## ABOUT THE GUIDE

This section provides a brief description of the scope, the audience, the references, the organization of the user guide and conventions incorporated into the user guide. The topics in this section are organized as follows:

- Scope of the guide
- Intended Audience
- Prerequisites
- Documentation Accessibility
- Access to Oracle Support
- Related Information Sources

## SCOPE OF THE GUIDE

This guide details the tasks that are required to be performed in the OFSAA environment. The integration requires effort on the FAH system also, for activities such as setting up supporting references, creating jobs to generate accounting entries and so on.

## INTENDED AUDIENCE

Welcome to release 8.0.1.0.0 of the Oracle Financial Services Data Integration Hub Foundation Pack Extension for Oracle Fusion Accounting Hub User Guide. This manual is intended for the following audience:

- ETL Developers: The ETL Developers from the IT Department of the financial services institution, who do the data sourcing.
- Business Analysts: The business analysts from the IT Department of the financial services institution, who do the mapping of the tables.

## PREREQUISITES

- Data Integration Hub (DIH) should be installed
- OFSAA – FAH Interface should be installed
- Oracle Data Integrator environment for executing the interfaces

## DOCUMENTATION ACCESSIBILITY

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

---

## ACCESS TO ORACLE SUPPORT

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## RELATED INFORMATION SOURCES

Along with this user manual, you can also refer to the following documents in [OTN](#) documentation Library:

- Oracle Financial Services Data Integration User Guide Release 8.0.1
- Oracle Financial Services Data Integration Application Pack Installation Guide Release 8.0.1
- Oracle Financial Services Data Integration Hub Foundation Pack Extension for Fusion Accounting Hub User Guide Release 8.0.1

## Acronyms

Acronym	Description
DIH	Data Integration Hub
UI	User Interface
ODI	Oracle Data Integrator
ADI	Application Data Interface

# 1 Introduction

## 1.1 About Oracle Financial Service Analytical Applications

Oracle Financial Services Analytical Applications (OFSAA) enables financial institutions to:

- Measure and meet risk adjusted performance objectives
- Cultivate a risk management culture through transparency
- Lower the costs of compliance and regulation
- Improve insight into customer behavior

OFSAA uses industry-leading analytical methods, shared data model and applications architecture to enable integrated risk management, performance management, customer insight, and compliance management. OFSAA actively incorporates risk into decision making, enables to achieve a consistent view of performance, promote a transparent risk management culture, and provide pervasive intelligence.

OFSAA delivers a comprehensive, integrated suite of financial services analytical applications for both banking and insurance domain. It includes many applications such as Profitability Management, Asset Liability Management, Customer Insight, and Risk Management.

## 1.2 About Fusion Accounting Hub

Fusion Accounting Hub (FAH) is an accounting integration and reporting platform that includes products, such as Sub ledger Accounting, Ledger, and Financial Reporting Center. FAH is an accounting integration platform. It standardizes the accounting from multiple third party transactional systems to consistently enforce accounting policies and meet multiple reporting requirements in an automated and controlled fashion. FAH includes a rules repository to centrally define and maintain accounting rules, a rules transformation engine to create, validate and store the accounting journals, and a detailed accounting repository that is used to reconcile to source system.

Oracle Fusion Accounting Hub (FAH) is an accounting integration platform that enables customers to integrate and standardize accounting from non-Oracle transactional systems to create accounting entries in any general ledger (for example, Fusion, E-Business Suite, PeopleSoft or other non-Oracle General Ledger systems).

## 1.3 Objective

Integration of FAH and OFSAA provides a basis for a unified finance and risk architecture to the financial services industry. The benefits of the having an out of the box interface between FAH and OFSAA are:

- The OFSAA repository of transaction and reference information becomes a single, unified analytical repository for risk and finance.
- The integration improves consistency in risk and finance data for producing risk adjusted measures.
- OFSAA customers can take advantage of FAH rules and accounting engines to improve the efficiency and audit ability of transforming transactions from financial services systems such as

deposits, loan accruals, payments, trades, and withdrawals into accounting.

- Information in the OFSAA foundation such as customer, account, product, branch, and channel information are accessible in FAH, for defining accounting treatments in addition to generating accounting balances. Conditional logic can be used to vary accounting treatments based upon values from transactions and contract balances. The same OFSAA transactions and contract balances are used by FAH to book entries and generate financial balances, which in turn are reused by OFSAA for analytical processing.
- Using FAH balances for analytical processing facilitates reconciliation of operational risk losses and accounting as prescribed by regulations such as Basel II and III. These accounting balances can be reconciled using the OFSAA Reconciliation Framework. Reconciliation rules can be defined to map FAH balances to product processor information. For example, accounting for provisions and losses can be based upon customer account balances, as provided to OFSAA and read by FAH enhancing the reliability of operational risk and provisioning measurement.

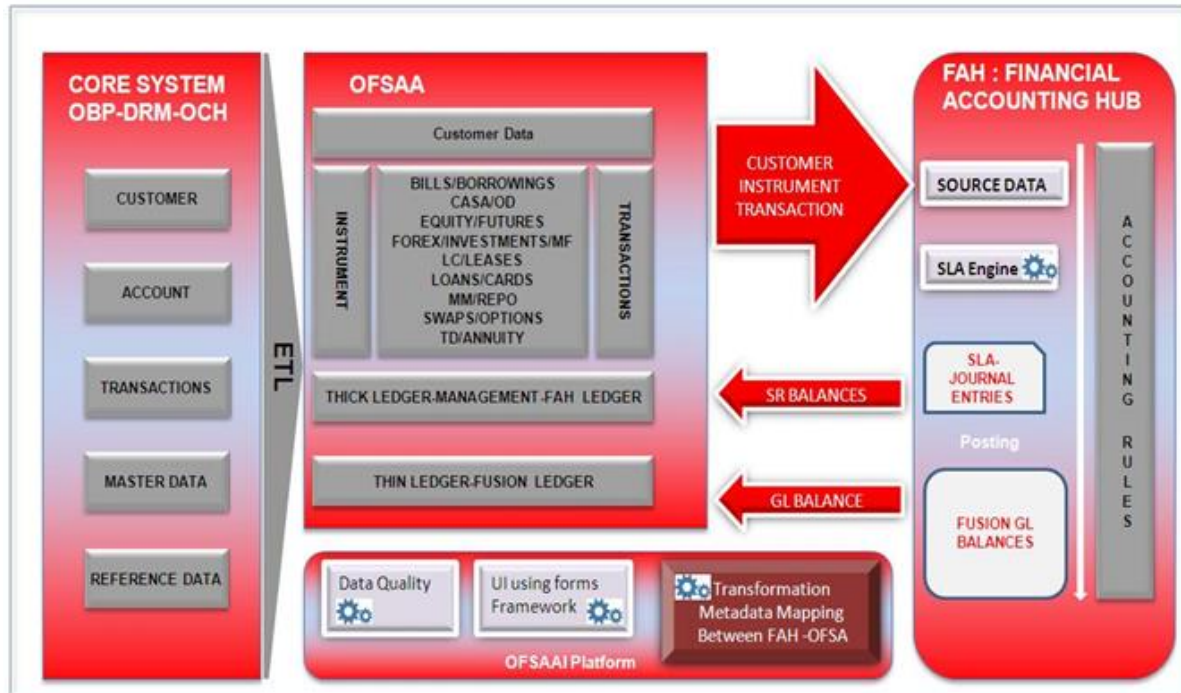

#### **1.4 About Oracle Financial Services Data Integration Hub Foundation Pack Extension for Oracle Fusion Accounting**

The major components that can be leveraged from FAH are:

- Seeded accounting rules and pre-defined Accounting Templates for FAH
- Use of OFSAA API to create accounting events in FAH
- Data Integration Hub (DIH) connectors to load General Ledger and supporting reference balances into the OFSAA common staging area.

