Oracle® Communications Session Border Controller & Session Router
Release Notes
Release S-CZ8.0

December 2017
Notices

Copyright© 2017, 2004, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

About this Guide

The Oracle Communications Session Border Controller (OCSBC) and Oracle Communications Session Router (OCSR) Release Notes document provides the following information when applicable:

- An introduction to the full release
- An overview of the new features available
- An overview of the interface enhancements
- A summary of known issues, caveats, and behavioral changes

If any of these sections does not appear in the document, then there were no changes to summarize in that category for that specific release.

Related Documentation

The following table lists the members that comprise the documentation set for this release:

<table>
<thead>
<tr>
<th>Document Name</th>

                   • Changes defect table to includes all defect ID numbers                                                                                                                                               |
| December 2017    | • Adds qualified Netra platform versioning                                                                                                                                                                     |
Introduction to S-CZ8.0.0

The Oracle Communications Session Border Controller and Session Router S-CZ8.0.0 Release Notes provide the following information about this product:

- Supported platforms and hardware requirements
- An overview of the new features available in this release
- An overview of previously-available features that are new to the GA of this major release
- A summary of changes the interfaces including the ACLI, MIB Support, and accounting interfaces.
- A summary of known issues, caveats, and behavioral changes

Platform Support

The following platforms are supported by the S-CZ8.0.0 version of the OCSBC, based on the Support per Release table following this section.

Acme Packet Platforms

- Acme Packet 4600
- Acme Packet 6100
- Acme Packet 6300
- Acme Packet 6350

The following platforms are supported by the S-CZ8.0.0 version of the OCSR, based on the Support per Release table following this section:

- Acme Packet 4600
- Acme Packet 6100
- Acme Packet 6300
- Netra X5-2
  - Note - Qualified via Platform Software Release 1.0.0 (ILOM 3.2.4.32, BIOS 32.00.01.01)
  - Caveat - Fortville Firmware - v4.53 (To resolve 10g Base-T link flap issue with Extreme X670V)

Qualified Virtual Machine Management Platforms

Oracle qualified the following components for deploying version S-CZ8.0.0 as a Virtual Network Function.

- XEN 4.4: Specifically using Oracle Virtual Machine (OVM) 3.4.2
KVM: Using version embedded in Oracle Linux 7 with RHCK.

Note the use of the following host component versions you must install:

- RHCK: 3.10.0-514
- DPDK: dpdk017.05.2
- QEMU: qemu-2.9.0
- OVS: openvswitch-2.8.0
- i40e: Firmware-version : 5.04, with driver 2.0.19
- ESXi : Using VMware vSphere Hypervisor 6.0 u2

Qualified hardware platforms for hypervisors:

- Netra X5-2
- Oracle Server X5-2

Qualified interface chipsets

- Intel x540/82599
- Intel i350
- Intel X710 / XL710

Firmware version information from dpdk.org is also presented, based on the DPDK version used in this release.

Intel x540/82599

- Intel(R) Ethernet Controller X540-AT2
- Firmware version: 0x80000389
- Device id (pf): 8086:1528
- Driver version: 3.23.2 (ixgbe)

- Intel(R) 82599ES 10 Gigabit Ethernet Controller
- Firmware version: 0x61bf0001
- Device id (pf/vf): 8086:10fb / 8086:10ed
- Driver version: 4.0.1-k (ixgbe)

Intel X710 / XL710

- Intel(R) Ethernet Converged Network Adapter X710-DA4 (4x10G)
- Firmware version: 5.05 (Note OL7 exception above)
- Device id (pf/vf): 8086:1572 / 8086:154c
- Driver version: 1.5.23 (i40e) (Note OL7 exception above)

- Intel(R) Ethernet Converged Network Adapter X710-DA2 (2x10G)
- Firmware version: 5.05 (Note OL7 exception above)
- Device id (pf/vf): 8086:1572 / 8086:154c
- Driver version: 1.5.23 (i40e) (Note OL7 exception above)

Qualified interface input-output modes

- Para-virtualized (VIF on XEN)
- SR-IOV
- PCI Passthrough

Qualified Updates for KVM Deployments over PCI Passthrough

Oracle recommends the user obtain and install the following for KVM deployments using PCI Passthrough interfaces.
Platform Support per Initial Release

Support for S-CZ8.0.0 across current platforms will be phased in according to the following table, which will be updated periodically.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Initial Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acme Packet 4600</td>
<td>S-CZ8.0.0p1</td>
</tr>
<tr>
<td>Acme Packet 6100</td>

<td>VMWare</td>
<td>S-CZ8.0.0p1</td>
</tr>
<tr>
<td>Netra X5-2 (OCSR Only)</td>
<td>S-CZ8.0.0p1</td>
</tr>
</tbody>
</table>

Virtual Machine Platform Resources

A Virtual Network Function (VNF) requires the CPU core, memory, disk size, and network interfaces specified for operation. The OCSCBC and OCSR use the Intel Data Plane Development Kit (DPDK) for datapath design, which imposes specific VNF resource requirements for CPU cores. Deployment details, such as the use of distributed DoS protection, dictate resource utilization beyond the defaults.

