Cartridge Overview

ASAP cartridges are discrete software components that are developed for the ASAP product. An ASAP cartridge offers specific domain behavior on top of the core ASAP software, and provides the configuration that supports a set of services on a network element (NE).

An ASAP cartridge is not a stand-alone component, but operates in conjunction with the ASAP core product. ASAP cartridges offer the following benefits:

- ◆ **Reduced Time to Market** - time to market of new services is reduced through simplified development, implementation, and extension of cartridges on customer sites.
- ◆ **Extendable** - cartridges can be extended to include additional services and components that deliver business value, without requiring changes to the original cartridge.
- ◆ **Simplified Effort** - the effort and technical knowledge that is required to perform customizations is reduced.
- ◆ **Ease of Installation** - cartridges can be installed into an ASAP environment without interfering with the existing install base.

An ASAP cartridge can be used to configure ASAP to provision the following:

- ◆ NEs from a specific vendor, such as Nortel or Lucent.
- ◆ Technologies, such as Asynchronous Transfer Mode (ATM) and Frame Relay switches, or Internet Protocol (IP) routers.
- ◆ Services that are supported on the NE, such as ATM, IP Virtual Private Networks (VPN), Wireless, or Optical.

Cartridges are designed for a specific technology, software load, and service.

An ASAP cartridge supports a particular set of services on an NE. These services are independent of customer-specific service definitions. Professional Services or systems integrators can perform extensions to the cartridge to support customer-specific requirements.

For more information on extending a cartridge, refer to the *ASAP Cartridge Development Guide for Service Activation*.

Cartridge content

An ASAP cartridge contains the following:

- ◆ An interface to the NE
- ◆ A set of scripts, such as State Tables or Java methods
- ◆ A set of atomic actions in the form of Atomic Service Description Layer (ASDL) commands
- ◆ A set of Common Service Description Layer (CSDL) commands that form meaningful services
- ◆ Sample work orders
- ◆ Installation scripts

Prerequisites

System integrators such as managers, designers, programmers, and testers who are responsible for the adaptation and integration of ASAP-based solutions should use this manual as a reference. It assumes that readers possess the following skills:

- ◆ A knowledge of ASAP programming concepts
- ◆ A good working knowledge of the UNIX operating system
- ◆ A thorough understanding of service and network provisioning
- ◆ Familiarity with telecommunications

About this guide

This guide provides a detailed description of the Lucent IN cartridge. It contains overview and technical information to assist with extending and integrating the cartridge into a customer environment.

The scope of this guide includes ASAP as it pertains to the use of this cartridge. It is not intended to be a complete ASAP reference guide.

For additional information when using this cartridge, refer to the following supporting documentation:

- ◆ **Activation documentation set**—for detailed information on the ASAP component.
- ◆ **ASAP Cartridge Development Guide for Service Activation**—for information on how to extend a cartridge.

The Lucent IN cartridge provides the ASAP service configuration and Network Element (NE) interface to activate Work Order, eVPN Account and eVPN Subscriber related services on E_LU-IN_6-0_HOST NEs.

Services, features, and options

This cartridge supports the following services:

Table 1: Supported services

Service	Description
Action	<ul style="list-style-type: none"> ◆ Completes a resumed asynchronous work order. ◆ Stops an asynchronous work order to wait for event server to resume it.
Calling Party Number	<ul style="list-style-type: none"> ◆ Adds a new entry to the Calling Party Numbers table. ◆ Deletes an entry from the Calling Party Numbers table.
COS Definition	<ul style="list-style-type: none"> ◆ Adds a new entry to the Class Of Service definition table. ◆ Deletes an entry from the Class Of Service definition table. ◆ Modifies an entry in the Class Of Service definition table.
COS Feature	<ul style="list-style-type: none"> ◆ Adds a new entry to the COS feature table. ◆ Deletes an entry from the COS feature table. ◆ Modifies an entry in the COS feature table.
COS Restriction	<ul style="list-style-type: none"> ◆ Adds a new entry to the COS restriction table. ◆ Deletes an entry from the COS restriction table. ◆ Modifies an entry in the COS restriction table.
COS Screening	<ul style="list-style-type: none"> ◆ Adds a new entry to the COS screening table. ◆ Deletes an entry from the COS screening table. ◆ Modifies an entry in the COS screening table.
eVPN Account	<ul style="list-style-type: none"> ◆ Adds an eVPN account. ◆ Deletes an eVPN account. ◆ Modifies an eVPN account. ◆ Queries an eVPN account.
eVPN Subscriber	<ul style="list-style-type: none"> ◆ Adds an eVPN subscriber. ◆ Deletes an eVPN subscriber. ◆ Modifies an eVPN subscriber. ◆ Queries an eVPN subscriber.
eVPN Virtual Member	<ul style="list-style-type: none"> ◆ Adds an eVPN virtual member. ◆ Deletes an eVPN virtual member. ◆ Modifies an eVPN virtual member. ◆ Queries an eVPN virtual member