#### **1.5 OFSAA-FAH Interface Architecture Overview**

The OFSAA-FAH Interface Architecture is illustrated in the below diagram:

The data flow between OFSAA and FAH is bi-directional in nature. OFSAA includes all the account, contract and transaction information which FAH needs to generate for its subledger accounting. Additionally, the General Ledger and supporting reference balances are required by the various products under the OFSAA suite.

The flow from OFSAA to FAH is established through a set of event creation API's in OFSAA. These API's expect data in transaction and reference objects in concurrence with the accounting rules and template. The accounting rules and templates should be deployed in FAH by applying the seed data ARU. Refer to the installation guide in [OTN](#) for more details.

The flow from FAH to OFSAA is achieved through some pre-built DIH connectors. These connectors extract the GL and SR Balances from FAH and load them into OFSAA staging post which this is available for all downstream applications.

## 2 Mapping the OFSAA User to FAH User Groups

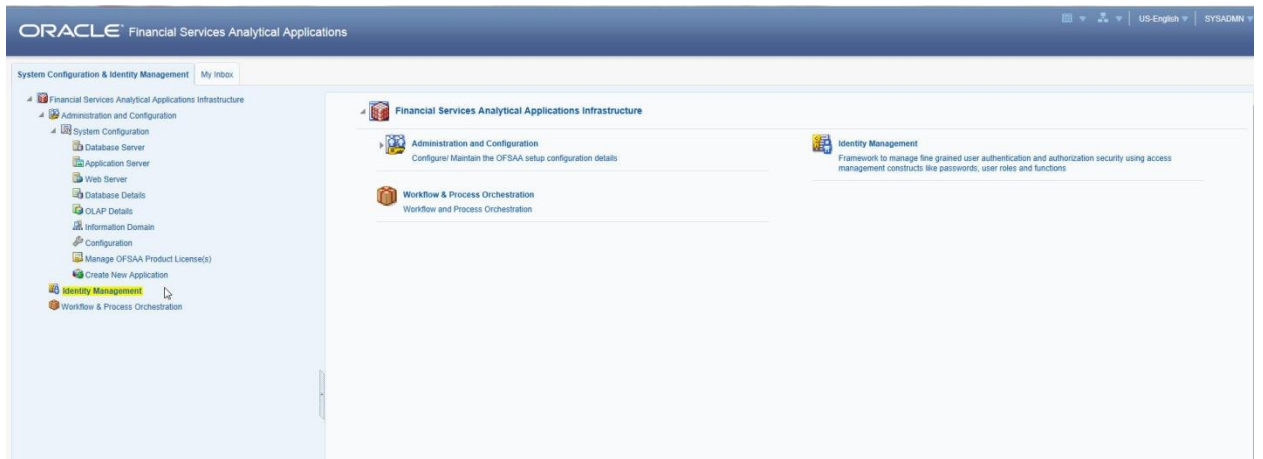

**User- User Group Map** enables you to map user(s) to specific user group which in turn is mapped to a specific Information Domain and role. Every user group mapped to the infodome should be authorized. Else, it cannot be mapped to users.

**User- User Group Map** screen displays fields such as **User ID**, **Name**, and the corresponding **User- User Group Map**. You can view and modify the existing mappings within the **User Group Maintenance** screen.

To access **User- User Group Map** navigate to **Identity Management**, and click **Security Management**. For details on mapping user to user groups refer to [OFSAAI User Guide](#) in OTN documentation library.

### Seeded User Groups for OFSAA - FAH Interface

Name	Description
FAH Admin	User mapped to this group will have access to all the menu items for entire FAH Application. The exclusive menu's which are available only to this group users are <i>FAH Administration</i>
FAH Data Mapping	User mapped to this group will have access to FAH Data Mapping Menu
FAH Operator	User mapped to this group will have access to Orchestration and Execution Menu

### 3 Logging into FAH-OFSAA Interface

Access the FAH-OFSAA Interface using your login credentials (User ID and password). The built-in security system ensures that you are permitted to access the window and actions based on the authorization only.

After logging into the application, select **Interface for Oracle Fusion Accounting Hub** from the applications drop-down list.

**Note:** You should be mapped at least any one of the FAH user groups in order to get the application in the drop down.

The FAH-OFSAA landing page is displayed below.

## 4 Component Details

The components included in this interface are:

- Predefined Accounting Rules and Templates
- OFSAA API's for creating accounting events
- DIH Connectors

### 4.1 Predefined Accounting Rules and Templates

This section details the predefined accounting rules and templates.

#### 4.1.1 Accounting Rules

The accounting rules are based on the instruments available in OFSAA. The instruments are categorized based on the types of FAH users and configurations. The below sub-ledger applications are enabled for this integration:

- Retail Banking
- Commercial Banking
- Investment Banking
- Treasury
- Islamic Banking

The list of product processors covered under each subledger Application is provided in the file [SLA Coverage](#).

Each instrument, such as loans, checking and savings accounts, is represented by an event class. For each event class, there are predefined accounting events based upon expected activities for the instrument.

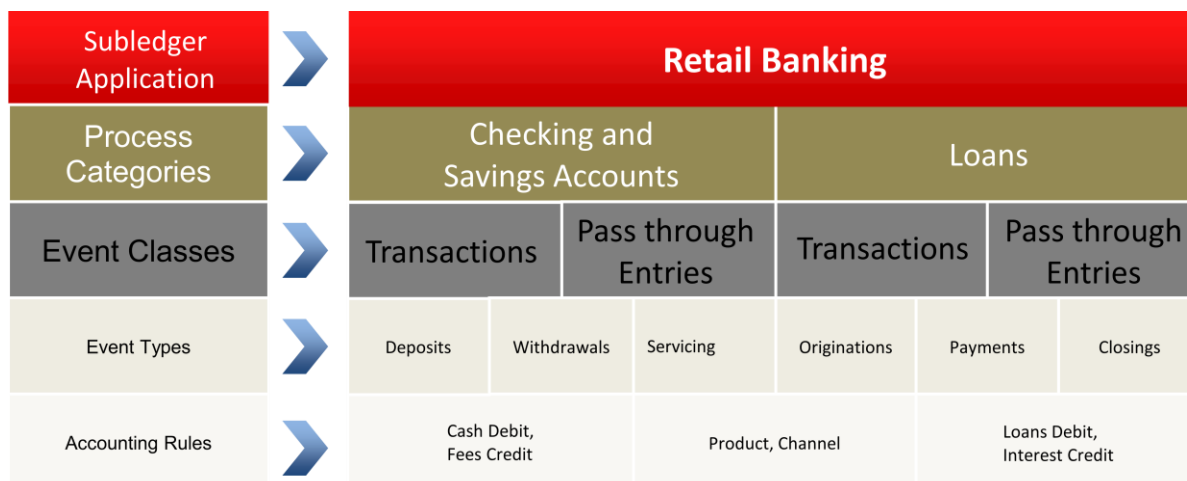

There are two types of accounting templates for each event class. The first type is based upon transactions. This indicates that FAH receives transaction information which is not pre-formatted for accounting. There are no debits or credits. The second type is based upon pass through accounting entries. There are debits and credits from the source system. The rules vary based on the templates used.

