Informations field to access the Flow Information fields. Double-click each column to edit the values in the column. Click Del next to an existing Flow Information row to delete the row.

Predefined PCC Rule Extension Traffic Profile Configuration Parameters

Note: For the PCC Rule Profile Extension to be listed, you must have the Cisco Gx feature enabled.

Parameter	Description
Name	Name identifying the Predefined PCC Rule Extension. The name must not contain apostrophes (').
Volume Threshold	Enter a number between 1 and 9999999999 .
Service Flow Detection Trigger	Select from the following: <ul style="list-style-type: none"> • N/A (default) • ENABLE • DISABLE
Charging Rule Remove Trigger	Select from the following: <ul style="list-style-type: none"> • N/A (default) • ENABLE • DISABLE

PCC Rule Traffic Profile Configuration Parameters

Parameter	Description
Rule Name	Name identifying the provisioned PCC rule. The name must not contain apostrophes (').
QoS Class Identifier	Identifies the QoS class. Enter a value between 1 and 254 or select from the following: <ul style="list-style-type: none"> • N/A (default) • 1 = Conversational speech • 2 = Conversational • 3 = Streaming speech • 4 = Streaming • 5 = Interactive with priority 1 signalling • 6 = Interactive with priority 1 • 7 = Interactive with priority 2 • 8 = Interactive with priority 3 • 9 = Background • 65 = MC-PTT Voice • 66 = PTT Voice • 69 = MC-PTT Signaling • 70 = MC Data

Parameter	Description
	Note: QCI values between 1 and 254 are supported. Values other than 1-9, 65, 66, 69, and 70 are undefined.
Uplink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for uplinks (user equipment to network).
Downlink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for downlinks (network to user equipment).
Uplink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for uplinks (user equipment to network). Only applicable if the QoS class identifier is between 1 and 4 .
Downlink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for downlinks (network to user equipment). Only applicable if the QoS class identifier is between 1 and 4 .
ARP Priority Level	Allocation and Retention Priority level of the service flows associated with this Diameter profile. Specify 1 (highest) to 15 (lowest).
ARP Preemption Capability	Select from the following: <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_CAPABILITY_ENABLED • PREEMPTION_CAPABILITY_DISABLED
ARP Preemption Vulnerability	Select from the following: <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_VULNERABILITY_ENABLED • PREEMPTION_VULNERABILITY_DISABLED
Service Identifier	Credit-control service identifier associated with the traffic defined by this rule. Only applicable if online charging is enabled.
Rating Group	Credit-control rating group associated with the traffic defined by this profile. Only applicable if online charging is enabled.
Monitoring Key	Select a monitoring key that may apply to the PCC profile. For more information on monitoring keys, see Managing Monitoring Keys . The default is N/A.
Reporting Level	Select from the following: <ul style="list-style-type: none"> • N/A (default) • SERVICE_IDENTIFIER_LEVEL • RATING_GROUP_LEVEL • SPONSORED_CONNECTIVITY_LEVEL
Online Charging	Specifies whether or not online charging is enabled in this profile. Select from the following: <ul style="list-style-type: none"> • N/A (default) • DISABLE_ONLINE • ENABLE_ONLINE

Parameter	Description
Offline Charging	<p>Specifies whether or not offline charging is enabled in this profile. Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • DISABLE_OFFLINE • ENABLE_OFFLINE
Metering Method	<p>Defines how service data-flow traffic is metered for offline charging. Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • DURATION • VOLUME • DURATION_VOLUME • EVENT <p>Note: Event-based charging is only applicable to predefined PCC rules using a service data-flow filter and any PCC rule (predefined and dynamic) using an application detection identifier.</p>
Flow Status	<p>Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • ENABLED_UPLINK • ENABLED_DOWNLINK • ENABLED • DISABLED
Precedence	<p>Precedence value of the profile. The lower the precedence, the higher the priority.</p>
Resource Allocation Notification	<p>Indicates that the allocation of resources for the related PCC rules will be confirmed. Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • ENABLE_NOTIFICATION
Required Access Info	<p>Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • USER_LOCATION — the subscriber's location • MS_TIME_ZONE — the mobile subscriber's time zone • USER_LOCATION and MS_TIME_ZONE — the (mobile) subscriber's location and time zone <p>If this field is not set, the device uses the values sent in AF requests; otherwise, it uses the values set here.</p>
Sponsor Identity	<p>Name identifying a connectivity sponsor.</p>
Application Service Provider Identity	<p>Name identifying an application service provider.</p>

Parameter	Description
PS to CS Session Continuity	<p>Indicates that the service data flow carries video and allows for packet switch (PS) to circuit switch (CS) session continuity. Select from the following:</p> <ul style="list-style-type: none"> • N/A (default) • VIDEO_PS2CS_CONT_CANDIDATE
Flow Descriptions	<p>IP flows associated with this profile. A comma-separated list of Diameter IP Filter rules following the format specified in <i>RFC 3588 section 4.3</i>. Used in the following cases:</p> <ul style="list-style-type: none"> • An old traffic profile is imported, and the flow description is not an empty string. • An upgrade from an older version is in process and the existing traffic profile flow description is not an empty string. <p>For all other cases, the Use Flow Informations fields indicate the IP flows.</p>
Use Flow Informations	<p>IP flow description, TOS traffic class, TOS traffic class mask, and flow direction information associated with the profile. Multiple Flow Informations can be added to the same traffic profile. This field is used instead of the Flow Descriptions field.</p> <p>Note: If the Flow Descriptions field is populated, then the Use Flow Informations field cannot be used.</p> <p>To manage Flow Informations:</p> <ol style="list-style-type: none"> 1. Click Add next to the Use Flow Informations field to access the Flow Information fields. 2. Double-click each column to edit the values in the column. 3. Click Del next to an existing Flow Information row to delete the row. <p>Note: Variables are not available for this configuration parameter.</p>

Predefined ADC Rule Traffic Profile Configuration Parameters

Parameter	Description
Rule Name	Name identifying the Predefined ADC Rule. The name must not contain apostrophes (').
Description	Description of the rule.

Predefined ADC Rule Base Traffic Profile Configuration Parameters

Parameter	Description
Rule Name	Name identifying the Predefined ADC Rule Base. The name must not contain apostrophes (').
Description	Description of the rule base.

Predefined PCC Rule Traffic Profile Configuration Parameters

Parameter	Description
Rule Name	Name identifying the Predefined PCC Rule. The name must not contain apostrophes (').
Description	Description of the rule.
Monitoring Key	Select N/A or the name of a monitoring key defined in the CMP database. See Managing Monitoring Keys for information on monitoring keys.
ServiceFlowDetection	Select from the following: <ul style="list-style-type: none"> • N/A (default) • ENABLE_DETECTION Note: For ServiceFlowDetection to be listed, you must have the PCC Extensions mode enabled.

Predefined PCC Rule Base Traffic Profile Configuration Parameters

Parameter	Description
Rule Base Name	Name identifying the Predefined PCC Rule Base. The name must not contain apostrophes (').
Description	Description of the rule base.
ServiceFlowDetection	Select from the following: <ul style="list-style-type: none"> • N/A (default) • ENABLE_DETECTION Note: For ServiceFlowDetection to be listed, you must have the PCC Extensions mode enabled.

SCE Profile Traffic Profile Configuration Parameters

Note: For the SCE Profile to be listed, you must have the SCE-Gx feature enabled.

Parameter	Description
Name	Name identifying the SCE profile. The name must not contain apostrophes (').
Package ID	Identifier corresponding to a policy defined on the SCE.
Description	Description of the SCE profile.

Creating a Cable Traffic Profile

To create a traffic profile in Cable mode:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**. The content tree displays a list of traffic profile group; the initial group is **ALL**.

2. Select the **Traffic Profiles** group.
The **Traffic Profile Administration** page opens in the work area and lists available traffic profiles.
3. Click **Create Traffic Profile**.
The **New Traffic Profile** page opens.
4. Enter the **Name** for the traffic profile.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 255 characters.
5. Select the **Traffic Profile Type** from the list.
The types of traffic profiles available depend on the mode in which the CMP system is operating.
Cable Mode contains the following traffic profile types:
 - **Best Effort** (default) — Transmission opportunities are granted on a first-come, first-served basis. Appropriate for upstream service flows such as Web browsing, e-mail, or instant messaging.
 - **Diameter QoS** — a policy and charging control rule.
 - **Downstream** — Defined through a similar set of QoS parameters that are associated with the best-effort scheduling type on upstream service flows. Appropriate for all downstream service flows.
 - **Non-Real-Time Polling** — Cable modems are polled at a fixed interval for queued data. Appropriate for upstream service flows that require high throughput, and traffic that requires variable-sized data grants on a regular basis, such as high-bandwidth FTP.
 - **RSVP Flow Spec** — Receivers initiate reservation requests for unidirectional data flows, and senders respond with path information.
 - **Real-Time Polling** — Cable modems are polled at a fixed but short interval for queued data. Appropriate for upstream service flows of real-time traffic that generate variable-sized data packets on a periodic basis and have inflexible latency and throughput requirements, such as MPEG video.
 - **Service Class** — The profile will use a service class that is configured on the CMTS.
 - **Unsolicited Grant** — A fixed-size grant is offered to service flows at fixed intervals without additional polling or interaction. Appropriate for upstream service flows of real-time traffic that generate fixed-size data packets on a periodic basis, such as VoIP.
 - **Unsolicited Grant with Activity Detection** — When there is activity, the CMTS sends unsolicited fixed grants at fixed intervals to the cable modem. When there is no activity, the CMTS sends unicast poll requests to the cable modem to conserve unused bandwidth. Appropriate for upstream service flows that include silence suppression.
6. Select to **Enable Dynamic Override** (available for Diameter QoS profiles).
If you select this option, **Dynamic Value** fields are displayed for configuration parameters. You can enter variables for the configuration parameters. Variable names must be enclosed in curly braces ({}). For more information about dynamic overrides, see [About Traffic Profile Variables](#).
7. Enter the parameters for the selected **Traffic Profile Type**.
The set of fields displayed on the **Traffic Profile** page varies depending on the **Traffic Profile Type** you select.
The following list details the configuration parameters for traffic profile types:
 - [Best Effort Traffic Profile Configuration Parameters](#)
 - [Diameter QoS Traffic Profile Configuration Parameters](#)
 - [Downstream Traffic Profile Configuration Parameters](#)

- [Non-Real-Time Polling Traffic Profile Configuration Parameters](#)
- [RSVP Flow Spec Traffic Profile Configuration Parameters](#)
- [Real-Time Polling Traffic Profile Configuration Parameters](#)
- [Unsolicited Grant Traffic Profile Configuration Parameters](#)
- [Unsolicited Grant with Activity Detection Traffic Profile Configuration Parameters](#)

8. Click **Save**.

The traffic profile is defined in the CMP database and can now be used in a policy.

Best Effort Traffic Profile Configuration Parameters

Parameter	Description
Traffic Priority	Priority for the service flow. Higher-priority service flows are given preference over lower-priority service flows.
Request Transmission Policy	The interval usage code that the cable modem uses for upstream transmission requests and packet transmissions for this service flow. It also specifies whether requests can be piggybacked with data.
Max Sustained Traffic Rate (bps)	The maximum sustained rate, in bits per second, at which traffic can operate over the service flow.
Max Traffic Burst	The maximum burst size for the service flow.
Min Reserved Traffic Rate (bps)	The guaranteed minimum rate, in bits per second, that is reserved for the service flow.
Assumed Min Packet Size (bytes)	The assumed minimum packet size, in bytes, for which the minimum reserved traffic rate is provided.
Maximum Concatenated Bursts (bytes)	The maximum size, in bytes, of a concatenated frame (a group of frames) that a service flow can transmit.
Upstream Peak Traffic Rate	A four-byte unsigned integer field that specifies the peak traffic rate, in bits per second, that is allowed for a service flow. The range is 0 – 4,294,967,295 bps (4 Gbps–1).
Required Attribute Mask	A 32-bit mask that specifies whether certain attributes are required in a service flow.
Forbidden Attribute Mask	A 32-bit mask that specifies whether certain attributes are forbidden in a service flow.
Attribute Aggregation Rule Mask	A 32-bit mask that controls whether groups of attributes are either required or forbidden in a service flow.
Minimum Buffer	The lower limit for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is a value of 0, which indicates that there is no lower limit.
Target Buffer	The value for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). If the parameter is omitted or set to a value of 0, then the device selects any buffer size within the range of the minimum and maximum buffers, using a vendor-specific algorithm.

Parameter	Description
Maximum Buffer	The upper limit for the size of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is no limit.

Diameter QoS Traffic Profile Configuration Parameters

Parameter	Description
QoS Class Identifier	Identifies the QoS class. Select from the following: <ul style="list-style-type: none"> • N/A (default) • 1 = Conversational speech • 2 = Conversational • 3 = Streaming speech • 4 = Streaming • 5 = Interactive with priority 1 signalling • 6 = Interactive with priority 1 • 7 = Interactive with priority 2 • 8 = Interactive with priority 3 • 9 = Background
Uplink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for uplinks (user equipment to network).
Downlink Max Authorized Rate (bps)	Maximum authorized bandwidth in bits per second for downlinks (network to user equipment).
Uplink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for uplinks (user equipment to network). Only applicable if the QoS class identifier is between 1 and 4.
Downlink Min Guaranteed Rate (bps)	Minimum guaranteed bandwidth in bits per second for downlinks (network to user equipment). Only applicable if the QoS class identifier is between 1 and 4.
ARP Priority Level	Allocation and Retention Priority level of the service flows associated with this Diameter profile. Specify 1 (highest) to 15 (lowest).
ARP Preemption Capability	Select from the following: <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_CAPABILITY_ENABLED • PREEMPTION_CAPABILITY_DISABLED
ARP Preemption Vulnerability	Select from the following: <ul style="list-style-type: none"> • N/A (default) • PREEMPTION_VULNERABILITY_ENABLED • PREEMPTION_VULNERABILITY_DISABLED
Resource Allocation Notification	Indicates that the allocation of resources for the related PCC rules will be confirmed. Select from the following: <ul style="list-style-type: none"> • N/A (default)

Parameter	Description
• ENABLE_NOTIFICATION	

Downstream Traffic Profile Configuration Parameters

Parameter	Description
Traffic Priority	Priority for the service flow. Higher-priority service flows are given preference over lower-priority service flows.
Downstream Resequencing	<p>A 1-byte unsigned integer specifying the use of sequencing numbers in downstream service flows to allow the cable modem to re-order out of sequence packets. The cable modem will hold higher numbered packets while waiting for lower numbered packets to arrive.</p> <p>Note: Applications that can tolerate lost packets or applications that cannot tolerate packet latency of up to 18 milliseconds can disable the use of sequence numbers by setting the Downstream Resequencing value to 1.</p>
Max Sustained Traffic Rate (bps)	The maximum sustained rate, in bits per second, at which traffic can operate over the service flow.
Max Traffic Burst	The maximum burst size for the service flow.
Min Reserved Traffic Rate (bps)	The guaranteed minimum rate, in bits per second, that is reserved for the service flow.
Assumed Min Packet Size (bytes)	The assumed minimum packet size, in bytes, for which the minimum reserved traffic rate is provided.
Max Downstream Latency	The maximum latency for downstream service flows.
Downstream Peak Traffic Rate	A four-byte unsigned integer field, specifying the rate parameter P of a token-bucket based peak rate limiter for packets of a downstream service flow. This lets you define a Max Traffic Burst value for the Max Sustained Traffic Rate much larger than a maximum packet size, but still limit the burst of packets consecutively transmitted for a service flow.
Required Attribute Mask	A 32-bit mask that specifies whether certain attributes are required in a service flow.
Forbidden Attribute Mask	A 32-bit mask that specifies whether certain attributes are forbidden in a service flow.
Attribute Aggregation Rule Mask	A 32-bit mask that controls whether groups of attributes are either required or forbidden in a service flow.
Minimum Buffer	The lower limit for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is a value of 0, which indicates that there is no lower limit.
Target Buffer	The value for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). If the parameter is omitted or set to a value of 0, then the device selects any buffer size within the range of the minimum and maximum buffers, using a vendor-specific algorithm.

Parameter	Description
Maximum Buffer	The upper limit for the size of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is no limit.

Non-Real-Time Polling Traffic Profile Configuration Parameters

Parameter	Description
Traffic Priority	Priority for the service flow. Higher-priority service flows are given preference over lower-priority service flows.
Request Transmission Policy	The interval usage code that the cable modem uses for upstream transmission requests and packet transmissions for this service flow. It also specifies whether requests can be piggybacked with data.
Max Sustained Traffic Rate (bps)	The maximum sustained rate, in bits per second, at which traffic can operate over the service flow.
Max Traffic Burst	The maximum burst size for the service flow.
Min Reserved Traffic Rate (bps)	The guaranteed minimum rate, in bits per second, that is reserved for the service flow.
Assumed Min Packet Size (bytes)	The assumed minimum packet size, in bytes, for which the minimum reserved traffic rate is provided.
Nominal Polling Interval (microsec)	The nominal interval, in microseconds, between successive unicast request opportunities for this service flow.
Maximum Concatenated Bursts (bytes)	The largest transmission of concatenated frames, in bytes, that a modem can make on behalf of the service flow.
Upstream Peak Traffic Rate	A four-byte unsigned integer field that specifies the peak traffic rate, in bits per second, that is allowed for a service flow. The range is 0 – 4,294,967,295 bps (4 Gbps–1).
Required Attribute Mask	A 32-bit mask that specifies whether certain attributes are required in a service flow.
Forbidden Attribute Mask	A 32-bit mask that specifies whether certain attributes are forbidden in a service flow.
Attribute Aggregation Rule Mask	A 32-bit mask that controls whether groups of attributes are either required or forbidden in a service flow.
Minimum Buffer	The lower limit for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is a value of 0, which indicates that there is no lower limit.
Target Buffer	The value for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). If the parameter is omitted or set to a value of 0, then the device selects any buffer size within the range of the minimum and maximum buffers, using a vendor-specific algorithm.
Maximum Buffer	The upper limit for the size of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is no limit.

RSVP Flow Spec Traffic Profile Configuration Parameters

Parameter	Description
Service Number	Select from the following: <ul style="list-style-type: none"> • N/A (default) • 2 = Guaranteed Service — controls the maximum delay and ensures no packet loss • 5 = Controlled Load Service — appropriate for soft QoS applications
Token Bucket Rate (bytes/sec)	Defines how traffic will be injected into the inter network by the sending application.
Token Bucket Size (bytes)	The maximum amount of data that the flow can send at the peak rate.
Peak Data Rate (bytes/sec)	The peak data rate of bytes of data transmitted per second at peak times.
Minimum Policed Unit (bytes)	The minimum policed unit of a packet that can be subject to policing.
Maximum Packet Size (bytes)	The maximum packet size of a burst of data that can exceed the given bandwidth limit
Rate (bytes/sec)	The rate in bytes per second at which data is transmitted.
Slack Term (microsec)	The slack term due to latency or jitter depending on the service.

Real-Time Polling Traffic Profile Configuration Parameters

Parameter	Description
Request Transmission Policy	The interval usage code that the cable modem uses for upstream transmission requests and packet transmissions for this service flow. It also specifies whether requests can be piggybacked with data.
Max Sustained Traffic Rate (bps)	The maximum sustained rate, in bits per second, at which traffic can operate over the service flow.
Max Traffic Burst	The maximum burst size for the service flow.
Min Reserved Traffic Rate (bps)	The guaranteed minimum rate, in bits per second, that is reserved for the service flow.
Assumed Min Packet Size (bytes)	The assumed minimum packet size, in bytes, for which the minimum reserved traffic rate is provided.
Nominal Polling Interval (microsec)	The nominal interval, in microseconds, between successive unicast request opportunities for this service flow.
Tolerated Poll Jitter (microsec)	The maximum amount of time, in microseconds, that unicast request intervals can be delayed beyond the nominal polling interval.
Maximum Concatenated Bursts (bytes)	The maximum size, in bytes, of a concatenated frame (a group of frames) that a service flow can transmit.

Parameter	Description
Upstream Peak Traffic Rate	A four-byte unsigned integer field that specifies the peak traffic rate, in bits per second, that is allowed for a service flow. The range is 0 – 4,294,967,295 bps (4 Gbps–1).
Required Attribute Mask	A 32-bit mask that specifies whether certain attributes are required in a service flow.
Forbidden Attribute Mask	A 32-bit mask that specifies whether certain attributes are forbidden in a service flow.
Attribute Aggregation Rule Mask	A 32-bit mask that controls whether groups of attributes are either required or forbidden in a service flow.
Minimum Buffer	The lower limit for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is a value of 0, which indicates that there is no lower limit.
Target Buffer	The value for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). If the parameter is omitted or set to a value of 0, then the device selects any buffer size within the range of the minimum and maximum buffers, using a vendor-specific algorithm.
Maximum Buffer	The upper limit for the size of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is no limit.

Unsolicited Grant Traffic Profile Configuration Parameters

Parameter	Description
Request Transmission Policy	The interval usage code that the cable modem uses for upstream transmission requests and packet transmissions for this service flow. It also specifies whether requests can be piggybacked with data.
Unsolicited Grant Size (bytes)	The size, in bytes, of the individual data grants provided to the service flow.
Grants Per Interval	The actual number of data grants given to the service flow during each nominal grant interval.
Nominal Grant Interval	The nominal interval between successive unsolicited data grant opportunities for this service flow.
Tolerated Grant Jitter (microsec)	The maximum amount of time, in microseconds, that the transmission opportunities can be delayed beyond the nominal grant interval.
Upstream Peak Traffic Rate	A four-byte unsigned integer field that specifies the peak traffic rate, in bits per second, that is allowed for a service flow. The range is 0 – 4,294,967,295 bps (4 Gbps–1).
Required Attribute Mask	A 32-bit mask that specifies whether certain attributes are required in a service flow.
Forbidden Attribute Mask	A 32-bit mask that specifies whether certain attributes are forbidden in a service flow.

Parameter	Description
Attribute Aggregation Rule Mask	A 32-bit mask that controls whether groups of attributes are either required or forbidden in a service flow.
Minimum Buffer	The lower limit for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is a value of 0, which indicates that there is no lower limit.
Target Buffer	The value for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). If the parameter is omitted or set to a value of 0, then the device selects any buffer size within the range of the minimum and maximum buffers, using a vendor-specific algorithm.
Maximum Buffer	The upper limit for the size of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is no limit.

Unsolicited Grant with Activity Detection Traffic Profile Configuration Parameters

Parameter	Description
Request Transmission Policy	The interval usage code that the cable modem uses for upstream transmission requests and packet transmissions for this service flow. It also specifies whether requests can be piggybacked with data.
Unsolicited Grant Size (bytes)	The size, in bytes, of the individual data grants provided to the service flow.
Grants Per Interval	The actual number of data grants given to the service flow during each nominal grant interval.
Nominal Grant Interval	The nominal interval between successive unsolicited data grant opportunities for this service flow.
Tolerated Grant Jitter (microsec)	The maximum amount of time, in microseconds, that the transmission opportunities can be delayed beyond the nominal grant interval.
Nominal Polling Interval (microsec)	The nominal interval, in microseconds, between successive unicast request opportunities for this service flow.
Tolerated Poll Jitter (microsec)	The maximum amount of time, in microseconds, that unicast request intervals can be delayed beyond the nominal polling interval.
Upstream Peak Traffic Rate	A four-byte unsigned integer field that specifies the peak traffic rate, in bits per second, that is allowed for a service flow. The range is 0 – 4,294,967,295 bps (4 Gbps–1).
Required Attribute Mask	A 32-bit mask that specifies whether certain attributes are required in a service flow.
Forbidden Attribute Mask	A 32-bit mask that specifies whether certain attributes are forbidden in a service flow.
Attribute Aggregation Rule Mask	A 32-bit mask that controls whether groups of attributes are either required or forbidden in a service flow.

Parameter	Description
Minimum Buffer	The lower limit for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is a value of 0, which indicates that there is no lower limit.
Target Buffer	The value for the size, in bits, of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). If the parameter is omitted or set to a value of 0, then the device selects any buffer size within the range of the minimum and maximum buffers, using a vendor-specific algorithm.
Maximum Buffer	The upper limit for the size of the buffer to be provided for a service flow. The range is 0 – 4,294,967,295 bits (4 Gb–1). The default is no limit.

Deploying a Traffic Profile

To deploy a traffic profile to an MPE device:

1. From the **Policy Server** section of the navigation pane, select **Configuration**.
The content tree displays a list of server groups; the initial group is **ALL**.
2. From the content tree, select the MPE device.
The **Policy Server Administration** page opens.
3. Select the **Policy Server** tab.
The page shows the current configuration for the selected device.
4. Click **Modify**.
The **Modify Policy Server** page opens.
5. In the **Diameter** section, select the **Diameter PCEF Default Profile** from the list.
The list includes all the traffic profiles defined in the CMP system.
6. Click **Save**.

The traffic profile is deployed to the specified device.

Modifying a Traffic Profile

To modify a traffic profile:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. Select the **Traffic Profiles** group.
The **Traffic Profile Administration** page opens in the work area and lists available traffic profiles.
3. Select the profile you want to modify.
Profile information is displayed.
4. Click **Modify**.
The **Modify Traffic Profile** page opens.
5. Modify profile information as required.
For a description of the fields contained on this page, see the traffic profile section for your mode:
 - [Creating a Wireless Traffic Profile](#)

- [Creating a Cable Traffic Profile](#)

6. Click **Save**.

The traffic profile is modified.

Deleting a Traffic Profile

Note: You cannot delete a traffic profile that is included in a policy or is deployed on an MPE device.

To delete a traffic profile:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. Select the **Traffic Profiles** group.
The **Traffic Profile Administration** page opens in the work area and lists available traffic profiles.
3. Delete the traffic profile using one of the following methods:
 - From the work area, click  (trash can icon), located to the right of the traffic profile.
 - From the content tree, select the traffic profile and click **Delete**.

A confirmation message displays.

4. Click **OK** to delete the traffic profile.

The traffic profile is deleted.

About Traffic Profile Groups

For organizational purposes, you can aggregate traffic profiles into groups. After a traffic profile group is created, it can be populated with individual traffic profiles.

This section describes how to manage traffic profile groups:

- [Creating a Traffic Profile Group](#)
- [Creating a Wireless Traffic Profile](#)
- [Modifying a Traffic Profile Group](#)
- [Removing a Traffic Profile from a Traffic Profile Group](#)
- [Deleting a Traffic Profile Group](#)

Creating a Traffic Profile Group

To create a traffic profile group:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. Select the **Traffic Profiles** group.
The **Traffic Profile Administration** page opens in the work area and lists available traffic profiles.
3. Click **Create Group**.
The **Create Group** editor page opens.

4. Enter the **Name** of the new traffic profile group.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 250 characters.
5. (Optional) Enter a **Description / Location** of the traffic profile group.
6. Click **Save**.

The traffic profile group is created.

Adding a Traffic Profile to a Traffic Profile Group

To add a traffic profile to a traffic profile group:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. From the content tree, select a Traffic Profile group.
The **Traffic Profile Administration** page opens in the work area and lists the contents of the selected traffic profile group.
3. Click **Add Traffic Profile**.
The **Add Traffic Profile** page opens and lists the traffic profiles that are not part of the group.
4. Click on the traffic profile you want to add; use the Ctrl or Shift keys to select multiple traffic profiles.
5. Click **Save**.

The selected traffic profiles are added to the traffic profile group.

Modifying a Traffic Profile Group

To modify a traffic profile group:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. From the content tree, select the traffic profile group you want to modify.
The **Traffic Profile Administration** page opens in the work area.
3. Click **Modify**.
The **Modify Group** page opens.
4. Edit the **Name** or **Description / Location** fields.
The name can only contain the characters A–Z, a–z, 0–9, period (.), hyphen (-), and underline (_).
The maximum length is 255 characters.
5. Click **Save**.

The group is modified.

Removing a Traffic Profile from a Traffic Profile Group

Removing a traffic profile from a traffic profile group does not delete the profile. To delete a traffic profile, see [Deleting a Traffic Profile](#).

To remove a traffic profile from a traffic profile group:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. From the content tree, select the traffic profile group.
The **Traffic Profile Administration** page opens in the work area and lists the contents of the traffic profile group.
3. Remove the traffic profile using one of the following methods:
 - Click  (scissors icon) located to the right of the traffic profile you want to remove.
 - From the traffic profile group in the content tree, select the traffic profile and click **Remove**.

The traffic profile is removed from the group; there is no confirmation message.

Deleting a Traffic Profile Group

Deleting a traffic profile group does not delete any traffic profiles associated with the deleted group; profiles remain in the **ALL** group. You cannot delete the **ALL** group.

To delete a traffic profile group:

1. From the **Policy Server** section of the navigation pane, select **Traffic Profiles**.
The content tree displays a list of traffic profile group; the initial group is **ALL**.
2. From the content tree, select the traffic profile group.
The **Traffic Profile Administration** page opens in the work area and lists the contents of the selected traffic profile group.
3. Click **Delete**.
A confirmation message displays.
4. Click **OK** to delete the group.

The traffic profile group is deleted.

Part III

Writing Policy Rules: Conditions, Actions, and Variables Reference

Topics:

- [Conditions for Writing Policy Rules.....228](#)
- [Actions for Writing Policy Rules.....464](#)
- [Policy Rule Variables.....589](#)

The policy wizard supports a large number of conditions, actions, and variables that can be used for constructing policy rules. This chapter provides a list of all available conditions, actions, and variables.

Note: Some conditions, actions, and variables may not appear in some modes. The actual conditions, actions, and variables available in the policy wizard depend on the modes in which your CMP system is configured.

Conditions for Writing Policy Rules

The policy wizard supports a large number of conditions that can be used for constructing policy rules. To help you find the conditions you want, the conditions are organized into different categories, which are summarized in [Policy Condition Categories](#).

The conditions that are included within each of these categories are described in the sections that follow. Within each category, conditions are listed in alphabetical order. The parameters that can be modified within each condition are also detailed.

Policy Condition Categories

Variable Name	Mode and Description
Application	<p>All Modes</p> <p>Conditions related to the application associated with the request. See Application Conditions.</p> <p>Note: This category is disabled for SPC mode.</p>
Device Usage	<p>All Modes</p> <p>Conditions related to the calculated usage for the network device for which the policy rule is being evaluated. This usage includes device-level tracking of both bandwidth and flow/session counts. See Device Usage Conditions.</p>
Mobility	<p>Wireless Mode</p> <p>Conditions that are based on information associated with wireless networks that include mobile subscribers. See Mobility Conditions.</p>
Network Devices	<p>All Modes</p> <p>Conditions related to the specific network device for which the policy rule is being evaluated. This includes conditions based on the network device type, as well as those that refer to specific unique identifiers for network devices. See Network Devices Conditions.</p>
Notification	<p>Wireless Mode</p> <p>Conditions related to notifications from Sh and Sy data sources. See Notification Conditions.</p>
Policy Context Properties	<p>All Modes</p> <p>Conditions related to the context in which a policy is evaluated. See Policy Context Properties Conditions.</p>
Policy Counters	<p>Wireless Mode</p> <p>Conditions related to policy counters stored in online charging systems (OCSs). See Policy Counters Conditions.</p>
Policy SDP Properties	<p>Wireless Mode</p>

Variable Name	Mode and Description
	Conditions related to SDP properties that are used to check the codec type (offer/answer) for the device (remote/local). See Policy SDP Properties Conditions .
RADIUS	Wireless Mode Conditions related to RADIUS Change of Authorization (CoA) requests. See RADIUS Conditions .
Request	All Modes Conditions that are based on information that is explicitly contained within or related to the protocol message (request) that triggered the policy rule execution. See Request Conditions . Note: This category is disabled for the SPC mode.
State Variables	Wireless Mode Conditions related to state variables in wireless networks. See State Variables Conditions .
Time of Day	All Modes Conditions related to the time at which the policy rules are being executed. See Time of Day Conditions .
User	All Modes Conditions related to the subscriber, or subscriber account, that is associated with the protocol message that triggered the policy rule execution. This includes subscriber-level and account-level tracking of usage. See User Conditions . Note: This category is disabled for SPC mode.

Application Conditions

Application conditions are related to the application associated with the request. See [Managing Application Profiles](#) for information on creating and managing application profiles.

where **AMID** is the application manager ID

Mode

Cable

Syntax

where *number* is the application manager ID

Parameters

number

A 32-bit numeric value that is greater than 0.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the access manager ID in the message.

where *AppType* is the application type

Mode

Cable

Syntax

where *number* is the application type

Parameters

number

A 16-bit numeric value that is greater than 0.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the application type in the message (this is a sub-field within the AMID).

where the application is latency sensitive

Mode

Cable, Wireless

Syntax

where the application is latency sensitive

Parameters

None

Description

Triggers a policy when the associated application is latency sensitive (can be set in the CMP system when applications are defined).

where the application *is one of specified name*

Mode

Cable, Wireless

Syntax

where the application *operator-binary* one of *app-name*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

app-name

Names of an application. The application must exist in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the associated application.

where the application will be using *greater than #* and *less than #* bps *specified class of bandwidth*

Mode

Wireline

Syntax

where the application will be using *operator-greater bandwidth* and *operator-less bandwidth* bps *class-of-service* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total amount of bandwidth used by the associated application as it relates to a defined range. This can be further qualified by the allocation class of service of the bandwidth. The total represents the amount of bandwidth that is allocated if the current request is approved.

where the application will be using *greater than #* and *less than # downstream* sessions

Mode

Wireline

Syntax

where the application will be using *operator-greater number* and *operator-less number qos-direction* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the total number of sessions used by the associated application as it relates to a defined range and direction. The total represents the number of sessions that are allocated if the current request is approved.

where the application will be using *greater than #* and *less than # specified class of sessions*

Mode

Wireline

Syntax

where the application will be using *operator-greater number* and *operator-less number class-of-service sessions*

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total number of sessions used by the associated application as it relates to a defined range. The total represents the number of sessions that are allocated if the current request is approved.

where the application will be using *greater than #* bps of *specified class* of bandwidth

Mode

Wireline

Syntax

where the application will be using *operator-greater bandwidth* bps of *class-of-service* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

class-of-service

One of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total amount of bandwidth used by the associated application as it relates to a defined threshold. This can be further qualified by the allocation class of service of the bandwidth. The total represents the amount of bandwidth that is allocated if the current request is approved.

where the application will be using *greater than #* bps *upstream reserved* bandwidth

Mode

Cable, Wireless

Syntax

where the application will be using *operator-greater bandwidth bps*
qos-direction qos-status bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth used by the associated application as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the amount of bandwidth that is allocated if the current request is approved.

where the application will be using *greater than # bps upstream reserved* bandwidth

Mode

Wireline

Syntax

where the application will be using *operator-greater bandwidth bps*
qos-direction qos-status bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

qos-status

One of the following:

- **reserved** (default)
- **committed**

Description

Triggers a policy based on the total amount of bandwidth used by the associated application as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the amount of bandwidth that is allocated if the current request is approved.

where the application will be using *greater than #* sessions

Syntax

where the application will be using *operator-greater number* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

Description

Triggers a policy based on the total number of sessions used by the associated application as it relates to a defined threshold. The total represents the number of sessions that are allocated if the current request is approved.

where the application will be using *greater than # specified class of* sessions

Mode

Wireline

Syntax

where the application will be using *operator-greater number class-of-service* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

class-of-service

One of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total number of sessions used by the associated application as it relates to a defined threshold. The total represents the number of sessions that are allocated if the current request is approved.

where the application will be using *greater than # upstream reserved* flows

Mode

Cable, Wireless

Syntax

where the application will be using *operator-greater bandwidth qos-direction qos-status* flows

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)

- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows used by the associated application as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the flows. The total represents the number of flows that is allocated if the current request is approved.

where there is no application associated with the request

Mode

Cable, Wireless

Syntax

where there is no application associated with the request

Parameters

None

Description

Triggers a policy when there is no associated application.

