## rtrv-e1

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the `ent -e1` command for an HC-MIM or E5-E1T1/E5-E1T1-B card used as an E1 or SE-HSL card.

**Parameters****e1port (optional)**

E1 port number

The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card (`loc` parameter).

**Range:**

1 - 8

**Default:**

If not specified, all E1 ports are listed.

**loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**Default:**

If not specified, all E1 card locations are listed.

**Example**

```
rtrv-e1
```

```
rtrv-e1:loc=1307:e1port=2
```

```
rtrv-e1:loc=1311:e1port=1
```

### Dependencies

The **loc** and **e1port** parameters must be specified together in the command.

The E1 interface of the E1 card specified by the **loc** parameter must already be defined (see the **ent-e1** command) before this command can be entered.

The card specified by the **loc** parameter must be a LIME1 card type.

The Card (IMT) table must be accessible.

The E1/T1 table must be accessible.

An E1 interface must already be defined on the port specified by the **e1port** parameter before this command can be entered.

The following card locations (**loc** parameter) are not valid for this command: 1113 through 1118 and all *xy*09 and *xy*10 locations (where *x* is the frame and *y* is the shelf).

### Notes

None.

### Output

This example shows HC-MIM cards used as E1 cards. Cards with **LINKCLASS=UNCHAN** have SE-HSL links.

```
rtrv-e1
```

```
tekelecstp 17-03-09 09:25:22 EST EAGLE 46.5.0.0.0-70.19.0
```

```
  rtrv-e1
```

```
  Command entered at terminal #4.
```

| E1   |      |      |        |    |    | LINK   | MINSU |
|------|------|------|--------|----|----|--------|-------|
| LOC  | PORT | CRC4 | ENCODE | SI | SN | CLASS  | RATE  |
| 1101 | 1    | ON   | HDB3   | 0  | 0  | CHAN   | ----  |
| 1107 | 8    | ON   | HDB3   | -- | -- | UNCHAN | 2000  |

```
;
```

### Legend

- **LOC**—E1 card location
- **E1PORT**—E1 port number on an E1 card
- **CRC4**—CRC4 indicator
- **ENCODE**—Indicator for use of HDB3 or AMI encoding/decoding
- **SI**—Value of two Spare International bits of NFAS data
- **SN**—Value of five Spare National bits of NFAS data
- **LINKCLASS**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" E1 Card (CHAN) or an "unchannelized" SE-HSL card (UNCHAN)

- **MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.
- **TSx**—Timeslot

## rtrv-eisopts

Use this command to retrieve the status of the copy functions for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-eisopts
```

**Dependencies**

The NETOPTS table must be accessible.

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

**Notes**

None

**Output**

```
rtrv-eisopts
```

```
rlghncxa03w 17-08-21 11:12:15 EST  EAGLE 46.6.0
EIS OPTIONS
-----
EISCOPY = ON

-----
FCGPL = IPSG      FCMODE = FCOPY
-----
;
```

**Related Topics:**[chg-eisopts](#)

## rtrv-enum-acl

Use this command to retrieve an entry from the ENUM Access Control List (ACL) Table. The ENUM ACL Table supports the provisioning information related to the allowed IP addresses for the ENUM application.

### Parameters

#### **ipaddr (optional)**

This is a TCP/IP address expressed in standard dot notation. It specifies allowed IP addresses for the ENUM application.

#### **Range:**

Four numbers separated by dots, with each number in the range of 0-255, \*.

---

---

**Note:** It also supports wildcard characters as follows:

```
xxx.xxx.xxx.*
xxx.xxx.*.*
xxx.*.*.*
```

where xxx can be any number in range of 0-255.

---

---

#### **System Default:**

0.0.0.0

### Example

```
rtrv-enum-acl
rtrv-enum-acl:ipaddr=10.248.13.9
rtrv-enum-acl:ipaddr=10.248.13.*
rtrv-enum-acl:ipaddr=10.248.*.*
rtrv-enum-acl:ipaddr=10.*.*.*
```

### Dependencies

The ENUM ACL Table should be accessible.

The IP address specified by the IPADDR parameter should be provisioned in the ENUM ACL Table.

The IP address specified by the IPADDR parameter must be a valid IP address.

### Notes

Wildcard IP addresses are allowed to support the ranges of IP addresses.

### Output

This example displays output when the IPADDR parameter is not specified:

```
rtrv-enum-acl
```

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0

## rtrv-enum-prof

Use this command to retrieve the existing profile entry which has data to generate the ENUM response for three supported resource record formats such as NAPTR, NS and CNAME. The ENUM Profile Table stores the profile entry.

### Parameters

#### **prn (optional)**

Profile name. This parameter specifies the unique logical name assigned to the profile entry used to generate the ENUM response.

#### **Range:**

*zzzzzzzzzz*

A string of alphanumeric characters, beginning with a letter and up to 10 characters in length. Valid values are a..z, A..Z, 0..9.

#### **rtype (optional)**

Response type. This parameter specifies the response type for the profile. It identifies the profile used to generate the ENUM response for each resource record type.

#### **Range:**

*naptr*

*cname*

*ns*

**Default:**

No change to the current value

**System Default:**

*naptr*

**sparm (optional)**

Service parameter. This parameter specifies the supported ENUM services. The ENUM application shall only support two ENUM Services.

**Range:**

*pstntel*

*pstnsip*

*sip*

**Default:**

No change to the current value

**System Default:**

*pstntel*

**Example**

```
rtrv-enum-prof:prn=pr1
rtrv-enum-prof:sparm=pstntel
rtrv-enum-prof:rtype=ns
rtrv-enum-prof:rtype=naptr:sparm=sip
rtrv-enum-prof:rtype=naptr:sparm=pstnsip
```

**Dependencies**

The ENUM Profile Table should be accessible.

The Profile name parameter cannot be specified with any other parameter.

The Profile name must be present in the ENUM Profile Table.

Either provide the SPARM parameter alone or with the RTYPE=NAPTR parameter.

**Notes**

None.

**Output**

The example shows the output of a profile having RTYPE = NAPTR.

```
> rtrv-enum-prof:prn=pr1
```

```
tekelecstp 18-05-29 04:55:20 MST EST EAGLE 46.1.0

## rtrv-enum-profsel

Use this command to retrieve an entry from the ENUM Profile Selection Table or the ENUM DN Block Table. The ENUM Profile Selection Table supports the provisioning information related to mapping the Entity Id to the Profile Selection Id. The ENUM DN Block table supports the provisioning information related to mapping the DN Block to the Profile Selection Id.

#### Parameters

##### **edn (optional)**

End Dialed Number

##### **Range:**

5-15 digits

##### **entityid (optional)**

Network Entity

##### **Range:**

1-15 digits

##### **sdn (optional)**

Start Dialed Number

##### **Range:**

5-15 digits

#### Example

```
rtrv-enum-profsel:entityid=12345
```

```
rtrv-enum-profsel:sdn=11223344
```

```
rtrv-enum-profsel:edn=1324566
```

```
rtrv-enum-profsel
```

#### Dependencies

The value specified for the EntityId, SDN, or EDN parameters must already exist in the ENUM Profile Selection Table or the ENUM DN Block Table respectively.

The ENUM Profile Selection Table should be accessible.

The ENUM DN Block Table should be accessible.

Entity Id cannot be specified with SDN or EDN.

### Notes

None

### Output

This example displays output when entity Id is specified:

**rtrv-enum-profsel:entityid=1234**

```
tekelecstp 14-05-28 15:04:28 EST EAGLE 46.1.0

## rtrv-feat

Use this command to show the status of optional features in the system that are controlled with the `chg-feat` command.

#### Parameters

This command has no parameters.

#### Example

```
rtrv-feat
```

#### Dependencies

The MAS configuration table must be accessible.

The database cannot be accessed. There is a severe database failure.

None

#### Notes

This command is not allowed in upgrade mode.

## Output

---

**Caution:** The following output example may differ from the output shown at your terminal and may include unsupported features. Some optional features must be purchased before you turn the feature on. If you are not sure whether you are entitled to turn a feature on, contact your Oracle Sales Representative or Account Representative. After you turn on a feature with the `chg-feat` command, you cannot turn it off.

---

### Legend

- **GTT**—Global Title Translation feature
- **GWS**—Gateway Screening feature
- **NRT**—Network Routing feature
- **LAN**—STPLAN feature
- **CRMD**—Cluster Routing and Management Diversity feature
- **LFS**—Link Fault Sectionalization feature
- **MTPRS**—ANSI MTP Restart feature
- **FAN**—Cooling Fan feature
- **DSTN5000**—DSTN5000 (5000 Routes) feature
- **WNP**—Wireless Number Portability feature
- **CNCF**—Calling Name Conversion Facility with Redirect Capability feature
- **TLNP**—Triggerless Local Number Portability feature
- **IPISUP**—ISUP Routing over IP feature
- **SEAS**—SEAS feature
- **SCCPCNV**—SCCP Conversion feature
- **TCAPCNV**—TCAP Conversion feature

- **PLNP**—PCS 1900 Number Portability feature
- **NCR**—Nested Cluster Routing feature
- **ITUMTPRS**—ITU MTP Restart feature
- **SLSOCB**—Other CIC Bit Used feature
- **EGTT**—Enhanced Global Title Translation feature
- **VGTT**—Variable Length GTT feature
- **MPC**—Multiple Point Code feature
- **ITUDUPPC**—ITU National Duplicate Point Code feature
- **TSCSYNC**—Time Slot Counter Synchronization (TSC) feature
- **E5IS**—EAGLE 5 Integrated Monitoring Support feature
- **MEASPLAT**—Measurements Platform feature

## **rtrv-frm-pwr**

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

**Parameters**

**frm (optional)**

Frame ID. This parameter displays the FPT table entry for the specified provisioned frame.

**Range:**

*cf00*

Control frame

*ef00*

First extension frame

*ef01*

Second extension frame

*ef02*

Third extension frame

*ef03*

Fourth extension frame

*ef04*

Fifth extension frame

**Example**

Retrieve all provisioned Frame Power Threshold table entries.

```
rtrv-frm-pwr
```

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00).

```
rtrv-frm-pwr:frm=cf00
```

**Dependencies**

The following values are valid for the *frm* parameter: *CF00*, *EF00*, *EF01*, *EF02*, *EF03*, *EF04*.

The *frm* parameter value must specify a provisioned frame.

The Frame Power Threshold (FPT) table must be accessible.

The *frm* parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

**Notes**

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the *frm* parameter is specified, the FPT entry corresponding to the specified frame is displayed.

**Output**

This example retrieves all Frame Power Threshold table entries:

```
rtrv-frm-pwr
```

```
tekelecstp 06-04-11 12:38:01 EST  EAGLE 35.0.0
```

| Frame | Power Threshold (Amps) |
|-------|------------------------|
| ----- | -----                  |
| cf00  | 56                     |
| ef00  | 36                     |
| ef01  | 40                     |

```
FRAME POWER THRESHOLD table is (3 of 10) 30% full;  
RTRV-FRM-PWR: MASP A - COMPLTD
```

```
;
```

This example Retrieve the Frame Power Threshold table entry for the control shelf:

```
rtrv-frm-pwr:frm=cf00
```

```
tekelecstp 06-04-11 12:38:01 EST  EAGLE 35.0.0
```

| Frame | Power Threshold (Amps) |
|-------|------------------------|
| ----- | -----                  |
| cf00  | 56                     |

```
FRAME POWER THRESHOLD table is (3 of 10) 30% full;  
RTRV-FRM-PWR: MASP A - COMPLTD
```

```
;
```

## **rtrv-ftp-serv**

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

**Parameters****app (optional)**

Application. This parameter specifies the FTP Client application that interfaces with the FTP Server.

**Range:***db*

Database Backup\Restore application

*dist*

EAGLE Software Release Distribution application

*meas*

Measurements Platform application

*sflog*

SS7 Firewall Logging application

*user*

FTP-based Table Retrieve Application (FTRA)

**ipaddr (optional)**

IP Address of the FTP Server.

**Range:**

4 numbers separated by dots, with each number in the range of 0-255.

**mode (optional)**

Full or brief report indicator.

**Range:***full**brief***Default:***brief*

**Example**

```
rtrv-ftp-serv
rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100
rtrv-ftp-serv:mode=brief
rtrv-ftp-serv:app=meas
rtrv-ftp-serv:ipaddr=1.255.0.100
rtrv-ftp-serv:mode=full
rtrv-ftp-serv:app=sflog
```

**Dependencies**

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **mode** parameter allows you to display either the full 100 characters of the path string for each entry (**mode=full**), or the first 29 characters of the path string for each entry (**mode=brief**).

**Notes**

The LOGIN and PATH are displayed in mixed case.

**Output**

```
rtrv-ftp-serv
```

```
tekelecstp 12-09-19 15:15:04 EST 45.0.0-64.42.0
rtrv-ftp-serv
Command entered at terminal #4.
```

## rtrv-gpl

Use this command to show the version numbers of the GPLs stored on each fixed disk or drive and the system release table stored on each fixed disk.

### Parameters

#### gpl (optional)

Generic program load. The GPL for which to retrieve information.

#### Range:

*xyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

*atmhc*—Used by E5-ATM-B cards to allow the card to support up to 3 signaling links

*bldc32*—Flash GPL containing a tar image with all code required on E5-MCAP cards to support VxWorks6.9 32-bit application, as in OAMHC69.

*bldc64*—Flash GPL containing a tar image with all code required on E5-SM8G-B cards for SCCP64, ENUM64, SIP64 and DEIR64 applications.

*blmcap*—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards

*blslc32*—Flash GPL containing a tar image with all code required on SLIC cards for 32-bit application i.e. MCPHC, IPSHC etc.

*blslc64*—Flash GPL containing a tar image with all code required on SLIC cards for 64-bit application i.e. SCCP64, ENUM64, SIP64 and DEIR64.

*blsl932*—Flash GPL containing a tar image with all code required on SLIC cards for 32-bit application on VxWorks6.9, as in IPSHC69 and MCPHC69.

*deirhc*—Used by E5-SM8G-B cards to support the S13/S13' EIR feature

*enumhc*—Used by E5-SM8G-B cards to support the ENUM Mobile Number Portability and Tier One Address Resolution application

*erthc*—Used by E5-ENET-B cards for EAGLE 5 Integrated Monitoring Support functions

*hipr2*—Communication software used on the High Speed IMT Packet Router (HIPR2) card

*ipsg*—Used by E5-ENET-B cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

*ipsg32*—Used by SLIC cards to support IPSG application with 64-bit addressing either with GTT functionality or without it.

*ipshc*—Used by E5-ENET-B cards to support the IPS application

*ipshc69*—Used by E5-ENET-B and SLIC cards to support the IPS application when running on VxWorks69.

*mcp<sup>hc</sup>*—Used by E5-MCPM-B cards for the Measurements Platform feature

*mcp<sup>hc</sup>69*—Used by E5-MCPM-B and SLIC cards for the Measurements Platform feature when running on VxWorks69.

*oam<sup>hc</sup>*—Used by E5-MCAP cards for enhanced OAM functions

*oam<sup>hc</sup>69*—Used by E5-MCAP cards for enhanced OAM functions, when running on VxWorks 69.

*scc<sup>phc</sup>*—Used by E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM8G-B card is present, then the GPL processes normal GTT traffic.

*sfapp*—Used by SLIC cards to support the Stateful Firewall Application.

*sip<sup>hc</sup>*—Used by E5-SM8G-B Cards to support the SIP application.

*ss7<sup>hc</sup>*—Application GPL used by E5-E1T1-B and SLIC cards to support **E1** and **T1** signaling links.

**Default:**

Display all

**Example**

```
rtrv-gpl
```

```
rtrv-gpl:gpl=hipr2
```

**Dependencies**

No other activate, change, copy, or retrieve GPL command can be in progress when this command is entered.

The value specified for the `gpl` parameter must be supported.

**Notes**

To check the version of the EPAP or ELAP application, use the `rept-stat-mps` command.

If no application is specified, the approved and trial versions for all GPLs are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the `act-gpl` command.

The trial GPL is the version of the GPL that was downloaded from the removable drive, but not activated by the `act-gpl` command.

When the `act-gpl` command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the OAM GPL trial version on the fixed disk and for all GPLs on the plug-in USB flash drive when the drive is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (rtrv-gpl) and for each RUNNING GPL (rept-stat-gpl) that does not match the GPL in the RELEASE column of the rtrv-gpl output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the rept-stat-gpl command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

## Output

This example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

### rtrv-gpl

## Command Executed

This example shows the output with the E5-based control cards feature. A removable drive is in the latched USB port and a plug-in flash drive is in the flush-mounted USB port of the active OAM. A removable drive is not present in the latched USB port of the standby OAM.

### Legend

- **GPL**—GPL associated with each card in the display
- **APPROVED**—GPL version that is the approved GPL.
- **CARD**—Card location.
- **RELEASE**—Version number of each GPL that is required to be installed and approved for a specific release of software for the system.
- **REMOVE TRIAL**—GPL version that is on the removable drive.
- **TRIAL**—GPL version that is the trial GPL.
- **-----**—GPL is not present at the specified location.
- **ALM**—Alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.
- **CORRUPTED**—Data audit has determined that the GPL is corrupted.

## rtrv-gserv-data

Use this command to display all values in the GSERV table or to display specific translation type, originating point code, or global title address data. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port service.

### Parameters

---

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

---

**display (optional)**

Use this parameter to display a specified category of entries in the GSERV table.

**Range:**

*all*

Display all entries in the GSERV table.

*gta*

Display all calling party (CgPA) global title addresses in the GSERV table.

*opc*

Display all message transfer part (MTP) originating point codes in the GSERV table.

*tt*

Display all called party (CdPA) translation types in the GSERV table.

**gta (optional)**

Global title address. Use this parameter to specify a CgPA global title address.

**Range:**

1 - 21 digits

**opc (optional)**

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:**

*opca*

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**opc/opca/opci/opcn/opcn24 (optional)**

Originating point code. Use these parameters to specify MTP originating point codes.

**opci (optional)**

ITU international originating point code with subfields *zone-area-id*.

**Range:***s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

**opcn (optional)**

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:***s-, p-, ps-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**nnnnn—0-16383**gc—aa-zz**m1-m2-m3-m4—0-14* for each member; values must sum to 14**opc24 (optional)**

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:***p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p**msa—000-255**ssa—000-255**sp—000-255***tt (optional)**

Translation type. Use this parameter to specify a CdPA translation type.

**Range:** 0 - 255

**Example**

```
rtrv-gserv-data:display=all
```

```
rtrv-gserv-data:tt=26
```

```
rtrv-gserv-data:display=opc
```

### Dependencies

The system is busy, or the GSERV table is corrupted.

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The G-Port feature must be on before this command can be entered.

The gta, opc/opca/opci/opcn/opcn24, tt, or display parameter must be specified.

The display, tt, opc, and gta parameters cannot be specified together in the command.

### Output

```

## rtrv-gsmmap-scrn

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

### Parameters

#### **opname (mandatory)**

User-defined name for the operation code. This value references the operation code defined with the `ent-gsms-opcode` command.

#### **Range:**

*ayyyyyyy*

Up to 8 alphanumeric characters

#### **action (optional)**

Screening action to take if a message is forbidden as defined by the *forbid* parameter.

#### **Range:**

*pass*

Route the message as normal to the destination.

*discard*

Discard the MSU.

*atierr*

Generate an ATI reject message. This option is only valid for ATI MAP operation codes.

*route*

Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to

which normal GTT would be sent if no GSM MAP actions are taken.

***forward***

Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

***duplicate***

Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

***dupdisc***

Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

**Default:**

Display all screening actions

**cdsr (optional)**

CdPA Screening Reference.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

**cgsr (optional)**

CgPA Screening Reference.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 optional alphanumeric characters

**eaddr (optional)**

Ending origination address, in association with *npv* and *naiv* for the CGPA address to be screened.

**Range:**

1–15 hexadecimal digits. Valid digits are 0–9, *a-f*, *A-F*

**forbid (optional)**

Forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the *action* parameter.

**Range:**

***all***

All parameters are forbidden. Take the specified screening action defined by the *action* parameter for messages arriving at the system.

***location***

Take the specified screening action defined by the *action* parameter for messages arriving at the system that contain *location* as the forbidden parameter value for the entered address/operation code combination. This value is valid only for GSM ATI messages.

***none***

None of the parameters are forbidden. Route the message to its destination.

***state***

Take the specified screening action defined by the *action* parameter for messages arriving at the system that contain *state* as the forbidden parameter value for the entered address/operation code combination. This value is valid only for GSM ATI messages.

**Default:**

Display all forbidden parameter values

**mapset (optional)**

MAP set ID.

**Range:**

*1 - 36000, dflt*

*dflt* —Default MAP set

**naiv (optional)**

Nature of Address value for the address or range of CgPA and CdPA addresses.

**Range:**

*0 - 127, \**

**npv (optional)**

Numbering Plan value for the address or range of CgPA and CdPA addresses.

**Range:**

*0 - 15, \**

**ri (optional)**

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

**Range:**

*gt*

*ssn*

**saddr (optional)**

Starting origination address in association with `npv` and `naiv` for the single entry or range of entries of the CGPA address to be screened.

**Range:**

1 - 15 digits, \*

1-15 hexadecimal digits. Valid digits are 0-9, a-f, A-F

**Default:**

\*

**tt (optional)**

Translation type. This parameter specifies the value that the CdPA translation type is set to as the result of Enhanced GSM Map Screening.

**Range:**

0 - 255, none

**Default:**

Display all translation types

**Example**

The following example retrieves all CgPA entries for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=e
```

The following example retrieves the specified CgPA range entry for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=ati:saddr=9194620000000000:eaddr=9194630000000000
```

The following example retrieves all CdPA entries for the specified CGSR:

```
rtrv-gsmmap-scrn:opname=xyz:cgsr=fela
```

The following example retrieves the specified CDSR entry for the specified CGSR:

```
rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4
```

The following examples retrieves the specified RI for the specified OPNAME:

```
rtrv-gsmmap-scrn:opname=e:ri=ssn
```

```
rtrv-gsmmap-scrn:opname=e:mapset=dflt:ri=gt
```

```
rtrv-gsmmap-scrn:opname=rr:cgsr=au:cdsr=aj
```

```
rtrv-gsmmap-scrn:opname=test4:tt=12
```

**Dependencies**

The GSM Map Screening feature must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The `cgsr` parameter can be specified.
- The `cdsr` parameter can be specified.
- The `saddr=*`  parameter can be specified.

- The `saddr` and `eaddr` parameters can contain hexadecimal digits.

The specified `opname` parameter value must exist in the GSM Map Op-Code table.

If the `eaddr` parameter is specified, its value must contain the same number of digits as the `saddr` parameter value.

If the `eaddr` parameter is specified, its value must be greater than the `saddr` parameter value.

If the `eaddr` parameter is specified, the `saddr` parameter must be specified.

If the `saddr=*`  parameter is specified, then the `eaddr` parameter cannot be specified.

If the `saddr` parameter is specified, the `cgsr` and `cdsr` parameters cannot be specified.

The `saddr`, `npv`, and `naiv` parameters must be specified together in the command.

If any of the `saddr/eaddr/npv/naiv` and `cdsr` parameters are specified, then the `forbid` and `action` parameters cannot be specified.

A value of *state* or *location* cannot be specified for the `forbid` parameter unless the operation code referenced by the `opname` parameter is 71. The `forbid` option is only valid for ATI MAP operation codes, and the `opcode=71` parameter signifies an ATI MAP operation code.

The `action=atierr` parameter cannot be specified unless the operation code referenced by the `opname` parameter is 71. The `atierr` option is only valid for ATI MAP operation codes, and the `opcode=71` parameter signifies an ATI MAP operation code.

The GSM Map Op-Code table must be accessible.

The GSM Map Screening table must be accessible.

If the `cdsr` parameter is specified, then the `cgsr` parameter must be specified.

The specified `cgsr` parameter value must exist in the database.

The specified `cdsr` parameter value must exist in the database.

The `opname` parameter must consist of alphanumeric characters.

The `opname` parameter must be entered.

The `cgsr` and `cdsr` parameters must each begin with an alphabetic character.

The `cgsr` and `cdsr` parameters must each consist of 1-4 alphanumeric characters.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist.

## Notes

None

## Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

## Legend

- **Single Entries/Range Entries**—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.
- **CgPA**—Calling Party Address entry
- **CdPA**—Called Party Address entry
- **OPNAME**—User-defined MAP operation code name.
- **SADDR**—Start origination address.
- **EADDR**—End origination address. This column is displayed for range entries only.
- **NPV**—Numbering plan value.
- **NAIV**—Nature of address indicator value.
- **FORBID** or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the *action* parameter. (Some values are abbreviated; for example, *locat* means *location*.)
- **ACTION** or **ACT**—Screening action, if forbidden. Possible actions are pass, discard (disc), atterr, route, forward, duplicate (dupl), and dupdisc.
- **PC** or **PCA**—ANSI Point Code
- **PCI**—ITU International Point Code
- **PCN**—ITU National Point Code
- **PCN24**—24-bit ITU National Point Code
- **SSN**—Subsystem Number
- **CGSR**—CgPA Screening Reference
- **CDSR**—CdPA Screening Reference
- **MAPSET**—MAP set
- **RI**—Routing Indicator
- **TT**—Translation Type

## rtrv-gsms-opcode

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

### Parameters

#### mapset (optional)

MAP set ID.

##### Range:

*1 - 36000, dflt*

*dflt* —Default MAP set

#### opcode (optional)

MAP operation code.

##### Range:

*0 - 255, \**

##### Default:

Display all MAP operation codes

#### opname (optional)

User-defined name for the operation code. This value is defined with the `ent -gsms -opcode` command.

##### Range:

*ayyyyyyy*

Up to 8 alphanumeric characters

**Default:**

Display all operation code names

**ri (optional)**

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

**Range:**

*gt*

*ssn*

**tt (optional)**

Translation type. The value the CdPA TT is set to as the result of Enhanced GSM Map Screening.

**Range:**

0 - 255

**Default:**

Display all translation types

**Example**

```
rtrv-gsms-opcode
rtrv-gsms-opcode:opname=ati
rtrv-gsms-opcode:ri=gt
rtrv-gsms-opcode:tt=11
```

**Dependencies**

The GSM Map Screening feature must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The opcode=\* parameter can be specified.
- An opname parameter can be specified that refers to an opcode=\* parameter.

The GSM Map Op-Code table must be accessible.

The opcode and opname parameters cannot be specified together in the command.

The value of the opcode parameter must be between 0 - 255 or \*.

The specified opname parameter must exist in the GSM MAP Op-Code table.

If the opname parameter is specified, then it must be alphanumeric.

The opname parameter must be no more than 8 characters in length.

The Flexible GTT Load Sharing feature must be enabled before the mapset parameter can be specified.

The specified MAP set must exist.

**Notes**

None

**Output**

rtrv-gsms-opcode

```

## rtrv-gsmssn-scrn

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

## Parameters

### ssn (optional)

Subsystem number.

#### Range:

000 - 255

#### Default:

Display all

**type (optional)**

Subsystem type.

**Range:**

*orig*

Origination SSN

*dest*

Destination SSN

**Default:**

Display all

**Example**

```
rtrv-gsmssn-scrn
```

```
rtrv-gsmssn-scrn:ssn=0:type=dest
```

**Dependencies**

The GSM Map Screening feature must be enabled before this command can be entered.

The SSN Map Screening table is corrupt or cannot be found.

A valid value must be specified for the *ssn* parameter.

A valid value must be specified for the *type* parameter.

**Notes**

If specified, the *ssn/type* parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

```
SSN ORIG DEST
```

```
No matching entries with the specified criteria found.
```

**Output**

```
rtrv-gsmssn-scrn:ssn=10:type=orig
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
010 Yes Yes
GSMMS SSN table is (256 of 512) 50% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
;
```

```
rtrv-gsmssn-scrn
```

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 Yes No
010 Yes Yes
GSMMS SSN table is (2 of 512) 1% full
```

```
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
;
```

### Legend

- **SSN**—Subsystem number
- **ORIG**—Specifies whether the subsystem type is origination
- **DEST**—Specifies whether the subsystem type is destination

## rtrv-gta

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

---

**Note:** If the EGTT feature is turned on, then the GTT Selector (`ent/chg/dlt/rtrv-gttset`), GTT Set (`ent/dlt/rtrv-gttset`), and GTA (`ent/chg/dlt/rtrv-gta`) commands replace the Translation Type (`ent/dlt/rtrv-tt`) and Global Title Translation (`ent/chg/dlt/rtrv-gtt`) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

---

### Parameters

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

#### **gttsn (mandatory)**

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

#### **Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters

#### **acn (optional)**

Application context name. The ITU TCAP *acn* field in the incoming MSU.

**Range:**

0 - 255, \*, *none*

The *acn* field supports up to 7 subfields separated by a dash (e.g., 1-202-33-104-54-26-007).

\* —any valid value in the ITU TCAP *acn* field in the incoming MSU

*none* —there is no ITU TCAP *acn* field in the incoming MSU

**actsn (optional)**

GTT Action Set Name.

**Range:**

ayyyyyyyyy, *none*

1 leading alphabetic character and up to 8 following alphanumeric characters

**cdssn (optional)**

Starting CdPA subsystem number.

**Range:**

0 - 255

**cggtmod (optional)**

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

**Range:**

*yes*

*no*

**cgpc (optional)**

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:**

*cgpca*

**Range:**

0-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-\*-\** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

#### **cgpci (optional)**

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

##### **Range:**

*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code *0-000-0* is not a valid point code.

#### **cgpcn (optional)**

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

##### **Range:**

*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

#### **cgpcn24 (optional)**

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

##### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

#### **cgpcn16 (optional)**

16-bit ITU national CgPA point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

**Range:***000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000---127**sna---000---15**mna---000---31***cgpcaction (optional)**

This parameter is used to provide the required abilities, indicating what any particular translation needs to do with CgPA PC.

**Range:***dflt*

protocol will be allowed to perform all the required processing/conversion with CGPC.

*ignore*

CGPC will be left as it was in incoming MSU.

*remove*

CGPC will be removed from outgoing MSU.

**Default:***dflt***cgssn (optional)**

Starting CgPA subsystem number.

**Range:** *0 - 255*

**defmapvr (optional)**

Default MAP version for MBR opcodes. This parameter is used to provide the default MAP version for supported MBR opcodes if the Application Context Name (ACN) is not present in an incoming MAP message.

**Range:***v1**v2**v3***dpc (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:***dpca***Range:***0-255, \**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, `ni=000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni=001–005`.

When `chg-sid:pctype=ansi` is specified, `nc=000` is valid if `ni=006–255`.

When `chg-sid:pctype=ansi` is specified, `ni-*` is valid if `ni =006–255`.

The point code `000-000-000` is not a valid point code.

### **dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)**

Point Code.

#### **dpci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

##### **Range:**

*s*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code `0-000-0` is not a valid point code.

#### **dpcn (optional)**

ITU destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

##### **Range:**

*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*-

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

#### **dpcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

##### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000–255

*ssa*—000–255

*sp*—000–255

**dpcn16 (optional)**

16-bit ITU national destination point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

**eaddr (optional)**

End Address (Similar to EGTA). This parameter specifies the end of a range of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

**Range:**

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**Default:**

Same as the specified SADDR value.

**ecdssn (optional)**

Ending CdPA subsystem number.

**Range:**

0 - 255

**ecgssn (optional)**

Ending CgPA subsystem number.

**Range:**

0 - 255

**egta (optional)**

End global title address. The end of a range of global title digits.

**Range:**

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**Default:**

The first **gta** entry for the given GTT selector

**family (optional)**

The ANSI TCAP *family* field in the incoming MSU.

**Range:**

0 - 255, \*, *none*

\*

any valid value in the ANSI TCAP *family* field in the incoming MSU

*none*

there is no value in the ANSI TCAP *family* field in the incoming MSU

**force (optional)**

Display more than 1000 entries.

**Range:**

*yes*

*no*

**Default:**

*no*

**gta (optional)**

Global title address. The beginning of a range of global title digits.

**Range:**

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**Default:**

The first **gta** entry for the given GTT selector

**gtmodid (optional)**

Global title modification identifier.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

**Default:**

displays all GT Modification Indicators for the GTA

**loopset (optional)**

SCCP loopset name. This parameter retrieves translation entries associated with the specified loopset.

**Range:**

*ayyyyyyy, none*

1 alphabetic character followed by up to 7 alphanumeric characters.

*none* —Translation entries with no association to any loopset.

**mapset (optional)**

MAP set ID. This parameter retrieves GTA information for a specified Mated Application set.

**Range:**

*1 - 36000, dflt*

*dflt* —Default MAP set

**Default:**

Retrieves GTA information for the default MAP set.

**mrnset (optional)**

MRN set ID. This parameter retrieves GTA information for a specified Mated Relay Node set.

**Range:**

*1 - 3000, dflt, none*

*dflt* —Default MRN set

*none* —The GTA translation does not participate in any loadsharing.

**num (optional)**

Number of entries to display.