The OFSAA data model is registered with FAH. The attributes of the transactions, pass through entries, and product processors are used by the templates. They are also available for creating new rules configurations to tailor accounting treatments.

There are templates available for each type of FAH accounting rule, such as journal line rules and account rules. They can be used directly or copied to create new rules that can be modified. Additionally, you can create new rules that do not use the templates, but are based upon the OFSAA attributes registered in FAH.

## 4.1.2 Accounting Templates

An example of the structure for accounting templates for OFSAA integration is illustrated below:

The retail banking sub-ledger application has two process categories, such as checking and savings accounts and loans. Each of these process categories has two event classes, such as transactions and pass through entries. You can use either or both of these, based upon the nature of the information received by FAH. Such process categories are provided for every instrument included in the integration. Various event types are registered for each of the event classes. For checking and savings accounts, event types include deposits, withdrawals, and servicing. For loans, event types include originations, payments, and closings. For each event class, there are collections of rule templates that predefine accounting treatment. In this example, cash debit and fees credits are journal line rules for checking and savings accounts. Other rules components, such as descriptions and account rules may be used by different event classes.

Supporting references, which provide the ability to create accounting balances at a more detailed level than is provided by the general ledger chart of accounts, are available across all the subledger applications provided for the integration. These can be associated with journal line rules as desired. Product and channel are examples of potential supporting references.

## 4.2 API from OFSAA for Creating Accounting Events

OFSAA can create the accounting events for each event class/sub ledger application either one event at a time or in bulk mode. The pre-requisite for this process is the availability of data in corresponding header and line tables. Depending on event class and the execution mode, the correct procedure should be triggered with the necessary input parameters to create the accounting process. Additionally, you can perform bulk event processing at a sub-ledger application level rather than an entity type level.

### 4.3 DIH Connectors

The DIH connectors to load ledger and supporting reference balances into OFSAA are created as part of the interface installer. These connectors have pre-built mappings between FAH source views for GL/SR balances and OFSAA staging entities meant to store ledger data.

The following views are provided by FAH for GL and SR balances:

View Name	Purpose
GL_OFSAA_BALANCES_V	FAH GL balances view
GL_OFSAA_LEDGER_COA_V	FAH GL balances supplemental information
XLA_OFSAA_BALANCES_V	FAH SR balances view. Additionally, it contains supplemental information.
GL_OFSAA_BALANCES_DELTA_V	Incremental balances

The two connectors to be deployed are:

- **Con\_Fah\_Gl\_Balances:** Connector to load thin ledger balances into STG\_GL\_DATA table in OFSAA. This connector accepts the below input parameters:
  - FIC\_MIS\_DATE
  - Period Name
- **Con\_Fah\_Sr\_Balances:** Connector to load thick ledger/supporting reference balances into STG\_MANAGEMENT\_LEDGER tables in OFSAA. This connector accepts the below input parameters:
  - FIC\_MIS\_DATE
  - Period Name

---

**Note:** OFSAA can extract data from a single FAH ledger at a time. This is determined by the value entered setup\_master table. Refer to section Setup Master Configuration section for details.

---

## 5 Implementation

This chapter includes:

- Background
- Transaction and Object Population
- Setup Master Configuration
- Accounting Event Creation

### 5.1 Background

Transaction objects in FAH are tables or views defined for each event class, capturing source transaction data for accounting events. The create accounting process gets the source transaction data from the transaction objects to generate journal entries. Creation of transaction objects is performed as part of the interface installer. There are different types of transaction objects, indicating whether they are used at the header or line level.

Header sources have the same value for all transaction lines or distributions associated with an accounting event. These sources are associated with a transaction header or with transaction reference data. Line sources have values that can vary by the transaction lines or distributions associated with an accounting event. They must be stored in the transaction objects at the line level. List of transaction objects and reference views defined as part of this integration are mentioned in the file [OFSAA Transaction and Reference Views](#).

Two separate header tables, such as one for each flow type have been introduced in OFSAA staging area for defining header and line sources in FAH:

- Stage Transaction Header (STG\_TXN\_HEADER) for event based accounting
- Stage Accounting Entries Header (STG\_ACCT\_ENTRIES\_HEADER) for pass through accounting

Accounting event program in OFSAA scans through all the unprocessed records for a particular accounting date in the header tables and creates accounting events in FAH by calling its event creation API's. This API call creates an entry in xla\_events table in the FUSION schema. This is further processed by FAH to generate journal entries and post these entries to General Ledger module in FAH.

### 5.2 Transaction Object population

Transaction objects should be populated before processing of the accounting events occurs in FAH. Else, the source transaction information will be unavailable to generate the journal entries for the events. Both the header and line tables should be populated as per specification of the accounting rules to ensure accounting events are processed correctly in FAH.

Depending on the flow that the you chooses to implement, populate the corresponding header and line tables. You can map multiple transaction lines to an accounting event by grouping these individual lines into a header record and mapping the header record to the transaction event.

For example, withdrawal of cash from a checking and savings accounts could result in a withdrawal fee being collected from the customer account. In case of Event based accounting , “Withdrawal “ would be the event and the individual transaction lines. This indicates that cash withdrawal and withdrawal fee would be populated in the line table, such as STG\_CASA\_TXNS. Capture the line number in column N\_LINE\_ID present in all transaction tables.

Additionally, map the individual transaction record to a column named V\_TXN\_MNEMONIC\_CODE in the line table as per the list of values specified in the below excel sheet. These mnemonic codes are used in the Journal Entry Rules set definition.

A key exercise during implementation will be mapping of transaction type as defined in the source system to the appropriate mnemonic codes. Accounting rules and templates should be enhanced to accommodate the outliers. The list of Mnemonic codes configured against the various journal lines are mentioned in the file [Mnemonic Code Usage in Journal Line](#).

Group these lines under a single header record through column V\_HEADER\_ID and populate the grouped record in the STG\_TXN\_HEADER table. The header table in column V\_EVENT\_TYPE stores the event information.

The header record also requires additional information to map the accounting event to the event class (Product processor) and to the subledger application to enable processing of accounting event in FAH as per the OOTB accounting template. Data for the former is captured in the column V\_FAH\_ENTITY\_TYPE\_CODE and for the latter is captured in the column V\_SUBLEDGER\_APP\_CODE.

List of event types configured under each event class and for a sub-ledger application is mentioned in the file [Event to Journal Line Mapping](#).

Refer to the file [LOVs Header Tablekey columns](#) for populating columns V\_EVENT\_TYPE, V\_FAH\_ENTITY\_TYPE\_CODE and V\_SUBLEDGER\_APP\_CODE in the header tables. Depending on the event class, populate the exact values in these columns for FAH accounting templates to function as per expectation.

### 5.3 Setup Master Configuration

Configure the metadata attributes Ledger ID, Ledger Name in the Setup Master Table before execution of create accounting event API's.