Device Usage Conditions

Device Usage conditions are related to the calculated usage for the network device for which the policy rule is being evaluated. This usage includes device-level tracking of both bandwidth and flow/session counts.

where the device will be handling *greater than #* and *less than #* bps of *specified class of* bandwidth

Mode

Wireline

Syntax

where the device will be handling *operator-greater bandwidth* and *operator-less bandwidth* bps of *class-of-service* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One or more of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total amount of bandwidth used by the current device as it relates to a defined range. This can be further qualified by the class of service of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* and *less than #* bps of *specified class of* sessions

Mode

Wireline

Syntax

where the device will be handling *operator-greater number* and *operator-less number* bps of *class-of-service* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One or more of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total number of sessions used by the device as it relates to a defined range. This can be further qualified by the class of service of the sessions. The total represents the number of sessions that are allocated if the current request is approved.

where the device will be handling *greater than #* and *less than #* percent of *downstream* capacity

Mode

Wireline

Syntax

where the device will be handling *operator-greater bandwidth* and *operator-less bandwidth* percent of *qos-direction* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second

- **G** — gigabits per second

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the percentage of capacity used by the current device as it relates to a defined range. This can be further qualified by the direction of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* and *less than # specified class of* sessions

Mode

Wireline

Syntax

where the device will be handling *operator-greater number* and *operator-less number class-of-service* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One or more of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total number of sessions used by the device as it relates to a defined range. This can be further qualified by the class of service of the sessions. The total represents the number of sessions that are allocated if the current request is approved.

where the device will be handling *greater than # bps downstream* bandwidth

Mode

Wireline

Syntax

where the device will be handling *operator-greater bandwidth bps*
qos-direction bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the total amount of bandwidth used by the current device as it relates to a defined threshold and direction. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* bps of *specified class of* bandwidth

Mode

Wireline

Syntax

where the device will be handling *operator-greater bandwidth* bps of
class-of-service bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

class-of-service

One or more of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total amount of bandwidth used by the current device as it relates to a defined threshold. This is further qualified by the class of service of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* bps *reserved* bandwidth in total for
specified class of traffic

Mode

Cable

Syntax

where the device will be handling *operator bandwidth* bps *qos-status* bandwidth in total for *class-of-service* traffic

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**

- Non Real-time Polling
- Real-time Polling
- UGS
- Background
- Conversational
- Streaming
- Interactive

In Wireline mode, one of the following:

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth allocated for specific classes of service by the current device as it relates to a defined threshold. This can be further qualified by the allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than # bps upstream reserved* bandwidth

Mode

Cable, Wireless

Syntax

where the device will be handling *operator bandwidth bps qos-direction*
qos-status bandwidth

Parameters

operator

One of the following:

- greater than or equal to
- greater than
- less than or equal to
- less than
- equal to
- not equal to

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- k — kilobits per second
- K — kilobits per second

- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth used by the current device as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than # bps upstream reserved* bandwidth in total for *specified application*

Mode

Cable, Wireless

Syntax

where the device will be handling *operator bandwidth* bps bandwidth
qos-direction qos-status bandwidth in total for *app-name*

Parameters

operator

One of the following:

- **greater than or equal to**

- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Description

Triggers a policy based on the total amount of bandwidth allocated for specific applications by the current device as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than # downstream* sessions

Mode

Wireline

Syntax

where the device will be handling *operator-greater number qos_direction* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

See common parameters.

qos-direction

See common parameters.

Description

Triggers a policy based on the total number of sessions used by the device as it relates to a defined direction and threshold. The total represents the number of sessions that are allocated if the current request is approved.

where the device will be handling *greater than #* percent of *downstream* capacity

Mode

Wireline

Syntax

where the device will be handling *operator percent percent of qos-direction* capacity

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

percent

A numeric value.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the percent of bandwidth capacity used by the current device as it relates to a defined threshold. This can be further qualified by the direction of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* percent of *reserved* capacity for *specified class of* traffic

Mode

Cable

Syntax

where the device will be handling *operator* *percent* percent of *qos-status* capacity for *class-of-service* traffic

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

percent

An integer value between 0 and 100.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**
- **Non Real-time Polling**
- **Real-time Polling**
- **UGS**
- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Wireline mode, one of the following:

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the percent of bandwidth capacity allocated for specific classes of service by the current device as it relates to a defined threshold. This can be further qualified by the allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* percent of *upstream reserved* capacity

Mode

Cable, Wireless

Syntax

where the device will be handling *operator percent* percent of *qos-direction qos-status* capacity

Parameters

operator

One of the following:

- greater than or equal to
- greater than
- less than or equal to
- less than
- equal to
- not equal to

The default for this condition is **greater than**.

percent

An integer value between 0 and 100.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the percent of bandwidth capacity used by the current device as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than #* percent of *upstream reserved* capacity for *specified application*

Mode

Cable, Wireless

Syntax

where the device will be handling *operator percent percent of qos-direction
qos-status capacity for app-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

percent

An integer value between 0 and 100.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Description

Triggers a policy based on the percent of bandwidth capacity allocated for specific applications by the current device as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the device will be handling *greater than # reserved* flows in total for *specified class of* traffic

Mode

Cable

Syntax

where the device will be handling *operator number qos-status* flows in total for *class-of-service* traffic

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**
- **Non Real-time Polling**
- **Real-time Polling**
- **UGS**
- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Wireline mode, one of the following:

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows for specific classes of service used by the current device as it relates to a defined threshold. This can be further qualified by the allocation status of the flows. The total represents the number of flows that are allocated if the current request is approved.

where the device will be handling *greater than # specified class of* sessions

Mode

Wireline

Syntax

where the device will be handling *operator-greater number class-of-service* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

class-of-service

One or more of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total number of sessions used by the device as it relates to a defined threshold. The total represents the number of sessions that are allocated if the current request is approved.

where the device will be handling *greater than # upstream reserved* flows

Mode

Cable, Wireless

Syntax

where the device will be handling *operator number qos-direction qos-status*
flows

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows used by the current device as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the flows. The total represents the number of flows that are allocated if the current request is approved.

where the device will be handling *greater than # upstream reserved* flows in total for *specified application*

Mode

Cable, Wireless

Syntax

where the device will be handling *operator number qos-direction qos-status*
flows in total for *app-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows for specific applications used by the current device as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the flows. The total represents the number of flows that are allocated if the current request is approved.

Mobility Conditions

Mobility conditions are based on information associated with networks that include mobile subscribers (such as a wireless network).

where network initiated requests are *supported*

Mode

Wireless

Syntax

where network initiated requests are *support*

Parameters

support

One of the following:

- **not supported**
- **supported** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated when network initiated requests are or are not supported.

where the APN *matches one of specified APN value(s)*

Mode

Wireless

Syntax

where the APN *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific access point name (APN) values (based on matching wildcard patterns). A valid APN value is any domain name; for example: `network.operator.com`.

where the BSID *matches one of specified Bsid value(s)*

Mode

Wireless

Syntax

where the BSID *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)

- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific BSID values (based on matching wildcard patterns).

where the Cell Identifier *matches one of specified CI value(s)*

Mode

Wireless

Syntax

where the Cell Identifier *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Cell Identifier values (based on matching wildcard patterns). A valid Cell Identifier is an integer between 0 and 65535.

where the cell state is *specified*

Mode

Wireless

Syntax

where the cell state is *state*

Parameters

state

One of the following:

- **congested**
- **not congested**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the level of congestion in the cell.

where the E-UTRAN Cell Identifier *matches one of specified ECI value(s)*

Mode

Wireless

Syntax

where the E-UTRAN Cell Identifier *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific E-UTRAN Cell Identifier values (based on matching wildcard patterns).

where the IP address of the Serving Gateway *matches one of specified address(es)*

Mode

Wireless

Syntax

where the IP address of the Serving Gateway *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Serving Gateway addresses (based on matching wildcard patterns).

where the IP address of the Serving PCF *matches one of specified address(es)*

Mode

Wireless

Syntax

where the IP address of the Serving PCF *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)

- does not match any of

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Serving PCF addresses (based on matching wildcard patterns).

where the IP-CAN type is *specified*

Mode

Wireless

Syntax

where the IP-CAN type is *ip-can-type*

Parameters

ip-can-type

One or more of the following:

- 3GPP GPRS
- 3GPP EPS
- Non_3GPP EPS
- 3GPP2
- WiMAX
- DOCSIS
- xDSL

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for a protocol message with a specific IP-CAN type.

where the Location Area Code *matches one of specified LAC value(s)*

Mode

Wireless

Syntax

where the Location Area Code *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Location Area Code values (based on matching wildcard patterns). A valid Location Area Code is an integer between 0 and 65535.

where the mobile session *supports* sponsored connectivity

Mode

Wireless

Syntax

where the mobile session *support* sponsored connectivity

Parameters

support

One of the following:

- **does not support**
- **supports** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that evaluates whether or not the mobile session supports sponsored data connectivity. This condition supports sponsored data connectivity for both Gx and Rx requests.

Example

The following condition evaluates as true if the mobile session supports sponsored data connectivity:

```
where the mobile session supports sponsored connectivity
```

where the MStimezone DST is *configured daylight savings in hours*

Mode

Wireless

Syntax

where the MStimezone DST is *offset*

Parameters

offset

One of the following:

- **0 hours**
- **1 hour**
- **2 hours**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated if the applied Daylight Saving Time offset for the location of a mobile subscriber/mobile station (MS) matches the parameter.

where the MStimezone offset is *configured timezone offset*

Mode

Wireless

Syntax

where the MStimezone offset is *offset*

Parameters

offset

Greenwich Mean Time (GMT) time zone offset.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated if the applied time zone for a mobile subscriber/mobile station (MS) matches the parameter.

where the RAT type is *specified*

Mode

Wireless

Syntax

where the RAT type is *rat-type*

Parameters

rat-type

One or more of the following:

- GERAN
- UTRAN
- HSPA Evolution
- UMA/GAN
- EUTRAN
- EUTRAN NB IoT
- WLAN
- CDMA2000 1x
- HRPD
- UMB
- eHRPD

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for a protocol message with a specific Radio Access Technology (RAT) type.

Example

The following example changes usage tracking when a user goes into a high rate packet data (HRPD) RAT type:

```
where the RAT type is HRPD
and where the event trigger is one of RAT CHANGE
and where the request is modifying an existing session

grant total volume to 100 percent used for hrpd using key3
continue processing message
```

where the Routing Area Code *matches one of specified RAC value(s)*

Mode

Wireless

Syntax

where the Routing Area Code *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific RAC values (based on matching wildcard patterns).

where the Routing Area Identifier *matches one of specified RAI value(s)*

Mode

Wireless

Syntax

where the Routing Area Identifier *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Routing Area Identifier values (based on matching wildcard patterns). For a description of the format of a Routing Area Identifier, see the 3GPP TS 23.003 standard.

where the Service Area Code *matches one of specified SAC value(s)*

Mode

Wireless

Syntax

where the Service Area Code *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Service Area Code values (based on matching wildcard patterns). A valid Service Area Code is an integer between 0 and 65535.

where the Serving MCC-MNC *matches one of specified MCC-MNC value(s)*

Mode

Wireless

Syntax

where the Serving MCC-MNC *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific mobile country code (MCC)-mobile network code (MNC) values (based on matching wildcard patterns). A valid value consists of a 3-digit mobile country code and a 2- or 3-digit mobile network code, such as **123045**. See the *CMP Wireless User's Guide* for information on mapping serving gateways to MCCs and MNCs.

where the subscribed PRA area *matches one of specified PRA area(s)*

Mode

Wireless mode with the 3GPP mode enabled.

Syntax

where the subscribed PRA area *matches-op pra-areas*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

pra-areas

One of the following:

- **predefined PRA lists** — select one or more defined PRA lists
- **manual input** — enter the identifier for the PRA in hexadecimal format or a custom PRA from a subscriber profile in the format *{User.CustomField}*. For information on creating custom fields in subscriber profiles, see the *CMP Wireless User's Guide*.
- **default area** — the PRA to which the user equipment is already subscribed, if any.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific PRA values. If **default area** is selected as the definition for the parameter *pra-areas*, the policy is only evaluated if the user equipment is already subscribed to a PRA.

where the Tracking Area Code *matches one of specified TAC value(s)*

Mode

Wireless

Syntax

where the Tracking Area Code *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Tracking Area Code values (based on matching wildcard patterns).

where the UE is *inside/outside* subscribed PRA area

Mode

Wireless mode with the 3GPP mode enabled.

Syntax

where the UE is *location* subscribed PRA area

Parameters

location

One of the following:

- **inside**
- **outside**

Description

Triggers a policy that is only evaluated when the user equipment is or is not inside the subscribed PRA.

Network Devices Conditions

Network Devices conditions are related to the specific network device for which the policy rule is being evaluated. This includes conditions based on the network device type, as well as those that refer to specific unique identifiers for network devices. See the appropriate *CMP User's Guide* for information on defining the network elements available in your network.

where *#* is the CMTS blade index

Mode

Cable

Syntax

where *number* is the CMTS blade index

Parameters

number

A numeric value between 0 and 255.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for a specific CMTS blade (based on the index number of the blade).

where # is the CMTS channel index

Mode

Cable

Syntax

where *number* is the CMTS channel index

Parameters

number

A numeric value between 0 and 255.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for a specific CMTS channel (based on the index number of the channel).

where the An-Gw status is *active*

Mode

Wireless

Syntax

where the An-Gw status is *active*

Parameters

active

An-Gw status is either active or inactive.

Click **OK**.

Click **OK**.

Description

Triggers a policy based on whether the An-Gw status is active or not.

where the cable modem IP address is in *specified subnet*

Mode

Cable

Syntax

where the cable modem IP address is in *subnet*

Parameters

subnet

- An IPv4 subnet in CIDR notation (for example, 1.2.3.0/24).
- An IPv6 subnet (for example, fc00::1006/64).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for cable modems whose IP address falls within a specific subnet.

where the cable modem IP address is *specified address*

Mode

Cable

Syntax

where the cable modem IP address is *ip-address*

Parameters

ip-address

An IPv4 or IPv6 address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for a specific cable modem (based on its IP address).

where the cable modem MAC address is *specified address*

Mode

Cable

Syntax

where the cable modem MAC address is *mac-address*

Parameters

mac-address

MAC address, in the format *hh:hh:hh:hh:hh:hh*.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for protocol messages that are using the MAC address of the cable modem. To evaluate this condition, the MPE device must be configured with cable modem provisioning information.

where the device name *matches one of specified name(s)*

Mode

Cable, Wireless

Syntax

where the device name *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the device name matches one or more wildcard match patterns.

where the device type *is specified type*

Mode

Cable, Wireless, Wireline

Syntax

where the device type *operator-binary device-type*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

device-type

In Cable mode, one or more of the following:

- **CMTS**
- **Blade**
- **Channel**
- **Cable Modem**
- **CPE**

In Wireless mode, one or more of the following:

- **PDSN**
- **GGSN**
- **HomeAgent**
- **HSGW**
- **PGW**
- **SGW**
- **DPI**

In Wireline mode, one or more of the following:

- **B-RAS**
- **Router**
- **VOD Server**
- **Interface**
- **Subscriber Group**
- **Wireline Gateway**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the device type for which it is evaluated.

where the endpoint IP address is in *specified subnet*

Mode

Cable, Wireless

Syntax

where the endpoint IP address is in *subnet*

Parameters

subnet

- An IPv4 subnet in CIDR notation (for example, 1.2.3.0/24).
- An IPv6 subnet (for example, fc00::1006/64).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for endpoints whose IP address falls within a specific subnet.

where the endpoint IP address is *specified address*

Mode

Cable, Wireless

Syntax

where the endpoint IP address is *ip-address*

Parameters

ip-address

An IPv4 or IPv6 address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for a specific endpoint (based on its IP address).

where the network element name *matches one of specified name(s)*

Mode

Cable, Wireless, Wireline

Syntax

where the network element name *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the name of the network element for which it is being evaluated.

where the network element type *is specified type*

Mode

Cable, Wireless, Wireline

Syntax

where the network element type *operator-binary element-type*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

element-type

In Cable mode, only **CMTS** is available.

In Wireless mode, one or more of the following:

- **GGSN**
- **PDSN**

- HomeAgent
- HSGW
- PGW
- SGW
- DPI

In Wireline mode, one or more of the following:

- B-RAS
- Router
- VOD Server
- Subscriber Group
- Wireline Gateway

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the type of network element for which it is being evaluated. If the policy is being evaluated for a device that is not a network element but is contained within a network element (such as an interface within a router) then the network element container is used as the basis of comparison.

where the network element's description field is equal to *specified description(s)*

Mode

Wireless, Wireline

Syntax

where the network element's description field is equal to *value*

Parameters

value

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated if the Description field of the network element matches the specified string.

where the network element's diameter identity *matches one of specified description(s)*

Mode

Wireless

Syntax

where the network element's diameter identity *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

The wildcards * (asterisk) and ? (question mark) are allowed.

Description

Triggers a policy that is evaluated based on the diameter identity of the network element.

where the remote MPE is *unavailable*

Mode

Wireless

Syntax

where the remote MPE is *status*

Parameters

status

One of the following:

- available
- unavailable

Click **OK**.

Description

Checks whether the remote site in a geo-redundant configuration is available or not.

Example

```
AND
where the enforcement session is an IP-CAN session
where the remote MPE is unavailable
set session revalidation time to 18000 seconds
```

where the request is not using the cable modem IP address

Mode

Cable

Syntax

where the request is not using the cable modem IP address

Parameters

None

Description

Triggers a policy that is only evaluated for protocol messages that are not using the IP address of the cable modem. In order to know this, the MPE device must be configured with cable modem provisioning information.

where the request is using the cable modem IP address

Mode

Cable

Syntax

where the request is using the cable modem IP address

Parameters

None

Description

Triggers a policy that is only evaluated for protocol messages that are not using the IP address of the cable modem. In order to know this, the MPE device must be configured with cable modem provisioning information.

where the User Equipment ESN *matches one of specified ESN value(s)*

Mode

Wireless

Syntax

where the User Equipment ESN *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific ESN values (based on matching wildcard patterns). A valid ESN value has eight hexadecimal digits, representing the 32 bits of the ESN. For example: A01F3D45.

where the User Equipment IMEISV *matches one of specified IMEISV value(s)*

Mode

Wireless

Syntax

where the User Equipment IMEISV *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific IMEISV values (based on matching wildcard patterns). A valid IMEISV value has 16 decimal digits, as defined in the 3GPP TS 23.003 standard.

where the User Equipment MAC *matches one of specified MAC value(s)*

Mode

Wireless

Syntax

where the User Equipment MAC *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific Media Access Control (MAC) values (based on matching wildcard patterns). A MAC address is formatted as six groups of two hexadecimal digits separated by colons (:) or hyphens (-).

where the User Equipment MEID *matches one of specified MEID value(s)*

Mode

Wireless

Syntax

where the User Equipment MEID *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific MEID values (based on matching wildcard patterns). A valid MEID value has 14 hexadecimal characters; for example: 123456789abcde.

Notification Conditions

Notification conditions are related to notifications from Sh and Sy data sources.

The mandatory action **reject message** is not applicable to policies that contain notification conditions. It does not reject the notification. Instead, use the mandatory action **accept message**.

The following optional actions are applicable to policies that contain notification conditions. Optional actions not listed here are not applicable to work with such policies.

Note: There is no validation done when other policy actions are added. During policy execution they will have no effect.

- clear alarm with severity *`severity level`*, id *`unique alarm identifier`* and message *`message text`*
- disable forwarding to next hop gateway
- disable VLAN tagging
- enable forwarding to next hop gateway with address *none*
- enable VLAN tagging with Id specified
- evaluate policy group *select policy group*

- evaluate policy *select policy*
- Re-authorize all credit control sessions associated with *select scope*
- Re-authorize all PCEF/TDF sessions associated with *select scope*
- Release all credit control sessions associated with *select scope*
- Release all PCEF/TDF sessions associated with *select scope*
- release the session
- remove all policy context properties
- remove all the *scope* state variables and save *always*
- remove policy context property *name*
- remove the *scope* state variable *name* and save *always*
- send http *POST* notification to *select notification destination* with headers *headers* and content *content*
- send http *POST* notification to url *URL* with headers *headers* and content *content*
- send notification to syslog with *`message text`* and severity *`severity level`*
- send notification to trace log with *`message text`* and severity *`severity level`*
- send SMS *`specified`* to *`default`* destination address, *`default`* TON and *`default`* NPI from *`default`* source address, *`default`* TON and *`default`* NPI on user billing day. Request delivery receipt *`default`*.
- send SMS *`specified`* to *`default`* destination address, *`default`* TON and *`default`* NPI from *`default`* source address, *`default`* TON and *`default`* NPI. Request delivery receipt *`default`*.
- send SMS *`specified`* to user on their Billing Day. Request delivery receipt *`default`*.
- send SMS *`specified`* to user. Request delivery receipt *`default`*.
- send SMTP message with the following text/plain content.
- set alarm with severity *`severity level`*, id *`unique alarm identifier`* and message *`message text`*
- set policy context property name to *value*

where notification from Sh datasource is received for *User Profile*

Mode

Wireless

Syntax

where notification from Sh datasource is received for *object-type*

Parameters

object-type

One or more of the following:

- User Profile
- Pool Profile
- Dynamic quota Profile
- Pool Dynamic quota Profile
- Quota Usage
- User state
- Pool Quota Usage
- Pool State
- Service

- User Session Policy
- User Location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated when notification is received from one of the specified object types in an Sh data source. The mandatory action **reject message** is not applicable to this condition.

Note: This condition generates an RAR/RAA message pair for each notification from each selected object type. Using this condition to generate an action for all object types can significantly impact performance. You should generally process only provisioning changes or quota resets.

Examples

The following example re-authorizes user sessions for all provisioning change notification and when quota usage is reset to zero:

```
where the user is using equal to 100 percent of total volume for plan1
quota
And where notification from Sh datasource is received for Quota Usage
Or where notification from Sh datasource is received for User Profile,Pool
Profile,Dynamic quota Profile,Pool Dynamic quota Profile
re-authorize all PCEF/TDF sessions associated with User
continue processing message
```

If an MPE device is configured to process all notifications (see the *CMP Wireless User's Guide*), but you want to use the functions of a previous releases, you must write a policy rule similar to the following:

```
where notification from Sh datasource is received for User Profile,Pool
Profile,Dynamic quota Profile,Pool Dynamic quota Profile
re-authorize all PCEF/TDF sessions associated with User
continue processing message
```

The following example issues an updated RADIUS CoA message when a Profile Notification Request (PNR) message is received from an SPR system:

```
where notification from Sh datasource is received for Quota Usage
send CoA with CoA10-24
continue processing message
```

Policy Context Properties Conditions

Policy context properties are user-defined name/value string pairs that can be created from policy actions and evaluated from policy conditions. By using policy context properties, one policy can influence the execution of other policies. Policy context properties exist across multiple policy executions on the same request, but are not persistent across requests. Subscriber properties are stored in an SPR

system and can be accessed from the SPR multiple times if needed. Subscriber properties exist for multiple requests.

where the policy context property *name exists*

Mode

Cable, Wireless, Wireline

Syntax

where the policy context property *property-name accessibility*

Parameters

property-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Triggers a policy based on whether or not the specified policy context property exists.

where the policy context property *name* is numerically *equal to value*

Mode

Cable, Wireless, Wireline

Syntax

where the policy context property *property-name* is numerically *operator value*

Parameters

property-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

For this condition the default is **equal to**.

value

String.

Integer value in the inclusive range of -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807 (that is, -2^{63} to $2^{63}-1$).

Description

Triggers a policy based on a numerical comparison between the specified policy context property value and a specified value.

Example

The following policy will release the session if the DATA_LIM for the subscriber is changed from non-zero to zero:

```
where the reauth is triggered by subscriber profile update with
notification type SUBSCRIBER_POOL
And where at least one of pool fields DATA_LIM have been updated
And where the policy context property {Previous.Pool.DATA_LIM} is
numerically greater than 0
release the session
accept message
```

where the policy context property *name matches one of `value(s)`*

Mode

Cable, Wireless, Wireline

Syntax

where the policy context property *property-name matches-op `match-list`*

Parameters

property-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the specified policy context property value matches a list of specified values (based on matching wildcard patterns).

where the policy context property *name1 matches one of name2*

Mode

Wireless

Syntax

where the policy context property *property-name matches-op property-name*

Parameters

property-name

String.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

Description

Triggers a policy based on whether a policy context property value matches one of a set of specified policy context property values.

Policy Method Conditions

Policy Method conditions are related to the methods used to process the policy.

where evaluate the customized method *specified name(s)*

Mode

Wireless

Syntax

where evaluate the customized method *specified name(s)*

Parameters

specified name(s)

The name of one or more policy methods.

Description

Uses customized policy methods to evaluate policies.

Policy Counters Conditions

Policy Counter conditions are related to policy counters stored in online charging servers (OCSs).

where a *current* status *exists* for Policy Counter IDs *select names*

Mode

Wireless

Syntax

where a *status* status *accessibility* for Policy Counter IDs *counter -name*

Parameters

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

accessibility

One of the following:

- **exists** (default)
- **does not exist**

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.

- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the specified policy counter ID property exists or does not exist in the selected counter ID status. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Filter-Ids for Policy Counter ID *select name current* status match one or more of *Filter-Ids to match*

Mode

Wireless

Syntax

where the Filter-Ids for Policy Counter ID *counter -name status* status match one or more of *match-list*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the specified policy counter ID property matches the selected counter ID status and filter expression(s). See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Final-Unit-Action for Policy Counter IDs *select names current* status matches *Final-Unit-Action to match*

Mode

Wireless

Syntax

where the Final-Unit-Action for Policy Counter IDs *counter -name status*
status matches *action*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

action

The action to match. One of the following:

- **ACTION_TERMINATE** (default)
- **ACTION_REDIRECT**
- **ACTION_RESTRICT_ACCESS**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Tests whether the Policy Counter ID contains a Final Unit Action (FUA) attribute-value pair (AVP) matching the specified FUA. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Final-Unit-Indication AVP for Policy Counter IDs *select names current* status *exists*

Mode

Wireless

Syntax

where the Final-Unit-Indication AVP for Policy Counter IDs *counter -name*
status *status* *accessibility*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Determines whether the Final-Unit-Indication AVP for the Policy Counter ID is accessible. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Policy Counter ID *select name current* status *is* between *value* and *value*

Mode

Wireless

Syntax

where the policy counter ID *counter -name* *status**status* *operator-binary*
between *value* and *value*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

operator-binary

One of the following:

- **is** (default)
- **is not**

value

Integer value in the inclusive range of $-9,223,372,036,854,775,808$ to $9,223,372,036,854,775,807$ (that is, -2^{63} to $2^{63}-1$).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on a numerical comparison between the specified policy counter ID value and a pair of specified values, and whether the ID is or is not within the range defined by the two values. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Policy Counter ID *select name current* status *is* contained in Match Lists *select lists*

Mode

Wireless

Syntax

where the Policy Counter ID *counter -name status status operator-binary* contained in Match Lists *match-list*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

operator-binary

One of the following:

- **is** (default)
- **is not**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the status of a policy counter ID matches, or does not match, any of the values in a match list. Any of the types can be selected in combination. The order will match the list from top to bottom. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs. See [Managing Match Lists](#) for information about defining match lists.

where the Policy Counter ID *select name current* status is numerically *equal to value*

Mode

Wireless

Syntax

where the policy context property *counter -name status* status is numerically
operator value

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.

- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

For this condition the default is **equal to**.

value

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on a numerical comparison between the specified policy counter ID status value and a specified value. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Policy Counter ID *select name current* status *matches one of specified value(s)*

Mode

Wireless

Syntax

where the Policy Counter ID *counter -name status status matches-op value-list*

Parameters

counter -name

- Select a **Policy Counter Id** to specify a policy counter ID defined in the CMP database. You can select only one ID for this condition.

- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

status

One of the following:

- **pending** — Accesses the pending status closest to the current time.
- **current** — Accesses the current status (default).

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the status of a specified policy counter ID value matches, or does not match, a list of specified values (based on matching wildcard patterns). See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Policy Counter ID *select name* status *is* equal to default status

Mode

Wireless

Syntax

where the Policy Counter ID *counter -name* status *operator-binary* equal to default status

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Selects protocol messages based on whether the policy counter ID status is, or is not, equal to the default status defined for the policy counter ID. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Policy Counter IDs *select names exists*

Mode

Wireless

Syntax

where the Policy Counter IDs *counter -name accessibility*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Triggers a policy based on whether or not the specified policy counter ID property exists or does not exist. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

where the Sy Session *exists*

Mode

Wireless

Syntax

where the Sy Session *accessibility*

Parameters

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Determines whether the Sy Session is accessible. See [Managing Policy Counter Identifiers](#) for information on policy counter IDs.

Policy SDP Properties Conditions

Session Description Protocol (SDP) properties conditions identify any specific SDP attributes and evaluate their value. This includes setting proper bandwidth values on related PCC rules. The following conditions are available.

where the *local* codec data is an *offer*

Mode

Wireless

Syntax

where the *sdp_capabilities* codec data is an *codec-type*

Parameters

sdp_capabilities

Specifies where to search for the SDP property:

- **Local** — The capabilities of the device for the subscriber.
- **Remote** — The capabilities of the device for the remote party.
- **Common** — The capabilities that the local and remote devices have in common.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

codec-type

Specifies the Codec type. The options are:

- **offer** (default)
- **answer**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Checks the Codec type (offer or answer) for a subscribers device (remote, local or both).

where the *local specified SDP property exists*

Mode

Wireless

Syntax

where the *sdp_capabilities SDP property accessibility*

Parameters

sdp_capabilities

Specifies where to search for the SDP property:

- **Local** — The capabilities of the device for the subscriber.
- **Remote** — The capabilities of the device for the remote party.
- **Common** — The capabilities that the local and remote devices have in common.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

SDP property

A comma-delimited list of SDP properties. Specify the SDP properties using one of the following methods:

- Generic descriptor

sdp.[option]

Where:

option Is any name (for example, i) or any keyword (for example, a=ptime)

Examples using an SDP generic descriptor:

- where the common *sdp.[a]* exists
- where the remote *sdp.[a=ptime]* exists
- where the common *sdp.[gd]* exists

- Media descriptor

sdp.[m.option]

Where:

- option*
- fmt
 - port
 - numberofports
 - media
 - proto

Examples using an SDP media descriptor:

- where the local `sdp.[m]` exists

- `rtpmap`

`sdp.[codec-name(codec-name).rtpmap.OPTION]`

Where:

<i>codec-name</i>	Specifies a codec name.
<i>option</i>	<ul style="list-style-type: none"> • <code>payloadtype</code> • <code>clockrate</code> • <code>encodingparameters</code>

Examples using `rtpmap`:

- where the remote `sdp.[codec-name(AMR-WB).rtpmap]` exists

- `fntp`

`sdp.[codec-name(codec-name).fntp.OPTIONS]`

Where:

<i>codec-name</i>	Specifies a codec name.
<i>option</i>	<ul style="list-style-type: none"> • <code>fnt</code> • <code>profile-level-id</code> • <code>mode-set</code> • <code>packetization-mode</code> • Any other parameter to be conveyed

Examples using `fntp`:

- where the common `sdp.[codec-name(AMR-WB).fntp.fnt]` exists

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Checks for the existence or non-existence of any SDP property.

where the *local specified SDP property* is numerically *equal to value*

Mode

Wireless

Syntax

where the *sdp_capabilities sdp_capabilities* is numerically *operator value*

Parameters

sdp_capabilities

Specifies where to search for the SDP property:

- **Local** — The capabilities of the device for the subscriber.
- **Remote** — The capabilities of the device for the remote party.
- **Common** — The capabilities that the local and remote devices have in common.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

SDP property

A comma-delimited list of SDP properties. Specify the SDP properties using one of the following methods:

- **Generic descriptor**

Syntax: *sdp.[option]*

Where:

<i>option</i>	Is any name (for example, i) or any keyword (for example, a=ptime)
---------------	--

Examples using an SDP generic descriptor:

- where the common *sdp.[a=ptime]* is numerically equal to 20
- where the common *sdp.[f=hello]* is numerically equal to 20

- **Media descriptor**

Syntax: *sdp.[m.option]*

Where:

<i>option</i>	<ul style="list-style-type: none"> • fmt • port • numberofports • media • proto
---------------	--

Example using an SDP media descriptor:

- where the local *sdp.[m.numberofports]* is numerically equal to 2

- **rtpmap**

Syntax: `sdp.[codec-name(codec-name).rtpmap.OPTION]`

Where:

<i>codec-name</i>	Specifies a codec name.
<i>option</i>	<ul style="list-style-type: none"> • payloadtype • clockrate • encodingparameters

Examples using rtpmap:

- where the local `sdp.[codec-name(AMR-WB).rtpmap.clockrate]` is numerically less than or equal to 16000

- **fntp**

Syntax: `sdp.[codec-name(codec-name).fntp.OPTIONS]`

Where:

<i>codec-name</i>	Specifies a codec name.
<i>option</i>	<ul style="list-style-type: none"> • fmt • profile-level-id • mode-set • packetization-mode • Any other parameter to be conveyed

Example using fntp:

- where the local `sdp.[codec-name(AMR-WB).fntp.mode-set]` is numerically less than or equal to 4

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

For this condition the default is **equal to**.

value

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Compares a numerical SDP property value against a specified number.

where the *local specified SDP property matches one of value(s)*

Mode

Wireless

Syntax

where the *sdp_capabilities SDP property matches-op value-list*

Parameters

sdp_capabilities

Specifies where to search for the SDP property:

- **Local** — The capabilities of the device for the subscriber.
- **Remote** — The capabilities of the device for the remote party.
- **Common** — The capabilities that the local and remote devices have in common.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

SDP property

A comma-delimited list of SDP properties. Specify the SDP properties using one of the following methods:

- **Generic descriptor**

Syntax: *sdp.[option]*

Where:

<i>option</i>	Is any name (for example, i) or any keyword (for example, a=ptime)
---------------	--

Examples using an SDP generic descriptor:

- where the local *sdp.[i]* matches one of **recvonly**
- where the common *sdp.[a=ptime]* matches one of 20
- where the common *sdp.[a]* matches one of *ptime: 20*
- where the common *sdp.[u]* matches one of *http://www.oracle.com:8080/hr/one.htm*
- where the common *sdp.[u=http://www.oracle.com]* matches one of *8080/hr/one.htm*
- where the common *sdp.[u=http]* matches one of *//www.oracle.com:8080/hr/one.htm*
- where the remote *sdp.[xy]* matches one of *z*

- where the remote `sdp.[xy=z]` matches one of 80

- **Media descriptor**

Syntax: `sdp.[m.option]`

Where:

- | | |
|---------------|---|
| <i>option</i> | <ul style="list-style-type: none"> • <code>fmt</code> • <code>port</code> • <code>numberofports</code> • <code>media</code> • <code>proto</code> |
|---------------|---|

Examples using an SDP media descriptor:

- where the common `sdp.[m.fmt]` matches one of 102
- where the common `sdp.[m.port]` does not match any of 41000,41002
- where the remote `sdp.[m.media]` matches one of audio,video
- where the local `sdp.[m.proto]` matches one of RTP/AVP

- **rtpmap**

Syntax: `sdp.[codec-name(codec-name).rtpmap.OPTION]`

Where:

- | | |
|-------------------|---|
| <i>codec-name</i> | Specifies a codec name. |
| <i>option</i> | <ul style="list-style-type: none"> • <code>payloadtype</code> • <code>clockrate</code> • <code>encodingparameters</code> |

Examples using rtpmap:

- where the common `sdp.[codec-name(AMR-WB).rtpmap]` matches one of 104 AMR-WB/160000
- where the common `sdp.[codec-name(AMR-WB).rtpmap.encodingparameters]` matches one of 2
- where the common `sdp.[codec-name(AMR-WB).rtpmap.payloadtype]` matches one of 104,102

- **fntp**

Syntax: `sdp.[codec-name(codec-name).fntp.OPTIONS]`

Where:

- | | |
|-------------------|---|
| <i>codec-name</i> | Specifies a codec name. |
| <i>option</i> | <ul style="list-style-type: none"> • <code>fmt</code> • <code>profile-level-id</code> • <code>mode-set</code> • <code>packetization-mode</code> |

- Any other parameter to be conveyed

Examples using fntp:

- where the common sdp.[codec-name(AMR-WB).fntp.fmt] matches one of 104,102
- where the common sdp.[codec-name(AMR-WB).fntp.mode-set] matches one of 2,4
- where the commonsdp.[codec-name(H264).fntp.profile-level-id] matches one of 42e00c

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Checks the Codec type (offer or answer) for a subscribers device (remote, local or both) for specific values.

