## Cartridge Overview

---

ASAP cartridges are discrete software components that are developed for the ASAP product. An ASAP cartridge offers specific domain behavior on top of the core ASAP software, and provides the configuration that supports a set of services on a network element (NE).

An ASAP cartridge is not a stand-alone component, but operates in conjunction with the ASAP core product. ASAP cartridges offer the following benefits:

- ◆ **Reduced Time to Market**—time to market of new services is reduced through simplified development, implementation, and extension of cartridges on customer sites.
- ◆ **Extendable**—cartridges can be extended to include additional services and components that deliver business value, without requiring changes to the original cartridge.
- ◆ **Simplified Effort**—the effort and technical knowledge that is required to perform customizations is reduced.
- ◆ **Ease of Installation**—cartridges can be installed into an ASAP environment without interfering with the existing install base.

An ASAP cartridge can be used to configure ASAP to provision the following:

- ◆ NEs from a specific vendor, such as Nortel or Lucent.
- ◆ Technologies, such as Asynchronous Transfer Mode (ATM) and Frame Relay switches, or Internet Protocol (IP) routers.
- ◆ Services that are supported on the NE, such as ATM, IP Virtual Private Networks (VPN), Wireless, or Optical.

Cartridges are designed for a specific technology, software load, and service.

An ASAP cartridge supports a particular set of services on an NE. These services are independent of customer-specific service definitions. Professional Services or systems integrators can perform extensions to the cartridge to support customer-specific requirements.

For more information on extending a cartridge, refer to the *ASAP Cartridge Development Guide for Service Activation*.

## Cartridge content

An ASAP cartridge contains the following:

- ◆ An interface to the NE
- ◆ A set of scripts, such as State Tables or Java methods
- ◆ A set of atomic actions in the form of Atomic Service Description Layer (ASDL) commands
- ◆ A set of Common Service Description Layer (CSDL) commands that form meaningful services
- ◆ Sample work orders
- ◆ Installation scripts

## Prerequisites

System integrators such as managers, designers, programmers, and testers who are responsible for the adaptation and integration of ASAP-based solutions should use this manual as a reference. It assumes that readers possess the following skills:

- ◆ A knowledge of ASAP programming concepts
- ◆ A good working knowledge of the UNIX operating system
- ◆ A thorough understanding of service and network provisioning
- ◆ Familiarity with telecommunications

## About this guide

This guide provides a detailed description of the BroadWorksAS cartridge. It contains overview and technical information to assist with extending and integrating the cartridge into a customer environment.

The scope of this guide includes ASAP as it pertains to this cartridge. It is not a complete ASAP reference guide.

For additional ASAP information when using this cartridge, refer to the following supporting documentation:

- ◆ **ASAP documentation set**—for detailed information on the ASAP core product.
- ◆ **ASAP Cartridge Development Guide for Service Activation**—for information on how to extend a cartridge.

The BroadWorksAS cartridge provides the ASAP service configuration and network element (NE) interface to activate cross-connect services on VBNA\_BAS-001 NEs.

## Services, features, and options

The following table lists the provisioning services provided in the cartridge.:.

This chapter describes the following procedures related to installing and testing the cartridge:

- ◆ [Downloading the cartridge](#)
- ◆ [Installing the cartridge using scripts](#)
- ◆ [Uninstalling the cartridge using scripts](#)
- ◆ [Testing the cartridge installation](#)
- ◆ [Installation and deployment of the cartridge using Studio](#)

### Downloading the cartridge

Before you install the cartridge, you must use the internet to download the cartridge's TAR file from Oracle's Customer Portal.

Use the following instructions to download, then unTAR the TAR file.

#### To download the TAR file

1. Login to Oracle MetaLink internet home page (<http://www.metalink.oracle.com>).
2. Download the cartridge patch to your workstation.

#### To unTAR the TAR file

1. On your workstation, create a repository directory—the naming of which is your choice.

```
mkdir <repository dir>
```

2. Untar BroadSoftAS\_13\_X\_R1\_0\_0.<buildID>.tar.

```
tar xvf BroadSoftAS_13_X_R1_0_0.<buildID>.tar
```

The directory structure in the repository directory should look like the following illustration. (this illustration describes the minimum required structure; you can enhance this directory structure with additional directories based on your requirements and deliverables).

```
<repository_directory>
  /README
  /installCartridge
  /uninstallCartridge
  /Broadsoft_BAS_13_X.sar
```

## Starting ASAP

Before installing the cartridge, ensure that ASAP is running.

