## Introduction

In Oracle Banking Platform, Collection system identifies delinquent accounts, fetches the account and party related data and stores it in the staging tables. After validation of these records, entity creation batch processes these records and moves them to Collections tables. For other host systems, it is expected that delinquent account data is pushed into these staging tables.

The feeder services exposed by Collections are invoked when changes in data take place in OBP. These services bring modified data into staging tables before batch processes these and update collections tables.

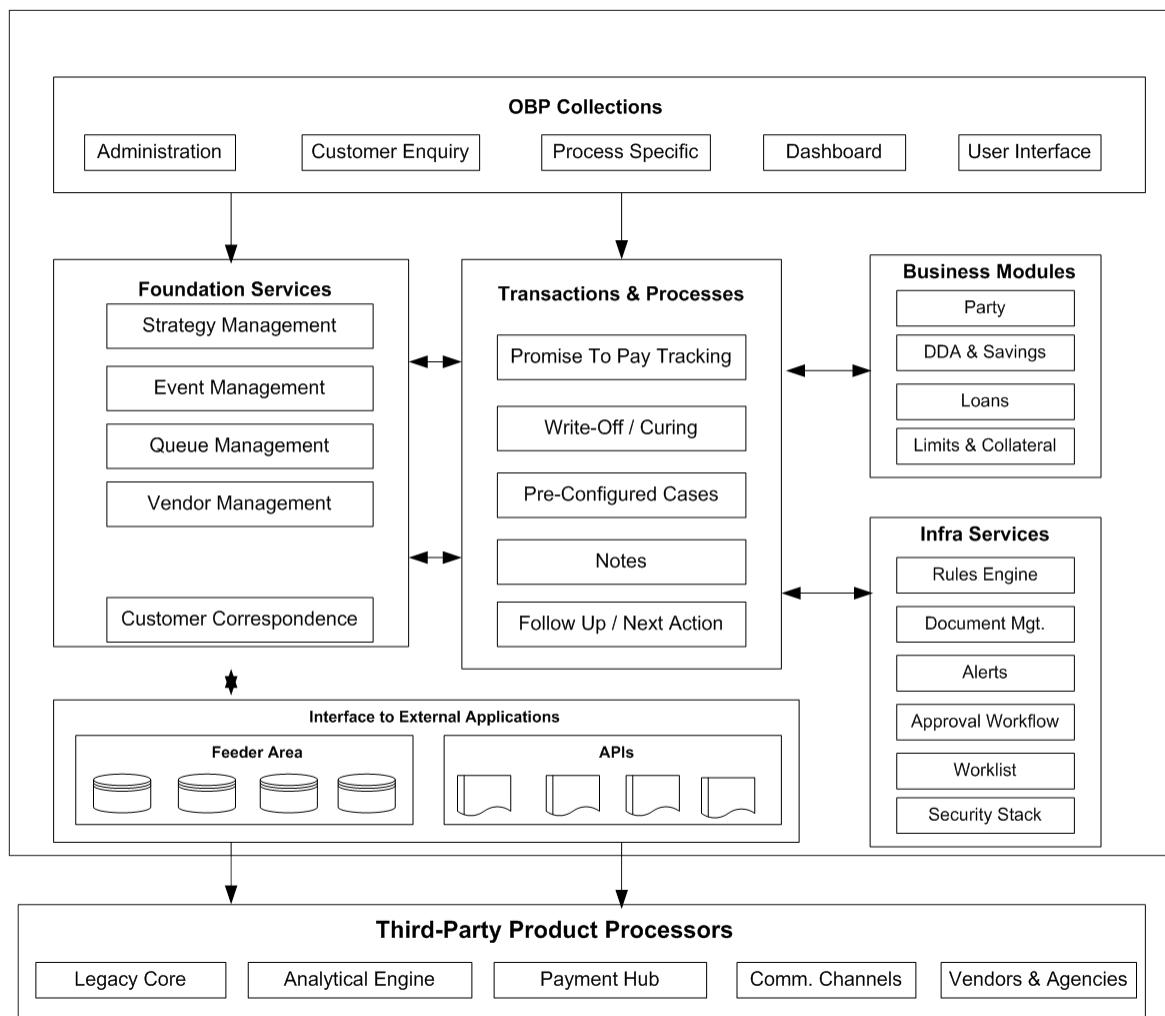

## System Overview

This chapter provides information about the modules or systems interfaced with OBP Collections.

The diagram below shows the interface that Collections has with other modules or systems. It depicts the collections flow and its interface with OBP modules.