RADIUS Conditions

RADIUS conditions are related to RADIUS Change of Authorization (CoA) requests.

where the BNG COA destination port *is port number*

Mode

Wireless

Syntax

where the BNG COA destination port *operator-binary port*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

port

Enter a port number.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated depending on the value of the destination port number of a broadband network gateway associated with the request.

where the RADIUS accounting request is ***RADIUS Accounting-Start***

Mode

Wireless

Syntax

where the RADIUS accounting request is *radius-request*

Parameters

radius-request

One or more of the following:

- **Accounting-Start** (default) — RADIUS Accounting-Start message
- **Accounting-Stop** — RADIUS Accounting-Stop message
- **Interim-Update** — RADIUS Interim-Update message
- **Accounting-On** — RADIUS Accounting-On message
- **Accounting-Off** — RADIUS Accounting-Off message

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Evaluated as true when the RADIUS message has a code field value that matches one of the specified message types.

An Accounting-Start message is interpreted as a request to begin a session; an Accounting-Stop message is interpreted as a request to end a session. An Interim-Update message is interpreted as a keep-alive message. An Accounting-On message is interpreted as meaning the BNG device has restarted, while an Accounting-Off message is interpreted as meaning the BNG device is about to restart; in both cases the MPE device removes all the sessions' state information and any previously installed services, and marks the sessions as stale, to be removed during the next session cleanup cycle.

Example

where the RADIUS accounting request is *Accounting-Start*
send CoA with *CoA Template*

where the RADIUS request *contains* a TLV / VSA of *name or ID*

Mode

Wireless

Syntax

where the RADIUS request *containment* a TLV / VSA of *vsa*

Parameters

containment

One of the following:

- **contains one of** (default)
- **does not contain any of**

vsa

A VSA or TLV name, in the format *name:vendor_id* or *code*.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Evaluates whether the RADIUS request message contains, or does not contain, the specified vendor-specific attribute (VSA) or type-length-value (TLV). You can specify either a standard TLV or VSA or a custom TLV or VSA number defined in the RADIUS dictionary.

where the RADIUS request contains TLV / VSA *name or ID* whose value *is* contained in Match List *List of TLV / VSA value as string*

Mode

Wireless

Syntax

where the RADIUS request contains TLV / VSA *vsa* whose value *operator-binary* contained in Match List *match-list*

Parameters

vsa

A TLV or VSA name, in the format *name:vendor_id* or *code*.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Evaluates whether the specified type-length-value (TLV) or vendor-specific attribute (VSA) in a RADIUS request message is contained, or is not contained, in a match list of values. The values are compared as strings. You can specify either a standard TLV or VSA or a custom TLV or VSA number defined in the RADIUS dictionary.

where the RADIUS request contains TLV / VSA *name or ID* whose value is numerically *equal to number*

Mode

Wireless

Syntax

where the RADIUS request contains TLV / VSA *vsa* whose value is numerically *operator number*

Parameters

vsa

A TLV or VSA name, in the format *name:vendor_id* or *code*.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**

- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

For this condition the default is **equal to**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Compares the specified type-length-value (TLV) or vendor-specific attribute (VSA) in a RADIUS request message with a numeric value. The values are compared as numbers. You can specify either a standard TLV or VSA or a custom TLV or VSA number defined in the RADIUS dictionary.

where the RADIUS request contains TLV / VSA *name or ID* whose value *matches one of TLV / VSA value as string*

Mode

Wireless

Syntax

where the RADIUS request contains TLV / VSA *vsa* whose value *matches-op value-list*

Parameters

vsa

A TLV or VSA name, in the format *name:vendor_id* or *code*.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Evaluates whether the RADIUS request message contains, or does not contain, the specified type-length-value (TLV) or vendor-specific attribute (VSA) by comparing the name or ID against a list of values. The values are compared as strings. You can specify either a standard TLV or VSA or a custom TLV or VSA number defined in the RADIUS dictionary.

where the RADIUS request contains VSAs from *vendor*

Mode

Wireless

Syntax

where the RADIUS request contains VSAs from *vendor-list*

Parameters

vendor-list

One of the following:

- IETF
- 3GPP
- 3GPP2
- Camiant
- Cisco
- Cisco-BBSM
- Cisco-VPN3000
- Cisco-VPN5000
- Juniper
- Juniper-M-Series
- Any defined custom vendors appear at the end of the list; for more information see [Managing Custom Vendors](#)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Evaluates as true if the RADIUS request message contains a type-length-value (TLV) or vendor-specific attribute (VSA) from the specified vendor. The vendor value can be either a standard or custom value defined in the RADIUS dictionary.

Note: The base RADIUS TLVs are considered as being from IETF.

Request Conditions

Request conditions are based on information that is explicitly contained within, or related to, the protocol message (request) that triggered the policy rule execution.

where at least one Filter-ID AVP exists

Mode

Wireless

Syntax

where at least one Filter-ID AVP exists

Parameters

None

Description

Tests whether the current request contains one or more Filter-ID AVPs.

where at least one Final-Unit-Action matches *Final-Unit-Action to match*

Mode

Wireless

Syntax

where at least one Final-Unit-Action matches *action*

Parameters

action

One of the following:

- ACTION_TERMINATE (default)
- ACTION_REDIRECT
- ACTION_RESTRICT_ACCESS

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Tests whether the current request contains a Final Unit Action (FUA) attribute-value pair (AVP) matching the specified FUA.

where at least one Final-Unit-Indication AVP exists

Mode

Wireless

Syntax

where at least one Final-Unit-Indication AVP exists

Description

Tests whether the current request contains one or more Final-Unit-Indication (FUI) AVPs.

where at least one flow has media type that matches *specified type(s)*

Mode

Wireless

Syntax

where at least one flow has media type that matches *media-type*

Parameters

media-type

One or more of the following, used to determine the type of media:

- **Audio**
- **Video**
- **Data**
- **Application**
- **Control**
- **Text**
- **Message**
- **Other**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether at least one flow matches one or more of the specified media types.

Example

```
where at least one flow has media type that matches Video,Application
```

where at least one flow with media type *specified type(s)* has one of the statuses *specified status(s)*

Mode

Wireless

Syntax

where at least one flow with media type *media-type* has one of the statuses *media-status*

Parameters

media-type

One or more of the following, used to determine the type of media:

- **Audio**
- **Video**
- **Data**
- **Application**
- **Control**
- **Text**
- **Message**
- **Other**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

media-status

One or more of the following status type:

- **Enabled**
- **Enabled Uplink**
- **Enabled Downlink**
- **Disabled**
- **Removed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether at least one flow with one of the specified media types matches at least one of the specified statuses.

Example

```
where at least one flow with media type Video has one of the statuses  
Enabled, Enabled Downlink
```

where Filter-ID AVP does not exist

Mode

Wireless

Syntax

where Filter-ID AVP does not exist

Parameters

None

Description

Tests whether the current request contains no Filter-ID AVPs.

where Final-Unit-Indication AVP does not exist

Mode

Wireless

Syntax

where Final-Unit-Indication AVP does not exist

Parameters

None

Description

Allows for a condition that will determine if the current request contains a Final-Unit-Indication (FUI) AVP.

where the AF-Application-ID *is* available

Mode

Wireless

Syntax

where the AF-Application-ID *operator-binary* available

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Checks for the presence or absence of the AF Application Identifier field. A valid AF Application identifier is any string describing the application, for example VoIP or streaming.

where the AF-Application-ID matches one of *specified value(s)*

Mode

Cable, Wireless

Syntax

where the AF-Application-ID matches one of *value-list*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the Diameter AF Application Identifier field. A valid AF Application identifier is any string describing the application, for example VoIP or streaming.

Example

```
where the AF-Application-ID matches one of ptt-application-id
apply PTT to all flows in the request
continue processing message
```

where the AF-Application *is* one of managed-applications

Mode

Wireless

Syntax

where the AF-Application-ID *operator-binary* one of managed-applications

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Determines whether the AF Application is a managed application.

where the Application-Service-Provider-Identity matches one of *specified Application Service Provider Identity(s)*

Mode

Wireless

Syntax

where the Application-Service-Provider-Identity matches one of *value-list*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the Application-Services-Provider-Identity AVP matches a list of application services providers. This condition supports sponsored data connectivity.

Example

The following condition is true if the Application-Services-Provider-Identity AVP matches either YouTube or FaceBook.

```
where the Application-Service-Provider-Identity matches one of  
YouTube, FaceBook
```

where the bearer usage is *General*

Mode

Wireless

Syntax

where the bearer usage is *bearer-usage*

Parameters

bearer-usage

One of the following:

- **General** (default)
- **IMS Signaling**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol message based on the user or equipment information.

where the Classifier parameters are equal to *specified value*

Mode

Cable

Syntax

where the Classifier parameters are equal to *classifier*

Parameters

classifier

One or more of the following:

- **PCMM Classifier (Extended) - Action**
- **PCMM Classifier (Extended) - Activation State**
- **PCMM Classifier (Extended) - Classifier Id**
- **PCMM Classifier (Extended) - Destination Mask**
- **PCMM Classifier (Extended) - Destination Port End**
- **PCMM Classifier (Extended) - Source Mask**
- **PCMM Classifier (Extended) - Source Port End**
- **PCMM Classifier (IPv6) - Destination Address**
- **PCMM Classifier (IPv6) - Destination Prefix Length**
- **PCMM Classifier (IPv6) - Flags**

- PCMM Classifier (IPv6) - Flow Label
- PCMM Classifier (IPv6) - Next Header Type
- PCMM Classifier (IPv6) - Source Address
- PCMM Classifier (IPv6) - Source Prefix Length
- PCMM Classifier (IPv6) - tc-high
- PCMM Classifier (IPv6) - tc-low
- PCMM Classifier (IPv6) - tc-mask
- PCMM Classifier - Destination Address
- PCMM Classifier - Destination Port
- PCMM Classifier - DSCP/TOS Field
- PCMM Classifier - DSCP/TOS Mask
- PCMM Classifier - Priority
- PCMM Classifier - ProtocolId
- PCMM Classifier - Source Address
- PCMM Classifier - Source Port

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between different types of PCMM classifier parameters.

where the codec name for the flow *matches one of specified codec name(s)*

Mode

Cable, Wireless

Syntax

where the codec name *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the codecs in the flow.

Example

where the codec name for the flow *matches one of AMR-WB*

where the corresponding enforcement session *supports* feature *name*

Mode

Wireless

Syntax

where the corresponding enforcement session *action* feature *value-list*

Parameters

action

Select one of the following :

- **supports** (default)
- **does not support**

value-list

A comma-delimited list of values to compare against.

This list can contain one or more supported feature. To use a wildcard match pattern, select **Evaluate as Expression**. Wildcard match patterns use the following characters:

- * (asterisk) character to match zero or more characters
- ? (question mark) character to match exactly one character

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Evaluates the feature name in the enforcement session that correlates to the corresponding application (Rx) request.

Example

where the corresponding enforcement session *supports* feature *GroupComService*.

where the DPI session is *a Gx Lite session*

Mode

Wireless

Syntax

where the DPI session is *dpi-session*

Parameters

dpi-session

One of the following:

- **a Gx Lite session** (default)
- **a Gx Plus session**
- **a SCE Gx session**
- **a TDF Solicit SD session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between types of DPI sessions.

where the enforcement session is *an IP-CAN session*

Mode

Wireless

Syntax

where the enforcement session is *enforcement-session-type*

Parameters

enforcement-session-type

One or more of the following:

- **an IP-CAN session** (default) — a Gx session
- **a gateway control session** — a Gxx session
- **a DPI enforcement session** — a Gx-Lite or Sd session
- **an S9 sub-session** — an S9 session

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between different types of enforcement sessions.

Example

```
where the request is creating a new session  
And where the session is an enforcement session  
And where the enforcement session is an S9 sub session  
install EPS2-ims PCC rule(s) for session  
accept message
```

where the event trigger is one of *specified trigger(s)*

Mode

Wireless

Syntax

where the event trigger is one of *event-trigger*

Parameters

event-trigger

One or more of the following:

- SGSN_CHANGE
- LOSS_OF_BEARER
- RECOVERY_OF_BEARER
- GW_PCEF_MALFUNCTION
- MAX_NR_BEARERS_REACHED
- QOS_CHANGE_EXCEEDING_AUTHORIZATION
- RAI_CHANGE
- USER_LOCATION_CHANGE
- OUT_OF_CREDIT
- REALLOCATION_OF_CREDIT
- REVALIDATION_TIMEOUT
- UE_IP_ADDRESS_ALLOCATE
- UE_IP_ADDRESS_RELEASE
- DEFAULT_EPS_BEARER_QOS_CHANGE
- AN_GW_CHANGE
- SUCCESSFUL_RESOURCE_ALLOCATION
- APPLICATION_START
- APPLICATION_STOP
- ADC_REVALIDATION_TIMEOUT
- CHARGING_CORRELATION_EXCHANGE
- CREDIT_MANAGEMENT_SESSION_FAILURE
- ACCESS_NETWORK_INFO_REPORT

- QOS_CHANGE
- RAT_CHANGE
- TFT_CHANGE
- PLMN_CHANGE
- IP_CAN_CHANGE
- RESOURCES_LIMITATION
- UE_TIME_ZONE_CHANGE
- USAGE_THRESHOLD_REACHED
- USAGE_REPORT
- TAI_CHANGE
- ECGI_CHANGE
- CELL_CONGESTED
- CELL_CLEAR
- SERVICE_FLOW_DETECTION
- APN_AMBR_MODIFICATION_FAILURE
- USER_CSG_INFORMATION_CHANGE
- DEFAULT_EPS_BEARER_QOS_MODIFICATION_FAILURE
- USER_CSG_HYBRID_SUBSCRIBED_INFORMATION_CHANGE
- USER_CSG_HYBRID_UNSUBSCRIBED_INFORMATION_CHANGE

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the event trigger.

Examples

App Start policy

where the request is *modifying an existing session*
 And where the event trigger is one of *APPLICATION_START*
 And where the TDF-Application-Identifier matches one of *TDFID01,TDFID02*
 install *pcc_rule1* PCC rule(s) for *session*
 continue processing message

App Stop policy

where the request is *modifying an existing session*
 And where the event trigger is one of *APPLICATION_STOP*
 And where the TDF-Application-Identifier matches one of *TDFID01,TDFID02*
 remove *pcc_rule1* PCC rule(s)
 continue processing message

where the Filter-Ids in the Final-Unit-Indication AVPs match one or more of *Filter-Ids to match* and the search type is *search type*

Mode

Wireless

Syntax

where the Filter-Ids in the Final-Unit-Indication AVPs match one or more of *value-list* and the search type is *search*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

search

One of the following:

- MATCH_ALL_FROM_ANY_REPORT (default)
- MATCH_NONE
- MATCH_ANYONE
- MATCH_ALL_FROM_ONE_REPORT

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provides a minimum of at least one Filter-ID in the message that must match the provisioned value or list. Each ID in the provisioned list must match what is in the message.

where the flow has *greater than #* grants per interval

Mode

Cable

Syntax

where the flow has *operator number* grants per interval

Parameters

operator

One of the following:

- greater than or equal to
- greater than
- less than or equal to
- less than
- equal to
- not equal to

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the number of grants per interval in the flow.

where the flow is *an application flow*

Mode

Cable, Wireless

Syntax

where the flow is *flow-type*

Parameters

flow-type

One or more of the following:

- **an application flow** (default)
- **a UE flow**
- **an application detection flow**
- **the default flow**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the type of flow:

- An application flow is created based on an application request, such as an Rx AAR message. Application flows are created in the context of an application session (for example, an Rx Media-Sub-Component message). In the context of policy and charging control, corresponding application flows are also created as part of the associated enforcement session (for example, a Gx PCC rule associated with the corresponding Rx Media-Sub-Component message).

- A UE flow is created based on a user equipment-initiated resource request, such as a GPRS PDP context creation or a UE-requested bearer resource modification.
- An application detection flow is created to identify the AVP Application_Detection_Information.
- For the Gx and Rx interfaces, the condition **where flow is the default flow** is deprecated, and always evaluates as false.

where the flow media type is one of *specified type(s)*

Mode

Cable, Wireless

Syntax

where the flow(s) media type is one of *media-type*

Parameters

media-type

One or more of the following, used to determine the type of media:

- **Audio**
- **Video**
- **Data**
- **Application**
- **Control**
- **Text**
- **Message**
- **Other**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the media type of the flow or flows.

where the flow media type *matches one of user defined media type(s)*

Mode

Wireless

Syntax

where the flow media type *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects one or more protocol messages that match one or more user-defined media types.

where the flow media type *specified type(s)* is one of *specified status(s)*

Mode

Cable

Syntax

where the flow media type *media-type* is one of *media-status*

Parameters

media-type

One or more of the following, used to determine the type of media:

- **Audio**
- **Video**
- **Data**
- **Application**
- **Control**
- **Text**
- **Message**
- **Other**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

media-status

One or more of the following status type:

- **Enabled**
- **Enabled Uplink**
- **Enabled Downlink**
- **Disabled**
- **Removed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages that matches the media type and the status type of the flow.

where the flow packet filter *matches one of specified packet filter(s)*

Mode

Cable, Wireless

Syntax

where the flow packet filter *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the packet filters. The packet filters use IPFilterRule format, as defined in the Diameter base protocol (RFC 3588). For example: permit in ip from 10.0.0.1 to 10.0.0.2 5060.

where the flow usage is one of *specified usage(s)*

Mode

Cable, Wireless

Syntax

where the flow usage is *flow-usage-type*

Parameters

flow-usage-type

One or more of the following:

- **No Information**
- **RTCP**
- **AF Signaling**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the flow usage.

where the IP-CAN bearer is *the primary bearer*

Mode

Wireless

Syntax

where the IP-CAN bearer is *bearer-type*

Parameters

bearer-type

One or more of the following:

- **the primary bearer** (default)
- **a secondary bearer**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the IP-CAN bearer type.

where the names of the installed PCC/ADC rules *contains one of specified PCC/ADC rule names*

Mode

Wireless

Syntax

where the names of the installed PCC/ADC rules *containment value-list*

Parameters

containment

One of the following:

- **contains one of** (default)
- **does not contain any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines whether an installed policy and charging control or application detection control rule contains a specified PCC or ADC rule name. See [Managing Traffic Profiles](#) for information on traffic profiles.

where the PCC rule being reinstalled ***contains one of specified rule name(s)*** and the retry ***is*** the final attempt

Mode

Wireless

Syntax

where the PCC rule being reinstalled *containment value-list* and the retry *operator-binary* the final attempt

Parameters

containment

One of the following:

- **contains one of** (default)
- **does not contain any of**

value-list

A comma-delimited list of values to compare against.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Checks for the presence or absence of one more PCC rules in a session based on the PCC rule names.

where the PCC/ADC rule being reinstalled contains one of *specified rule name(s)* and the retry *is* the final attempt

Mode

Wireless

Syntax

where the PCC/ADC rule being reinstalled contains one of *value-list* and the retry *operator-binary* the final attempt

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Reinstalls the specified policy and charging control or application detection control rule depending on whether this is the final retry attempt or not. See [Managing Traffic Profiles](#) for information on traffic profiles.

where the protocol being executed is *PCMM*

Mode

Cable

Syntax

where the protocol being executed is *protocol*

Parameters

protocol

One of the following:

- **PCMM** (default)
- **Diameter AF**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocols being executed.

where the QoS parameters in the flow are equal to *specified value*

Mode

Cable, Wireless

Syntax

where the QoS parameters in the flow are equal to *profile-param*

Parameters

profile-param

Names of profile parameters that are derived from internal representations of protocol messages. For the specific meaning of the fields, consult the specific protocol specifications.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on values of specific parameters in the protocol message for which there may be an explicit condition. Depending on the parameter chosen, you may be prompted to enter the value to compare against.

where the QoS upgrade is *supported*

Mode

Wireless

Syntax

where the QoS upgrade is *support-option*

Parameters

support-option

One of the following

- **not supported**
- **supported** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines whether the QoS upgrade is supported.

where the quota is *requested*

Mode

Wireless

Syntax

where the quota is *quota-change-type*

Parameters

quota-change-type

One or more of the following:

- **requested** (default)
- **debited**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the type of change to the quota. See [Managing Quotas](#) for information about defining quotas.

where the quota usage rating conditions changed trigger is one of *specified values*

Mode

Wireless

Syntax

where the quota usage rating conditions changed trigger is one of
trigger-type

Parameters

trigger-type

One or more of the following:

- **CHANGE_IN_SGSN_IP_ADDRESS**
- **CHANGE_IN_QOS**
- **CHANGE_IN_LOCATION**
- **CHANGE_IN_RAT**
- **CHANGE_IN_QOS_TRAFFIC_CLASS**
- **CHANGE_IN_QOS_RELIABILITY_CLASS**
- **CHANGE_IN_QOS_DELAY_CLASS**
- **CHANGE_IN_QOS_PEAK_THROUGHPUT**
- **CHANGE_IN_QOS_PRECEDENCE_CLASS**

- CHANGE_IN_QOS_MEAN_THROUGHPUT
- CHANGE_IN_QOS_MAXIMUM_BIT_RATE_FOR_UPLINK
- CHANGE_IN_QOS_MAXIMUM_BIT_RATE_FOR_DOWNLINK
- CHANGE_IN_QOS_RESIDUAL_BER
- CHANGE_IN_QOS_SDU_ERROR_RATIO
- CHANGE_IN_QOS_TRANSFER_DELAY
- CHANGE_IN_QOS_TRAFFIC_HANDLING_PRIORITY
- CHANGE_IN_QOS_GUARANTEED_BIT_RATE_FOR_UPLINK
- CHANGE_IN_QOS_GUARANTEED_BIT_RATE_FOR_DOWNLINK
- CHANGE_IN_LOCATION_MCC
- CHANGE_IN_LOCATION_MNC
- CHANGE_IN_LOCATION_RAC
- CHANGE_IN_LOCATION_LAC
- CHANGE_IN_LOCATION_CELL_ID
- CHANGE_IN_MEDIA_COMPOSITION
- CHANGE_IN_PARTICIPANTS_NMB
- CHANGE_IN_THRSHLD_OF_PARTICIPANTS_NMB
- CHANGE_IN_USER_PARTICIPATING_TYPE
- CHANGE_IN_SERVICE_CONDITION
- CHANGE_IN_SERVING_NODE

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the quota usage rating conditions changed. See [Managing Quotas](#) for information about defining quotas.

where the quota usage reporting reason is one of *specified values*

Mode

Wireless

Syntax

where the quota usage reporting reason is one of *reporting-reason*

Parameters

reporting-reason

One or more of the following:

- threshold reached
- quota holding time reached
- final reporting
- quota exhausted

- validity time expired
- other quota type reported
- rating condition changed
- forced reauthorization
- pool exhausted

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the quota usage reporting reason. See [Managing Quotas](#) for information about defining quotas.

where the RAN-NAS-Release-Cause is *Protocol Type* and *Cause Type*

Mode

Wireless

Syntax

where the RAN-NAS-Release-Cause is *protocol-type* and *cause-type*

Parameters

protocol-type

- S1AP Cause
- EMM Cause
- ESM Cause

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

cause-type

- n/a
- S1AP - Radio Network Layer
- S1AP - Transport Layer
- S1AP - NAS
- S1AP - Protocol
- S1AP - Miscellaneous

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines the RAN-NAS-Release-Cause in the request.

where the reauth is triggered by *specified type(s)*

Mode

Wireless

Syntax

where the reauth is triggered by *containment*

Parameters

containment

One or more of the following:

- TOD
- NOTIFICATION
- REVALIDATION_TIMEOUT

Description

Tests whether an RAR is triggered by a the specific event.

where the reauth is triggered by subscriber profile update with notification type *specified type(s)*

Mode

Wireless

Syntax

where the reauth is triggered by subscriber profile update with notification type *specified type(s)*

Parameters

specified type(s)

One of the following:

- USER
- SUBSCRIBER_POOL
- DYNAMIC_QUOTA
- POOL_DYNAMIC_QUOTA
- ENTITY_STATE
- POOL_ENTITY_STATE
- QUOTA_ENTITY_USAGE
- POOL_QUOTA_ENTITY_USAGE

Description

Checks whether the RAR is triggered by PNR with changes for the specified type.

Example

The following policy will release the session if the DATA_LIM for the subscriber is changed from non-zero to zero.

```
where the reauth is triggered by subscriber profile update with
notification type SUBSCRIBER_POOL
And where at least one of pool fields DATA_LIM have been updated
And where the policy context property {Previous.Pool.DATA_LIM} is
numerically greater than 0
release the session
accept message
```

The following policy will ignore an RAR that is triggered by the PNR at user level.

```
where the reauth is triggered by subscriber profile update with
notification type USER
accept message
```

where the reauth request is triggered by scheduled task containing *Service key* with *action*

Mode

Wireless

Syntax

where the reauth request is triggered by scheduled task containing *Service key* with *action* action

Parameters

service

- **Service**
- **User Session Policy**
- **Billing Day**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

key

Name(s) of a specific entity.

- For Service, the key is a Service Code.
- For User Session Policy, the key is a Policy Code

- For Billing Day, the key is set to any.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

action

The action to take for the service.

- **reset**
- **activate** (default)
- **deactivate**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines if the reauth request is triggered by a scheduled task in the specific service using a specific action (activate or deactivate).

where the reauthorization reason is **REASON_REVALIDATION_TIMEOUT**

Mode

Wireless

Syntax

where the reauthorization reason is *reason*

Parameters

reason

One of the following:

- **REASON_DEFAULT**
- **REASON_AUDIT**
- **REASON_TOD**
- **REASON_LI**
- **REASON_RELEASE_SESSION**
- **REASON_POLICY**
- **REASON_NOTIFICATION**
- **REASON_RETRY**
- **REASON_AF**
- **REASON_REVALIDATION_TIMEOUT** (default)
- **REASON_USER_SCHEDULED_TASK**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines the type of RAR message that is used to reset the usage for a quota.

where the request AVP Media-Component-Description *exists*

Mode

Cable, Wireless

Syntax

where the request AVP Media-Component-Description *accessibility*

Parameters

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Determines whether the AVP Media-Component-Description is accessible.

where the request AVP *name exists*

Mode

Wireless

Syntax

where the request AVP *avp accessibility*

Parameters

avp

AVP in one of the following formats:

```
name:vendorID
```

or a full path

```
[avp_name1]:vendorID.[avp_name2]:vendorID...
```

for the members of the grouped AVPs

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Checks for the presence or absence of the third-party AVP in an incoming Diameter message.

Note: The condition supports both loaded base Diameter AVPs and third-party AVPs.

where the request AVP *name* value *contains one of value(s)*

Mode

Wireless

Syntax

where the request AVP *avp* value *containment* *value-list*

Parameters

avp

AVP in the format:

```
name : vendorID
```

or a full path

```
[ avp_name1 ] : vendorID . [ avp_name2 ] : vendorID ..
```

for the members of the grouped AVPs

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

containment

One of the following:

- **contains one of** (default)
- **does not contain any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Performs a lookup of the sub-strings in the AVP value. It is possible to check multiple sub-string entries at on time. If the operation type is changed, you can check the opposite scenario, which would not include any of the provided sub-strings.

Note: The condition supports both loaded base Diameter AVPs and third-party AVPs.

where the request AVP *name* value *is* contained in Match Lists *select lists*

Mode

Wireless

Syntax

where the request AVP *avp* value *operator-binary* contained in Match Lists
match-list

Parameters

avp

AVP in one of the following formats:

```
name:vendorID
```

or a full path

```
[avp_name1]:vendorID.[avp_name2]:vendorID...
```

for the members of the grouped AVPs

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Compares the specified AVP value with the values or variables from the specified match list. The condition is where the request AVP name value matches one of the values. The values can be evaluated for equality as well as inequality. To evaluate an AVP value for inequality, the condition **matches one of** must be changed to **does not match any of**.

Note: The condition supports both loaded base Diameter AVPs and third-party AVPs.

where the request AVP *name* value is numerically *equal to value*

Mode

Wireless

Syntax

where the request AVP *avp* value is numerically *operator value*

Parameters

avp

AVP in one of the following formats:

```
name:vendorID
```

or a full path

```
[avp_name1]:vendorID.[avp_name2]:vendorID...
```

for the members of the grouped AVPs

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **equal to**.

value

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Compares a numerical AVP value against a specified number or policy context number variable value.

Note: The condition supports both loaded base Diameter AVPs and third-party AVPs.

where the request AVP *name* value *matches one of value(s)*

Mode

Wireless

Syntax

where the request AVP *avp matches-op value-list*

Parameters

avp

AVP in one of the following formats:

```
name:vendorID
```

or a full path

```
[avp_name1]:vendorID.[avp_name2]:vendorID...
```

for the members of the grouped AVPs

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Compares the specified AVP value with the values or variables from the specified list. The condition is where the request AVP name value matches one of the values. The values can be evaluated for equality as well as inequality. To evaluate an AVP value for inequality, the variable **matches one of** must be changed to **does not match any of**.

Note: The condition supports both loaded base Diameter AVPs and third-party AVPs.

where the request Credit Management Status is one of *specified type(s)*

Mode

Wireless

Syntax

where the request Credit Management Status is one of *credit-management-status*

Parameters

credit-management-status

One or more of the following:

- **End User Service Denied**
- **Credit Control Not Applicable**
- **Authorization Rejected**
- **User Unknown**
- **Rating Failed**
- **No Gyn Session Service Allowed**
- **No Gyn Session Service Not Allowed**

Description

Selects protocol messages based on whether the Traffic Detection Function (TDF) Credit Management Status field matches one of the selected credit management status options.

Example

where the request Credit Management Status is one of *End User Service Denied, User Unknown*

where the request is *creating a new flow*

Mode

Cable, Wireless

Syntax

where the request is *change-type*

Parameters

change-type

One or more of the following:

- **creating a new flow** (default)
- **modifying an existing flow**
- **provisioning a default flow**

- **terminating an existing flow**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocol messages based on the type of operation being performed on the flow.

where the request is *creating a new session*

Mode

Cable, Wireless

Syntax

where the request is *request-type*

Parameters

request-type

One or more of the following:

- **creating a new session** (default)
- **modifying an existing session**
- **re-authorizing an existing session**
- **terminating an existing session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocol messages based on the type of operation being performed on the session for the subscriber.

Examples

App Start policy

where the request is *modifying an existing session*
And where the event trigger is one of *APPLICATION_START*
And where the TDF-Application-Identifier matches one of *TDFID01,TDFID02*
install *pcc_rule1* PCC rule(s) for *session*
continue processing message

App Stop policy

where the request is *modifying an existing session*
And where the event trigger is one of *APPLICATION_STOP*

```
And where the TDF-Application-Identifier matches one of TDFID01,TDFID02  
remove pcc_rule1 PCC rule(s)  
continue processing message
```

where the request is for *downstream* bandwidth

Mode

Wireline

Syntax

where the request is for *qos-direction* bandwidth

Parameters

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Distinguishes between protocol messages based on the direction of bandwidth that is being updated.

where the request is for *reserved* bandwidth

Mode

Cable, Wireless

Syntax

where the request is for *qos-status* bandwidth

Parameters

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocol messages based on the type of bandwidth that is being updated.

where the request *is* for *specified class of* traffic

Mode

Cable, Wireline

Syntax

where the request *operator-binary* for *class-of-service* traffic

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

class-of-service

Select one or more from the list.

For Cable mode:

- **Best Effort**
- **Non Real-Time Polling**
- **Real-Time Polling**
- **UGS**
- **Background**
- **Conversational**
- **Streaming**
- **Interactive**
- **Standard Definition**
- **High Definition**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocol messages based on the class of service for the network traffic that is being updated.

where the request is for *upstream* bandwidth

Mode

Cable, Wireless

Syntax

where the request is for *qos-direction* bandwidth

Parameters

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocol messages based on the direction of bandwidth that is being updated.

where the request is reporting quota usage using *monitoring key*

Mode

Wireless

Syntax

where the request is reporting quota usage using *mon-key*

Parameters

mon-key

Name(s) of a monitoring key in the CMP database.

Description

Verifies if the request is reporting any usage with the specified monitoring key. See [Managing Quotas](#) for information on quotas.

Example

```
where the request is reporting quota usage using VOIIP
grant total volume to Min of 20M bytes and 100 percent used for DATA_Plan
using SESS
continue processing message
```

where the request is reporting session quota usage

Mode

Wireless

Syntax

where the request is reporting session quota usage

Parameters

None

Description

Verifies if the request is reporting usage for the quota on the session level. See [Managing Quotas](#) for information on quotas.

Example

```
where the request is reporting session quota usage
grant total volume to Min of 20M bytes and 100 percent used for DATA_Plan
using SESS
continue processing message
```

where the request MPS Identifier *matches one of value(s)*

Mode

Cable, Wireless

Syntax

where the MPS Identifier *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines whether the MPS Identifier matches a specified value(s).

where the request **supports** feature **name**

Mode

Wireless

Syntax

where the request *supports* feature *value-list*

Parameters

supports

One of the following:

- **supports** (default)
- **does not support**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines whether the request supports a specified feature.

where the requested **downstream** bandwidth is **greater than #** and **less than #** bps

Mode

Wireline

Syntax

where the requested *qos-direction* bandwidth is *operator-greater bandwidth* and *operator-less bandwidth* bps

Parameters

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

Description

Selects protocol messages based on the direction and amount of bandwidth being requested, relative to a numeric value range.

where the requested GCS Identifier *matches one of value(s)*

Mode

Wireless

Syntax

where the requested GCS Identifier *matches-op value-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

value-list

A comma-delimited list of values to compare against.