You configure CPU core utilization from the ACLI based on your deployment. You can also define memory and hard disk utilization based on your deployment. You must configure the hypervisor with the appropriate settings prior to startup, if you need settings other than the machine defaults set by the machine template (OVA).

Default VM Resources

VM resource configuration defaults to the following:

- 4 CPU Cores
- 8 GB RAM
- 40 GB hard disk (pre-formatted)
- 8 interfaces as follows:
  - 1 for management (wancom0)
  - 2 for HA (wancom1 and 2)
  - 1 spare
  - 4 for media

Interface Host Mode

The OCSCBC S-CZ8.0.0 and OCSR VNFs support interface architectures using Hardware Virtualization Mode - Paravirtualized (HVM-PV):

- ESXi - No manual configuration required.
- KVM - HVM mode is enabled by default. Specifying PV as the interface type results in HVM plus PV.
• XEN - The user must configure HVM+PV mode.

CPU Core Resources

The OCSBC S-CZ8.0.0 and OCSR VNFs require an Intel Core2 processor or higher, or a fully emulated equivalent including 64-bit SSSE3 and TSC support.

If the hypervisor uses CPU emulation (qemu etc), Oracle recommends that you set the deployment to pass the full set of host CPU features to the VM.

Virtual Network Function (VNF) Limitations

Oracle Communications Session Border Controller (OCSBC) functions not available in VNF deployments of this release include:

• Native transcoding for codecs other than G.711 and G.729.
  Workaround: For all other codecs, configure your environment and system for pooled transcoding.
• Inband DTMF detection
• DTMF generation
• RTCP generation for G.711 or G.729
• RTCP detection
• MSRP functionality
• TSCF functionality
• LI-PCOM
• H.323 signaling or H.323-SIP inter-working
• Remote Packet Trace
• ARIA Ciphers
• IPSEC functionality not available in VNF deployments of this release:
  • IKEv1
  • Authentication header (AH)
  • The AES-XCBC authentication algorithm
  • Dynamic reconfiguration of security-associations
  • Hitless HA failover of IPSEC connections.

Image Files and Boot Files

For Engineered Hardware

Use the following files for new installations and upgrades on Acme Packet platforms.

• Image file: nnSCZ800.bz.
• Bootloader file: nnSCZ800.boot.

For Virtual Machines

The OCSBC S-CZ8.0.0p1 version includes distributions suited for deployment over hypervisors. Download packages contain virtual machine templates for a range of virtual architectures. Use the following distributions to deploy the OCSBC as a virtual machine:

• nnSCZ800p1-img-vm_ova.ova—Open Virtualization Archive (.ova) distribution of the OCSBC VNF for Oracle (XEN) virtual machines.
• nnSCZ800p1-img-vm_kvm.tgz—Compressed image file including OCSBC VNF for KVM virtual machines.
• nnSCZ800p1-img-vm_vmware.ova—Open Virtualization Archive (.ova) distribution of the OCSBC VNF for ESXi virtual machines.
The OVM, KVM, and VMware packages include:

- Product software—Bootable image of the product allowing startup and operation as a virtual machine. This disk image is in either the vmdk or qcow2 format.
- usbc.ovf—XML descriptor information containing metadata for the overall package, including identification, and default virtual machine resource requirements. The .ovf file format is specific to the supported hypervisor.
- legal.txt—Licensing information, including the Oracle End-User license agreement (EULA) terms covering the use of this software, and third-party license notifications.

**Bootloader Requirements**

The Acme Packet 4600, 6100, 6300, and 6350 platforms require a Stage 3 bootloader that accompanies the OCSBC image file, as distributed. It should be installed according to the instructions found in the Installation Guide.

**Upgrade Information**

This section provides key information about upgrading to this software version.

**Supported Upgrade Paths**

Note that the S-CZ8.0.0 GA release is supported on the Acme Packet 6350 platform only. This platform is new, with the first supported release being S-CZ8.0.0 GA. This means there are no upgrade paths valid for S-CZ8.0.0 GA.

The following upgrade paths are supported to S-CZ800p1:

- S-CZ7.3.0m2 -> S-CZ8.0.0p1
- S-CZ7.3.0m2p1 -> S-CZ8.0.0p1
- S-CZ7.3.9p4 -> S-CZ8.0.0p1
- S-CZ8.0.0 -> S-CZ8.0.0p1

When upgrading to this release from a release older than the previous release, read all intermediate Release Notes documents for notification of incremental changes.

**Upgrading Systems Running IMS-AKA DDoS**

When upgrading an OCSBC running IMS-AKA DDoS and HA from S-CZ7.3.0M1 and later to S-CZ8.0.0, the user must upgrade and simultaneously reboot both the active and secondary nodes. This properly clears ACLs built by the earlier version, allowing the system to instantiate new, operational ACLs.