V_COMPONENT_CODE	V_COMPONENT_DESC	V_COMPONENT_VALUE
FAH_LEDGER_ID	PRE CONFIGURED FAH LEDGER ID	<Provide valid Ledger ID>
FAH_LEDGER_NAME	PRE CONFIGURED FAH LEDGER NAME	<Provide valid Ledger Name>
FAH_GL_ACCT_COMB_REF	PRE CONFIGURED FAH_GL_ACCT_COMB_REF	<Provide valid combination id>

**Note:** gl\_ledgers and gl\_code\_combinations table in FUSION schema can be queried for the above values.

### 5.4 Accounting Event Creation

The Data Transformations (Wrapper Procedures) are integrated with post load changes framework in FAH user interface. There are two wrapper procedures each for Transactional and Pass through accounting. There are two seeded batches which will execute the DTs accordingly.

Flow Type	Data Transformation & Batch Name	Procedure Signature
Event based Accounting	DT : fn_fah_tran_event_gen Batch : <INFODOM>_FAH_EVENT_ACC_FLOW	fn_fah_tran_event_gen( p_batch_run_id VARCHAR2, p_as_of_date VARCHAR2, p_execution_mode VARCHAR2, p_application_name VARCHAR2, p_entity_type VARCHAR2 )
Pass through Accounting	DT : fn_fah_passthru_event_gen Batch: <INFODOM>_FAH_PASSTHRU_ACC_FLOW	fn_fah_passthru_event_gen( p_batch_run_id VARCHAR2, p_as_of_date VARCHAR2, p_execution_mode VARCHAR2, p_application_name VARCHAR2, p_entity_type VARCHAR2 )

# OFS DIH Foundation Pack Extension for FAH User Manual

The screenshot displays the Oracle Financial Services Analytical Applications interface. On the left, a tree view shows 'Data Management Tools' with 'Transformations' expanded. The main workspace shows a 'Transformation' block connected to 'Input Parameters' and 'Expression Generator'. Below this, the 'Parameter Definition' table lists parameters: p\_execution\_mode (Varchar2, null), p\_application\_name (Varchar2, null), and p\_entity\_type (Varchar2, null). The 'Stored Procedure Editor' shows the following PL/SQL code:

```

    WHEN 'SLAMCBANKING' THEN
        v_application_id = 100003;
    WHEN 'TREASURY' THEN
        v_application_id = 100004;
    END CASE;
    CASE p_execution_mode
    WHEN 'BULK' THEN
        pkg_sfas_fah_event_generate_bulk_event_wrap(p_batch_id => p_batch_run_id, p_process_date => to_number(p_as_of_date), p_application_id => v_application_id, p_entity_type => p_entity_type);
    WHEN 'SINGULAR' THEN
        IF p_entity_type IS NULL THEN
            dms_output.put_line('Error Occured : p_entity_type cannot be NULL when execution mode is SINGULAR');
            RETURN();
        END IF;
        pkg_sfas_fah_event_generate_event_wrap(p_batch_id => p_batch_run_id, p_process_date => to_number(p_as_of_date), p_application_id => v_application_id, p_entity_type => p_entity_type);
    WHEN NULL THEN
        dms_output.put_line('Error Occured : Invalid execution mode as NULL');
        RETURN();
    ELSE
        dms_output.put_line('Error Occured : Invalid execution mode as ' || p_execution_mode);
        RETURN();
    END CASE;

```

The screenshot displays the Oracle Financial Services Analytical Applications interface. On the left, a tree view shows 'Data Management Tools' with 'Transformations' expanded. The main workspace shows a 'Transformation' block connected to 'Input Parameters' and 'Expression Generator'. Below this, the 'Parameter Definition' table lists parameters: p\_execution\_mode (Varchar2, null), p\_application\_name (Varchar2, null), and p\_entity\_type (Varchar2, null). The 'Stored Procedure Editor' shows the following PL/SQL code:

```

    END P;
    WHEN NULL THEN
        dms_output.put_line('Error Occured : Invalid execution mode as NULL');
        RETURN();
    ELSE
        dms_output.put_line('Error Occured : Invalid execution mode as ' || p_execution_mode);
        RETURN();
    END CASE;
    EXCEPTION
    WHEN OTHERS THEN
        dms_output.put_line('Error Occured While Executing Procedure fr_fah_pasatru_event_gen: '||sqlerrm);
        dms_output.put_line('parameters passed are:');
        dms_output.put_line('p_batch_run_id: '||p_batch_run_id);
        dms_output.put_line('p_process_date: '||p_process_date);
        dms_output.put_line('p_application_name: '||p_application_name);
        dms_output.put_line('p_entity_type: '||p_entity_type);
        RETURN();
    END fr_fah_pasatru_event_gen;

```

The parameter for above wrapper functions needs to be provided as per below table.

Parameter Name	User Input Required	Format	Valid Values
p_batch_run_id	No		
p_as_of_date	No	YYYYMMDD	FIC_MIS_DATE

p_execution_mode	Yes		'SINGULAR' , 'BULK'
p_application_name	Yes		'RETAILBANKING' 'COMMERCIALBANKING' 'INVESTMENTBANKING' 'ISLAMICBANKING' 'TREASURY'
p_entity_type	Optional		<Valid Entity Types>

While generating events for 'Create Accounting', considerable level of logging is done in the table fsi\_message\_log. You can query this table in case of any failures in event generation process.

These API's eventually create event records in FAH database schema in a table xla\_events table. Events in this table are taken up for processing by submitting a job named "Create Accounting" in FAH. Some input to be provided while submitting this job is shown below.

### Process Details

Process Options | Advanced | Submit | Cancel

Name Create Accounting

Description Creates subledger journal entries.  Notify me when this process ends

Schedule As soon as possible      Submission Notes

---

#### Parameters

- \* Subledger Application
- \* Ledger
- Process Category
- \* End Date
- \* Accounting Mode
- \* Process Events
- \* Report Style
- \* Transfer to General Ledger
- \* Post in General Ledger
- Journal Batch
- \* Include User Transaction Identifiers

On successful processing, accounting entries are generated and posted to ledger module in FAH which inturn update the balances in the views exposed by FAH for this integration.

FAH provides thick and thin ledger balances via database views on its native schema and the data from these views are loaded into OFSAA staging table through DIH. Supporting Reference balances (thick ledger) are loaded in STG\_MANAGEMENT\_LEDGER and General Ledger Balances (thin ledger) are loaded in STG\_GL\_DATA.

## 6 Prerequisites for Deploying OFSAA-FAH Connectors

The deployment process requires certain actions to be performed prior to starting the interface Deployment. Ensure that these requirements are met before starting the installation.

Deployment of FAH Interface requires multiple steps to be executed either by FAH admin or by OFSAA admin. The steps are mentioned below, and should be followed in sequential manner.

### 6.1 Applying ARUs/Patches on FAH Environment

- Fusion Accounting Hub Schema (FUSION Schema) and OFSAA Atomic Schema, both should exist on the same Oracle database with same SID (Instance) as two separate schemas.
- The ARU's/patches associated with the below mention bug needs to be downloaded and applied in the FAH environment before proceeding with the interface installation

Bug ID	Description
20801168	REL92: OFSAA: FAH INTEGRATION BACKPORT FOR 17954083
20801172	REL92: OFSAA:ALLOW TXN/REF OBJECTS AND TXN VIEW TO BE IN OTHER
20801186	REL92:BACKPORT:ACCOUNTING HOOKS FOR OFSAA
20829957	REL9.2: NEW VIEW FOR OFSAA/FAH INTEGRATION
20830303	REL9.2: OFSAA INTEGRATION CHANGES

### 6.2 Installing OFSAA Components in FAH Fusion Schema

The following mentioned file need to executed by FAH database admin in the FUSION schema for this integration to work

- `Pre_Interface_Install_Scripts_fusion.sql`

The above scripts can be download from the Oracle support site using the below Bug reference

Bug ID	Description
21074954	OFSAA SCRIPTS TO CREATE REQUIRED OBJECTS AND GRANTS IN FUSION SCHEMA

Run the following script to create OFSAA objects in Fusion schema and provide necessary grants on required fusion objects to ofsa atomic schema.