A GCS Identifier value must be formatted as an octet string.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the requested GCS Identifier matches at least one of a list of group communication service values.

Example

```
where the requested GCS Identifier matches one of  
10 FA BB BA 00,11 FA BB BA 00
```

where the requested guaranteed *downstream* bandwidth is *greater than #* bps

Mode

Wireline

Syntax

where the requested guaranteed *qos-direction* bandwidth is *operator* bandwidth
bps

Parameters

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

Description

Selects protocol messages based on the amount of bandwidth being requested in a specific direction relative to a numeric value.

where the requested guaranteed *upstream* bandwidth is *greater than* # bps

Mode

Cable, Wireless

Syntax

where the requested guaranteed *flow-direction* bandwidth is *operator* *bandwidth* bps

Parameters

flow-direction

One of the following:

- **upstream**
- **downstream**
- **upstream or downstream** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the amount of bandwidth being requested in a specific direction relative to a numeric value.

where the requested maximum *upstream* bandwidth is *greater than specified* bps

Mode

Cable, Wireless

Syntax

where the requested maximum *flow-direction* bandwidth is *operator bandwidth* bps

Parameters

flow-direction

One of the following:

- **upstream**
- **downstream**
- **upstream or downstream** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second

- M — megabits per second
- g — gigabits per second
- G — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the maximum amount of bandwidth being requested in a specific direction relative to a numeric value.

Example

```
And
  where the request is creating a new session
  where the session is an application session
  where the requested maximum upstream or downstream bandwidth is greater
    than 2400 bps
reject message
```

where the requested media component description reservation priority is one of *specified*

Mode

Cable, Wireless

Syntax

where the requested media component description reservation priority is one of *priority*

Parameters

priority

One or more of the following:

- DEFAULT
- PRIORITY_ONE
- PRIORITY_TWO
- PRIORITY_THREE
- PRIORITY_FOUR
- PRIORITY_FIVE
- PRIORITY_SIX
- PRIORITY_SEVEN
- PRIORITY_EIGHT
- PRIORITY_NINE
- PRIORITY_TEN
- PRIORITY_ELEVEN

- PRIORITY_TWELVE
- PRIORITY_THIRTEEN
- PRIORITY_FOURTEEN
- PRIORITY_FIFTEEN

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects Rx protocol messages based on the requested media component description reservation priority.

where the requested minimum *upstream* bandwidth is *greater than specified* bps

Mode

Cable, Wireless

Syntax

where the requested minimum *flow-direction* bandwidth is *operator bandwidth* bps

Parameters

flow-direction

One of the following:

- **upstream**
- **downstream**
- **upstream or downstream** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the minimum amount of bandwidth being requested in a specific direction relative to a numeric value.

Example

```
And
  where the request is creating a new session
  where the session is an application session
  where the requested minimum upstream bandwidth is greater than 10000
  bps
reject message
```

where the requested QCI is one of *specified*

Mode

Cable, Wireless

Syntax

where the requested QCI is one of *class-of-service*

Parameters

class-of-service

One or more of the following:

- **1** (Conversational speech)
- **2** (Conversational)
- **3** (Streaming speech)
- **4** (Streaming)
- **5** (Interactive with priority 1 signalling)
- **6** (Interactive with priority 1)
- **7** (Interactive with priority 2)
- **8** (Interactive with priority 3)
- **9** (Background)
- **65** (Mission critical push-to-talk voice)

- 66 (Push-to-talk voice)
- 69 (Mission critical push-to-talk signalling)
- 70 (Mission critical data)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the QoS class identifier (QCI).

where the requested quota is one of *select quota*

Mode

Wireless

Syntax

where the requested quota is one of *quota-name*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the requested quotas. See [Managing Quotas](#) for information about defining quotas.

where the requested rating group is one of *select rating group*

Mode

Wireless

Syntax

where the requested rating group is one of *rating-group-name*

Parameters

rating-group-name

Names of rating groups that are defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the subscriber's rating group. See [Managing Services and Rating Groups](#) for information on services.

where the requested service class *matches one of specified name(s)*

Mode

Cable

Syntax

where the requested service class *matches-op service-class-name*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

service-class-name

Names of service classes that are defined in the CMP database or that have been discovered via SNMP.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the service class name in the request. See [Managing Traffic Profiles](#) for information on service classes.

where the requested services are *select service*

Mode

Wireless

Syntax

where the requested services are *service-profile-name*

Parameters

service-profile-name

Names of service classes that are defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the services in the request. See [Managing Services and Rating Groups](#) for information on services.

where the requested session reservation priority is one of *specified*

Mode

Cable, Wireless

Syntax

where the requested session reservation priority is one of *priority*

Parameters

priority

One or more of the following:

- **DEFAULT**
- **PRIORITY_ONE**
- **PRIORITY_TWO**
- **PRIORITY_THREE**
- **PRIORITY_FOUR**
- **PRIORITY_FIVE**
- **PRIORITY_SIX**
- **PRIORITY_SEVEN**
- **PRIORITY_EIGHT**
- **PRIORITY_NINE**
- **PRIORITY_TEN**
- **PRIORITY_ELEVEN**
- **PRIORITY_TWELVE**
- **PRIORITY_THIRTEEN**
- **PRIORITY_FOURTEEN**
- **PRIORITY_FIFTEEN**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects Rx protocol messages based on the requested session reservation priority.

where the requested time limit is *greater than #* seconds

Mode

Cable

Syntax

where the requested time limit is *operator seconds* seconds

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

seconds

A numeric value that specifies time in units of seconds.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the specified time limit.

where the requested time limit is **unlimited (or unspecified)**

Mode

Cable

Syntax

where the requested time limit is **unlimited (or unspecified)**

Parameters

None

Description

Selects protocol messages that have no time limit.

where the requested *upstream* APN aggregate maximum bitrate is *greater than #* bps

Mode

Wireless

Syntax

where the requested *flow-direction* APN aggregate maximum bitrate is *operator*
bandwidth bps

Parameters

flow-direction

One of the following:

- **upstream**
- **downstream**
- **upstream or downstream** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the maximum bitrate being requested for an access point name (APN) in a specific direction relative to a numeric value.

where the requested volume limit is *greater than #* kilobytes

Mode

Cable

Syntax

where the requested volume limit is *operator bandwidth* kilobytes

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the specified volume limit.

where the requested volume limit is unlimited or unspecified

Mode

Cable

Syntax

where the requested volume limit is unlimited or unspecified

Parameters

None

Description

Selects protocol messages that have no volume limit.

where the Required-Access-Info *matches one of value(s)*

Mode

Wireless

Syntax

where the Required-Access-Info *matches-op info*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

info

One or more of the following actions:

- **USER_LOCATION**
- **MS_TIME_ZONE**
- **USER_LOCATION and MS_TIME_ZONE**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This condition lets you take action based on the value of the Rx Required-Access-Info AVP field.

Example

where the Required-Access-Info *matches one of* *USER_LOCATION*

where the roaming profile for the session is one of Roaming Profile *name*

Mode

Wireless

Syntax

where the roaming profile for the session is one of Roaming Profile
profile-name

Parameters

profile-name

Select a profile name from the list of available Roaming Profiles.

Description

This condition lets you identify the current roaming profile associated with the Rx, Gx or the S9 sub session. See [Managing Roaming Profiles](#) for information on roaming profiles.

where the rule report contains one of *specified rule name(s)* and the final unit action is one of *specified values* and the rule status is *active*

Mode

Wireless

Syntax

where the rule report contains one of *value-list* and the final unit action is one of *action* and the rule status is *field*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

action

One of the following:

- **TERMINATE**

- REDIRECT
- RESTRICT_ACCESS

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

One of the following:

- **active** (default)
- **inactive**
- **temporarily_inactive**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the message contains a specified rule name, reported final unit action, and status received in a rule report.

where the rule report contains one of *specified rule name(s)* and the rule status is *active*

Mode

Wireless

Syntax

where the rule report contains one of *value-list* and the rule status is *field*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

One of the following:

- **active** (default)
- **inactive**
- **temporarily_inactive**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether a rule name and a status was received in a rule report.

where the rule report contains one of *specified rule name(s)* and the rule status is *active* and the rule failure code is one of *specified failure code(s)*

Mode

Wireless

Syntax

where the rule report contains one of *value-list* and the rule status is *field* and the rule failure code is one of *failcode*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

One of the following:

- **active** (default)
- **inactive**
- **temporarily_inactive**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

failcode

One of the following:

- **UNKNOWN_RULE_NAME**
- **RATING_GROUP_ERROR**
- **SERVICE_IDENTIFIER_ERROR**
- **GW_PCEF_MALFUNCTION**
- **RESOURCES_LIMITATION**
- **MAX_NR_BEARERS_REACHED**
- **UNKNOWN_BEARER_ID**
- **MISSING_BEARER_ID**
- **MISSING_FLOW_INFORMATION**
- **RESOURCE_ALLOCATION_FAILURE**

- UNSUCCESSFUL_QOS_VALIDATION
- INCORRECT_FLOW_INFORMATION
- PS_TO_CS_HANDOVER
- TDF_APPLICATION_IDENTIFIER_ERROR
- NO_BEARER_BOUND
- FILTER_RESTRICTIONS
- AN_GW_FAILED
- MISSING_REDIRECT_SERVER_ADDRESS
- CM_END_USER_SERVICE_DENIED
- CM_CREDIT_CONTROL_NOT_APPLICABLE
- CM_AUTHORIZATION_REJECTED
- CM_USER_UNKNOWN
- CM_RATING_FAILED

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether a rule name or names, status, and failure code are received in a rule report.

where the rule report contains one of *specified rule name(s)* and the rule status is *active* and the rule failure code is one of *specified failure code(s)* and the maximum retry count *is* reached

Mode

Wireless

Syntax

where the rule report contains one of *value-list* and the rule status is *field* and the rule failure code is one of *failcode* and the maximum retry count *operator-binary* reached

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

One of the following:

- **active** (default)

- **inactive**
- **temporarily_inactive**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

failcode

One of the following:

- **UNKNOWN_RULE_NAME**
- **RATING_GROUP_ERROR**
- **SERVICE_IDENTIFIER_ERROR**
- **GW_PCEF_MALFUNCTION**
- **RESOURCES_LIMITATION**
- **MAX_NR_BEARERS_REACHED**
- **UNKNOWN_BEARER_ID**
- **MISSING_BEARER_ID**
- **MISSING_FLOW_INFORMATION**
- **RESOURCE_ALLOCATION_FAILURE**
- **UNSUCCESSFUL_QOS_VALIDATION**
- **INCORRECT_FLOW_INFORMATION**
- **PS_TO_CS_HANDOVER**
- **TDF_APPLICATION_IDENTIFIER_ERROR**
- **NO_BEARER_BOUND**
- **FILTER_RESTRICTIONS**
- **AN_GW_FAILED**
- **MISSING_REDIRECT_SERVER_ADDRESS**
- **CM_END_USER_SERVICE_DENIED**
- **CM_CREDIT_CONTROL_NOT_APPLICABLE**
- **CM_AUTHORIZATION_REJECTED**
- **CM_USER_UNKNOWN**
- **CM_RATING_FAILED**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is (default)**
- **is not**

Description

Selects protocol messages based on whether a rule name or names, status, failure code, and the maximumretry count are reached in a rule report. The maximum retry count is the result of multiplying the Maximum Retry Attempts by the Maximum Retry Cycles (see [Creating a Retry Profile](#) for details on configuring retry attempts).

where the rule report contains RAN-NAS-Release-Cause and is *Protocol Type* and *Cause Type*

Mode

Wireless

Syntax

where the rule report contains RAN-NAS-Release-Cause and is *protocol-type* and *cause-type*

Parameters

protocol-type

- S1AP Cause
- EMM Cause
- ESM Cause

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

cause-type

- n/a
- S1AP - Radio Network Layer
- S1AP - Transport Layer
- S1AP - NAS
- S1AP - Protocol
- S1AP - Miscellaneous

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines the value of RAN-NAS-Release-Cause in the Charging-Rule-Report.

where the rule report for the flow has status *active*

Mode

Wireless

Syntax

where the rule report for the flow has status *field*

Parameters
field

One of the following:

- **active** (default)
- **temporarily_inactive**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Tests whether the status of the rule for the flow matches the specified status.

where the *select type* is contained in Match Lists *select lists*

Mode

Wireless

Syntax

where the *field* is contained in Match Lists *match-list*

Parameters
field

One or more of the following:

- **Serving Gateway Address** — IP address of the serving gateway
- **Requested QCI** — Requested QoS Class Identifier
- **APN** — Access Point Name
- **User Equipment IMEISV**
- **User Equipment MEID**
- **User Equipment ESN**
- **User Equipment MAC**
- **USER IMSI** — User International Mobile Subscriber Identity
- **USER E.164** — User E.164 phone number
- **User SIP URI** — User Session Initiation Protocol Uniform Resource Identifier
- **User NAI** — User Network Access Identifier
- **Endpoint IP Address** — IP address of the endpoint
- **Serving MCC-MNC** — Serving Mobile Country Code, Mobile Network Code
- **Cell Identifier**
- **Location Area Code** — Unique identifier of a LAC
- **Service Area Code** — Unique identifier of a SAC
- **Routing Area Code** — Identifies a routing area within a location area
- **Routing Area Identifier** — Combination of the location area code and routing area code
- **Tracking Area Code**

- **E-UTRAN Cell Identifier** — Identifies cells within a PLMN
- **MPS Identifier** — MPS-Identifier AVP
- **GCS Identifier** — Group Communication Service Identifier
- **AF Application Id**
- **User MCC-MNC** — Identifies a user MCC-MNC
- **Sponsor Identity** — Sponsor identity AVP
- **App Service Provider Id** — Application services provider identity AVP
- **Entitlements** — A defined entitlement
- **NetworkElementDiameterIdentity** — The diameter identity of a network element
- **TWAN_SSID** — The SSID for the trusted WLAN (TWAN), in ASCII string format
- **TWAN_BSSID** — The BSSID for the TWAN, in MAC address format
- **TWAN_PLMNId** — The PLMN identifier for the TWAN, in MCC-MNC address format
- **TWAN_OperatorName** — The Operator Name for the TWAN
- **TWAN_RelayIdentity** — The Relay Identity type for the TWAN, in IP address or FQDN format
- **TWAN_CircuitId** — The relay Circuit ID for the TWAN

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the messages or associated sessions match any of the values in a match list. Any of the types can be selected in combination. The order will match the list from top to bottom. See [Managing Match Lists](#) for information about defining match lists.

Example

where the *USER IMSI,LAC,SAC* is contained in Match Lists
Black1,Black2,Black3

where the *select type* is not contained in Match Lists *select lists*

Mode

Wireless

Syntax

where the *field* is not contained in Match Lists *match-list*

Parameters

field

One or more of the following:

- **Serving Gateway Address** — IP address of the serving gateway
- **Requested QCI** — Requested QoS Class Identifier
- **APN** — Access Point Name
- **User Equipment IMEISV**
- **User Equipment MEID**
- **User Equipment ESN**
- **User Equipment MAC**
- **USER IMSI** — User International Mobile Subscriber Identity
- **USER E.164** — User E.164 phone number
- **User SIP URI** — User Session Initiation Protocol Uniform Resource Identifier
- **User NAI** — User Network Access Identifier
- **Endpoint IP Address** — IP address of the endpoint
- **Serving MCC-MNC** — Serving Mobile Country Code (MCC), Mobile Network Code (MNC)
- **Cell Identifier**
- **Location Area Code** — Unique identifier of a LAC
- **Service Area Code** — Unique identifier of a SAC
- **Routing Area Code** — Identifies a routing area within a location area
- **Routing Area Identifier** — Combination of the location area code and routing area code
- **Tracking Area Code**
- **E-UTRAN Cell Identifier** — Identifies cells within a PLMN
- **MPS Identifier** — MPS-Identifier AVP
- **GCS Identifier** — Group Communication Service Identifier
- **AF Application Id**
- **User MCC-MNC** — User Mobile Country Code (MCC), Mobile Network Code (MNC)
- **Sponsor Identity** — Sponsor identity AVP
- **App Service Provider Id** — Application services provider identity AVP
- **Entitlements** — A defined entitlement
- **NetworkElementDiameterIdentity** — The diameter identity of a network element
- **TWAN_SSID** — The SSID for the trusted WLAN (TWAN), in ASCII string format
- **TWAN_BSSID** — The BSSID for the TWAN, in MAC address format
- **TWAN_PLMNId** — The PLMN identifier for the TWAN, in MCC-MNC address format
- **TWAN_OperatorName** — The Operator Name for the TWAN
- **TWAN_RelayIdentity** — The Relay Identity type for the TWAN, in IP address or FQDN format
- **TWAN_CircuitId** — The relay Circuit ID for the TWAN

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the messages or associated sessions do not match any of the values in a match list. Any of the types can be selected in combination. The order will match the list from top to bottom. See [Managing Match Lists](#) for information about defining match lists.

Example

```
where the USER IMSI,LAC,SAC is not contained in Match Lists  
BLACK1, BLACK2, BLACK3
```

where the service info status is one of *specified*

Mode

Cable, Wireless

Syntax

where the service info status is one of *status*

Parameters

status

One of the following:

- **FINAL_SERVICE_INFORMATION**
- **PRELIMINARY_SERVICE_INFORMATION**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects Rx protocol messages based on the service information status.

where the Service-URN is one of *specified value(s)*

Mode

Cable, Wireless

Syntax

where the Service-URN is one of *value-list*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects Rx protocol messages based on the value of the Service-URN field.

where the session granted quota using *monitoring key is valid*

Mode

Wireless

Syntax

where the session granted quota using *mon-key operator-binary* valid

Parameters

mon-key

Name(s) of a monitoring key in the CMP database.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Verifies that the session has been granted usage for the specified monitoring key. See [Managing Quotas](#) for information on quotas.

Example

```
where the session granted quota using VOIP is not valid  
grant total volume to Min of 20M bytes and 100 percent used for DATA_Plan  
using SESS  
continue processing message
```

where the session granted session level quota *is* valid

Mode

Wireless

Syntax

where the session granted session level quota using *operator-binary* valid

Parameters

operator-binary

One of the following:

- *is* (default)
- *is not*

Description

Verifies that the session has been granted usage on the session level. See [Managing Quotas](#) for information on quotas.

Example

```
where the session granted session level quota is not valid  
grant total volume to Min of 20M bytes and 100 percent used for DATA_Plan  
using SESS  
continue processing message
```

where the session is *an enforcement session*

Mode

Cable, Wireless

Syntax

where the session is *session-type*

Parameters

session-type

One of the following:

- **an enforcement session** (default)
- **an application session**
- **a credit control session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Distinguishes between protocol messages that are operating on different sessions.

where the SessionClassID is *specified value*

Mode

Cable

Syntax

where the SessionClassID is *unit*

Parameters

unit

A number between 0 and 255.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the value of the SessionClassID field.

where the specific action is one of *specified action(s)*

Mode

Wireless

Syntax

where the specific action is one of *action*

Parameters

action

One or more of the following actions:

- SERVICE_INFORMATION_REQUEST
- CHARGING_CORRELATION_EXCHANGE
- INDICATION_OF_LOSS_OF_BEARER
- INDICATION_OF_RECOVERY_OF_BEARER
- INDICATION_OF_RELEASE_OF_BEARER
- INDICATION_OF_ESTABLISHMENT_OF_BEARER
- INDICATION_OF_IP_CAN_CHANGE
- INDICATION_OF_OUT_OF_CREDIT
- INDICATION_OF_SUCCESSFUL_RESOURCES_ALLOCATION
- INDICATION_OF_FAILED_RESOURCES_ALLOCATION
- USAGE_REPORT
- ACCESS_NETWORK_INFO_REPORT

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This condition lets you take action based on the value of the Specific-Action AVP field within an Rx RAA message.

where the Sponsor-Identity matches one of *specified Sponsor Identity(s)*

Mode

Wireless

Syntax

where the Sponsor-Identity matches one of *value-list*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on whether the Sponsored-Identity AVP matches a list of sponsors. This condition supports sponsored data connectivity.

Example

The following condition is true if the Sponsored-Identity AVP matches either ESPN or FIFA:

```
where the Sponsor-Identity matches one of ESPN,FIFA
```

where the TDF-Application-Identifier matches one of *specified TDF application id(s)*

Mode

Wireless

Syntax

where the TDF-Application-Identifier matches one of *value-list*

Parameters

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Selects protocol messages based on the Traffic Detection Function (TDF) Application Identifier field. A valid TDF application identifier is any string describing the TDF.

Examples

App Start policy

```
where the request is modifying an existing session  
And where the event trigger is one of APPLICATION_START  
And where the TDF-Application-Identifier matches one of TDFID01,TDFID02  
install pcc_rule1 PCC rule(s) for session  
continue processing message
```

App Stop policy

```
where the request is modifying an existing session  
And where the event trigger is one of APPLICATION_STOP  
And where the TDF-Application-Identifier matches one of TDFID01,TDFID02  
remove pcc_rule1 PCC rule(s)  
continue processing message
```

where the user field *field is* available

Mode

Wireless

Syntax

where the user field *string operator-binary* available

Parameters

string

A string representing the name of a field.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Determines whether a specified user field is available.

where top-up instance being granted for *select type* using *monitoring key is* valid

Mode

Wireless

Syntax

where top-up instance being granted for *select type* using *mon-key operator-binary* valid

Parameters

select type

Select a data plan.

mon-key

Name(s) of a monitoring key in the CMP database.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Determines whether a specified plan is valid for top-up instance.

State Variables Conditions

Note: State Variables replace User State Conditions. When upgrading from an earlier release that used State Variable, the properties for User State Conditions are automatically mapped to the corresponding State Variable values. Therefore, the **subscriber** property is mapped to the **subscriber remote** state variable and the **pool** property is mapped to the **pool** state variable.

State Variables are set within a policy action to be used at a later time during policy rule execution (in either conditions or actions). The names of these variables are not predefined and are determined at the time of creation. State variables have a scope which determines how long the value persists after it is set. The scopes are:

- **Subscriber Remote State Variable** — This state variable exists remotely in an SPR as long as the subscriber exists in the SPR. Using this variable requires that an SPR/HSS be configured that is capable of storing this variable.
- **Pool State Variable** — This variable is associated with a quota pool (of multiple subscribers). This variable is stored remotely in an SPR and exists as long as the pool exists in the SPR. Using this variable requires that an SPR/HSS be configured that is capable of storing this variable.
- **Subscriber Local State Variables** — This variable exists locally on the MPE and has a value as long as the associated subscriber has at least one session on that MPE. After the last session is terminated these variables no longer have value and will no longer be available for use in policies.
- **Session State Variables** — This variable has a value that is saved as long as the session the variable is associated with is still valid. After the session is terminated, this variable no longer has value and will no longer be available for use in policies.
- **Policy Evaluation State Variables** — This variable are available for the lifetime of a policy evaluation cycle (the process of evaluating all the policies for a single request or context)

where the *scope* state variable *name + 0 days* rounded *up* with *same* granularity is *after now* using *configured local time*

Mode

Wireless

Syntax

where the *scope* state variable *variable-name direction duration granularity1* rounded *rounding* with *granularity2* granularity is *datetime-compare datetime* using *time-zone*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.

- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

direction

One of the following, indicating a time offset in the future or past:

- **+** (default)
- **-**

duration

Positive integer.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

granularity1

The offset is expressed in this granularity

- **days** (default)
- **months**
- **hours**
- **minutes**

rounding

One of the following, indicating rounding up or down:

- **up** (default)
- **down**

granularity2

The calculated date-time is expressed in this granularity:

- **same** (default) — Indicates that the value for *granularity1* is used.
- **months**
- **days**
- **hours**
- **minutes**

datetime-compare

One of the following:

- **after** (default)
- **before**
- **at or before**
- **at or after**

datetime

One of the following:

- A policy variable.
- **now** (default) — The local date-time.
- A date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

- **Date** — Select the date from the calendar interface.
- **Time** — Select hh:mm:ss.
- **UTC Offset** — Select number of hours before or after UTC time to start.
- **now** — Select for the local date-time.
- **Time only** — Select to use the time only.
- A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*. Click **Evaluate as expression** to bypass date-time format validation.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated for a state variable based on the result of a comparison between a base date-time value and an offset against either the current date-time or another date-time. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

where the *scope* state variable *name exists*

Mode

Wireless

Syntax

where the *scope* state variable *variable-name accessibility*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Triggers a policy based on whether or not the specified variable exists within the scope.

where the *scope* state variable *name* is *in* the current billing cycle using *configured local time*

Mode

Wireless

Syntax

where the *scope* state variable *variable-name* is *comparison-op* the current billing cycle using *time-zone*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

comparison-op

One of the following:

- **in** (default)
- **not in**
- **before**
- **after**

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the comparison between the timestamp value of the specified state variable and the current billing cycle. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

Note: The quota reset date may vary from the billing cycle end date. If the quota reset cycle is set to more than 1 month, the NextResetTime could be set to a date other than the current billing cycle end date. The billing cycle end date is calculated from the monthly billing cycle.

Note: When the user local time context is in effect, the MPE device ends the billing cycle or resets the quota based on the user local time. If user equipment enters a different time zone near the end of a billing cycle, the subscriber may find that the billing cycle ended earlier than expected, or the service provider may find that the billing cycle ended later than expected.

where the *scope* state variable *name* is numerically *equal to value*

Mode

Wireless

Syntax

where the *scope* state variable *variable-name* is numerically *operator value*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**

- less than or equal to
- less than
- equal to
- not equal to

For this condition the default is **equal to**.

value

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on a numerical comparison between the state variable value and a specified value.

where the *scope* state variable *name is* the current mobile country code

Mode

Wireless

Syntax

where the *scope* state variable *variable-name operator-binary* the current mobile country code

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the comparison between the value of the state variable and the current mobile country code.

where the *scope* state variable *name matches one of `value(s)`*

Mode

Wireless

Syntax

where the *scope* state variable *variable-name matches-op `match-list`*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the specified state variable value matches a list of specified values (based on matching wildcard patterns).

where the *scope* state variable *name* value *is* contained in Match Lists *selected lists*

Mode

Wireless

Syntax

where the *scope* state variable *variable-name* value *operator-binary* contained in Match Lists *match-list`*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the specified state variable value matches a list of specified values (based on matching wildcard patterns).

Time of Day Conditions

Time-of-Day conditions are related to the time at which the policy rules are being executed.

where the current time *is* between *start time* and *end time* using *configured local time*

Mode

Cable, Wireless, Wireline

Syntax

where the current time *operator-binary* between *time-of-day* and *time-of-day* using *time-zone*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

time-of-day

A time, in the format of *hh:mm*, where *hh* is a number in the range from 0 to 23.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on time. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

where the current time *is* within the *specified* time period(s)

Mode

Wireless

Syntax

where the current time *operator-binary* within the *time-period* time periods

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

time-period

Names of one or more time periods that are defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the time period.

where today is a week day using *configured local time*

Mode

Cable, Wireless, Wireline

Syntax

where today is a week day using *time-zone*

Parameters

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the day of the week. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

where today is a weekend day using *configured local time*

Mode

Cable, Wireless

Syntax

where today is a weekend day using *time-zone*

Parameters

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the day of the week. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

where today *is day* using *configured local time*

Mode

Cable, Wireless

Syntax

where today *operator-binary day-of-week* using *time-zone*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

day-of-week

One of the following:

- **Sunday**
- **Monday**
- **Tuesday**
- **Wednesday**
- **Thursday**
- **Friday**
- **Saturday**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the day of the week. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

where today *is* the *specified number(s)* th day(s) of *Any Month* in *natural order* using *configured local time*

Mode

Wireless

Syntax

where today *operator-binary* the *value-list* th days of *month* in *order* using *time-zone*

Parameters

operator-binary

One of the following:

- **is** (default)
- **is not**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

month

One or more of the following:

- **January**
- **February**
- **March**
- **April**
- **May**
- **June**
- **July**
- **August**
- **September**
- **October**
- **November**
- **December**

order

Specifies the order to evaluate the value list. The options are:

- **natural order**

- **reverse order**

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on a day in a month. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

Example

The following conditions, if evaluated as true, will trigger a policy:

where today *is* the *1,2,3,4* th days of *March, April, May* in *natural order* using *USER LOCAL TIME*

User Conditions

User conditions are related to the quota pool, subscriber or subscriber account that is associated with the protocol message that triggered the policy rule execution. This includes subscriber-level and account-level tracking of usage. The following conditions are available.

where at least one of *subscriber or pool* fields *named* have been updated

Syntax

where at least one of *subscriber* fields *field-name* have been updated

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

field-name

String.

Description

Triggers a policy based on whether at least one flow with one of the specified media types matches at least one of the specified statuses.

Example

The following policy will release the session if the DATA_LIM for the subscriber is changed from non-zero to zero.

```
where the reauth is triggered by subscriber profile update with
notification type SUBSCRIBER_POOL
And where at least one of pool fields DATA_LIM have been updated
And where the policy context property {Previous.Pool.DATA_LIM} is
numerically greater than 0
release the session
accept message
```

where the account id *matches one of specified id(s)*

Mode

Cable, Wireline

Syntax

where the account id *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific user ID values (based on matching wildcard patterns).

where the account will be handling *greater than #* and *less than #* percent of *downstream* limit

Mode

Wireline

Syntax

where the account will be handling *operator-greater percent* and *operator-less percent* percent of *qos-direction* limit

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

percent

A numeric value.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the percent of the bandwidth limit used by the account related to a defined range. This can be further qualified by the direction of the bandwidth. The total is the bandwidth allocated if the request is approved.

where the account will be handling *greater than #* percent of *downstream* limit

Mode

Wireline

Syntax

where the account will be handling *operator percent* percent of *qos-direction* limit

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

percent

A numeric value.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the percent of the bandwidth limit used by the account as it relates to a defined threshold. This can be further qualified by the direction of the bandwidth. The total is the bandwidth allocated if the request is approved.

where the account will be handling *greater than #* percent of *upstream reserved* limit

Mode

Cable

Syntax

where the account will be handling *operator percent percent* of *qos-direction qos-status* limit

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

percent

An integer value between 0 and 100.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the percent of the bandwidth limit used by the account as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total is the bandwidth allocated if the request is approved.

where the account will be using *greater than #* and *less than #* bps *downstream* bandwidth

Mode

Wireline

Syntax

where the account will be using *operator-greater bandwidth* and *operator-less bandwidth* bps *qos-direction* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the total amount of bandwidth used by the account as it relates to a defined range. This can be further qualified by the direction of the bandwidth. The total is the bandwidth allocated if the request is approved.

where the account will be using *greater than #* and *less than # downstream* sessions

Mode

Wireline

Syntax

where the account will be handling *operator-greater number* and *operator-less number qos-direction* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**

- **less than** (default)

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the number of sessions for a specific direction of service used by the account as it relates to a defined range. The total is the number of sessions allocated if the request is approved.

where the account will be using *greater than # bps downstream* bandwidth

Mode

Wireline

Syntax

where the account will be using *operator bandwidth bps qos-direction*
bandwidth

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

qos-direction

One of the following:

- **upstream** (default)

- **downsteam**

Description

Triggers a policy based on the total amount of bandwidth used by the account as it relates to a defined threshold. This can be further qualified by the direction of the bandwidth. The total is the bandwidth allocated if the request is approved.

where the account will be using *greater than #* bps of *specified class of* bandwidth

Mode

Wireline

Syntax

where the account will be using *operator-greater number* bps of
class-of-service bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

class-of-service

One of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total amount of bandwidth used by the account as it relates to a defined threshold. This can be further qualified by the class of service of the bandwidth. The total is the amount of bandwidth allocated if the request is approved.

where the account will be using *greater than #* bps *reserved* bandwidth in total for
specified class of traffic

Mode

Cable

Syntax

where the account will be using *operator bandwidth* bps *qos-status* bandwidth
in total for *class-of-service* traffic

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**
- **Non Real-time Polling**
- **Real-time Polling**
- **UGS**
- **Background**

- **Conversational**
- **Streaming**
- **Interactive**

In Wireline mode, one of the following:

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth for specific classes of service used by the associated accounts as it relates to a defined threshold. This can be further qualified by the allocation status of the bandwidth. The total represents the amount of bandwidth that are allocated if the current request is approved.

where the account will be using *greater than #* bps upstream bandwidth in total for *specified application*

Mode

Cable

Syntax

where the account will be using *operator bandwidth* bps upstream bandwidth in total for *app-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second

- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth allocated for specific applications by the associated account as it relates to a defined threshold. The total represents the bandwidth that is allocated if the current request is approved. See [Managing Application Profiles](#) for information on applications.

where the account will be using *greater than # bps upstream reserved* bandwidth

Mode

Cable

Syntax

where the account will be using *operator bandwidth bps qos-direction*
qos-status bandwidth

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second

- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth used by the account as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total is the bandwidth allocated if the request is approved.

where the account will be using *greater than # downstream* sessions

Mode

Wireline

Syntax

where the account will be using *operator number qos-direction* sessions

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**

- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Description

Triggers a policy based on the total number of sessions used by the associated account as it relates to a defined threshold. This can be further qualified by the direction of the sessions. The total represents the number of sessions that are allocated if the current request is approved.

where the account will be using *greater than # reserved* flows in total for *specified class of* traffic

Mode

Cable

Syntax

where the account will be using *operator number qos-status* flows in total
for *class-of-service* traffic

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**
- **Non Real-time Polling**
- **Real-time Polling**
- **UGS**
- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Wireline mode, one of the following:

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows for specific classes of service used by the associated accounts as it relates to a defined threshold. This can be further qualified by the allocation status of the flows. The total represents the number of flows that are allocated if the current request is approved.

where the account will be using *greater than # specified class of* sessions

Mode

Wireline

Syntax

where the account will be using *operator-greater number class-of-service* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

class-of-service

One of the following:

- **Standard Definition**
- **High Definition**

Description

Triggers a policy based on the total number of sessions for specific classes of service used by the account as it relates to a defined threshold. This can be further qualified by the class of the sessions. The total is the number of sessions allocated if the request is approved.

where the account will be using *greater than #* upstream flows in total for *specified application*

Mode

Cable

Syntax

where the account will be using *operator number* upstream flows in total for *app-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows for specific applications used by the associated accounts as it relates to a defined threshold. The total represents the number of flows that are allocated if the current request is approved. See [Managing Application Profiles](#) for information on applications.

where the account will be using *greater than # upstream reserved* flows

Mode

Cable

Syntax

where the account will be using *operator number qos-direction qos-status*
flows

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows used by the associated account as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the flows. The total represents the number of flows that are allocated if the current request is approved.

where the pool type is *basic*

Mode

Wireless

Syntax

where the pool type is *pool-type*

Parameters

pool-type

Select one of the following:

- **basic**
- **enterprise**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated if the pooled quota group type matches the selected type.