**Range:**

*1 - 1000000*

**Default:**

*1* —if *gta* is specified

*20* —if *gta* is not specified

**opc (optional)**

ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:**

*opca*

**Range:**

*0-255, \**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni=001–005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006–255*.

When *chg-sid:pctype=ansi* is specified, *ni-\*-\** is valid if *ni =006–255*.

The point code *000-000-000* is not a valid point code.

### **opci (optional)**

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

#### **Range:**

*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

### **opcni (optional)**

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

#### **Range:**

*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

### **opcni24 (optional)**

24-bit ITU originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

#### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000–255

*ssa*—000–255

*sp*—000–255

#### **opc16 (optional)**

16-bit ITU originating point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

##### **Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

#### **opcode (optional)**

The TCAP *opcode* field in the incoming MSU.

##### **Range:**

0 - 255, \*, *none*

\*—any valid value in the TCAP *opcode* field in the incoming MSU

*none*—there is no value in the TCAP *opcode* field in the incoming MSU

#### **pc (optional)**

ANSI point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

##### **Synonym:**

*pca*

##### **Range:**

*p*-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p*-

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

#### **pci (optional)**

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:***s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

**pcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:***s-, p-, ps-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**nnnnn—0-16383**gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**pcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:***p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p**msa—000-255**ssa—000-255**sp—000-255***pcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

**Range:***p--, 000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p*

*un---000---127*

*sna---000---15*

*mna---000---31*

**pctype (optional)**

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:**

*ansi*

*itui*

*itun*

*itun16*

*itun24*

*ituis*

*ituns*

**Default:**

Display all point code types

**pkgtype (optional)**

Package type. The ANSI TCAP and ITU TCAP package type.

**Range:**

*ansiuni*

ANSI unidirectional

*qwp*

Query with Permission

*qwop*

Query with out Permission

*resp*

Response

*cwp*

Conversation with Permission

*cwop*

Conversation with out Permission

*ansiabort*

ANSI abort

*any*  
Wildcard value

*bgn*  
Begin

*end*  
End

*cnt*  
Continue

*ituabort*  
ITU abort

*ituuni*  
ITU unidirectional

**ANSI TCAP PKGTYPE**  
*ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any*

**ITU TCAP PKGTYPE**  
*bgn, ituabort, ituuni, any, end, cnt*

**ppmeasreqd (optional)**  
Per Path Measurement required.

**Range:**

*yes*

*no*

**refgttsn (optional)**  
Referred GTT set name. The GTT Set Name referred in the GT Translation Entry by the optsn, opcsn, and cgcnsn parameters.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters

**saddr (optional)**  
Start Address (Similar to GTA). This parameter specifies the beginning of a range of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA).

**Range:**

1 - 21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**ssn (optional)**

Subsystem number.

**Range:**

002 - 255

**Default:**

Display all

**testmode (optional)**

Test mode. This parameter displays all translation entries that have a specified value of the testmode parameter.

**Range:**

*on*

*off*

**Default:**

*off*

**xlat (optional)**

Translate indicator. This parameter specifies translation actions and routing actions.

**Range:**

*dpc*

*dpcngt*

*dpcssn*

*none*

```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI/ITU SCCP Conversion feature must be enabled before the `pctype` parameter can be specified.

The `gttsn` parameter must be specified, cannot have a value of *none*, and must match an existing `gttsn`.

The `pc/pca/pci/pcn/pcn24/pcn16`, `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16`, `opc/opca/opci/opcn/opcn24/opcn16`, and `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameters must have valid values within the range for each subfield.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code that is of a different domain than the GTT set specified by the `gttsn` parameter can be specified.

If the `egta/eaddr` parameter is specified, the `gta/saddr` parameter must be specified. The `gta/saddr` and `egta/eaddr` parameters must be the same length, and the value for the `egta/eaddr` parameter must be greater than the value for the `gta/saddr` parameter.

If the specified `num` parameter value is greater than 1000, the `force=yes` parameter must be specified.

The number of digits in the specified `gta/saddr` parameter must be at least the number of digits provisioned for the GTT set specified by the `gttsn` parameter. If the VGTT feature is turned on, then up to 10 GTA/SADDR lengths can exist per GTT set.

If the Support for 16 GTT Lengths in VGTT feature is turned on, then up to 16 GTA/SADDR lengths can exist per GTT set.

If the Flexible GTT Load Sharing feature is not enabled, then the `mapset` parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

If the `ecgssn/ecdssn` parameter is specified, the `cgssn/cdssn` parameter must be specified.

If the `ecgssn/ecdssn` parameter is specified, the `cgssn/cdssn` parameter must be specified, and the `ecgssn/ecdssn` parameter must be greater than the `cgssn/cdssn` parameter.

The OBSR feature must be enabled before the `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16`, `opc/opca/opci/opcn/opcn24/opcn16`, `cgssn`, or `ecgssn` parameter can be specified.

The range specified by the `cgssn/ecgssn` or the `cdssn/ecdssn` parameters must exist for the specified GTT set.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `gta/saddr` and `egta/eaddr` parameters.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must already exist in the database.

The Loopset table is corrupt or cannot be found.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the `mrnset` parameter.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggmod` parameter can be specified.

The `xlat=none` parameter must be specified before the `mapset` and `mrnset` parameters can be specified together in the command.

A TOBR quantity feature must be turned on before the `opcode`, `pkgtype`, `acn`, `family`, `saddr`, `eaddr`, or `defmapvr` parameter can be specified.

The `opcode`, `pkgtype`, and `family` parameters must be specified together for ANSI TCAP translations. The `opcode`, `pkgtype`, and `acn` parameters must be specified together for ITU TCAP translations.

The `acn` and `family` parameters cannot be specified together in the command.

If the `family` parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the `pkgtype` parameter.

If the `acn` parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the `pkgtype` parameter.

If the `pkgtype=ituabort` parameter is specified, then a value of *none* must be specified for the `acn` and `opcode` parameters.

If the `pkgtype=ansiabort` parameter is specified, then a value of *none* must be specified for the `family` and `opcode` parameters.

The *cgpc*, *cgssn*, *gta*, *opc*, *cdssn*, *opcode*, *acn*, *pkgtype*, *family*, and *saddr* parameters cannot be specified together in the command.

If the *cgssn* and *cdssn* parameters are both specified in the same command (in any order), then only the value for the last of the two parameters specified is used during processing.

Failure while reading the GTT Action Set table.

The value specified by the *actsn* parameter must already exist in the database.

The FLOBR feature must be turned on before the *dpc*, *cdssn*, or *ecdssn* parameter can be specified.

The specified point code must be a full point code.

The value specified for the *gtmodid* parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

A value of *none* cannot be specified for the *gttsn* and *refgttsn* parameters.

If the *xlat=none* parameter is specified, then the *pc/pca/pci/pcn/pcn24/pcn16*, *force*, *ssn*, and *ccgt* parameters cannot be specified.

The specified GTT set must have a set type of *opcode* (see the *ent-gttset* command) before the *opcode/acn/pkgtype* or *opcode/family/pkgtype/family* parameters can be specified. The specified GTT set must have a set type of *cdssn*, *cgssn*, *cdgta/cgta*, *opc*, or *cgpc* before the *cdssn*, *cgssn*, *gta*, *opc*, or *cgpc* parameter, respectively, can be specified.

If the *cgssn* parameter is specified, then the *ecdssn* parameter cannot be specified. If the *cdssn* parameter is specified, then the *ecgssn* parameter cannot be specified.

If the *opc* or *dpc* parameter is specified, then the *(e)gta*, *(e)cgssn*, *(e)cdssn*, *acn*, *pkgtype*, *family*, and *opcode* parameters cannot be specified.

The specified GTT set must have a set type of *opcode* (see the *ent-gttset* command) before the *defmapvr* parameter can be specified.

The *SADDR* parameter must be specified if the *EADDR* parameter is specified in the command.

## Notes

The percentage full and number of cells used report that is provided with the *rtrv-gta* command reflects the total entries in the GTA table without regard to the selector specified.

This command can be canceled using the **F9** function key or the *canc-cmd* command. See *canc-cmd* for more information.

If the *rtrv-gta* command is entered with only the *gta* parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if *gta=8005556666* is specified, the six-digit GTT set *800555* would be a match. If the VGTT feature is turned on and the *egta* parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The point code domain translation types for EGTT are handled by the EAGLE protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

When the Origin-based SCCP Routing feature is enabled, its parameters are displayed. If no data is provisioned for these parameters, they are displayed as dashes.

## Output

---

**Note:** The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.

---

This example retrieves all GTAs for the specified GTT Set:

### Legend

- **GTTSN**—GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.
- **NETDOM**—The network domain.
- **NDGT**—The number of digits required for GTAs associated with this set.
- **START GTA**—The start global title address.
- **END GTA**—The end global title address.
- **XLAT**—The translate indicator.
- **RI**—The routing indicator.
- **PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24, ITUN16 PC**—Translated point code.
- **SSN**—The translated subsystem number.
- **CCGT**—The cancel called global title indicator.
- **MRN**—Mated Relay Node
- **MRNSET**—MRN set ID
- **MAPSET**—MAP set ID
- **CGGTMOD**—Calling Party Global Title Modification Indicator
- **ACTSN**—GTT Action Set Name
- **GTMODID**—Global Title Modification Identifier
- **PPMEASREQD**—Per Path Measurement Required
- **OPCODE**—TCAP opcode field
- **ACN**—Application context name. ITU TCAP *acn* field.
- **PKGTYPE**—TCAP package type
- **FAMILY**—ANSI TCAP *family* field

- **TESTMODE**—Invokes a Test Tool to debug the FLOBR/TOBR rules
- **DPC**—Destination point code
- **CGPC**—CgPa point code
- **OPC**—Originating point code
- **NPSN**—Not present set name
- **SADDR**—Start of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA)
- **EADDR**—End of MAP digits (IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA)
- **DEFMAPVR**—Default MAP version
- **PRIO**—Priority of each translation of the type OPCODE GTTSET
- **TRANSMEASRQD**—Per GTT Translation Measurement Required

## rtrv-gtcnv

Use this command to display entries in the Default Global Title Conversion table.

**Parameters**

**dir (optional)**

Direction of conversion.

**Range:**

*atoi*

ANSI to ITU conversion

*itoa*

ITU to ANSI conversion

*both*

Conversion in both directions

**gtixlat (optional)**

Global title indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

**Range:**

**22**

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

**24**

Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

**nai (optional)**

Nature of address indicator.

**Range:**

0 - 63, \*

**np (optional)**

Numbering plan.

**Range:**

0 - 15, \*

**tta (optional)**

ANSI translation type.

**Range:**

0 - 255, \*

**tti (optional)**

ITU translation type.

**Range:**

0 - 255, \*

**Example**

rtrv-gtcnv

**Dependencies**

The ANSI/ITU SCCP Conversion feature must be enabled before the command can be entered.

**Notes**

None

**Output**

This example displays output containing decimal global title digits:

rtrv-gtcnv

```
tekelecstp 06-11-07 13:44:12 EST  EAGLE 35.3.0
```

| DIR  | GTIXLAT | TTA | TTI | NP  | NAI | DEL | POS | ADD |
|------|---------|-----|-----|-----|-----|-----|-----|-----|
| atoi | 22      | 10  | 5   | --- | --- | 10  | pfx | 123 |

```
GTCNV    table is (1 of 1000) 1% full.
;
```

This example shows output containing hexadecimal global title digits:

**rtrv-gtcnv**

```
tekelecstp 06-11-07 11:52:58 EST  EAGLE 35.3.0

DIR  GTIXLAT  TTA  TTI  NP  NAI  DEL  POS  ADD
atoi  22    1    3   --- ---  ---  pfx  abcdef0123456789abcdef
ittoa  24    5    6    2   1   ---  sfx  abcdef0123456789abcef

GTCNV    table is (2 of 1000) 1% full.
;
```

### Legend

- **DIR**—Direction of the translation: ANSI to ITU or ITU to ANSI
- **GTIXLAT**—GTI translation
- **TTA**—ANSI translation type
- **TTI**—ITU translation type
- **NP**—Numbering plan
- **NAI**—Nature of address indicator
- **DEL**—Deletion status, listing the number of incoming MSUs that will be deleted prior to translation
- **POS**—Prefix or Suffix
- **ADD**—Global title address

## rtrv-gtmod

Use this command to display entries from the GTMOD table. A GTMOD entry consists of a GTMOD ID and GTMOD specific data.

### Parameters

---

**Note:** Definitions for the feature options specified by the **on** and **off** parameters are located in the Notes section.

---

**cgpassn (optional)**

Calling Party Subsystem number. The calling party subsystem address that receives the message.

**Range:**

*002 - 255*

**gtmodid (optional)**

GT Modification Identifier.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

**ngti (optional)**

New Global Title Indicator. This parameter specifies whether a new GTI translation format is type 2 or type 4.

**Range:**

*2*

*4*

*none*

**nnai (optional)**

New nature of address indicator. The value used to replace the received NNAI.

**Range:**

*0 - 127, none*

**nnp (optional)**

New numbering plan. The value used to replace the received numbering plan.

**Range:**

*0 - 15, none*

**npdd (optional)**

Number of prefix digits to be deleted. The number of digits to be deleted from the prefix of the received GT address.

**Range:**

*1 - 21, none*

**npds (optional)**

New prefix digits string. The digits to be prefixed to the received GT address.

**Range:**

*1 - 21 digits, none*

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

**Default:**

Display all

**nsdd (optional)**

Number of suffix digits to be deleted. The number of digits to be deleted from the suffix of the received GT address.

**Range:**

1 - 21, none

**nsds (optional)**

New suffix digits string. The digits to be suffixed to the received GT address.

**Range:**

1-21 digits, none

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are 0-9 .

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F .

**ntt (optional)**

New Translation Type. The value that is used to replace the received Translation Type.

**Range:**

0 - 255, none

**off (optional)**

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

**Range:**

*gt0fill*

**on (optional)**

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

**Range:**

*gt0fill*

*refcnt*

**precd (optional)**

Precedence. This parameter specifies whether the prefix or suffix takes precedence when modifying the received GT address

**Range:**

*px*

*sfx*

**Example**

```
rtrv-gtmod:gtmodid=id2
rtrv-gtmod:npdd=5:on=refcnt
rtrv-gtmod:nsdd=10:precd=sfx:nnai=2:nnp=5
rtrv-gtmod:ngti=4:on=gt0fill:cgpasn=12
```

**Dependencies**

The GTMOD table is corrupt or cannot be found.

The Hex Digit Support for GTT feature must be turned on before hexadecimal digits can be specified for the npds and nsds parameters.

The `gtmodid=none` parameter cannot be specified.

If the `gtmodid` parameter is specified, then the `on=refcnt` parameter is the only other parameter that can be specified.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The same value cannot be specified for the `on` and `off` parameters.

**Notes**

**on/off options**

- *gt0fill* —GT zero fill. Specifies whether the last 0 of the GTA is a treated as a valid digit (OFF) or as filler (ON) during GT Modification for the `gti(x)=2` to `gti(x)=4` scenario.
- *refcnt* —Reference count. Specifies the number of entries in the GTT Table that references the GTMOD entry. This option is ON only.

**Output**

```

## rtrv-gtt

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the *type* parameter specified.

---

**Note:** If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

---

## Parameters

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

### **cggtmod (optional)**

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

#### **Range:**

*yes*

*no*

### **egta (optional)**

End global title address. This parameter specifies the end of a range of global title digits.

#### **Range:**

1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

#### **Default:**

If the gta parameter is specified, the egta parameter default value is the specified gta parameter value.

### **force (optional)**

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

#### **Range:**

*yes*

*no*

**Default:***no***gta (optional)**

Global title start address. The beginning of a range of global title digits.

**Range:**

1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are 0-9.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are 0-9, a-f, A-F.

**Default:**

The first GTT entry for the given translation type.

**gtmodid (optional)**

Global Title Modification Identifier.

**Range:***ayyyyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

**loopset (optional)**

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

**Range:***ayyyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters.

*none* —Translation entries with no association to any loopset.

**mapset (optional)**

MAP set ID.

**Range:***1 - 36000, dflt*

*dflt* —Default MAP set

**mrnset (optional)**

MRN set ID. This parameter retrieves GTT information for a specified Mated Relay Node set.

**Range:***1 - 3000, dflt, none*

*dflt* —Default MRN set

*none* —The GTA translation does not participate in any loadsharing.

**num (optional)**

The number of entries to be shown.

**Range:**

1 - 1000000

1-1000 —if **force=yes** is not specified

1-1000000 —if **force=yes** is specified

**Default:**

1 —if **gta** is specified

20 —if **gta** is not specified

**pc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:**

*pca*

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When **chg-sid:pctype=ansi** is specified, *ni = 000* is not valid.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is not valid if *ni = 001-005*.

When **chg-sid:pctype=ansi** is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

**Default:**

Display all

**pc/pca/pci/pcn/pcn24 (optional)**

Point code.

**pci (optional)**

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code 0-000-0 is not a valid point code.

**Default:**

Display all

**pcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt1` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**Default:**

Display all

**pcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p*

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**Default:**

Display all

**pctype (optional)**

Point code type. This parameter retrieves a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:**

*ansi*

*itui*

*itun*

*itun24*

*ituis*

*ituns*

**Default:**

Display all

**ssn (optional)**

Subsystem number. The subsystem address that is to receive the message.

**Range:**

002 - 255

**Default:**

Display all

**ttn (optional)**

Translation name.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

**Default:**

None given

**type/typea/typei/typen/typen24/typeis/typens (optional)**

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The type and typea parameters specify an ANSI network.

The typei parameter specifies an ITU-international network.

The typen parameter specifies an ITU-national network.

The typen24 parameter specifies a 24-bit ITU-national network.

The typeis parameter specifies an ITU-international spare network.

The typens parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as ANSI type (type or typea) and as an ITU type (typei/typen/typen24/typeis/typens). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

**Range:**

0 - 255

**Default:**

None given

**Example**

```
rtrv-gtt:type=5:ttn=lidb1:gta=919555
rtrv-gtt:type=5:gta=919555
rtrv-gtt:type=5:gta=919555:num=2500:force=yes
rtrv-gtt:typen24=0
rtrv-gtt:typei=7:pctype=ansi
rtrv-gtt:typen=106:pctype=itui
rtrv-gtt:type=55:pctype=itun
rtrv-gtt:type=9:pctype=itun24
rtrv-gtt:typei=4:pci=s-1-24-1
rtrv-gtt:typen=3:pcn=s-124
rtrv-gtt:ttn=tbla
rtrv-gtt:ttn=tbla:mapset=1
rtrv-gtt:type=4:cggmod=yes
rtrv-gtt:ttn=ituset:gtmodid=set1
rtrv-gtt:typens=5:gta=123456
rtrv-gtt:typeis=5:gta=123456
```

**Dependencies**

The ANSI/ITU SCCP Conversion feature must be enabled before the `pctype` parameter can be specified.

If the `pcn` parameter is specified, its format must match the format that was assigned with the `chg-stpopts:npfmt1` parameter.

The first character of the translation name must be a letter.

The value of the `tt` parameter must exist in the Translation Type table.

The value specified for the `tt` parameter must correspond to a value of the `type/typea/typei/typen/typen24/typeis/typens` parameter (see the `ent/chg-gtt` command).

If the value of the `num` parameter exceeds 1000, then the `force=yes` parameter must be specified.

The `type` or `ttn` parameter must be specified.

The value of the `pc/pca/pci/pcn/pcn24` parameter must be a full point code.

If the `egta` parameter is specified, the `gta` parameter must be specified.

If the system is defined as an ANSI system, the `pc/pca` parameter must be specified as a valid ANSI point code.

The ANSI/ITU SCCP Conversion feature must be enabled before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified `gta` parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the

`ent-gtt` command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The value of the `tt` parameter must not be defined as an alias.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist in the database.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the `gta` and `egta` parameters.

The value of the `num` parameter must not exceed the maximum table size.

The length of the `egta` parameter must equal the length of the `gta` parameter.

The value of the `egta` parameter must be greater than the value of the `gta` parameter.

If the `tt` parameter is not specified, then the value of the `ttn` parameter must match the value of a `tt` parameter in the STP database.

The value of the `gta` parameter must exist.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value of the `loopset` parameter must already exist in the database.

The Loopset table is corrupt or cannot be found.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the `mrnset` parameter.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggmod` parameter can be specified.

The `mapset` and `mrnset` parameters cannot be specified together in the command.

The GTT set associated with the translation type specified by the `ttn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

The `ttn=none` parameter cannot be specified.

The network domain of the translation type specified by the `ttn` parameter cannot be CROSS (see the `ent-gttset` command).

## Notes

If the `rtrv-gtt` command is entered with only the `gta` parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if `gta=8005556666` is specified, the six-digit translation type `800555` would be a match. If the VGTT feature is turned on and the `egta` parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If you do not know either the translation type or the translation type name, use the `rtrv-tt` command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The number of entries to be shown (the `num` parameter) can be specified for any valid combination of parameters.

If the `gta` parameter is not specified, then the first entry in the global title translation table that corresponds to the translation type is the first entry shown.

If the `num` and `gta` parameters are not specified, then up to 20 entries are shown.

If the `gta` parameter is specified, but the `num` parameter is not specified, then only one entry is shown.

If the `num` parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the `num` parameter.

If the `gta` and `egta` parameters are specified, then the entry that matches the `gta` parameter, or is the nearest entry below the `gta` parameter, is the first entry shown for the specified range.

The `rtrv-gtt` command can retrieve only CdGTA entries that were provisioned through GTA commands when the OBSR or FLOBR feature is turned on.

## Output

`rtrv-gtt:type=10:num=65535:force=yes`

### Legend

- **type/typea/typei/typen/typen24/typeis/typens**—Translation type
- **TTN**—Translation name
- **NDGT**—Number of digits
- **GTT TABLE IS 10% FULL**—Relative size of the GTT table
- **x of y**—Number of entries in the table (x) and the maximum number of entries configured for the table (y)
- **START GTA**—Global title start address
- **END GTA**—Global title end address
- **XLAT**—Translate indicator
- **RI**—Route indicator
- **PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Point code
- **SSN**—Subsystem number
- **MRN**—Mated Relay Node

- **MRNSET**—MRN set ID
- **MAPSET**—MAP set ID
- **CGGTMOD**—Calling Party GT Modification Indicator
- **GTMODID**—Global Title Modification Identifier

## rtrv-gttact

Use this command to display entries from the Global Title Translations (GTT) Action table.

**Parameters**

---

---

**Note:** Definitions for the feature options specified by the **on** and **off** parameters are located in the Notes section.

---

---

**act (optional)**

Action. The action applied to the message.

**Range:***disc*

discard message with no return error

*dup*

route a copy of the message to a specified duplicate node

*fwd*

route the original message to a specified forward node instead of the destination indicated by the GTT/ DB data

*scpval*

perform the SCCP MAP validation on MO/MT-FSM messages

*sflog*

send a copy of the original message to the SFLOG card

*sfthrot*

discard message if threshold exceeded

*sroc*

apply service (GPORT/GFLEX/SMSMR) on the message.

***tcaperr***

discard message that has a specified TCAP error

***udts***

discard message and send udts/xudts

***sfapp***

route message to SFAPP card

**actid (optional)**

GTT Action Id.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic followed by up to 8 alphanumeric characters

**atcaperr (optional)**

ANSI TCAP Error Cause. The reason for discarding the message containing the ANSI TCAP portion that is associated with the TCAPERR GTT Action.

**Range:**

*0 - 255*

**cdgtmodid (optional)**

Called party global title modification identifier.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

**cggtmodid (optional)**

Calling party global title modification identifier.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character followed by up to 8 alphanumeric characters

**cgpc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:**

*cgpca*

**Range:**

*p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

### **cgpci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

#### **Range:**

*s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code `0-000-0` is not a valid point code.

### **cgpcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfnti` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

#### **Range:**

*s-, p-, ps-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

### **cgpcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

#### **Range:**

*p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p*

*msa—000–255*

*ssa—000–255*

*sp—000–255*

**cgpcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix- un-sna-mna*).

**Range:**

*p--, 000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p*

*un---000---127*

*sna---000---15*

*mna---000---31*

**cgpcogmsg (optional)**

The data that is used as the Calling Party Point Code in the outgoing message.

**Range:**

*cgpcicmsg*

CgPA PC data from the incoming MSU

*dflt*

Default. The standard Global Title Translation process provides the CgPA PC.

*opcicmsg*

OPC data from the incoming MSU

*provcgpc*

provisioned CGPC/CGPCA/CGPCI/CGPCN/CGPCN24 data in the GTT Action

*remove*

CGPC will be removed from the outgoing MSU

**defactid (optional)**

Default Action ID. The Action ID associated with the Forward/SCPVAL/SFTHROT action.

**Range:**

*disc*

GTT Action ID of type *disc*

*udts*

GTT Action ID of type *udts*

***tcaperr***

GTT Action ID of type *tcaperr*

***fallback***

The MSU is routed using routing data in the incoming MSU when action is *fwd*. When action is set to *scpvat*/*sftthrot*, the MSU is discarded.

**failactid (optional)**

Fail Action ID. The default action that is performed to route the message when the VLR Validation fails on Stateful App.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character followed by 8 alphanumeric characters

The *failactid* parameter can take one of the following values:

- GTT Action ID with a GTT Action of *disc*, *udts* or *tcaperr* (see the *act* parameter). This value must already be defined in the GTT Action table.
- *fallback* -The MSU is discarded.

**Default:**

*fallback*

**fwdgtt (optional)**

Forward GTT. The forward GTT Action ID that is to be used to route the MSU.

**Range:**

*ayyyyyyyyy*

**hlraddr (optional)**

It is used to address the HLR for the ATI message.

**Range:**

*USECDPA* --- Use the CDPA GTA from the query message

*TCAPPARM* --- GTT translation shall be performed on MAP Parameter.

MAP parameter will be used in SCCP CDPA for GTT translation

*FWDACT* --- Route the message to a specified forward node indicated in FWD GTT Action ID

**Default:**

*USECDPA*

**itcaperr (optional)**

ITU TCAP Error Cause. The reason for discarding the message containing the ITU TCAP portion that is associated with the TCAPERR GTT Action.

**Range:**

0 - 255

**loopset (optional)**

SCCP loopset name. This parameter retrieves action entries that are associated with the specified loopset.

**Range:**

*ayyyyyyy*

One alphabetic character followed by up to 7 alphanumeric characters.

*none* —Action entries with no association to any loopset.

**mapset (optional)**

MAP Set ID. The Mated Application Set ID.

**Range:**

*1 - 36000, dflt*

*dflt* —Default MAP set

**mrnset (optional)**

MRN Set ID. The Mated Relay Node Set ID.

**Range:**

*1 - 3000, dflt*

*dflt*

Default MRN Set ID

*none*

The GTT Action table entry with no association to any mrnset.

**off (optional)**

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

**Range:**

*uimreqd*

*useicmsg*

**on (optional)**

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

**Range:**

*refcnt*

*uimreqd*

*useicmsg*

**pc (optional)**

ANSI point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The value "none" indicates that the Origin Point Code (OPC) field in the message will be used in place of CGPC.

**Synonym:**

*pca*

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p-*

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**pci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code *0-000-0* is not a valid point code.

**pcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*nnnnn*—0-16383

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**pcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix- un-sna-mna*).

**Range:**

*p--, 000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p*

*un---000---127*

*sna---000---15*

*mna---000---31*

**pcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix- msa-ssa-sp*).

**Range:**

*p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p*

*msa—000–255*

*ssa—000–255*

*sp—000–255*

**ri (optional)**

Routing indicator.

**Range:**

*gt*

*ssn*

**snaï (optional)**

The service nature of address indicator.

**Range:**

*ccrndn*

Country code, routing number, and national directory number

*intl*

International number

***Natl***

National significant number

***rnidn***

Routing number prefix and international dialed/directory number

***rnndn***

Routing number prefix and national dialed/directory number

***rnsdn***

Routing number prefix and subscriber dialed/directory number

***Sub***

Subscriber number

**snp (optional)**

The service numbering plan.

**Range:*****e164***

E.164 numbering plan

***e212***

E.212 numbering plan

***e214***

E.214 numbering plan

**sprn (optional)**

SCCP Parameter. This parameter is used to decide whether the SCCP GTA, NP, and NAI (if GTI=4 and NP/NAI are present) will be picked up from CDPA or CGPA for comparison.

**Range:*****CDPA***

SCCP CDPA GTA, NP, and NAI (if GTI=4 and NP/NAI are present) will be used for comparison

***CGPA***

SCCP CGPA GTA, NP, and NAI (if GTI=4 and NP/NAI are present) will be used for comparison

**svcerr (optional)**

The action to be taken when the Service triggered by the GTT Action Service fails. The MSU can be processed by either applying the results of the pre-Service GTT, or continuing with the specific Service error processing.

**Range:*****SRVC***

Continue with specific service error

**GTT**

Apply the result of pre-GTT service

**Default:**

*SRVC*

**srvcname (optional)**

Service to be applied on the MSU when **act** is set to **srvc**.

**Range:**

*GFLEX, GPORT, SMSMR*

**ssn (optional)**

Subsystem number.

**Range:**

*2 - 255, none*

**tprm (optional)**

TCAP Parameter. This parameter is used to decide whether the MAP digits, NP, and NON (if NP and NON are present) will be picked up from SMRPDA or SMRPOA for comparison.

**Range:*****SMRPDA***

MAP digits, NP, and NON (if NP and NON are present) from SMRPDA will be used for comparison

***SMRPOA***

MAP digits, NP, and NON (if NP and NON are present) from SMRPOA will be used for comparison

**udtserr (optional)**

UDTS error cause. This parameter specifies the reason for discarding the message that is associated with UDTS GTT Action.

