1. OBIEE Metadata Repository Deployment Guide

1.1 Introduction

The Oracle Business Intelligence Server is a stand-alone process that maintains the logical data model which it provides to BI Presentation Services via ODBC. Metadata is maintained for the data model in a local proprietary file called the repository file (rpd). On the back-end, the BI Server connects to customer data stores via data source adaptors.

1.1.1 Layers in RPD

The Physical layer defines the data sources to which Oracle BI Server submits queries and the relationships between physical databases and other data sources that are used to process multiple data source queries. The recommended way to populate the Physical layer is by importing metadata from databases and other data sources. The data sources can be of the same or different varieties. You can import schemas or portions of schemas from existing data sources. Additionally, you can create objects in the Physical layer manually.

When you import metadata, many of the properties of the data sources are configured automatically based on the information gathered during the import process. After import, you can also define other attributes of the physical data sources, such as join relationships, that might not exist in the data source metadata. There can be one or more data sources in the Physical layer, including databases, spreadsheets, and XML documents. In this example, you import and configure tables from the sample SH schema included with the Oracle 10g database.

The Business Model and Mapping layer of the Administration Tool defines the business, or logical, model of the data and specifies the mappings between the business model and the Physical layer schemas. This is where the physical schemas are simplified to form the basis for the users' view of the data. The Business Model and Mapping layer of the Administration Tool can contain one or more business model objects. A business model object contains the business model definitions and the mappings from logical to physical tables for the business model.

The main purpose of the business model is to capture how users think about their business using their own vocabulary. The business model simplifies the physical schema and maps the users’ business vocabulary to physical sources. Most of the vocabulary translates into logical columns in the business model. Collections of logical columns form logical tables. Each logical column (and hence each logical table) can have one or more physical objects as sources.

There are two main categories of logical tables: fact and dimension. Logical fact tables contain the measures by which an organization gauges its business operations and performance. Logical dimension tables contain the data used to qualify the facts.

The Presentation layer is built after the Physical layer and Business Model and Mapping layer and adds a level of abstraction over the Business Model and Mapping layer. It is the view of the data seen by end users in client tools and applications, such as Oracle BI Answers. The Presentation layer provides a means to further simplify or customize the Business Model and Mapping layer for end users. For example, you can organize columns into catalogs and folders.

Simplifying the view of the data for users makes it easier to craft queries based on users’ business needs because you can expose only the data that is meaningful to the users, organize the data in a way that aligns with the way users think about the data, and rename data as necessary for the set of users.
You typically create Presentation layer objects by dragging objects from the Business Model and Mapping layer. Corresponding objects are automatically created in the Presentation layer. Presentation layer objects can then be renamed and reorganized.

1.1.2 **FCIS OBIEE RPD**

In FCIS OBIEE we have a single RPD. In this document we will see how merge a RPD to FCIS Metadata RPD. We will also see how to deploy sample dashboards generated using these RPDs.

1.2 **Prerequisites**

1.2.1 **Hardware / Software Required**

<table>
<thead>
<tr>
<th>Server</th>
<th>OBIEE 12.2.1.2.0</th>
</tr>
</thead>
</table>

1.3 Deployment in OBIEE

1.3.1 Rpd Connection Changes

1. Open OBIEE Administration tool.
2. Open rpd in offline mode.

3. Enter Password: Weblogic123 and click ‘OK’.
4. Double click on connection pool.
5. Change Data source name.
6. Change Data source name for the marked info given in the below format:

    (DESCRIPTION = (ADDRESS_LIST = (ADDRESS = (PROTOCOL = TCP)(HOST = <Host Address>)(PORT = <Port>)))(CONNECT_DATA = (SERVICE_NAME <Servicename>)) )

![Image of Database Configuration Panel]
7. Enter User ID and password and click OK. Again enter the same password when it prompts. Save the Rpd changes.

8. Click 'OK' and the following screen is displayed:
9. Click ‘OK’ and the following screen is displayed:

![Oracle BI Administration Tool](image)

Do you wish to check global consistency?

- Yes
- No
- Cancel

10. Click ‘Yes’.

![Check Consistency](image)

Running Consistency Check...
Invalid Use of EvaluateAggr

11. Click ‘Close in below window’.

![Consistency Check Manager](image)
1.3.2 **Deploying RPD**

Earlier OBIEE RPD deployment was through Enterprise manager, now a command from putty.

```
sh data-model-cmd.sh uploadrpd -l <rp name> -W <RPD password> -SI ssi -U <console user name> -P <console password>
```