### To start ASAP

1. To start ASAP, execute the following script:

```
start_asap_sys -d
```

2. Ensure the ASAP Daemon (DAEM\$ENV\_ID) is running by checking the ASAP status using the ASAP script “status”.
3. Check whether the WebLogic instance for this ASAP environment is running. If not, start the WebLogic instance.

The *ASAP Administration Guide* contains more information on starting ASAP, the ASAP Daemon, and WebLogic.

## Installing the cartridge using scripts

Run the installation script *installCartridge* to install the cartridge. The script executes the following tasks:

- ◆ Configures the BroadWorksAS-specific NE using the SACT.
- ◆ Deploys the BroadWorksAS cartridge service model (only if the BroadWorksAS service model is not yet deployed) using the Service Activation Deployment Tool (SADT).
- ◆ Copies the BroadWorksAS-specific jar files and the cpp library file to the ASAP environment.
- ◆ Loads the sample work orders to the SRP database.

For information on the SACT and the SADT, refer to the *ASAP Administration Guide*.

### To install the cartridge

1. Run the *installCartridge* script. At the prompt, type:

```
installCartridge Broadsoft_BAS_13_X.sar
```

2. The script prompts you for the values of the following WebLogic login parameters:

- ◆ WebLogic Hostname
- ◆ WebLogic HTTP Port
- ◆ WebLogic Login User ID
- ◆ WebLogic Login Password

The script loads the NEP-NE configuration and the CSDL-ASDL configuration to the SARM database, and loads sample work orders to the SRP database. The script also copies the cartridge-specific jar files and cpp library file to the ASAP environment.

3. Copy studio\_2\_6\_0.jar file to the \${ASAP\_BASE}/lib directory.
4. Add \${ASAP\_BASE}/lib/studio\_2\_6\_0.jar to the CLASSPATH in the JInterpreter file under \${ASAP\_BASE}/programs directory.
5. Restart ASAP to upload the cartridge configuration into ASAP.

## Uninstalling the cartridge using scripts

Run the uninstallation script *uninstallCartridge* to uninstall the BroadWorksAS cartridge. The script executes the following tasks:

- ◆ Unconfigures BroadWorksAS-specific NEs using the SACT.
- ◆ Undeploys the BroadWorksAS cartridge service model (only if the BroadWorksAS service model is already deployed) using the Service Activation Deployment Tool (SADT).
- ◆ Removes the BroadWorksAS-specific jar files and cpp library file from the ASAP environment.

For more information on the SACT and the SADT, refer to the *ASAP Administration Guide*.

### To uninstall the cartridge

1. Run the *uninstallCartridge* script. At the prompt, type:

```
uninstallCartridge Broadsoft_BAS_13_X.<date>.<timestamp>.sar
```

2. The script prompts you for the values of the following parameters:

- ◆ WebLogic Hostname
- ◆ WebLogic HTTP Port
- ◆ WebLogic Login User ID
- ◆ WebLogic Login Password

The script unloads the NEP-NE configuration and CSDL-ASDL configuration from SARM database. It also removes the cartridge specific jar files and cpp library file from the ASAP environment.

## Testing the cartridge installation

To test this cartridge installation, you need to know about the network element (NE), services, and basic Activation configuration. You may need to perform adjustments to provision a service for a specific NE, network, or connectivity configuration.

You can test the cartridge installation using one of the following methods:

- ◆ **Loopback mode**—does not actually connect to or send commands to the NE.
- ◆ **Live mode**—connects to and sends commands to a live NE.

## Configuring loopback and live mode parameters

Set the following variables to test the cartridge in loopback or live testing modes.

### Loopback mode

Set the following parameter to test the cartridge in loopback mode.

**Table 2: Loopback Mode Parameter Settings**

Configuration Variable	Parameter Settings	Location
LOOPBACK_ON	1 (default setting)	ASAP.cfg

## Live mode

Set the following parameter to test the cartridge in live mode.

**Table 3: Live Mode Parameter Settings**

Configuration Variable	Parameter Settings	Location
LOOPBACK_ON	0	ASAP.cfg

## Communication parameters

The following are the list of parameters for the sample NE configuration XML used by SACT.

**Table 4: Communication parameters**

param_label	param_value	param_desc
HOST_IPADDR	10.9.1.224	Remote Host IP address.
NAME_SERV	1050	Naming service port.
PASSWORD	admin	Password.
USER	admin	User login.
READ_TIMEOUT	60	The read timeout in seconds.
FIREWALL	Y	Firewall flag, value Y or N. If Corba server is inside the firewall, set flag to Y and IOR will be set with NAT-ed IP address.
RESPONSELOG	true	Flag to turn off or on Response log.