**Range:**

*0 - 255*

**Example**

```

rtrv-gttact:hlraddr=fwdact

rtrv-gttact:hlraddr=tcapparm

## Dependencies

The GTT Action table is corrupt or cannot be found.

The specified GTT Action entry must already exist in the database.

If the Flexible GTT Load Sharing feature is not enabled, then the `mapset` parameter cannot be specified.

The value specified for the `pc/pca/pci/pcn/pcn24/pcn16` and `cgpc/cgpca/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must be a full point code and must have a valid value within the range for each subfield.

The Flexible GTT Load Sharing feature must be enabled before the `mrnset` parameter can be specified.

The `mapset` and `mrnset` parameters cannot be specified together in the command.

A value of *none* or *fallback* cannot be specified for the `actid` parameter.

A value of *disc*, *udts*, *tcaperr*, *scpval*, or *sfapp* must be specified for the `act` parameter before a value of *uimreqd* can be specified for the `on` or `off` parameter.

A value of *dup* or *fwd* must be specified for the `act` parameter before the `pc`, `ssn`, `ri`, `mrnset`, `mapset`, `loopset`, `cgpc`, `cgpcogmsg`, `cggmodid` or `cdgtmodid` parameters can be specified.

A value of *dup*, *fwd*, *scpval*, or *sfthrot* must be specified for the `act` parameter before a value of *useicmsg* can be specified for the `on` or `off` parameter.

The `act=fwd/scpval/sfthrot` parameter must be specified before the `defactid` parameter can be specified.

The `pc`, `ssn`, `ri`, `mrnset`, `mapset`, `loopset`, `cgpc`, `cgpcogmsg`, `defactid`, `tprm`, and `sprm` parameters cannot be specified in the same command as the `atcaperr`, `itcaperr`, or `udtserr` parameters.

Values of *useicmsg* and *uimreqd* cannot be specified for the `on` or `off` parameters in the same command.

If the `actid` parameter is specified, then the `ri`, `pc`, `ssn`, `mrnset`, `mapset`, `loopset`, `on`, `off`, `atcaperr`, `itcaperr`, `udtserr`, `act`, `cgpc`, `cgpcogmsg`, `defactid`, `cggmodid`, `cdgtmodid`, `snp snai`, `svcerr`, `svcname`, `sprm`, and `tprm` parameters cannot be specified.

The `act=tcaperr` parameter must be specified before the `atcaperr` or `itcaperr` parameter can be specified.

The `act=udts` parameter must be specified before the `udtserr` parameter can be specified.

The `udtserr` and `svcerr` parameters cannot be specified in the same command.

The `atcaperr` and `itcaperr` parameters cannot be specified in the same command.

The `pc`, `ri`, `ssn`, `mrnset`, `mapset`, `loopset`, `cdgtmodid`, `defactid`, `cgpc`, `cgpcogmsg`, and `cggmodid` parameters cannot be specified in the same command with the `atcaperr`, `itcaperr`, and `udtserr` parameters.

The `srvcname`, `snp`, `snai` and `srvcerr` parameters can only be specified when `act` is set to `srvc`.

The `sprm` and `tprm` parameters can be specified only when `act` is set to `scpval`.

The `scfaddr`, `hlraddr`, `tt`, `failactid` and `fwdgtt` parameters can only be specified if action type is `sfapp`.

The point code specified for the `pc/pci/pcn/pcn24/pcn16` and `cgpc/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must be a full point code.

The SCCP Loop Detection feature must be enabled before the `loopset` parameter can be specified.

The value specified for the `loopset` parameter must already exist in the database.

The Loopset table is corrupt or cannot be found.

The value specified for the `cdgtmodid` or `cggmodid` parameter must already exist in the GTMOD table.

The GTMOD table is corrupt or cannot be found.

The `defactid=none` or `failactid=none` parameter cannot be specified.

The value specified for the `pc/pca/pci/pcn/pcn24/pcn16` and `cgpc/cgpci/cgpcn/cgpcn24/cgpcn16` parameters must have the same domain.

The same value cannot be specified for the `on` and `off` parameters.

The specified MAP set must already exist in the MAP table.

The specified MRN set must already exist in the MRN table.

A value of `fwd`, `dup`, or `scpval` must be specified for the `act` parameter before a value of `useicmsg` can be specified for the `on` or `off` parameter.

## Notes

### on/off options

- `uimreqd` —UIM required. Specifies whether a UIM should be generated.
- `useicmsg` —Use Incoming Message. Specifies whether to apply GTT Action data to the message as the message was received (OFF) or after any EPAP or GTT translation/modification data has been applied (ON).

## Output

## rtrv-gttapath

Use this command to retrieve a GTT Action path entry. A GTT Action path consists of pairs of "setname + value" for Opcode/CgGTA/CdGTA. Each "setname + value" pair must already be defined in the GTT translation table.

### Parameters

#### **acn (optional)**

Application context name. The ITU TCAP *acn* field in the incoming MSU.

##### **Range:**

*0 - 255, none*

*none*—there is no ITU TCAP *acn* field in the incoming MSU

#### **cdgta (optional)**

Called Party Global Title Address.

##### **Range:**

1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are *0-9*.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are *0-9, a-f, A-F*.

#### **cdgttsn (optional)**

GTT set name (CDPA type).

##### **Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters

#### **cggta (optional)**

Calling Party Global Title Address.

##### **Range:**

1-21 digits

If the Hex Digit Support for GTT feature is not enabled, the range is 1 - 21 decimal digits; valid digits are *0-9*.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are *0-9, a-f, A-F*.

#### **cggtsn (optional)**

GTT set name (CGPA type).

##### **Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

**family (optional)**

The ANSI TCAP *family* field in the incoming MSU.

**Range:**

0 - 255, \*, *none*

*none* —there is no value in the ANSI TCAP *family* field in the incoming MSU

**gttgn (optional)**

GTT Path name.

**Range:**

*ayyyy*

1 leading alphabetic character and up to 4 following alphanumeric characters.

**opcode (optional)**

The TCAP *opcode* field in the incoming MSU.

**Range:**

0 - 255, \*, *none*

*none* —there is no value in the TCAP *opcode* field in the incoming MSU

**opgttsn (optional)**

GTT set name (Opcode type).

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

**pkgtype (optional)**

The ANSI and ITU TCAP package type.

**Range:**

*ituuni*

ITU unidirectional

*qwp*

Query with Permission

*qwop*

Query without Permission

*resp*

Response

*cwp*

Conversation with Permission

*cwop*

Conversation without Permission

*any*  
Wildcard value

*bgn*  
Begin

*end*  
End

*cnt*  
Continue

*ituabort*  
ITU abort

*ansiabort*  
ANSI abort

*ansiuni*  
ANSI unidirectional  
ANSI TCAP Package Types—*ansiuni, qwp, qwop, resp, cwp, cwop, ansiabort, any*  
ITU TCAP Package Types—*bgn, ituabort, ituuni, any, end, cnt*

### Example

```
rtrv-  
gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2:cggtsn=  
sn=cgsn3: cggta=987654:cdgttsn=cdsn1:cdgta=123456  
rtrv-gttapath:opgttsn=opsn2:pkgtype=ansiuni:opcode=124:family=2  
rtrv-gttapath
```

### Dependencies

The *acn* and *family* parameters cannot be specified together in the command.

The GTA table is corrupt or cannot be found.

The GTT DBMM table is corrupt or cannot be found.

The GTT Action - DISCARD, GTT Action - FORWARD, or GTT Action - DUPLICATE feature must be enabled before this command can be entered.

The GTT Set table must be accessible.

A value of *none* cannot be specified for the *opgttsn*, *cggtsn*, and *cdgttsn* parameter(s).

The *opcode*, *pkgtype*, and *family* parameters must be specified together for ANSI TCAP translations. The *opcode*, *pkgtype*, and *acn* parameters must be specified together for ITU TCAP translations.

If the *family* parameter is specified, then a value of *ansiuni*, *qwp*, *qwop*, *resp*, *cwp*, *cwop*, *ansiabort*, or *any* must be specified for the *pkgtype* parameter.

If the *acn* parameter is specified, then a value of *bgn*, *ituabort*, *ituuni*, *any*, *end*, or *cnt* must be specified for the *pkgtype* parameter.

If the `pkgtype=ituabort`, then a value of *none* must be specified for the `acn` and `opcode` parameters.

If the `pkgtype=ansiabort` is specified then a value of *none* must be specified for the `family` and `opcode` parameters.

If the `family` and `opcode` parameters are specified in the command, then either both parameters must have a value of *none* or neither parameter can have a value of *none*.

The GTT Action Path table is corrupt or cannot be found.

At least one GTT set-value combination must be specified.

The value specified for the `gttpn` parameter must already exist in the database.

Both Path name and set-value combination(s) cannot be specified together.

The value specified for the `gttpn` parameter cannot be a reserved word.

## rtrv-gttaset

Use this command to display entries from the Global Title Translations (GTT) Action Set table.

**Parameters**

---

---

**Note:** Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

---

---

**actid1 (optional)**

GTT Action ID 1. This parameter specifies the first action ID associated with the GTT action set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**actid2 (optional)**

GTT Action ID 2. This parameter specifies the second action ID associated with the GTT action set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**actid3 (optional)**

GTT Action ID 3. This parameter specifies the third action ID associated with the GTT action set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**actid4 (optional)**

GTT Action ID 4. This parameter specifies the fourth action ID associated with the GTT action set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**actid5 (optional)**

GTT Action ID 5. This parameter specifies the fifth action ID associated with the GTT action set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**actid6 (optional)**

GTT Action ID 6. This parameter specifies the sixth action ID associated with the GTT action set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**actsn (optional)**

GTT Action Set Name.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters

**off (optional)**

Disables or turns off the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned off. Up to 8 feature options can be specified in the list.

**Range:**

*testmode*

**on (optional)**

Enables or turns on the specified feature options. This parameter specifies a comma-separated list of feature options that are requested to be turned on. Up to 8 feature options can be specified in the list.

**Range:**

*testmode*

*refcnt*

**Example**

```
rtrv-gttaset:actid1=disc1
```

```
rtrv-gttaset:actsn=asetdisc1:on=refcnt
```

```
rtrv-gttaset:on=testmode
```

**Dependencies**

The GTT Action Set table is corrupt or cannot be found.

The specified GTT Action Set must already exist in the database.

The *actsn=none* parameter cannot be specified.

If the *actsn* parameter is specified, then the *on=refcnt* parameter is the only other parameter that can be specified.

A value of *fallback* or *none* cannot be specified for the *actid1/actid2/actid3/actid4/actid5/actid6* parameters.

The EGTT feature must be on before this command can be entered.

The action ID specified by the *actid1/actid2/actid3/actid4/actid5/actid6* parameter(s) must already exist in the GTT Action table.

The *actid1/actid2/actid3/actid4/actid5/actid6* parameters must each specify a unique GTT Action ID in the command.

Only one Action ID with an action of *disc*, *udts*, *tcaperr* or *srvc* can be specified.

If an Action ID with an act of *fwd* is specified, then no other Action ID in the Action Set with an act of *disc*, *udts*, *tcaperr*, *fwd* or *srvc* can be specified.

If an Action ID associated with an action of *srvc* is specified, then no other Action ID in the same Action Set can be associated with an act of *fwd*, *disc*, *udts*, *tcaperr*, or *srvc*.

If 5 Action IDs with an act of *dup* are specified then the remaining Action ID with an act of *dup* cannot be specified.

The same value cannot be specified for the *on* and *off* parameters.

**Notes**

When only the *actidX* (where X=1, 2, 3, 4, 5, 6) parameter is specified, and its value matches any action set, then all such matches will be displayed.

**on/off options**

- *testmode* —Invokes a field-safe Test Tool in order to debug the GTT Action Set rules.
- *refcnt* —Reference Count. Displays the number of GTTs that reference the GTT Action Set. This feature option is ON only.

**rtrv-gttset**

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

---

**Note:** If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

---

**Parameters**

---

**Note:** The nature of address indicator parameters (naiv or nai) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. [Table 58: NAIV/NAI Mapping](#) shows the mapping between the naiv and the nai parameter values.

---

---

**Note:** The numbering plan parameters (npv or np) can be specified using a mnemonic or an explicit value. Either value can be specified; however, both values cannot be specified at the same time for the same parameter. [Table 59: NPV/NP Mapping](#) shows the mapping between the npv and np parameter values.

---

**cdgtasn (optional)**  
CdPA GTA GTT set name.

**Range:**  
ayyyyyyyyy

1 leading alphabetic character and up to 8 following alphanumeric characters.

**cdgttsn (optional)**

CdPA GTT set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

**cggtasn (optional)**

CgPA GTA GTT set name.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters.

**cggttsn (optional)**

CgPA GTT set.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

**cgpcsn (optional)**

CgPA PC GTT set name.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic character and up to 8 following alphanumeric characters.

**cgssn (optional)**

CgPA subsystem number.

**Range:**

*0 - 255*

**eaglegen (optional)**

This parameter specifies whether the selector is used by EAGLE generated messages.

**Range:**

*yes*

The selector is used by EAGLE generated messages

**gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16 (optional)**

Global title indicator.

For all EGGT selector commands, the domain is defined as GTI and GTIA (ANSI), GTII (ITU international), GTIN (ITU national), GTIN24 (24-bit ITU national), GTIIS

(ITU international spare), and GTINS (ITU national spare) and GTIN16 (16-bit ITU National).

For the selector commands, GTI and GTIA are equivalent. GTT selectors can be provisioned for the same translation type (TT) with different ITU domains. For example, if an entry with `gtii=2` and `tt=4` already exists, an entry with `gtin=2` and `tt=4` can be specified.

**Range:**

0, 2, 4

Supported value for ANSI: `gti=0, 2` and `gtia=0, 2`

Supported values for ITU: `gtii/gtin/gtin24/gtiis/gtins/gtin16=0, 2, 4`

**Default:**

display all `gti(x)` parameter values

**gttsn (optional)**

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

**Default:**

Display all

**lsn (optional)**

Linkset name.

**Range:**

*ayyyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**msgtype (optional)**

SCCP message type.

Allow one or more SCCP message types (UDT/UDTS/XUDT/XUDTS) for every GTT Selector entry. This will help in screening different message types differently.

**Range:**

*sub*

*u*

*us*

*x*

*xs*

*all*

**Default***all***na*i* (optional)**

Nature of Address indicator.

**Range:***sub**rsvd**natl**intl**dflt***Default:**

Display all

**na*iv* (optional)**

Nature of Address indicator value.

**Range:***0 - 127***Default:**

Display all

**np (optional)**

Numbering Plan.

**Range:***e164**generic**x121**f69**e210**e212**e214**private**dflt***Default:**

Display all

**npv (optional)**

Numbering Plan value.

**Range:***0 - 15***Default:**

Display all

**ovrlapd (optional)**

Overlapped GTT Selectors.

**Range:***yes***Default:***no***selid (optional)**

Selector ID.

**Range:***0 - 65534, none***tt (optional)**

Translation type.

**Range:***0 - 255***Default:**

Display all

**Example**

```
rtrv-gttssel
```

```
rtrv-gttssel:gtii=2
```

```
rtrv-gttssel:tt=0:np=e164
```

```
rtrv-gttssel:gti=2:tt=10
```

```
rtrv-gttssel:gttsn=setint000
```

```
rtrv-
```

```
gttsel:gtia=2:tt=21:cggttsn=setcgpc:cdgttsn=setcdgta:cgssn=20:selid=1: lsn=ls10
```

```
rtrv-gttssel:gtia=2:tt=2:lsn=ls1010
```

```
rtrv-gttssel:gtia=2:eaglegen=yes
```

```
rtrv-gttssel:cdgttsn=setdpc
```

```
rtrv-gttssel:ovrlapd=yes
```

```
rtrv-gttset:gtin16=2  
rtrv-gttset:msgtype=u  
rtrv-gttset:msgtype=u,us
```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

Only entries that exactly match all specified parameters will be displayed. If no match is found, the following message is displayed in the Scroll Area of the terminal: "No GTT Selectors matching the specified criteria were found."

The np and npv parameters cannot be specified together in the same command.

The nai and naiv parameters cannot be specified together in the same command.

The gti/gtia=4, gti(x)=1, and gti(x)=3 parameters cannot be specified.

If the gti/gtia/gtii/gtin/gtin24/gtiis/gtins/gtin16=2 parameter is specified, then the np/npv and nai/naiv parameters cannot be specified.

If a full GTT selector key is specified by the gti(x), tt, np/npv, nai/naiv, cgssn, selid, and lsn parameters, then the GTT set specified by the cgpcsn, cggtsn, or cggtsn parameters cannot be specified.

The OBSR feature must be enabled before the cggtsn, cgpcsn, cgssn, or cdgtsn parameters can be specified.

The GTT set specified by the cggtsn or cgpcsn parameter must exist in the database before it is assigned to a GTT selector.

The set type of the cggtsn or cgpcsn parameter must match the set type of the corresponding entry in the GTT set table. For example, the cggtsn parameter should have a set type of *cggta*, and the cgpcsn parameter should have a set type of *cggpc*.

The SSNSELID table must be accessible.

The FLOBR feature must be turned on before the lsn, eaglegen, cdgtsn, or cggtsn parameter can be specified.

If the eaglegen=yes parameter is specified, then the msgtype, lsn, selid, gtsn, cdgtsn, cgssn, cggtsn, cggtsn, and cgpcsn parameters cannot be specified.

The value specified for the cdgtsn or gtsn parameter must match the name of an existing GTT set.

The GTT set specified by the cdgtsn or gtsn parameter must have a set type of *cdgta* (see the ent-gttset command).

If the OBSR feature is enabled or the FLOBR feature is turned on, then the gtsn parameter cannot be specified.

The GTT Set table is corrupt or cannot be found.

The GTT Selector table is corrupt or cannot be found.

The GTTDBMM table is corrupt or cannot be found.

The linkset specified by the lsn parameter must already exist in the Linkset table.

The CdPA GTT Set specified by the gtsn, cdgtsn, or cggtsn parameter must already exist in the GTT Set table.

A value of *dflt* must be specified for the *np* and *nai* parameters, or neither value can be *dflt*.

The Linkset table is corrupt or cannot be found.

If a full GTT selector key is specified by the *gti(x)*, *tt*, *np/npv*, *nai/naiv*, *selid*, and *lsn* parameters, then the GTT set specified by the *gttsn*, *cdgtasn*, or *cdgttsn* parameters cannot be specified.

If the *lsn* parameter is specified, then the *cdgttsn* or *cggttsn* parameter must be specified.

The *cggtasn*, *cgpcsn*, and *cggttsn* parameters cannot be specified together in the command.

The *gttsn*, *cdgtasn*, and *cdgttsn* parameters cannot be specified together in the command.

If the *gttsn*, *cdgttsn*, or *cdgtasn* parameter is specified, then the *cgssn* parameter cannot be specified.

If the *eaglegen=yes* parameter is specified, then the *lsn*, *selid*, *gttsn*, *cdgtasn*, *cgssn*, *cggttsn*, *cggtasn*, or *cgpcsn* parameters cannot be specified.

If the FLOBR feature is turned on, then the *cdgtasn*, *cggtasn*, and *cgpcsn* parameters cannot be specified.

If a value of *dflt* is specified for the *np* and *nai* parameters, then the *cggtasn*, *cgpcsn*, *cgssn*, *selid*, *lsn*, *cggttsn*, and *eaglegen* parameters cannot be specified.

A value of *none* cannot be specified for the *gttsn*, *cdgtasn*, *cdgttsn*, *cggttsn*, *cggtasn*, and *cgpcsn* parameters.

If the *gti(x)=0* parameter is specified, then the *eaglegen*, *tt*, *np/npv*, and *nai/naiv* parameters cannot be specified.

### Notes

There is no J7 FAK dependency on the GTIA/GTIN16/GTIN24 parameters. The command can be entered successfully whether the J7 FAK is enabled or not enabled.

GTT Selector entries configured using GTIN24/GTIN16 parameters shall be treated as ITU-N24 entries if the J7 FAK is disabled and shall be treated as ITU-N16 entries if the J7 FAK is enabled.

Also, if the J7 Support feature is enabled, the *rtrv-gttset* output displays the GTIN16 header and if the J7 feature is not enabled, the *rtrv-gttset* output displays the GTIN24 header.

When *msgtype* is specified in the *rtrv-gttset* command, the best match for the specified *msgtype* is shown in the output. For example, say there are two GTT Selector entries provisioned with *msgtype=u*, *us* and *msgtype=us* for different GTI(x), TT, NP and NAI combination. The command *rtrv-gttset:msgtype=us* will display both selectors in the output.

### Output

This example retrieves all GTT selectors when EGTT is ON:

```
rtrv-gttset
```

```

[dlt-gttset](#)

[ent-gttset](#)

## rtrv-gttset

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

---

**Note:** If the EGTT feature is turned on, then the GTT Selector (`ent/chg/dlt/rtrv-gttset`), GTT Set (`ent/dlt/rtrv-gttset`), and GTA (`ent/chg/dlt/rtrv-gta`) commands replace the Translation Type (`ent/dlt/rtrv-tt`) and Global Title Translation (`ent/chg/dlt/rtrv-gtt`) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

---

### Parameters

#### **actsn (optional)**

GTT Action Set Name.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

#### **gtmodid (optional)**

Global title modification identifier.

**Range:**

*ayyyyyyyyy*

**Default:**

Display all

#### **gttsn (optional)**

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

#### **netdom (optional)**

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

**Range:**

*ansi*

*itu*

*cross*

**Default:**

Display all

**npsn (optional)**

GTT set name (Not Present Set Name). This parameter can have the IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA GTT set types.

**Range:**

*ayyyyyyyyy*

1 leading alphabetic and up to 8 following alphanumeric characters.

**refcnt (optional)**

GTT set reference count. The count of GTT set being referred in GTT Selectors, GTA Translations, BPARTYGTTSN and IS41SMSCGTTSN options in GSMSMSOPTS table and BPARTYGTTSN option in IS41SMSOPTS table.

**Range:**

*yes*

**setidx (optional)**

GTT set index.

---

---

**Note:** A comma-separated setidx list that allow GTT set information to be retrieved based on the GTT index number. Up to 7 setidx can be specified in the list.

---

---

**Range:**

*0 - 9999*

**settype (optional)**

GTT set type.

**Range:**

*cdgta*

*cdssn*

*cggta*

*cgpc*

*cgssn*

*dpc*

*imei*

*imsi*

*msisdn*

*opc*

*opcode*

*smrpda*

*smrpoa*

*vlrnb*

**Default:**

Display all

**sxudt (optional)**

Segmented XUDT. This parameter specifies whether TOBR will support the processing of segmented XUDT message.

**Range:**

*yes*

perform decoding of segmented XUDT message

*no*

do not perform decoding of segmented XUDT message

**Default:**

*no*

**Example**

```
rtrv-gttset
```

```
rtrv-gttset:netdom=ansi
```

```
rtrv-gttset:gttsn=t800
```

```
rtrv-gttset:netdom=ansi:settype=cdssn
```

```
rtrv-gttset:settype=opcode
```

```
rtrv-gttset:setidx=1
```

```
rtrv-gttset:actsn=actdisc1
```

```
rtrv-gttset:refcnt=yes
```

```
rtrv-gttset:gtmodid=set1
```

```
rtrv-gttset:npsn=imsi1
```

```
rtrv-gttset:setidx=3,7,65,22
```

```
rtrv-gttset:sxudt=yes
```

**Dependencies**

The EGTT feature must be turned on before this command can be entered.

If the `gttsn` parameter is specified, it cannot have a value of *none*, and must match an existing `gttsn`.

If the `netdom` parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

No GTT Sets matching the specified criteria were found.

The `netdom=cross` parameter is valid if the `settype=cdgta/imei/imsi/msisdn/vlrnb/smrpoa/smrpda` parameter is specified.

If the `gttsn` parameter is specified then the `settype`, `netdom`, `actsn`, and `gtmodid` parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the `settype` parameter is *cggtta*, *cgssn*, *opc*, or *cgpc*.

The ANSI/ITU SCCP Conversion feature must be enabled before the `netdom=cross` parameter can be specified.

The TOBR feature must be turned on before the `opcode=settype` parameter can be specified.

If the `setidx` parameter is specified, then no other parameter can be specified in the command.

The FLOBR feature must be turned on before a value of *cdssn* or *dpc* can be specified for the `settype` parameter.

The value specified for the `gtmodid` parameter must already exist in the GTMOD table.

The value specified for the `npsn` parameter must match the name of an existing GTT Set of IMEI/IMSI/MSISDN/VLRNB/SMRPOA/SMRPDA type.

The `SXUDT` parameter must be specified with the `OPCODE` GTT set type only.

Duplicate values cannot be specified for the `SETIDX` parameter.

## Notes

When the Origin-based SCCP Routing feature is turned on, the `settype` parameter is displayed regardless of feature key status. If the feature key is not enabled, the `settype=cdgta` parameter (default value) is displayed.

Only entries that match the `setidx` values specified in the command will be displayed. If no GTTSet is found for a particular `setidx`, the following message is displayed in the Scroll Area of the terminal: "No Entry found." along with the `setidx` for which GTTSet was not found.

## Output

This example retrieves all GTT sets:

`rtrv-gttset`

```

## rtrv-gtw-stp

Use this command to display the level 3 ANSI transfer control status (TFCSTAT) parameter. This value is the level 3 control status used on a TFC message received from an ITU node destined for an ANSI node.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-gtw-stp
```

**Dependencies**

None

**Notes**

None

**Output**

```
rtrv-gtw-stp
```

```
rlghncxa03w 03-03-11 11:34:04 EST  EAGLE 31.3.0
TFCSTAT
1
;
```

**Related Topics:**[chg-gtw-stp](#)

## rtrv-gtwy-acthresh

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

**Parameters****lsn (optional)**

Linkset name.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:**

Display all

**Example**

```
rtrv-gtwy-acthresh:lsn=wy644368
```

```
rtrv-gtwy-acthresh
```

**Dependencies**

The Extended Linkset table must be accessible.

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The Linkset table must be accessible.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

**Notes**

None

**Output**

This example shows the thresholds of all linksets:

```
rtrv-gtwy-acthresh
```

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN      REJ    RECV   INTRVL
WY644368 10      1000   10
WY234456 25      2000   20
LN123445 -        -       -
LN123556 25      2500   30
OP239900 -        5       5
;
```

This example shows linkset WY644368 rejection thresholds:

```
rtrv-gtwy-acthresh: lsn=wy644368
```

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0

## rtrv-gtwy-prmtrs

Use this command to display the STP values that limit the display of certain notification messages that could become excessive. Only the values set by the `set - scrrej -prmtrs` command are displayed.

#### Parameters

This command has no parameters.

#### Example

```
rtrv-gtwy-prmtrs
```

#### Dependencies

The Extended STP Options table must be accessible.

None

#### Notes

None

#### Output

```
rtrv-gtwy-prmtrs
```

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LIMIT INTRVL
1000 15
;
```

**Legend**

- **LIMIT**—The threshold not to be exceeded.
- **INTRVL**—Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Related Topics:**

## rtrv-gws-actset

Use this command to display the values defined for gateway screening stop actions.

**Parameters****actid (optional)**

The identification number of the gateway screening stop action.

**Range:**

4 - 16

**Default:**

Display all

**actname (optional)**

The name of the gateway screening stop action set.

**Range:**

*ayyyyy*

One alphabetic character followed by up to five alphanumeric characters.

**Default:**

Display all

**Example**

```
rtrv-gws-actset
rtrv-gws-actset:actname=cr
rtrv-gws-actset:actid=6
```

**Dependencies**

Either actname or actid can be specified, but not both.

**Notes**

If neither actname nor actid are specified, all gateway screening stop actions are displayed.

**Output**

```
rtrv-gws-actset:actname=cr
```

```

## rtrv-gws-redirect

Use this command to display the provisioning data for the redirect function. The parameters and values that are retrieved using this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected.

#### Parameters

**This command has no parameters.**

**Example**

```
rtrv-gws-redirect
```

**Dependencies**

None

**Notes**

None

**Output**

The second column in the output displays the type of point code used:

- ANSI—DPCA
- International—DPCI
- ITU National—DPCN
- ITU National 24—DPCN24
- ITU National 16---DPCN16

```
rtrv-gws-redirect

## rtrv-home-smsc

Use this command to retrieve HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command reads the HOME SMSCADDR table.

### Parameters

#### **force (optional)**

Display more than 50 entries.

##### **Range:**

*yes*

*no*

##### **Default:**

*no*

#### **num (optional)**

Number of entries to display. The **force** parameter must also be specified to display more than 50 entries.

##### **Range:**

*1 - 500*

##### **Default:**

*50*

#### **smsc (optional)**

Short Message Service Center address.

##### **Range:**

*1-21 hexadecimal digits*

### Example

```
rtrv-home-smsc
```

```
rtrv-home-smsc:smsc=552611646
```

```
rtrv-home-smsc:num=100:force=yes
```

### Dependencies

One of the following features must be enabled

- MO SMS IS41-to-GSM Migration
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- MT-Based GSM SMS NP

- MT-Based IS41 SMS NP
- Portability Check for Mobile Originated SMS

When the specified num parameter value is greater than 50, the force=yes parameter must also be specified.

The HOME SMSCADDR table must be accessible.

The GSM DBMM table must be accessible.

### Notes

None

### Output

rtrv-home-smsc

```
rlghncxa03w 03-03-28 08:50:12 EST  EAGLE 31.3.0
SMSC ADDRESS

13214564894498
55231465465434
5465455655656456

## rtrv-homern

Use this command to retrieve a list of routing number prefixes that belong to the operating network.

### Parameters

This command has no parameters.

### Example

rtrv-homern

### Dependencies

The HOMERN table must be accessible.

### Notes

None

### Output

rtrv-homern

```
rlghncxa03w 03-03-28 08:50:12 EST  EAGLE 31.3.0
RN
-----
216780909087654

**Related Topics:**[dlt-homern](#)[ent-homern](#)

## rtrv-inpopts

Use this command to retrieve INP-specific options.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-inpopts
```

**Dependencies**

None.

The INPOPTS table must be accessible.

**Notes**

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 126.

If either the DRANAI value or DRANAIV value has been provisioned, the DRANAI mnemonic string for the provisioned value is displayed.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANP default mnemonic value of E164.

If either the DRANP value or DRANPV value has been provisioned, the DRANP mnemonic string for the provisioned value is displayed.

The command output displays each CDPNPFX value with its associated DLTPFX setting.

The command output displays each CDPNNAI value with its associated SNAI value.

If no NEC value has been provisioned, a value of *none* is displayed.

If a RELCAUSE value was not provisioned, then the default value of 31 is displayed.

### Output

This example shows output with default INP options:

rtrv-inpopts

```
rlghncxa03w 10-03-17 15:35:05 EST  EAGLE 42.0.0

## rtrv-ip-card

Use this command to retrieve IP networking parameters for a given card.

**Parameters****loc (optional)**

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115*

**Example**

```
rtrv-ip-card:loc=1211
rtrv-ip-card
```

## Dependencies

The value specified for the `loc` parameter must correspond to the location of a card that can run an IP application (other than the `EROUTE` application, which is not supported by this command).

## Notes

None

## Output

`rtrv-ip-card:loc=1211`

```
rlghncxa03w 13-09-24 15:35:05 EST EAGLE 46.0.0
```

```

**Legend**

- **LOC**—Card location
- **SRCHORDR**—Host table search order. LOCAL indicates that the Local Host table is searched first. SRVR indicates that the Domain server is searched first. SRVRONLY indicates that only the Domain server is searched.
- **DNSA**—IP address of Domain Server A
- **DNSB**—IP address of Domain Server B
- **DEFROUTER**—IP address for the default router
- **DOMAIN**—TDomain name of the Domain server
- **SCTPCSUM**—SCTP checksum algorithm type
- **BPADDR**—Bonded port IPv6 address
- **BPSUBMASK**—Bonded port IP submask

## rtrv-ip-conn

## Parameters

**Connection name.** This parameter specifies the unique logical name assigned to each SIP or ENUM connection.

ZZZZZZZZZZZZZZZZZZZZ

Local host name. This parameter specifies the local host name as defined in the IP Host table.

[illegible]

The card location as stenciled on the shelf of the system.

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

This parameter specifies which of the SIP or ENUM connections are allowed to receive SIP or ENUM traffic and which are not.

*yes*

no

## Commands 4-2461

**prot (optional)**

Underlying SIP or ENUM connection protocol.

**Range:**

*tcp*

Transmission Control Protocol.

*udp*

User Datagram Protocol.

---

---

**Note:** For ENUMHC, only udp is supported.

---

---

**Example**

```
rtrv-ip-conn
rtrv-ip-conn:cname=conn1101a
rtrv-ip-conn:loc=1101
rtrv-ip-conn:prot=tcp
rtrv-ip-conn:lhost=lss1
rtrv-ip-conn:open=yes
```

**Dependencies**

SIPNP Feature must be enabled before retrieving any SIP connection entry.

At least one ENUM card must be provisioned before entering any ENUM connection information.

IPCONN table should be accessible.

The value specified for the HOST parameter must begin with an alphabetic character and can contain a..z, A..Z, 0..9, - (hyphen), or . (period).

The specified card location must be equipped.

The location specified with this command should be of a SIP or ENUM card.

**Notes**

If optional parameters are specified, only the entries that match the entered parameters are displayed.

If the host name contains a hyphen, then the host name must be enclosed within quotation marks.

**Output**

This example displays output when no parameter is specified:

```
rtrv-ip-conn
```

```
tekelecstp 16-10-28 01:15:18 EST  EAGLE 46.4.0.0-69.15.0
rtrv-ip-conn
Command entered at terminal #4.
```

;

## Output

If this command is entered without any parameters, then the command displays up to a maximum of 50 entries. The `display=all` parameter must be specified to display all entries in the IP Host table.

This example displays output when no other parameter is specified:

`rtrv-ip-host`

## rtrv-ip-lnk

Use this command to retrieve the IP link table.

**Parameters****loc (optional)**

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115*

**Default:**

All card location link data are displayed.

**port (optional)**

Ethernet interface port ID.

**Range:**

*a, b, c, d*

**Default:**

All IP link port data associated with all ports on the card are displayed.

**Example**

```
rtrv-ip-lnk:loc=1211:port=a
rtrv-ip-lnk:loc=1211
rtrv-ip-lnk
rtrv-ip-lnk:loc=1211:port=c
```

## Dependencies

The value specified for the `loc` parameter must correspond to the location of a card that can run an IP application (other than the `EROUTE` application, which is not supported by this command).

The card in the location specified by the `loc` parameter must support the port specified by the `port` parameter.

## Notes

Interface A/D is used for ExAP connectivity, and interface B/C is used for signaling network on SLIC cards running the `DEIR/SIP/ENUM` applications.

## Output

`rtrv-ip-lnk`

```

```

## Legend

- **LOC**—Card location
- **PORT**—Ethernet interface port ID
- **IPADDR**—IPv4 address for the specified port
- **SUBMASK**—Subnet mask of the IPv4 interface
- **DUPLEX**—Mode of operation of the interface
- **SPEED**—Bandwidth for the interface in megabits per second
- **MACTYPE**—Media Access Control Type of the interface. 802.3 indicates the IEEE standard number 802.3 for Ethernet 1, and DIX indicates the Digital/Inter/Xerox de facto standard for Ethernet 2.
- **AUTO**—Whether to automatically determine duplex and speed. If YES, duplex and speed are automatically determined. If NO, duplex and speed are not automatically determined.
- **MCAST**—Multicast Control. Enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the Service Module card to the MPS system.

## rtrv-ip-node

Use this command to display one or more nodes that are directly connected to a IP data link. This command can display a connection, an application on a node, or an entire node. No parameters are required to display an entire node. An application can be specified by giving either the application name or its IP port on the node.

## Parameters

### ipaddr (optional)

Remote host IP address. This address is expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host

number. An example IP address is 192.126.100.5, where *192.126.100* is the network number and 5 is the machine's host number.

**Range:**

1-223, 0-255

4 numbers separated by dots

1-223—first number

0-255—the other three numbers

**Default:**

Display all

**ipappl (optional)**

IP application supported by the node.

**Range:**

*stplan*

**ipport (optional)**

Logical IP port that addresses the application on the node.

**Range:** 1024 - 5000

**Default:**

Display all

**iprte (optional)**

Default router IP address. This address is expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where *192.126.100* is the network number and 5 is the machine's host number.

**Range:**

1-223, 0-255

4 numbers, separated by dots

1-223—first number

0-255—the other three numbers

**Default:**

Display all

**loc (optional)**

The card location as stenciled on the shelf of the system that contains the link that will be directly connected to the node.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 -

5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**Default:**

Display all

**Example**