Hardware and software requirements

The following sections contain the high-level software and hardware environment requirements for Work Order, eVPN Account and eVPN Subscriber services including:

- ◆ Network element (NE) interface
- ◆ ASAP version

Network element (NE) interface

The following database tables in SARM are configured to support the NE configuration:

- ◆ `tbl_host_clli`
- ◆ `tbl_clli_route`
- ◆ `tbl_comm_param`
- ◆ `tbl_resource_pool`
- ◆ `tbl_ne_config`

ASAP version

This cartridge was developed and tested using ASAP 4.6.3.

For more information on the operating environment of this ASAP version, refer to the ASAP version 4.6.3 Release Record.

Connecting to the NE

This cartridge supports both asynchronous and synchronous mode communications and CORBA 2.3, to connect to the NE.

Related documentations

This cartridge was developed according to the following Network Element Provisioning Specifications:

- ◆ eSM CORBA Upstream Interface Programmer's.pdf

Installing and Testing the Cartridge

This chapter describes the following procedures related to installing and testing the cartridge:

- ◆ [Downloading the cartridge](#)
- ◆ [Installing the cartridge using scripts](#)
- ◆ [Uninstalling the cartridge using scripts](#)
- ◆ [Testing the cartridge installation](#)
- ◆ [Installation and deployment of the cartridge using Studio](#)
- ◆ [Uninstallation and Undeployment of the cartridge using Studio](#)

Downloading the cartridge

Before you install the cartridge, you must use the internet to download the cartridge's TAR file from Oracle's Customer Portal.

Use the following instructions to download, then unTAR the TAR file.

To download the TAR file

1. Login to Oracle MetaLink internet home page (<http://www.metalink.oracle.com>).
2. Download the cartridge patch to your workstation.

To unTAR the TAR file

1. On your workstation, create a repository directory—the naming of which is your choice.

```
mkdir <repository dir>
```

2. Untar LucentIN_6_X_X_R1_0_0.<build number>.tar.

```
tar xvf LucentIN_6_X_X_R1_0_0.<build number>.tar
```

The directory structure in the repository directory should look like the following illustration. (this illustration describes the minimum required structure; you can enhance this directory structure with additional directories based on your requirements and deliverables).

```
<repository_directory>
  /custom_scripts
  /README
  /installCartridge
  /uninstallCartridge
  /LucentIN_6_0.sar
```

Starting ASAP

Before installing the cartridge, ensure that ASAP is running.

To start ASAP

1. To start ASAP, execute the following script:

```
start_asap_sys -d
```

2. Ensure the ASAP Daemon (DAEM\$ENV_ID) is running by checking the ASAP status using the ASAP script “status”.
3. Check whether the WebLogic instance for this ASAP environment is running. If not, start the WebLogic instance.

The *ASAP Administration Guide* contains more information on starting ASAP, the ASAP Daemon, and WebLogic.

Installing the cartridge using scripts

The following is the layout of the cartridge:

- ◆ custom_scripts contains the customized scripts used in the installation, uninstallation and running of the cartridge.
- ◆ install_new_NEPE_1.sh - will create a new NEP which runs on JAVA 1.4. Java 1.4 is required for the events server implementation. Defaults can be used safely for testing.
- ◆ uninstall_new_NEPE.sh - will remove the new NEP configuration and the JRE directory from \$ASAP_BASE.
- ◆ add_luin_message_nepTable_3.sh - will create a custom NEP DB table used by the ASYNCHRONOUS mechanism.
- ◆ add_luin_param_nepTable_4.sh - will create a custom NEP DB table used by the ASYNCHRONOUS mechanism.
- ◆ add_luin_request_id_seq_5.sh - will create a sequence used by the ASYNCHRONOUS mechanism.
- ◆ add_eventsServer_ctrlDB_2.sh - will create a new entry in CTRL DB, tbl_appl_proc for the LucentINEvents Server.
- ◆ remove_eventsServer_ctrlDB.sh - will remove the entry from tbl_app_proc related to LucentINEvents Server.
- ◆ /source - contains files and libraries used for cartridge deployment.
- ◆ /post_deploy - contains scripts used by installCartridge.
- ◆ /asap463_patch - contains an ASAP 463 patch which fixes a RESUME WO issue.
- ◆ installCartridge - install cartridge script including all standard and custom steps.
- ◆ uninstallCartridge - uninstall cartridge script including all standard and custom steps.
- ◆ LucentIN_6_0.sar - Cartridge deployment file.