## Modifying VBNA\_BAS-001.xml

Use the following procedure to modify VBNA\_BAS-001.xml.

### To modify VBNA\_BAS-001.xml

1. Create a new source directory. You can give this directory any appropriate, meaningful name you want to.

```
mkdir <new_source_directory>
```

2. Copy Broadsoft\_BAS\_13\_X.sar to this new source directory.

```
cp Broadsoft_BAS_13_X.sar ./<new_source_directory>
```

3. Change directory to <new\_source\_directory>.

```
cd <new_source_directory>
```

4. Un-jar Broadsoft\_BAS\_13\_X.sar. This extracts the contents of the sar file.

```
jar xvf Broadsoft_BAS_13_X.sar
```

5. Edit VBNA\_BAS-001.xml with the appropriate changes, which is available under <new\_source\_directory>/NetworkElements.

6. Create a new sar file at the <new\_source\_directory> level.

```
CreateSar $PWD
```

7. Uninstall the cartridge using Broadsoft\_BAS\_13\_X.sar. (That is, use the original sar file that you copied in Step 2 above—see “[Uninstalling the cartridge using scripts](#)” on page 15 for uninstallation instructions).
8. After you uninstall the cartridge, rename the sar file, so you have a backup copy of it.
9. Copy the new sar file from <new\_source\_directory>.
10. Reinstall the cartridge (see “[Installing the cartridge using scripts](#)” on page 15 for installation instructions).

## Testing the installation

The following procedure describes the steps required to test the cartridge installation in loopback mode. We recommend that you perform the initial cartridge installation test in loopback mode.

### To test in loopback mode

1. Stop ASAP by typing the following command at the UNIX prompt:

```
stop_asap_sys -d
```

2. Ensure loop back mode is on. See “[Loopback mode](#)” on page 16 for a description of how to set the loop back parameter to “On”.

3. Start ASAP by typing:

```
start_asap_sys -d
```

4. Send the sample work orders through the SRP Emulator by typing:

```
run_suite $SRP <ctrl_password> <suite name>
```

You can locate the suite names by typing:

```
grep SUITE * | grep -v END
```

A list of all available suites appears.

For more information on the SRP Emulator, refer to the *ASAP Administration Guide*.

5. Verify the status of the sample work orders by typing:

```
asap_utils -d 1
```

All successful work orders returns to the 104 state.

To view the sample work orders provided with this cartridge, refer to the BroadWorksAS cartridge source.

## **Viewing the sample work orders**

You can find the sample work orders under the **SampleWorkOrders** directory in the sar file. The following procedure describes how to view the sample work orders.

### **To view the sample work orders**

1. Create a repository directory, copy the sar file to the new directory and un-jar the sar file, as described by [Step 1](#) through [Step 4](#) in “[Modifying VBNA\\_BAS-001.xml](#)” on page 17.
2. Locate and view the sample work order files.

# **Installation and deployment of the cartridge using Studio**

Before installing the cartridge, ensure weblogic and ASAP are started and running.

The following are the steps involved:

1. Open Studio in design perspective. Choose **Import** from the **File** menu and select **Activation Archive (SAR)** under **Studio Wizards** to import the sar file. Browse for the path to the sar file and click **Finish**.
2. Create a new **Service Activation Project**.
3. Define a new **NE Entity**, based on the **NE Template** contained in the cartridge provided by Oracle.
4. Ensure that the primary pool of the newly created NE is different from the NE template primary pool. You can modify it, if necessary.
5. Ensure that the test work order provided with the cartridge targets the newly defined NE. If not, then modify the test work orders file(s).
6. Create a new **Activation Environment Project** from the **Studio** menu. (Use Studio help for more information).
7. Create **Activation Environment** inside the **Activation Environment Project** and configure the **Connection Details** tab with your Environment ID, Activation version and weblogic data.
8. Connect to your environment using the **Connect** button.
9. Select the **Cartridge** tab of the **Activation Environment** and click **Add** to add your projects to the environment. The cartridge and the newly created **Service Activation** should appear in the **Cartridges** list.