```
rtrv-ip-node
rtrv-ip-node:ipappl=stplan
rtrv-ip-node:ipaddr=193.4.201.50
rtrv-ip-node:ipaddr=193.4.201.50:ipport=1024
rtrv-ip-node:loc=1201
```

**Dependencies**

Only one of the `ipappl`, `ipport`, or `loc` parameters can be specified in the command.

The `ipaddr` parameter must be specified before the `ipport` parameter can be specified.

The shelf and card must be equipped.

If the `loc` parameter is specified, the card location must be equipped with an IP data link.

If the `iprte` parameter is not specified, then all IP nodes meeting the display criteria are displayed. If the IP node has no IP router assigned to it, dashes are displayed in the IP RTE field.

**Notes**

None

## rtrv-ip-rte

Use this command to display all static IP route entries in the Static IP Route table, entries for a specific card, entries for a specific destination IP address, or entries for a specific gateway IP address.

**Parameters****dest (optional)**

Destination IP Address. The IP Address of a remote destination host or network.

**gtwy (optional)**

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

**Range:**

4 numbers separated by dots, with each number in the range of 0-255.  
The IP address 0.0.0.0 is not valid.

**loc (optional)**

Card location. The unique identifier of a specific IP card in the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**num (optional)**

Number of IP route entries to be retrieved.

**Range:**

*1 - 2048*

**Default:**

*2048*

**Example**

```
rtrv-ip-rte
rtrv-ip-rte:loc=1301
rtrv-ip-rte:dest=128.252.10.5
rtrv-ip-rte:gtwy=140.190.15.3
```

## Dependencies

Only one of the **dest**, **gtwy**, or **loc** optional parameters can be specified in a single command.

The value specified for the **loc** parameter must not correspond to an E5 TDM-A or TDM-B

The specified destination IP address (**dest** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (0.0.0.0)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

## Notes

## rtrv-is41-msg

Use this command to display the configured IS41 test message parameter values.

**Parameters****msgn (mandatory)**

Message number. The test message number that is retrieved.

**Range:**

*1 - 10*

**Example**

```
rtrv-is41-msg:msgn=5
```

**Dependencies**

The TSTMSG table is corrupt or cannot be found.

None.

**Output**

```
rtrv-is41-msg:msgn=1
```

```
tekelecstp 08-12-02 10:47:51 EST EAGLE 40.1.0
MSG = 1                ACTIVE = YES
```

```
CGPA_GT = 2
CGPA_GT_NAI = 4      CGPA = 919818000001
```

```
CDPA_GT = 2
CDPA_GT_NAI = 4      CDPA = 919818000002
```

```

## rtrv-is41opts

Use this command to retrieve the IS41 option indicators maintained in the IS41OPTS table.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-is41opts
```

**Dependencies**

The APORT or IGM feature must be enabled before this command can be entered.

**Output**

```
rtrv-is41opts
```

```
tekelecstp 10-03-15 12:49:20 EST EAGLE 42.0.0
```

**rtrv-j1**

Use this command to retrieve information for a specified J1 interface or for all J1 interfaces that have been defined by the ent-j1 command.

**Parameters****loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**Default:**

All T1 card locations having J1 interfaces configured are listed.

**j1port (optional)**

J1 port number. The value must be a J1 port that has already been configured with a J1 interface on the specified J1 card having application as CCS7ITU.

**Range:**

*1-8*

**Default:**

If not specified, all T1 card locations having J1 interfaces configured are listed.

**Example**

```
rtrv-j1
rtrv-j1:loc=1101:j1port=1
```

**Dependencies**

The `loc` and `j1port` parameters must be specified together, if any parameters are specified for the command.

The J1 interface of the J1 card specified by the `loc` parameter must already be defined before this command can be entered.

The card specified by the `loc` parameter must be a LIMT1 card type and the application must be CCS7ITU.

The Card (IMT) table must be accessible.

The J1 table must be accessible.

The port specified by the `j1port` parameter on the card specified by the `loc` parameter must already be equipped with a J1 interface.

The following card locations (`loc` parameter) are not valid for this command: 1113 - 1118 and all `xy09` and `xy10` locations (where `x` is the frame and `y` is the shelf).

The `j1port` parameter must be in the range from 1 to 8.

**Notes**

None.

**Output**

```
rtrv-j1
```

- J1TSEL-- J1 timing source indicator (external = master timing source, line= slave timing source).

**Related Topics:**[chg-j1](#)[dlt-j1](#)[ent-j1](#)[tst-j1](#)

## rtrv-l2t

Use this command to display the values of the SS7 MTP Level 2 timers. The timers are organized in 40 timer sets of 10 timer values each. The timer sets are grouped and system default values are initialized by specification (ANSI, ITU, High Speed for China, High Speed for Q.703 Annex A, JT Q703, and High Speed for Unchannelized T1). Each timer set is administered individually by the chg - l2t command. The ent-slk command is used to assign an SS7 signaling link to any of the timer sets. Each assigned link is associated with a timer set.

**Parameters****l2tset (optional)**

Level 2 timer set identifier, or timer set number. Up to 40 different SS7 MTP Level 2 timer sets can be defined.

**Range:**

1 - 40

**Default:**

Displays all timer sets

**Example**

```
rtrv-l2t
```

```
rtrv-l2t:l2tset=36
```

**Dependencies**

The Level 2 Timer Set table is corrupt or cannot be found.

None.

## Notes

The timer values are shown in the output for this command in seconds, even though they were specified in milliseconds in the `chg-l2t` command.

## Output

The timer values are shown in the output for this command in seconds.

## rtrv-l3t

Use this command to show values of the SS7 level 3 timers. The timers are grouped into sets that are assigned to linksets.

### Parameters

#### **l3tset (optional)**

Level 3 timer set table. Only one level 3 timer set table can be defined. The timer set can then be assigned to a linkset using the `ent - ls` or `chg - l3t` command.

#### **Range:**

1

**Default:**  
Display table

### Example

```
rtrv-l3t:l3tset=1
```

### Dependencies

Only one timer set is supported in this release.

### Notes

The timer output for this command is in seconds, even though it could have been entered in milliseconds in the `chg-l3t` command.

### Output

```
rtrv-l3t:l3tset=1
```

```

### Legend

- **L3TSET**—Level 3 timer set table.
- **T1**—Delay, in seconds, to avoid message missequencing on changeover. Also used as the ITU MTP restart isolation timer.
- **T2**—Amount of time, in seconds, to wait for changeover acknowledgment
- **T3**—Time controlled diversion – the delay, in seconds, to avoid missequencing on changeback
- **T4**—Amount of time, in seconds, to wait for changeback acknowledgment, first attempt
- **T5**—Amount of time, in seconds, to wait for changeback acknowledgment, second attempt

- **T6**—Delay, in seconds, to avoid message missequencing on controlled rerouting
- **T7**—Amount of time, in seconds, to wait for signaling data link connection acknowledgment
- **T8**—Transfer-prohibited inhibited timer (transient solution)
- **T10**—Amount of time, in seconds, to wait before repeating the signaling-route-set-test message
- **T11**—Transfer-restricted timer
- **T12**—Amount of time, in seconds, to wait for uninhibit acknowledgment
- **T13**—Amount of time, in seconds, to wait for force uninhibit
- **T14**—The amount of time, in seconds, to wait for inhibition acknowledgment
- **T15**—Amount of time, in seconds, to wait before repeating the signaling-route-set-congestion test
- **T16**—Amount of time, in seconds, to wait for route-set-congestion status update
- **T17**—Delay, in seconds, to avoid oscillation of initial alignment failure and link restart
- **T18**—Repeat TFR once by response method timers
- **IT18**—Timer within an STP whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set. The amount of time, in seconds, to wait for links to align and to receive TRAs from all adjacent nodes.
- **T19**—Failed link craft referral timer
- **IT19**—Amount of time, in seconds, for the supervision timer to wait during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages
- **T20/IT22**—Amount of time, in seconds, to wait before repeating the local inhibit test
- **IT20**—Amount of time, in seconds, to wait overall for the MTP restart at the signaling point whose MTP restarts
- **T21/IT23**—Amount of time, in seconds, to wait before repeating the remote inhibit test
- **IT21**—Overall MTP restart timer at a signaling point adjacent to one whose MTP restarts
- **T22**—Timer at the restarting STP. The amount of time, in seconds, to wait for signaling links to become available
- **T23**—Timer at the restarting STP. Starting after T22, the amount of time, in seconds, to wait to receive all TRA messages.
- **T24**—Timer at the restarting STP with transfer function. Starting after T23, the amount of time, in seconds, to wait to broadcast all TRA messages.
- **T25**—Timer at the adjacent and restarting STPs. The amount of time, in seconds, to wait for a TRA message (may be started at level 2).

- **T26**—Timer at the restarting STP. The amount of time, in seconds, to wait to repeat a TRW message.
- **T28**—Timer at the STP adjacent to the restarting STP. The amount of time, in seconds, to wait for a TRW message.
- **T29**—Timer started when a TRA message is sent in response to an unexpected TRA or TRW. Also, the timer started when traffic is resumed without receipt of a TRA message.
- **T30**—Timer used to limit the sending of TFPs/TFRs in response to an unexpected TRA or TRW message
- **T31**—False link congestion detection timer
- **T32**—Link oscillation timer—Procedure A

## rtrv-lbp

Use this command to retrieve the current value of a far-end loopback point maintained in the link fault sectionalization table.

**Parameters****lbp (optional)**

Loopback point ID. A far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

**Range:**

1 - 32

**Default:**

Display all

**Link (optional)**

SS7 signaling link. The SS7 signaling link that is to be tested.

**Synonym:**

*port*

**Range:**

*a, b, a1 - a31, b1 - b31*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling links.

**Default:**  
Display all

**loc (optional)**

Card location. The unique identifier of a specific application subsystem located in the STP.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 531, 6101 - 6108, 6111 - 6118*

**Default:**  
All card locations.

**Example**

```
rtrv-lbp
rtrv-lbp:loc=1202
rtrv-lbp:loc=1202:link=a
rtrv-lbp:loc=1202:link=a:lbp=3
```

**Dependencies**

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location specified in the `loc` parameter cannot be reserved by the system.

If the `link` parameter is specified, the `loc` parameter must be specified. If the `lbp` parameter is specified, the `loc` and `link` parameters must be specified.

The card location (`loc` parameter) must identify a provisioned HC-MIM, E5-E1T1, or E5-E1T1-B card, provisioned with the LIMT1 card type, configured with either the SS7ANSI or CCS7ITU application.

The card location specified in the `loc` parameter must be equipped.

The Link Fault Sectionalization table containing the Loopback Point (LBP) database must be accessible.

**Notes**

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

**Output**

This example displays the attributes for the loopback points for SS7 links assigned to the STP:

## rtrv-lg-card

Use this command to retrieve and display LG card provisioning.

The command class is TKLC\_INTERNAL inheriting properties of DEBUG class.

The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

**Parameters****loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**Example**

```
rtrv-lg-card:loc=1302
```

**Dependencies**

The card location must not be 1113-1118, or *xy*09 and *xy*10 where *x* is the frame and *y* is the shelf.

The LG Card table is corrupt or cannot be found.

Loc is mandatory

The card location specified in the `loc` parameter must be of a provisioned LG card.

**Output**

```
rtrv-lg-card:loc=1302
```

```

## rtrv-lg-event

Use this command to display an LG event provisioning. The command class is TKLC\_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

## Parameters

### **dir (optional)**

Direction of Event generation or reception.

#### **Range:**

*Tx*  
Transmit Event

*Rx*  
Receive Event

### **event (optional)**

The name of the LG event.

#### **Range:**

*aaaaaaaaaa*

Up to 10 alphanumeric characters; the first character must be a letter

## Example

```
rtrv-lg-event
rtrv-lg-event:event=txisup1
rtrv-lg-event:event=txsnm1
rtrv-lg-event:dir=rx
```

## Dependencies

When failed to read LG Event table.

The value specified for the **event** parameter must already exist in the table.

The **dir** or **event** parameter must be specified.

The value specified for the **event** parameter cannot be an Eagle reserved name

## Output

```
rtrv-lg-event
```

```
tekelecstp 09-04-29 18:15:20 EST xx.x.x-xx.x.x
LG Event Configuration
```

## rtrv-lg-grp

Use this command to retrieve and display LG card groups. The command class is TKLC\_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSP, IPLHC, IPGHC and SS7HC GPLs.

**Parameters****grp (optional)**

LG group name

**Range:**

*aaaaaaaaaa*

Up to 10 alphanumeric characters; the first character must be a letter

**Example**

```
rtrv-lg-grp
```

```
rtrv-lg-grp:grp=lggroup1
```

**Dependencies**

The value specified for the **grp** parameter must already exist in the LG Group table.

The LG Group table is corrupt or cannot be found.

**Output**

rtrv-lg-grp

```
tekelecstp 09-04-29 18:15:20 EST  xx.x.x-xx.x.x

## rtrv-lg-sys

Use this command to display and retrieve all LG groups, cards, engines and events provisioning in the system.

The command class is TKLC\_INTERNAL inheriting properties of DEBUG class. The Load Generator is supported on IPSG, IPLHC, IPGHC and SS7HC GPLs.

**Parameters**

No Parameters

**Example**

rtrv-lg-sys

**Dependencies**

The LG System table is corrupt or cannot be found.

The LG Engine table is corrupt or cannot be found.

The LG Group table is corrupt or cannot be found.

The LG Card table is corrupt or cannot be found.

When failed to read LG Event table.

**Output**

rtrv-lg-sys

```

## rtrv-lnp-serv

Use this command to retrieve all LNP services. This command displays the assigned translation type, translation type name, service type, LNP digit validity indication, and TT aliases.

**Parameters**

This command has no parameters.

**Example**

rtrv-lnp-serv

**Dependencies**

The LNP TT SERV table is corrupt or cannot be found.

The LNP feature must be turned on before this command can be entered.

The LNP database is corrupt or cannot be found.

The GTT Action table is corrupt or cannot be found.

**Notes**

None

**Output**

This example shows output when EGTT is ON.

rtrv-lnp-serv

```
rlghncxa03w 10-11-11 13:45:15 EST EAGLE 43.0.0

## rtrv-lnpopts

Use this command to display all the LNP-specific system options from the database.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-lnpopts
```

**Dependencies**

The LNP feature or AINPQ feature must be turned on before this command can be entered.

The LNP Options table must be accessible.

The LNP database must be accessible.

**Notes**

None

**Output**

The JIPPROV and JIPDIGITS fields appear in the output only when the Triggerless LNP feature is turned on.

```
rtrv-lnpopts
```

```
AMASLPID    = 123456789
INCSLP      = yes
AMACTYPE    = 003
AMAFEATID   = 010
CIC         = 1369
AUD         = on
SP          = a123
ADMHIPRI    = yes
GTWYSTP     = yes
JIPPROV     = yes
JIPDIGITS   = 919460

## rtrv-log

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

### Parameters

#### **dir** (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

#### **Range:**

***fwd***

Display entries from nearer the beginning of the log toward entries at the end of the log

***bkwd***

Display entries from nearer the end of the log toward entries at the beginning of the log

**Default:**

*fwd*

**edate (optional)**

End date. Report only log entries that were created on or before the specified date (*dir=fwd*), or only log entries that were created on or after the specified date (*dir=bkwd*). See the Notes section for usage information.

**Range:**

000101 - 991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:**

Report log entries regardless of their creation date

**enum (optional)**

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

**Range:**

1 - 1999

1-999 —Alarms (UAMs)

1000-1999 —UIMs

**Default:**

If *enum* is not specified and:

If *snum* is specified, the default *enum* value is the same as the specified *snum* value.

If *snum* is not specified and *type* is *alarm* or not specified, the default *enum* value is 999.

If *snum* is not specified and *type* is *all* or *uim*, the default *enum* value is 1999.

**etime (optional)**

End time. Report only log entries that were created on or before the specified time (*dir=fwd*), or only log entries that were created on or after the specified time (*dir=bkwd*). See the Notes section for usage information.

**Range:**

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59)) y)

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as 130503.

**Default:**

Report log entries regardless of their creation time

**mode (optional)**

Log display mode; display all information or just summary information from each log entry.

---

**Note:** If the entry is only one line, the same information (one line) is displayed in brief and full mode for that entry.

---

**Range:***brief*

Display only the first "Summary" line of the log entry

*full*

Display all information available in the log entry

**Default:**

*full*

**next (optional)**

Number of additional records to display using the same direction (*dir*) and filtering criteria of *outgrp*, *type*, *slog*, and *mode* that were used for the previous successful *rtrv-log* command at the same terminal.

**Range:**

*1 - 65500*

**num (optional)**

Number of records that can be displayed before the report is stopped.

**Range:**

*1 - 65500*

**Default:**

*15*

**outgrp (optional)**

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on.

**Range:***all*

Retrieve information for all Output Groups

*appserv*

Application Server

*appss*

Application Subsystem

*card*

Card

*clk*

Clock

*db*

Database

*dbg*

Debug

*gtt*

*traf*

Traffic

**Default:**

If the next parameter is not specified, the default is *all*.

If the next parameter is specified, the output is the same as the immediately previous successful `rtrv-log` command that was entered at the same terminal (and no `rtrv-log` command was entered at another terminal).

**sdate (optional)**

Start date. Report only log entries that were created on or after the specified date (*dir=fwd*), or only log entries that were created on or before the specified date (*dir=bkwd*). See the Notes section for usage information.

**Range:**

000101 - 991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:**

Report log entries regardless of their creation date

**slog (optional)**

Source of log. The OAM Maintenance log to access.

**Range:**

*act*

Active OAM

*stb*

Standby OAM

**Default:**

*act*

**snum (optional)**

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the *outgrp* parameter is specified.

**Range:**

1 - 1999

1-999 —Alarms (UAMs)

1000-1999 —UIMs

**Default:**

All entries for the specified *type* are displayed.

If *type=all*, *alarm*, or not specified, the default value is 1.

If *type=uim*, the default value is 1000.

**stime (optional)**

Start time. Report only log entries that were created on or after the specified time (*dir=fwd*), or only log entries that were created on or before the specified time (*dir=bkwd*). See the Notes section for usage information.

**Range:**

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as 130503.

**Default:**

Report log entries regardless of their creation time

**type (optional)**

Type of Maintenance log to access for the report.

**Range:***all*

UAMs and UIMs

*alarm*

UAMs

*uim*

UIMs

**Default:**

*alarm*

**Example**

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all
```

```
rtrv-log:next=100
```

**Dependencies**

No other `rtrv-log` command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the `rtrv-log` command can be entered.

If the `sdate` and `edate` parameters are specified:

- In the forward direction, the `sdate` value must be less than or equal to the `edate` value.
- In the backward direction, the `sdate` value must be greater than or equal to the `edate` value.

The month component of the `sdate` and `edate` parameters must be in the range 1–12.

The day component of the `sdate` and `edate` parameters must be in the range 1–31 and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the `stime` and `etime` parameters must be in the range 00–59.

The minutes component of the `stime` and `etime` parameters must be in the range 00–59.

If the `sdate` parameter value is equal to the `edate` parameter value,

- In the forward direction, the `stime` value must be less than or equal to the `etime` value.
- In the backward direction, the `stime` value must be greater than or equal to the `etime` value.

The `sdate` parameter value plus the `stime` parameter value must be less than the current time and date combination.

If `dir=bkwd` is specified with a date and time range, `sdate/stime` must be greater than `edate/etime`.

When the `enum` parameter is specified, the `snum` parameter must be specified with a value less than or equal to the specified `enum` value.

The specified `enum` parameter value and the specified `snum` value must be within the same range: 1-999 for Alarms (UAMs) and 1000-1999 for UIMs.

The `type` parameter and the `snum/enum` parameters cannot be specified together in the command.

The `rtrv-log:next=` command must be entered on the same terminal where the previous successful `rtrv-log` command was entered in the system. No other parameters can be entered with the `next` parameter in the command.

The `rtrv-log:next=` command cannot be entered following a `rtrv-log` command that contained the `type=all` parameter. A `rtrv-log` command without the `type=all` parameter must be entered before the `rtrv-log:next=` command can be entered.

Because entries can be overwritten between the entry of a `rtrv-log` command without the `next` parameter and the entry of a `rtrv-log:next=` command, the `rtrv-log:next=` command might not execute successfully. Another `rtrv-log` command without the `next` parameter must be entered before the `rtrv-log:next=` command can be entered again,

The values specified for the `edate` with the `stime` parameter combination must be valid.

The values specified for the `edate` with `stime` and `etime` parameter combination must be valid.

When an `enum` parameter is specified, it requires an `snum` as its mated parameter.

No other parameters can be entered with the `next` parameter in the command.

The selected log must be accessible and free of errors.

The standby OAM is corrupt or cannot be found.

When the `snum` parameter is specified, it must be within the valid range: 1-999 for Alarms (UAMs) and 1000-1999 for UIMs.

When the `enum` parameter is specified, it must be within the valid range: 1-999 for Alarms (UAMs) and 1000-1999 for UIMs.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

- years 95–99 = 1995 through 1999
- years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any `sdate`/`edate` value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of the `num` and `dir` parameters. The `num` parameter determines the maximum number of entries to display, and the `dir` parameter determines whether entries are displayed from the oldest end (`dir=fwd` or not specified) or the newest end (`dir=bkwd`).

When `sdate` is specified and `edate` is not specified in the forward direction, `edate` is defaulted to be the end of the log.

When `edate` is specified and `sdate` is not specified in the forward direction, `sdate` is defaulted to be the beginning of the log.

When `sdate` is specified and `edate` is not specified in the backward direction, `edate` is defaulted to be the beginning of the log.

When `edate` is specified and `sdate` is not specified in the backward direction, `sdate` is defaulted to be the end of the log.

When `stime` is specified and `etime` is not specified in the forward direction, `etime` is defaulted to 235959.

When `etime` is specified and `stime` is not specified in the forward direction, `stime` is defaulted to 000000.

When `stime` is specified and `etime` is not specified in the backward direction, `etime` is defaulted to 000000.

When `etime` is specified and `stime` is not specified in the backward direction, `stime` is defaulted to 235959.

When `stime` or `etime` is specified but neither the `sdate` or `edate` parameters are specified, `sdate` and `edate` are each defaulted to the value *today*.

The `num` parameter is used to control the maximum number of entries to be displayed by one command.

The `dir` parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the `dir` parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (`outgrp`) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When `outgrp=all` is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The `next` parameter is used to display a specified number of additional log records after the previous `rtrv-log` entry at the terminal. New records that are logged after the previous `rtrv-log` command was entered will not be displayed when the `rtrv-log:next=` command is entered. The `next` parameter is valid only under the following conditions:

- The `rtrv-log:next=` command is entered at the same terminal from which the previous `rtrv-log` command was entered. The previous `rtrv-log` command must not include the `type=all` parameter.
- No other terminal has issued a `rtrv-log` command after the `rtrv-log` command entered at the terminal from which the `rtrv-log:next=` command is entered.
- The `next` parameter is the only parameter specified in the `rtrv-log` command.
- There are still logs present that match the conditions (except `time/date/num`) specified in the previous `rtrv-log` command.

When either a single `snum` or range of `snum/enum` is specified, only those Alarms or UIMs within the specified range are displayed.

When `snum` is specified and `enum` is not specified, the `enum` value defaults to the specified `snum` value.

When `enum` is specified, an `snum` value must be specified that is less than or equal to the specified `enum` value.

If an `snum` is specified within the range 1-999, its corresponding `enum` must be greater than or equal to the `snum` and also within the range of 1-999.

If an `snum` is specified within the range 1000-1999, its corresponding `enum` must be greater than or equal to the `snum` and also within the range of 1000-1999.

When `enum` is not specified and the specified `snum` Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the `snum` value is out of range.

If `snum` and `enum` are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

The Alarm log only stores minimal information about each alarm. Only a few alarms support multiple-line formats that would be displayed when `mode=full` is used. The majority of alarms display the same information when either `mode=full` or `mode=brief` is used.

## Output

In this example, the sequence numbers that are replaced by the dashes (---) represent the UIMs that were discarded due to the UIM thresholding feature:

```
rtrv-log:type=uim:sdate=960715:stime=220000:num=50
```

```

## rtrv-loopset

Use this command to retrieve loopset data from the database.

### Parameters

#### **disp (optional)**

Display method. The manner in which the retrieved data is displayed.

#### **Range:**

##### *detail*

Provides detailed information for a loopset entry.

##### *list*

Provides a list of loopset entries.

#### **Default:**

*detail*

#### **force (optional)**

#### **Range:**

*yes*

**mode (optional)**

Mode of operation. Retrieves loopset entries that have been assigned the specified mode.

**Range:**

*notify*

Generates a UIM without discarding the message.

*discard*

Generates a UIM and discards the message.

**name (optional)**

Loopset name.

**Range:**

*ayyyyyyy*

1 alphabetic and up to 7 alphanumeric characters.

**num (optional)**

The number of entries to be retrieved.

**Range:**

*1 - 1000*

**Default:**

*50*

**Example**

This example provides detailed information for the first 50 valid loopset entries in the loopset table.

```
rtrv-loopset
```

This example provides detailed information for the loopset entry RTP1.

```
rtrv-loopset:name=rtp1
```

This example provides detailed information for the first 100 valid loopset entries in the loopset table.

```
rtrv-loopset:num=100:force=yes
```

This example provides a list of the first 100 valid loopset entries in the loopset table.

```
rtrv-loopset:force=yes:num=100:disp=list
```

This example provides detailed information for the first 100 valid loopset entries set to *discard* mode in the loopset table.

```
rtrv-loopset:force=yes:num=100:mode=discard
```

This example provides a list of the first 100 valid loopset entries set to *notify* mode in the loopset table.

```
rtrv-loopset:force=yes:num=100:mode=notify:disp=list
```

## Dependencies

If the value of the `num` parameter is greater than 50, then the `force=yes` parameter must be specified.

The value of the `name` parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The Loopset table must be accessible.

The `name=none` parameter cannot be specified.

If the `name` parameter is specified, then the `disp=list` parameter cannot be specified.

## Output

This example displays loopset entry details for loopset RTP1:

```
rtrv-loopset:name=rtp1
```

```

## rtrv-ls

Use this command to show the linkset information.

#### Parameters

**apc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code 000-000-000 is not a valid point code.

**apc/apca/apci/apcn/apcn24/apcn16 (optional)**

Adjacent point code.

**apci (optional)**

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code 0-000-0 is not a valid point code.

**apcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

### **apcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The prefix indicates a private point code (*prefix-msa-ssa-sp*).

#### **Range:**

*p-, 000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p*

*msa—000-255*

*ssa—000-255*

*sp—000-255*

### **apcn16 (optional)**

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The prefix indicates a private point code (*prefix-un-sna-mna*).

#### **Range:**

*p--, 000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p*

*un---000---127*

*sna---000---15*

*mna---000---31*

### **cggtnmod (optional)**

Calling party GT modification indicator. This parameter displays the linksets that have the specified value of the calling party GT modification indicator.

#### **Range:**

*yes*

*no*

### **islsrsb (optional)**

Incoming rotated signaling link selection (SLS) bit. This parameter displays the linksets with the specified rotated bit.

#### **Range:**

*1 - 8*

ITU linksets— *1-4*

ANSI linksets— *1-8*

#### **Default:**

Display all link sets

**itutfr (optional)**

ITU TFR (Transfer Restricted) procedure indicator. This parameter displays the linksets that have the specified value of the `itutfr` parameter.

This parameter is valid for ITU national linksets only.

**Range:**

*on*

*off*

**Default:**

Display all link sets

**lsn (optional)**

Linkset name

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:**

Display all link sets

**lst (optional)**

Linkset type. This parameter specifies whether to display proxy links.

This parameter can be specified only when the Proxy Point Code feature is enabled.

**Range:**

*prx*

Display proxy links.

**mtprse (optional)**

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

**Range:**

*yes*

equipped

*no*

not equipped

**Default:**

Display all link sets

**pct (optional)**

This parameter displays the linksets where the Point Code and CIC Translation has the specified status.

**Range:***on**off***ppc (optional)**

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

**Synonym:***ppca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**ppc/ppca/ppci/ppcn/ppcn24/ppcn16 (optional)**

Proxy Point Code.

The proxy point code must be a full point code.

**ppci (optional)**

ITU international proxy point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:***s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

**ppcn (optional)**

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:***s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*-*nnnnn*—0-16383*gc*—*aa-zz**m1-m2-m3-m4*—0-14 for each member; values must sum to 14**ppcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—*000-255**ssa*—*000-255**sp*—*000-255***ppcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

**Range:***000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000---127**sna---000---15**mna---000---31***randsls (optional)**

Random SLS (signaling link selection). This parameter displays linksets that have the specified value of the **randsls** parameter.

**Range:***off*

Displays all linksets where random SLS is disabled.

*class0*

Displays linksets where random SLS generation for Class0 SCCP traffic is enabled.

*all*

Displays ITU linksets where random SLS generation for Class0 and Class1 SCCP traffic is enabled and ANSI linksets where random SLS generation for Class0 and ISUP traffic is enabled.

**Default:***off***slsruobit (optional)**

Other CIC (Circuit Identification Code) Bit. This parameter displays the linksets that have the `slsruobit` parameter set to a value from 5 - 16.

**Range:\***

\*

Specifies all possible values (5-16)

**Default:**

Display all link sets

**slsruosb (optional)**

Rotated SLS (Signaling Link Selection) Bit. This parameter displays the linksets with the specified rotated bit.

**Range:**

1 - 4

**Default:**

Display all link sets

**spc (optional)**

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni = 000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni = 001-005*.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**spc/spca/spci/spcn/spcn24/spcn16 (optional)**

Secondary point code.

**spci (optional)**

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

#### **spcn (optional)**

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

##### **Range:**

*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

#### **spcn24 (optional)**

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

##### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

#### **spcn16 (optional)**

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

##### **Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

**Example**

Display all linksets having the parameter `pct=on`:

```
rtrv-ls:pct=on
```

Display the attributes of all link sets:

```
rtrv-ls
```

Retrieve linkset LS1:

```
rtrv-ls:lsn=ls1
```

Retrieve all link sets with the `mtprse=yes` parameter:

```
rtrv-ls:mtprse=yes
```

Retrieve all link sets that use the `slsocbit` parameter with a value from 5 - 16:

```
rtrv-ls:slsocbit=*
```

Display an ITU linkset to view the settings for the `slsrsb` or `slsocbit` parameters:

```
rtrv-ls:lsn=lsitu
```

Retrieve all ITU national linksets that have the `itutfr` parameter set to *on*:

```
rtrv-ls:itutfr=on
```

Retrieve the specified ITU national linkset and display its setting for the `itutfr` parameter:

```
rtrv-ls:lsn=lsitun
```

Retrieve all linksets where random SLS generation is enabled for SCCP ITU traffic and Class0 ANSI traffic:

```
rtrv-ls:randsls=class0
```

Display all proxy linksets:

```
rtrv-ls:lst=prx
```

Display all linksets using a specified proxy point code:

```
rtrv-ls:ppc=11-11-11
```

Display all linksets using a specified secondary point code:

```
rtrv-ls:spc=2-2-2
```

Display all linksets using a specified adjacent point code:

```
rtrv-ls:apc=1-1-2
```

Retrieves all linksets where calling party global title modification is requested:

```
rtrv-ls:cggmod=yes
```

Retrieves all link sets with the `ISLSRSB` value 6:

```
rtrv-ls:islsrsb=6
```

Display all linksets using a specified adjacent point code:

```
rtrv-ls:apcn16=121-10-15
```

**Dependencies**

A PCT quantity feature must be enabled before the `pct` parameter can be specified.

The specified linkset must be in the database.

The Linkset table is corrupt or cannot be found.

All optional parameters, except for the combination of the `slsocbit` and `slrsrb` parameters, can only be used individually. Any combination of 2 or more of the optional parameters, other than the specified exception, is invalid.

If the `apcn` parameter is specified as the Adjacent Point Code, then the format of the `apcn` parameter must match the format dictated by the `chg-stpopts:npcfmti` parameter.

The SLSOCB feature must be enabled before the `slsocbit` parameter can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the `apc` and `spc` parameters can be specified.

A NULL pointer was sent into a function. An ATH will also be issued.

The Signaling Link table is corrupt or cannot be found.

The extended link table is corrupt or cannot be found.

The STPOPTS table is corrupt or cannot be found.

At least one linkset must be associated with the value of the `apc` parameter.

The Proxy Point Code feature must be enabled before the `lst=prx` parameter can be specified.

The Proxy Point Code feature must be enabled before the `ppc` parameter can be specified.

The value specified for the `ppc` parameter must be a full point code.

The value specified for the `ppc` parameter must already exist in the Destination table, and the `prx=yes` parameter must have been specified.

The value specified for the `apc` parameter must be a full point code.

The value specified for the `spc` parameter must be a full point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the `cggmod` parameter can be specified.

The ISLSRSB feature must be enabled before the `islsbr` parameter can be specified.

The PPC specified must not be a private point code.

4722 E4722 Cmd Rej: PPC not supported for Private PC

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The `CLLI`, `TFATCABMLQ`, `MTPRSE`, and `ASL8` fields are displayed only when a specific linkset is specified. The `SLSOCBIT` and `SLSRSB` fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the `tfatcabmlq` parameter database value is 0 for a linkset, then the value displayed is one-half (rounded-up) of the number of links assigned to the given linkset (or 1 if there are 2 or fewer links in the linkset).

If the `tfatcabmlq` parameter database value is 0, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE to be a minimum of 1 for linksets

containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links. The calculated value is displayed in the `rtrv-ls` command output.

If the `tfatcabmlq` parameter value is set to a specific value greater than 0, then the EAGLE does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the `rtrv-ls` command output.

The EAGLE `ent-ls` command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS `vfy-ls` command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS `vfy-ls` output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

The value specified for the `ppc` parameter must be a full point code. Cluster point codes and private point codes are not supported.

The ICNIMAP and OGNIMAP fields are displayed only if the linkset name is specified in the command, the ITU Spare Point Code feature is enabled, and an ITUN or ITUI point code is associated with the linkset.

IPSG linksets have SLKTPS configured. SLKTPS configures the transactions per second for each link assigned to the IPSG linkset. For an IPSG linkset, the calculated IP TPS value (shown under the 'CONFIG' column in the report) is made up of the aggregate calculated SLKTPS of all of the provisioned links in the linkset. Non-IPSG hosted links are not counted in the calculation as they do not support SLKTPS.

If a linkset contains a mixture of IPLIMx M2PA and IPSG-M2PA links, then the command does not report any data below the TPS header or raise alarms.

## Output

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before information can be retrieved for an adjacent point code or a secondary point code.

The Proxy Point Code feature must be enabled before information can be retrieved by proxy point code or proxy linkset.

If information is requested for a linkset, then the secondary point code field is displayed in the output. If the MLS feature is not enabled, or if the linkset was not created with a secondary point code, the field contains dashes.

Headings for unequipped cards are not displayed.

This example shows all linksets where random SLS generation is enabled for Class0 and Class1 SCCP traffic for ITU linksets and Class0 and ISUP traffic for ANSI linksets:

```
rtrv-ls:randsls=all
```

```
tekelecstp 10-03-06 19:36:00 EST EAGLE 42.0.0

;

Command Executed

## Legend

- **LSN**—Name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the apctype=itunchina parameter specified.
- **APC/APCI/APCN/APCN24/APCN16**—Adjacent DPC of the linkset
- **SPC/SPCI/SPCN/SPCN24/SPCN16**—Secondary PC of the linkset
- **SCRN**—Screen set assigned to the linkset
- **L3TSET**—Level 3 timer set value assigned to the linkset

- **SLTSET**—SLTM record associated with the linkset
- **BEI**—Broadcast exception indicator. Indicates whether TFP (transfer prohibited) messages can be broadcast on the linkset.
- **LST**—Type of links in the linkset (access links, bridge links, etc.)
- **LNKS**—Number of links in the linkset
- **GWSA**—Shows whether gateway screening is used on the specified linkset
- **GWSM**—Shows whether the display of messages generated for each screened message is turned on or off
- **GWSD**—Shows whether the gateway screening message discard function is turned on or off
- **SLSCI**—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset
- **NIS**—Shows whether the Network Indicator Spare option is on or off for the specified linkset
- **CLLI**—The far end Common Language Location Identifier (CLLI)
- **TFATCABMLQ**—the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted
- **MTPRSE**—Shows whether the adjacent node is equipped with MTP restart
- **ASL8**—Shows whether the adjacent node is sending MSUs with 8-bit SLSs
- **MULTGC**—Shows whether multiple group codes are allowed
- **MATELSN**—Name of the mate IP Gateway linkset
- **LSUSEALM**—Percent of the linkset TPS (IPTPS) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured IPTPS value for the linkset
- **SLKUSEALM**—Percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured IPTPS. The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.
- **LOC**—Location of the card containing the signaling links that make up the linkset
- **PORT**—Port on the card containing the signaling link
- **SLSOCBIT**—Setting of the Other CIC (Circuit Identification Code) Bit
- **SLSRSB**—Setting of the Rotated SLS (Signaling Link Selection) Bit
- **ISLSRSB**—setting of the Incoming Rotated SLS (Signaling Link Selection) Bit
- **GSMSCRN**—Shows whether the GSM MAP screening indicator is turned on or off
- **ITUTFR**—Shows whether the ITU TFR procedure indicator is turned on or off

- **L2TSET**—Level 2 timer set value associated with the signaling link
- **SLC**—Signaling link code of the signaling link
- **TYPE**—Type of card
- **BPS**—Transmission rate for the link in bits per second
- **E1PORT**—E1 port with the E1 interface that services the link
- **E1LOC**—Card location of the E1 card with the E1 interface that services the link
- **T1PORT**—T1 port with the T1 interface that services the link
- **T1LOC**—Card location of the T1 card with the T1 interface that services the link
- **TS**—Timeslot assigned to the link that is serviced by the E1 or T1 interface
- **E1ATMCRC4**—Indicator of whether CRC4 multi-frame structure is enabled or disabled
- **E1ATMSI**—Value of two Spare International bits of NFAS data
- **E1ATMSN**—Value of five Spare National bits of NFAS data
- **RANDSLS**—The setting of linkset for Random SLS generation
- **ADAPTER**—Shows whether the linkset is IPSP M2PA or IPSP M3UA linkset
- **RSVDSLKTPS**—Guaranteed SLKTPS for an IPSP linkset
- **MAXSLKTPS**—Maximum SLKTPS for an IPSP linkset
- **RCONTEXT**—Routing context ID of IPSP M3UA linkset
- **ASNOTIF**—Shows whether AS notifications will be generated for IPSP M3UA linkset
- **ANAME**—Association name configured for signaling link of IPSP linkset
- **SLKTPS**—Provisioned TPS for concerned signaling link of the specified IPSP linkset
- **CGGTMOD**—Shows whether calling party global title modification indicator is yes or no for the linkset
- **PPC/PPCI/PPCN/PPCN24/PPCN16**—The proxy point code of the linkset
- **NUMSLKALW**—Threshold value for IPSP M3UA linkset used to transition to Allowed state from Restricted or Prohibited state
- **NUMSLKRSTR**—Threshold value for IPSP M3UA linkset used to transition to Restricted state from Allowed state
- **NUMSLKPROH**—Threshold value for IPSP M3UA linkset used to transition to Prohibited state from Restricted or Allowed state
- **ICNIMAP**—Incoming NI Map
- **OGNIMAP**—Outgoing NI Map
- **RSLS8**—Shows whether the incoming SLS is rotated by 8 bits

- **PCT**—Shows whether the Point Code & CIC Translation (PCT) feature is applied to messages coming in or going out on links of a particular link set
- **RFT**—Shows whether the linkset is in SLT Reflect mode
- **J1PORT**—J1 port with the J1 interface that services the link
- **CHGMTP3OPC**—Shows whether OPC is going to be replaced by SPC.

## rtrv-m2pa-tset

Use this command to retrieve either one M2PA timer set or all M2PA timer sets.

**Parameters****tset (optional)**

The name of the M2PA timer set to be retrieved.

**Range:**

*1 - 20*

**ver (optional)**

The M2PA version supported by the association.

**Range:**

*d6*

*rfc*

**Example**

```
rtrv-m2pa-tset
```

```
rtrv-m2pa-tset:tset=1
```

**Dependencies**

None

**Notes**

If a timer set is not specified in the command, all timer sets are retrieved.

**Output**

```
rtrv-m2pa-tset:tset=1:ver=d6
```

```

[chg-m2pa-tset](#)

## rtrv-map

Use this command to show the mated application relationship information and Alternate RI Mate information maintained by the system. The GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature must be enabled to view Alternate RI Mate information. This information is used to support the routing of SCCP management SSP/SSA messages.

#### Parameters

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

---

**Note:** Definitions for the feature options specified by the on parameter are located in the Notes section.

---

#### mapset (optional)

MAP set ID.

#### Range:

1 - 36000, *dflt*

*dflt* —Default MAP set

**Default:**

*dflt*

The default value is *dflt* only when the Flexible GTT Load Sharing feature is not enabled.

**on (optional)**

Enables or turns on the specified options. A comma-separated list of options that are requested to be turned on. Up to 8 options can be specified in the list.

**Range:**

*refcnt*

**pc (optional)**

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:**

*pca*

**Range:**

*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**pc/pca/pci/pcn/pcn24/pcn16 (optional)**

Point code.

**pci (optional)**

ITU international point code in the form of *zone-area-id*.

**Range:**

*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**pcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**pcn24 (optional)**

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**pcn16 (optional)**

16-bit ITU national point code in the form of *unit number-sub number area-main number area* (*un-sna-mna*).

**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

**ssn (optional)**

Subsystem number

**Range:**

2 - 255

**Default:**

All subsystem numbers and their mates are shown for the given point code.

**Example**

```
rtrv-map
rtrv-map:pc=2-2-2
rtrv-map:pca=1-1-4:ssn=15
rtrv-map:mapset=2
rtrv-map:mapset=dflt:pcn=s-10155-ab
rtrv-map:pcn=1001:on=refcnt
rtrv-map:pcn16=1-2-3
```

**Dependencies**

The value of the `pc/pca/pci/pcn/pcn24/pcn16` parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Site Identification table is corrupt or cannot be found.

The Flexible GTT Load Sharing feature must be enabled before the `mapset` parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

The MAP table is corrupt or cannot be found.

**Notes**

This command can be canceled using the **F9** function key or the `canc-cmd` command. See the `canc-cmd` command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix ( `s-` ).

If the Flexible GTT Load Sharing feature is enabled, then the retrieved MAP examples contain the MAPSET ID for each MAP set. MAP sets that were configured before the Flexible GTT Load Sharing feature was enabled are shown as MAPSET ID=DFLT after the Flexible GTT Load Sharing feature is enabled.

The `pc/pca/pci/pcn/pcn24/pcn16`, `ssn`, and `mapset` parameters can be used to screen the output of all MAP sets. These parameters allow retrieval of only those MAP sets that contain the desired parameters.

A MAP set can contain one primary entry and up to 31 mated entries.

If no parameters are entered, all defined mated point codes (up to 36,000) are shown.

If the Flexible Final GTT Loadsharing feature is not enabled, then the number of entries in the MAP table is based on unique point codes. Point codes that are duplicated in MRN sets using different SSNs are counted only once in the number of entries.

If the Flexible Final GTT Loadsharing feature is enabled, then the number of entries in the MAP table is based on unique point code and SSN combinations. Point codes that are duplicated in MRN sets are counted in the number of entries).

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MRNSET and MRNPC fields, is displayed for all MAP Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

### on option

*refcnt*—displays the MAPSET, MAPSET/PC, and MAPSET/PC/SSN reference counts

### Output

All subsystem numbers for the specified point code and its mates are shown.

The NET column is shown only when a MAP set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

If an MRC value is preceded with an "\*", then the MRC value is not applicable for the current multiplicity mode (MULT field). The MRC value is only valid when MULT is *DOM*.

If an SRM value is preceded with an "\*", then the SRM value is not applicable for the current multiplicity mode (MULT field). The SRM value is only valid when MULT is *DOM* or *COM*.

If an SSN REFCNT value is preceded with an "\*", then the entry can be deleted if any other entry with the same point code exists in that MAP set.

This example retrieves an ANSI MAP set for a specified point code:

```
rtrv-map:pc=2-2-2
```

```
flexgttoff 09-08-09 12:05:28 EST  EAGLE 41.1.0
PCA      Mate PCA      SSN RC MULT SRM MRC GRP NAME SSO
002-002-002      10 10  SHR *Y  *Y  ----- OFF
                002-002-003  20 10  SHR *Y  *Y  ----- OFF
```

MAP table is (8 of 1024) 1% full.

This example includes MAP sets with a Concerned Signaling Point Code group name and spare point codes, (s-). The ITUDUPPC (ITU National Duplicate Point Code) feature is on, and the Flexible ITU National Point Code STP option is set to 4.

### Legend

- **MAPSET ID**—MAP set number or DFLT when numbered MAP sets are allowed
- **PCA/PCI/PCN/PCN24/PCN16**—Point code of the SCP where the primary application resides

- **NET**—Mate network type of the point code when an ITU MAP set contains both ITU-I and ITU-N point codes. The field can show I if the MATE PC is an ITU-I point code or N if the MATE PC is an ITU-N point code.
- **MATE PC/PCA/PCI/PCN/PCN24/PCN16**—Point code of the SCP where the mate application resides
- **SSN**—Applications subsystem number
- **RC**—Relative cost of the point code/subsystem
- **MULT**—Multiplicity mode SOL (Solitary), DOM (Dominant), SHR (Shared), or COM (Combined - Shared and Dominant) Load sharing. See the "Notes" section in the `ent -map` command description for an explanation of multiplicity modes.
- **SRM**—Specifies whether subsystem routing messages are transmitted is on (YES), off (NO), not applicable (\*Y) but would be YES if applicable, or not applicable (\*N) but would be NO if applicable. See the "Notes" section in the command description for SRM non applicable Load sharing modes.
- **MRC**—Specifies whether message routing under congestion is on (YES), off (NO), not applicable (\*Y) but would be YES if applicable, or not applicable (\*N) but would be NO if applicable. See the "Notes" section in the `rtrv-map` command for MRC non applicable Load sharing modes.
- **GRP NAME**—Name of a group of point codes (broadcast list group name) to be notified of the subsystem status
- **SSO**—Subsystem Status Option. Subsystem status (ON=prohibited or OFF=allowed) for PC/SSN MAP entries.
- **WT**—Weight assigned to the PC
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within an RC group falls below the in-service threshold, that RC group is considered out-of-service and traffic is routed to the next lowest RC group.
- **MRNSET**—Alternate RI Mate MRN Set ID
- **MRNPC**—Alternate RI Mate point code
- **MAPSET REFCNT**—Count of GTT Translation table entries with XLAT=NONE that refer to the corresponding MAP set
- **MAPSETPCSSN REFCNT**—Count of entries from MRN, GSM MAP Screening, GSM MAP Opcode, GTT Translation and GTT Action tables that refer a MAP entry with a MAPSET/PC/SSN combination
- **MAPSETPC REFCNT**—Count of entries from MRN, GTT Translation, GSM MAP Screening, GSM MAP Opcode and Prepaid SMS Options tables that refer a MAP entry with a MAPSET/PC combination

## rtrv-meas-sched

Use this command to retrieve the list of measurement reports currently scheduled to be dumped to the UI, and the collection settings for OAM based measurements.

This command provides no information on Measurements Platform (MCP) scheduled FTP reports or on the status of MCP measurements (see `rtrv-measopts`).

Refer to the *Measurements Manual* for specific details on measurement reports.

### Parameters

This command has no parameters.

### Example

```
rtrv-meas-sched
```

### Dependencies

None

### Notes

None

### Output

Output with measurement collection on.

```
rtrv-meas-sched
```

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = on
GTWYLSFLTR   = both
-----
SYSTOT-STP   = on
SYSTOT-TT    = off
SYSTOT-STPLAN = off
COMP-LNKSET  = on
COMP-LINK    = on
GTWY-STP     = on
GTWY-LNKSET  = on
MTCD-STP     = on
MTCD-LINK    = on
MTCD-STPLAN  = on
MTCD-LNKSET  = on
;
```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

```
rtrv-meas-sched
```

```

r1ghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT      = off
GTWYLSFLTR   = (both)
-----
SYSTOT-STP   = (off)
SYSTOT-TT    = (off)
SYSTOT-STPLAN = (off)
COMP-LNKSET  = (off)
COMP-LINK    = (off)
GTWY-STP     = (off)
GTWY-LNKSET  = (off)
MTCD-STP     = (on)
MTCD-LINK    = (on)
MTCD-STPLAN  = (on)
MTCD-LNKSET  = (on)
;

```

### Legend

- **COLLECT**—Shows whether measurement collection is on or off.
- **GTWYLSFLTR**—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:
  - *both*—Only gateway linksets are included in the report to the terminal and SEAS.
  - *stp*—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.
  - *seas*—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.
  - *none*—All defined linksets are included in the report to the terminal and SEAS.
- **SYSTOT-STP**—System total-STP measurement collection is on or off.
- **SYSTOT-TT**—System total-translation type measurement collection is on or off.
- **SYSTOT-STPLAN**—System total-STP LAN measurement collection is on or off.
- **COMP-LNKSET**—Component-linkset measurement collection is on or off.
- **COMP-LINK**—Component-link measurement collection is on or off.
- **GTWY-STP**—Gateway administration-STP measurement report is on or off.
- **GTWY-LNKSET**—Gateway administration-LNKSET measurement report is on or off.
- **MTCD-STP**—Maintenance daily-STP measurement collection is on or off.
- **MTCD-LINK**—Maintenance daily-link measurement collection is on or off.
- **MTCD-STPLAN**—Maintenance daily-STP LAN measurement collection is on or off.
- **MTCD-LNKSET**—Maintenance daily-LNKSET measurement report is on or off.

## rtrv-measopts

Use this command show the status of:

- All FTP scheduled measurements reports
- the Measurements Platform collection function (PLATFORMENABLE setting)
- the 15 Minute Measurements collection function (COLLECT15MIN setting)
- the CLI-based report file name option (CLLIBASEDNAME setting)
- the Integrated Measurements collection function (OAMHCMEAS setting)
- the unchannelized link label function (UNCHLINKLABEL setting)

**Parameters**

This command has no parameters.

**Example**

```
rtrv-measopts
```

**Dependencies**

This command cannot be entered while in upgrade mode.

**Notes**

None

**Output**

```
rtrv-measopts
```

### Legend

- **PLATFORMENABLE**—status of the Measurements Collection function
- **COLLECT15MIN**—status of the 15 Minute Measurements collection function
- **OAMHCMEAS**—Indicates the status of the Integrated Measurements collection function on an E5-OAM card
- **UNCHLINKLABEL**—status of the unchannelized link label for high-speed MTP2 links
- **CLLIBASEDNAME**—indicates whether the CLLI-based file name option is turned on or off
- **SYSTOTSTP**—System Total measurements report for the entire STP
- **SYSTOTTT**—System Total report for Translation Type measurements
- **SYSTOTIDPR**—System Total measurements report for the entire IDPR Measurements
- **SYSTOTSIP**—System Total measurements report for the entire SIP Measurements
- **SYSTOTSFTHROT**—System Total measurements report for SFTHROT GTT Action Measurements
- **COMPLINK**—Component measurements report for links
- **COMPLNKSET**—Component measurements report for link sets
- **COMPSCTPASOC**—Component measurements report for SCTP associations
- **COMPSCTPCARD**—Component measurements report for SCTP cards
- **COMPUA**—Component measurements report for M3UA and SUA application server/association pairs
- **GTWYORIGNI**—Gateway Administration measurements report per originating network (large network uniquely identified by NI only)
- **GTWYORIGNINC**—Gateway Administration measurements report per originating network (small network identified by NI-NC)

- **GTWYLSORIGNI**—Gateway Administration measurements report per link set and originating network
- **GTWYLSDESTNI**—Gateway Administration measurements report per link set and destination network
- **GTWYLSONISMT**—Gateway Administration measurements report per link set, per originating network, per ISUP message type
- **NMLINK**—Network Management measurements report for links
- **NMLNKSET**—Network Management measurements report for link sets
- **NMSTP**—Network Management measurements report for the entire STP
- **AVLINK**—Hourly Availability report for links
- **AVLDLINK**—Daily Availability report for links

## rtrv-mrn

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing feature is on and the Flexible GTT Load-Sharing feature is enabled, then use this command to retrieve MRN set information.

If the GTT Load Sharing with Alternate Routing Indicator (GTT LS ARI) feature is enabled, then use this command to display Alternate RI Mate information.

**Parameters**

---

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

---

---

---

**Note:** Definitions for the feature options specified by the **on** parameter are located in the Notes section.

---

---

**mrnset (optional)**

MRN set ID.

**Range:**

*1 - 3000, dflt*

*dflt* —Default MRN set

**on (optional)**

Enables or turns on the specified options. A comma-separated list of options that are requested to be turned on. Up to 8 options can be specified in the list.

**Range:**

*refcnt*

**pc (optional)**

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:**

*pca*

**Range:**

*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**pc/pca/pci/pcn/pcn24/pcn16 (optional)**

Post-GTT-translated point code.

**pci (optional)**

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**

*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**pcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:***s*-, 0-16383, *aa*-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*-*nnnnn*—0-16383*gc*—*aa*-zz*m1-m2-m3-m4*—0-14 for each member; values must sum to 14**pcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area*-*sub signaling area*-*signaling point* (*msa-ssa-sp*).

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255*ssa*—000-255*sp*—000-255**pcn16 (optional)**

16-bit ITU national point code with subfields *unit number*-*sub number* *area*-*main number* *area* (*un-sna-mna*).

**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127*sna*---000---15*mna*---000---31**Example**`rtrv-mrn``rtrv-mrn:pc=1-1-2``rtrv-mrn:pcn=s-1-1-1-123-aa``rtrv-mrn:pci=1-55-1:mrnset=2``rtrv-mrn:pcn=1001:mrnset=df1t:on=refcnt``rtrv-mrn:pcn16=1-2-3:mrnset=df1t`**Dependencies**

A point code that is specified in the command must already exist in the MRN table.

The `mrnset` parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the Flexible GTT Load Sharing feature is ON, then the PC and MRN set must be specified together.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The Intermediate Global Title Translation Load Sharing (IGTTLS) feature must be turned on before this command can be entered.

### Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

If any entries are provisioned in the SCCP-SERV table, then the maximum number of entries shown for the MRN table are reduced by that amount.

When the GTT LS ARI feature is enabled, the Alternate RI Mate, identified by the MAPSET, MAPPC, and MAPSSN fields, is displayed for all MRN Sets. When the GTT LS ARI feature is not enabled, the Alternate RI Mate is not displayed, and the display is unchanged.

### on options

*refcnt* —displays the MRNSET and MRNSET/PC reference counts

### Output

The NET column is shown only when an MRN set contains mixed network point code types. Addition of the NET column realigns all remaining columns in the output. The re-alignment is constant even if the NET column is not shown.

| DFLT   | 002-02-02 | 10 | 10 | 25  | 1   |
|        | 001-02-03 | 10 | 30 | 75  | 1   |

MRN table is (2 of 6000) 1% full.

### Legend

- **MRNSET**—MRN set ID
- **NET**—Mated network type of the point code when an ITU MRN set contains both ITU-I and ITU-N point codes. The field can show I if the PC is an ITU-I point code or N if the PC is an ITU-N point code.
- **PC/PCI/PCN/PCN24/PCN16**—Point Code
- **RC**—Relative Cost
- **WT**—PC Weight
- **%WT**—Relative percentage, according to weight, of an in-service PC within an RC group
- **THR**—Service threshold. If the relative percentage, according to weight, of in-service PCs within a RC group falls below the in-service threshold, that RC group is considered out-of-service, and traffic is routed to the next lowest RC group.
- **MAPSET**—Secondary mate MAP Set
- **MAPPCN**—Alternate RI Mate point code
- **MAPSSN**—Alternate RI Mate subsystem number
- **MRNSET REFCNT**—Count of GTA table entries with XLAT=NONE that refer to the corresponding MRN set
- **MRNSETPC REFCNT**—Count of entries from the MAP, GTT Translation, GTT Action, and Prepaid SMS Options tables that refer to the corresponding MRN entry with an MRNSET/PC combination

## rtrv-netopts

Use this command to retrieve the user-specified options for the IP and Fast Copy (FC) networks used by the EAGLE. This command displays the PVN IP address, PVN subnet mask, and FC Network parameters.

### Parameters

This command has no parameters.

### Example

```
rtrv-netopts
```

### Dependencies

The NETOPTS table must be accessible.

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

### Notes

None

### Output

```
rtrv-netopts
```

```
rlghncxa03w 08-12-11 16:35:57 IST  EAGLE 40.1.0
NETWORK OPTIONS
-----

## rtrv-npp-as

Use this command to display a Numbering Plan Processor (NPP) Action Set (AS) entry.

### Parameters

#### asn (optional)

Action set name. The name of the AS.

#### Range:

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

### mode (optional)

This parameter allows the command to display Service Action optional numerical and digit string data values.

### Range:

*full*

### Example

```
rtrv-npp-as
rtrv-npp-as:asn=asn6
rtrv-npp-as:mode=full
```

### Dependencies

None

### Output

---

**Note:** The `asn` or `mode=full` parameter must be specified before FA list information is displayed in the `rtrv-npp-as` output.

---

This example displays all AS entries:

```
rtrv-npp-as

## rtrv-npp-srs

Use this command to display a Numbering Plan Processor (NPP) Service Rule Set entry.

### Parameters

#### **asn (optional)**

Action set name.

##### **Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

#### **fdl (optional)**

Filter digit length. The number of digits on the incoming digit string that is filtered by the NPP.

##### **Range:**

*1 - 32, \**

\* —multiple lengths of digit strings can be filtered

#### **fnai (optional)**

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

##### **Range:**

*intl, natl, nai1, nai2, nai3, unkn*

*intl*—filter messages with NAI=INTL

*natl*—filter messages with NAI=NATL

*nai1*—filter messages with NAI=NAI1

*nai2*—filter messages with NAI=NAI2

*nai3*—filter messages with NAI=NAI3

*unkn*—filter messages with NAI=UNKN

The `chg-npp-serv` command is used to assign values to the various FNAI classes.

#### **fpfx (optional)**

Filter prefix. The prefix used to filter incoming digit strings.

##### **Range:**

1 - 16 hexadecimal digits inclusive of single digit wildcard (?); or wildcard (\*) matching the entire digit string; Valid digits are ?, \*, 0-9, a-f, A-F.

#### **srvn (optional)**

Service name.

##### **Range:**

*nppt*  
NPP Test Service

*idprcdpn*  
IDPRCDPN Service

*idprcgpn*  
IDPRCGPN Service

*tif*  
TIF Service

*tif2*

IDPRCDPN4 Service

*tifcgpn*  
TIFCGPN Service

*tifcgpn2*  
TIFCGPN2 Service

*tifcgpn3*  
TIFCGPN3 Service

**Example**

Display all NPP Service Rule Set table entries for a given service.

**rtrv-npp-srs**

Display NPP Service Rule Set table entries for a specified digit length.

**rtrv-npp-srs:fdl=\***

Display NPP Service Rule Set table entries for a specified filter prefix and filter digit length.

**rtrv-npp-srs:fpfx=91:fdl=16**

**Dependencies**

The value specified for the **fpfx** parameter cannot have a ? as the final character.

**Output**

**rtrv-npp-srs**

tekelecstp 11-02-28 16:41:44 EST EAGLE 44.0.0

## rtrv-obit

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

### Parameters

#### **loc (mandatory)**

The address of the card that is running the OAM from which the obituary information is to be retrieved.

##### **Range:**

*1113, 1115*

#### **mode (optional)**

Display mode

##### **Range:**

*c*

Continuous mode; shows obituaries already logged and new obituaries as they occur.

*m*

Manual mode; shows obituaries on demand only, when this command is entered.

##### **Default:**

*c*

#### **num (optional)**

The number of obituaries to display.

##### **Range:**

*1 - 512*

##### **Default:**

*150*

### Example

```
rtrv-obit:loc=1115:num=2
```

### Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the `mode` parameter is specified without the `num` parameter, the entire log is displayed.

Only one `rtrv-obit` or `rtrv-trbl` command at a time can be in progress throughout the entire system.

The card location specified by the `loc` parameter must be either 1113 or 1115.

If the `loc` parameter specifies the card that is running the standby OAM, that card must be available.

The `num` parameter value must be between 1 - 512.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command when the command is entered for the active OAM. See `canc-cmd` for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the `mode=m` parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which includes MUX and HC-MIM cards) contains significantly more information than an obituary from an X86-based processor card. The data in an IXP obituary is spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

## Output

This example shows output for two obituaries from an x86-based card:

```
rtrv-obit:loc=1115:num=2

## rtrv-pct

Use this command to display Point Code and CIC Translations.

### Parameters

#### ecice (optional)

The end of the Emulated Circuit Identification Code range.

#### Range:

0 - 4294967295, \*

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP

- 0-4294967295 —ANSI Q.BICC

**Default:**

\*

**ecics (optional)**

The start of the Emulated Circuit Identification Code range.

**Range:**

0 - 4294967295, \*

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

**Default:**

\*

**epc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:**

*epca*

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**epci (optional)**

ITU international destination point code with subfields *zone-area-id*.

**Range:**

0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*zone*—0-7

*area*—000-255

*id*—0-7

The point code *0-000-0* is not a valid point code.

**epcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

**Range:**

*0-16383*, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**filtpc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:**

*filtpca*

**Range:**

*0-255*, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc = 000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-\*-\** is valid if *ni =006-255*.

The point code *000-000-000* is not a valid point code.

**filtpci (optional)**

ITU international destination point code with subfields *zone-area-id*.

**Range:**

*0-255*, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**filtpcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-`

**stopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:**

16363, *aa-zz*, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**rcice (optional)**

The end of the Real Circuit Identification Code range.

**Range:**

0 - 4294967295, \*

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

**Default:**

\*

**rcics (optional)**

The start of the Real Circuit Identification Code range.

**Range:**

0 - 4294967295, \*

- 0-4095 —ITU TUP/ISUP
- 0-16383 —ANSI ISUP
- 0-4294967295 —ANSI Q.BICC

**Default:**

\*

**realpc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni* = 000 is not valid.

When *chg-sid:pctype=ansi* is specified, *nc* = 000 is not valid if *ni* = 001–005.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.  
The point code `000-000-000` is not a valid point code.

**Range:**

**realpci (optional)**

ITU international destination point code with subfields *zone-area-id*.

**Range:**

*0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**realpcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:**

*0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**relcause (optional)**

Release Cause

**Range:**

*0 - 127*

**Default:**

*0*

**si (optional)**

Service Indicator

**Range:**

*0*

NM

*3*

SCCP

5  
ISUP

4  
TUP

13  
ANSI Q. BICC

\*

**Default:**  
\*

**ssn (optional)**  
SCCP Subsystem number

**Range:**  
0 - 255, \*

**Default:**  
\*

### Example

```
rtrv-pct:epc=1-1-1  
rtrv-pct:realpc=2-2-2
```

### Dependencies

If the `ssn` or `ecics` parameter is specified, then the `si` parameter must be specified.

A full point code must be specified as the value for the `realpc/realpca/realpci/realpcn` and `epc/epca/epci/epcn` parameters.

The value specified for the `ecice/rcice` parameter must be equal to or greater than the value specified for the `ecics/rcics` parameter, respectively.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters must have the same domain.

The PCT table is corrupt or cannot be found.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must have at least one route for each value defined in the Route table.

If a groupcode is specified then the values specified for the `realpc`, `filtpc`, and `epc` parameters must have the same group code.

A spare point code cannot be specified as a value for the `epci/epcn`, `filtpci/filtpcn`, and `realpci/realpcn` parameters.

The `ecics` or `rcics` parameter must be specified before the `relcause` parameter can be specified.

The `si=3` parameter must be specified before the `ssn` parameter can be specified.

If the `ecice` or `rcice` parameter is specified, then the `ecics` or `rcics` parameter must be specified, respectively.

If the `ecics`, `ecice`, and `rcics` parameters are specified, then the `rcice` parameter must be specified.

A value of 4, 5, or 13 must be specified for the `si` parameter before the `ecice/ecics` and `rcice/rcics` parameters can be specified.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be same as the STP point code.

The values specified for the `epc/epca/epci/epcn`, `filtpc/filtpca/filtpci/filtpcn`, and `realpc/realpca/realpci/realpcn` parameters cannot be same as the STP capability point code.

The `epc/epca/epci/epcn` or `realpc/realpca/realpci/realpcn` parameter must be specified if any other optional parameter is specified.

The values specified for the `ecics/ecice` and `rcics/rcice` parameters must be within the range specified by the parameter definition.

The difference between the values specified for the `ecice` and `ecics` parameters must be equal to the difference between the values specified for the `rcice` and `rcics` parameters.

A value of 5 or 13 must be specified for the `si` parameter before the `relcause` parameters can be specified.

The values specified for the `realpc/realpca/realpci/realpcn` and `filtpc/filtpca/filtpci/filtpcn` parameters must already exist in the Route table.

The `ssn` and `cic` parameters cannot be specified together in the command.

If the `ecics`, `rcics`, and `rcice` parameters are specified, then the `ecice` parameter must be specified.

If the same value is specified for the `epc` and `realpc` parameters, then the values specified for the `ecics/ecice` and `rcics/rcice` parameters cannot indicate the same range.

Only one of the `filtpc/filtpca/filtpci/filtpcn` parameters can be specified in the command.

The value specified for the `epc/epci/epcn` parameter cannot be the same as a secondary point code.

## Output

### rtrv-pct

```
tekelecstp 10-08-26 11:31:14 EST EAGLE 43.0.0

## rtrv-ppsopts

Use this command to display Prepaid Short Message Service options from the PPSOPTS table.