Pre installation steps

The installation of this cartridge, will install and configure a new customized NEP named NEP_LUIN. All work order requests from this cartridge will go through this NEP.

In order to install the cartridge you must follow these steps:

1. Apply the ASAP 4.6.3 patch for the RESUME work order (please read the README_patch for more info about the issue)

```
cd asap463_patch  
sqlplus $SARM_USER/$SARM_USER < SAS_update.4.6.5.i.sql
```

Note: This patch should be applied once per environment.

2. Create the custom NEP - NEP_LUIN. If default value will be used, the install_new_NEPE_1.sh script will create a new NEP running on JAVA 1.4

```
cd custom_scripts
```

```
install_new_NEPI_1.sh
```

3. Manually update the the NEP_LUIN_jinterpreter file from \$ASAP_BASE/programs with the database connection information

```
"DDB_CONNECT=" (DESCRIPTION = (ADDRESS_LIST = (ADDRESS = (PROTOCOL = TCP) (HOST = 10.9.1.250) (PORT = 1531))) (CONNECT_DATA = (SERVICE_NAME = RH9206)))"\\"
```

4. Create the custom NEP tables and sequence by running the following scripts:

```
cd custom_scripts  
add_luin_message_nepTable_3.sh  
add_luin_param_nepTable_4.sh  
add_luin_request_id_seq_5.sh
```

5. Start (or bounce) ASAP and make sure that BEA is running.

6. Deploy the cartridge:

```
install_cartridge LucentIN_6_0.sar
```

Note: Make sure that the JAVA_HOME=\$ASAP_BASE/JRE is setup in your environment.

7. Change the WLS URL parameter from tbl_comm_param to point to the real BEA instance (host:port).

8. Specify the port for cartridge-Event Server communications.

```
export LUIN_SOCKET_SERVER_PORT=<port number>
```

If this is not set up, the default port 16899 will be used.

9. Add the Events server to the ASAP CTRL database. This causes the Event Server to be monitored by ASAP.

```
add_eventsServer_ctrlDB_2.sh
```

The events server will write the logs at the console and also will write a log file called eSMEEventsServer.log in \$ASAP_BASE/DATA/logs.

10. Specify the host IP address the Event Server should start on.

```
export LUIN_EVT_SERVER_HOST=<host IP address>
```

If this is not set up, the default host IP will be used. This may cause a problem for host with multiple network interface cards and firewall restrictions.

11. Specify the port the Event Server should start on.

```
export LUIN_EVT_SERVER_PORT=<port>
```

If this is not set up, the ORB will select a random port. This may cause a problem with firewall restrictions.

12. Specify the NE host.

```
export LUIN_NE_HOST=<NE host>
```

13. BOUNCE ASAP

Note: The sample work orders used for loopback testing can be found in SampleWorkOrders directory. These orders are not deployed automatically by the install script.

Run the installation script *installCartridge* to install the cartridge. The script executes the following tasks:

- ◆ Configures the Lucent IN-specific NE using the SACT.
- ◆ Deploys the Lucent IN cartridge service model (only if the Lucent IN service model is not yet deployed) using the Service Activation Deployment Tool (SADT).
- ◆ Copies the Lucent IN-specific jar files and the cpp library file to the ASAP environment.
- ◆ Loads the sample work orders to the SRP database.

For information on the SACT and the SADT, refer to the *ASAP Administration Guide*.

To install the cartridge

1. Run the *installCartridge* script. At the prompt, type:

```
installCartridge LucentIN_6_0.sar
```

2. The script prompts you for the values of the following WebLogic login parameters:

- ◆ WebLogic Hostname
- ◆ WebLogic HTTP Port
- ◆ WebLogic Login User ID
- ◆ WebLogic Login Password

The script loads the NEP-NE configuration and the CSDL-ASDL configuration to the SARM database, and loads sample work orders to the SRP database. The script also copies the cartridge-specific jar files and cpp library file to the ASAP environment.

3. Copy studio_2_6_0.jar file to the \$ASAP_BASE/lib directory.
4. Add \${ASAP_BASE}/lib/studio_2_6_0.jar to the CLASSPATH in the JIInterpreter file under \$ASAP_BASE/programs directory.
5. Restart ASAP to upload the cartridge configuration into ASAP.

Uninstalling the cartridge using scripts

Run the uninstallation script *uninstallCartridge* to uninstall the Lucent IN cartridge. The script executes the following tasks:

- ◆ Unconfigures Lucent IN-specific NEs using the SACT.
- ◆ Undeploys the Lucent IN cartridge service model (only if the Lucent IN service model is already deployed) using the Service Activation Deployment Tool (SADT).
- ◆ Removes the Lucent IN-specific jar files and cpp library file from the ASAP environment.