10. Deploy the **NetworkActivation** (NA) cartridge provided by Oracle. (No NE information is to be deployed with this cartridge, therefore it isn't necessary to deploy the **NEP map** info).
11. Deploy the **Service Activation** (SA) project as follows:
  - On the **Cartridge** tab, select the necessary SA cartridge and click the **Deploy** button.
  - Select the **NEP Map** tab of the **Activation Environment**. Choose the necessary **NEP** server from the drop-down box of the **Network Element Processors** (Use Studio help for more information).
  - Select the SA cartridge from the **Network Element Processor Map** and click the **Deploy** button.
12. Verify the **SADT** console to confirm the installation.
13. Go to ASAP environment.
14. Copy studio\_2\_6\_0.jar file to the \$ASAP\_BASE/lib directory.
15. Add \${ASAP\_BASE}/lib/studio\_2\_6\_0.jar to the CLASSPATH in the JInterpreter file under \$ASAP\_BASE/programs directory.
16. Restart **ASAP** in order to start working with the cartridge.

## Uninstallation and Undeployment of the cartridge using Studio

The following are the steps involved:

1. Connect to your environment using the **Connect** button.
2. Select the necessary cartridge from the **Environment Cartridge** list in Studio 2.6 and click the **Undeploy** button.
3. Verify the Environment Cartridge list. The Check Box with the name of the cartridge should be in unchecked state.

## Atomic Service Description Layer (ASDL) Commands

---

ASDL commands represent a set of atomic actions that ASAP can perform on a network element (NE). ASAP can combine ASDLs to create meaningful services (CSDLs) within a cartridge.

This chapter presents detailed information on the ASDL parameters that we provide with this cartridge. The following table lists and describes the type of parameter information that is included.

**Table 5: ASDL parameter information**

Item	Description
Parameter Name	Identifies the parameter that is configured for the stated service.
Description	Describes the parameter.
Range	Describes or lists the range of values that can be used to satisfy this parameter.
Default Value	Configures a default value for the parameter so that it is not mandatory for the upstream system to provide a value.

**Table 5: ASDL parameter information**

Item	Description
Type	<p>Indicates one of the following parameter types:</p> <ul style="list-style-type: none"> <li>◆ S—Scalar, specifies the parameter label transmitted on the ASDL command. Scalar parameters are conventional name-value pair parameters.</li> <li>◆ C—Compound, specifies the base name of the compound parameter transmitted on the ASDL command. A compound parameter contains structures or arrays of information that are represented by a particular structure name or compound parameter name. Each compound parameter can contain a large number of elements. If you use compound parameters, you only require a single entry in the ASAP translation tables to call the compound parameter and all its associated parameter elements.</li> <li>◆ I—Indexed, identifies a parameter that contains a sequential numerical index value to tell the SARM that it should execute the same operation (for example, an ASDL command) for all occurrences of that index. Consequently, if there are several options on a particular CSDL command (OPT1, OPT2, OPT3, etc.), you can specify the OPT parameter as an indexed parameter. When you specify the OPT parameter as an indexed parameter, the SARM generates several occurrences of that same ASDL command and each command has a different value for the option being transmitted to the NEP.</li> </ul> <p>For more information on parameter types, refer to the <i>ASAP Developer's Reference</i>.</p>
Class	<p>Indicates one of the following parameter classifications:</p> <ul style="list-style-type: none"> <li>◆ R—Required scalar parameter</li> <li>◆ O—Optional scalar parameter</li> <li>◆ C—Required compound parameter</li> <li>◆ N—Optional compound parameter</li> <li>◆ M—Mandatory indexed parameter</li> <li>◆ I—Optional indexed parameter</li> <li>◆ S—Parameter count</li> </ul>

For a detailed description of the Required and Optional parameter classifications, refer to the *ASAP Administration Guide*.

## User exit types

User exit types allow cartridge developers and systems administrators to map ASDL exit codes to one of the predefined base exit types. Base exit types determine the product behavior. Cartridges map return codes and status values from a network element to a user defined exit type.

Regular expressions (regex) are used to perform pattern searches on responses from network elements. The pattern is stored in "tbl\_user\_err" in the SARM database. The user exit type contains a regex pattern that is applied at runtime.

Regular expressions enable users to associate a series of responses to a specific base type. For example, a regular expression "6." can identify a pattern where any response with the character "6" followed by any number of characters will translate to base type of FAIL.

Regular expressions can also allow very specific searches within a response from a network element. Regular expressions are typically compiled before being executed. Compilation produces a binary version of the expression and ensures that the syntax of the regular expression is correct. This compilation occurs using SACT\SADT when user exit types are deployed into ASAP. If the syntax is deemed to be incorrect during compilation, SADT displays an error message and the deployment of the user exit type will fail.

For more information on pattern matching, refer to the *ASAP Developer Reference* and the *ASAP Administration Guide*.