#### Parameters

##### **ppt (optional)**

Prepaid portability type. An IN platform.

##### **Range:**

1 - 32

#### Example

```
rtrv-ppsopts
```

```
rtrv-ppsopts:ppt=2
```

#### Dependencies

The Prepaid SMS Intercept Ph1, IDP A-Party Routing, or IDP Service Key Routing feature must be enabled and turned on before this command can be entered.

The Prepaid SMS Options Table must be available.

#### Output

Set ID values are displayed only if the Flexible GTT Load Sharing (FGTTLS) feature is enabled.

This example displays Prepaid SMS options for a specific Prepaid Type:

```
rtrv-ppsopts:ppt=1
```

```
tekelecstp 08-12-17 15:07:01 EST  EAGLE 40.1.0
```

```

Prepaid SMS Options
-----
BPARTYCHK      = OFF
PPT            PCA/PCI/PCN          SSN    RI
---            -
1             PCI:   1-001-1        1      GT
;

```

This example displays Prepaid SMS options for all Prepaid Types:

rtrv-ppsopts

```
tekelecstp 08-12-17 15:11:22 EST  EAGLE 40.1.0
```

```

## rtrv-prefix

Use this command to retrieve provisioned prefix information for all supported features or for a specified feature.

## Parameters

**feature (optional)**

Feature Name. The name of an enabled controlled feature supported by this command. The parameter value must match the feature name as it is displayed in the `rtrv-ctrl-feat` command output.

**Range:**

[illegible]

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks. The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with “GSM MAP.” Enough additional characters to identify which GSM MAP feature is being entered (at least “GSM MAP SR” to identify the “GSM MAP SRI Redirect” feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

## Example

Retrieve provisioned prefix information for all supported features.

```
rtrv-prefix
```

Retrieve prefix information for the GSM MAP SRI Redirect feature.

```
rtrv-prefix:feature="GSM MAP SRI Redirect"
```

## Dependencies

The feature name must be the name of an enabled controlled feature as it is displayed in the `rtrv-ctrl-feat` command output. The following controlled features are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

The FEATPFX table is corrupt or cannot be found by the system.

## Notes

None

## Output

This example retrieves the provisioned prefix information for all features. Additional information is displayed in the function column for prefix numbers 6 and 7 of the "ISUP NP with EPAP" feature.

```
rtrv-prefix
```

```
rlghncxa03w 14-09-20 09:04:14 EST EAGLE 46.1.0

Feature          NUM  Prefix          Function
-----
GSM MAP SRI Redirect    1  1a1a
GSM MAP SRI Redirect    2  ffff
GSM MAP SRI Redirect    3  1234
GSM MAP SRI Redirect   26  1224
ISUP NP with EPAP       1  3b4c
ISUP NP with EPAP       6  886             Insertion Country Code
ISUP NP with EPAP       7  0               Deletion Condition

FEATPFX table is (7 of 256) 2% full

;
```

This example retrieves provisioned prefix information for the "GSM MAP SRI Redirect" feature. The table capacity for the total number of entries in use is reported, not just the number of entries displayed. No additional information is displayed in the Function column for this feature.

```
rtrv-prefix:feature="GSM MAP SRI Redirect"
```

```
rlghncxa03w 14-09-20 09:04:14 EST EAGLE 46.1.0

Feature          NUM  Prefix          Function

## rtrv-rte

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the "Notes" section for this command for details.

### Parameters

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

#### **clli (optional)**

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:**

*ayyyyyyyyyyy*

1 alphabetic character followed by 10 alphanumeric characters

**Default:**

No value given

#### **dpc (optional)**

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:**

*dpca*

**Range:**

*p-, 000-255, \*, \*\*, \*\*\**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

The asterisk values *\**, *\*\**, and *\*\*\** are not valid for the *ni* subfield.

If *\*\** or *\*\*\** is specified for the *nc* subfield, either *\**, *\*\**, or *\*\*\** must be specified for the *ncm* subfield.

When *chg-sid:pctype=ansi* is specified, *ni=000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc=000* is not valid if *ni=001-005*.

When *chg-sid:pctype=ansi* is specified, *nc=000* is valid if *ni=006-255*.

When *chg-sid:pctype=ansi* is specified, *ni-\*-\** is valid if *ni= 006-255*.

The point code *000-000-000* is not a valid point code.

#### **dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)**

Destination point code.

**dpci (optional)**

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**dpcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt1* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps*, 0-16383, *aa-zz*, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—*s-*, *p-*, *ps-*

*nnnnn*—0-16383, \*

*gc*—*aa-zz*, \*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**dpcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p*

*msa—000–255*

*ssa—000–255*

*sp—000–255*

**dpcn16 (optional)**

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*). The *prefix* indicates a private point code (*prefix-un-sna-mna*).

**Range:**

*p--, 000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p*

*un---000---127*

*sna---000---15*

*mna---000---31*

**lsn (optional)**

Linkset name

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:**

Display all

**mode (optional)**

The method used to display the output report.

**Range:**

*full*

**pcst (optional)**

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

**Range:**

*none*

Display all point codes that do not have subtype prefixes

*s*

Display only spare point codes

*p*

Display only private point codes

*ps*

Display only private and spare point codes

**pctype (optional)**

Point code domain. This parameter displays the point codes of the specified domain type.

**Range:***ansi**itui**itun**itun24***Example**

```

rtrv-rte
rtrv-rte:dpc=240-012-004:lsn=ls000001

rtrv-rte:pctype=itun24:pcst=none
rtrv-rte:dpc=1-1-**
rtrv-rte:dpc=1-1-***
rtrv-rte:dpc=1-**-*
rtrv-rte:dpc=1-***-*
rtrv-rte:dpc=1-**-*:lsn=ab64
rtrv-rte:dpc=1-**-*:lsn=xx64
rtrv-rte:dpcn=1000-*
rtrv-rte:dpcn=1000-*:lsn=dpcn64
rtrv-rte:dpcn=p-**-aa
rtrv-rte:dpcn=s-9000-*
rtrv-rte:pctype=itun16:pcst=none

```

**Dependencies**

The value of the dcp/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must exist in the Destination Point Code table.

The value specified for the `lsn` parameter must exist in the routeset of the destination if the `dpc` parameter is specified.

If the `dpcn` parameter is specified, its format must match the format that was assigned with the `chg-stpopts` command `npcfmti` parameter.

If the `pctype` parameter has a value of *ansi* or *itun24*, then the `pcst` parameter cannot have a value of *s* or *ps*.

The `pctype` and `pcst` parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, `clli`, `msar=only`, and `ncai` parameters.

When using network routing, if the destination point code has a value of *\** in the *nc* field, the *ncm* field must also be *\** (for example, `dpc=21 - * - *`).

The value of the `dpc/dpca/dpci/dpcn/dpcn24/dpcn16` parameter must be a valid point code.

If the `clli` parameter is specified, then the value must exist in the Route table.

All link sets currently assigned to a route set must still be equipped.

All link sets must be defined in the route set.

The Linkset table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The Site ID table is corrupt or cannot be found.

The database must be consistent.

The value specified for the `lsn` parameter must already be assigned to the specified routeset.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (*s-*) and the private and spare point code subtype prefix (*ps-*). All of the point code types support the private (internal) point code subtype prefix (*p-*).

### Asterisks in ANSI Point Codes

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, `20-2-**`). This does not include the specified cluster point code (for example, `20-2-*`).

Three asterisks in the *ncm* subfield of a cluster point code (for example, `20-2-***`) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified and the `dpc/dpca` parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified `dpc/dpca` parameter subfield values.

### Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, *10101-\**).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, *\*-ab*).

When the ITUDUPPC feature is on and the STP flexible point code option (*npcfmt.i*) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, *15*)
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, *\**, *\*-15-\*-\*-\*ab* is not valid).

## Output

In these command output examples, the point code prefixes *s-*, *p-*, and *ps-* indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

Abbreviated output is indicated by 3 vertical dots as shown:

.  
.  
.

This example displays output when the Route table is provisioned. The example displays abbreviated output.

;

This example displays the output when the Route table is empty:

rtrv-rte

tekelecstp 08-01-01 12:31:35 EST EAGLE 38.0.0

rtrv-rte

Command entered at terminal #4.

No routes meeting the requested criteria were found

;

This example retrieves a route by linkset name:

rtrv-rte:lsn=e2e1

eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0

rtrv-rte:lsn=e2e1

Command entered at terminal #4.

Extended Processing Time may be Required

| LSN  | DPCA        | RC |
|------|-------------|----|
| e2e1 | 001-001-000 | 10 |
|      | 001-101-001 | 10 |
|      | 004-101-001 | 20 |
|      | 100-100-*   | 10 |
|      | 100-100-001 | 10 |

;

This example retrieves a route by linkset name and destination point code:

rtrv-rte:dpc=4-101-1:lsn=e2e1

eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0

| LSN  | DPCA        | RC |
|------|-------------|----|
| e2e1 | 004-101-001 | 20 |

;

In this example, the chg-stpopts:npcfmt1 value is set to 7-4-3:

rtrv-rte:dpcn=127-15-7

eagle10115 08-12-09 10:00:37 EST EAGLE 40.1.0

| DPCN     | ALIASA | ALIASI | LSN     | RC          | APCN     |
|----------|--------|--------|---------|-------------|----------|
| 127-15-7 | -----  | -----  | ls1     | 10          | 100-10-2 |
|          |        |        | RTX: No | CLLI: ----- |          |

;

In this example, the chg-stptopts:npcfmt1 value is set to 11-1-1-1 and the ITUDUPPC feature is on:

rtrv-rte:lsn=ls3

```
eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0
rtrv-rte:lsn=ls3
Command entered at terminal #4.
Extended Processing Time may be Required
```

```
;
```

In this example, the `chg-stpopts:npcfmt.i` value is set to 11-1-1-1 and the ITUDUPPC feature is on:

```
rtrv-rte:lsn=e1m3itun
```

```
eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0
rtrv-rte:lsn=e1m3itun
Command entered at terminal #4.
Extended Processing Time may be Required
```

| LSN      | DPCN          | RC |
|----------|---------------|----|
| e1m3itun | 2047-1-1-1-pe | 10 |

```
;
```

This example contains a route with 24-bit ITU-N point codes:

```
rtrv-rte:lsn=lsn66
```

```
eagle10115 10-10-09 10:00:37 EST EAGLE 43.0.0
rtrv-rte:lsn=lsn66
Command entered at terminal #4.
Extended Processing Time may be Required
```

| LSN   | DPCN24      | RC |

;

This example contains a route with 16-bit ITU-N point codes:

```
rtrv-rte:lsn=lsn66
```

```
tekelecstp 10-10-09 10:00:37 EST EAGLE 45.1.0
rtrv-rte:lsn=lsn66
Command entered at terminal #4.
Extended Processing Time may be Required

LSN          DPCN16      RC
lsn66        006-005-004  10
              006-004-002  10

;
```

### Legend

- **DPC, DPCA, DPCI, DPCN, DPCN24, DPCN16**—Destination point code to be reached through this route
- **ALIAS, ALIASA, ALIASI, ALIASN/N24, ALIASN16**—Alias associated with the route
- **CLLI**—CLLI associated with the route
- **LSN**—Name of the linkset assigned to this route
- **RC**—Relative cost (priority) assigned to the route
- **APC, APCA, APCI, APCN, APCN24, APCN16**—Point code of the STP or SSP that is directly adjacent to the linkset. The point code may or may not be the same as the destination point code assigned to this route.

## rtrv-rtx

Use this command to retrieve one or more exception route entries. Because all parameters are optional, the retrieve examines the entire Route table to find all entries that match the specified parameters. Entries with CIC-ECIC range values that fall in the range specified by the **cic** and **ecic** parameters are displayed.

## Parameters

### **cic (optional)**

Starting Circuit Identification Code. This parameter is used alone or together with the `ecic` parameter as exception routing criteria for the specified exception route.

**Range:**

0 - 16383

### **class (optional)**

Exception routing class. This parameter displays all exception route sets provisioned for the specified class.

**Range:**

*opc*

*ilsn*

*cic*

*si*

### **dpc (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:**

*dpca*

**Range:**

*p-*, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When `chg-sid:pctype=ansi` is specified, *ni=000* is not valid.

When `chg-sid:pctype=ansi` is specified, *nc=000* is not valid if *ni=001-005*.

When `chg-sid:pctype=ansi` is specified, *nc=000* is valid if *ni=006-255*.

When `chg-sid:pctype=ansi` is specified, *ni-\*-\** is valid if *ni= 006-255*.

The point code 000-000-000 is not a valid point code.

### **dpcli (optional)**

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**dpcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps*, 0-16383, *aa-zz*, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—*s-*, *p-*, *ps-*

*nnnnn*—0-16383, \*

*gc*—*aa-zz*, \*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**dpcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p*

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**dpcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*). The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

**Range:**

*p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

*un---*000---127

*sna---*000---15

*mna---*000---31

**ecic (optional)**

Ending Circuit Identification Code. This parameter, together with the *cic* parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:**

0 - 16383

**ilsn (optional)**

Incoming Link Set Name. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**lsn (optional)**

Link Set Name. The linkset associated with the specified exception route.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**opc (optional)**

ANSI origination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:**

*p-*, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p-*

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When `chg-sid:pctype=ansi` is specified, `ni=000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc=000` is not valid if `ni=001-005`.

When `chg-sid:pctype=ansi` is specified, `nc=000` is valid if `ni=006-255`.

When `chg-sid:pctype=ansi` is specified, `ni-*-*` is valid if `ni=006-255`.

The point code `000-000-000` is not a valid point code.

### **opci (optional)**

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

#### **Range:**

*s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code `0-000-0` is not a valid point code.

### **opcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt1` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

#### **Range:**

*s-, p-, ps-, 0-16383, aa-zz, \**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix—s-, p-, ps-*

*nnnnn—0-16383, \**

*gc—aa-zz, \**

*m1-m2-m3-m4—0-14* for each member; values must sum to 14; or *\*-\*-\*-\** when the point code includes a group code.

**opcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p*

*msa—000–255*

*ssa—000–255*

*sp—000–255*

**opcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

**Range:**

*p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---**p*

*un---000---127*

*sna---000---15*

*mna---000---31*

**si (optional)**

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:**

3 - 15

**Example**

rtrv-rtx:dpca=1-1-1

rtrv-rtx:opca=6-\*-\*

rtrv-rtx:ilsn=lset4

rtrv-rtx:si=5

rtrv-rtx:cic=0:ecic=16383

rtrv-rtx:dpcn16=121-10-25

**Dependencies**

Only one of the *opc*, *ilsn*, *cic*, *si*, or *class* parameters can be specified.

If the *ecic* parameter is specified, the *cic* parameter must also be specified.

The *ecic* parameter value cannot be less than the *cic* parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the `lsn` or `lsn` parameter, must exist.

The Linkset table is corrupt or cannot be found.

The Route table is corrupt or cannot be found.

The Route Exception table is corrupt or cannot be found.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

## Notes

**\*\*** can be used in the network cluster member (*ncm*) subfield of `dpc/dpca` and `opc/opca` parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*).

**\*\*** can be used in the network cluster (*nc*) subfield of `dpc/dpca` and `opc/opca` parameters to retrieve all point codes residing in (members of) a given network (*ni*).

**\*\*\*** can be used in the network cluster member (*ncm*) subfield of `dpc/dpca/opc/opca` parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*), and the network cluster address (if any).

**\*\*\*** can be used in the network cluster (*nc*) subfield of `dpc/dpca` and `opc/opca` parameters to retrieve all point codes residing in (members of) a given network (*ni*), and the network address (if any).

**\*** is allowed only for retrieves (for example, `rtrv-rtx:dpcn=*-aa` or `rtrv-rtx:opc=*-xy`) on ITU-N DPCs and ITU-N OPCs if the ITUDUPPC feature is on.

**\*\*** and **\*\*\*** are not allowed for ITU-N DPCs and OPCs (for example, `dpcn=**-xy` is rejected). The node and group code cannot both be **\*** (`dpcn=*-*` is rejected).

## Output

This example retrieves all provisioned exception routes:

`rtrv-rtx`

## rtrv-sccp-msg

Use this command to display the configured SCCP message parameter values.

### Parameters

#### **msgn (optional)**

Message number. The number of the SCCP message.

#### **Range:**

*1 - 10*

### Example

```
rtrv-sccp-msg:msgn=1
```

### Dependencies

The TSTMSG table is corrupt or could not be found.

The GTT feature must be turned on before this command can be entered.

### Notes

None

### Output

```
rtrv-sccp-msg:msgn=1
```

```
tekelecstp 16-10-03 14:18:10 MST  EAGLE 46.5.0.0.0

## rtrv-sccp-serv

Use this command to display the SCCP Service application relationship information maintained by the EAGLE.

**Parameters****serv (optional)**

Name of the service to be retrieved.

**Range:**

*gflex*  
G-Flex (GSM Flexible Numbering)

*gport*  
G-Port (GSM Mobile Number Portability)

## *mnv* Mobile Number Portability

### Dependencies

The A-Port or IGM feature must be enabled before the `serv=mnv` parameter can be specified.

The G-Flex feature must be enabled before the `serv=gflex` parameter can be specified.

The G-Port feature must be enabled before the `serv=gport` parameter can be specified.

Failed reading the MRN table.

Failed reading the SCCP Service table.

### Notes

The `rtrv-sccp-serv` command is cancelable using the **F9** key or the `canc-cmd` command. Please refer to [8] for details and an example of a command abort in KSR mode. The `canc-cmd` command and **F9** are not applicable for pure SEAS commands.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

Point codes are grouped by service in the output.

### Output

The number of entries reported in use for the SCCPSRV table includes an entry for each point code network type. This entry is not displayed with the point code entries in the output. For example, if 3 ANSI point codes are used, the reported number of ANSI entries is 4.

This example displays output when no supporting features are turned on, and the SCCP Service table is empty:

## rtrv-scr-aftpc

Use this command to show the allowed affected point code (AFTPC) screening references in the AFTPC entity set.

**Parameters****actname (optional)**

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

**Range:***ayyyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

**all (optional)**

Displays all AFTPC screening references.

**Range:***yes**no***Default:***no*

**area (optional)**

ITU international area. The *area* in the point code represented by *zone-area-id*.

**Range:**

000 - 255, \*

\*—the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:**

0 - 7, \*

\* —the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:**

0 -- 31, \*

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000-255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 000-255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 000-255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 000-255

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

---

**Range:**

00000 - 16383, \*

\* —the full range of values from 00000–16383

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

*stop*—The gateway screening process ends and the message proceeds through normal routing.

**Default:**

Display all

**nsr (optional)**

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**

*none*

*s*

**Default:**

*none*

**sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:**

0 -- 15, \*

\* —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000-255

**sr (optional)**

The AFTPC screening reference name

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**ssa (optional)**

24-bit ITU national sub signaling area. The *ssa* specified in the point code represented by *msa-ssa-sp*.

**Range:**

0 - 255, \*

\* —the full range of values from 000-255

**ssn (optional)**

Subsystem number.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all.

**un (optional)**

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

**Range:**

0 – 127, \*

\* —the full range of values from 0–127

**zone (optional)**

ITU international zone. The zone in the point code represented by *zone-area-id*.

**Range:**

0 – 7, \*

\* —the full range of values from 0–7

**Example**

rtrv-scr-aftpc

rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010&&014:ssn=012

rtrv-scr-aftpc:sr=iec

rtrv-scr-aftpc:all=yes

rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010:ssn=012:actname=copy

rtrv-scr-aftpc:sr=aft1

rtrv-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s

rtrv-scr-aftpc:sr=aft2:un=1:sna=2:mna=3

**Dependencies**

If the *nsfi* parameter is specified, the parameter value must be *stop*.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If *nc=\** is specified, *ncm=\** must be specified.

If *ni=\** is specified, *nc=\** and *nc=\** must be specified.

If *zone=\** is specified, *area=\** and *id=\** must be specified.

If *area=\** is specified, *id=\** must be specified.

If *msa=\** is specified, *ssa=\** and *sp=\** must be specified.

If *ssa=\** is specified, *sp=\** must be specified.

If *un=\** is specified, *sna=\** and *mna=\** must be specified.

If *sna=\** is specified, *mna=\** must be specified.

The character *c* is not a valid value for the *ni*, *nc*, *ncm*, *zone*, *area*, *id*, *msa*, *ssa*, *sp*, *un*, *sna*, *mna*, and *npc* parameters.

The *nsr* parameter cannot be specified if the *actname* parameter is specified.

The *nsr* parameter cannot be specified if the *nsfi=stop* parameter is specified.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the `ACT NAME` field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the `sr` parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

If specified, the `sr` parameter value must exist in the AFTPC screen entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16, and ITU-N24 point codes.

Any specified `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, `nep`, `nsfi`, and `nsr` parameters must already exist in the AFTPC entity for the screening reference.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is defined by separating the values that define the range by two ampersands (&&) for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

If no parameters are specified, a list of allowed AFTPC references is produced indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every allowed AFTPC screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

The spare point code subtype prefix (s-) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-blkdpc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED AFTPC**—Screen type

- **SR**—Identifies the various screen sets being used. It can be up to four characters in length
- **NI-NC-NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA - SSA - SP. For 16-bit ITU national point codes, these columns are UN - SNA - MNA. For national point codes, these columns become the single column NPC.
- **SSN**—Subsystem number associated with the point code identified by *ni-nc-ncm*
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR –up to four characters) or action to be taken (ACT –up to six characters), if the message passes this screen

## rtrv-scr-blkdpc

Use this command to show the blocked destination point code (BLKDPC) screening references in the BLKDPC entity set.

#### Parameters

##### **actname (optional)**

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see [chg-gws-actset](#) and [rtrv-gws-actset](#)).

##### **Range:**

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

##### **all (optional)**

Displays all blocked DPC screening references.

##### **Range:**

*yes*

*no*

##### **Default:**

*no*

**area (optional)**

ITU international area. The area in the point code specified by *zone-area-id*.

**Range:**

000 - 255, \*

\* —the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:**

0 - 7, \*

\* —the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:**

0 - 31, \*

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000–255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing the specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing the specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255.

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

**Range:**

00000 - 16383, \*

\* —the full range of values from 00000–16383

**nsfi (optional)**

This parameter specifies the next screening category used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

*cgpa*

Allowed calling party address is the next screening category

*destfld*

Allowed destination field (DESTFLD) is the next screening category

*fail*

The received message should be discarded.

*isup*

ISUP message type (ISUP) is the next screening category

*stop*

The gateway screening process ends and the message proceeds through normal routing

**Default:**

Display all

**nsr (optional)**

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This

parameter is mandatory if *nsfi* is other than *stop* or *fail* and cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

**Range:**

*ayyy* 1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype. This parameter specifies whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**

*none*

*s*

**Default:**

*none*

**sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:**

*0 -- 15, \**

*\** —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. This parameter specifies the signaling point in the point code represented by *msa-ssa-sp*.

**Range:**

*000 - 255, \**

*\** —the full range of values from 000-255

**sr (optional)**

The BLKDPC screening reference name

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all.

**ssa (optional)**

24-bit ITU national sub signaling area. The sub signaling area specified in the point code represented by *msa-ssa-sp*.

**Range:**

0 - 255, \*

\* —the full range of values from 000-255

**un (optional)**16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.**Range:**

0 -- 127, \*

\* —the full range of values from 0-127

**zone (optional)**ITU international zone. The zone in the point code represented by *zone-area-id*.**Range:**

0 - 7, \*

\* —the full range of values from 0-7

**Example**

rtrv-scr-blkdpc

rtrv-scr-

blkdpc:sr=iec:ni=240:nc=001:ncm=010&amp;&amp;018:nsfi=stop:actname=rdct

rtrv-scr-blkdpc:sr=iec

rtrv-scr-blkdpc:all=yes

rtrv-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s

rtrv-scr-blkdpc:sr=bl01:un=1:sna=2:mna=3

**Dependencies**

A complete point code must be specified, and must be one and only one of the five point code parameter combinations: *ni-nc-ncm*, *zone-area-id*, *msa-ssa-sp*, *un-sna-mna*, or *npc*, except in the special case of entering *c* for "continue."

If the *ni=c* parameter is specified, then the *nc* and the *ncm* parameters must have a value of *c* or must not be specified. If the *ni=c* parameter is specified, and the *nc* and the *ncm* parameters are not specified, then the *nc* and *ncm* parameters default to a value of *c*.

If the *zone=c* parameter is specified, then the *area* and *id* parameters must have a value of *c* or must not be specified. If the *zone=c* parameter is specified, and the *area* and the *id* parameters are not specified, then the *area* and *id* parameters default to a value of *c*.

If the *msa=c* parameter is specified, then the *ssa* and *sp* parameters must have a value of *c* or must not be specified. If the *msa=c* parameter is specified, and the *ssa* and the *sp* parameters are not specified, then the *ssa* and *sp* parameters default to a value of *c*.

If the *un=c* parameter is specified, then the *sna* and *mna* parameters must have a value of *c* or must not be specified. If the *un=c* parameter is specified, and the *sna* and the *mna* parameters are not specified, then the *sna* and *mna* parameters default to a value of *c*.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the value of the `nsfi` parameter is *stop* or *fail*, then the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

If the `actname` parameter is specified with the `sr` parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `ni` parameter is specified as an asterisk (`ni=*`) or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and the `nc` parameters must be specified with a single value.

The value of the `sr` parameter must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

Any specified `id`, `mna` or `sp` parameter must already exist in the database.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

Any specified `nc` parameter must already exist in the database

Any specified `ncm` parameter must already exist in the database

Any specified `zone`, `un` or `msa` parameter must already exist in the database.

Any specified `ni` parameter must already exist in the database

Any specified `nsr` parameter must already exist in the database

Any specified `nsfi` parameter must already exist in the database

Any specified `npc` parameter must already exist in the database

Any specified `area`, `sna`, or `ssa` parameter must already exist in the database.

Any specified `pcst` parameter must already exist in the database

The Gateway Screening Stop Action table must be accessible.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

The GWSOA parameter combination should be known and valid.

## Notes

This command can be canceled using the **F9** function key or the `canc -cmd` command. See `canc -cmd` for more information.

If no parameters are specified, a list of blocked DPC screening references is displayed indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every blocked DPC screening table is output.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The character *c* is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code has the value *c*.

If the character *c* is specified for any subfield of a three-subfield point code, all three subfields must have the value *c*. No other values can be used. For example, a point code *c* is not allowed. The point code must be *c*. The asterisk (\*) value cannot be used with the character *c* (for example, a point code *c* is not allowed).

In all cases, if *c* for "continue" is entered for the first subfield in the point code, the other subfields default to *c* in the database.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code *c*. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix *s-* is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-blkdpc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = BLOCKED DPC**—Screen type
- **SR**—Identifies the screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, columns are ZONE - AREA - ID. For 24-bit ITU national point codes, columns are MSA-SSA-SP. For 16-bit ITU national point codes, columns are UN-SNA-MNA. For national point codes, columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-blkopc

Use this command to show the blocked originating point code (BLKOPC) screening references in the BLKOPC entity set.

## Parameters

### actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

#### Range:

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none*—Display gateway screening rules that do not have an assigned gateway screening stop action set

### all (optional)

Displays all blocked OPC screening references.

**Range:***yes**no***Default:***no***area (optional)**

ITU international area. The area in the point code represented by *zone-area-id*.

**Range:***000 - 255, \**

\* — the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:***0 - 7, \**

\* —the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:***0 -- 31, \**

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

**Range:***000 - 255, \**

\* —the full range of values from 000-255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

**Range:***0 - 255*

\* —the full range of values from 0–255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

---

**Range:**

00000 - 16383, \*

\* —the full range of values from 00000–16383

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

*cgpa*

Allowed calling party address is the next screening category

*stop*

The gateway screening process ends and the message proceeds through normal routing.

*fail*

The received message should be discarded.

***sio***

Allowed SIO is the next screening category.

***dpc***

Allowed DPC is the next screening category.

***blkdpc***

Blocked DPC is the next screening category.

**Default:**

Display all

**nsr (optional)**

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than *stop* or *fail*. The **nsr** parameter cannot be entered if **nsfi** is *stop* or *fail*, or the **copy=yes** parameter is specified.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**

*none*

*s*

**Default:**

*none*

**sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:**

0 -- 15, \*

\* —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000-255

### **sr (optional)**

The BLKOPC screening reference name

#### **Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

#### **Default:**

Display all.

### **ssa (optional)**

24-bit ITU national sub signaling area. The sub signaling area is specified in the point code represented by *msa-ssa-sp*.

#### **Range:**

0 - 255, \*

\* —the full range of values from 000-255

### **un (optional)**

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

#### **Range:**

0 -- 127, \*

\* —the full range of values from 0-127

### **zone (optional)**

ITU international zone. The zone in the point code represented by *zone-area-id*.

#### **Range:**

0 - 7, \*

\* —the full range of values from 0-7

### **Example**

```
rtrv-scr-blkopc
```

```
rtrv-scr-blkopc:sr=iec:ni=240:nc=001:ncm=010&&018:actname=copy
```

```
rtrv-scr-blkopc:sr=iec
```

```
rtrv-scr-blkopc:all=yes
```

```
rtrv-scr-blkopc:sr=bop1:npc=128:nsfi=fail
```

```
rtrv-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

```
rtrv-scr-blkopc:sr=bop1:un=121:sna=10:mna=17:nsfi=fail:pcst=s
```

### **Dependencies**

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

Any specified `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `ncp`, `nsfi`, `un`, `sna`, `mna`, and `nsr` parameters must already exist in the database.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or `s-`) must exist in the database.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `nsr` parameter is specified, then the `actname` parameter cannot be specified.

If the value of the `nsfi` parameter is *stop* or *fail*, then the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the value *c* is specified for any subfield of a three-subfield point code, then all three subfields must have a value of *c* (*c-c-c*). No other values, including asterisks can be used.

If the value of the first subfield is *c*, then the other subfields default to *c* in the database.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (*s-*) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `nc=*` parameter is specified, then the `ncm=*` parameter must be specified.

The Gateway Screening Stop Action table must be accessible.

If the `ni=*` parameter is specified, then the `nc=*` and `ncm=*` parameters must be specified.

If the `zone=*` parameter is specified, then the `area=*` and `id=*` parameters must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and `mna=*` parameters must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

The GWSOA parameter combination should be known and valid.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of blocked OPC references is displayed indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every blocked OPC screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

For point codes with three subfields, the value `c` (continue) is used as a place holder. If the point code is not found in this screen set, the continue value points to the `nsfi` and `nsr` to be applied next.

The character `c` is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, `nsfi`, and `nsr`. The point code `c`.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code `c`. The `nsfi` and `nsr` in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix `S-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-blkopc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table.

For a detailed report:

- **SCREEN = BLOCKED OPC**—Screen type
- **SR**—Identifies the various screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For the 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC .
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference ( NSR - up to four characters) or action to be taken ( ACT - up to six characters), if the message passes this screen

## rtrv-scr-cdpa

Use this command to show the allowed called party address (CDPA) screening references in the CDPA entity set.

## Parameters

### actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

#### Range:

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none*—Display gateway screening rules that do not have an assigned gateway screening stop action set

### all (optional)

Displays all allowed CDPA screening references.

**Range:***yes**no***Default:***no***area (optional)**

ITU international area. The area in the point code represented by *zone-area-id*.

**Range:***000 - 255, \**

\*—the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:***0 - 7, \**

\*—the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:***0 -- 31, \**

\*—the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area specified in the point code represented by *msa-ssa-sp*.

**Range:***000 - 255, \**

\* — the full range of values from 000-255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

**Range:***0 - 255, \**

\*—the full range of values from 0–255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

---

**Range:**

00000 - 16383, \*

\* —the full range of values from 00000–16383

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

*aftpc*

Allowed affected point code is the next screening category

*stop*

The gateway screening process ends and the message proceeds through normal routing

**Default:**

Display all

**nsr (optional)**

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. This parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype indicator. This parameter indicates whether the ITU international or ITU national point codes to be displayed must have the spare point code prefix (s-).

**Range:***none*

No spare point code prefix required

*s*

Spare point code prefix required

**Default:**

none

**scmgfid (optional)**

SCCP management (SCMG) format ID, which consists of a 1-octet field and uniquely defines the function and format of each SCMG message. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS

**Range:***1 - 255, \**

\*—the full range of values from 1-255

**Default:**

All SCMG format IDs are shown.

**sna (optional)**

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:***0 -- 15, \**

\* —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:***000 - 255, \***\** —the full range of values from 000-255**sr (optional)**

Displays all allowed CDPA screening references.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all.