\*\* Input ofsa atomic schema user name when prompted for value of "atomic\_schema\_user"

```
$ sqlplus fusion/<password>@<oracle sid>
sql>@"Pre_Interface_Install_Scripts_fusion.sql"
```

### 6.3 Additional DIH Configurations for FAH Interface

Perform the following steps:

1. Complete the ODI settings using “**Settings**” option in **DIH Application** menu before deploying the interface.

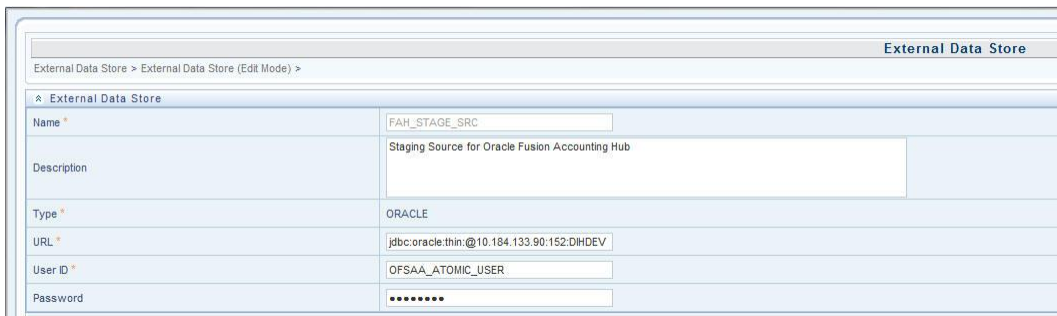

The ODI settings screen is displayed. Update the setting information correctly before proceeding to the deployment of FAH interface connectors.

Settings Menu	Values Required	Example
ODI User	User Name used for Login to ODI	SUPERVISOR
ODI Password	ODI Password for the ODI user to login	odipassword
Master Repository DB User	Master Repository DB Schema User Name created for ODI	DIHDEV_ODI_REPO
Master Repository DB Password	Master Repository DB Schema Password	dbpassword
Master DB Driver	Oracle Driver (Use the Default)	oracle.jdbc.OracleDriver
Master DB Connection	Oracle Database JDBC URL	jdbc:oracle:thin:@10.184.135.6:1521:DIHDB
Work Repository	Repository used inside ODI	DIHREP

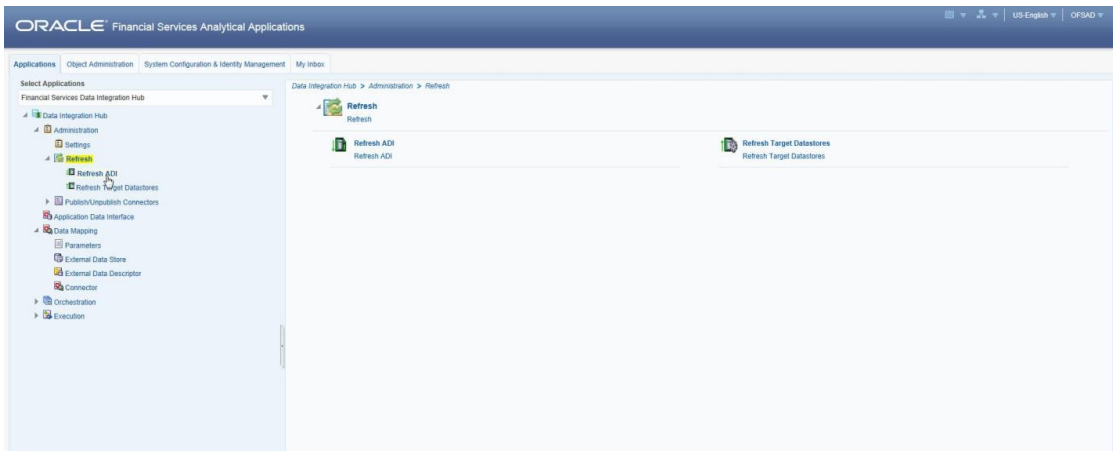

2. A source named **FAH\_STAGE\_SRC** is present in **External Data Store** under **DIH Application**. Select the entry **FAH\_STAGE\_SRC** and click **Edit**.

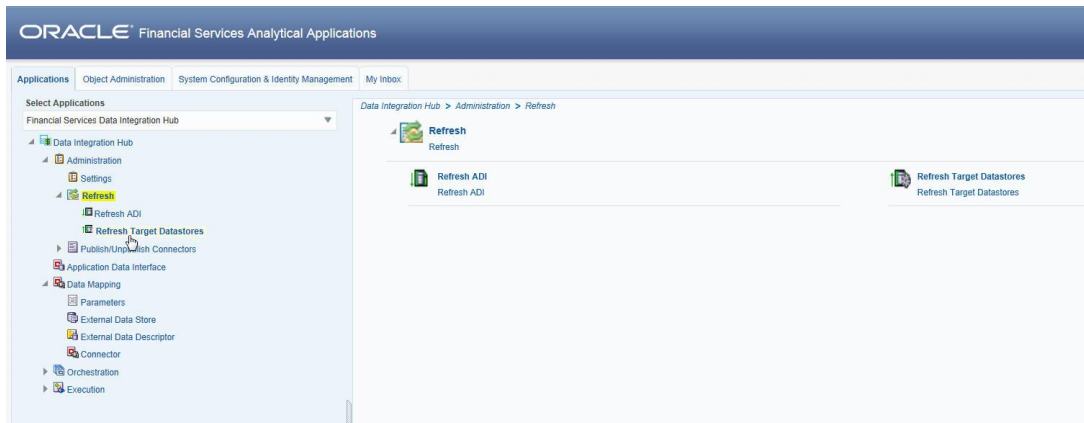

3. Provide the details of OFSAA Atomic schema. Source wrapper views required for this integration will be created in the OFSAA atomic schema. Refer to DIH User manual for more details on External Data Store settings.

4. Navigate to **DIH Application**, select **Administration** menu and Click **Refresh ADI**. This will refresh all the Application Data Interfaces, and creates the Application Data Interfaces for all the staging tables present in the model which is being uploaded in the same Infodom.

5. Navigate to **DIH Application**, select **Administration** menu and click **Refresh Target Databases**. This will refresh all the available target data stores.