IMS-AKA DDoS is not supported in releases prior to S-Cz7.3.0M1. Upgrades from those versions to S-Cz8.0.0, therefore, do not require this simultaneous reboot.

**Self-Provisioned Entitlements and License Keys**

This release uses the following self-provisioned entitlements and license keys to enable features.

**Table 1: Self-provisioned Features**

These licenses are enabled with the setup entitlements command.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP Sessions</td>
<td>number of sessions</td>
</tr>
</tbody>
</table>
### Table 2: License-key enabled Features

These features are enabled by installing a license key at the `system > license` configuration element. Request license keys at the License Codes website at [http://www.oracle.com/us/support/licensecodes/acme-packet/index.html](http://www.oracle.com/us/support/licensecodes/acme-packet/index.html)

<table>
<thead>

</tr>
</tbody>
</table>

### System Capacities

System capacities vary across the full range of platforms which support the Oracle Communications Session Border Controller. To query the current system capacities for the platform you are using, execute the `show platform limit` command.

### Transcoding Support

The Oracle Communications Session Border Controller supports different sets of codecs and transcoding functions depending upon the platform on which it runs. Virtual platforms support one set of codecs. The
Acme Packet 4600 and Acme Packet 6300/6350 add a second set of codecs with transcoding hardware. VNF platforms support transcoding when you configure one or more transcoding cores.

The pooled transcoding feature on the VNF uses an external transcoding Session Border Controller (SBC), as defined in "Co-Product Support," for supported Oracle Communications SBCs for the Transcoding-SBC (T-SBC) role.

**Table 3: S-CZ8.0.0 Supported Codecs Per Platform**

<table>
<thead>
<tr>
<th>Platform</th>
<th>Supported Codecs</th>
</tr>
</thead>
</table>
| Virtual Platforms (with transcoding core) | • PCMU

**Oracle Communications Session Router Platform Requirements**

The Oracle Communications Session Router, release S-CZ8.0.0 supports the following platforms:

- Acme Packet 4600
- Acme Packet 6100
- Acme Packet 6300
- Netra Server X5-2
- Virtual Platforms

Minimum hardware requirements for Netra Server X5-2 are:
### Coproduct Support

The products/features listed in this section run in concert with the Oracle Communications Session Border Controller for their respective solutions.

**Oracle Communications Subscriber-Aware Load Balancer**

With an Oracle Communications Subscriber-Aware Load Balancer running S-CZ7.3.10 software, SBC cluster members may run S-CZ8.0.0 on the following hardware:

- Acme Packet 4600
- Acme Packet 6100
- Acme Packet 6300

Please refer to the *Oracle Communications Subscriber-Aware Load Balancer Essentials Guide* for additional limitations.

**Pooled Transcoding**

The pooled transcoding feature enables a non-transcoding Oracle Communications Session Border Controller to access the resources of a transcoding Oracle Communications Session Border Controller (T-SBC) to perform transcoding on its behalf. When the A-SBC/P-CSCF function is based on S-CZ8.0.0 software, the following hardware/software combinations may be used as a T-SBC in a pooled transcoding scenario:

- Acme Packet 3820, Transcoding NIU: S-CZ7.3.0+, S-CZ7.4.0+
- Acme Packet 4500, Transcoding NIU: S-CZ7.3.0+, S-CZ7.4.0+
- Acme Packet 4600, Transcoding NIU: S-CZ7.3.0+, S-CZ7.4.0+, S-CZ8.0.0+
- Acme Packet 6300, Transcoding NIU: S-CZ7.3.0+, S-CZ7.4.0+, S-CZ8.0.0+
- Acme Packet 6350, Transcoding NIU: S-CZ8.0.0+

**Oracle Communications Session Element Manager**

Oracle Communications Session Element Manager (SEM) versions 8.0 and later, with the SD-plugin 1.0, supports this GA release of the Oracle Communications Session Border Controller. Partial support is available in earlier 7.5 versions of SEM, if desired. Contact your Sales representative for further support and requirement details.

### Deprecated Features

The features listed in this section are removed from the Oracle Communications Session Border Controller beginning with the version stated.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>First Deprecated</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSRP Stitching</td>
<td>This feature, which supported peer-to-peer TCP connections for peers behind NATs, enabling Message Session Relay Protocol (MSRP) clients to communicate with one another, is not supported. Note that you can still accomplish this function using MSRP B2BUA.</td>
<td>SCZ8.0.0</td>
</tr>
<tr>

</table>
Behavioral Changes

This section documents the behavioral changes in this software release of which the user should be aware.

SOobject Debugging

By default, the system now has the `enable-sobject-debugger` option enabled.

To improve serviceability, `enable-sobject-debugger` is enabled by default. This may have a negative effect on system performance. If this impact is unacceptable, then the user can disable this option.

Codec Entitlement

As of S-CZ8.0.0, the user can use the G729 codec without having to enable it by either entitlement or license key.

IPv6 Addressing on Wancom0

Beginning with this software version, you must configure all three components of an IPv6 address, including address, mask and gateway, in your system’s boot parameters for wancom0 addressing. The system requires all three components for IPv6 Neighbor Discovery to work properly.