Example

```
where the pool type is enterprise
```

where the *subscriber or pool* does not have any of the *named* entitlements

Mode

Wireless

Syntax

where the *subscriber* does not have any of the *value-list* entitlements

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated as true for users who do not have any of the specified entitlements. The user must have none of the entitlements in the specified list. See the *CMP Wireless User's Guide* for information on entitlements.

where the *subscriber or pool* does not have at least one of the *named* entitlements

Mode

Wireless

Syntax

where the *subscriber* does not have at least one of the *value-list* entitlements

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated as true for users who do not have all of the specified entitlements. False if the user has all of the entitlements in the specified list. See the *CMP Wireless User's Guide* for information on entitlements.

where the *subscriber or pool field + 0 days rounded up* with *same* granularity is *after now* using *configured local time*

Mode

Wireless

Syntax

where the *subscriber field-name direction duration granularity1 rounded rounding with granularity2 granularity is datetime-compare datetime using time-zone*

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field-name

String representing a datetime.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

direction

One of the following, indicating a time offset in the future or past:

- + (default)
- -

duration

Positive integer.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

granularity1

The calculated datetime is expressed in this granularity:

- **days** (default)
- **months**
- **hours**
- **minutes**

rounding

One of the following, indicating rounding up or down:

- **up**
- **down**

granularity2

Rounding, either up or down, is expressed in this granularity:

- **same** (same as *granularity1*)
- **months**
- **days**
- **hours**
- **minutes**

datetime-compare

One of the following:

- **after** (default)
- **before**
- **at or before**
- **at or after**

datetime

One of the following:

- A policy variable.
- **now** (default) — The local date-time.
- A date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

- **Date** — Select the date from the calendar interface.
- **Time** — Select hh:mm:ss.
- **UTC Offset** — Select number of hours before or after UTC time to start.

- **now** — Select for the local date-time.
- **Time only** — Select to use the time only.
- A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCoffset*. Click **Evaluate as expression** to bypass date-time format validation.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the result of a comparison between a base date-time value and an offset against either the current date and time or another date-time for the subscriber or subscriber pool. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

Example

where the *FamilyPlanGold PromoEnrollTime + 10 days* rounded up with same granularity is *before now* using *configured local time*

where the *subscriber or pool field exists*

Mode

Wireless

Syntax

where the *subscriber fieldname accessibility*

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber

- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

fieldname

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Triggers a policy that is evaluated if the specified field either exists or does not exist within the subscriber or subscriber pool data.

where the *subscriber or pool field exists* before update

Mode

Wireless

Syntax

where the *subscriber fieldname accessibility* before update

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

fieldname

String.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Triggers a policy that is evaluated if the specified field either exists or does not exist within the subscriber or quota pool data if the pool or subscriber existed before provisioning. For information on quota pools, see [Managing Quotas](#).

where the **subscriber or pool field** is **in** the current billing cycle using **configured local time**

Mode

Wireless

Syntax

where the *subscriber field-name* is *comparison-op* the current billing cycle using *time-zone*

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

comparison-op

One of the following:

- **in** (default)
- **not in**
- **before**
- **after**

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the comparison of the specified timestamp value and the current billing cycle for the subscriber or subscriber pool. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

Note: The quota reset date may vary from the billing cycle end date. If the quota reset cycle is set to more than 1 month, the NextResetTime could be set to a date other than the current billing cycle end date. The billing cycle end date is calculated from the monthly billing cycle.

Note: When the user local time context is in effect, the MPE device ends the billing cycle or resets the quota based on the user local time. If user equipment enters a different time zone near the end of a billing cycle, the subscriber may find that the billing cycle ended earlier than expected, or the service provider may find that the billing cycle ended later than expected.

where the *subscriber or pool field is* modified via notification

Mode

Wireless

Syntax

where the *subscriber field-name operator-binary* modified via notification

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Triggers a policy that is evaluated based on the reception of a notification of a change to the subscriber or subscriber pool field value.

where the *subscriber or pool field* is numerically *equal to value*

Mode

Wireless

Syntax

where the *subscriber field-name* is numerically *operator value*

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **equal to**.

value

Integer value in the inclusive range of -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807 (that is, -2^{63} to $2^{63}-1$).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the result of a comparison between the value of a specified field and a numerical value for the subscriber or subscriber pool.

Example

where the *FamilyPlanGold total-session-count* is numerically *less than 5*

where the *subscriber or pool field matches one of specified value(s)*

Mode

Wireless

Syntax

where the *subscriber field-name matches-op match-list*

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the result of a comparison between the value of a specified field and a list of specified values (based on matching wildcard patterns) for the subscriber or subscriber pool.

where the *subscriber or pool field* prior to notification *matches one of specified value(s)*

Mode

Wireless

Syntax

where the *subscriber field-name* prior to notification *matches-op match-list*

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated based on the result of a comparison between the value of a specified field and a list of specified values (based on matching wildcard patterns) prior to notification for the subscriber or subscriber pool.

where the *subscriber or pool* has all of the *named* entitlements

Mode

Wireless

Syntax

where the *subscriber* has all of the *value-list* entitlements

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for users that have specific entitlements. The user must have all the entitlements in the specified list. See the *CMP Wireless User's Guide* for information on entitlements.

where the *subscriber or pool* has at least one of the *named* entitlements

Mode

Wireless

Syntax

where the *subscriber* has at least one of the *value-list* entitlements

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated as true for users that have specific entitlements. The user must have one of the entitlements in the specified list. See the *CMP Wireless User's Guide* for information on entitlements.

where the *subscriber or pool* profile data *is* available

Mode

Wireless

Syntax

where the *subscriber* profile data *operator-binary* available

Parameters

subscriber

One of the following:

- **subscriber** (default) — Individual subscriber
- **pool** — Subscriber pool defined on the SPR

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-binary

One of the following:

- **is** (default)
- **is not**

Description

Triggers a policy based on whether subscriber or subscriber pool data is or is not available.

where the subscriber profile data *expiration timestamp field for day pass in millis* is less than *hours from expiration* hours from expiring

Mode

Wireless

Syntax

where the subscriber profile data *field-name* is less than *number* hours from expiring

Parameters

field-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on whether the value of a subscriber profile timestamp field is less than the specified number of hours away.

where the tier *is* one of *specified tier(s)*

Mode

Cable, Wireless, Wireline

Syntax

where the tier *operator-binary* one of *tiers*

Parameters

operator-binary

One of the following:

- *is* (default)

- **is not**

tiers

A comma-separated list of names of one more tiers defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is or is not evaluated for one or more specific tiers.

where the tier will be handling *greater than #* and *less than # specified class of* sessions

Mode

Wireline

Syntax

where the tier will be handling *operator-greater number* and *operator-less number class-of-service session*

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One of the following:

Description

Triggers a policy based on the total number of sessions for a specific class of service used by the tier as it relates to a defined range. The total is the number of sessions allocated if the request is approved.

where the tier will be handling *greater than # specified class of* sessions

Mode

Wireline

Syntax

where the tier will be handling *operator-greater number class-of-service* sessions

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

class-of-service

One of the following:

Description

Triggers a policy based on the total number of sessions for a specific class of service used by the tier as it relates to a defined threshold. The total is the number of sessions allocated if the request is approved.

where the tier will be using *greater than #* and *less than #* bps of *specified class of* bandwidth

Mode

Wireline

Syntax

where the tier will be using *operator-greater number* and *operator-less number* bps of *class-of-service* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**
- **Non Real-time Polling**
- **Real-time Polling**
- **UGS**
- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Wireline mode, one of the following:

Description

Triggers a policy based on the total amount of bandwidth used by the tier as it relates to a defined range. This can be further qualified by the class of service of the bandwidth. The total is the amount of bandwidth allocated if the request is approved.

where the tier will be using *greater than #* bps of *specified class of* bandwidth

Mode

Wireline

Syntax

where the tier will be using *operator-greater number* and *operator-less number* bps of *class-of-service* bandwidth

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

number

A numeric value.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

class-of-service

One of the following:

Description

Triggers a policy based on the total amount of bandwidth used by the tier as it relates to a defined threshold. This is further qualified by the class of service of the bandwidth. The total is the amount of bandwidth allocated if the request is approved.

where the user E.164 phone number *matches one of specified number(s)*

Mode

Wireless

Syntax

where the E.164 phone number *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific E.164 phone numbers (based on matching wildcard patterns). A valid E.164 phone number is any phone number.

where the user has *greater than #* of passes named *select type*

Mode

Wireless

Syntax

where the user has *operator number* of passes named *pass_name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pass_name

Select a name from the pass selection pop-up.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the number of selected passes.

where the user has *greater than #* of rollover units of type *unit type* for plan *plan name* and usage *usage type*

Mode

Wireless

Syntax

where the user has *operator number* of rollover units of type *unit_type* for plan *plan_name* and usage *usage_type*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

unit_type

One of the following:

- **Time**
- **Volume**
- **Service Specific**
- **Uplink Volume**
- **Downlink Volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

plan_name

Select a name from the plan selection pop-up.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

usage_type

One of the following:

- **Limit**
- **Available**
- **Consumed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the number of rollover units of a selected unit type for a selected plan and selected usage type.

where the user has *greater than #* of top-ups for plan *select type*

Mode

Wireless

Syntax

where the user has *operator number* of top-ups for plan *plan-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

plan-name

Select a name from the plan selection pop-up.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the number of top-ups in the selected plan.

where the user IMSI *matches one of specified number(s)*

Mode

Wireless

Syntax

where the user IMSI *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific IMSI values (based on matching wildcard patterns). A valid IMSI value is not more than 15 digits, including the mobile country code (3 digits), mobile network code (2 to 3 digits), and the mobile station identification number. For example: 310150123456789.

where the user is a *home* user

Mode

Wireless

Syntax

where the user is a *user-type* user

Parameters

user-type

One of the following:

- **home**
- **visiting**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Defines the user type. A user is local (home) when the MCC-MNC from the IMSI matches an MCC-MNC configured in the home MCC-MNC match list(s); otherwise, the user is visiting. If the IMSI is not available, the user is deemed local.

where the user is using dynamic quota for *selected*

Mode

Wireless

Syntax

where the user is using dynamic quota for *quota-name*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This condition allows the PCRF to send SMS messages when the user's quota usage reaches a certain usage ratio. It checks to see if the user is using any dynamic quota of a specified quota profile. See [Managing Quotas](#) for information on quotas.

where the user is using *greater than #* percent and *less than #* percent *select type* of dynamic quota for *selected*

Mode

Wireless

Syntax

where the user is using *operator-greater number* percent and *operator-less number* percent of *service-type* for dynamic *quota-name*

Parameters

operator-greater

One of the following:

- **greater than or equal to**
- **greater than** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator-less

One of the following:

- **less than or equal to**
- **less than** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

number

A number with the maximum of 6 decimals within the range: 0-10000.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This condition allows the PCRF to send SMS messages when the user's quota usage reaches a certain usage ratio. It checks to see whether the used service unit (USU) of a dynamic quota of a specified quota profile is within the specified percent range for the specified type. See [Managing Quotas](#) for information on quotas.

where the user is using *greater than # percent select type* of dynamic quota for *selected*

Mode

Wireless

Syntax

where the user is using *operator number percent service-type* of dynamic quota for *quota-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

number

A number with the maximum of 6 decimals within the range: 0-10000.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This condition allows the PCRF to send SMS messages when the user's quota usage reaches a certain usage ratio. It checks to see whether the used service unit (USU) of a dynamic quota of a specified quota profile exceeds the specified percent for the specified type. See [Managing Quotas](#) for information on quotas.

where the user is using *greater than #* seconds in total for *selected* quota

Mode

Wireless

Syntax

where the user is using *operatorseconds* seconds in total for *quota-name*
quota

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

seconds

A numeric value that specifies time in units of seconds.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the amount of the time-based quota used by the subscriber as it relates to a defined threshold. The total represents the quota that is allocated if the current request is approved. See [Managing Quotas](#) for information on quotas.

where the user is using *greater than #* service-specific units for *selected* quota

Mode

Wireless

Syntax

where the user is using *operator number* service-specific units for *quota-name*
quota

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the amount of the service-based quota used by the subscriber as it relates to a defined threshold. The total represents the quota that is allocated if the current request is approved. See [Managing Quotas](#) for information on quotas.

where the user is using *greater than #* units of *total volume (bytes)* for *selected* quota

Mode

Wireless

Syntax

where the user is using *operator number* units of *service-unit* for *quota-name*
quota

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-unit

One of the following:

- **time (seconds)**
- **total volume (bytes)**
- **uplink volume (bytes)**
- **downlink volume (bytes)**

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the amount of the quota used by the subscriber as it relates to a defined threshold. See [Managing Quotas](#) for information on quotas.

Example

where the user is using **greater than 50000** units of **total volume (bytes)**
for **Monthly1,Daily1**

where the user is using *greater than specified* percent and *less than #* percent of *select type* for *selected* quota

Mode

Wireless

Syntax

where the user is using *operator extended-percent* percent and *operator extended-percent* percent of *service-type* for *quota-name* quota

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than** for the first occurrence and **less than** for the second.

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the percent of the specific quota used by the subscriber as it relates to a range. The total represents the quota that is allocated if the current request is approved. See [Managing Quotas](#) for information on quotas.

The calculation used to determine the percentage of quota used differs based on if the aggregate quota function is enabled.

- If the aggregate quota function is enabled, the usage calculation uses the subscriber's usage against the quota plan, top-ups, and rollovers.
- If the aggregate quota function is disabled, the usage calculation only uses the quota plan and ignores any top-ups or rollovers.

For more information on the aggregate quota function, see [Creating a Quota Convention](#).

Note: If this condition applies to a quota pass, then the calculation is not affected by the aggregate quota option. Aggregate quota only affects quota plans.

Example

```
where the user is using greater than 80 percent and less than 100 percent  
of total volume for Monthly1,Daily1
```

where the user is using *greater than specified* percent of *select type* for *selected* quota

Mode

Wireless

Syntax

where the user is using *operator extended-percent* percent of *service-type*
for *quota-name* quota

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the percent of the specific quota used by the subscriber as it relates to a defined threshold. The total represents the quota that is allocated if the current request is approved. See [Managing Quotas](#) for information on quotas.

The calculation used to determine the percentage of quota used differs based on if the aggregate quota function is enabled.

- If the aggregate quota function is enabled, the usage calculation uses the subscriber's usage against the quota plan, top-ups, and rollovers.
- If the aggregate quota function is disabled, the usage calculation only uses the quota plan and ignores any top-ups or rollovers.

For more information on the aggregate quota option, see [Creating a Quota Convention](#).

Note: If this condition applies to a quota pass, then the calculation is not affected by the aggregate quota option. Aggregate quota only affects quota plans.

Example

where the user is using *greater than 100* percent of *total volume* for *Monthly1,Daily1*

where the user NAI *matches one of specified id(s)*

Mode

Wireless

Syntax

where the user NAI *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific NAI values (based on matching wildcard patterns).

where the user realm *matches one of specified realm(s)*

Mode

Wireless

Syntax

where the user realm *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific realms (based on matching wildcard patterns).

where the user *Service key exists*

Mode

Wireless

Syntax

where the user *service key field accessibility*

Parameters

service

One of the following:

- **Service**
- **User Session Policy**
- **User Location**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

key

Name(s) of a specific entity.

- For Service, the key is a Service Code.
- For User Session Policy, the key is a Policy Code
- For User Location, the key is a Location Code.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

The name of a field belonging to the selected service.

accessibility

One of the following:

- **exists** (default)
- **does not exist**

Description

Determines if the selected service exists.

where the user *Service key field contains one of specified value(s)*

Mode

Wireless

Syntax

where the user *service key field containment value-list*

Parameters

service

- **Service** (default)
- **User Session Policy**
- **User Location**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

key

Name(s) of a specific entity.

- For Service, the key is a Service Code.
- For User Session Policy, the key is a Policy Code
- For User Location, the key is either a Location Code or a Policy Code.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

The name of a field belonging to the selected service.

containment

One of the following:

- **contains one of** (default)
- **does not contain any of**

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines if the entity field contains the specified value.

where the user *Service key field matches one of value(s)*

Mode

Wireless

Syntax

where the user *service key field matches-op match-list*

Parameters

service

- **Service**
- **User Session Policy**
- **User Location**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

key

Name(s) of a specific entity:

- For Service, the key is a Service Code
- For User Session Policy, the key is a Policy Code
- For User Location, the key is either a Location Code or a Policy Code

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

The name of a field belonging to the selected service.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy when the specified fields match the selected entity.

where the user *Service key field* prior to notification *matches one of* previous value

Mode

Wireless

Syntax

where the user *service key field* prior to notification *matches-op* previous value

Parameters

service

- **Service**
- **User Session Policy**
- **User Location**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

key

Name(s) of a specific entity.

- For Service, the key is a Service Code.
- For User Session Policy, the key is a Policy Code
- For User Location, the key is either a Location Code or a Policy Code.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

field

The name of a field belonging to the selected service.

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

Description

Determines if the field value of a service changed because of a notification request from SPR.

where the user *Service key* is *in* the activation timeframe using *configured local time*

Mode

Wireless

Syntax

where the user *service key* is *comparison-op* the activation timeframe using *time-zone*

Parameters

service

- **Service** (default)
- **User Session Policy**
- **User Location**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

key

Name(s) of a specific entity.

- For Service, the key is a Service Code.
- For User Session Policy, the key is a Policy Code
- For User Location, the key is a Location Code.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

comparison-op

One of the following:

- **in** (default)
- **not in**
- **before**
- **after**

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Determines if the specific entity is active by comparing the start/end time for the entity with the current time.

where the user SIP URI *matches one of specified URI(s)*

Mode

Wireless

Syntax

where the user SIP URI *matches-op match-list*

Parameters

matches-op

One of the following:

- **matches one of** (default)
- **does not match any of**

match-list

A comma-separated list of values, where each value is a wildcard match pattern that uses the * (asterisk) character to match zero or more characters and the ? (question mark) character to match exactly one character.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is only evaluated for one or more specific SIP URI values (based on matching wildcard patterns).

where the user will be handling *greater than #* percent of *upstream reserved* limit

Mode

Wireless

Syntax

where the user will be handling *operator percent percent of qos-direction*
for *qos-status*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**

- **equal to**
- **not equal to**

The default for this condition is **greater than**.

percent

An integer value between 0 and 100.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the percent of the specific quota used by the subscriber as it relates to a defined threshold. The total represents the quota that is allocated if the current request is approved. See [Managing Quotas](#) for information on quotas.

where the user will be using *greater than # bps reserved* bandwidth in total for *specified class of* traffic

Mode

Wireless

Syntax

where the user will be using *operator bandwidth bps qos-status bandwidth* in total for *class-of-service* traffic

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

class-of-service

In Wireless mode, one (or more) of the following:

- **Background**
- **Conversational**
- **Streaming**
- **Interactive**

In Cable mode, one (or more) of the following:

- **Best Effort**
- **Non Real-time Polling**
- **Real-time Polling**
- **UGS**
- **Background**
- **Conversational**
- **Streaming**

- **Interactive**

In Wireline mode, one of the following:

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth allocated for specific classes of service by the associated subscriber as it relates to a defined threshold. This can be further qualified by the allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the user will be using *greater than # bps upstream reserved* bandwidth

Mode

Wireless

Syntax

where the user will be using *operator bandwidth bps qos-direction qos-status*
bandwidth

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth allocated. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved.

where the user will be using *greater than # bps upstream reserved* bandwidth in total for *specified application*

Mode

Wireless

Syntax

where the user will be using *operator bandwidth bps qos-direction qos-status* bandwidth in total for *app-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total amount of bandwidth allocated for specific applications by the associated subscriber as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the bandwidth. The total represents the bandwidth that is allocated if the current request is approved. See [Managing Application Profiles](#) for information on applications.

where the user will be using *greater than # upstream reserved* flows

Mode

Wireless

Syntax

where the user will be using *operator number qos-direction qos-status* flows

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows used by the associated subscriber as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of these flows. The total represents the number of flows that are allocated if the current request is approved.

where the user will be using *greater than # upstream reserved* flows in total for *specified application*

Mode

Wireless

Syntax

where the user will be using *operator number qos-direction qos-status* flows in total for *app-name*

Parameters

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

qos-status

One of the following:

- **reserved** (default)
- **committed**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

app-name

Names of an application. The application must exist in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy based on the total number of flows for specific applications used by the associated subscriber as it relates to a defined threshold. This can be further qualified by both the direction and allocation status of the flows. The total represents the number of flows that are allocated if the current request is approved. See [Managing Application Profiles](#) for information on applications.

where the User's Tier *downstream* bandwidth limit is between # bps and # bps

Mode

Wireline

Syntax

where the User's Tier *qos-direction* bandwidth limit is between *bandwidth* bps and *bandwidth* bps

Parameters

qos-direction

One of the following:

- **upsteam**
- **downsteam** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated for a user tier based on the bandwidth limit. This can be further qualified by the direction of the bandwidth. See the appropriate *CMP User's Guide* for information on tiers.

Example

```
where the User's Tier downstream bandwidth limit is between 2M bps and  
25M bps
```

where the User's Tier *downstream* bandwidth limit is *greater than* # bps

Mode

Wireline

Syntax

```
where the User's Tier qos-direction bandwidth limit is operator bandwidth  
bps
```

Parameters

qos-direction

One of the following:

- **upstream**
- **downstream** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**
- **less than**
- **equal to**
- **not equal to**

The default for this condition is **greater than**

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated for a user tier based on the comparison between the bandwidth limit and a numerical value. This can be further qualified by the direction of the bandwidth. See the appropriate *CMP User's Guide* for information on tiers.

Example

where the User's Tier *downstream* bandwidth limit is *less than or equal to 25M* bps

where the User's Tier *upstream* bandwidth limit is between *#* bps and *#* bps

Mode

Cable, Wireless

Syntax

where the User's Tier *qos-direction* bandwidth limit is between *bandwidth* bps and *bandwidth* bps

Parameters

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated for a user tier based on the bandwidth limit. This can be further qualified by the direction of the bandwidth. See the appropriate *CMP User's Guide* for information on tiers.

Example

```
where the User's Tier downstream bandwidth limit is between 2M bps and  
25M bps
```

where the User's Tier *upstream* bandwidth limit is *greater than #* bps

Mode

Cable, Wireless

Syntax

```
where the User's Tier qos-direction bandwidth limit is operator bandwidth  
bps
```

Parameters

qos-direction

One of the following:

- **upstream** (default)
- **downstream**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

operator

One of the following:

- **greater than or equal to**
- **greater than**
- **less than or equal to**

- less than
- equal to
- not equal to

The default for this condition is **greater than**

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers a policy that is evaluated for a user tier based on the comparison between the bandwidth limit and a numerical value. This can be further qualified by the direction of the bandwidth. See the appropriate *CMP User's Guide* for information on tiers.

Example

where the User's Tier *downstream* bandwidth limit is *less than or equal to* *25M* bps

Actions for Writing Policy Rules

The policy wizard supports a large number of actions that can be used for constructing policy rules. There are two types of policy-processing actions:

- | | |
|--------------------------|--|
| Mandatory actions | This action defines what happens when the current policy is through executing. When you are creating a policy rule in the policy wizard, these actions are displayed at the top of the list of available actions with a radio button that forces you to select only one of these actions. |
| Optional actions | These are actions executed when the conditions in the policy rule have been met. When you are creating a policy rule in the policy wizard, this is a list of actions that you can add to your policy rule. You can select none, one, several, or up to 40 of these optional actions per rule. However, each action is limited, so that it can be executed only once per policy rule. |

In the same way that you can customize conditions by editing parameter values, many of these actions can be customized by specifying parameter values as well.

Actions are listed in alphabetical order. Actions also are affected by the current mode. Therefore, some of the actions documented may not be available in your policy wizard.

Mandatory Policy-Processing Actions

Policy-processing actions define what the Policy Engine should do when the current policy is through executing. The following are the mandatory policy-processing actions; one of these actions must be selected in each policy.

accept message

Mode

Cable, Wireless, Wireline

Syntax

accept message

Parameters

None

Description

After executing the current policy rule, the Policy Engine continues with the normal processing of the protocol message but no further policy rules are evaluated.

break from policy level

Mode

Cable, Wireless

Syntax

break from policy level

Parameters

None

Description

Stop evaluating the current policy and continue policy evaluation with the next policy at the parent's level. You should use this action only in reference policies.

continue processing message

Mode

Cable, Wireless, Wireline

Syntax

continue processing message

Parameters

None

Description

After executing the current policy rule, the Policy Engine continues with the next policy rule.

Example

```
where the request is terminating an existing session  
And where the enforcement session is an IP-CAN session  
send notification to trace log with `### Alert :: Gx Session Terminated  
###` and severity `Alert`  
continue processing message
```

reject message

Mode

Cable, Wireless, Wireline

Syntax

reject message

Parameters

None

Description

After executing the current policy rule, the Policy Engine terminates all policy-rule processing and rejects the current protocol message. The specific interpretation of rejecting the message varies depending on the associated protocol. For most application-level requests this translates into some type of error being sent back to the application.

reject message with code `*number*`

Mode

Wireless

Syntax

reject message with code `*number*`

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

After executing the current policy rule, the MPE device terminates all policy-rule processing and rejects the current protocol message with a specified error code. If the input number is an invalid error code, then the message returns DIAMETER_AUTHORIZATION_REJECTED(5003).

reject message with code `*number*`

Mode

Wireline

Syntax

reject message with code `*number*`

Parameters

number

qos-direction

A numeric value.

This value is an integer from 1–2000000000.

Description

After executing the current policy rule, the generated code is propagated back to the VoD server.

reject message with Experimental-Result-Code `*number*` and Vendor-ID `*number*`

Mode

Wireless

Syntax

reject message with Experimental-Result-Code `number` and Vendor-ID `number`

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This action applies to Rx requests only. After executing the current policy rule, the message is rejected, including the specified experimental result code and vendor ID AVPs in the AAA message and the trace log. This action supports sponsored data connectivity.

Example

The following conditions, if evaluated as true, accept sponsored data connectivity, but otherwise reject the message with Experimental-Result-Code 5067 ("UNAUTHORIZED_SPONSORED_DATA_CONNECTIVITY") and Vendor-ID 10415 (3GPP):

Or

where the Sponsor-Identity matches one of *nba*

And where the Application-Service-Provider-Identity matches one of *netmovies*

And where the AF-Application-ID matches one of *streaming,voip*

And where the application *is* one of *af-10.24*

continue processing message

reject message with Experimental-Result-Code `5067` and Vendor-ID `10415`

skip to next device

Mode

Cable, Wireless

Syntax

skip to next device

Parameters

None

Description

Stop evaluating policies for the current device and continue policy evaluation with the next device. If there is no next device, policy execution ends.

skip to next flow

Mode

Cable, Wireless

Syntax

skip to next flow

Parameters

None

Description

Stop evaluating policies for the current flow and continue policy evaluation with the next flow. If there is no next flow, evaluation continues with the next device; if there is no next device, policy execution ends.

Optional Policy-Processing Actions

The following optional policy-processing actions are available.

accumulate reported quota usage of *selected* to *selected*

Mode

Wireless

Syntax

accumulate reported quota usage of *select-quota1* to *select-quota2*

Parameters

select-quota1

Name of a quota.

select-quota2

Name of a different quota.

Description

Transfers the quota usage report for the quota to the specified quota. See [Managing Quotas](#) for information on quotas.

add custom grouped AVP *name* and send *always*

Mode

Wireless

Syntax

add custom grouped AVP *name* and send *send-mode*

Parameters

name

Select an existing grouped third-party AVP Name and Vender ID, or an AVP name from an existing policy table.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

send-mode

One of the following:

- **always** (default)
- **unless rejected**
- **if rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Add or send new custom grouped AVP to the current reply. A condition can be set specifying that the AVP is always set to send mode. If you are defining a new grouped third party AVP with members, the grouped AVP has to appear first in the policy. If you are adding a new member AVP that does not have its parent AVP added yet, the policy attempts to locate this grouped AVP in the rest of the policy. If you are including a grouped AVP multiple times in the same message, you have to follow the order in which it appears in the message.

add the APP Detection Flow *select scope* to *specified* PCC rules

Mode

Wireless

Syntax

add the APP Detection Flow *flow-type* to *value-list* PCC rules

Parameters

flow-type

Select one of the following options:

- **Flow-information** (default)
- **TDF-Application-Instance-Identifier**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This action binds the specified TDF-Application-Identifier and TDF-Application-Instance-Identifier information of the current application detection flow to the Policy and Charging Control (PCC) rules, so that the MPE device can find the mapping. The specified PCC rules must be installed in this Credit Control Answer (CCA), or the PCC rules are ignored and not installed.

When **Flow-Information** is specified, the TDF-Application-Identifier and TDF-Application-Instance-Identifier information of the current application detection flow is recorded in the MPE device that is associated with the PCC rules. During this process, the MPE device removes related rules while reporting Application-Detection-Information with TDF-Application-Identifier and TDF-Application-Instance-Identifier for an application stop . The Flow-Information is added to the specified PCC rules if select scope is Flow-Information. And do not add duplicated Flow.

When **TDF-Application-Instance-Identifier** is specified, the TDF-Application-Identifier and TDF-Application-Instance-Identifier information of the current application detection flow is recorded in the MPEdevice that is associated with the PCC rules. During this process, the MPE device removes related rules while reporting Application-Detection-Information with TDF-Application-Identifier and TDF-Application-Instance-Identifier for an application stop.

Advanced: set values for QoS and Charging parameters to *specified value*

Mode

Cable, Wireless

Syntax

Advanced: set values for QoS and Charging parameters to *profile-param*

Parameters

profile-param

Names of profile parameters that are derived from internal representations of protocol messages. This list is lengthy and subject to change as new protocols are supported, and therefore is not given here. The policy wizard includes a customized dialog to

help you in the selection of parameters and valid values for them. For the specific meaning of the fields it may be necessary to consult protocol specifications.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the corresponding settings in the current protocol message. If you specify settings that are not relevant in the current protocol message, the settings are stored for an upcoming relevant message. For example, if you use this action to set session parameters for a Gx session when an Rx request is received, the settings will not be relevant for the current Rx protocol message and will be stored for an upcoming Gx protocol message.

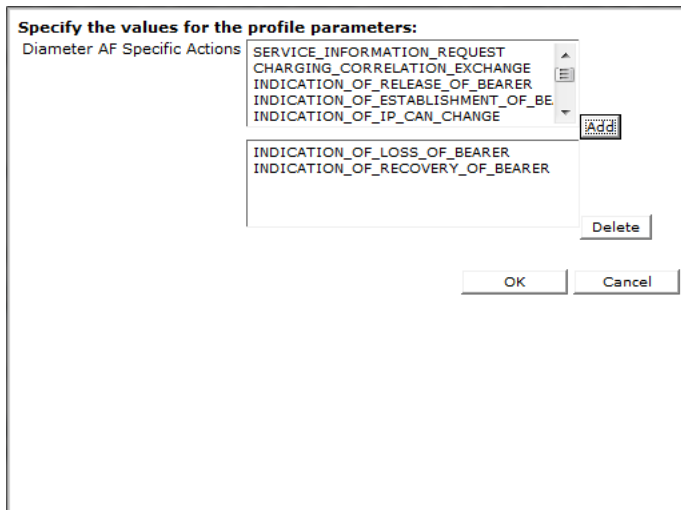

Example

This is the sequence of steps within the policy wizard needed to specify the following action:

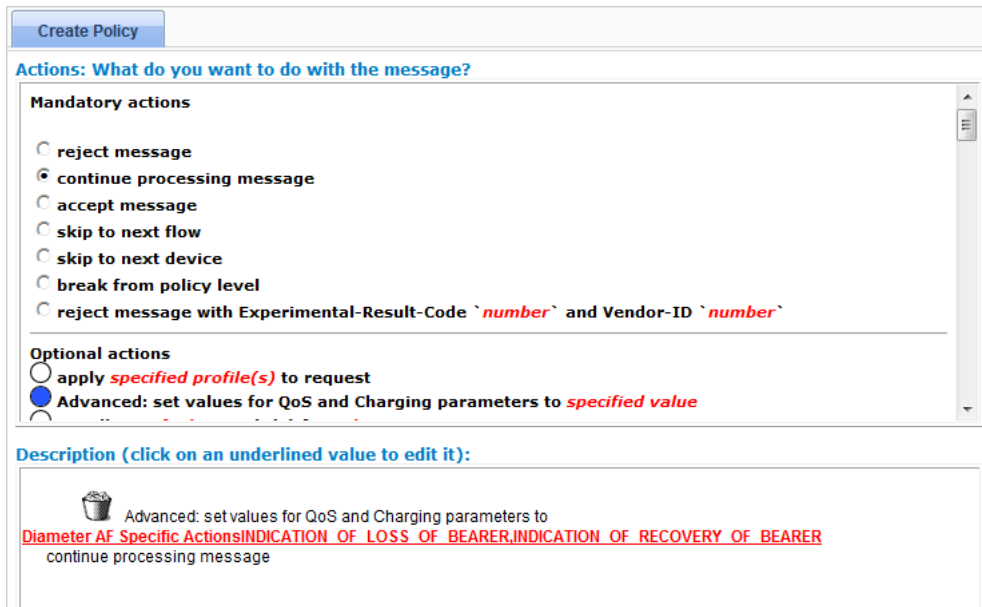

Advanced: set values for QoS and Charging Parameters to *Diameter AF Specific Actions* *INDICATION_OF_LOSS_OF_BEARER, INDICATION_OF_RECOVERY_OF_BEARER*

1. In the Actions step, select the optional action **Advanced: set values for QoS and Charging Parameters to *specified value***. The action is displayed in the Description section of the page.

2. In the Description section of the page, click on *specified value*. The **Profile Parameter** window opens.
3. In the **Profile Parameter** window, select **Diameter AF Specific Actions**, and click **OK**. You are prompted, Specify the values for the profile parameters:.
4. Use Shift-click or Ctrl-click to select **INDICATION_OF_LOSS_OF_BEARER** and **INDICATION_OF_RECOVERY_OF_BEARER**, and click **Add** to move the values to the list of selected values.