For more information on the SACT and the SADT, refer to the *ASAP Administration Guide*.

To uninstall the cartridge

1. Run the *uninstallCartridge* script. At the prompt, type:

```
uninstallCartridge LucentIN_6_0.<date>.<timestamp>.sar
```

2. The script prompts you for the values of the following parameters:

- ◆ WebLogic Hostname
- ◆ WebLogic HTTP Port
- ◆ WebLogic Login User ID
- ◆ WebLogic Login Password

The script unloads the NEP-NE configuration and CSDL-ASDL configuration from SARM database. It also removes the cartridge specific jar files and cpp library file from the ASAP environment.

If you want to remove the Events Server from ASAP CTRL database, run:

```
remove_eventsServer_ctrlDB.sh
```

To remove the secondary NEP, run:

```
uninstall_new_NEP.sh
```

Testing the cartridge installation

To test this cartridge installation, you need to know about the network element (NE), services, and basic Activation configuration. You may need to perform adjustments to provision a service for a specific NE, network, or connectivity configuration.

You can test the cartridge installation using one of the following methods:

- ◆ **Loopback mode**—does not actually connect to or send commands to the NE.
- ◆ **Live mode**—connects to and sends commands to a live NE.

Configuring loopback and live mode parameters

Set the following variables to test the cartridge in loopback or live testing modes.

Loopback mode

Set the following parameter to test the cartridge in loopback mode.

Table 2: Loopback Mode Parameter Settings

Configuration Variable	Parameter Settings	Location
LOOPBACK_ON	1 (default setting)	ASAP.cfg

Live mode

Set the following parameter to test the cartridge in live mode.

Table 3: Live Mode Parameter Settings

Configuration Variable	Parameter Settings	Location
LOOPBACK_ON	0	ASAP.cfg

Communication parameters

The following are the list of parameters for the sample NE configuration XML used by SACT.

Table 4: Communication parameters

param_label	param_value	param_desc
VPN_VIEW_NAME	VPN_VIEW_NAME	Default view name from comm_params for VPN service.
VPN_VERSION_NAME	261	Default VPN version name from comm_params for VPN service.
VPN_WO_INFO	VPN_WO_INFO	Default VPN work order information from comm_params for VPN service.
VPN_PRIORITY	5	Default VPN priority value from comm_params for VPN service.
VPN_DUE_DATE	0	Default VPN due date from comm_params for VPN service.
VPN_WO_DELETE_MODE	SYSTEM_WODELMO DE	Default VPN work order delete mode from comm_params for VPN service.
VPN_EVENT_DESTINATION	LuINEvtDest	Event destination prefix for VPN service.
VPN_WO_TYPE	PROV_WO	Default work order type from comm_params for VPN service. Possible values are: PROV_WO and NEQUERY_WO.
VPN_SO_GRP_NAME	VPN_SO_GRP_NAME	Identifies the NE to be updated - defined by eSM administrator to restrict access (for provisioning system GUI users) - set as comm_param.

Table 4: Communication parameters

param_label	param_value	param_desc
VPN_OWNER_NAME	VPN_OWNER_NAME	Service object group name.
VPN_ACCT_GRP_NAME	prov	Account group name.
VPN_NE_NAME[1]	VPN_NE_NAME[1]	NE that may be provisioned or queried by a work order. These names will be set by the administrator and if required will be set as comm_param.
MONITOR_INTERVAL	60	Work order monitoring time interval in seconds.
TIMEOUT	10	Work order timeout period in minutes.
USERNAME	USERNAME	User name to log in to eSM.
PASSWORD	PASSWORD	Password to log in to eSM.
VPN_ACCESS_GRP_NAME	VPN_ACCESS_GRP_N AME	Default VPN access group names.
THROTTLE	0	Time in milli-seconds to throttle transmission of successive requests.
VPN_EVENT_FILTER	LuNEvtFilter	Filter name prefix used to subscribe for the events.
WO_NAME_PREFIX	VFNZ	Prefix for the request ID.
LU_IN_NE_HOST	E_LU-IN_6-0_HOST	Host name of the network element.
STOP_ASDL_CHECK_INTERVAL	50	Sleep interval in milli-seconds between checks for completion of all requests in STOP ASDL.
STOP_ASDL_CHECK_NUMBER	40	Total number of checks for completion of all requests in STOP ASDL.
ASYNC_MODE	N	Mode of interaction with the network element.
SYNC_REQ_TIMEOUT	10	Timeout for synchronous request in seconds.