Enabling Admin Security

As of S-CZ8.0.0p1, the user enables the Admin Security feature from the `setup entitlements` menu.

Documentation Changes

This section lists and describes the changes made to the Oracle Communications Session Border Controller (OCSBC) documentation set for this version.

Virtual Network Function (VNF)

This version of the OCSBC supports deployment as a VNF. Documentation supporting this functionality is provided as follows:

- These S-CZ8.0.0 Release Notes
  - Specifications and Requirements Chapter
    - Supported Hypervisor List
    - Required VM Resources
    - VM-specific Distributions
    - VM-related Upgrade Detail
  - Known Issues and Caveats - Including VM-specific Issues
- Installation and Platform Preparation Guide
  - Introduction to Platform Preparation and Software Deployment — VM Platform Introduction
  - The OCSBC as a Virtual Machine
    - Hypervisor Configuration Recommendations
    - VM Configuration Overview
    - VM-Related VLAN Support
  - Virtual Machine Platforms — Hypervisor-specific Procedures for VM Deployment
  - Interface Considerations for VM Platforms
  - DPDK-Based OVS Installation — Example OVM Hypervisor Configuration
- ACLI Configuration Guide
Header Manipulation Rules Documentation
The documentation on Header Manipulation Rules (HMR) for the OCSBC is moved from the ACLI Configuration Guide to the new HMR Guide beginning with release SCz8.0.0. This book is now maintained as a component of the OCSBC documentation set.

Entitlements Documentation
A section has been added to these Release Notes to consolidate the presentation of purchased feature types and the method you use to enable them.

Neighbor Release Patch Equivalency
Patch equivalency indicates which patch content in neighbor releases is included in this release. This assures you that in upgrading, defect fixes in neighbor stream releases are included in this release.

Neighbor Release Patch Equivalency for S-Cz8.0.0 GA
The patch baseline, the most recent patch build from which the GA build was created, is SCZ730m2p1.

Neighbor Release Patch Equivalency for S-Cz8.0.0p1
- S-Cz7.4.0m1p1
- S-CZ7.3.9p4
The patch baseline, the most recent patch build from which the GA build was created, is SCZ800 GA.

Supported SPL Engines
The following SPL engine versions are supported by this software:

- C2.0.0
- C2.0.1
- C2.0.2
- C2.0.9
- C2.1.0
- C2.2.0
- C2.2.1
- C2.3.2
- C3.0.0
- C3.0.1
- C3.0.2
- C3.0.3
- C3.0.4
- C3.0.6
- C3.0.7
- C3.1.0
- C3.1.1
- C3.1.2
• C3.1.3
• C3.1.4
• C3.1.5
• C3.1.6
• C3.1.7
• C3.1.8
• C3.1.9
New Features in OCSBC Release S-CZ8.0.0

This chapter lists and describes features developed and released new for S-CZ8.0.0.

Note: System session capacity and performance are subject to variations between various use cases (e.g. call models) and major software releases.

Acme Packet 6350

The Acme Packet 6350 is the newest and highest performing member of the Acme Packet platform family. Functionally equivalent to AP6300, the Acme Packet 6350 platform also provides three expansion slots in the familiar 3RU rack-mountable chassis. The AP6300 Network Interface Units (NIU), Transcoding Carrier Units (TCU), and Secure Services Modules version 3 (SSM3) are also supported by the AP6350.

Benefits and Features

- 8 Core CPU with 48 GB system memory
- High density transcoding
- Field proven architecture
- High capacity in a small footprint (3RU chassis)
- Leverages AP6300 NIUs, TCUs, and SSM3
- Functionally equivalent to Acme Packet 6300

System Features

The features listed in this section are related to the Oracle Communications Session Border Controller’s internal systems functionality. These features are used for every day integration and maintenance within in your network. The location of each feature description across the documentation set is noted.

Gratuitous ARP Rate Limiting

You can configure the Oracle Communications Session Border Controller (OCSBC) to minimize the rate of IPv4 GARP and IPv6 Neighbor Discovery (ND) traffic it sends out during a failover. This can prevent address resolution errors, caused by slow switching infrastructure. If you do not configure this rate limiting the system sends these messages as fast as possible, based on system load.

This feature description is found in the ACLI Configuration Guide, High Availability chapter.

Note: This feature is available in the S-CZ8.0.0p1 release and later.
Redundancy Debug Information

Additional information about HA operation is now available via enhancements to the system’s `show redundancy`, `reset redundancy` and `show queues` commands. The new information is especially useful for geo-redundant HA deployments. You should typically use these commands and data under the direction of Oracle support.

These change descriptions are found in the ACLI Configuration Guide, High Availability Configuration chapter. Related content can be found in the Monitoring and Troubleshooting guide.

† † Note: This feature is available in the S-CZ8.0.0p1 release and later.