## Staging Area

This chapter provides information about the modules or systems interfaced with OBP Collections.

### 3.1 Feeder Tables

The feeder tables listed in this section provide a staging area for the host systems to push data. Offline collection batch process reads this data and creates accounts in Collections.

#### 3.1.1 Account Data

This section provides information on the tables related to accounts.

<b>Parameters</b>	<p><b>Name:</b> Input Key1  <b>Required (Yes/No):</b> Yes  <b>Description:</b> Primary Key name of defined BO.</p> <p><b>Name:</b> Input Key2  <b>Required (Yes/No):</b> No  <b>Description:</b> Primary Key name of defined BO.</p> <p><b>Name:</b> Input Key3  <b>Required (Yes/No):</b> No  <b>Description:</b> Primary Key name of defined BO.</p> <p><b>Name:</b> Input Key4  <b>Required (Yes/No):</b> No  <b>Description:</b> Primary Key name of defined BO.</p> <p><b>Name:</b> Input Key5  <b>Required (Yes/No):</b> No  <b>Description:</b> Primary Key name of defined BO.</p>

**Table 4-77 (Cont.) Rule Facts Populating Algorithm: C1-BRLSR**

Parameters	<p><b>Name:</b> Input BO Name1  <b>Required (Yes/No):</b> Yes  <b>Description:</b> BO name to fetch fact values. If BOName1 is defined then its primary key name must be defined in Input Key 1. Similarly configure other BO names.</p> <p><b>Name:</b> Input BO Name2  <b>Required (Yes/No):</b> No  <b>Description:</b> BO name to fetch fact values. If BOName1 is defined then its primary key name must be defined in Input Key 1. Similarly configure other BO names.</p> <p><b>Name:</b> Input BO Name3  <b>Required (Yes/No):</b> No  <b>Description:</b> BO name to fetch fact values. If BOName1 is defined then its primary key name must be defined in Input Key 1. Similarly configure other BO names.</p> <p><b>Name:</b> Input BO Name4  <b>Required (Yes/No):</b> No  <b>Description:</b> BO name to fetch fact values. If BOName1 is defined then its primary key name must be defined in Input Key 1. Similarly configure other BO names.</p> <p><b>Name:</b> Input BO Name5  <b>Required (Yes/No):</b> No  <b>Description:</b> BO name to fetch fact values. If BOName1 is defined then its primary key name must be defined in Input Key 1. Similarly configure other BO names.</p>
Parameters	<p><b>Name:</b> Bo Fields  <b>Required (Yes/No):</b> Yes  <b>Description:</b> Comma separated BO fields of defined BO names.</p> <p><b>Name:</b> Rule Fact Codes  <b>Required (Yes/No):</b> Yes  <b>Description:</b> Comma separated fact codes for rule to be executed. BO Fields and Rule Fact codes should be defined in the same order.</p> <p><b>Name:</b> Pre Populated Rule Facts Algorithm Code  <b>Required (Yes/No):</b> No  <b>Description:</b> Algorithm code of algorithm holding pre populated facts. Rule facts which cannot be retrieved from BO fields can be pre populated in algorithm. These facts will be appended to input facts for rule under execution. Algorithm type must be defined on algorithm spot 'Rule Execution - Pre Populated Rule Facts' (For more information check sample implementation 'C1-PPSF').</p>
Detailed Design	<p>This algorithm is used to populate rule facts from Business object (BO). Business object fields are fetched using combination of BO name and its respective primary key. Further these values are mapped to rule fact code. Also, pre-populated facts are appended to these values, if provided from external algorithm. These populated facts will act as input to defined rule through soft parameter.</p>

## Feeder Services

Feeder tables in Collections act as an additional layer to validate incoming data pulled from the host. Since ORMB has its own architecture and framework, incoming data from any host is validated as per ORMB objects standard.

**Table 5-1 Feeder Services**

Service Name	Method Name	Description	Mandatory Fields
AccountFeederApplicationService	AccountFeederResponse update(SessionContext sessionContext, AccountFeederWrapperDTO accountFeederWrapperDTO) throws FatalException;	This service adds or updates account related fields in the feeder table. It handles add, update and delete operations.	hostAcctNumber, srcHostId
AccountHardshipDtlsFeederApplicationService	AccountHardshipDtlsFeederResponse update(SessionContext sessionContext, AccountFeederHardshipDtlsWrapperDTO accountFeederHardshipDtlsWrapperDTO) throws FatalException;	This service adds or updates accounts hardship related fields in the feeder table.