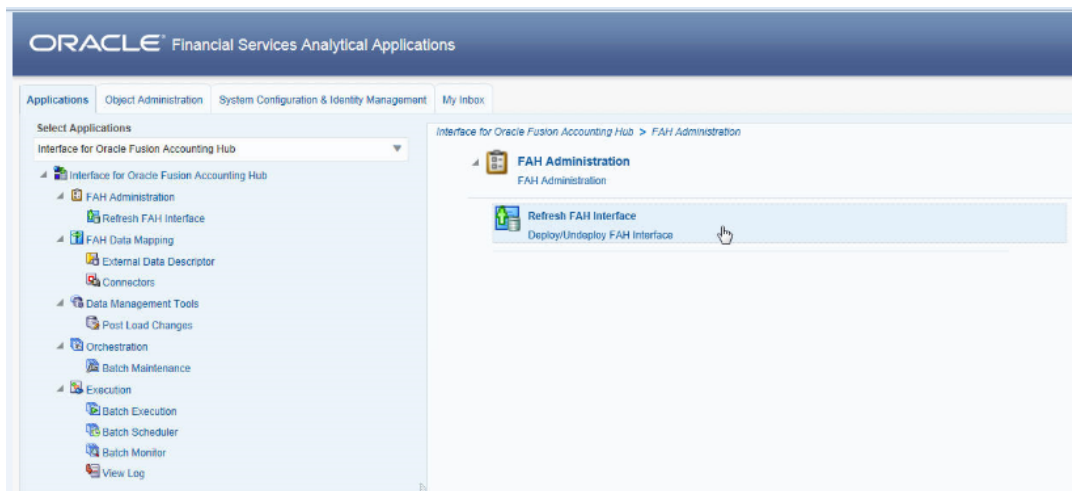

Refer to [DIH user manual](#) to obtain detailed information for any of the steps mentioned above.

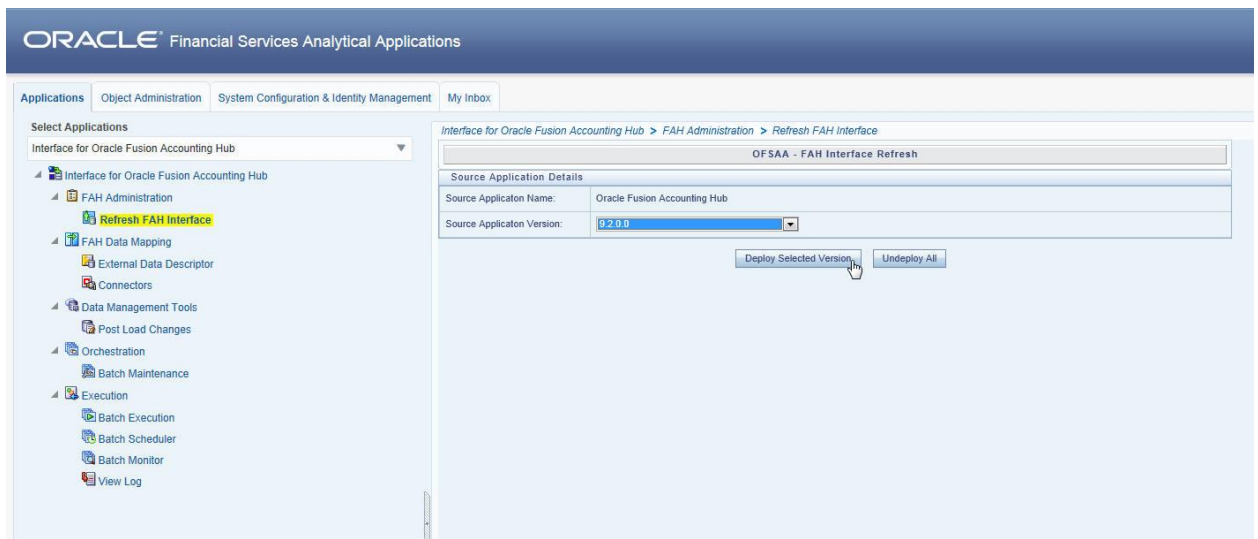

## 7 Deploying OFSAA-FAH Connectors Using Refresh FAH Interface Menu

After the pre-requisites are complete, you can deploy the FAH connectors that map the multiple file EDD's to the corresponding ADI's, by using **Refresh FAH Interface** menu. This creates the corresponding External Data Descriptor and Connectors inside **Data Mapping** Menu of the FAH Interface.

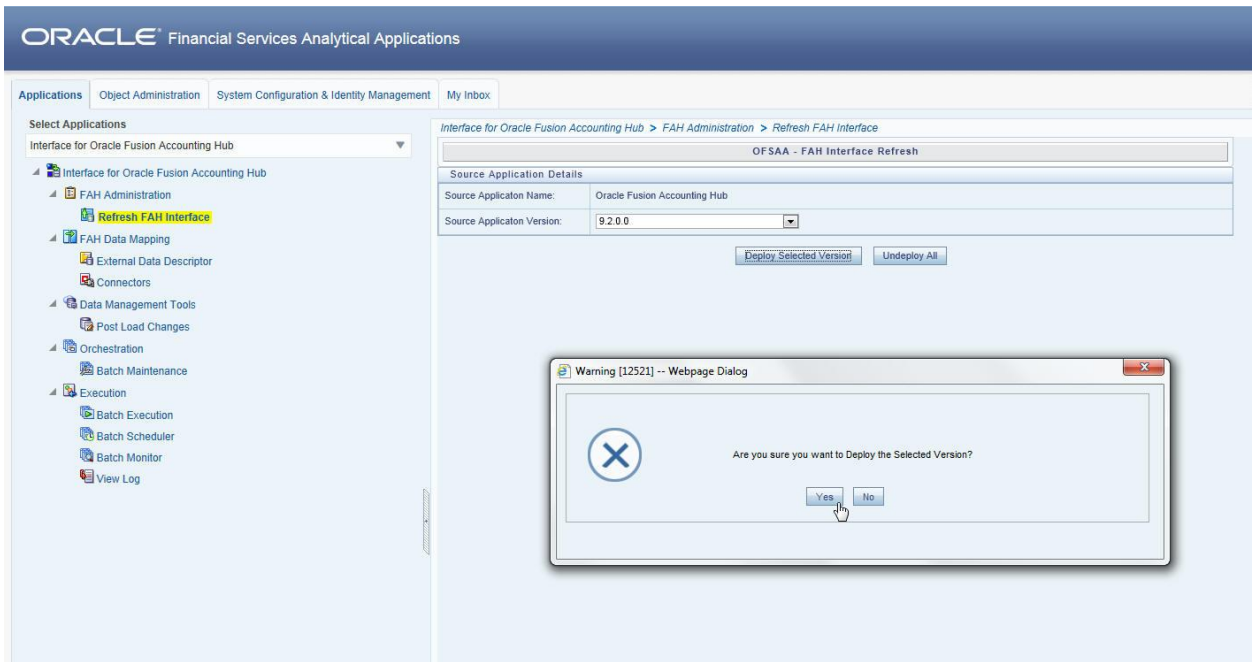

1. Navigate to the FAH application interface.
2. Select **Administration**, and click **Refresh FAH Interface**.

3. Select the **Source Application Version** (FAH Version 9.2.0) from the drop-down menu.
4. Click **Deploy Selected Version**

5. A message "Are you sure you want to Deploy the Selected Version?" is displayed. Click Yes to proceed.

After the deployment is complete, the “*Deployment Successful*” message is displayed.

6. Navigate to **External Data Descriptor** and **Connectors** under **FAH Data Mapping** for checking the deployed EDDs, Connectors and the Mappings.