SNMP Trap on ACL Drops

You can configure the Oracle Communications Session Border Controller (OCSBC) to generate an SNMP trap upon the expiration of a configurable time period during which the ACL packet drop ratio has exceeded a configured drop threshold. This trap reports the total number of dropped packets in that time period. The feature is disabled by default, and requires SNMP traps and DoS enabled.

This feature description is found in the ACLI Configuration Guide, Security chapter. Related content can be found in the MIB guide.

† † Note: This feature is available in the S-CZ8.0.0p1 release and later.

Incremental QoS Updates (Provided to OCOM)

The Interim Quality of Service (QoS) Update setting supported on the Acme Packet 3900, the Acme Packet 4600, and the Acme Packet 6300 provides a more granular view of voice quality for troubleshooting by providing updates in 10 second increments. Without the Interim QoS Update setting selected, the Oracle Communications Session Border Controller (OCSBC) probe provides an average Mean Opinion Score (MOS) only at the end of the call. A troubleshooter cannot see what occurred in other parts of the call. For example, suppose your employee or agent complains of poor voice quality that occurred in the middle of the call, but the average MOS score at the end of the call is 4.40. The troubleshooter might determine that the quality is acceptable, without knowing that the score in the middle of the call is 2.50. The Interim QoS Update setting provides MOS scores every 10 seconds, and with more granular data to help troubleshooting efforts.

† † Note: This feature is available in the S-CZ8.0.0p1 release and later.

Factory Reset for the OCSBC

If you remove the Admin Security feature, some irrevocable changes and information remain on the system. You can return your platforms to their initial factory settings (zeroization) to remove all traces of the previous implementation. The factory reset process differs depending on whether you’re performing it on an Acme Packet hardware platform or a Virtual platform.

See the Administrative Security Essentials Guide for a description and instructions on this feature.

† † Note: This feature is available in the S-CZ8.0.0p1 release and later.

Accounting Features

The features listed in this section are related to the Oracle Communications Session Border Controller’s VoIP application functions. New functionality listed in this section may include accounting features.
NPLI in Interim CDRs

You can configure the Oracle Communications Session Border Controller (OCSBC) with a trigger to generate an INTERIM Call Detail Record (CDR) during applicable originating and terminating Voice over LTE and WiFi call flows when the INVITE egresses the system. This CDR contains Network Provided Location Information (NPLI) information received from the Policy and Charging Rules Function (PCRF) or other source that may be more accurate than network location information presented in the start CDR. When configured, the OCSBC adds this NPLI to RADIUS, DIAMETER, and/or local CSV CDRs.

This feature description is found in the ACLI Configuration Guide, IMS chapter.

Note: This feature is available in the S-CZ8.0.0p1 release and later.

Signaling Features

The features listed in this section are related to the Oracle Communications Session Border Controller’s VoIP application functions. New functionality listed in this section may include protocol features, application-oriented network entity features, and application monitoring features. Locations of the features descriptions within the Oracle Communications Session Border Controller documentation set are noted.

Fax Tone Detection

In some deployments, an originator sends inband fax messages through the Oracle Communications Session Border Controller (OCSBC) to terminating endpoints that do not support uncompressed codecs. Thus the terminating call leg must communicate FAXes either through out of band T.38 or in-band G.711 codecs. In some cases the terminating endpoint can determine that it is being sent a FAX and send a re-INVITE to request that it be sent T.38 FAX instead of inband FAX, thereby switching from an audio call to a FAX call. If the OCSBC does not receive this re-INVITE, it will send its own re-INVITE toward the terminating endpoint to establish the FAX session with a codec the endpoint can support.

This feature description is found in the ACLI Configuration Guide, IWF chapter.

Note: This feature is available in the S-CZ8.0.0p1 release and later.

TSCF Features

The features listed in this section are related to the Tunneled Services Control Function feature group.

TSCF Logging Enhancement

You can configure the system to generate a NOTICE-level log message containing inner, outer and listening socket IP information, including address, port and realm for each TSM tunnel opened. You do this by enabling the `tscf-config`'s `log-ip-info` parameter.

This parameter is documented in the ACLI Reference Guide.

Note: This feature is available in the S-CZ8.0.0p1 release and later.
Inherited Features

Feature descriptions found in this chapter are inherited (forward merged) from Oracle Communications Session Border Controller releases:

- S-CZ7.3.0M3
- S-CZ7.4.1

These features are not included in S-CZ7.4.0 GA docset.

S-CZ7.3.0 Maintenance Release Features

The following features appear in this major release documentation set for the first time.

**RTP Timestamp Synchronization**

The Oracle Communications Session Border Controller maintains the continuity of egress transcoded media streams during HA switchover by synchronizing the RTP timestamps between active and standby systems.

This feature description is found in the ACLI Configuration Guide, High Availability Nodes chapter.

Note: This feature is available in the S-CZ8.0.0p1 release and later.

S-CZ7.4.1 Release Features

The following features appear in this major release documentation set for the first time.

**CDR Push Capability**

This feature provides the Oracle Communications Session Border Controller user with a mechanism to manage CDRs in a High Availability (HA) environment that helps prevent CDR loss during HA events. The user configures the function by setting the `cdr-out-redundancy` parameter to the `standby-push` value.