5. Click OK. The action is defined.

apply roaming profile *name*

Mode

Wireless

Syntax

apply Roaming Profile *roaming-profile*

Parameters

roaming-profile

The name of the Roaming Profile. For more information on roaming profiles, see [Managing Roaming Profiles](#).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This parameter allows you to apply a specific roaming profile.

apply *specified profile(s)* to all flows in the request

Mode

Cable, Wireless

Syntax

apply *traffic-profile* to all flows in the request

Parameters

traffic-profile

One or more traffic profiles. For more information on traffic profiles, see [Managing Traffic Profiles](#).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This parameter allows you to choose different traffic profiles to apply to different types of calls.

apply *specified profile(s)* to request

Mode

Cable, Wireless

Syntax

apply *traffic-profile* to request

Parameters

traffic-profile

One or more traffic profiles. For more information on traffic profiles, see [Managing Traffic Profiles](#).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the corresponding settings in the current protocol message. If multiple traffic profiles are selected they are applied in the order in which they are specified. If the traffic profile contains settings that are not relevant in the current protocol message, they are ignored.

apply *specified profiles* to flow(s) whose media type matches one of *specified types*

Mode

Wireless

Syntax

apply *traffic-profile* to flows whose media type matches one of *media-type*

Parameters

traffic-profile

One or more traffic profiles. For more information on traffic profiles, see [Managing Traffic Profiles](#).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

media-type

One or more of the following, used to determine the type of media:

- **Audio**
- **Video**
- **Data**
- **Application**
- **Control**
- **Text**
- **Message**
- **Other**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Applies one or more traffic profiles to one or more flows of the specified types. Overwrites the corresponding settings in the protocol messages of the specified flows. If multiple traffic profiles are selected they are applied in the order in which they are specified. If a traffic profile contains settings

that are not relevant in the current protocol message, they are ignored. The second parameter lets you apply different traffic profiles to flows of different types.

apply *specified profiles* to selected *specified types* flows in the request

Mode

Cable, Wireless

Syntax

apply *traffic-profile* to selected *media-type* flows in the request

Parameters

traffic-profile

One or more traffic profiles. For more information on traffic profiles, see [Managing Traffic Profiles](#).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

media-type

One or more of the following, used to determine the type of media:

- **Audio**
- **Video**
- **Data**
- **Application**
- **Control**
- **Text**
- **Message**
- **Other**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the corresponding settings in the protocol messages of the specified type. If multiple traffic profiles are selected, they are applied in the order in which they are specified. If the traffic profile contains settings that are not relevant in the current protocol message, they are ignored. The second parameter lets you choose different traffic profiles to apply to different types of calls.

clear alarm with severity *severity level*, id *unique alarm identifier* and message *message text*

Mode

Cable, Wireless

Syntax

clear alarm with severity *level*, id *alarm-id* and message *message*

Parameters

level

One of the following, used to determine which alarm ID is cleared:

- **Critical** (ID 74000)
- **Major** (ID 74001)
- **Minor** (ID 74002)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

alarm-id

The alarm ID. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Clears an alarm on the CMP Active Alarms display containing the specified severity level and message text. This notification is written to the Alarm History Report with severity Clear. To be cleared, a notification must be uniquely identified by severity and alarm ID. For more information, see the appropriate *CMP User's Guide*.

disable forwarding to next hop gateway

Mode

Wireless

Syntax

disable forwarding to next hop gateway

Parameters

None.

Description

Disables forwarding to the next hop gateway.

disable *monitoring key*

Mode

Wireless

Syntax

disable *mon-key*

Parameters

mon-key

Name(s) of a monitoring key in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Disables usage monitoring from the PCEF. This sets the value of the Usage-Monitoring-Information AVP sent to the MPE device to USAGE_MONITORING_DISABLED. The MPE device will send a usage report. See [Managing Monitoring Keys](#) for information on monitoring keys.

discard next quota usage report in grace period of *select-quota*

Mode

Wireless

Syntax

discard next quota usage report in grace period of *quota-name*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

Description

Discards the next quota usage report for the specified quota. See [Managing Quotas](#) for information on quotas.

Example

```
where the policy context property ICHGFLAG matches one of 'TYPE:3'  
And where the session granted quota using INT is valid  
discard next quota usage report in grace period of DATA_Plan_NEVER_RESET  
break from policy level
```

discard next quota usage report in grace period of *select-quota* using *monitoring-key*

Mode

Wireless

Syntax

discard next quota usage report in grace period of *quota-name* using *mon-key*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

mon-key

Name(s) of a monitoring key in the CMP database.

Description

Discards the next quota usage report for the specified quota that has the specified monitoring key. See [Managing Quotas](#) for information on quotas.

Example

```
where the policy context property ICHGFLAG matches one of 'TYPE:3'  
And where the session granted quota using INT is valid  
discard next quota usage report in grace period of DATA_Plan_NEVER_RESET  
using INT  
break from policy level
```

enable event messaging for this request

Mode

Cable

Syntax

enable event messaging for this request

Parameters

None

Description

Enables event messaging for the current message, using the default Event Messaging parameters for this MPE device. If there is no EventGenerationInfo object in the current message, a new one is added.

enable subscription for notification of user profile changes

Mode

Wireless

Syntax

enable subscription for notification of user profile changes

Parameters

None

Description

Causes the MPE device to subscribe to an SPR system for notification of user profile changes.

Note: Within the same MPE device, if subscription to profile updates (that is, Sh:Notify) has occurred (for example, as a result of a policy action), then the MPE device will not resubscribe to update notifications on subsequent triggers (that is, it will not send additional SNR messages to the SPR system).

enable subtracting usage from *select quota* for *monitoring key*

Mode

Wireless

Syntax

enable/disable subtracting usage from *quota-name* for *mon-key*

Parameters

enable/disable

Select one of the following:

- **enable** (default)
- **disable**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

mon-key

Name(s) of a monitoring key in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Allows or disallows subtraction of the usage reported by the specified monitoring key(s) from the specified quota(s). See [Managing Monitoring Keys](#) for information on monitoring keys.

Example

In this example, to implement a free promotion, quota granted for a video session is subtracted from the total used at the session level:

```
where the request is creating a new session
install video PCC rule(s) for session
grant total volume to 100 percent used for video1 using key2
grant total volume to 100 percent used for quotal
enable subtracting usage from quotal for key2
```

enable/disable PRA subscription

Mode

Wireless mode with the 3GPP mode enabled.

Syntax

status PRA subscription

Parameters

status

One of the following:

- **enable**
- **disable**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This action enables or disables PRA subscription.

establish traffic detection session using the IP-CAN TDF information

Mode

Wireless

Syntax

establish traffic detection session using the IP-CAN TDF information

Parameters

None

Description

Use this action to establish an Sd session specified in a Gx CCR request with a single TDF device. On IP-CAN session establishment, the policy action will trigger a TSR command that is sent to the TDF device. This information is received in the TDF-information AVP within the IP-CAN session request.

Example

```
where the request is creating a new session  
And where the session is an enforcement session  
And where the enforcement session is an IP-CAN session  
establish traffic detection session using the IP-CAN TDF information  
continue processing message
```

establish traffic detection session with *select network element identity*

Mode

Wireless

Syntax

establish traffic detection session with *tdf*

Parameters

tdf

One or more TDF network elements defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

On a IP-CAN session establishment, the policy action will trigger a TSR command that is sent to the selected TDF device(s) to establish an Sd session.

Example

```
where the request is creating a new session
And where the session is an enforcement session
And where the enforcement session is an IP-CAN session
establish traffic detection session with
tdf1.GalacTel.com,tdf2.GalacTel.com
continue processing message
```

evaluate policy group *select policy group*

Mode

Cable, Wireless

Syntax

evaluate policy group *group-name*

Parameters

group-name

Name of a policy group defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

If the conditions evaluates to true, evaluate the rules in a policy group. When you click the **select policy group** parameter, a pop-up window opens so you can select an existing policy group.

evaluate policy *select policy*

Mode

Cable, Wireless

Syntax

```
evaluate policy policy-name
```

Parameters

policy-name

Name of a policy defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

If the conditions evaluate to true, evaluate a policy. When you click the **select policy parameter**, a pop-up window opens, giving you the choice of selecting an existing policy or creating a new policy. If you click **Create**, a new **Policy Wizard** tab opens so you can create the new policy. When you save the new policy, it is added to the list of policies available for selection at this point.

evaluate the schedule task on *Service*

Mode

Wireless

Syntax

```
evaluate the schedule task on Service
```

Parameters

service

- **Service** (default)
- **User Session Policy**
- **Billing Day**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

If the conditions evaluate to true, evaluate the task.

Example

```
where notification from Sh datasource is received for Service  
And where the user Service 21012501234567890123456789012301  
ServiceStartDateTime prior to notification does not match any of previous  
value  
evaluate the schedule task on Service  
accept message
```

fetch Policy Counters *default* from OCS

Mode

Wireless

Syntax

fetch Policy Counters *counter-name* from OCS

Parameters

counter-name

Select one or more policy counter IDs defined in the CMP database; or enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Fetches one or more policy counters, by ID, from an online charging server.

grant # bytes for quota

Mode

Wireless

Syntax

grant *number* bytes for quota

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Grants a user the specified number of bytes for the requested service. See [Managing Quotas](#) for information on quotas.

grant # of *select units* for *select quota*

Mode

Wireless

Syntax

grant *number* of *unit* for *quota-name*

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

unit

One of the following:

- **Seconds**
- **Bytes**
- **Service Specific**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the usage threshold to the specified number of units for the selected quota profile(s). See [Managing Quotas](#) for information on quotas.

Example

```
grant 40000000 of Bytes for DailyVol,MonthlyVol
```

grant # percent in service-specific units for quota

Mode

Wireless

Syntax

grant *extended-percent* percent in service-specific units for quota

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Grants a user the specified percentage of the service-specific unit limit for the requested service.

grant # percent in time for quota

Mode

Wireless

Syntax

grant *extended-percent* percent in time for quota

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Grants a user the specified percentage of the initial time limit (in seconds) for the requested service.

grant # percent in volume for quota

Mode

Wireless

Syntax

grant *extended-percent* percent in volume for quota

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Grants a user the specified percentage of the user's volume limit (in bytes) for the requested service.

grant # percent of *select type* for BEST OF *select quota*

Mode

Wireless

Syntax

grant *extended-percent* percent of *service-type* for BEST OF *quota-name*

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-type

One of the following:

- **Time** (Gx only)
- **Volume**
- **Service Specific**
- **Uplink Volume**
- **Downlink Volume**
- **All Volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the usage threshold to the highest available percentage of time, volume, or service-specific quantity of the selected quota profiles. See [Managing Quotas](#) for information on quotas. The best quota is determined using the following rules:

1. Passes are always better than plans
2. Between two passes, the one with the higher priority is better
3. Between two passes with equal priorities, the one with the earlier expiration date is better
4. Between two passes with equal priorities and expiration dates, the one with the earlier purchase date is better

Example

```
grant 100 percent of remaining on Volume for BEST OF  
GoldDailyVol,GoldWeeklyVol,GoldMonthlyVol
```

grant # percent of *select type* for *select quota*

Mode

Wireless

Syntax

grant *extended-percent* percent of *type* for *quota-name*

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

type

One of the following:

- **Time**
- **Volume**
- **Service Specific**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the usage threshold to the specified percentage of time, volume, or service-specific quantity for the selected quota profile(s). See [Managing Quotas](#) for information on quotas.

Example

```
grant 100 percent of remaining on Volume for  
GoldDailyVol,GoldWeeklyVol,GoldMonthlyVol
```

grant # seconds for quota

Mode

Wireless

Syntax

grant *number* seconds for quota

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Grants a user the specified amount of time (in seconds) for the requested service. See [Managing Quotas](#) for information on quotas.

grant # service-specific units for quota

Mode

Wireless

Syntax

`grant number service-specific units for quota`

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Grants a user the specified service-specific units for the requested service. See [Managing Quotas](#) for information on quotas.

grant # units of *total volume (bytes)* for *select quota*

Mode

Wireless

Syntax

`grant number units of service-unit for quota-name`

Parameters

volume-type

One of the following:

- **total** (default)
- **uplink**
- **downlink**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-unit

One of the following:

- **time (seconds)**
- **total volume (bytes)**
- **uplink volume (bytes)**

- **downlink volume (bytes)**

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the session quota limit in bytes or seconds for the named quota profile. See [Managing Quotas](#) for information on quotas.

Example

```
where the request is creating a new session
grant 50000 units of total volume (bytes) for used
continue processing message
```

grant # units of *total volume (bytes)* for *select quota* using *monitoring key*

Mode

Wireless

Syntax

grant *number* units of *service-unit* for *quota-type* using *mon-key*

Parameters

number

A numeric value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

service-unit

One of the following:

- **time (seconds)**
- **total volume (bytes)**
- **uplink volume (bytes)**
- **downlink volume (bytes)**

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

mon-key

Name(s) of a monitoring key in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Allows quota profiles to be associated with one or more monitoring keys. This action can be used at the session and rule levels. If two policy actions grant usage for the same monitoring key or usage instance, the last action takes precedence, unless an action grants uplink volume followed by an action that grants downlink volume (or vice versa), which case the actions are grouped as one action when the message is processed. A policy that grants quota for a monitoring key will overwrite any previous grant of quota for that same monitoring key. This includes any subtraction previously enabled for the same monitoring key. See [Managing Quotas](#) for information on quotas. See [Managing Monitoring Keys](#) for information on monitoring keys.

Example

```
where the request is creating a new session
grant 50000 units of total volume (bytes) for used using key1

continue processing message
```

grant session time limit to *specified* percent of *select quota*

Mode

Wireless

Syntax

grant session time limit to *extended-percent* percent of *quota-name*

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the session time limit based on a percentage of the time limit, retrieved from up to five named quota profiles. See [Managing Quotas](#) for information on quotas.

grant *total* volume to *Min* of # bytes and # percent *used* for *select quota*

Mode

Wireless

Syntax

grant *volume-type* volume to *extrema* of *number* bytes and *percent* percent
quota-type for *quota-name*

Parameters

volume-type

One of the following:

- **total** (default)
- **uplink**
- **downlink**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

extrema

One of the following:

- **Min** (default) — Specifies that the calculation sets the minimum level for the quota.
- **Max** — Specifies that the calculation sets the maximum level for the quota.

number

A numeric value.

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

quota-name

Name(s) of quota defined in the CMP database.

Description

Grants a user the specified service-specific units for the requested service. See [Managing Quotas](#) for information on quotas.

Example

```
where the user is using less than 100 percent of total volume for DATA_Plan
quota
grant total volume to Min of 20M bytes and 100 percent used for DATA_Plan
continue processing message
```

grant *total* volume to *Min* of # bytes and # percent *used* for *select quota* using *monitoring key*

Syntax

grant *volume-type* volume to *extrema* of *number* bytes and *percent* percent for *quota-type* using *mon-key*

Parameters

volume-type

One of the following:

- **total** (default)
- **uplink**
- **downlink**

extrema

One of the following:

- **Min** (default) — Specifies that the calculation sets the minimum level for the quota.
- **Max** — Specifies that the calculation sets the maximum level for the quota.

number

A numeric value.

percent

An integer value between 0 and 100.

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

quota-name

Name(s) of quota defined in the CMP database.

mon-key

Name(s) of a monitoring key in the CMP database.

Description

Grants a user the specified service-specific units for the requested service. See [Managing Quotas](#) for information on quotas.

Example

```
where the user is using less than 100 percent of total volume for DATA_Plan
quota
grant total volume to Min of 20M bytes and 100 percent used for DATA_Plan
using SESS
continue processing message
```

grant *total volume* to *specified* percent *used* for BEST OF *select quota*

Mode

Wireless

Syntax

grant *service-type* to *extended-percent* percent *quota-type* for BEST OF
quota-name

Parameters

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the usage threshold to the highest available percentage volume or time of the selected quota profiles. See [Managing Quotas](#) for information on quotas. The best quota is determined using the following rules:

1. Passes are always better than plans
2. Between two passes, the one with the higher priority is better
3. Between two passes with equal priorities, the one with the earlier expiration date is better
4. Between two passes with equal priorities and expiration dates, the one with the earlier purchase date is better

Example

```
where the request is creating a new session
grant total volume to 100 percent used for BEST OF Monthly1,Daily1
continue processing message
```

grant *total volume* to *specified* percent *used* for BEST OF *select quota* using *monitoring key*

Mode

Wireless

Syntax

```
grant service-type to extended-percent percent quota-type for BEST OF
quota-name using mon-key
```

Parameters

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

mon-key

Name(s) of a monitoring key in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Allows quota profiles to be associated with one or more monitoring keys. This action can be used at the session and rule levels. If two policy actions grant usage for the same monitoring key or usage instance, the last action takes precedence, unless an action grants uplink volume followed by an action that grants downlink volume (or vice versa), which case the actions are grouped as one action when the message is processed. A policy that grants quota for a monitoring key will overwrite any previous

grant of quota for that same monitoring key. This includes any subtraction previously enabled for the same monitoring key. See [Managing Quotas](#) for information on quotas. See [Managing Monitoring Keys](#) for information on monitoring keys. The best quota is determined using the following rules:

1. Passes are always better than plans
2. Between two passes, the one with the higher priority is better
3. Between two passes with equal priorities, the one with the earlier expiration date is better
4. Between two passes with equal priorities and expiration dates, the one with the earlier purchase date is better

Example

```
where the request is creating a new session  
grant total volume to 100 percent used for BEST OF Monthly1,Daily1 using  
key1  
  
continue processing message
```

grant *total volume* to *specified* percent *used* for *select quota*

Mode

Wireless

Syntax

grant *service-type* to *extended-percent* percent *quota-type* for *quota-name*

Parameters

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the session quota limit in time or volume based on a percentage of the quota used, retrieved from the SPR, for the named quota profile. This action can only be used at the session level. See [Managing Quotas](#) for information on quotas.

Example

```
where the request is creating a new session
grant total volume to 100 percent used for Monthly1,Daily1

continue processing message
```

grant *total volume* to *specified* percent *used* for *select quota* using *monitoring key*

Mode

Wireless

Syntax

```
grant service-type to extended-percent percent quota-type for quota-name
using mon-key
```

Parameters

service-type

One of the following:

- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-type

One of the following:

- **used** (default) — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit minus the quota used so far.
- **initial** — Calculates the quota to grant by subtracting the specified amount in bytes from the initial quota limit.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

mon-key

Name(s) of a monitoring key in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Allows quota profiles to be associated with one or more monitoring keys. This action can be used at the session and rule levels. If two policy actions grant usage for the same monitoring key or usage instance, the last action takes precedence, unless an action grants uplink volume followed by an action that grants downlink volume (or vice versa), which case the actions are grouped as one action when the message is processed. A policy that grants quota for a monitoring key will overwrite any previous grant of quota for that same monitoring key. This includes any subtraction previously enabled for the same monitoring key. See [Managing Quotas](#) for information on quotas. See [Managing Monitoring Keys](#) for information on monitoring keys.

Example

where the request is *creating a new session*

```
grant total volume to 100 percent used for Monthly1,Daily1 using key1  
continue processing message
```

install *specified* ADC rule(s) for *select scope*

Mode

Wireless

Syntax

```
install adc-rule ADC rule(s) for adc-rule-scope-install
```

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- ADC Rule
- Predefined ADC Rule
- Predefined ADC Rule Base

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified ADC rule or rules are installed for the session, using the values specified in the associated traffic profile. See [Managing Traffic Profiles](#) for information on traffic profiles.

Example

```
where the enforcement session is a DPI enforcement session  
install ADC1,ADC5,ADC6 ADC rule(s) for session  
continue processing message
```

install *specified* ADC rule(s) for *select scope* active between *start time and end time*

Mode

Wireless

Syntax

install *adc-rule* ADC rule(s) for *adc-rule-scope-install* active between
start-and-end-time

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **ADC Rule**
- **Predefined ADC Rule**
- **Predefined ADC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

start-and-end-time

Specifies the start and end time for rule to be active. If start time is not specified, the rule becomes active immediately. If end time is not specified, the rule never deactivates. Select either absolute time or relative time for both start-time and end-time:

- **None**— Specifies the time to start/end in the form *HH:mm:ss*. The date is calculated to be the minimum future date for that time.
- **Specific Time** — Specifies the time and date to start/end in the form *YYYY-MM-ddTHH:mm:ss*.
- **Relative time** — Specifies the number of hours, minutes, or seconds from the current time to start/end in the form *HH:mm:ss*. Variables include:
 - Hours
 - Minutes
 - Seconds
- **Policy Counter ID** — Select one or more policy counter IDs defined in the CMP database; or enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified ADC rule or rules are installed for the session, using the values specified in the associated traffic profile, and is active between the specified start and end times. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* ADC rule(s) for *select scope* active within *Time Period*

Mode

Wireless

Syntax

```
install adc-rule ADC rule(s) for adc-rule-scope-install active within  
time-period
```

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **ADC Rule**
- **Predefined ADC Rule**
- **Predefined ADC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-period

Select a predefined time period.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified ADC rule or rules are installed for the session, using the values specified in the associated traffic profile, and the rule is active for the specified time period. When a time period is used in a policy, you cannot delete that time period from the CMP database. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* ADC rule(s) for *select scope* for *specified retry profile* active between *start time and end time*

Mode

Wireless

Syntax

```
install adc-rule ADC rule(s) for adc-rule-scope-install for retry-profile  
active between start-end-time
```

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- ADC Rule
- Predefined ADC Rule
- Predefined ADC Rule Base

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- session

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Name of a retry profile that is defined in the CMP database. (See [Managing Retry Profiles](#) for more information.)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

start-end-time

Specifies the start and end time for rule to be active. If a start time is not specified, the rule becomes active immediately. If an end time is not specified, the rule never

deactivates. Select either absolute time or relative time for both the start time and the end time:

- **Absolute time but no date** — Specifies the time to start/end in the form *HH:mm:ss*. The date is calculated to be the minimum future date for that time.
- **Absolute time and date** — Specifies the time and date to start/end in the form *YYYY-MM-ddTHH:mm:ss*.
- **Relative Time** — Specifies the number of hours, minutes, or seconds from the current time to start/end in the form *HH:mm:ss*. Variables include:
 - Hours
 - Minutes
 - Seconds

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified ADC rule or rules are installed for the session, using the values specified in the associated traffic profile and the associated retry profile, and the rule is active for the specified time period. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* ADC rule(s) for *select scope* for *specified retry profile* active within *Time Period*

Mode

Wireless

Syntax

```
install adc-rule ADC rule(s) for adc-rule-scope-install for retry-profile  
active within time-period
```

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- ADC Rule
- Predefined ADC Rule
- Predefined ADC Rule Base

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Name of a retry profile that is defined in the CMP database. (See [Managing Retry Profiles](#) for more information.)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-period

Specifies the time period when the rule is active. When that time period begins the rule activates, and when the time period ends the rule deactivates. Select one of the following:

- **Time Period** — Select pre-defined time period.
- **Policy Table Field** — Select time-related field from Policy Table selected for this Policy.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified ADC rule or rules are installed for the session, using the values specified in the associated traffic profile and the associated retry profile, and the rule is active for the specified time period. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* ADC rule(s) for *select scope* with *specified retry profile*

Mode

Wireless

Syntax

install *adc-rule* ADC rule(s) for *adc-rule-scope-install* with *retry-profile*

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **ADC Rule**
- **Predefined ADC Rule**
- **Predefined ADC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Name of a retry profile that is defined in the CMP database. (See [Managing Retry Profiles](#) for more information.)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified ADC rule or rules are installed for the session, using the values specified in the associated traffic profile and the associated retry profile. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* PCC rule(s) for *select scope*

Mode

Wireless

Syntax

```
install pcc-rule PCC rule(s) for pcc-rule-scope-install
```

Parameters

pcc-rule

Names of policy and charging control traffic profiles that are defined in the CMP database. The PCC profiles must be one of the following types:

- **PCC Rule**
- **Predefined PCC Rule**
- **Predefined PCC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified PCC rule or rules are installed for either the session or flow, using the values specified in the associated traffic profile. See [Managing Traffic Profiles](#) for information on traffic profiles.

install **specified** PCC rule(s) for **select scope** active between **start time and end time**

Mode

Wireless

Syntax

install *pcc-rule* PCC rule(s) for *pcc-rule-scope-install* active between *start-and-end-time*

Parameters

pcc-rule

Names of policy and charging control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **PCC Rule**
- **Predefined PCC Rule**
- **Predefined PCC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

start-and-end-time

Specifies the start and end time for rule to be active. If start time is not specified, the rule becomes active immediately. If end time is not specified, the rule never deactivates. Select either absolute time or relative time for both start-time and end-time:

- **None** — Specifies the time to start/end in the form *HH:mm:ss*. The date is calculated to be the minimum future date for that time.
- **Specific Time** — Specifies now or the date and time to start/end. Variables include:
 - Date — Pick the date from the calendar interface
 - Time
 - UTC Offset — Select number of hours before or after UTC time to start/end
 - now — Select to start/end now
 - time only — Select to use the time only

The content can use policy variable substitution.

- **Relative time** — Specifies the number of hours, minutes, or seconds from the current time to start/end in the form *HH:mm:ss*. Variables include:
 - Hours
 - Minutes
 - Seconds
- **Policy Counter Id** — Select one or more policy counter IDs defined in the CMP database; or enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified PCC rule or rules are installed for either the session or flow, using the values specified in the associated traffic profile, and is active between the specified start and end times. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* PCC rule(s) for *select scope* active within *Time Period*

Mode

Wireless

Syntax

```
install pcc-rule PCC rule(s) for pcc-rule-scope-install active within
time-period
```

Parameters

pcc-rule

Names of policy and charging control profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- PCC Rule
- Predefined PCC Rule
- Predefined PCC Rule Base

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-period

Specifies the time period when the rule is active. When that time period begins the rule activates, and when the time period ends the rule deactivates. Select one of the following:

- **Time Period** — Select pre-defined time period.
- **Policy Table Field** — Select time-related field from Policy Table selected for this Policy.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified PCC rule or rules are installed for either the session or flow, using the values specified in the associated traffic profile, and the rule is active for the specified time period. When a time period is used in a policy, you cannot delete that time period from the CMP database. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* PCC rule(s) for *select scope* for *specified retry profile* active between *start time and end time*

Mode

Wireless

Syntax

install *pcc-rule* PCC rule(s) for *pcc-rule-scope-install* for *retry-profile*
active between *start-end-time*

Parameters

pcc-rule

Names of policy and charging control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **PCC Rule**

- **Predefined PCC Rule**
- **Predefined PCC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Name of a retry profile that is defined in the CMP database. (See [Managing Retry Profiles](#) for more information.)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

start-and-end-time

Specifies the start and end time for rule to be active. If start time is not specified, the rule becomes active immediately. If end time is not specified, the rule never deactivates. Select either absolute time or relative time for both start-time and end-time:

- **None**— Specifies the time to start/end in the form *HH:mm:ss*. The date is calculated to be the minimum future date for that time.
- **Specific Time** — Specifies now or the date and time to start/end. Variables include:
 - **Date** — Pick the date from the calendar interface.
 - **Time**
 - **UTC Offset** — Select number of hours before or after UTC time to start/end.
 - **now** — Select to start now.
 - **time only** — Select to use the time only.

The content can use policy variable substitution.

- **Relative Time** — Specifies the number of hours, minutes, or seconds from the current time to start/end in the form *HH:mm:ss*. Variables include:
 - **Hours**
 - **Minutes**
 - **Seconds**
- **Policy Counter Id** — Select one or more policy counter IDs defined in the CMP database; or enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified PCC rule or rules are installed for either the session or flow, using the values specified in the associated traffic profile and the associated retry profile, and is active between the specified start and end times. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* PCC rule(s) for *select scope* for *specified retry profile* active within *Time Period*

Mode

Wireless

Syntax

```
install pcc-rule PCC rule(s) for pcc-rule-scope-install for retry-profile
active within time-period
```

Parameters

pcc-rule

Names of policy and charging control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- PCC Rule
- Predefined PCC Rule
- Predefined PCC Rule Base

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Name of a retry profile that is defined in the CMP database. (See [Managing Retry Profiles](#) for more information.)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-period

Specifies the time period when the rule is active. When that time period begins the rule activates, and when the time period ends the rule deactivates. Select one of the following:

- **Time Period** — Select pre-defined time period.
- **Policy Table Field** — Select time-related field from policy table selected for this policy.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified PCC rule or rules are installed for either the session or flow, using the values specified in the associated traffic profile and the associated retry profile, and the rule is active for the specified time period. See [Managing Traffic Profiles](#) for information on traffic profiles.

install *specified* PCC rule(s) for *select scope* with *specified retry profile*

Mode

Wireless

Syntax

install *pcc-rule* PCC rule(s) for *pcc-rule-scope-install* with *retry-profile*

Parameters

pcc-rule

Names of policy and charging control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **PCC Rule**
- **Predefined PCC Rule**
- **Predefined PCC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Name of a retry profile that is defined in the CMP database. (See [Managing Retry Profiles](#) for more information.)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

The specified PCC rule or rules are installed for either the session or flow, using the values specified in the associated traffic profile and the associated retry profile. See [Managing Traffic Profiles](#) for information on traffic profiles.

mark request AVP *name* as failed if exists and send *always*

Mode

Wireless

Syntax

mark request AVP *name* as failed if exists and send *send-mode*

Parameters

name

String representing existing AVP name, entered in the format *AVPname:VendorID* or, for nested AVP names in an AVP group, entered in the format *[AVPname1]:VendorID.[AVPname2]:VendorID ...* for the members of the grouped AVPs. There is also the option to evaluate as an expression (click to select check box).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

send-mode

One of the following:

- **always** (default)
- **unless rejected**
- **if rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Marks a request AVP as failed in the reply message, and notifies the opposite peer of the failed AVP validation. This action supports both loaded base Diameter AVPs and third-party AVPs.

overwrite Conditional Policy Information with Execution-Time to *time* and parameters *specified*

Mode

Wireless

Syntax

replace-add Conditional Policy Information with Execution-Time to *time-type*
and parameters *AVP-values*

Parameters

replace-add

One of the following:

- **overwrite** (default) — Replace any existing Conditional-Policy-Information AVPs
- **add** — Create a new Conditional-Policy-Information AVP and add or append it to the existing list

time-type

Opens a window that prompts you to specify the execution time with a variety of options. The options available depend on what you select for **Set Time**:

- **Specific Time** — Specifies execution at a specific time. The available options are:
 - **Enter now or a datetime** — Enter the time:
 - **now** (default)—The local date and time.
 - A date and time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

 - **Date** — Select the date from the calendar interface.
 - **Time** — Select hh:mm:ss.
 - **UTC Offset** — Select number of hours before or after UTC time to start.
 - **now** — Select for the local date-time.
 - **time only** — Select to use the time only.
 - A policy variable.
 - A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*. Click **Evaluate as expression** to bypass date-time format validation.
- **Select Time Mode** — The optional time zone. Select one of the following:
 - **N/A**
 - **CONFIGURED LOCAL TIME** — Calculate the time from the location configured for this MPE device
 - **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device

- **USER LOCAL TIME** (default) — Calculate the time from the location configured for the user equipment's location
- **Relative Time** — Specifies the number of hours, minutes, or seconds from the current time to the execution time. Select the time unit (**Hours**, **Minutes**, or **Seconds**) and enter a positive integer. For example, select **Hours** and enter **12** to set the execution time to 12 hours from now. You can instead enter a policy rule variable.
- **Policy Counter Id** — Select one or more policy counter IDs defined in the CMP database; or enter a comma-separated string of policy counter IDs.
- **Day Of Week** — Specifies one or more days of the week, plus a time during the day:
 - **Choose the day(s) of the week to check:**
 - **Sunday**
 - **Monday**
 - **Tuesday**
 - **Wednesday**
 - **Thursday**
 - **Friday**
 - **Saturday**
 - **Enter time:** The execution time during the day, in the form *hh:mm*.
 - **Select Time Mode** — The optional time zone. Select one of the following:
 - **N/A**
 - **CONFIGURED LOCAL TIME** — Calculate the time from the location configured for this MPE device
 - **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
 - **USER LOCAL TIME** (default) — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

AVP-values

Enter values for:

- Diameter-APN-Aggregate-Max-Bitrate-UL
- Diameter-APN-Aggregate-Max-Bitrate-DL
- Diameter Default EPS Bearer QoS, which include:
 - Diameter Default EPS Bearer QCI
 - Diameter Default EPS Bearer ARP Priority Level
 - Diameter Default EPS Bearer ARP Preemption Capability:
 - **N/A**
 - **PREEMPTION_CAPABILITY_ENABLED**
 - **PREEMPTION_CAPABILITY_DISABLED**

- Diameter Default EPS Bearer ARP Preemption Vulnerability:
 - N/A
 - PREEMPTION_VULNERABILITY_ENABLED
 - PREEMPTION_VULNERABILITY_DISABLED

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

You can use this action in two ways. You can add a new Conditional-Policy-Information AVP with specified parameter values to the existing list of Conditional-Policy-Information AVP(s). Alternatively, you can replace an existing list of Conditional-Policy-Information AVP(s).

Example

The following example shows adds Conditional-Policy-information AVPs and overwrite the Conditional-Policy-information AVPs:

```
where the request is modifying an existing session
And where the event trigger is one of OUT_OF_CREDIT
add Conditional Policy Information with Execution-Time to
2016-11-11T00:00:00 and parameters
Diameter APN-Aggregate-Max-Bitrate-DL 1000
add Conditional Policy Information with Execution-Time to
2016-11-12T00:00:00 and parameters
Diameter APN-Aggregate-Max-Bitrate-DL 1500
overwrite Conditional Policy Information with Execution-Time to
2016-11-13T00:00:00 and parameters
Diameter APN-Aggregate-Max-Bitrate-DL 2000
```

overwrite DSCP/TOS field with

Mode

Cable

Syntax

overwrite DSCP/TOS field with *dscp*

Parameters

dscp

A numeric representation of DSCP bits to be inserted into the message.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the DSCP/TOS field with a value. Although this is a number, the policy wizard includes a customized dialog to help you construct the value.

overwrite SessionClassId with

Mode

Cable

Syntax

overwrite SessionClassId with *number*

Parameters

number

A numeric value.

Valid range is 0–2000000000.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the *SessionClassId* field in the message with the specified value.

re-authorize all credit control sessions associated with User

Mode

Wireless

Syntax

re-authorize all credit control sessions associated with User

Parameters

None

Description

Triggers reauthorization for PCEF sessions for all the user's sessions.

re-authorize all PCEF/TDF sessions associated with *select scope*

Mode

Wireless

Syntax

re-authorize all PCEF/TDF sessions associated with *pcef-scope-install*

Parameters

pcef-scope-install

One of the following:

- **IP-CAN session**
- **user**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers reauthorization for PCEF or TDF sessions, either within the IP-CAN session associations (that is, all Gx sessions sharing the same IP address and APN) or for all the user's sessions (that is, all Gx sessions sharing the same user ID). Each reauthorization request contains the original event that triggered the reauthorization action, so information from this event can be evaluated by the Policy Engine during the evaluation of the request. For example, an event trigger received in a CCR on one interface, such as RAT_CHANGE, can be used in the evaluation of the reauthorization request triggered by this CCR. This action is valid regardless of whether Gx correlation is enabled or disabled.

release all credit control sessions associated with User

Mode

Wireless

Syntax

release all credit control sessions associated with User

Parameters

None

Description

Triggers release of credit control sessions for all the sessions for the user.

release all PCEF/TDF sessions associated with *select scope*

Mode

Wireless

Syntax

release all PCEF/TDF sessions associated with *pcef-scope-install*

Parameters

pcef-scope-install

One of the following:

- **IP-CAN session**
- **user**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Triggers release of PCEF or TDF sessions, either within the IP-CAN session associations (that is, all Gx sessions sharing the same IP address and APN) or for all the user's sessions (that is, all Gx sessions sharing the same user ID).

release the session

Mode

Wireless

Syntax

release the session

Parameters

None

Description

Releases the session.

release the session with cause *`ReleaseCause`*

Mode

Wireless

Syntax

release the session with cause *release_cause*

Parameters

release_cause

One of the following:

- **UNSPECIFIED_REASON**
- **UE_SUBSCRIPTION_REASON**
- **INSUFFICIENT_SERVER_RESOURCES**
- **IP_CAN_SESSION_TERMINATION**
- **UE_IP_ADDRESS_RELEASE** — Indicates the IPv4 address of a dual-stack IP-CAN session is released (applies only to Sd interface)

Description

Releases the session and provides the cause.

remove ADC rule type(s) *select types of rules* for *select scope*

Mode

Wireless

Syntax

remove ADC rule types *adc-rule-type* for *adc-rule-scope-install*

Parameters

adc-rule-type

One or more of the following:

- **none**
- **predefined**
- **predefined base**
- **dynamically provisioned**
- **all**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

adc-rule-scope-install

One of the following:

- **session**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Removes the application detection control rules from the current session based on their type. See [Managing Traffic Profiles](#) for information on ADC traffic profiles.

remove all policy context properties

Mode

Cable, Wireless, Wireline

Syntax

```
remove all policy context properties
```

Parameters

None

Description

In Wireless mode, removes all subscriber properties in the SPR.