The screenshot shows the Oracle Financial Services Analytical Applications interface. The breadcrumb trail is: Interface for Oracle Fusion Accounting Hub > FAH Data Mapping > External Data Descriptor. The page title is "External Data Descriptor" with an "As of Date" of 09/09/2014. A search bar is present. Below it is a table with columns: Name, Description, External Data Store Name, External Data Store Type, Status, Last Modified Date, and Last Modified By. Two entries are listed:

Name	Description	External Data Store Name	External Data Store Type	Status	Last Modified Date	Last Modified By
<input type="checkbox"/> OFSAA_WRAP_GL_BAL	FAH Custom view for GL Balances	FAH_STAGE_SRC	ORACLE DB	Saved	07/13/2015 19:03:00	DIHUSER
<input type="checkbox"/> OFSAA_WRAP_SR_BAL	FAH Custom view for Supporting References	FAH_STAGE_SRC	ORACLE DB	Saved	07/13/2015 19:03:00	DIHUSER

### FAH External Data Descriptor

The screenshot shows the Oracle Financial Services Analytical Applications interface. The breadcrumb trail is: Interface for Oracle Fusion Accounting Hub > FAH Data Mapping > Connectors. The page title is "Connectors" with an "As of Date" of 09/09/2014. A search bar is present. Below it is a table with columns: Name, Description, EDD, External Data Store Name, Status, Last Modified Date, and Last Modified By. Two entries are listed:

Name	Description	EDD	External Data Store Name	Status	Last Modified Date	Last Modified By
<input type="checkbox"/> Con_Fah_GL_Balances	Connector to load General Ledger Data	OFSAA_WRAP_GL_BAL	FAH_STAGE_SRC	Saved	07/13/2015 19:03:00	DIHUSER W
<input type="checkbox"/> Con_Fah_Sr_Balances	Connector to load Supporting References	OFSAA_WRAP_SR_BAL	FAH_STAGE_SRC	Saved	07/13/2015 19:03:00	DIHUSER W

### FAH Connectors

## 8 Post Deployment Configuration for FAH Interface

After the deployment is complete, perform the following activities on Fusion Accounting Hub Fusion schema.

1. Create synonyms for OFSAA transaction and reference objects in FUSION schema

Execute the below script to create synonyms in Fusion schema. You can download the script from Oracle support site using the below mentioned bug number

Bug Reference	Description
21074954	OFSAA SCRIPTS TO CREATE REQUIRED OBJECTS AND GRANTS IN FUSION SCHEMA

```
$ sqlplus fusion/<password>@<oracle sid>
sql>"Post Interface Install Scripts fusion.sql"
```

2. Import OFSAA seed data into FAH

This step is optional and is required only if you need to leverage the out of box seed data accounting rules and templates to post journal entries to Fusion Ledger.

The seed data ARU can be downloaded from Oracle Support site using the below mentioned bug Reference number.

Bug Reference	Description
21270802	SEED DATA STUB ARU FOR OFSAA-FAH INTEGRATION

## 9 Undeploying OFSAA-FAH Connectors Using Refresh FAH Interface Menu

You can use the **Undeploy All** button to undeploy the connectors. Use the undeploying feature in the following scenarios.

### 9.1 Deploying Upgraded Source Version

If there is an upgraded source application (FAH) available, you can undeploy the existing version of the connector, and redeploy the same by selecting the available upgraded source version. The current available source version for FAH connector supports FAH version 9.2.0.

**Note:** You can deploy only one source version at a time. You need to upgrade the source, undeploy the version and deploy the required version.

### 9.2 Changes in ODI / External Data Store Settings

If there is a change in the ODI/ External Data Store settings, then you can undeploy the connectors. Modify the settings and redeploy to obtain the latest connector settings.

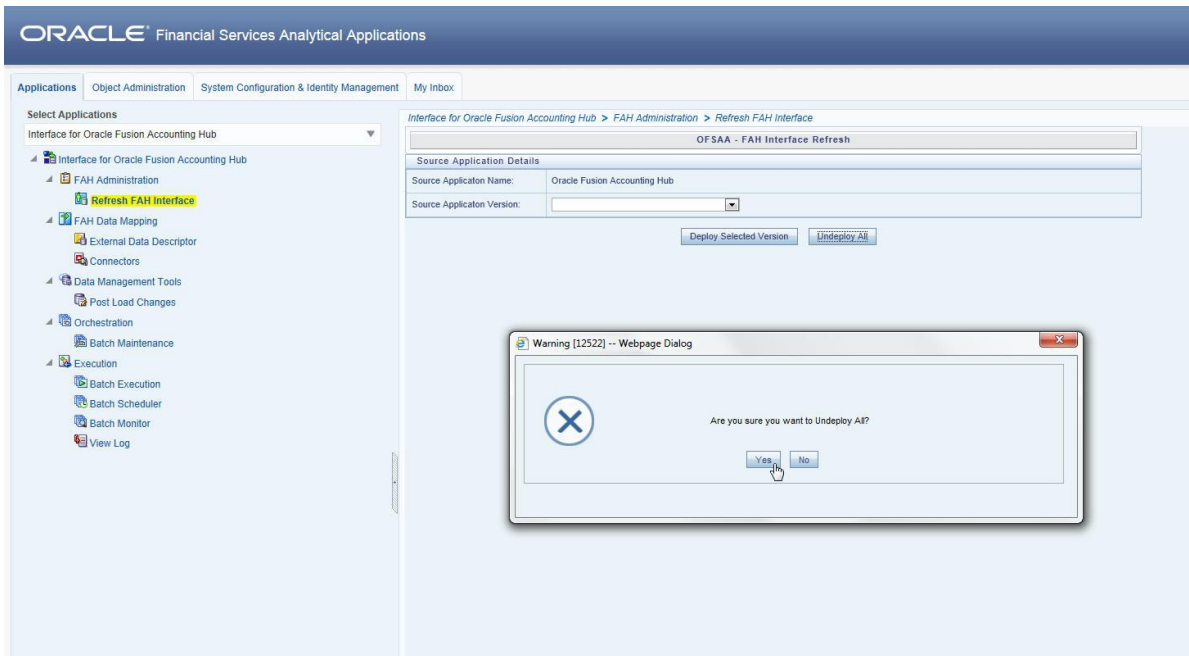

**Note:** You cannot undeploy the connectors if any of the Connector/External Data Descriptor is in published mode. Unpublish all the Connector/External Data Descriptor before proceeding with undeployment.

Follow the below steps to undeploy:

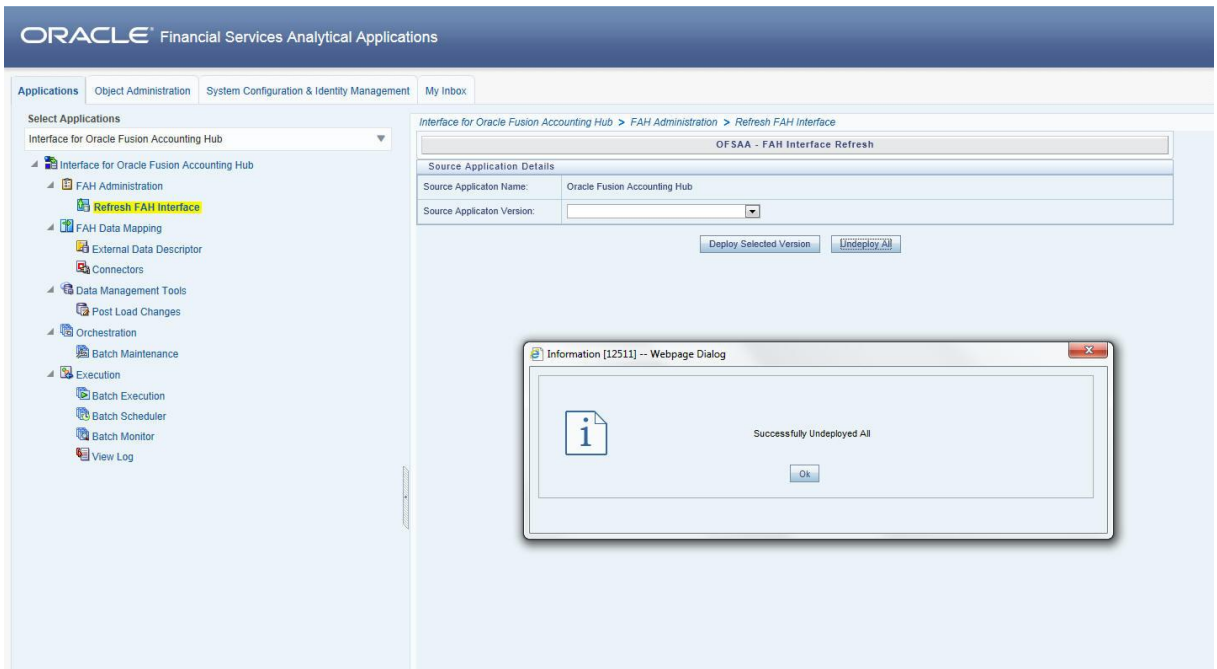

1. Click **Undeploy All** to undeploy the Connector version.

2. A message "Are you sure you want to Undeploy All?" is displayed. Click Yes to proceed.

3. After the undeployment is complete, the “*Successfully Deployed All*” message is displayed.

## 10 GL and SR Balance Extraction using FAH Connectors

This chapter includes:

- Metadata Configuration
- Enable Delta Balance Extraction
- Refresh Wrapper Views
- Execute DIH Connectors

### 10.1 Metadata Configuration

This section details the metadata configuration.

#### 10.1.1 Chart of Account to OFSAA Dimension Mapping

FAH requires customers to map Chart of Accounts segments to OFSAA attributes. These mappings are used to pull the data in OFSAA staging area during FAH interface execution.

The COA segments need to be mapped to OFSAA attributes in STG\_GL\_DATA table. Ensure that all the active segments in the view GL\_OFSAA\_LEDGER\_COA\_V are mapped for the specific OFSAA dimension. FAH accommodates up to 30 segment in the COA definition.

Currently, this mapping is partially seeded in a table named FSI\_FAH\_COA\_OFSAA\_ATTR\_MAP in the OFSAA atomic schema.

Sample entries assuming that COA structure is made up of 3 segments namely Legal Entity, Business Unit and Account as mentioned in the below table.

COA_SEGMENT_NAME	FAH_ATTRIBUTE	OFSAA_COLUMN_NAME
COA_SEGMENT1_NAME	Legal Entity	v_lv_code
COA_SEGMENT2_NAME	Business Unit	v_org_unit_code
COA_SEGMENT3_NAME	Account	v_gl_code

---

**Note:** If a particular segment in COA structure in FAH is unavailable in STG\_GL\_DATA table, you need to customize the table along with the corresponding DIH connector.

---

#### 10.1.2 Supporting Ref Codes to OFSAA Dimension Mapping

Map the supporting ref codes to attributes in STG\_MANAGEMENT\_LEDGER table. Ensure that all the active supporting references in the view XLA\_OFSAA\_BALANCES\_V are mapped for the specific OFSAA dimension. FAH accommodates up to 30 supporting references in addition to the 30 segments.

This mapping is currently stored in a table named FSI\_FAH\_SR\_OFSAAT\_ATTR\_MAP

Sample mapping provided in the below table assumes that the 3 additional supporting references have been configured , such as Account Number, Customer Reference and Customer Type.

SUP_REF_CODE	FAH_ATTRIBUTE	OFSAAT_COLUMN_NAME
SUP_REF_CODE1	Account Number	v_account_number
SUP_REF_CODE2	Customer Reference	v_cust_ref_code
SUP_REF_CODE3	Customer Type	v_cust_type

## 10.2 Enable Delta balance extraction

In order to enable extraction of balances incrementally and multiple during a business day, FAH provides the incremental movements in a separate view. This delta balance tracking mechanism is available for a combination of ledger/period in FAH. This needs to be turned on by updating columns LEDGER\_ID and PERIOD\_NAME in a table named GL\_TRACK\_DELTA\_BALANCES located in the FUSION schema. Sample insert statement is as follows

The source view GL\_OFSAAT\_BALANCES\_DELTA\_V will be refreshed with the delta balances after the accounting process submission. The delta balances are loaded into OFSAAT in a processing table FSI\_FAH\_LEDGER\_DELTA\_BAL by executing the below procedure.

Procedure Name	Execution Mode	Procedure Signature
pop_fah_delta_bal. pop_delta_bal	Bulk Only	PROCEDURE pop_delta_bal( v_fic_mis_Date DATE, v_period_name VARCHAR2, v_ledger_name VARCHAR2)

**Note:** A Data Transformation named `fn_fah_pop_delta_bal` has also been provided in “Post Load Changes” menu of OFSAAT FAH user interface. Also there is one seeded batch <INFODOM>\_POP\_FAH\_DELTA\_BALANCE which can be used for executing the above procedure.

Sample insert statement for reference is given below:

```
INSERT
INTO GL_TRACK_DELTA_BALANCES
(
    LEDGER_ID,
    PROGRAM_CODE,
    , PERIOD_NAME
    , ACTUAL_FLAG
    , EXTRACT_LEVEL_CODE
    , CURRENCY_TYPE_CODE
    , ENABLED_FLAG
    , LAST_UPDATE_DATE
    , LAST_UPDATED_BY
    , CREATION_DATE
    , CREATED_BY
    , LAST_UPDATE_LOGIN
    , OBJECT_VERSION_NUMBER
)
VALUES
(
    <<Replace with Ledger_ID as per FAH>>
    , 'FEM'
    , <<Replace with Period_Name as per FAH>>
    , 'A'
    , 'DTL'
    , 'B'
    , 'Y'
    , systimestamp
    , USER
    , systimestamp
    , USER
    , USER
    , 1
)
);
```

---

### 10.3 Refresh Wrapper Views

The GL and SR balances views of FAH have wrappers written in OFSAA schema which refer to the metadata for created above for COA and SR segments. These wrapper views are configured as EDD's within DIH connector definition.

Execute the below PL/SQL block in OFSAA atomic schema to accomplish this:

```
SET serveroutput ON;

BEGIN

ofsaa_vw_create_util.fah_ofsaa_cr_gl_view(); ---- to refresh wrapper view
for GL balance extraction

ofsaa_vw_create_util.fah_ofsaa_cr_sr_view(); ---- to refresh wrapper view
for SR balance extraction

END;
```

---

**Note:** Refresh these views manually whenever there is a change in metadata mappings in tables FSI\_FAH\_COA\_OFSAA\_ATTR\_MAP and FSI\_FAH\_SR\_OFSAA\_ATTR\_MAP

---

### 10.4 Executing FAH Connectors

To extract GL balances from FAH after performing the steps mentioned above, publish and execute connector **Con\_Fah\_GI\_Balances**.

To extract SR balances from FAH after performing the steps mentioned above, publish and execute connector **Con\_Fah\_Sr\_Balances**.

Refer to the DIH User Guide for more information on publishing and executing DIH connectors.