This feature description is found in the Accounting Guide, Configuring Accounting chapter. Additional feature information is found in the ACLI Reference Guide.

Note: This feature is available in the S-CZ8.0.0p1 release and later.
Inherited Features

Increase in Self Entitlement Capacity

The user may now set the capacity of the OCSR in dialog mode up to 512k concurrent sessions, depending on their entitlements.

Note: This feature is available in the S-CZ8.0.0p1 release and later.
Interface Changes

This chapter summarizes ACLI, SNMP, HDR, Alarms, and RADIUS changes (where applicable) for S-CZ8.0.0. Additions, removals, and changes appearing in this chapter are since the previous major release of the Oracle Communications Session Border Controller.

ACLI Command Changes

This section summarizes the ACLI command changes that first appear in the Oracle Communications Session Border Controller release S-CZ8.0.0

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show acl summary</td>
<td>Enhanced to display ACL statistics for the current data collection window as well as the accumulative counters. “Current” refers to all data since the last time the user ran show acl current or show acl summary.</td>
</tr>
<tr>
<td>show acl current</td>
<td>New command parameter showing new data since the last time the user ran show acl current or show acl summary.</td>
</tr>
<tr>
<td>show redundancy &lt;taskname&gt;</td>
<td>Displays redundancy statistics for the specified task.</td>
</tr>
<tr>
<td>show redundancy &lt;taskname&gt; journals size</td>
<td>Displays journal size statistics for the specified redundancy task.</td>
</tr>
<tr>
<td>show redundancy &lt;taskname&gt; journals perf</td>
<td>Displays journal performance statistics for the specified redundancy task.</td>
</tr>
<tr>
<td>show redundancy &lt;taskname&gt; actions</td>
<td>Displays most recent redundancy actions for the specified task.</td>
</tr>
<tr>
<td>show redundancy sipd objects actions</td>
<td>Displays most recent redundancy actions for all sipd redundancy objects.</td>
</tr>
<tr>
<td>reset redundancy</td>
<td>Expands reset capability to reset new redundancy statistics.</td>
</tr>
</tbody>
</table>
### Interface Changes

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show queues sipd [ commands [ by-id # ] ]</td>
<td>Displays a summary of queue command statistics for all sipd queues. The by-id argument allows the user to specify a single queue.</td>
</tr>
<tr>
<td>show memory sobjects</td>
<td>Displays the number of object classes currently consuming system memory. Use this command only for debugging purposes under the direction of Oracle support.</td>
</tr>
<tr>
<td>show platform heap-statistics</td>
<td>Adds classless processes to the output display when run with the heap-statistics argument. Use this command only for debugging purposes under the direction of Oracle support.</td>
</tr>
<tr>
<td>show datapath usdp eth-stats [ slot &lt;slot#&gt; port &lt;port #&gt; [ reset ] ]</td>
<td>Displays all the ethernet statistics counters for all media ports or the specified slot/port. The &quot;reset&quot; argument resets all counters for the port, providing it is supported by PMD. Use this command only for debugging purposes under the direction of Oracle support.</td>
</tr>
<tr>
<td>management</td>
<td>This command is deprecated.</td>
</tr>
<tr>
<td>show interfaces</td>
<td>This command has two arguments added, including ethernet and mapping.</td>
</tr>
<tr>
<td>show interface-mapping</td>
<td>This command is deprecated. Equal functionality is provided using the interface-mapping branch’s show command and the show interfaces mapping command.</td>
</tr>
</tbody>
</table>

There are no previously undocumented ACLI command changes that first appeared in a release prior to Oracle Communications Session Border ControllerS-CZ8.0.0, and are new to this major release.

### ACLI Configuration Element Changes

This section summarizes the ACLI configuration element changes that first appear in release Oracle Communications Session Border ControllerS-CZ8.0.0

#### System Options

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system-config &gt; option system-heap-log-interval</td>
<td>RTC option to set the interval the system uses to log memory information. The range is 0 (disabled) to 86400 seconds. The default is 300.</td>
</tr>
<tr>
<td>system-config &gt; option critical-memory-abort</td>
<td>RTC option to trigger system reboot and core dump when the system issues its critical memory alarm. Values include enabled and disabled (default).</td>
</tr>
</tbody>
</table>
Redundancy Features

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>redundancy-config &gt; garpMessages</td>
<td>Specifies the number of GARP and IPv6 ND messages the system sends out within its interval window during an HA failover.</td>
</tr>
<tr>
<td>redundancy-config &gt; garpInterval</td>
<td>Specifies the window within which the system limits the number of GARP and IPv6 ND messages during an HA failover.</td>
</tr>
</tbody>
</table>

Accounting Features (for VoLTE)

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>account-config &gt; generate-interim &gt; Egress-Invite</td>
<td>Causes the system to generate an additional interim CDR when the system sends applicable VoLTE and Wifi calls' INVITEs out towards the called party.</td>
</tr>
</tbody>
</table>