In Cable mode, removes all policy context properties.

In Wireline mode, removes all policy context properties.

remove all the *scope* state variables and save *always*

Mode

Wireless

Syntax

```
remove all the scope state variables and save save-mode
```

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: *save-mode* is not applicable with the **policy_evaluation** scope since this variable only exists in the policy.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Deletes all the state variable for a scope. You can specify that the properties are not deleted if the policy rejects the message.

remove custom AVP *name* from reply *always*

Mode

Wireless

Syntax

remove custom AVP *name* from reply *send-mode*

Parameters

name

An existing AVP name and Vender ID, or an AVP name from an existing Policy Table.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

send-mode

One of the following:

- **always** (default)
- **unless rejected**
- **if rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Removes the custom AVP name previously set from the reply message.

remove *default* PCC rules of *default* TDF application IDs for APPLICATION_STOP

Mode

Wireless

Syntax

remove *traffic-profile* PCC/ADC rule(s) of *value-list* TDF application ID(s)
for APPLICATION_STOP

Parameters

traffic-profile

One or more traffic profiles. For more information on traffic profiles, see [Managing Traffic Profiles](#).

If **default** (default) is specified, all associated PCC rules according to Application-Detection-Information AVP in this report are removed. If specific PCC rules are specified, the associated PCC rules that should be removed must also in specified PCC rules.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value-list

A comma-delimited list of values to compare against.

If **default** (default) is specified, all PCC rules according to Application-Detection-Information AVP in this report are removed. If specific TDF-Application-Identifiers are specified, the associated PCC rules that should be removed must also in specified PCC rules.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

This action removes PCC rules when the PCEF reports an application stop.

The TDF-Application-Identifier and TDF-Application-Instance-Identifier must be bound to the PCC rules before the application start.

If there is not a TDF-Application-Instance-Identifier in the Application-Detection-Information AVP, but PCC rules contain binding info to that a TDF-Application-Identifier is installed, the MPE device logs the following warning in the trace log and continues with the session processing.

```
Policy Trace policy name: Could not execute 'remove PCC rules of TDF application  
ids for APPLICATION_STOP' because there is no TDF-Application-Instance-Identifier  
in  
Application-Detection-Information AVP
```

If the PCC rules that are associated with the TDF-Application-Identifier and TDF-Application-Instance-Identifier info is not found, then MPE device logs the following warning in the trace log and continues with the session processing.

```
Policy Trace policy name: Could not execute 'remove PCC rules of TDF application  
ids for APPLICATION_STOP ' because can not find related PCC rule to remove,  
TDF-Application-Identifier:TDFID,  
TDF-Application-Instance-Identifier:InstanceID
```

remove PCC rule for the flow

Mode

Wireless

Syntax

remove PCC rule for the flow

Parameters

None

Description

Removes the policy and charging control rule from the current flow. See [Managing Traffic Profiles](#) for information on PCC traffic profiles.

remove PCC rule type(s) *select types of rules* for *select scope*

Mode

Wireless

Syntax

remove PCC rule types *pcc-rule-type* for *pcc-rule-scope-install*

Parameters

pcc-rule-type

One or more of the following:

- none
- predefined
- predefined base
- dynamically provisioned
- all

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

pcc-rule-scope-install

One of the following:

- **flow**
- **session**
- **all**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Removes the policy and charging control rules from the current flow/session based on their type. See [Managing Traffic Profiles](#) for information on PCC traffic profiles.

remove policy context property *name*

Mode

Cable, Wireless, Wireline

Syntax

remove policy context property *property-name*

Parameters

property-name

String. May contain policy rule variables (see [Policy Rule Variables](#)) to perform parameter substitution within the property name.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Removes a policy context property (in Cable mode and Wireline mode) or a subscriber property in the SPR (in Wireless mode).

remove *specified* ADC rule(s)

Mode

Wireless

Syntax

remove *adc-rule* ADC rules

Parameters

adc-rule

Names of application detection control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **ADC Rule**
- **Predefined ADC Rule**
- **Predefined ADC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Removes the ADC rules from the current session.

remove *specified* PCC rule(s)

Mode

Wireless

Syntax

```
remove pcc-rule PCC rules
```

Parameters

pcc-rule

Names of policy and charging control traffic profiles that are defined in the CMP database. The traffic profiles must be one of the following types:

- **PCC Rule**
- **Predefined PCC Rule**
- **Predefined PCC Rule Base**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Removes the PCC rules from the current flow/session. See [Managing Traffic Profiles](#) for information on traffic profiles.

remove the *scope* state variable *name* and save *always*

Mode

Wireless

Syntax

remove the *scope* state variable *variable-name* and save *save-mode*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: *save-mode* is not applicable with the **policy_evaluation** scope since this variable only exists in the policy.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Deletes a state variable. You can specify that the variable is not deleted if the policy rejects the message.

request usage report for *monitoring key*

Mode

Wireless

Syntax

request usage report for *mon-key*

Parameters

mon-key

Name(s) of a monitoring key in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Requests a usage report from the PCEF. This sets the value of the Usage-Monitoring-Information AVP sent to the MPE device to USAGE_MONITORING_REPORT_REQUIRED. See [Managing Monitoring Keys](#) for information on monitoring keys.

reset all plan usage

Mode

Wireless

Syntax

```
reset all plan usage
```

Parameters

None

Description

Resets all plans for the subscriber.

reset all plan usage with reset type of *select reset type*

Mode

Wireless

Syntax

```
reset all plan usage with reset type of reset_type
```

Parameters

reset_type

One of the following:

- **Usage**
- **Rollover**
- **Billing Cycle**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Resets all plan usage for the selected reset type. See [Managing Quotas](#) for information on quotas.

reset all subscriber data

Mode

Wireless

Syntax

reset all subscriber data

Parameters

None

Description

Resets all data for the subscriber.

reset *select quota* reset type of *select reset type*

Mode

Wireless

Syntax

reset *quota-name* reset type of *reset-type*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

reset-type

One of the following:

- Usage
- Rollover
- Billing Cycle

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Resets the selected quota with the selected reset type. See [Managing Quotas](#) for information on quotas.

reset usage for *select quota*

Mode

Wireless

Syntax

reset usage for *quota-name*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Resets the selected quota. See [Managing Quotas](#) for information on quotas.

revalidate the session at *datetime* using *configured local time*

Mode

Wireless

Syntax

revalidate the session at *datetime* using *time-zone*

Parameters

datetime

One of the following:

- A policy variable.
- **now** (default) — The local date-time.
- A date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

- **Date** — Select the date from the calendar interface.
- **Time** — Select hh:mm:ss.
- **UTC Offset** — Select number of hours before or after UTC time to start.
- **now** — Select for the local date-time.
- **Time only** — Select to use the time only.
- **A JavaScript code snippet** — Enter a JavaScript statement that evaluates to a date-time in the format: `yyyy-mm-ddThh:mm:ss+UTCoffset`. Click **Evaluate as expression** to bypass date-time format validation.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Revalidates the session at the specified time. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

Example

```
revalidate the session at {User.State.end-time} using configured local time
```

schedule next RAR for resetting usage for *select quota*

Mode

Wireless

Syntax

schedule next RAR for resetting usage for *quota-name*

Parameters

quota-name

Name(s) of quota defined in the CMP database.

Description

Causes the next RAR that is sent to reset usage for a selected quota.

send CoA with *COA Template*

Mode

Wireless

Syntax

send CoA with *coa*

Parameters

coa

Select a RADIUS CoA template from the list.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Send a RADIUS change of authorization (CoA) message, constructed using the specified CoA template, to the broadband network gateway that sent the RADIUS request that caused the policy to be triggered. To send multiple CoA messages, include this action multiple times in the policy.

Example

The following example issues an updated RADIUS CoA message when a Profile Notification Request (PNR) message is received from an SPR system:

```
where notification from Sh datasource is received for Quota Usage
send CoA with CoA10-24
continue processing message
```

send http *POST* notification to *select notification destination* with headers *headers* and content *content*

Mode

Wireless mode or Cable mode with the SMS:SMPP or SMS:XML function enabled.

Syntax

send http *http_method* notification to *server* with headers *headers* and content *content*

Parameters

http_method

String. The HTTP method for the request message. Supported methods are:

- **POST** — (default) a method for sending data for processing by the application specified by URL
- **GET** — a method for requesting the retrieval of data located at the specified URL
- **PUT** — a method for requesting the storage of the data at the specified URL
- **DELETE** — a method for deleting the data located at the specified URL

server

A list of the defined notification servers. Select the notification server from the list. See [Managing Notification Servers](#) for information about adding a notification server.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

headers

String. One or more HTTP message headers (up to a maximum of 20 headers) using the format: *field-name:field-value*. For example, *Content-Type:text/xml*, *Content-Type:application/json*, and *Content-Type:text/plain*. See the HTTP standard at <http://www.ietf.org> for details on valid message header fields and values. This field cannot be empty.

Note: MPE does not validate whether the field-value corresponds to the field-name.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

content

String. The message body content that supports any type of notification like JSON/XML/Text message. The content can use policy variable substitution and can contain up to 4000 characters.

Note: MPE does not validate whether the message headers correspond to particular content.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Enables PCRF to send a configurable HTTP request message using the Web services interface. These notification messages are sent to pre-configured destinations. After a notification message is sent, PCRF receives the response from the specified URL. In the event of a failure, PCRF does not attempt to re-send the message.

Examples

XML POST

```
send http POST notification to NS1 with headers
Content-Type: text/xml; charset=UTF-8 and content <?xml version="1.0"
encoding="UTF-8"?> <subscriber> <msisdn>{User.MSISDN}</msisdn>
<quota>{User.Quota.Foo.Volume}</quota> </subscriber>
```

JSON POST

```
send http POST notification to NS2 with
headers Content-Type: application/json and content
{"class": "Subscriber", "entitlement": "Extended
Service", "msisdn": "{User.MSISDN}", "name": "{User.name}"}
```

HTTP GET with query parameters

```
send http GET notification to
NS3 with headers Content-Type: text/plain and content ``
```

send http **POST** notification to url **URL** with headers **headers** and content **content**

Mode

Wireless mode or Cable mode with the SMS:SMPP or SMS:XML function enabled.

Syntax

send http *http_method* notification to url *URL* with headers *headers* and content *content*

Parameters

http_method

String. The HTTP method for the request message. Supported methods are:

- **POST** — (default) a method for sending data for processing by the application specified by URL
- **GET** — a method for requesting the retrieval of data located at the specified URL
- **PUT** — a method for requesting the storage of the data at the specified URL
- **DELETE** — a method for deleting the data located at the specified URL

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

URL

String. The dynamic URL for the server that is the destination for the HTTP request message. This URL can use policy variable substitution, for example, *http://10.15.20.190:80/rs/quota/notify/{User.MSISDN}*.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

headers

(Required) String. One or more HTTP message headers (up to a maximum of 20 headers) using the format: *field-name* :*field-value*. For example:

- Content-Type:text/xml
- Content-Type:application/json
- Content-Type:text/plain

See the HTTP standard at <http://www.ietf.org> for details on valid message header fields and values. This field cannot be empty.

Note: MPE does not validate whether the field-value corresponds to the field-name.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

content

String. The message body content that supports any type of notification like JSON/XML/Text message. The content can use policy variable substitution and can contain a maximum of 4000 characters.

Note: MPE does not validate whether the message headers correspond to particular content.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Enables PCRF to send a configurable HTTP request message using the web services interface. These notification messages are sent to either servers configured in CMP or to servers using a dynamic URL. After a notification message is sent, PCRF receives the response from the specified URL. In the event of a failure, PCRF does not attempt to resend the message.

Examples

XML POST

```
send http POST notification to url
http://10.15.20.190:80/rs/quota/xmlnotify with
headers Content-Type:text/xml; charset=UTF-8 and
content <?xml version="1.0" encoding="UTF-8"?> <subscriber>
<msisdn>{User.MSISDN}</msisdn> <quota>{User.Quota.Foo.Volume}</quota>
</subscriber>
```

JSON POST

```
send http POST notification to url
http://10.15.20.190:80/rs/quota/jsonnotify/{User.MSISDN} with
headers Content-Type: application/json and content
{"class": "Subscriber", "entitlement": "Extended
Service", "msisdn": "{User.MSISDN}", "name": "{User.name}"}``
```

HTTP GET with query parameters

```
send http GET notification to url
http://10.15.20.190:80/rs/quota/notify?msisdn={User.MSISDN}&quota={User.Quota.Foo.Volume}
with
headers Content-Type: text/plain and content ``
```

send notification to syslog with *message text* and severity *severity level*

Mode

- Cable mode
- Wireless mode
- Wireless-C mode with CMPP enabled
- Wireline mode

Syntax

send notification to syslog with *message* and severity *level*

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

level

The sevlog severity. One of the following:

- Emergency
- Alert
- Critical
- Error
- Warning
- Notice
- Info

- **Debug**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends a message to the syslog service containing the specified message text and at the specified severity level.

Note: Policies written before V7.5 that used the action `send alert` with ``text`` and severity ``severity level`` will be converted to use this action, which sends a notification to the syslog instead of an alarm to the CMP system.

send notification to trace log with ``message text`` and severity ``severity level``

Mode

- Cable mode
- Wireless mode
- Wireless-C mode with CMPP enabled
- Wireline mode

Syntax

send notification to trace log with ``message`` and severity ``level``

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

level

One of the following:

- **Emergency** (ID 4560)
- **Alert** (ID 4561)
- **Critical** (ID 4562)
- **Error** (ID 4563)
- **Warning** (ID 4564)
- **Notice** (ID 4565)
- **Info** (ID 4566)
- **Debug** (ID 4567)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends a message to the trace log containing the specified message text and at the specified severity level. If the configured minimum notification severity level is higher than that specified in the policy action, then the policy action does not generate the notification.

Note: Policies written before V7.5 that used the action `write `text`` to the log file are converted to use this action, with the severity of Info.

Example

```
where the request is terminating an existing session  
And where the enforcement session is an IP-CAN session  
send notification to trace log with ### Alert :: Gx Session Terminated  
###` and severity `Alert`  
continue processing message
```

send SMS Alert *`specified`* to user

Mode

Wireless mode with the SMS:XML function enabled.

Syntax

```
send SMS Alert `message` to user
```

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS alert message, with specified text, to the subscriber associated with the message.

Example

```
send SMS alert `you have reached 80% of your quota {User.MSISDN}` to user
```

send SMS *`specified`* to *`default`* destination address, *`default`* TON and *`default`* NPI from *`default`* source address, *`default`* TON and *`default`* NPI on *`now`*. Request delivery receipt *`default`*.

Mode

Wireless mode the SMS:SMPP function enabled:

Syntax

send SMS *`message`* to *`dest_address`* destination address, *`ton`* TON and *`npi`* NPI from *`source_address`* source address, *`ton`* TON and *`npi`* NPI on *delivery-day*. Request delivery receipt *`receipt`*.

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text.

dest_address

String. If not the default, this overrides the configured address. You can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

ton

If not the default, this overrides the configured Type of Number. One of the following:

- **default** (default)
- **UNKNOWN**
- **INTERNATIONAL**
- **NATIONAL**
- **NETWORK SPECIFIC**
- **SUBSCRIBER NUMBER**
- **ALPHANUMERIC**
- **ABBREVIATED**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

npi

If not the default, this overrides the configured Number Plan Indicator. One of the following:

- **default** (default)
- **UNKNOWN**
- **ISDN (E163/E164)**

- DATA (X.121)
- TELEX (F.69)
- LAND MOBILE (E.212)
- NATIONAL
- PRIVATE
- ERMES
- INTERNET (IP)
- WAP CLIENT ID

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

source_address

String. If not the default, this overrides the configured address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

delivery-day

String. Enter a value in one of the following formats:

- **now** (default) — Keep the default value **now** to deliver the SMS immediately when the policy is triggered.
- **day** — Enter an integer between 1 and 31 to deliver the SMS on the specified day of the month. If the specified day of the month has passed for the current month, the SMS will be delivered on that day in the following month. If the specified day of the month does not exist in the current month, the SMS will be delivered on the last day of the month. Any value less than 1 or greater than 31 is invalid.
- **smart string** — Enable the **Evaluate as Expression** checkbox. In the **Value** field, enter an arithmetic expression containing one of the following policy parameters:
 - **{User.BillingDay}** — The billing day for the subscriber profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.custom_field}**, where *custom_field* is a configured custom subscriber profile field, may also be used if the custom field resolves to an integer value.
 - **{User.Pool.BillingDay}** — The billing day for the subscriber's pool profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.Pool.custom_field}**, where *custom_field* is a configured custom pool profile field, may also be used if the custom field resolves to an integer value.

The arithmetic expression supports addition and subtraction and must not contain the default value **now**. The result will be evaluated with consideration to the number of days in the current month. For example, the expression **{User.BillingDay}-4** would deliver the SMS four days before the user's billing day. If the expression would result in the SMS being sent in the past, the SMS will not be sent.

Note: Scheduled SMS delivery is only available when the user's billing type is monthly.

receipt

One of the following:

- **default** (default) — Use global default configured for this MPE device.
- **No Delivery Receipt**
- **Delivery Receipt on success and failure**
- **Delivery Receipt on failure**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS text message, with specified text, to the subscriber associated with the message.

In SMPP mode, messages can be up to 254 characters long. If SMPP long message support is configured, SMS messages longer than 160 characters are split into segments and reassembled by the receiving device; messages of up to 1000 characters are supported. See the appropriate *CMP User's Guide* for information on configuring SMPP long message support.

Note: Messages over 1000 characters are truncated.

The default source and destination address, TON, and NPI configured on the MPE device can be used or overridden.

To send notifications to multiple destinations, you can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile. Destinations must all be of the same type; this ensures that the same TON and NPI settings configured in the policy action will apply to all destinations. No transformations are performed on the subscriber's profile data by the MPE device, so custom fields used as alternate destinations must contain values formatted as required by the SMSC. Multivalued fields (LDAP attributes) are not supported.

If the address(es) specified are not available (for example, if a custom field is not populated in the subscriber database), then the global default is used; if the global default is not configured, then the SMS message is sent to the subscriber's MSISDN; if the subscriber's MSISDN cannot be determined, then no SMS message is sent and a trace log alert is generated.

You can request a receipt from the SMSC server, which will be logged in the file SMPP.log, when the message is delivered to the subscriber. You can request a receipt on success, failure, or in either case. See the *CMP Wireless User's Guide* for information on configuring delivery receipt default actions.

Example

```
send SMS `you have reached 80%% of your quota` to
`{User.MSISDN},{User.AltDest1},{User.AltDest2}` destination address,
`default` TON and `default` NPI from `614` source address, `default` TON
and `default` NPI on `now`. Request delivery receipt `default`.
```

send SMS *specified* to *default* destination address, *default* TON and *default* NPI from *default* source address, *default* TON and *default* NPI on *Billing Day*. Request delivery receipt *default*.

Mode

Wireless mode the SMS:SMPP function enabled:

Syntax

send SMS *message* to *dest_address* destination address, *ton* TON and *npi* NPI from *source_address* source address, *ton* TON and *npi* NPI *delivery-day*. Request delivery receipt *receipt*.

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text.

dest_address

String. If not the default, this overrides the configured address. You can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

ton

If not the default, this overrides the configured Type of Number. One of the following:

- **default** (default)
- **UNKNOWN**
- **INTERNATIONAL**
- **NATIONAL**
- **NETWORK SPECIFIC**
- **SUBSCRIBER NUMBER**
- **ALPHANUMERIC**
- **ABBREVIATED**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

npi

If not the default, this overrides the configured Number Plan Indicator. One of the following:

- **default** (default)
- **UNKNOWN**
- **ISDN (E163/E164)**

- DATA (X.121)
- TELEX (F.69)
- LAND MOBILE (E.212)
- NATIONAL
- PRIVATE
- ERMES
- INTERNET (IP)
- WAP CLIENT ID

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

source_address

String. If not the default, this overrides the configured address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

delivery-day

String. Enter a value in one of the following formats:

- **Billing Day** (default) — Keep the default value **Billing Day** to deliver the SMS on the user's billing day. If the policy is triggered on the user's billing day, the SMS will be delivered on the current billing day.
- **day** — Enter an integer between 1 and 31 to deliver the SMS on the specified day of the month. If the specified day of the month has passed for the current month, the SMS will be delivered on that day in the following month. If the specified day of the month does not exist in the current month, the SMS will be delivered on the last day of the month. Any value less than 1 or greater than 31 is invalid.
- **smart string** — Enable the **Evaluate as Expression** checkbox. In the **Value** field, enter an arithmetic expression containing one of the following policy parameters:
 - **{User.BillingDay}** — The billing day for the subscriber profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.custom_field}**, where *custom_field* is a configured custom subscriber profile field, may also be used if the custom field resolves to an integer value.
 - **{User.Pool.BillingDay}** — The billing day for the subscriber's pool profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.Pool.custom_field}**, where *custom_field* is a configured custom pool profile field, may also be used if the custom field resolves to an integer value.

The arithmetic expression supports addition and subtraction and must not contain the default value **Billing Day**. The result will be evaluated with consideration to the number of days in the current month. For example, the expression **{User.BillingDay}-4** would deliver the SMS four days before the user's billing day. If the expression would result in the SMS being sent in the past, the SMS will not be sent.

Note: Scheduled SMS delivery is only available when the user's billing type is monthly.

receipt

One of the following:

- **default** (default) — Use global default configured for this MPE device.
- **No Delivery Receipt**
- **Delivery Receipt on success and failure**
- **Delivery Receipt on failure**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS text message, with specified text, to the subscriber associated with the message on the billing day for the subscriber.

In SMPP mode, messages can be up to 254 characters long. If SMPP long message support is configured, SMS messages longer than 160 characters are split into segments and reassembled by the receiving device; messages of up to 1000 characters are supported. See the appropriate *CMP User's Guide* for information on configuring SMPP long message support.

Note: Messages over 1000 characters are truncated.

The default source and destination address, TON, and NPI configured on the MPE device can be used or overridden.

To send notifications to multiple destinations, you can specify `dest_address` as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile. Destinations must all be of the same type; this ensures that the same TON and NPI settings configured in the policy action will apply to all destinations. No transformations are performed on the subscriber's profile data by the MPE device, so custom fields used as alternate destinations must contain values formatted as required by the SMSC. Multivalued fields (LDAP attributes) are not supported.

If the address(es) specified are not available (for example, if a custom field is not populated in the subscriber database), then the global default is used; if the global default is not configured, then the SMS message is sent to the MSISDN for the subscriber. If the MSISDN for the subscriber cannot be determined, then an SMS message is not sent and a trace log alert is generated.

You can request a receipt from the SMSC server, which will be logged in the file `SMPP.log`, when the message is delivered to the subscriber. You can request a receipt on success, failure, or in either case. See the *CMP Wireless User's Guide* for information on configuring delivery receipt default actions.

Example

```
send SMS `you have reached 80%% of your quota` to
`{User.MSISDN},{User.AltDest1},{User.AltDest2}` destination
address, `default` TON and `default` NPI from `614` source
address, `default` TON and `default` NPI on Billing Day.
Request delivery receipt `Default`.
```

send SMS *specified* to *default* destination address, from *default* source address on user billing day. Request delivery receipt *default*.

Mode

Wireless mode With at least one of the following functions enabled:

- SMS:SMPP
- SMS:XML
- SMS:CMPP

Syntax

send SMS *message* to *dest_address* destination address, from *source_address* source address. Request delivery receipt *receipt*.

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

dest_address

String. If not the default, this overrides the configured address. You can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

source_address

String. If not the default, this overrides the configured address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

receipt

One of the following:

- **default** (default) — The Registered Delivery value is used. See the appropriate *CMP User's Guide*.
- **No Delivery Receipt**
- **Delivery Receipt**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS CMPP text message, with specified text, to the subscriber associated with the message on the user billing day.

The default source and destination address configured on the MPE device can be used or overridden.

To send notifications to multiple destinations, you can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile. Destinations must all be of the same type. No transformations are performed on the subscriber's profile data by the MPE device, so custom fields used as alternate destinations must contain values formatted as required by the SMSC. Multivalued fields (LDAP attributes) are not supported.

If the address(es) specified are not available (for example, if a custom field is not populated in the subscriber database), then the global default is used; if the global default is not configured, then the SMS message is sent to the subscriber's MSISDN; if the subscriber's MSISDN cannot be determined, then no SMS message is sent and a trace log alert is generated.

send SMS *specified* to *default* destination address, from *default* source address.
Request delivery receipt *default*.

Mode

Wireless mode With at least one of the following functions enabled:

- SMS:SMPP
- SMS:XML
- SMS:CMPP

Syntax

`send SMS `message` to `dest_address` destination address, from
`source_address` source address. Request delivery receipt `receipt`.`

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

dest_address

String. If not the default, this overrides the configured address. You can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

source_address

String. If not the default, this overrides the configured address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

receipt

One of the following:

- **default** (default) — The Registered Delivery value is used. See the appropriate *CMP User's Guide*.
- **No Delivery Receipt**
- **Delivery Receipt**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS CMPP text message, with specified text, to the subscriber associated with the message.

The default source and destination address configured on the MPE device can be used or overridden.

To send notifications to multiple destinations, you can specify *dest_address* as one or more comma-separated static values, or as one or more comma-separated references to custom fields in the subscriber profile. Destinations must all be of the same type. No transformations are performed on the subscriber's profile data by the MPE device, so custom fields used as alternate destinations must contain values formatted as required by the SMSC. Multivalued fields (LDAP attributes) are not supported.

If the address(es) specified are not available (for example, if a custom field is not populated in the subscriber database), then the global default is used; if the global default is not configured, then the SMS message is sent to the subscriber's MSISDN; if the subscriber's MSISDN cannot be determined, then no SMS message is sent and a trace log alert is generated.

Example

The following example uses a custom field named "Custom7" in the User.Pool object, defined in an SPR, of comma-separated MSISDN values to send a notification message to all members of a subscriber pool:

```
send SMS `1 GB of data has been granted to your subscriber pool.` to
`{User.Pool.Custom7}` destination
address, from `default` source address. Request delivery receipt `default`.
```

Because a custom field is limited to 255 characters, the list of MSISDNs in a large subscriber pool may require multiple variables. The following example uses a series of custom fields

in the User.Pool object, defined in an SPR, each containing comma-separated MSISDN values, to send a message to all members of a large subscriber pool:

```
send SMS `1 GB of data has been granted to your subscriber pool.` to
`{User.Pool.Custom7},{User.Pool.Custom8},{User.Pool.Custom9}` destination
address, from `default` source address. Request delivery receipt `default`.
```

send SMS *specified* to user from *default* source address if exceed *number* *days* for *Identity*. Request delivery receipt *default*.

Mode

Wireless mode With at least one of the following functions enabled:

- SMS:SMPP
- SMS:XML
- SMS:CMPP

Syntax

send SMS *message* to user from *source_address* source address, if exceed *number* *days* for *identity*. Request delivery receipt *receipt*.

Parameters

message

String. This text can contain policy parameters (described later in this section) to perform parameter substitution within the message text.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

source_address

String. If not the default, this overrides the configured address. To specify the the default, enter **default**. The default uses the value of the attribute smpp.protocol.srcId configured in the SMPP.properties file.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

number

Positive integer.

days

The calculated datetime is expressed in this granularity:

- **days** (default)
- **hours**

Identity

String. Identifies different types of SMS messages. Must be less than 20 characters.

receipt

One of the following:

- **default** (default) — Uses global default configured for this MPE device. Uses the Registered Delivery global default which is configured in SMS profile section of the **Policy Server** tab.
- **No Delivery Receipt** — Does not request a delivery receipt when sending an SMS message.
- **Delivery Receipt** — Requests a delivery receipt when sending an SMS message.

Description

Sends an SMS text message to an end user once during the configured interval.

You can request a receipt from the SMSC server, which will be logged in the file CMPP.log, when the message is delivered to the subscriber. You can also request a receipt. See the *CMP User's Guide* for information on configuring delivery receipt default functions.

The last delivery time for each type of SMS message (specified in the *Identity* variable) is listed on the **State** tab of the **Profile Data** in the **SPR** section of the navigation pane.

send SMS *specified* to user on *now*. Request delivery receipt *default*.

Mode

Wireless mode with at least one of the following functions enabled:

- SMS:SMPP
- SMS:XML

Syntax

send SMS *message* to user on *delivery-day*. Request delivery receipt *receipt*.

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

delivery-day

String. Enter a value in one of the following formats:

- **now** (default) — Keep the default value **now** to deliver the SMS immediately when the policy is triggered.
- **day** — Enter an integer between 1 and 31 to deliver the SMS on the specified day of the month. If the specified day of the month has passed for the current month, the SMS will be delivered on that day in the following month. If the specified day of the month does not exist in the current month, the SMS will be delivered on the last day of the month. Any value less than 1 or greater than 31 is invalid.
- **smart string** — Enable the **Evaluate as Expression** checkbox. In the **Value** field, enter an arithmetic expression containing one of the following policy parameters:
 - **{User.BillingDay}** — The billing day for the subscriber profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.custom_field}**, where *custom_field* is a configured custom subscriber profile field, may also be used if the custom field resolves to an integer value.
 - **{User.Pool.BillingDay}** — The billing day for the subscriber's pool profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.Pool.custom_field}**, where *custom_field* is a configured custom pool profile field, may also be used if the custom field resolves to an integer value.

The arithmetic expression supports addition and subtraction and must not contain the default value **now**. The result will be evaluated with consideration to the number of days in the current month. For example, the expression **{User.BillingDay}-4** would deliver the SMS four days before the user's billing day. If the expression would result in the SMS being sent in the past, the SMS will not be sent.

Note: Scheduled SMS delivery is only available when the user's billing type is monthly.

receipt

One of the following:

- **default** (default) — Use global default configured for this MPE device.
- **No Delivery Receipt**
- **Delivery Receipt on success and failure**
- **Delivery Receipt on failure**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS text message, with specified text, to the subscriber associated with the message.

In SMPP mode, messages can be up to 254 characters long. If SMPP long message support is configured, SMS messages longer than 160 characters are split into segments and reassembled by the receiving device; messages of up to 1000 characters are supported. See the appropriate *CMP User's Guide* for information on configuring SMPP long message support.

Note: Messages over 1000 characters are truncated.

You can request a receipt from the SMSC server, which will be logged in the file SMPP.log, when the message is delivered to the subscriber. You can request a receipt on success, failure, or in either case. See the *CMP Wireless User's Guide* for information on configuring delivery receipt default functions.

Example

```
send SMS `you have reached 80%% of your quota` to user on  
`{User.BillingDay}-4`. Request delivery receipt `Default`.
```

send SMS *specified* to user on *Billing Day*. Request delivery receipt *default*.

Mode

Wireless mode with at least one of the following functions enabled:

- SMS:SMPP
- SMS:XML
- SMS:CMPP

Syntax

```
send SMS `message` to user on `delivery-day`. Request delivery receipt  
`receipt`.
```

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

delivery-day

String. Enter a value in one of the following formats:

- **Billing Day** (default) — Keep the default value **Billing Day** to deliver the SMS on the user's billing day. If the policy is triggered on the user's billing day, the SMS will be delivered on the current billing day.
- **day** — Enter an integer between 1 and 31 to deliver the SMS on the specified day of the month. If the specified day of the month has passed for the current month, the SMS will be delivered on that day in the following month. If the specified day of the month does not exist in the current month, the SMS will be delivered on the last day of the month. Any value less than 1 or greater than 31 is invalid.
- **smart string** — Enable the **Evaluate as Expression** checkbox. In the **Value** field, enter an arithmetic expression containing one of the following policy parameters:
 - **{User.BillingDay}** — The billing day for the subscriber profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.custom_field}**, where *custom_field* is a configured custom subscriber profile field, may also be used if the custom field resolves to an integer value.

- **{User.Pool.BillingDay}** — The billing day for the subscriber's pool profile. Resolves to an integer between 1 and 31. If this parameter is used, the parameter **{User.Pool.custom_field}**, where *custom_field* is a configured custom pool profile field, may also be used if the custom field resolves to an integer value.

The arithmetic expression supports addition and subtraction and must not contain the default value **Billing Day**. The result will be evaluated with consideration to the number of days in the current month. For example, the expression **{User.BillingDay}-4** would deliver the SMS four days before the user's billing day. If the expression would result in the SMS being sent in the past, the SMS will not be sent.

Note: Scheduled SMS delivery is only available when the user's billing type is monthly.

receipt

One of the following:

- **default** (default) — Use global default configured for this MPE device.
- **No Delivery Receipt**
- **Delivery Receipt on success and failure**
- **Delivery Receipt on failure**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an SMS text message, with specified text, to the subscriber associated with the message on the billing day for the subscriber.

In SMPP mode, messages can be up to 254 characters long. If SMPP long message support is configured, SMS messages longer than 160 characters are split into segments and reassembled by the receiving device; messages of up to 1000 characters are supported. See the appropriate *CMP User's Guide* for information on configuring SMPP long message support.

Note: Messages over 1000 characters are truncated.

You can request a receipt from the SMSC server, which will be logged in the file SMPP.log, when the message is delivered to the subscriber. You can request a receipt on success, failure, or in either case. See the *CMP Wireless User's Guide* for information on configuring delivery receipt default functions.

Example

```
send SMS `you have reached 80%% of your quota` to user on `Billing Day`.
Request delivery receipt `Default`.
```

send SMS *specified* to user. Request delivery receipt *default*.

Mode

Wireless mode with at least one of the following functions enabled:

- SMS:SMPP
- SMS:XML
- SMS:CMPP

Syntax

send SMS *message* to user. Request delivery receipt *receipt*.

Parameters

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

receipt

One of the following:

- **default** (default) — The value in the Registered Delivery field configured in the protocol options is used. See the appropriate *CMP User's Guide* for information on configuring protocol options.
- **No Delivery Receipt**
- **Delivery Receipt**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends a CMPP message, with specified text, to the subscriber associated with the message.

Example

```
send SMS 'you have reached 80%% of your quota' to user. Request delivery  
receipt 'Default'.
```

send SMTP message with the following *text/plain* content

Mode

Wireless mode with SMS:SMPP or SMS:XML function enabled.

