# 1. Introduction

This document introduces the reader to the procedure to be followed for Scheduler JAVA JOB Creation for FLEXCUBE Universal Banking Solutions.

---

## 2. Background

This document is based on the requirement of creating JAVA Jobs to be executed by Quartz Scheduler.

This document describes the procedure to be followed to accomplish the above.

## 3. Procedure

This section describes job creation:

1. Launch the job maintenance screen STDJOBMT for creation of a Job.
2. Specify the field values. For information regarding individual fields please refer to Installation Docs.

The screenshot shows the 'Job Maintenance' window with the following configuration:

- Job Description:** Job Code: FTP\_COPY, Job Description: FTP COPY, Job Group: DEFAULT, Job Type: Java, Max Number Instances: 3, Scheduler: SchedulerFactory, Trigger Type: Simple, Scheduler Type: Quartz, Priority: Normal, Message Queue: (empty).
- Job Details:** Cron Expression: (empty), Class Or Procedure: duler.quartz.ftp.FtpCopy, No of Submissions: -1, Interval In Seconds: 60, Trigger Listener: (empty), Active: , Ds Name: (empty), Logging Required: , Veto Blocked Trigger: , Startup Mode: Manual.

**Parameter Details Table:**

Parameter Name	Data Type	Parameter Value
SOURCECOUNT	Number	2
SOURCE1	Varchar	/Test/src
DEST1	Varchar	/Test/dest
SOURCE2	Varchar	/Test/src1
DEST2	Varchar	/Test/dest

At the bottom of the window, there are fields for Maker, Checker, Mod No, Date Time, Record Status, and Authorization Status, along with a 'Cancel' button.

A Java job can be stateful or stateless.

### Stateful Job

If the job is configured to be STATEFUL then missed instances will be queued up so that scheduler would start executing once the long running job ends. It means there will be no parallel execution of the java class.

To make a class as Stateful, add two annotations to the job class.

- @PersistJobDataAfterExecution
- @DisallowConcurrentExecution

## Stateless Job

If the job is configured as STATELESS, threads can be run in parallel and can execute the same java class.

If the job is configured as stateless, the value of field **Max Number Instances** will denote the number of threads that can be executed in parallel .If the job is configured as stateful, then the above value will denote the number of missed instances that will be queued up so that quartz scheduler would start executing them once a long running job ends. This field specifies the number of such job instances that needs to be queued up.

The class defined in the class field has to be provided a fully qualified name.

Job params can be added to a particular java job in this screen as shown above.

---

## 4. Example

Suppose you have created a new FTP\_COPY job, to copy ftp files from one location to another. It is a java job, where the class to be executed is FtpCopy.java.

You have provided the fully qualified class name as com.ofss.scheduler.quartz.ftp. FtpCopy.

The physical location of the java file is  
INFRA\FCJNeoWeb\Javasource\com\ofss\scheduler\quartz\ftp\FtpCopy.java.

In this class, you have to override the execute method of Job class to provide the implementation logic, which is executed when the quartz scheduler executes the class. The execute method format is as below.

```
public void execute (JobExecutionContext context) throws JobExecutionException {}
```

The sample java file is attached:

**FtpCopy.java**