Table 4: Communication parameters

param_label	param_value	param_desc
USER_ERROR_FILE	config/ Lucent_IN_6_0_UserExitTypes.cfg	Full path name of user exit type mapping file under the ASAP base directory. Example: Value of config will be - \$ASAP_BASE/config
IOR_FILE	config/ Lucent_IN_6_0.cfg	Full path name of file containing eSM IOR, starting under the ASAP base directory. Example: Value of config will be - \$ASAP_BASE/config

Modifying E_LU-IN_6-0_HOST.xml

Use the following procedure to modify E_LU-IN_6-0_HOST.xml.

To modify E_LU-IN_6-0_HOST.xml

1. Create a new source directory. You can give this directory any appropriate, meaningful name you want to.

```
mkdir <new_source_directory>
```

2. Copy LucentIN_6_0.sar to this new source directory.

```
cp LucentIN_6_0.sar ./<new_source_directory>
```

3. Change directory to <new_source_directory>.

```
cd <new_source_directory>
```

4. Un-jar LucentIN_6_0.sar. This extracts the contents of the sar file.

```
jar xvf LucentIN_6_0.sar
```

5. Edit E_LU-IN_6-0_HOST.xml with the appropriate changes, which is available under <new_source_directory>/NetworkElements.

6. Create a new sar file at the <new_source_directory> level.

```
CreateSar $PWD
```

7. Uninstall the cartridge using LucentIN_6_0.sar. (That is, use the original sar file that you copied in Step 2 above—see “[Uninstalling the cartridge using scripts](#)” on page 9 for uninstallation instructions).

8. After you uninstall the cartridge, rename the sar file, so you have a backup copy of it.

9. Copy the new sar file from <new_source_directory>.

10. Reinstall the cartridge (see “[Installing the cartridge using scripts](#)” on page 7 for installation instructions).

Testing the installation

The following procedure describes the steps required to test the cartridge installation in loopback mode. We recommend that you perform the initial cartridge installation test in loopback mode.

To test in loopback mode

1. Stop ASAP by typing the following command at the UNIX prompt:

```
stop_asap_sys -d
```

2. Ensure loop back mode is on. See “[Loopback mode](#)” on page 10 for a description of how to set the loop back parameter to “On”.

3. Start ASAP by typing:

```
start_asap_sys -d
```

4. Send the sample work orders through the SRP Emulator by typing:

```
run_suite $SRP <ctrl_password> <suite name>
```

You can locate the suite names by typing:

```
grep SUITE * | grep -v END
```

A list of all available suites appears.

For more information on the SRP Emulator, refer to the *ASAP Administration Guide*.

5. Verify the status of the sample work orders by typing:

```
asap_utils -d 1
```

All successful work orders returns to the 104 state.

To view the sample work orders provided with this cartridge, refer to the Lucent IN cartridge source.

Viewing the sample work orders

You can find the sample work orders under the **SampleWorkOrders** directory in the sar file. The following procedure describes how to view the sample work orders.

To view the sample work orders

1. Create a repository directory, copy the sar file to the new directory and un-jar the sar file, as described by Step 1 through Step 4 in “[Modifying E_LU-IN_6-0_HOST.xml](#)” on page 13.
2. Locate and view the sample work order files.

Installation and deployment of the cartridge using Studio

Before installing the cartridge, ensure weblogic and ASAP are started and running.

The following are the steps involved:

1. Open Studio in design perspective. Choose **Import** from the **File** menu and select **Activation Archive (SAR)** under **Studio Wizards** to import the sar file. Browse for the path to the sar file and click **Finish**.
2. Create a new **Service Activation Project**.
3. Define a new **NE Entity**, based on the **NE Template** contained in the cartridge provided by Oracle.
4. Ensure that the primary pool of the newly created NE is different from the NE template primary pool. You can modify it, if necessary.
5. Ensure that the test work order provided with the cartridge targets the newly defined NE. If not, then modify the test work orders file(s).
6. Create a new **Activation Environment Project** from the **Studio** menu. (Use Studio help for more information).
7. Create **Activation Environment** inside the **Activation Environment Project** and configure the **Connection Details** tab with your Environment ID, Activation version and weblogic data.
8. Connect to your environment using the **Connect** button.
9. Select the **Cartridge** tab of the **Activation Environment** and click **Add** to add your projects to the environment. The cartridge and the newly created **Service Activation** should appear in the **Cartridges** list.
10. Deploy the **NetworkActivation** (NA) cartridge provided by Oracle. (No NE information is to be deployed with this cartridge, therefore it isn't necessary to deploy the **NEP map** info).
11. Deploy the **Service Activation** (SA) project as follows:
 - On the **Cartridge** tab, select the necessary SA cartridge and click the **Deploy** button.
 - Select the **NEP Map** tab of the **Activation Environment**. Choose the necessary **NEP** server from the drop-down box of the **Network Element Processors** (Use Studio help for more information).
 - Select the SA cartridge from the **Network Element Processor Map** and click the **Deploy** button.
12. Verify the **SADT** console to confirm the installation.
13. Go to ASAP environment.