Signaling Features

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>media-manager-config &gt; codec-policy &gt; tone-detection</td>
<td>Enable tone detect</td>
</tr>
<tr>
<td>media-manager-config &gt; codec-policy &gt; tone-detect-renegotiate-timer</td>
<td>Renegotiate tone detect timer</td>
</tr>
<tr>
<td>media-manager-config &gt; codec-policy &gt; reverse-fax-tone-detection-reinvite</td>
<td>Force SBC to send ReInvite on other realm</td>
</tr>
</tbody>
</table>

Security Features

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>media-manager-config &gt; acl-monitor-window</td>
<td>The time window, after which the system resets its ACL drop counters, and generates a trap if trusted or untrusted ACLs have exceeded their configured drop threshold. This parameter is not real-time configurable. Reboot after setting this parameter.</td>
</tr>
</tbody>
</table>

TSCF Features

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tscf-config &gt; log-ip-info</td>
<td>When enabled, causes the system to generate a NOTICE-level log message containing inner, outer and listening socket IP information, including address, port and realm for each tunnel opened.</td>
</tr>
</tbody>
</table>

IMS/VoLTE Features

There are no new configuration elements, nor new parameters for IMS-VoLTE features in this release.
Transcoding Features

There are no new configuration elements, nor new parameters for Transcoding features in this release.

Inherited Features

The following table summarizes the ACLI configuration element changes that first appeared in a release prior to Oracle Communications Session Border Controller S-CZ8.0.0, but are new to this major release.

<table>
<thead>
<tr>
<th>New Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>account-config &gt; cdr-output-redundancy &gt; standby-push</td>
<td>Redundancy setting that helps prevent CDR loss during HA events.</td>
</tr>
</tbody>
</table>

Application SNMP/MIB Changes

This section summarizes the Application SNMP/MIB changes that appear in the Oracle Communications Session Border Controller version S-CZ8.0.0.

The following MIB object files are updated, as follows:

- ap-apps.mib-Objects and traps added to support SNMP Traps on ACL drops.
- ap-agentcapability.mib-Objects and traps added to support SNMP Traps on ACL drops.

The following MIB objects are included in the `ap-agentcapability.mib` to support this feature:

- `apAclDropMibCapabilities 1.3.6.1.4.1.9148.2.1.31`
- `apAclDropCap 1.3.6.1.4.1.9148.2.1.31.1`
  description "Acme Packet Agent Capability for ACL drop monitoring MIB"

The following MIB objects are included in the `ap-apps.mib` to support this feature.

- `apAppsAclNotif 1.3.6.1.4.1.9148.3.16.2.2.4`
- `apAppsAclNotifications 1.3.6.1.4.1.9148.3.16.2.2.4.0`
- `apAclDropOverThresholdTrap 1.3.6.1.4.1.9148.3.16.2.2.4.0.1`
  description "The trap will be generated when acl drop ratio has exceeded the configured threshold"
- `apAclDropOverThresholdClearTrap 1.3.6.1.4.1.9148.3.16.2.2.4.0.2`
  description "The trap will be generated when acl drop ratio has gone below the configured threshold"
- `apAclNotificationGroups 1.3.6.1.4.1.9148.3.16.3.2.4`
- `apAclDropNotificationsGroup 1.3.6.1.4.1.9148.3.16.3.2.4.1`
  description "Traps to monitor acl drops"
- `apAppsAclObjects 1.3.6.1.4.1.9148.3.16.4`
- `apAclDropObjects 1.3.6.1.4.1.9148.3.16.4.1`
- `apAclDropType 1.3.6.1.4.1.9148.3.16.4.1.1`
  description "ACL drop type"
- `apAclDropCount 1.3.6.1.4.1.9148.3.16.4.1.2`
  description "ACL drop count within monitor time window"
- `apAclDropRatio 1.3.6.1.4.1.9148.3.16.4.1.3`
  description "ACL drop ratio as permillage of current time window. Valid range 0-1000"
Alarms

This section summarizes the Alarm changes that appear in the Oracle Communications Session Border Controller version S-CZ8.0.0.

ACL Alarms

The system writes a DEBUG level log message in log.sipd when NPLI is inserted into the CDR for debug purpose, which appear similar to the below.

Mar 9 19:25:01.803
[SESSION] (3) GenerateStart: adding NPLI string
3GPP-GERAN;network-provided
Mar 9 19:25:45.525
[SESSION] (3) GenerateInterim: adding NPLI string
3GPP-GERAN;network-provided
Mar 9 19:26:45.267
[SESSION] (3) GenerateStop: adding NPLI string
3GPP-GERAN;network-provided

Critical Memory Alarm Option

Although the critical memory alarm itself is not new, the system now includes a system-config option, critical-memory-abort, that allows the user to configure the system to reboot and perform a core dump upon the alarm.

Accounting

This section summarizes the accounting changes that appear in the Oracle Communications Session Border Controller version S-CZ8.0.0.