1. Pattern searches accommodate situations in which responses from the device contain small variants that represent the same meaning. The user type contains an associated search pattern that is applied at runtime. Using regular expressions, you can default a series of responses. For example a regular expression "90." can specify a pattern where any response with the character "90" followed by any character will translate to base type of FAIL. If the regular expression is defined as "90\*", then any response with the character "90" followed by any number of characters will translate to base type of FAIL
2. The user type that the search pattern maps to.
3. The base type that maps to the user type.
4. 101 to 110 and 201 to 215 will translate to a base type of SOFT\_FAIL
5. 801-850 will translate to a base type of SOFT\_FAIL. Note that the user type differs from the previous range.
6. 251 to 275 but not 261 to 265 will translate to a base type of DELAYED\_FAILURE.

The previous code sample shows some typical search pattern examples. Some additional examples follow:

- ◆ `^.*\b(one|two|three)\b.*$` = matches a complete line of text that contains any of the words "one", "two" or "three"
- ◆ `^(?=.*?\bone\b)(?=.*?\btwo\b)(?=.*?\bthree\b).*$` matches a complete line of text that contains all of the words "one", "two" and "three"
- ◆ `"[^"\r\n]*"` matches a single-line string that does not allow the quote character to appear inside the string.
- ◆ `\b\d{1,3}\.\d{1,3}\.\d{1,3}\.\d{1,3}\b` matches any IP address.

For more information on search patterns, refer to <http://java.sun.com/j2se/1.4.2/docs/api/java/util/regex/Pattern.html>.

For more information on user exit types, refer to chapter 3 of the *ASAP Developer Reference*.

## Service Definition

---

The BroadWorksAS cartridge contains a set of CSDLs that map to one or more ASDL commands. You can also create additional CSDLs that map to existing and newly-created ASDLs. An upstream system can assemble any of these CSDL commands onto a work order for provisioning.

This chapter presents detailed information on the CSDL parameters that we provide in this cartridge. The following table lists and describes the type of parameter information that is included.

**Table 279: ASDL parameter information**

Item	Description
Parameter Name	Identifies the parameter that is configured for the stated service.
Description	Describes the parameter.
Range	Describes or lists the range of values that can be used to satisfy this parameter.
Default Value	Configures a default value for the parameter and it is not mandatory for the upstream system to provide a value.

**Table 279: ASDL parameter information**

Item	Description
Type	<p>Indicates one of the following parameter types:</p> <ul style="list-style-type: none"> <li>◆ S—Scalar, specifies the parameter label transmitted on the ASDL command. Scalar parameters are conventional name-value pair parameters.</li> <li>◆ C—Compound, specifies the base name of the compound parameter transmitted on the ASDL command. A compound parameter contains structures or arrays of information that are represented by a particular structure name or compound parameter name. Each compound parameter can contain a large number of elements. If you use compound parameters, you only require a single entry in the ASAP translation tables to call the compound parameter and all its associated parameter elements.</li> <li>◆ I—Indexed, identifies a parameter that contains a sequential numerical index value to tell the SARM that it should execute the same operation (for example, an ASDL command) for all occurrences of that index. Consequently, if there are several options on a particular CSDL command (OPT1, OPT2, OPT3, etc.), you can specify the OPT parameter as an indexed parameter. When you specify the OPT parameter as an indexed parameter, the SARM generates several occurrences of that same ASDL command and each command has a different value for the option being transmitted to the NEP.</li> </ul> <p>For more information on parameter types, refer to the <i>ASAP Developer Reference</i>.</p>
Class	<p>Indicates one of the following parameter classifications:</p> <ul style="list-style-type: none"> <li>◆ R—Required scalar parameter</li> <li>◆ O—Optional scalar parameter</li> <li>◆ C—Required compound parameter</li> <li>◆ N—Optional compound parameter</li> <li>◆ M—Mandatory indexed parameter</li> <li>◆ I—Optional indexed parameter</li> <li>◆ S—Parameter count</li> </ul>

For a detailed description of the Required and Optional parameter classifications, refer to the *ASAP Administration Guide*.

## Extracting source files

Before you can access an XML file to modify it, you must extract it from the .sar file. Use the following procedure to extract source files from the sar file. (Use Studio help for more information).

### **To extract source files**

1. Create a repository directory. Copy the .sar file to the new directory and un-jar the sar file.
2. After you un-jar the sar file, you can access the XML files.

## **Loading a new XML file**

When you finish modifying an XML file, you must create a new sar file, then restart the cartridge using the new file.

Follow the instructions in “[Testing the installation](#)” on page 18, for directions on how to load a new XML file. (Use Studio help for more information).