14. Copy studio_2_6_0.jar file to the \$ASAP_BASE/lib directory.
15. Add \${ASAP_BASE}/lib/studio_2_6_0.jar to the CLASSPATH in the JInterpreter file under \$ASAP_BASE/programs directory.
16. Restart **ASAP** in order to start working with the cartridge.

Uninstallation and Undeployment of the cartridge using Studio

The following are the steps involved:

1. Connect to your environment using the **Connect** button.
2. Select the necessary cartridge from the **Environment Cartridge** list in Studio 2.6 and click the **Undeploy** button.
3. Verify the Environment Cartridge list. The Check Box with the name of the cartridge should be in unchecked state.

Atomic Service Description Layer (ASDL) Commands

ASDL commands represent a set of atomic actions that ASAP can perform on a network element (NE). ASAP can combine ASDLs to create meaningful services (CSDLs) within a cartridge.

This chapter presents detailed information on the ASDL parameters that we provide with this cartridge. The following table lists and describes the type of parameter information that is included.

Table 5: ASDL parameter information

Item	Description
Parameter Name	Identifies the parameter that is configured for the stated service.
Description	Describes the parameter.
Range	Describes or lists the range of values that can be used to satisfy this parameter.
Default Value	Configures a default value for the parameter so that it is not mandatory for the upstream system to provide a value.

Table 5: ASDL parameter information

Item	Description
Type	<p>Indicates one of the following parameter types:</p> <ul style="list-style-type: none"> ◆ S—Scalar, specifies the parameter label transmitted on the ASDL command. Scalar parameters are conventional name-value pair parameters. ◆ C—Compound, specifies the base name of the compound parameter transmitted on the ASDL command. A compound parameter contains structures or arrays of information that are represented by a particular structure name or compound parameter name. Each compound parameter can contain a large number of elements. If you use compound parameters, you only require a single entry in the ASAP translation tables to call the compound parameter and all its associated parameter elements. ◆ I—Indexed, identifies a parameter that contains a sequential numerical index value to tell the SARM that it should execute the same operation (for example, an ASDL command) for all occurrences of that index. Consequently, if there are several options on a particular CSDL command (OPT1, OPT2, OPT3, etc.), you can specify the OPT parameter as an indexed parameter. When you specify the OPT parameter as an indexed parameter, the SARM generates several occurrences of that same ASDL command and each command has a different value for the option being transmitted to the NEP. <p>For more information on parameter types, refer to the <i>ASAP Developer Reference</i>.</p>
Class	<p>Indicates one of the following parameter classifications:</p> <ul style="list-style-type: none"> ◆ R—Required scalar parameter ◆ O—Optional scalar parameter ◆ C—Required compound parameter ◆ N—Optional compound parameter ◆ M—Mandatory indexed parameter ◆ I—Optional indexed parameter ◆ S—Parameter count

For a detailed description of the Required and Optional parameter classifications, refer to the *ASAP Administration Guide*.

ASDL commands

This cartridge provides the following ASDL commands:

- ◆ A_LU-IN_6-0_ADD_CALL-PARTY-NUM
- ◆ A_LU-IN_6-0_ADD_COS-DEFINITION
- ◆ A_LU-IN_6-0_ADD_COS-FEATURE
- ◆ A_LU-IN_6-0_ADD_COS-RESTRICTION
- ◆ A_LU-IN_6-0_ADD_COS-SCREENING
- ◆ A_LU-IN_6-0_ADD_VPN-SUBSCRIBER
- ◆ A_LU-IN_6-0_CREATE_VPN-ACCOUNT
- ◆ A_LU-IN_6-0_CREATE_VPN-VM
- ◆ A_LU-IN_6-0_DELETE_CALL-PARTY-NUM
- ◆ A_LU-IN_6-0_DELETE_COS-DEFINITION
- ◆ A_LU-IN_6-0_DELETE_COS-FEATURE
- ◆ A_LU-IN_6-0_DELETE_COS-RESTRICTION
- ◆ A_LU-IN_6-0_DELETE_COS-SCREENING

- ◆ A_LU-IN_6-0 STOP_ACTION

A_LU-IN_6-0_ADD_CALL-PARTY-NUM

Adds a new entry to the Calling Party Numbers table.