The following accounting objects are added to support the inclusion on NPLI information in new INTERIM CDRs:

- For DIAMETER, the system now uses the Access-Network-Information AVP (code 1263) in the ACR (Rf interface), which is of type OctetString. Per 3GPP TS 32.299, this AVP indicates the SIP P-header, P-Access-Network-Information.
- For RADIUS, the system now uses the Access-Network-Information VSA in the CDR (code 248) in the Accounting-Request message. You may set the Acc-Status-Type to Start, Interim, or Stop.
- For Local CDRs, The CDR's NPLI object appears as the last object in Start, Interim, and Stop records as Access Network Information object, numbered for referenced as ACME 248.

HDR

This section summarizes the HDR changes that appear in the Oracle Communications Session Border Controller version S-CZ8.0.0.

sobject HDR Group

This release includes a new HDR ACLI-based group called sobjects that reports the ACLI's show memory sobjects command's data. Records appear in the format <time stamp>,<class name>,<count> where class-name is the name of each sobject, and count is the number of objects currently being used by the application.

The HDR group is documented in this release's HDR Guide. Configure and use this group only for debugging purposes under the direction of Oracle support.
Caveats and Known Issues

This chapter lists the caveats, known issues, limitations, and behavioral changes for this release. Oracle updates this Release Notes document to distribute issue status changes. Check the latest revisions of this document to stay informed about these issues.

Caveats

This section presents Oracle Communications Session Border Controller issues that are inherent to this major version of the product.

Virtual Network Function (VNF) Caveats

The following are functional caveats applicable to VNF deployments of this release:

- The OVM server 3.4.2 does not support the virtual back-end required for para-virtualized (PV) networking. VIF emulated interfaces are supported but have lower performance. Consider using SR-IOV or PCI-passthru as an alternative if higher performance is required.
- Default levels for scalability are set to ensure appropriate throttling based on platform capacity factors such as hypervisor type, number and role of CPU cores, available host memory and I/O bandwidth. In some cases, those defaults may not be appropriate and throttling may occur at lower or higher call rates than expected. Please contact Oracle Technical Support for details on how to override the default throttles, if required.
- To support HA failover, MAC anti-spoofing must be disabled for media interfaces on the host hypervisor/vSwitch/SR-IOV_PF.
- Lawful Intercept is supported for the X123. PCOM support for LI is not available on virtual platforms.
- There are occasional VM shutdowns experienced when running the VNF on KVM (OL7.3) with PCI passthrough interfaces. These shutdowns do not include any indication that the VNF is rebooting, and do not occur based on any specific VNF behavior or operations.

Oracle believes the hypervisor is triggering these shutdowns and recommends upgrading to OL7.4 if the user experiences them.

Interface Utilization Support

The Interface Utilization: Graceful Call Control, Monitoring, and Fault Management feature is unsupported for this release.
Caveats and Known Issues

Transcoding - general
Only SIP signaling is supported with transcoding.
Codec policies can only be used with realms associated with SIP signaling.
QoS is not supported for transcoded calls.
SIPREC may not be performed on a transcoded call.

T.38 Fax Transcoding
T.38 Fax transcoding available for G711 only at 10ms, 20ms, 30ms ptimes.
Pooled Transcoding for Fax is unsupported.

DTMF Interworking
RFC 2833 interworking with H.323 is unsupported.
SIP-KPML to RFC2833 conversion is not supported for transcoded calls.

H.323 Signaling Support
If H.323 and SIP traffic are run in system, each protocol (SIP, H.323) should be configured in its own separate realm.

Media Hairpinning
Media hairpinning is not supported for hair-pin/spiral call flows involving both H.323 and SIP protocols.

OCOM Support
When the user enables the 10 second QoS interim update feature for OCOM support, packet data includes the wrong source IP address for the incoming side of a call flow.
Note that the call and QoS monitoring are successful regardless of this issue. For monitoring/debugging purposes, the user can find the source IP in the SIP messages (INVITE/200OK).

Fragmented Ping Support
The Oracle Communications Session Border Controller does not respond to inbound fragmented ping packets.

Physical Interface RTC Support
After changing any Physical Interface configuration, a system reboot is required.

SRTP Caveats
The ARIA cipher is not supported by virtual machine deployments.
Linksys SRTP is not supported.

The packet-trace command
- VNF deployments do not support the packet-trace remote command.
- Output from the packet-trace local command on hardware platforms running this software version may display invalid MAC addresses for signaling packets.
- The packet-trace remote command does not work with IPv6.
RTCP Generation
Video flows are not supported in realms where RTCP generation is enabled.

SCTP
SCTP Multihoming does not support dynamic and static ACLs configured in a realm.
SCTP must be configured to use different ports than configured TCP ports for a given interface.

Known Issues
This table lists OCSBC known issues in version S-Cz8.0.0. The user can reference defects by Service Request number and can identify the issue, any workaround, when the issue was found, and when it was fixed using this table. Issue descriptions not carried forward from previous versions' Release Notes and documented herein are not relevant to this release. The user can review delivery information, including defect fixes via this release's Build Notes.

Unsupported Features