Syntax

send SMTP message with the following *format* content: To: *to_address* CC: *cc_address* BCC: *bcc_address* From: *from_address* Reply-To: *reply_address* Subject: *subject* Text: *message* Signature: *signature*

Parameters

format

One of the following:

- **text/plain** (default) — The email is in plain-text format.
- **text/html** — The email includes HTML formatting.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

to_address

String. If not the default, this overrides the configured address. You can specify up to five comma-separated static values, or up to five comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

cc_address

String. If not the default, this overrides the configured address. You can specify up to five comma-separated static values, or up to five comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

bcc_address

String. If not the default, this overrides the configured address. You can specify up to five comma-separated static values, or up to five comma-separated references to custom fields in the subscriber profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

from_address

String. The address of the author who sent the mail.

Note: You may not necessarily want the reply to come back from this address. This can be configured globally to a default value.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

reply_address

String. If not the default, this overrides the configured address.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

subject

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

message

String. Body of the message.

signature

String. If not default, this overrides the configured signature block.

Description

Sends an email message, with the specified text and signature block, to the subscriber associated with the address. The message is sent through an SMS Relay (SMSR) interface.

To send email to multiple destinations, you can specify up to five addresses (any combination of *to_address*, *cc_address*, or *bcc_address*) as comma-separated static values, or as comma-separated references to custom fields in the subscriber profile. You can specify up to five addresses. Destinations must all be of the same type. No transformations are performed on the subscriber's profile data by the MPE device, so custom fields used as alternate destinations must contain values formatted as required by the SMSR. Multivalued fields (LDAP attributes) are not supported.

If the address(es) specified are not available (for example, if a custom field is not populated in the subscriber database), then the global default is used; if the global default is not configured, then no SMTP message is sent and an SMTP log alert is generated. See the *CMP Wireless User's Guide* for information on configuring SMTP default values.

set alarm with severity`*severity level*`, id`*unique alarm identifier*` and message`*message text*`

Mode

Cable, Wireless

Syntax

set alarm with severity ``level``, id ``alarm-id`` and message ``message``

Parameters

level

One of the following:

- **Critical** (ID 74000)
- **Major** (ID 74001)
- **Minor** (ID 74002)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

alarm-id

The alarm ID. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

message

String. This text may contain policy parameters (described later in this section) to perform parameter substitution within the message text. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sends an alarm to the CMP system containing the specified severity level and message text. This alarm is written to the Alarm History Report, and will appear in the Active Alarms display for one hour, until cleared, or unless the server fails over, whichever comes first. Alarms generated by policy actions do not affect the HA score of a server, and will not cause a failover. For more information, see the appropriate *CMP User's Guide*.

set authorization validity time to # seconds

Mode

Wireless

Syntax

set authorization validity time to *seconds* seconds

Parameters

seconds

A numeric value that specifies time in units of seconds.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the authorization expiration time (in seconds) after which the enforcement device requests re-authorization from the MPE device for the requested user's service.

set authorization validity time to *datetime*

Mode

Wireless

Syntax

```
set authorization validity time to datetime
```

Parameters

datetime

One of the following:

- A policy variable.
- **now** (default) — The local date-time.
- A date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

- **Date** — Select the date from the calendar interface.
- **Time** — Select hh:mm:ss.
- **UTC Offset** — Select number of hours before or after UTC time to start.
- **now** — Select for the local date-time.
- **Time only** — Select to use the time only.
- A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCOffset*. Click **Evaluate as expression** to bypass date-time format validation.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the authorization expiration time (to the quarter hour) after which the enforcement device requests re-authorization from the MPE device for the requested user's service.

set authorization validity time to *time on day* using *configured local time*

Mode

Wireless

Syntax

set authorization validity time to *time* on *day-of-week* using *time-zone*

Parameters

time

A time, in the format *hh:mm* (limited to 15-minute intervals).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

day-of-week

One of the following:

- **Sunday**
- **Monday**
- **Tuesday**
- **Wednesday**
- **Thursday**
- **Friday**
- **Saturday**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the authorization expiration time (to the quarter hour) after which the enforcement device requests re-authorization from the MPE device for the requested user's service. If time-zone information is

available from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

set charging server(s) for the IP-CAN/Sd session to *specified values*

Mode

Wireless

Syntax

set charging server(s) for the IP-CAN/Sd session to *charging-server-name*

Parameters

charging-server-name

Names of charging servers that are defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the charging servers, as specified. To define a charging server, see the *CMP Wireless User's Guide*.

Example

```
set charging server(s) for the IP-CAN/Sd session to Primary Online  
Server:ocs_1, Secondary Online Server:ocs_2
```

set CSG reporting info to *select value*

Mode

Wireless

Syntax

set CSG reporting info to *info-type*

Parameters

info-type

- **CHANGE_CSG_CELL** — Indicates that the PCEF reports the user CSG information change to the charging domain when the UE enters/leaves/accesses via a CSG cell.
- **CHANGE_CSG_SUBSCRIBED_HIBRID_CELL** — Indicates that the PCEF reports the user CSG information change to the charging domain when the UE enters/leaves/accesses via a hybrid cell in which the subscriber is a CSG member

- **CHANGE_CSG_UNSUBSCRIBED_HIBRID_CELL** — Indicates that the PCEF reports the user CSG information change to the charging domain when the UE enters/leaves/accesses via a hybrid cell in which the subscriber is not a CSG member.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sent from the MPE device to the PCEF to request the PCEF to report the user CSG information change to the charging domain.

set custom AVP *name* value to the policy context property *name*

Mode

Wireless

Syntax

set custom AVP *avp-name* value to the policy context property *property-name*

Parameters

avp-name

An existing AVP Name and Vender ID, or an AVP name from an existing Policy Table.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

property-name

String that represents the policy context property.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Makes the AVP value accessible throughout the policy context so other policies can access this AVP value as a context property. The context property variable will be set only if this AVP exists in the request and its value is not null.

set custom AVP *name* value to the user property *name* and save *always*

Mode

Wireless

Syntax

set custom AVP *avp-name* value to the user property *property-name* and save *save-mode*

Parameters

avp-name

An existing AVP Name and Vender ID, or an AVP name from an existing Policy Table.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

property-name

String.

Up to 255 characters that represents a user property.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets an AVP value as a User object property to persist between sessions.

set DRMP AVP to **DRMP Level** in Re-Authorized Request

Mode

Wireless mode with the 3GPP mode enabled.

Syntax

set DRMP AVP to *drmp-level* in Re-Authorized Request

Parameters

drmp-level

The Diameter routing message priority (DRMP) priority. Select one of the values from the list, where PRIORITY_0 is the highest priority and PRIORITY_15 is the lowest priority.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the priority level of the DRMP AVP for Gx: RAR messages.

Example

```
where the requested session reservation priority is one of DEFAULT  
And where the request MPS Identifier matches one of  
MPSID1,MPSID2,MPSID3,MPSID4  
set DRMP AVP to PRIORITY_0 in Re-Authorized Request  
continue processing message
```

set *external field* to # percent of *select type* for *selected* quota

Mode

Cable, Wireless

Syntax

set *field* to value percent of *type* for *quota-name* quota

Parameters

field

String name of field in external database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value

New string name of field in external database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

type

One of the following:

- **service-specific**
- **time**
- **total volume**
- **uplink volume**
- **downlink volume**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets a field in an external database to a percentage of the time, total volume, or service-specific quota of one or more selected quotas. This can be an LDAP server or an SPR. The MPE device on which this policy is executed must have write access to the database, and the external field must be defined on the MPE device. For more information, see the appropriate *CMP User's Guide*. See [Managing Quotas](#) for information on quotas.

set *external field* to *`value`*

Mode

Cable, Wireless

Syntax

set *field* to *`value`*

Parameters

field

String name of field in external database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value

String.

Value specifies a field in the external database. If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the value of a field in an external database. This can be an LDAP server or, in wireless mode, an SPR. The MPE device on which this policy is executed must have write access to the database, and

the external field must be defined on the MPE device. For more information, see the appropriate *CMP User's Guide*.

Examples (Wireless Mode)

```
set Quota Volume to `{User.Quota.Gold.Volume}`
```

```
set Last Session to `{Date(2012-10-24 19:54:01)}`
```

set NoOptimization to request

Mode

Wireless

Syntax

```
set NoOptimization to request
```

Parameters

None

Description

Prevents the RAR optimization mechanism from being applied to a request. This functionality allows an RAR request to be sent to the MPE device without being impacted by optimization priorities.

set policy context property *name* to the instance name of dynamic quota of *selected* being used

Mode

Wireless

Syntax

```
set the policy context property-name to the instance name of dynamic  
quota-name being used
```

Parameters

property-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

quota-name

Name(s) of quota defined in the CMP database.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the instance ID of the dynamic quota being used for the specified quota profile into a policy context property. See [Managing Quotas](#) for information on quotas.

set policy context property *name* to *value*

Mode

Cable, Wireless, Wireline

Syntax

set policy context property *property-name* to *value*

Parameters

property-name

String.

May contain policy rule variables (see [Policy Rule Variables](#)) to perform parameter substitution within the property name.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets a subscriber property.

set Quota Exhaustion Action to *specified*

Mode

Wireless

Syntax

set Quota Exhaustion Action to *action*

Parameters

action

Specifies the action the GGSN takes when a subscriber reaches the quota grant. Selecting this parameter opens a window with the following options:

- **Quota Exhaustion Action** — Select one of the following:
 - **TERMINATE** (default) — Terminate the subscriber's session. If you select this option, the other options are not applicable.
 - **REDIRECT** — Redirect the session to another server. If you select this option, configure the following additional fields:
 - **Redirect Server Type** — Select **IPV4** (default), **IPV6**, **URL**, or **SIP URI**
 - **Redirect Server Address** — Type the server address
 - **RESTRICT ACCESS** — If you select this option, additional configuration fields appear:
 - **Restriction Filters** — Type a comma-separated list of Diameter IP Filter rules
 - **Filter ID List** — Type a comma-separated list of named filters on the GGSN

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the action to take if the subscriber's quota is exhausted. See [Managing Quotas](#) for information on quotas.

set session revalidation time to # seconds

Mode

Wireless

Syntax

set session revalidation time to *seconds* seconds

Parameters

seconds

A numeric value that specifies time in units of seconds.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the session revalidation time to the number of seconds from when the policy executes.

set session revalidation time to Policy Counter ID(s) *select name(s)*

Mode

Wireless

Syntax

session revalidation time to Policy Counter IDs *counter -name*

Parameters

counter -name

- Select **Policy Counter Id** to select one or more policy counter ID defined in the CMP database.
- Select **Policy Counter ID(s)(CSV)** to enter a comma-separated string of policy counter IDs.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Provisions the session revalidation time to the value in the specified policy counter ID or IDs.

set session revalidation time to *time* on *day* using *configured local time*

Mode

Wireless

Syntax

set session revalidation time to *time* on *day-of-week* using *time-zone*

Parameters

time

A time, in the format *hh:mm* (limited to 15-minute intervals).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

day-of-week

One of the following:

- **Sunday**
- **Monday**
- **Tuesday**
- **Wednesday**
- **Thursday**
- **Friday**
- **Saturday**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the session revalidation time (to the quarter hour) after which the enforcement device requests revalidation from the MPE device for the requested user's service. If time-zone information is available

from the user equipment, time can be calculated from either the MPE device or the user equipment's location.

set *specified* ARP to *value*

Mode

Wireless mode with Diameter 3GPP function.

Syntax

```
set arp_type ARP to arp_attribute
```

Parameters

arp_type

Select the ARP session type.

GCS	The Group Communication Service (GCS) feature.
eMPS	The enhanced Multimedia Priority Service (eMPS) feature.

arp_attribute

Priority Value	Defines the relative importance of a resource request. Enter a value from 1 to 15. The default is 1.
Preemption Capability	Defines whether a service data flow can get resources that were assigned to another service data flow with a lower priority level. Select Enable or Disable . The default is Enable .
Preemption Vulnerability	Defines whether a service data flow can release the assigned resources so that a service data flow with a higher priority level can be admitted. Select Enable or Disable . The default is Disable .

Description

Overrides the default ARP settings for eMPS or GCS ARP.

set the *scope* state variable *name* to *now + 0 days* rounded *up* with *same* granularity using *configured local time* and save *always*

Mode

Wireless

Syntax

```
set the scope state variable variable-name to datetime direction duration
granularity1 rounded rounding with granularity2 granularity using time-zone
and save save-mode
```

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: Any string up to 32 ASCII characters in length if the scope is **subscriber_local** or **session**.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

datetime

One of the following:

- A policy variable.
- **now** (default) — The local date-time.
- A date-time in the format: `yyyy-mm-ddThh:mm:ss+UTCOffset`.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

- **Date** — Select the date from the calendar interface.
- **Time** — Select hh:mm:ss.
- **UTC Offset** — Select number of hours before or after UTC time to start.
- **now** — Select for the local date-time.
- **Time only** — Select to use the time only.
- A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: `yyyy-mm-ddThh:mm:ss+UTCOffset`. Click **Evaluate as expression** to bypass date-time format validation.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

direction

One of the following, indicating a time offset in the future or past:

- **+** (default)

- -

duration

Positive integer.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

granularity1

The offset is expressed in this granularity:

- **days** (default)
- **months**
- **hours**
- **minutes**

rounding

One of the following, indicating rounding up or down:

- **up** (default)
- **down**

granularity2

The calculated date-time is expressed in this granularity:

- **same** (default)
- **months**
- **days**
- **hours**
- **minutes**

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets and saves a state date-time variable to either the current date and time or another date-time and an offset. If time-zone information is available from the user equipment, time can be calculated from either the MPE device or the location of the user equipment. You can specify that the variable is not saved if the policy rejects the message.

set the *scope* state variable *name* to *now* using *configured local time* and save *always*

Mode

Wireless

Syntax

set the *scope* state variable *variable-name* to *datetime* using *time-zone* and save *save-mode*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

datetime

One of the following:

- A policy variable.
- **now** (default) — The local date-time.
- A date-time in the format: *yyyy-mm-ddThh:mm:ss+UTCoffset*.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

- **Date** — Select the date from the calendar interface.

- **Time** — Select hh:mm:ss.
- **UTC Offset** — Select number of hours before or after UTC time to start.
- **now** — Select for the local date-time.
- **Time only** — Select to use the time only.
- A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: `yyyy-mm-ddThh:mm:ss+UTCoffset`. Click **Evaluate as expression** to bypass date-time format validation.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-zone

One of the following:

- **CONFIGURED LOCAL TIME** (default) — Calculate the time from the location configured for this MPE device
- **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
- **USER LOCAL TIME** — Calculate the time from the location configured for the user equipment's location

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets and saves a state variable timestamp to the current local time or a timestamp. If time-zone information is available from the SPR, time can be calculated from either the MPE device or the SPR device location. You can specify that the variable is not saved if the policy rejects the message.

set the *scope* state variable *name* to property *name + multiple of 0 days* rounded *up* with *same* granularity and save *always*

Mode

Wireless

Syntax

set the *scope* state variable *variable-name* to property *property-name*
direction multiplier duration granularity rounded rounding withgranularity2
granularity and save *save-mode*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

property-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

direction

One of the following, indicating a time offset in the future or past:

- + (default)
- -

multiplier

One of the following:

- **multiple of** (default) — the duration is added repeatedly until the result is in the future
- **exactly** — the duration is added once

duration

Positive integer.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

granularity

The offset is expressed in this granularity:

- **days** (default)
- **months**
- **hours**
- **minutes**

rounding

One of the following, indicating rounding up or down:

- **up** (default)
- **down**

granularity2

The calculated date-time is expressed in this granularity:

- **same** (default)
- **months**
- **days**
- **hours**
- **minutes**

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Offsets a scope date-time variable, either by the number of time units necessary to move the result into the future or by a specific number of time units.

- If the value of the first variable is in the future, either the exact offset, or one unit of the offset, is added.
- If the value of the first variable is in the past and you specify + **multiple of**, the duration is repeatedly added until the result is in the future.
- If the result of the offset is in the past (for example, if you specify + **exactly 1 day** and the result is still in the past), the action is ignored. You can specify that the property is not saved if the policy rejects the message.
- If the value of the second variable is null then the action is ignored.

set the *scope* state variable *name* to select traffic profile *name* and save *always*

Mode

Wireless

Syntax

set the *scope* state variable *variable-name* to select traffic profile *retry-profile* and save *save-mode*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

retry-profile

Select a profile.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)
- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets and saves a scope state variable to the specified traffic profile. You can specify that the variable is not saved if the policy rejects the message.

set the *scope* state variable *name* to *`value`* and save *always*

Mode

Wireless

Syntax

set the *scope* state variable *variable-name* to *`value`* and save *save-mode*

Parameters

scope

One of the following:

- **subscriber** — Subscribers in the remote SPR.
- **pool** — Subscriber pool defined in the SPR.
- **subscriber_local** — Subscribers in the local MPE.
- **session** — Session variables that have a value as long as the session they are associated with is open.
- **policy_evaluation** — Policy evaluation variables that last only for the duration of the policy evaluation cycle.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

value

String.

If you select **Evaluate as expression**, the text in the field is evaluated as an arithmetic expression, and the result is used.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

save-mode

One of the following:

- **always** (default)

- **unless rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets and saves a state variable. You can specify that the variable is not saved if the policy rejects the message.

set the *scope* state variable *name* to *time plus* random value within *#* seconds and save *always*

Mode

Wireless

Syntax

set the *scope* state variable *variable-name* to *time-type time-variance* random value within *seconds* seconds and save *save-mode*

Parameters

scope

The scope of the variable. Select one of the following:

- **subscriber** — Subscriber variable in the remote SPR as long as the subscriber exists in the SPR. The variable must be named **User.State.variable**.
- **pool** — Quota pool variable defined on the SPR as long as the pool exists in the SPR. The variable must be named **User.Pool.State.variable**.
- **subscriber_local** — Subscriber variable in the local MPE device as long as the subscriber has at least one session on the MPE device. The variable must be named **User.LocalState.variable**.
- **session** — Session variable that has a value as long as the session it is associated with is open. The variable must be named **Session.State.variable**.
- **policy_evaluation** — Policy evaluation variables that last for the duration of the policy evaluation cycle. The variable must be named **Policy.Variable.variable**.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

variable-name

String — Name of the variable.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

time-type

Supports time configured as:

- **Specific Time** — Specifies settings:
 - Set date and time:
 - A policy variable.
 - **now** (default)—The local date and time.
 - A date-time in the format: `yyyy-mm-ddThh:mm:ss+UTCOffset`.

Note: Enter the date-time directly into the field or click the calendar icon for assistance:

 - **Date** — Select the date from the calendar interface.
 - **Time** — Select hh:mm:ss.
 - **UTC Offset** — Select number of hours before or after UTC time to start.
 - **now** — Select for the local date-time.
 - **Time only** — Select to use the time only.
 - A JavaScript code snippet — Enter a JavaScript statement that evaluates to a date-time in the format: `yyyy-mm-ddThh:mm:ss+UTCOffset`. Click **Evaluate as expression** to bypass date-time format validation.
- **Select Time Mode** — The optional time zone. Select one of the following:
 - N/A
 - **CONFIGURED LOCAL TIME** — Calculate the time from the location configured for this MPE device
 - **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
 - **USER LOCAL TIME** (default) — Calculate the time from the location configured for the user equipment's location
- **Relative Time** — Specifies the number of hours, minutes, or seconds from the current time to the execution time. Select the time unit (**Hours**, **Minutes**, or **Seconds**) and enter a positive integer. For example, select **Hours** and enter **12** to set the execution time to 12 hours from now. You can instead enter a policy rule variable.
- **Policy Counter ID** — Select one or more policy counter IDs defined in the CMP database; or enter a comma-separated string of policy counter IDs.
- **Day Of Week** — Specifies one or more days of the week, plus a time during the day:
 - **Choose the day(s) of the week to check:**
 - **Sunday**
 - **Monday**
 - **Tuesday**
 - **Wednesday**
 - **Thursday**
 - **Friday**
 - **Saturday**
 - **Enter time:** The execution time during the day, in the form `hh:mm`.

- **Select Time Mode** — The optional time zone. Select one of the following:
 - N/A
 - **CONFIGURED LOCAL TIME** — Calculate the time from the location configured for this MPE device
 - **SYSTEM LOCAL TIME** — Calculate the time from the location of this MPE device
 - **USER LOCAL TIME** (default) — Calculate the time from the location configured for the user equipment's location

time-variance

Supports a randomization interval:

- **plus**
- **minus**
- **plus/minus**

seconds

A numeric value that specifies time in units of seconds.

Valid range is 0-1000000000.

save-mode

One of the following:

- **always (default)**
- **unless rejected**

Description

Sets a state variable with specified scope and name to a time with a specified time variance. To avoid message storms, you can specify that a random time value be used, within specified limits, for rule activation and execution; a random value is used in the time window you specify in *time-variance*.

Example

The following example shows how you can define state variables and use them in policy actions which add conditional policy information, set re-validation time, and which install a PCC rule:

```
set the session state variable {Session.State.StartTimeRandVar} to 1Hour
minus random value within 30 seconds and save always
set the session state variable {Session.State.EndTimeRandVar} to 2Hour
minus random value within 30 seconds and save always
add Conditional Policy Information with Execution-Time to
{Session.State.StartTimeRandVar} and parameters
Diameter APN-Aggregate-Max-Bitrates-DL 1000
revalidate the session at {Session.State.StartTimeRandVar} using CONFIGURED
LOCAL TIME
install pccrule1 PCC rule(s) for session active between
{Session.State.StartTimeRandVar} and {Session.State.EndTimeRandVar}
```

set the user property *name* to *Existing or New* custom AVP *name* and send *always*

Mode

Wireless

Syntax

set the user property *property-name* to *property-type* custom AVP *avp-name*
and send *send-mode*

Parameters

property-name

String.

May contain policy rule variables (see [Policy Rule Variables](#)) to perform parameter substitution within the property name.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

property-type

One of the following:

- **Existing or New** (default)
- **New**

avp-name

Select an existing AVP Name and Vender ID, or an AVP name from an existing Policy Table.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

send-mode

One of the following:

- **always** (default)
- **unless rejected**
- **if rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets the user property value for an outgoing AVP. If a user property with the corresponding name exists, the AVP will be sent in the reply message.

set threshold to # percent of *granted* quota for service-specific units

Mode

Wireless

Syntax

set threshold to *extended-percent* percent of *provided-quota* quota for service-specific units

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

provided-quota

One of the following:

- **initial**
- **granted** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets a threshold, based on a percentage of the volume (in service-specific units) granted to the user, so that the enforcement device (for example, a GGSN) notifies the MPE device when the threshold is reached. This action works on multiple quotas. See [Managing Quotas](#) for information on quotas.

set threshold to # percent of *granted* quota for time

Mode

Wireless

Syntax

set threshold to *extended-percent* percent of *provided-quota* quota for time

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

provided-quota

One of the following:

- **initial**
- **granted** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets a threshold, based on a percentage of the time (in seconds) granted to the user, so that the enforcement device (for example, a GGSN) notifies the MPE device when the threshold is reached. This action works on multiple quotas. See [Managing Quotas](#) for information on quotas.

set threshold to # percent of *granted* quota for volume

Mode

Wireless

Syntax

set threshold to *extended-percent* percent of *provided-quota* quota for volume

Parameters

extended-percent

An extended, non-integer percentage that can exceed 100 (for example, 102.4%).

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

provided-quota

One of the following:

- **initial**
- **granted** (default)

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Sets a threshold, based on a percentage of the volume (in bytes) granted to the user, so that the enforcement device (for example, a GGSN) notifies the MPE device when the threshold is reached. This action works on multiple quotas. See [Managing Quotas](#) for information on quotas.

set time limit to # seconds

Mode

Cable

Syntax

set time limit to *seconds* seconds

Parameters

seconds

A numeric value that specifies time in units of seconds.

Valid range is 0–1000000000.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the time limit in the current message. If there is no TimeLimit object in the current message, a new one is added with the specified value.

set *value* to *Existing or New* custom AVP *name* and send *always*

Mode

Wireless

Syntax

set *value* to *avp-type* custom AVP *avp-name* and send *send-mode*

Parameters

value

String.

This string represents a third-party non-grouped AVP. Check **Evaluate as expression** to evaluate this value as an expression.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

avp-type

Select type of AVP name:

- **Existing** (default)
- **New**

avp-name

An existing AVP Name and Vender ID.

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

send-mode

One of the following:

- **always** (default)
- **unless rejected**
- **if rejected**

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Adds the third-party non-grouped AVP to the current Diameter session with the specified value. If a third-party AVP value is set in the current Diameter session, it will be sent with the corresponding outgoing message. The value parameter must corresponds to the AVP data type, otherwise this AVP will not be set. If New is selected as the type of AVP name, every time this action is called a new AVP is added to the message, even if the AVP with the same name is present in the message.

set volume limit to # kilobytes

Mode

Cable

Syntax

set volume limit to *bandwidth* kilobytes

Parameters

bandwidth

A numeric value that specifies bandwidth in bits per second (bps). You can also specify the type to change the rate per second by specifying one of the following:

- **k** — kilobits per second
- **K** — kilobits per second
- **m** — megabits per second
- **M** — megabits per second
- **g** — gigabits per second
- **G** — gigabits per second

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Overwrites the volume limit in the current message. If there is no VolumeLimit object in the current message, a new one is added with the specified value.

subscribe PRA change for *PRA area*

Mode

Wireless mode with the 3GPP mode enabled.

Syntax

subscribe PRA change for *pra*

Parameters

pra

One of the following:

- **predefined PRA list** — select a defined PRA list
- **manual input** — enter the identifier for the PRA in hexadecimal format or a custom PRA from a subscriber profile in the format *{User.CustomField}*. For information on creating custom fields in subscriber profiles, see the *CMP Wireless User's Guide*.
- **default area** — the last PRA to which the user equipment was subscribed

Note: If you are using a policy table for this parameter, click **Use Policy Table**, choose the field (column) representing the parameter.

Click **OK**.

Description

Subscribes the user equipment to PRA changes in the specified PRA. If **default area** is selected as the definition for the parameter *pra*, subscribes the user equipment to PRA changes in the last subscribed PRA.

unsubscribe PRA change

Mode

Wireless mode with the 3GPP mode enabled.

Syntax

unsubscribe PRA change

Parameters

None

Description

Unsubscribes from PRA changes.

Policy Rule Variables

The MPE device supports policy rule variables within certain conditions and actions (for example, **where the policy context property**, **set policy context property**, and **send notification**), as well as in policy tables. During policy rule execution, variables are replaced with contextual information. Each time the policy rule is evaluated, the unique set of policy rule variable replacements is referred to as the policy context.

For information on policy rule variables, how to use them, and lists of available variables, see the *Policy Variables Reference*.

A

AAA	Authentication, Authorization, and Accounting (Rx Diameter command)
ADC	Application Detection and Control Policy rules that enable detection and control of application traffic and associated enforcement action.
APN	Access Point Name The name identifying a general packet radio service (GPRS) bearer service in a GSM mobile network. See also GSM.
application	The telecommunications software that is hosted on the platform. A service provided to subscribers to a network; for example, voice over IP (VoIP), video on demand (VoD), video conferencing, or gaming.
AVP	Attribute-Value Pair The Diameter protocol consists of a header followed by one or more attribute-value pairs (AVPs). An AVP includes a header and is used to encapsulate protocol-specific data (for example, routing information) as well as authentication, authorization or accounting information.

B

B

BNG	Broadband Network Gateway is an example of a BNG device is a broadband remote access server (B-RAS).
bps	Bits Per Second
BSSID	Basic Service Set Identifier MAC address of the wireless access point.

C

CCA	Credit Control Answer The Diameter message that is received from the prepaid rating engine to acknowledge a CCR command.
CCR	Credit Control Request A Diameter message to be sent to a prepaid rating engine to request credit authorization for an SMS.
Circuit ID	Identifies the relay circuit from which a DHCP client-to-server packet was received.
CS	Circuit Switching

D

DEA	Diameter Edge Agent Device through which LTE roaming signaling traffic is funneled to protect network element addresses from being exposed to third parties.
-----	---

D

Diameter	Protocol that provides an Authentication, Authorization, and Accounting (AAA) framework for applications such as network access or IP mobility. Diameter works in both local and roaming AAA situations. Diameter can also be used as a signaling protocol for mobility management which is typically associated with an IMS or wireless type of environment.
DOCSIS	Data Over Cable Service Interface Specification - An international telecommunications standard for adding high-speed data transfer to an existing cable TV system. Employed by many cable television operators to provide Internet access over their existing infrastructure.

E

EPS	Evolved Packet System EPS is the core or main component of an LTE (Long-Term Evolution) system.
-----	--

F

FQDN	Fully Qualified Domain Name The complete domain name for a specific computer on the Internet (for example, www.oracle.com). A domain name that specifies its exact location in the tree hierarchy of the DNS.
------	---

G

GBR	Guaranteed Bit Rate A minimum bit rate requested by an application for uplink and downlink traffic.
-----	--

G

GUI

Graphical User Interface

The term given to that set of items and facilities which provides you with a graphic means for manipulating screen data rather than being limited to character based commands.

Gx

The Diameter credit control based interface between a PCRF and a PCEF as defined by 3GPP. The interface is used to convey session information from the PCEF to the PCRF, and in reply the PCRF provides rule information for the PCEF to enforce.

H

HRPD

High Rate Packet Data

I

IMS

IP Multimedia Subsystem

These are central integration platforms for controlling mobile communications services, customer management and accounting for mobile communications services based on IP. The IMS concept is supported by 3GPP and the UMTS Forum and is designed to provide a wide range of application scenarios for individual and group communication.

IP

Internet Protocol - IP specifies the format of packets, also called datagrams, and the addressing scheme. The network layer for the TCP/IP protocol suite widely used on Ethernet networks, defined in STD 5, RFC 791. IP is a connectionless, best-effort packet switching protocol. It provides

I

packet routing, fragmentation and re-assembly through the data link layer.

L

LTE

Long Term Evolution

The next-generation network beyond 3G. In addition to enabling fixed to mobile migrations of Internet applications such as Voice over IP (VoIP), video streaming, music downloading, mobile TV, and many others, LTE networks will also provide the capacity to support an explosion in demand for connectivity from a new generation of consumer devices tailored to those new mobile applications.

M

MAC

Media Access Control Address

The unique serial number burned into the Ethernet adapter that identifies that network card from all others.

MCC

Mobile Country Code

A three-digit number that uniquely identifies a country served by wireless telephone networks. The MCC is part of the International Mobile Subscriber Identity (IMSI) number, which uniquely identifies a particular subscriber. See also MNC, IMSI.

MNC

Mobile Network Code

A number that identifies a mobile phone carrier. Used in combination with a Mobile Country Code (MCC) to uniquely identify a

M

mobile phone operator/carrier. See also MCC.

N

network device

A physical piece of equipment or a logical (software) entity connected to a network; for example, CMTS, video distribution router, gateway router, or a link. This may also include sub-components of network elements (such as an interface) or lower-level devices such as cable modems or CPEs.

O

Operator Name

Identifies the TWAN operator when the TWAN is not operated by a mobile operator usually encoded in the form of an Internet domain name.

P

pass

A quota profile that provides a one-time override of a subscriber's default plan.

PCC

Policy and Charging Control

Policy rules that define the conditions and actions used by a carrier network to control how subscribers and applications are treated and how network resources are allocated and used.

PCEF

Policy and charging enforcement function

A system responsible for enforcing policies on network subscriber authentication, authorization, accounting, and mobility. A PCEF

P

	device, such as a CMTS or GGSN, communicates with a PCRF device, such as a policy server.
PCRF	<p>Policy and Charging Rules Function</p> <p>The ability to dynamically control access, services, network capacity, and charges in a network.</p> <p>Maintains rules regarding a subscriber's use of network resources. Responds to CCR and AAR messages. Periodically sends RAR messages. All policy sessions for a given subscriber, originating anywhere in the network, must be processed by the same PCRF.</p> <p>In the Policy Management system, PCRF is located in the MPE device.</p> <p>Software node designated in real-time to determine policy rules in a multimedia network.</p>
plan	A quota profile that consists of a subscriber's basic, recurring service.
PLMN	<p>Public Land Mobile Network</p> <p>A wireless communications network that uses land-based radio transmitters or base stations, intended for public use by terrestrial subscribers in vehicles or on foot. A PLMN is identified by its Mobile Country Code (MCC) and Mobile Network Code (MNC).</p>
policy group	An ordered group of policies, organized for ease of administration or deployment.
PS	Packet Switching

Q

QoS	Quality of Service Control mechanisms that guarantee a certain level of performance to a data flow.
quota	Specifies restrictions on the amount of data volume, active session time, or service-specific events that a subscriber can consume.
quota convention	Specifies the default values for rollovers and enables top-ups. A quota convention is associated with a plan.
quota profile	Defines how quotas are implemented and specifies the default values. Quota profiles consist of passes and plans.

R

RAA	Re-Authorization Answer (Gx or Rx Diameter command)
RADIUS	Remote Authentication Dial-In User Service A client/server protocol and associated software that enables remote access servers to communicate with a central server to authorize their access to the requested service. The MPE device functions with RADIUS servers to authenticate messages received from remote gateways. See also Diameter.
RAR	Re-Authorization Request (Gx or Rx Diameter command)

R

RAT	Radio Access Technology
Relay Identity	Identifies the TWAN relay identity type as either IPv4/IPv6 or FQDN.
rollover	A quota convention that allows a subscriber to carry forward unused units from one billing cycle to another.

S

S9	The S9 Diameter interface includes Rx, Gx, and Gxx messages, but when these messages are used between a visited PCRF and the home PCRF, the interfaces are collectively referred to as S9. Defined by 3GPP 29.215 as the interface between a visited PCRF and a home PCRF. There is no difference in processing of Rx over S9 versus. Rx not over S9. The S9 interface is binding capable for Gx and Gxx only. Rx over S9 is binding dependent.
server	In Policy Management, a computer running Policy Management software, or a computer providing data to a Policy Management system.
SMPP	Short Message Peer-to-Peer Protocol An open, industry standard protocol that provides a flexible data communications interface for transfer of short message data.
SMS	Short Message Service

S

A communication service component of the GSM mobile communication system that uses standard communications protocols to exchange short text messages between mobile phone devices. See also GSM.

Shared Metric Service

SPC

Service Provisioning over COPS (Common Open Policy Service protocol)

SPR

Subscriber Profile Repository

A logical entity that may be a standalone database or integrated into an existing subscriber database such as a Home Subscriber Server (HSS). It includes information such as entitlements, rate plans, and so on. The PCRF and SPR functionality is provided through an ecosystem of partnerships.

SSID

Service Set Identifier

Used to uniquely identify a wireless LAN.

T

TDF

Traffic Detection Function

top-up

A quota convention that allows a subscriber to obtain additional units for an existing plan.

TWAN

Trusted Wireless Area Network

V

V

VoIP

Voice Over Internet Protocol

Voice communication based on the IP protocol competes with legacy voice networks, but also with Voice over Frame Relay and Voice and Telephony over ATM. Realtime response, which is characterized by minimizing frame loss and latency, is vital to voice communication. Users are only prepared to accept minimal delays in voice transmissions.

W

whitelist

Provisioning whitelist.

A list of entities that are granted a particular privilege, service, mobility, access, or recognition. A whitelist is the opposite of a blacklist.

X

XML

eXtensible Markup Language

A version of the Standard Generalized Markup Language (SGML) that allows Web developers to create customized tags for additional functionality.