It is implemented by the following Java method:

```
com.mslv.activation.cartridge.lu.in.x6_0.call_party_num.add.generated.AddCallPartyN
umProxy.execute
```

Table 6: A_LU-IN_6-0_ADD_CALL-PARTY-NUM

Parameter Name	Description	Range	Default Value	Type	Class
VPN_VIEW_NAME	Default view name from comm_params for VPN Service.		S	O	
VPN_VERSION_NAME	Default VPN version name from comm_params for VPN Service.		S	O	
VPN_WO_INFO	Default VPN work order information from comm_params for VPN Service.		S	O

False, This is an old WorkOrder
```

Output Parameters

woName – Unique name of the work order. This is either client-specified name or eSM generated name (if not specified by the client).

Note: eSM recommends that upstream client(s) always provide a unique work order names part of wo parameter.

Data – NE Query result as defined in the SMSProvExt::NEQResult data structure.

NEQResult: A query response should be in the form of a compound parameter and are mapped as follows:

```
VPN_ACC_QRY.VPN_ACCOUNT_ID
VPN_ACC_QRY.VPN_ACCOUNT_NAME
VPN_ACC_QRY.MAX_VPN_CODES

 VPN_ACC_QRY.CDPNLOC_ORIG_ONNET
 VPN_ACC_QRY.SED_RANGES
 VPN_ACC_QRY.SED_PREFIXES
 VPN_ACC_QRY.SUB_CALLG_DSPLY

ValErrors – List of static validation errors or warnings, if any. Static validation errors/warnings are due to execution of simple validation constraints of the service. Note that a constraint can be specified to raise either an error message or a warning.

ProvExt::SvcObj

```
void getSvcData(in string viewName,
in string versionName,
in string votName,
in string soName,
in string vdtName,
in SMSProvExt::Filter filter,
in StringList vatNames,
in short maxRecs,
```

```
out SMSProvExt::FindResult result,
out SMSProvExt::Records records)
raises(ApplError);
Input Parameters:
viewName - Name of the View
versionName - Version of the service package. If it is empty, defaulted to the
current active version of the service. If any changes are made to the view
using View Tool, (for example modification of default values, read /write
permission etc.) then versionName is required for this operation.
votName - Name of the View Object Type
soName - Name of the Service Object
• The soName + votName+viewName is the unique key to identify an SvcObj.
vdtName - Name of the View Data Type
• Must be unique within a viewName.
filter - Type and details of the filtering criteria to use.
vatNames - A list of VAT (View Attribute Type) names within the vdtName that
are to be retrieved from eSM. This is an optional field, if not specified, all
the VATs that are allowed to retrieve will be returned.
maxRecs- Maximum number of records to be sent back.
- Default value: -1 - returns up to eSM predefined maximum records parameter
value.
- Value: -1 - returns up to eSM pre-defined maximum records
X - returns X number of records.
Where X is greater than or equal to 1 and less than or equal to Y, and Y is
eSM maximum records parameter value.
```

Output Parameters

Compound Parameters returned:

- ◆ VPN_SUB_QRY

The query returns the values from the prefix tables if the Short Dial code or Member Number/ Authentication Id contain trailing 'X's.

These results can be returned in the additional compound parameters:

- ◆ NRN_PFX
- ◆ AUT_PFX
- ◆ CODE_RNG

User exit types

User exit types allow cartridge developers and systems administrators to map ASDL exit codes to one of the predefined base exit types. Base exit types determine the product behavior. Cartridges map return codes and status values from a network element to a user defined exit type.

Regular expressions (regex) are used to perform pattern searches on responses from network elements. The pattern is stored in "tbl_user_err" in the SARM database. The user exit type contains a regex pattern that is applied at runtime.

Regular expressions enable users to associate a series of responses to a specific base type. For example, a regular expression "6" can identify a pattern where any response with the character "6" followed by any number of characters will translate to base type of FAIL.

Regular expressions can also allow very specific searches within a response from a network element. Regular expressions are typically compiled before being executed. Compilation produces a binary version of the expression and ensures that the syntax of the regular expression is correct. This compilation occurs using SACT\SADT when user exit types are

deployed into ASAP. If the syntax is deemed to be incorrect during compilation, SADT displays an error message and the deployment of the user exit type will fail.

For more information on pattern matching, refer to the *ASAP Developer Reference* and the *ASAP Administration Guide*.

1. Pattern searches accommodate situations in which responses from the device contain small variants that represent the same meaning. The user type contains an associated search pattern that is applied at runtime. Using regular expressions, you can default a series of responses. For example a regular expression "90." can specify a pattern where any response with the character "90" followed by any character will translate to base type of FAIL. If the regular expression is defined as "90*", then any response with the character "90" followed by any number of characters will translate to base type of FAIL
 2. The user type that the search pattern maps to.
 3. The base type that maps to the user type.
 4. 101 to 110 and 201 to 215 will translate to a base type of SOFT_FAIL
 5. 801-850 will translate to a base type of SOFT_FAIL. Note that the user type differs from the previous range.

The previous code sample shows some typical search pattern examples. Some additional examples follow:

- ◆ `^.*\b(one|two|three)\b.*$` = matches a complete line of text that contains any of the words "one", "two" or "three"
- ◆ `^(?=.*?\bone\b)(?=.*?\btwo\b)(?=.*?\bthree\b).*$` matches a complete line of text that contains all of the words "one", "two" and "three"
- ◆ `"[^"\r\n]*"` matches a single-line string that does not allow the quote character to appear inside the string.
- ◆ `\b\d{1,3}\.\d{1,3}\.\d{1,3}\.\d{1,3}\b` matches any IP address.

For more information on search patterns, refer to <http://java.sun.com/j2se/1.4.2/docs/api/java/util/regex/Pattern.html>.

For more information on user exit types, refer to chapter 3 of the *ASAP Developer Reference*.

1. 251 to 275 but not 261 to 265 will translate to a base type of DELAYED_FAILURE.

User defined ASDL exit types

The following table lists the user defined ASDL exit types.

Table 34: User defined ASDL exit types

Search pattern	User_type	Base_type	Description
500	LUIN_INVALID_LOGIN	FAIL	Invalid login.
502	LUIN_PASSWORD_EXP	FAIL	Password expired.

Service Definition

The Lucent IN cartridge contains a set of CSDLs that map to one or more ASDL commands. You can also create additional CSDLs that map to existing and newly-created ASDLs. An upstream system can assemble any of these CSDL commands onto a work order for provisioning.

This chapter presents detailed information on the CSDL parameters that we provide in this cartridge. The following table lists and describes the type of parameter information that is included.

Table 35: ASDL parameter information

Item	Description
Parameter Name	Identifies the parameter that is configured for the stated service.
Description	Describes the parameter.
Range	Describes or lists the range of values that can be used to satisfy this parameter.
Default Value	Configures a default value for the parameter so that it is not mandatory for the upstream system to provide a value.

Table 35: ASDL parameter information

Item	Description
Type	<p>Indicates one of the following parameter types:</p> <ul style="list-style-type: none"> ◆ S—Scalar, specifies the parameter label transmitted on the ASDL command. Scalar parameters are conventional name-value pair parameters. ◆ C—Compound, specifies the base name of the compound parameter transmitted on the ASDL command. A compound parameter contains structures or arrays of information that are represented by a particular structure name or compound parameter name. Each compound parameter can contain a large number of elements. If you use compound parameters, you only require a single entry in the ASAP translation tables to call the compound parameter and all its associated parameter elements. ◆ I—Indexed, identifies a parameter that contains a sequential numerical index value to tell the SARM that it should execute the same operation (for example, an ASDL command) for all occurrences of that index. Consequently, if there are several options on a particular CSDL command (OPT1, OPT2, OPT3, etc.), you can specify the OPT parameter as an indexed parameter. When you specify the OPT parameter as an indexed parameter, the SARM generates several occurrences of that same ASDL command and each command has a different value for the option being transmitted to the NEP. <p>For more information on parameter types, refer to the <i>ASAP Developer Reference</i>.</p>
Class	<p>Indicates one of the following parameter classifications:</p> <ul style="list-style-type: none"> ◆ R—Required scalar parameter ◆ O—Optional scalar parameter ◆ C—Required compound parameter ◆ N—Optional compound parameter ◆ M—Mandatory indexed parameter ◆ I—Optional indexed parameter ◆ S—Parameter count

For a detailed description of the Required and Optional parameter classifications, refer to the *ASAP Administration Guide*.

Configuring ASAP to Support Additional NE Instances

You can configure ASAP to support the E_LU-IN_6-0_HOST - NEP configuration using the Service Activation Configuration Tool (SACT). Refer to the *ASAP Administration Guide* for more information.

Below is an example of the Activation.Configuration.XML file for the Lucent IN cartridge.

Extracting source files

Before you can access an XML file to modify it, you must extract it from the .sar file. Use the following procedure to extract source files from the sar file. (Use Studio help for more information).

To extract source files

1. Create a repository directory. Copy the .sar file to the new directory and un-jar the sar file.
2. After you un-jar the sar file, you can access the XML files.

Loading a new XML file

When you finish modifying an XML file, you must create a new sar file, then restart the cartridge using the new file.

Follow the instructions in “[Testing the installation](#)” on page 14, for directions on how to load a new XML file. (Use Studio help for more information).