**ssa (optional)**24-bit ITU national sub signaling area. The sub signaling area specified in the point code represented by *msa-ssa-sp*.**Range:***0 - 255, \***\** —the full range of values from 000-255**ssn (optional)**

Subsystem number.

**Range:***0 - 255, \***\** — the full range of values from 0–255**Default:**

Display all.

**un (optional)**16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.**Range:***0 -- 127, \***\** —the full range of values from 0–127**zone (optional)**ITU international zone. The zone in the point code represented by *zone-area-id*.**Range:***0 - 7, \***\** —the full range of values from 0–7**Example**`rtrv-scr-cdpa``rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ncm=010:ssn=001``rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ssn=002&&005`

```

rtrv-scr-cdpa:sr=cdp2:un=1:sna=2:mna=3
```

### Dependencies

If the `actname` parameter is specified, the `nsr` parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The `nsr` parameter cannot be specified when `nsfi=stop`.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area` is specified or respecified as an asterisk, `id` must also be an asterisk.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified, `sp=*` must be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and the `nc` parameters must be specified with a single value.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

Any specified *ni*, *nc*, *ncm*, *zone*, *area*, *id*, *msa*, *ssa*, *sp*, *un*, *sna*, *mna*, *ncp*, *nsfi*, *ri*, *ssn*, and *nsr* parameters must already exist in the CGPA entity for the screening reference.

If the *pcst* parameter is specified, point codes with the specified subtype prefix (no prefix or *s-*) must exist in the database.

The specified screening function identifier (*nsfi*) must be in the allowed CDPA entity set.

The Gateway Screening Stop Action table must be accessible.

If specified, the *sr* parameter value must exist in the AFTPC screen entity set.

The GWSOA parameter combination should be known and valid.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If no parameters are specified, the system displays a summary output.

If only the *all=yes* parameter is specified, the system displays a detailed output.

If the *all* parameter and any point code parameter are specified, the *all* parameter is ignored.

The REF column of the output of this command displays *YES* when the screen is referenced by another screen; otherwise, it displays *NO*.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, *ni=025&&100* specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix (*s-*) is supported only for ITU international and ITU national point codes. The *pcst* parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-cdpa:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED CDPA**—Screen type
- **SR**—Screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID . For 24-bit national point codes, these columns are MSA - SSA - SP. For 16-bit ITU national point codes, these columns are UN - SNA - MNA. For national point codes, these columns become the single column NPC.
- **SSN**—Subsystem number associated with the point code identified by the *ni-nc-ncm*.
- **SCMGFID**—SCMGFID format ID
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference ( NSR - up to four characters) or action to be taken ( ACT - up to six characters), if the message passes this screen.

## rtrv-scr-cgpa

Use this command to show the allowed calling party address (CGPA) screening references in the CGPA entity set.

## Parameters

---

**Note:** The *nc*, *ncm*, and *ni* parameters can be specified as a single value, range of values, or an asterisk (\*). An \* value indicates the full range of values. The *area*, *id*, *msa*, *ni*, *nsr*, *ri*, *sp*, *ssa*, *ssn*, *un*, *sna*, *mna*, and *zone* parameters can be specified as a single value or as an \*.

---

## actname (optional)

The name of the gateway screening stop action set. Stop actions must be administered using this parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

**Range:***ayyyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

**all (optional)**

Displays all allowed CGPA screening references.

**Range:***yes**no***Default:***no***area (optional)**

ITU international area. The area in the point code represented by *zone-area-id*.

**Range:***000 - 255, \**

\* —the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:***0 - 7, \**

\* —the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:***0 -- 31, \**

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area specified in the point code represented by *msa-ssa-sp*.

**Range:***000 - 255, \**

\* —the full range of values from 000-255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

**Range:***0 - 255, \***\* — the full range of values from 0–255***Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter display entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:***0 - 255, \***\* —the full range of values from 0–255***Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

**Range:***0 - 255, \***\* — the full range of values from 0–255***Default:**

Display all

**npc (optional)**

ITU national point code.

---

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

---

**Range:***00000 - 16383, \***\* —the full range of values from 00000–16383***nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** *cdpa, stop, tt*

*cdpa* —Allowed called party address point code is the next screening category.

*stop* —The gateway screening process ends and the message proceeds through normal routing.

*tt* —Allowed translation type point code is the next screening category.

**Default:**

Display all

**nsr (optional)**

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. This parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype indicator. This parameter indicates whether the ITU international or ITU national point codes to be displayed must have the spare point code prefix (s-).

**Range:***none*

No spare point code prefix required.

*s*

Spare point code prefix required.

**Default:***none***ri (optional)**

Routing indicator. Routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

**Range:***gt*

Allow a called party address with a routing indicator value of "global title."

*dpc*

Allow a called party address with a routing indicator value of "DPC/SSN."

\*

Allow both routing indicator values.

**Default:**

Display all

**sccpmt (optional)**

SCCP message type.

**Range:****9**

UDT

**10**

UDTS

**17**

XUDT

**18**

XUDTS

\*

All possible allowed values (9, 10, 17, 18)

**Default:**

Display all SCCP message types

**sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:**

0 -- 15, \*

\* —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000-255

**sr (optional)**

The CGPA screening reference name

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all.

**ssa (optional)**

24-bit ITU national sub signaling area. The sub signaling area specified in the point code. represented by *msa-ssa-sp*.

**Range:**

0 - 255, \*

\* — the full range of values from 000-255

**ssn (optional)**

Subsystem number.

**Range:**

0 - 255, \*

\* — the full range of values from 0–255

**Default:**

Display all.

**un (optional)**

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

**Range:**

0 -- 127, \*

\* —the full range of values from 0–127

**zone (optional)**

ITU international zone. The zone in the point code represented by *zone-area-id*.

**Range:**

0 - 7, \*

\* — the full range of values from 0–7

**Example**

```
rtrv-scr-
```

```
cgpa:sr=cgp1:un=1:sna=2:mna=1:ssn=1:sccpmt=9:nsfi=stop:ri=*
```

**Dependencies**

If the *ni* parameter is specified as an asterisk or as a range, the *nc* and *ncm* parameters must be specified as an asterisk or as the full range 000 – 255.

If the *nc* parameter is specified as an asterisk, the *ncm* parameter must be specified as an asterisk or as the full range 000 – 255.

If the *nc* parameter is specified as a single value or a range, a single value must be specified for the *ni* parameter.

If the *nc* parameter is specified as a range, the *ncm* parameter must be specified as an asterisk or as the full range 000 – 255.

If the *ncm* parameter is specified as a single value, or a range other than the full range of 000 – 255, the *ni* and the *nc* parameters must be specified with a single value.

If the *actname* parameter is specified, the *nsr* parameter cannot be specified.

If the *actname* parameter is specified, the *nsfi=stop* parameter must be specified.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If `zone=*` is specified, `area=*` and `id=*` must be specified.

If `area=*` is specified, `id=*` must be specified.

If `msa=*` is specified, `ssa=*` and `sp=*` must be specified.

If `ssa=*` is specified or re-specified, `sp=*` must also be specified.

If `un=*` is specified, `sna=*` and `mna=*` must be specified.

If `sna=*` is specified, `mna=*` must be specified.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

Any specified `ni`, `nc`, `ncm`, `zone`, `area`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, `ncp`, `nsfi`, `ri`, `ssn`, and `nsr` parameters must already exist in the CGPA entity for the screening reference.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

The specified screening reference (`sr`) must be in the allowed CGPA entity set.

If the `nsfi=stop` parameter is specified, the `nsr` parameter cannot be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` and `npcst` parameters cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the *ACT NAME* field of the `rtrv-gws-actset` command output.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

2483 E2483 Cmd Rej: Unknown / Invalid GWSOA parameter combination

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, the system displays a summary output.

If only the `all=yes` parameter is specified, the system displays a detailed output.

If the `all` parameter and any point code parameter are specified, the `all` parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix `s-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-cgpa:all=yes` command, or specify the specific screening reference.
- **RULES**—The number of screening rules in that screening table.

For a detailed report:

- **SCREEN = ALLOWED CGPA**—Screen type
- **SR**—Identifies the screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN - SNA - MNA. For national point codes, these columns become the single column NPC.
- **SSN**—Subsystem number associated with the point code identified by the *ni-nc-ncm*
- **RI**—Routing indicator in the called party address
- **SCCPMT**—SCCP message type
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-destfld

Use this command to show the attributes of one or more allowed affected destination field (DESTFLD) screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

### Parameters

#### **actname (optional)**

The name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

##### **Range:**

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none*—Display gateway screening rules that do not have an assigned gateway screening stop action set

#### **all (optional)**

Displays all allowed DPC screening references.

##### **Range:**

*yes*

*no*

##### **Default:**

*no*

#### **area (optional)**

ITU international area. The area in the point code represented by *zone-area-id*.

##### **Range:**

*000 - 255, \**

*\** —the full range of values from 000–255

##### **Default:**

Display all

#### **id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

##### **Range:**

*0 - 7, \**

*\** —the full range of values from 0–7

##### **Default:**

Display all

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:**

0 – 31, \*

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000-255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing the specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* — the full range of values from 0–255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing the specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

**Range:***00000 - 16383**\* —the full range of values from 00000–16383***nsfi (optional)**

This parameter indicates that the gateway screening process should stop.

**Range:***stop*

the gateway screening process ends and the message proceeds through normal routing

**Default:**

Display all screening references

**nsr (optional)**

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:***none**s***Default:***none***sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:***0 -- 15, \***\* —the full range of values from 0–15***sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:***000 - 255, \***\* —the full range of values from 000-255***sr (optional)**

The name of the individual DESTFLD screen to be displayed.

**Range:***ayyy**1 alphabetic character followed by up to 3 alphanumeric characters***Default:***Display all.***ssa (optional)**

24-bit ITU national sub signaling area. The sub signaling area in the point code represented by *msa-ssa-sp*.

**Range:***0 - 255, \***\* —the full range of values from 000-255.***un (optional)**

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

**Range:***0 -- 127, \***\* —the full range of values from 0–127***zone (optional)**

ITU international zone. The zone in the point code represented by *zone-area-id*.

**Range: 0 - 7, \****0 - 255, \***\* — the full range of values from 0–7***Example**

```

### Dependencies

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

The `nsfi=stop` parameter must be specified.

The `nsr` parameter cannot be specified in the command if the `nsfi` parameter has a value of *stop* or *fail*.

If the `actname` parameter is specified, the `nsr` parameter cannot be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and `nc` parameters must be specified with a single value.

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the `zone=*`  parameter is specified, then the `area=*`  and the `id=*`  parameters must be specified.

If the `area=*`  parameter is specified, then the `id=*`  parameter must be specified.

If the `msa=*`  parameter is specified, then the `ssa=*`  and the `sp=*`  parameters must be specified.

If the `un=*`  parameter is specified, then the `sna=*`  and the `mna=*`  parameters must be specified.

If the `ssa=*`  parameter is specified, then the `sp=*`  parameter must be specified.

If the `sna=*`  parameter is specified, then the `mna=*`  parameter must be specified.

The specified screening reference (`sr`) must be in the allowed DESTFLD entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `na`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or `s-`) must exist in the database.

Any specified `area`, `sna` or `ssa` parameter must already exist in the database.

Any specified `id`, `sp` or `mna` parameter must already exist in the database.

Any specified `zone`, `un` or `msa` parameter must already exist in the database.

Any specified `nc` parameter must already exist in the database.

Any specified `ncm` parameter must already exist in the database.

Any specified `ni` parameter must already exist in the database.

Any specified `npc` parameter must already exist in the database.

Any specified `nsfi` parameter must already exist in the database.

Any specified `nsr` parameter must already exist in the database.

Any specified `pcst` parameter must already exist in the database.

If the `nsfi=fail` parameter is specified, then the `nni`, `nc`, `ncm`, `narea`, `nzone`, `nid`, `nmsa`, `nssa`, `nsp`, `nun`, `nsna`, `nmna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, the system displays a summary output.

If only the `all=yes` parameter is specified, the system displays a detailed output.

If the `all` parameter and any point code parameter are specified, the `all` parameter is ignored.

The REF column of the output of this command displays *YES* when the screen is referenced by another screen; otherwise, it displays *NO*.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix (`s-`) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the `rtrv-scr-destfld:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table.

For a detailed report:

- **SCREEN = ALLOWED DESTFLD**—Screen type
- **SR**—Identifies the various screen sets being used. It can be up to four characters in length.
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-dpc

Use this command to show the attributes of one or more allowed DPC screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

### Parameters

**actname (optional)**

The name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

**Range:**

*ayyyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

**all (optional)**

Displays all allowed DPC screening references.

**Range:**

*yes*

*no*

**Default:**

*no*

**area (optional)**

ITU international area. The area in the point code represented by *zone-area-id*.

**Range:**

*000 - 255, \**

\*—the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:**

*0 - 7, \**

\* —the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:**

*0 -- 31, \**

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area specified in the point code represented by *msa-ssa-sp*.

**Range:**

*000 - 255*

\* — the full range of values from 000-255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing the specific cluster of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0-255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0-255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0-255

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. For multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#).

---

---

**Range:**

00000 - 16383, \*

\* —the full range of values from 00000-16383

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

***blkdpc***

Blocked DPC is the next screening category

***cgpa***

Allowed calling party address is the next screening category.

***destfld***

Allowed destination field (DESTFLD) is the next screening category.

***isup***

ISUP message type (ISUP) is the next screening category.

***stop***

The gateway screening process ends and the message proceeds through normal routing.

**Default:**

Display all screening references

**nsr (optional)**

Next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop* or *fail*. The *nsr* parameter cannot be entered if *nsfi* is *stop* or *fail*, or the *copy=yes* parameter is specified.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**

*none*

*s*

**Default:**

*none*

**sna (optional)**

16-bit ITU national main number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:**

0 -- 15, \*

\* —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000-255

**sr (optional)**

The allowed DPC screening reference name

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all.

**ssa (optional)**

24-bit ITU national sub signaling area. The sub signaling area in the point code represented by *msa-ssa-sp*.

**Range:**

0 - 255, \*

\* — the full range of values from 000-255

**un (optional)**

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

**Range:**

0 -- 127, \*

\* —the full range of values from 0-127

**zone (optional)**

ITU international zone. The zone in the point code represented by *zone-area-id*.

**Range:**

0 - 7, \*

\* — the full range of values from 0-7

```

## Dependencies

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

The specified screening reference (`sr`) must be in the allowed DPC entity set.

Any specified `ni` parameter must already exist in the allowed DPC entity for the screening reference.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (`s-`) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) or for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or `s-`) must exist in the database.

If the `ni=*` parameter is specified, then the `nc=*` and `ncm=*` parameters must be specified.

If the `nc=*` parameter is specified, then the `ncm=*` parameter must be specified.

If the `zone=*` parameter is specified, then the `area=*` and the `id=*` parameters must be specified.

If the `area=*` parameter is specified, then the `id=*` parameter must be specified.

If the `msa=*` parameter is specified, then the `ssa=*` and the `sp=*` parameters must be specified.

If the `un=*` parameter is specified, then the `sna=*` and the `mna=*` parameters must be specified.

If the `ssa=*` parameter is specified, then the `sp=*` parameter must be specified.

If the `sna=*` parameter is specified, then the `mna=*` parameter must be specified.

If the value of the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

If the `nsr` parameter is specified, then the `actname` parameter cannot be specified.

If the `actname` parameter is specified, then the `nsfi=stop` parameter must be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

Any specified `npc` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `ncm` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `nc` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `nsfi` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `nsr` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `pcst` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `area`, `sna` or `ssa` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `id`, `mna` or `sp` parameter must already exist in the allowed DPC entity for the screening reference.

Any specified `zone`, `un` or `msa` parameter must already exist in the allowed DPC entity for the screening reference.

If the `nsfi=fail` parameter is specified, then the `ni`, `nc`, `ncm`, `area`, `zone`, `nid`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, a list of allowed DPC references is displayed indicating whether they are referenced or not.

If a single allowed DPC screening reference is specified, the specified entity set requested is shown.

If `all=yes` and no other parameter is specified, detailed information for all of the screening reference entities in the allowed DPC entity set are shown.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100 .

The spare point code subtype prefix (`s-`) is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-dpc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED DPC**—Screen type
- **SR**—Identifies the screen sets being used. It can be up to four characters in length.
- **NI-NC-NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE-AREA-ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-isup

Use this command to display one allowed ISUP screening reference or all allowed ISUP screening references in the Allowed ISUP entity set.

## Parameters

### **actname (optional)**

The name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

**Range:**

*ayyyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

### **all (optional)**

This parameter displays all allowed ISUP screening references in the Allowed ISUP entity set.

**Range:**

*yes*

*no*

**Default:**

*no*

### **isupmt/tupmt (optional)**

ISUP message type or TUP message type in the specified entry. The `tupmt` parameter is not valid for SEAS. A single value or range of values can be entered.

**Range:**

*000 - 255, \**

\*—the entire range of 0-255

### **nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process.

**Range:** *stop* ,

*stop* —The gateway screening process ends and the message proceeds through normal routing.

### **nsr (optional)**

Next screening reference.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

No value given

### **sr (optional)**

The individual ISUP screen to be displayed.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Example**`rtrv-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2``rtrv-scr-isup:sr=tu01:tupmt=0&&255`**Dependencies**

If the `nsfi` parameter is specified, the value must be *stop*.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

The `nsr` parameter cannot be specified if the `nsfi=stop` parameter is specified.

If `sr` is specified, the value must exist in the database.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The GWSOA parameter combination should be known and valid.

**Notes**

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

A range of values for the `isupmt` or `tupmt` parameter can be specified by separating the values that define the range by two ampersands (&&); for example, `isupmt=025&&100` specifies all ISUP message types from 25 - 100. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk can be used for a parameter value in the `chg/dlt/rtrv-scr-isup` commands only if that parameter value was specified as an asterisk in the `ent-scr-isup` command to define the parameter value.

If no parameters are specified, a list of allowed ISUP references is produced indicating whether they are referenced or not.

**Output**`rtrv-scr-isup`

## rtrv-scr-opc

Use this command to show an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference).

#### Parameters

##### **actname (optional)**

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset** ).

##### **Range:**

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

##### **all (optional)**

Displays all allowed OPC screening references.

##### **Range:**

*yes*

*no*

##### **Default:**

Display all

**area (optional)**

ITU international area. The area in the point code represented by *zone-area-id*.

**Range:**

000 - 255, \*

\* —the full range of values from 000–255

**id (optional)**

ITU international ID. The ID in the point code represented by *zone-area-id*.

**Range:**

0 - 7, \*

\* —the full range of values from 0–7

**mna (optional)**

16-bit ITU national main number area. The *mna* in the point code represented by *un-sna-mna*.

**Range:**

0 - 31, \*

\* —the full range of values from 0–31

**msa (optional)**

24-bit ITU national main signaling area. The main signaling area in the point code represented by *msa-ssa-sp*.

**Range:**

000 - 255, \*

\* —the full range of values from 000–255

**nc (optional)**

Network cluster identifier value. This parameter displays entries containing this specific cluster of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ncm (optional)**

Network cluster member identifier value. This parameter displays entries containing this specific cluster member of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255, \*

\* —the full range of values from 0–255

**Default:**

Display all

**ni (optional)**

Network identifier value. This parameter displays entries containing this specific network of the point code represented by *ni-nc-ncm*.

**Range:**

0 - 255

\* —the full range of values from 0–255

**Default:**

Display all

**npc (optional)**

ITU national point code.

---

**Note:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see [Converting ITU National Point Code Formats](#) in Appendix A.

---

**Range:**

00000 - 16383, \*

\* —the full range of values from 00000–16383

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

*blkopc*

Blocked OPC is the next screening category.

*sio*

Allowed SIO is the next screening category

*dpc*

Allowed DPC is the next screening category.

*blkdpc*

Blocked DPC is the next screening category

*cgpa*

Allowed calling party address is the next screening category.

*stop*

The gateway screening process ends and the message proceeds through normal routing.

**Default:**

Display all screening references

**nsr (optional)**

Next Screening Reference. This parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than *stop* or *fail*. This parameter cannot be specified if **nsfi** is *stop* or *fail*, or the **copy=yes** parameter is specified.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pcst (optional)**

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:***none**s***Default:***none***sna (optional)**

16-bit ITU national sub number area. The *sna* in the point code represented by *un-sna-mna*.

**Range:***0 -- 15, \**

\* —the full range of values from 0–15

**sp (optional)**

24-bit ITU national signaling point. The signaling point in the point code represented by *msa-ssa-sp*.

**Range:***000 - 255, \**

\* —the full range of values from 000-255

**sr (optional)**

The allowed OPC screening reference name

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all.

**ssa (optional)**

24-bit ITU national sub signaling area. The sub signaling area *i* in the point code represented by *msa-ssa-sp*.

**Range:**

0 - 255, \*

\* — the full range of values from 000-255

**un (optional)**

16-bit ITU-national unit number. The *un* of the point code represented by *un-sna-mna*.

**Range:**

0 -- 127, \*

\* —the full range of values from 0-127

**zone (optional)**

ITU international zone. The zone in the point code represented by *zone-area-id*.

**Range:**

0 - 7, \*

\* —the full range of values from 0-7

**Example**

```
rtrv-scr-opc
```

```
rtrv-scr-opc:sr=iec:ni=240:nc=001:ncm=010&&018
```

```
rtrv-scr-opc:sr=iec:id=4
```

```
rtrv-scr-opc:all=yes
```

```
rtrv-scr-opc:sr=opc1:actname=cr
```

```
rtrv-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s
```

```
rtrv-scr-opc:sr=opc2:un=1:sna=2:mna=3
```

**Dependencies**

ANSI point code value 000-000-000 and ITU-International point code value 0-000-0 are not allowed.

If the *ni*=\* parameter is specified, the *nc*=\* and *ncm*=\* parameters must be specified.

If the *nc*=\* parameter is specified, then the *ncm*=\* parameter must be specified.

If the *zone*=\* parameter is specified, then the *area*=\* and *id*=\* parameters must be specified.

If the *area*=\* parameter is specified, then the *id*=\* parameter must be specified.

If the *msa*=\* parameter is specified, then the *ssa*=\* and *sp*=\* parameters must be specified.

If the *ssa*=\* parameter is specified, then the *sp*=\* parameter must be specified.

If the *un*=\* parameter is specified, then the *sna*=\* and the *mna*=\* must be specified.

If the *sna*=\* parameter is specified, then the *mna*=\* parameter must be specified.

If the `ni` parameter is specified as an asterisk or as a range, the `nc` and `ncm` parameters must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as an asterisk, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `nc` parameter is specified as a single value or a range, a single value must be specified for the `ni` parameter.

If the `nc` parameter is specified as a range, the `ncm` parameter must be specified as an asterisk or as the full range 000 – 255.

If the `ncm` parameter is specified as a single value, or a range other than the full range of 000 – 255, the `ni` and `nc` parameters must be specified with a single value.

If the `nsr` parameter is specified, then the `actname` parameter cannot be specified.

If the `actname` parameter is specified, the `nsfi=stop` parameter must be specified.

If the `nsfi=stop` parameter is specified, then the `nsr` parameter cannot be specified.

The value of the `actname` parameter must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

The specified screening reference must be in the allowed OPC entity set.

The Spare Point Code Support feature must be enabled before the `pcst` parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters `ni`, `nc`, `ncm`) or for 24-bit ITU national point codes (parameters `msa`, `ssa`, `sp`) for 16-bit ITU national point codes (parameters `un`, `sna`, `mna`). The `pcst` parameter cannot be specified for ANSI, ITU-N16 or ITU-N24 point codes.

If the `pcst` parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

Any specified `ni` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `nc` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `ncm` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `npc` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `nsfi` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `nsr` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `pcst` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `area`, `sna` or `ssa` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `id`, `mna` or `sp` parameter must already exist in the allowed OPC entity for the screening reference.

Any specified `zone`, `un` or `msa` parameter must already exist in the allowed OPC entity for the screening reference.

If the `nsfi=fail` parameter is specified, then the `ni`, `nc`, `ncm`, `area`, `zone`, `id`, `msa`, `ssa`, `sp`, `un`, `sna`, `mna`, and `npc` parameters cannot have a value of `c`.

The Gateway Screening Stop Action table must be accessible.

The GWSOA parameter combination should be known and valid.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified, a list of allowed OPC references is produced indicating whether they are referenced or not.

If a single allowed OPC screening reference is specified, the specified entity set requested is shown.

If `all=yes` and no other parameter is specified, detailed information for all of the screening reference entities in the allowed OPC entity set are shown.

If `all` is specified and other parameters are also specified, the `all` parameter is ignored.

An asterisk specified as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (`&&`); for example, `ni=025&&100` specifies all network indicators for ANSI point codes from 25 - 100.

The spare point code subtype prefix `s-` is supported only for ITU international and ITU national point codes. The `pcst` parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### Legend

For a summary report:

- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-opc:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED OPC**—Screen type
- **SR**—Identifies the various screen sets being used. It can be up to four characters in length
- **NI - NC - NCM**—Point code referenced within the screen. For international point codes, these columns are ZONE-AREA-ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For 16-bit ITU national point codes, these columns are UN-SNA-MNA. For national point codes, these columns become the single column NPC.
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-sio

Use this command to show the attributes of one or more `nic/si/h0/h1` combinations that are allowed for SS7 messages from another network.

### Parameters

#### **actname (optional)**

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

#### **Range:**

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

**all (optional)**

Displays all allowed SIO screening references.

**Range:**

*yes*

*no*

**Default:**

*no*

**h0 (optional)**

H0 heading code. A single value or a range of values can be specified.

**Range:**

0 - 15, \*

\* — all possible values from 0–15

**Default:**

Display all

**h1 (optional)**

H1 heading code. A single value or a range of values can be specified.

**Range:**

0 - 15, \*

\* —all possible values from 0–15

**Default:**

Display all

**nic (optional)**

Network indicator code.

**Range:**

0 - 3, \*

\* — all possible values from 0–3

**Default:**

Display all

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**

*blkdpc*

Blocked DPC is the next screening category.

***cgpa***

Allowed calling party address is the next screening category.

***cdpa***

Allowed called party address is the next screening category.

***destfld***

Allowed destination field (DESTFLD) is the next screening category.

***dpc***

Allowed DPC is the next screening category.

***isup***

ISUP message type (ISUP) is the next screening category.

***stop***

The gateway screening process ends and the message proceeds through normal routing.

**Default:**

Display all screening references

**nsr (optional)**

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process.

This parameter is mandatory if *nsfi* is other than *stop*; cannot be entered if *nsfi=stop*.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**pri (optional)**

Message priority. A single value or a range of values can be specified.

**Range:**

0 - 3

\* —all possible values from 0–3

**Default:**

Display all

**si (optional)**

Service indicator.

**Range:**

0 - 15, \*

\*—all possible values from 0–15

**Default:**  
Display all

**sr (optional)**  
Allowed SIO screening reference name

**Range:**  
*ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**  
Display all

### Example

```
rtrv-scr-sio
rtrv-scr-sio:sr=iec:nic=1:si=3:pri=2&&3
rtrv-scr-sio:sr=sio1:nic=1:si=1
rtrv-scr-sio:sr=sio1:nic=1:si=1:h0=1:h1=*
rtrv-scr-sio:sr=sio1:si=1:h0=1:h1=1
rtrv-scr-sio:all=yes
rtrv-scr-sio:sr=iec:nic=1:si=1:actname=crncf
```

### Dependencies

If the **si** parameter is not equal to 00, 01, or 02, the **h0** and **h1** parameters cannot be specified.

If the **nic**, **si**, and **h0/h1** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The **nic** parameter must be specified if the **si** parameter is specified.

The **nic** and **si** parameters must be specified if the **h0** and **h1** parameters are specified.

If an asterisk value is specified for the **h0** parameter, the **h1** parameter cannot be specified.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **nsr** parameter is specified, then the **actname** parameter cannot be specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **sr** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The Gateway Screening Stop Action table must be accessible.

Valid `nsfi` parameter combinations must be specified.

The GWSOA parameter combination should be known and valid.

For SEAS commands, the `pri` parameter specified must be in the range 0-3, \*.

For SEAS commands, the `h0` parameter specified must be in the range 0-15, \*.

For SEAS commands, the `h1` parameter specified must be in the range 0-15, \*.

### Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed SIO references is output indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every allowed SIO screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

### Output

`rtrv-scr-sio`

```

### Legend

For a summary report:

- **SR**—The screen sets being used
- **REF**—Indicates whether a screen is referenced by another screen. If NO, the screen is not used. For more detailed output, use the `rtrv-scr-sio:all=yes` command, or specify the specific screening reference.
- **RULES**—Number of screening rules in that screening table

For a detailed report:

- **SCREEN = ALLOWED SIO**—Screen type
- **SR**—The screen sets being used
- **NIC**—Network indicator code in the service information octet
- **PRI**—Priority of a single message or the beginning message priority in a range of priorities in the service information octet
- **SI**—Service indicator for the service information octet, which are the last two bits of the subservice field
- **H0**—H0 heading code
- **H1**—H1 heading code
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-tt

Use this command to show the allowed translation type (TT) screening reference in the TT entity set.

### Parameters

**actname (optional)**

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:**

*ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

**all (optional)**

Displays all allowed TT screening references.

**Range:**

*yes*

*no*

**Default:**

*no*

**nsfi (optional)**

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** *cdpa, stop*

*cdpa*

Allowed called party address is the next screening category.

*stop*

The gateway screening process ends and the message proceeds through normal routing.

**Default:**

Display all screening references

**nsr (optional)**

The next screening reference parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is mandatory if *nsfi* is other than *stop*. The *nsr* parameter cannot be entered if *nsfi* is *stop*, or the *copy=yes* parameter is specified.

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**sr (optional)**

The TT screening reference name

**Range:**

*ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**type (optional)**

Translation type. The global title translation type value in the called party address. This value is the decimal representation of the 1-byte field used in SS7.

**Range:**

*0 - 255, \**

\* —the full range of values from 0–255

**Default:**

Display all.

### Example

```
rtrv-scr-tt
rtrv-scr-tt:sr=iec
rtrv-scr-tt:all=yes
```

### Dependencies

If the `nsr` parameter is specified, `nsfi=stop` cannot be specified.

If the `actname` parameter is specified, the value specified for `nsfi` must be *stop*.

The value of the `actname` parameter must be defined in the gateway screening stop action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

If the `actname` parameter is specified with the screening reference name parameter, the specified value for the `actname` parameter must be assigned to that screening reference name.

Stop actions must be administered using the `actname` parameter in conjunction with the gateway screening stop action table (see `chg-gws-actset` and `rtrv-gws-actset`).

The specified value for the `nsfi` parameter is not valid for TT screen.

The `actname` parameter value must already be defined in the Gateway Screening Stop Action table with the `chg-gws-actset` command. These values are shown in the ACT NAME field of the `rtrv-gws-actset` command output.

The Gateway Screening Stop Action table must be accessible.

The screening reference and translation type for which the attributes are to be retrieved must exist.

The value specified for the `type` parameter must be within the allowed range.

The GWSOA parameter combination should be known and valid.

### Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed TT references is produced indicating whether they are referenced or not.

If only the `all=yes` parameter is specified, detailed information for every rule in every allowed TT screening table is displayed.

If the `all` parameter is specified and other parameters are also specified, the `all` parameter is ignored.

## rtrv-scrset

Use this command to show the attributes of one or more screen sets in the screen set entity set.

### Parameters

#### **actname (optional)**

Name of the gateway screening stop action set. Stop actions must be administered using this parameter with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

##### **Range:**

*ayyyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

*none* —Display gateway screening rules that do not have an assigned gateway screening stop action set

#### **all (optional)**

Displays all screen sets (except “placeholder” screen sets that contain only one rule with **nsfi=stop** specified in the rule).

##### **Range:**

*yes*

*no*

##### **Default:**

*no*

#### **destfld (optional)**

This parameter displays the indicator that specifies whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on in the screen set rule, the automatic screening is applied at the end of the provisioned screen set.

##### **Range:**

*yes*

*no*

##### **Default:**

Display all

**nsfi (optional)**

This parameter indicates the next screening category that is used in the gateway screening process, or that the gateway screening process should stop. In this command, information is displayed for one or more screen sets containing rules with the specified *nsfi* parameter value.

---

**Note:** When *nsfi=stop* is specified, the command displays only the “placeholder” screen sets that have only one rule, with *nsfi=stop* specified in the rule. This is a way to locate those “placeholder” screen sets, so that you can add or change the rules to accomplish appropriate screening.

---

**Range:***opc*

Display rules with Allowed OPC as the next screening category.

*blkopc*

Display rules with Blocked OPC as the next screening category.

*sio*

Display rules with Allowed SIO as the next screening category.

*dpc*

Display rules with Allowed DPC as the next screening category.

*blkdpc*

Display rules with Blocked DPC as the next screening category.

*stop*

Display only “placeholder” screen sets that have only one rule in the screen set, with *nsfi=stop* specified as the next screening category.

**Default:**

Display all

**nsr (optional)**

Next screening reference. This parameter indicates which screening reference in the specified screening category (*nsfi*) is to be used in the screening process. This parameter is used to display information for one or more screen sets with rules that have the specified *nsr* parameter value.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**scrn (optional)**

Screen set name.

**Range:***ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**

Display all

**Example**`rtrv-scrset``rtrv-scrset:scrn=scr1``rtrv-scrset:nsr=opc4``rtrv-scrset:nsfi=dpc``rtrv-scrset:actname=copy`**Dependencies**

The screen set name must already exist.

The `nsfi=stop` parameter must be specified before the `actname` parameter can be specified.

The `nsr` parameter cannot be specified if the `actname` parameter is specified.

If the `actname` parameter is specified with the screen set name parameter, the specified value for the `actname` parameter must be assigned to that screen set name.

The `nsfi` parameter must be valid for the SCRSET entity.

If the `nsfi=stop` parameter is not specified, then the `nsr` parameter must be specified.

The `nsr` parameter cannot be entered if the `nsfi` parameter value equals `stop`.

The GWSOA parameter combination should be known and valid.

**Notes**

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

If no parameters are specified for the `rtrv-scrset` command, the output shows all the screen sets, the screening function identifier of the root screening table, the screening reference of the root screening table, the memory usage (percentage), the number of entries in the screen set and the overall gateway screening statistics, followed by a summary of statistics for each screen set.

For the `rtrv-scrset:all=yes` command, the output consists of every screen set and every screening reference in each screen set (except "placeholder" screen sets that have only one rule with `nsfi=stop` specified in the rule). The `all=yes` and `nsfi=stop` parameters cannot be specified in the same command.

If the `scrn`, `nsfi`, or `nsr` parameter is entered, summary information for all screens that match the specified parameters is shown.

When the % FULL is over 100%, the screen is inaccessible. A screenset over 100% capacity size will not bind correctly. A screenset can become provisioned over capacity when linking one screen reference to another causes the size to become too large. To

reduce a screenset that is over 100% capacity, screen rules must be deleted (see the `dlt-scr-xxx` commands)

#### Legend

- **SCRN**—Name of the screen set
- **NSFI**—Next screening category to be used
- **NSR/ACT**—Name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen
- **FULL**—Capacity of allowed memory a given screen set occupies, expressed as a percentage
- **RULES**—Number of entries in the screen set
- **TABLES**—Number of tables in the screen set
- **DESTFLD**—Displays whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on, the automatic screening is applied at the end of the provisioned screen set.

## rtrv-seas-config

Use this command to retrieve configuration information for the CCS Message Router (CCS MR) and the name of the EAGLE source node for the SEAS Over IP interface.

### Parameters

This command has no parameters.

### Example

```
rtrv-seas-config
```

### Dependencies

The SEAS Over IP feature must be enabled before this command can be entered.

The SEASCFG Table must be accessible.

### Output

```
rtrv-seas-config
```

```
tekelecstp 07-01-23 18:46:01 EST  EAGLE 37.5.0
SEASCLLI      AUTHMODE
-----
DEVEAGLE001   Password

CONN      TERM  IPADDR          PORT  LOGIN          HNAME
-----
IPMR1      25   128.96.75.45    4010  ccscoor        tcpipmr1
IPMR2      33   128.96.75.46    4011  ccscoor        tcpipmr2
```

### Legend

- **PAGE**—Default password aging interval for newly created user IDs
- **UOUT**—number of successive days a user ID can go unused (no successful login) before the system denies login
- **MULTLOG**—Indicates whether users can be logged on to multiple terminals at the same time
- **MINLEN**—Minimum password length
- **ALPHA**—Minimum number of alphabetic characters (a–z) required in a new password
- **NUM**—Minimum number of numeric characters (0–9) required in a new password
- **PUNC**—Minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character.
- **MININTRVL**—Minimum number of days before a password can be changed again
- **PNOTIFY**—Number of days prior to password expiration in which the user will be notified about upcoming expiration
- **PGRACE**—Number of days after password expiration in which the user is allowed to login without requiring a password change
- **PREUSE**—Number of passwords in the password history that must be unique

- **PCHREUSE**—Number of characters that cannot be reused from the existing password when setting a new password
- **WARNING MESSAGE**—Message displayed when a user has successfully logged in
- **SSH**— Together with OAM IP security feature it indicates whether the telnet connections are secure or not

## rtrv-secu-trm

Use this command to display the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system.

**Parameters****trm (optional)**

Specifies the port about which information will be displayed.

**Range:**

1 - 16

**Default:**

Display all

**Example**

```
rtrv-secu-trm
```

```
rtrv-secu-trm:trm=9
```

**Dependencies**

The CCCNAMES table is corrupt or cannot be found.

The Terminal table is corrupt or cannot be found.

None

**Notes**

None

**Output**

This example shows attributes of all terminals when the Command Class Management feature is off:

```
rtrv-secu-trm
```

### Legend

- **TRM**—ID number of the terminal whose characteristics are to be changed
- **LINK**—Shows whether the Link Maintenance class of commands is allowed for this terminal
- **SA**—Shows whether the Security Administration class of commands is allowed for this terminal
- **SYS**—Shows whether the System Maintenance class of commands is allowed for this terminal
- **PU**—Shows whether the Program Update class of commands is allowed for this terminal
- **DB**—Shows whether the Database class of commands is allowed for this terminal
- **DBG**—Shows whether the Debug class of commands is allowed for this terminal
- **\*\*\***—Denotes a Security Administration port whose port type has been configured with a value of *none* or *printer*. These terminal types do not allow you to enter commands.
- **U01 - U32**—Configurable command class default names. (If configured with a user-specified name, that name appears.)

**Related Topics:**[chg-secu-trm](#)**rtrv-secu-user**

Use this command to show the security information for all users in the system.

**Parameters****uid (optional)**

User ID

**Range:**

*azzzzzzzzzzzzzzzzz*

1 alphabetic character followed by up to 15 alphanumeric characters

**Default:**

Display all

**Example**

```
rtrv-secu-user:uid=rogers
```

**Dependencies**

The CCCNAMES table is corrupt or cannot be found.

If a user ID is specified, the user ID must exist in the UserID table.

**Notes**

Only the system administrator should have access to this command.

Passwords cannot be shown.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

This example shows a display when the Command Class Management feature is not enabled:

## Legend

- **USER-ID**—Name of the user
- **AGE**—Current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value 999 is displayed.
- **PAGE**—Maximum password age established for the user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (\*) displayed after the value indicates that the system-wide default page parameter value, as configured on the `chg-secu-dflt` command, is in effect for the user ID.

- **UOUT**—User ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (\*) displayed after the value indicates that the system-wide default, uout parameter value, as configured on the `chg-secu-dflt` command, is in effect for the user ID.
- **REV**—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.
- **LINK**—Shows whether the user has access to all commands in the Link Maintenance command class
- **SA**—Shows whether the user has access to all commands in the Security Administration command class
- **SYS**—Shows whether the user has access to all commands in the System Maintenance command class
- **PU**—Shows whether the user has access to all commands in the Program Update command class
- **DB**—Shows whether the user has access to all commands in the Database Administration command class
- **DBG**—Shows whether the user has access to all commands in the Debug command class

If the Command Class Management feature is enabled, the following fields appear:

- **U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

## rtrv-seculog

Use this command to retrieve the contents of a security log and display it to the user in the scroll area. Various reports can be produced by varying the values of the command parameters. By default, the report is generated from the log on the active fixed disk, although the `s log` parameter can be used to generate the report from the log on the standby fixed disk.

## Parameters

### **edate (optional)**

End date. This parameter displays log entries that were created on or before the specified date. If the `sdate` parameter is specified, log entries created for the period specified by the `sdate` and `edate` combination are displayed.

#### **Range:**

*000101 - 991231*

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as 960101.

#### **Default:**

Report log entries regardless of their creation date

### **etime (optional)**

End time. This parameter displays log entries created between midnight (00:00:00) and the time specified by this parameter. If the `stime` parameter is specified, log entries created in the time period specified by the `stime` and `etime` combination are displayed.

#### **Range:**

*000000 - 235959*

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as 130503.

#### **Default:**

Report log entries regardless of their creation time

### **mode (optional)**

Use this parameter to produce a either full log report or an abbreviated log report.

#### **Range:**

##### *brief*

Causes only one line of output to be generated for each log entry reported. Some information in each reported log entry is not shown.

##### *full*

Produces a report showing multiple lines of output for each log record that is reported. This report displays more information from each log record (including the entire command) than the `mode=brief` report.

#### **Default:**

*brief*

### **num (optional)**

Number of records to be displayed before the report is terminated.

**Range:**

1 - 50000

**Default:**

500 —if mode=brie f is specified

250 —if mode=full is not specified

**rectype (optional)**

This parameter specifies whether to consider all records in the log for reporting or only new (un-uploaded) records.

**Range:** *new, both**new*

The report generator scans un-uploaded records when generating the report. Old records are not considered for reporting, even if they match the reporting criteria.

*both*

All records in the log are considered for reporting.

**Default:**

*new*

**sdate (optional)**

Start date. This parameter displays log entries created on or after the specified date. If the edate parameter is also specified, log entries created for the period specified by the sdate/edate combination are displayed.

**Range:**

000101 - 991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as 960101.

**Default:**

Report log entries regardless of their creation date

**slog (optional)**

Source log indicator. The log to be copied to the FTA.

**Range:***act*

produces the report from the log on the active MASP

*stb*

produces the report from the log on the standby MASP

**Default:**

*act*

**stime (optional)**

Start time. This parameter displays log entries created between the time specified by this parameter and the end of the day (23:59:59) inclusive. If the `etime` parameter is specified, log entries created in the time period specified by the `stime/etime` combination are displayed.

**Range:**

000000 - 235959

(in the form *hhmmss*, where *hh*=hours (00-23), *mm*=minutes (00-59), *ss*=seconds (00-59))

The time must be specified with 6 digits in a 24-hour format (*hhmmss*). For example, enter 1:05:03 p.m. as *130503*.

**Default:**

Report log entries regardless of their creation time

**trm (optional)**

Terminal ID. Use this parameter to report only those log entries created by the specified terminal.

**Range:**

1 - 16

**Default:**

Report log entries regardless of the associated terminal

**uid (optional)**

User ID. This parameter displays log entries created by the specified user ID. Specify `uid=seas` to display commands received on a SEAS terminal. Specify `uid=none` to display commands not associated with a user ID (for example, commands issued prior to login).

**Range:**

*azzzzzzzzzzzzzzzzz*

1 alphabetic character followed by up to 15 alphanumeric characters

**Default:**

Display all

**Example**

```
rtrv-seculog:sdate=960214:edate=960215:num=7
```

```
rtrv-seculog:mode=full:sdate=960214:edate=960214:stime=062900:etime=063200
```

**Dependencies**

If the `sdate` and `edate` parameters are specified, the date specified for the `sdate` parameter must be earlier than or equal to the date specified for the `edate` parameter.

If the `stime` and `etime` parameters are specified, the time specified for the `stime` parameter must be earlier than or equal to the time specified for the `etime` parameter.

The month component of the `sdate` and `edate` parameter combination must be specified in the range 1–12.

The day component of `sdate` and `edate` parameter combination must be specified in the range 1–31. This value must accurately reflect the number of days in the month and year indicated. For example, `sdate=960631` is not a valid parameter value because June has only 30 days.

The second component of the `stime` and `etime` parameter combination must be specified in the range 00–59.

The minute component of the `stime` and `etime` parameter combination must be specified in the range 00–59.

No other security log command can be in progress when this command is entered.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

### Notes

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

- years 95–99 = 1995 through 1999
- years 00–36 = 2000 through 2036

A consequence of this is that date 000101 (Jan 1, 2000) is greater than 991231 (December 31, 1999).

If the `mode=brie f` parameter is specified and the output report has a plus (+) symbol appearing at the end of the command, the plus symbol indicates that more command characters are available to be displayed. Specify the `mode=full` parameter to see these additional characters.

In the `mode=full` output report, a plus (+) symbol appearing at the end of the command indicates the command is longer than 150 characters. Note that even in the uploaded log, each record in the log has room to record only 150 characters of the entered command. If the command is longer than 150 characters, then only the first 149 characters of the command and the plus symbol (to indicate that truncation has occurred) are recorded.

Security log size is limited to 50,000 records. Data from a query that exceeds the size limit of the security log cannot be displayed.

The system checks to ensure that the day portion of any `sdate/edate` value entered is in agreement with the month and year. It issues error message E2252 if the day is found to be invalid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries.

The system uses the `sdate/edate` and `stime/etime` parameters to select log records for reporting as follows:

- If the date on which the log record was created is not in the date range specified by the `sdate/edate` parameters, the record is not reported. The default `sdate` is the date of the oldest record in the log, and the default `edate` is the current date.
- If the time of day at which the log record was created is not in the time range specified by the `stime/etime` parameters, the record is not reported. The default `stime` is 00:00:00 (midnight), and the default `etime` is 23:59:59.

- Otherwise, the log record is reported, unless it is disqualified by other parameters such as `uid` or `trm`.

As an example, if the following command is entered, records are displayed for October 10, 1996 from 2:00 p.m. until 4:00 p.m., for October 11, 1996, from 2:00 p.m. until 4:00 p.m., and for October 12, 1996, from 2:00 p.m. until 4:00 p.m.

```
rtrv-seculog:sdate=961010:edate=961012:stime=140000:etime=160000
```

It takes the system approximately one minute to display 500 lines of data in the scroll area. To output a complete `mode=full` report (150,000 lines maximum) takes approximately 300 minutes. For this reason, the `num` parameter defaults to 125 (`mode=full`) or 500 (`mode=brief`) to prevent an excessively long process time, unless you deliberately choose a longer report.

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

The following message appears in the scroll area if the `slog=stb` parameter is specified (either explicitly or by default) and the standby fixed disk is not available (for example, simplex mode).

Command Failed - unable to read security log

When the `rtrv-seculog` command is entered, one of the first things that the reporting function does is to examine the log overflow and logging failure flags in the header of the specified log. Depending on the nature of the information found, one of the following notices is displayed in the output:

Notice: Log overflow has occurred -- report may be incomplete.

Notice: Logging failure -- report may be incomplete.

## Output

This example shows output for records in the log created between 2/14/96 and 2/15/96 are displayed, up to a maximum of 9 records:

```
rtrv-seculog:sdate=960214:edate=960215:num=9
```

```
rlghncxa03w 96-02-14 06:32:20 EST EAGLE Release 34.0
Notice: Log overflow has occurred -- report may be incomplete.
Reporting parameters:
  sdate   = 960214
  edate   = 960215
  num     = 9
```

```

Report terminated -- output length limitation (NUM=) reached

10 records reported of 240 records scanned.  
END OF SECURITY LOG REPORT.

## Legend

- **uid**—User ID that issued the command. The value SEAS appears if the command was received on a SEAS port. The value NONE appears if no user ID was associated with the port at the time the command was logged.
- **trm**—Terminal ID of the terminal where the command was received
- **date**—Date the log entry was made; that is, the date on which the command was received for execution
- **time**—Time the log entry was made; that is, the time the command was received for execution. A 24-hour time format is used (for example, 1:00 p.m. = 130000).
- **st**—Two-letter shorthand notation of the command's status. The complete status can be obtained by re-entering the `rtrv-secu log` command and specifying the `mode=full` parameter. The status abbreviations are:
  - **AB**—Command aborted. Displayed when the `canc-cmd:trm` command is issued to abort the following commands: `rept-stat-card`, `rept-stat-dstn`, `rept-stat-ls`, `rept-stat-slk`, `rtrv-dstn`, `rtrv-gta`, `rtrv-gtt`, `rtrv-ls`, `rtrv-map`, `rtrv-rte`, `rtrv-secu log`, and `rtrv-slk`. An AB status indicates that processing and output of the command have been halted. This status is also displayed for SEAS flow-thru commands that are canceled with the `canc-cmd` (without the `trm` parameter).
  - **RJ**—Command rejected. Displayed whenever the results value that would be displayed in the `mode=full` report would be one of the following:
    - Edddd
    - FAILED
    - rrrrrr/mmmm
  - **RL**—Retry later. The system is busy.
  - **IP**—In Progress
  - **OK**—Command successfully executed
  - **TO**—Timed out.
- **cmd**—Command that was recorded. In the `mode=brie f` report, if the length of the recorded command is greater than or equal to 35 characters (as this much as can be displayed on a single line of the output report), then only the first 34 characters of the command are displayed, and the 35th character is displayed as a plus symbol (+) to indicate that more information is available in the log. Re-enter the `rtrv-secu log` command with the `mode=full` parameter to see the

additional information. In the `mode=full` report, a plus symbol at the end of a command indicates that the command is longer than 150 characters.

## rtrv-serial-num

Use this command to retrieve the NT serial number for the system.

### Parameters

This command has no parameters.

### Example

```
rtrv-serial-num
```

### Dependencies

None

### Notes

None

### Output

Dashes appear if the serial number has not yet been entered into the database.

```
rtrv-serial-num
```

```
rlghncxa03w 03-03-29 16:40:40 EST  EAGLE 31.3.0
System serial number = nt00001231
```

```
System serial number is locked.
```

```

DSCP                 20
;

```

**Legend**

- **SRKQ**—Static routing key quantity. Maximum number of routing key entries in the Static Routing Key table.
- **SNMPCONT**—System contact information for each E5-ENET or E5-ENET-B SNMP agent
- **GETCOMM**—Community name used for messages sent by SS7IPGW cards (SNMP Get and GetNext request validations)
- **SETCOMM**—Community name used for SNMP set request validation. This value applies for each E5-ENET or E5-ENET-B SNMP agent in the system.
- **TRAPCOMM**—Community name used when SNMP traps are generated. This value applies for each E5-ENET or E5-ENET-B SNMP agent in the system.
- **SCTPCSUM**—SCTP checksum algorithm type
- **IPGWABATE**—IPGWx SS7 congestion abatement procedures
- **UAMEASUSEDFTAS**—UA measurements are generated
- **DSCP**--- Subfield in IP header. Applicable to SIGTRAN based cards only.

**Related Topics:**[chg-sg-opts](#)[rtrv-appl-rtkey](#)**rtrv-shlf**

Use this command to display the frames and shelves that are currently provisioned in the system. The type of shelf is also shown.

**Parameters**

**loc (optional)**

The shelf location.

**Range:**

1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100, 6200, 6300

**Default:**

Display all configured locations

**Example**

```
rtrv-shlf
```

```
rtrv-shlf:loc=1300
```

```
rtrv-shlf:loc=6200
```

**Dependencies**

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (*xyzz*, where *x*=frame and *y*=shelf; *zz* is always 00 for this command).

The Shelf table is corrupt or cannot be found by the system.

**Notes**

None

**Output**

This example displays all configured STP equipment shelves:

```
rtrv-shlf

## rtrv-sid

Use this command to retrieve site identification characteristics of the system. It shows the point code assigned to this system, the CLLI code of the system, the capability code of the STP, and the type of point codes supported by the system.

### Parameters

---

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

---

#### **cpc (optional)**

ANSI capability point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

##### **Synonym:**

*cpc*

##### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni* = 000 is not valid.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is not valid if *ni* = 001–005.

When `chg-sid:pctype=ansi` is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

##### **Default:**

Display all

#### **cpc/cpc/cpci/cpcn/cpcn24/cpcn16 (optional)**

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

#### **cpci (optional)**

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

##### **Range:**

*s*-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code *0-000-0* is not a valid point code.

**Default:**

Display all

**cpcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**Default:**

Display all

**cpcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**Default:**

Display all

**cpcn16 (optional)**

16-bit ITU national point code with subfields *unit number sub number area main number area* (*un-sna-mna*).

**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

**Default:**  
Display all

**cpctype (optional)**

Capability point code type. This parameter displays the CPCs that are provisioned for the specified service.

**Range:**

*stp*  
*lnp*  
*inp*  
*eir*  
*gport*  
*gflex*  
*mnp*  
*atinpq*  
*vflex*  
*aiq*

**Default:**  
*stp*

**Example**

```
rtrv-sid
rtrv-sid:cpc=3-3-3
rtrv-sid:cyctype=inp
rtrv-sid:cpcn=s-00456
rtrv-sid:cpcn16=1-2-3
```

**Dependencies**

The STP destination point codes and capability point codes can be specified only as full point codes.

The ANSI point code 0-0-0 and the ITU-I point code 0-000-0 are invalid for STP capability point codes.

The LNP feature must be turned on before the `cpctype=lnp` parameter can be specified.

The INP feature must be turned on before the `cpctype=inp` parameter can be specified.

The EIR feature must be turned on before the `cpctype=eir` parameter can be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be retrieved.

The STP MAS Configuration table is corrupt or cannot be found.

If the `cpcn` parameter is specified, the format of the specified point code must match the format that was assigned with the `chg-stpopts:npcfmit` command.

The STP Site Identification table is corrupt or cannot be found.

The ATINP feature must be enabled before the `cpctype=atinpq` parameter can be specified.

The V-Flex feature must be turned on before the `cpctype=vflex` parameter can be specified.

The A-Port or the IS41 GSM Migration (IGM) feature must be enabled, before the `cpctype=mnq` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `cpctype=aiq` parameter can be specified.

### Notes

If the `cpc/cpca/cpci/cpcn/cpcn24/cpcn16` parameter is not specified, all site identification characteristics are displayed.

If the STP capability point code is specified and not provisioned, the report contains only the PCA, PCI, PCN, PCN16, PCN24, CLLI, and PCTYPE fields, with the message:

Capability Point Code specified is not provisioned.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

### Output

The `rtrv-sid` command CPC output is sorted using three sort keys.

- The first sort key is by the `cpctype` service, ordered by: `aiq`, `eir`, `gflex`, `inp`, `stp` (own STP, unlabeled), and `gport` or `mnq` depending on whether A-Port, ATINP, G-Port or V-Flex is enabled.
- The second sort key is by network type, ordered by: ANSI, ITU-I, ITU-N, then ITU-N24.
- The third sort key is by point code value, ordered low to high.

In the following output examples:

- When a 24-bit ITU-N site identification STP point code is configured, the PCN header is changed to PCN24.
- The `s-` point code prefix indicates an ITU national or international spare point code or spare capability point code.
- ANSI41 AIQ, EIR, G-Flex, G-Port, INP, LNP and V-Flex capability point codes are indicated in parentheses after the capability point code header.
- STP capability point codes have no parentheses after the header.

This example shows all site identification characteristics provisioned in the system at the time the command was entered. The output includes spare point codes.

### Legend

- **PCA**—ANSI point code of the STP.
- **PCI**—ITU-TSS international point code of the STP.
- **PCN**—ITU-TSS national point code of the STP.
- **PCN16**—16-bit ITU national point code of the STP.
- **PCN24**—24-bit ITU national point code of the STP.

- **CPCA**—ANSI capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network
- **CPCN**—ITU-TSS national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **CPCI**—ITU-TSS international capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **CPCN24**—ITU-TSS 24-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **CPCN16**—ITU-TSS 16-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.
- **(EIR)**—Equipment Identity Register (EIR) point code.
- **(INP)**—INAP Number Portability (INP) point code.
- **(LNP)**—Local number portability (LNP) point code.
- **(GFLEX)**—G-Flex (GFLEX) point code.
- **(GPORT)**—G-Port (GPORT) point code.
- **(MNP)**—MNP point code.
- **(VFLEX)**—V-Flex (VFLEX) point code.
- **(ATINP)**—ATINP feature (ATINPQ) point code.
- **(AIQ)**—ANSI41 AIQ feature (AIQ) point code.
- **CLLI**—Common language location identifier of the STP
- **PCTYPE**—Type of point code used by the STP. There are two types of point codes that the EAGLE STP can use, ANSI and OTHER. The value ANSI means the EAGLE STP supports point codes that meet the ANSI standard. The value OTHER means that the EAGLE STP supports point codes that do not meet the ANSI standard.

## rtrv-sip-npp

Use this command to retrieve existing number normalization rules (SIPPHCXT and SIPNNPFX). SIPPHCXT table will be used to provision the phone-context. SIPNNPFX table will be used to configure the prefixes against each phone context and it will also contain number of digits to be deleted (NPDD) and new prefix to be added (NPDS).

**Parameters****phctxt (optional)**

Phone Context

|      |     |   |      |
|------|-----|---|------|
| NONE | 232 | 0 |      |
| NONE | 231 | 0 |      |
| NONE | 11  | 0 |      |
| NONE | 1   | 0 | NONE |

PHCTXTID table is (3 of 101) 3% full.

;

The below two examples display the output when PHCTXT parameter is specified:

rtrv-sip-npp:phctxt=abc.com

tekelecstp 12-07-09 19:09:08 EST EAGLE 45.0.0

rtrv-sip-npp:phctxt=abc.com

Command entered at terminal #4.

| PHONE-CTXT | PFX   | NPDD | NPDS  |
|------------|-------|------|-------|
| -----      | ----- | ---- | ----- |
| abc.com    | 12    | 0    | NONE  |

PHCTXTID table is (3 of 101) 3% full.

;

rtrv-sip-npp:phctxt=dfmt

tekelecstp 12-07-09 19:09:08 EST EAGLE 45.0.0

rtrv-sip-npp:phctxt=dfmt

Command entered at terminal #4.

| PHONE-CTXT | PFX   | NPDD | NPDS  |
|------------|-------|------|-------|
| -----      | ----- | ---- | ----- |
| dfmt       | 15    | 0    | NONE  |

PHCTXTID table is (4 of 101) 4% full.

;

This example displays the output when PFX parameter is specified:

rtrv-sip-npp:phctxt=user@mart.com:pfx=91+

tekelecstp 12-07-09 19:09:08 EST EAGLE 45.0.0

rtrv-sip-npp:phctxt=user@mart.com:pfx=91+

Command entered at terminal #4.

| PHONE-CTXT    | PFX   | NPDD | NPDS  |
|---------------|-------|------|-------|
| -----         | ----- | ---- | ----- |
| user@mart.com | 91+   | 0    | NONE  |

PHCTXTID table is (3 of 101) 3% full.

;

## rtrv-sipopts

Use this command to retrieve SIP-configuration options.

**Parameters**

This command has no input parameters.

**Example**

```
rtrv-sipopts
```

**Dependencies**

SIPNP Feature must be enabled before retrieving SIP configuration-options.

SIPOPTS table should be accessible.

**Output**

This example shows output with default SIP options.

```
rtrv-sipopts
```

```
tekelecstp 12-06-25 11:43:52 EST EAGLE 45.0.0
rtrv-sipopts
Command entered at terminal #4.
NPRSPFMT      = RNDN
INCLUDENPDI   = on
INCLUDERN     = on
RNFMT         = RN
NPLKUPFAIL    = 404
RNCONTEXT     = null
```

```
;
```

This example shows output with SIP options provisioned.

```
rtrv-sipopts
```

```
tekelecstp 12-06-25 11:54:02 EST EAGLE 45.0.0
rtrv-sipopts
Command entered at terminal #4.
NPRSPFMT      = RN
INCLUDENPDI   = off
INCLUDERN     = off
RNFMT         = RNASD
NPLKUPFAIL    = 302
RNCONTEXT     = xyz
```

```
;
```

## Legend

- **NPRSPFMT**— Defines format of URI in Contact header, when INCLUDERN is OFF.
- **INCLUDENPDI**— Indicates whether to include "npdi" parameter in the response in cases where the RTDB dip is successfully performed.
- **INCLUDERN**— Indicates whether to include "rn" parameter in the response in cases where the RTDB dip is successfully performed.
- **RNFMT**— Defines format of Routing Number in the 302 response.
- **NPLKUPFAIL**— Indicates whether 302 or 404 response is sent, when DN is not found in RTDB lookup.
- **RNCONTEXT**— Describes how the "rn" parameter value should be interpreted (global or local).

## rtrv-slk

Use this command to show the parameters for low-speed signaling links, ATM high-speed signaling links, or both.

## Parameters

### **aname (optional)**

Association name. The name of the association assigned to the links to be displayed.

#### **Range:**

*aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

### **link (optional)**

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

#### **Synonym:**

*port*

#### **Range:**

*a, b, a1 - a63, b1 - b63*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have assigned signaling links.

#### **Default:**

Display all

### **loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**Default:**

All signaling links are shown.

**type (optional)**

Link type. This parameter specifies to display a sub-set of links.

**Range:*****e1***

Display signaling links for E1 cards. Includes low speed E1 and SE-HSL links.

***ipgw***

Display signaling links configured for IPGW linksets

***iplim***

Display signaling links configured for IPLIM linksets

***ipsg***

Display signaling links configured for IPSEG linksets

***j1***

Display signaling links for J1 cards. Includes low speed J1 links.

***mtp2***

Display low-speed signaling links

***saal***

Display ATM high-speed signaling links

***t1***

Display signaling links for T1 cards. Includes low speed T1 and ST-HSL-A links.

**Default:**

Display all signaling links

**Example**

```
rtrv-slk:loc=1302:link=a
rtrv-slk:loc=1302:link=b2
rtrv-slk:loc=1303:link=a31
rtrv-slk:aname=asocm2pa
rtrv-slk:loc=1305
rtrv-slk:type=j1
```

## Dependencies

If the `link` parameter is specified, the `loc` parameter must be specified. The `loc` parameter can be specified without the `link` parameter.

The `loc` parameter or the `class` parameter, but not both, can be specified in the command.

The slot portion of the specified `loc` parameter must be 01 - 18, except 09 and 10 cannot be specified (`loc=xyss`, where *x* is the frame, *y* is the shelf, and *ss* is the slot).

Card locations 1113 - 1118 cannot be specified for the `loc` parameter.

The LIMATM, LIME1ATM, LIME1, LIMT1, DCM, and ENET/ENETB card types are the only valid card types for this command.

The card must be an E5-ATM, E5-ATM-B, E5-E1T1, E5-E1T1-B, E5-ENET, E5-ENET-B, or HC-MIM.

The specified card location must be equipped.

The IMT (Card) table must be accessible.

The Link table must be accessible.

The Linkset table must be accessible.

If an E5-ATM or E5-ATM-B card is used, then a value of A, B, or A1 must be specified for the `link` parameter. A 3 Links per E5-ATM Card feature quantity must be enabled before the `link=a1` parameter can be specified.

## Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Guide* provides an illustration of the card locations.

## Output

rtrv-slk

```
tekelecstp 09-12-17 13:54:32 EST EAGLE 42.0.0
rtrv-slk

IPTPS for LOC = 1301 is (3400 of 9500) 35%

;

### Legend

- **LOC**—Location of the card containing the signaling link
- **LINK**—Signaling link assigned to the card
- **LSN**—Name of the linkset containing the signaling link
- **SLC**—Signaling link code of the signaling link
- **TYPE**—Type of card
- **ANAME**—Association name
- **SLKTPS/RSVDSLKTPS**—SLKTPS guaranteed for an IPSG link
- **MAXSLKTPS**—Maximum SLKTPS allowed for an IPSG link
- **L2TSET**—Number of the level 2 timer set associated with the signaling link
- **BPS**—Transmission rate of the signaling link in bits per second
- **ECM**—Basic of PC for transmission
- **PCRN1**—MSU number

- **PCRN2**—Octet number
- **LPSET**—ATM link parameter set identifier
- **ATMTSEL**—ATM timing selector. Possible values are as follows:
  - **Internal**—Derived from an internal clock source operating at 1.544 MHz  $\pm$  200 Hz (ANSI) or 2.048 MHz  $\pm$  103 Hz (ITU).
  - **External**—Derived from the High-Speed Master Clock (T1 or E1)
  - **Line**—Derived from its received data stream, if present
- **VCI**—ATM virtual channel identifier
- **VPI**—ATM virtual path identifier
- **LL**—ATM line length
- **E1PORT**—E1 card port that has an E1 interface assigned to it.
- **T1PORT**—T1 card port that has a T1 interface assigned to it
- **TS**—Timeslot associated with the signaling link that is serviced by the E1 or T1 interface
- **E1ATMCRC4**—E1 ATM card CRC4 multi-frame structure enable/disable indicator
- **E1ATMSI**—Value of two Spare International bits of NFAS data for the E1 ATM card
- **E1ATMSN**—Value of five Spare National bits of NFAS data for the E1 ATM card
- **J1PORT**— J1 card port that has a J1 interface assigned to it.

## rtrv-slt

Use this command to display the fields of an SLTM (signaling link test message) record in the SLTM table.

## Parameters

### **enabled (optional)**

Displays the SLTM records that are either enabled or disabled ( *off* ).

#### **Range:**

*on*

display enabled records

*off*

display disabled records

#### **Default:**

All SLTM records with the specified value for the enabled parameter are shown.

### **sltset (optional)**

The signaling link test message (SLTM) record number in the SLTM table.

#### **Range:**

1 - 20

#### **Default:**

Display all

## Example

```
rtrv-slt
```

```
rtrv-slt:sltset=1
```

```
rtrv-slt:enabled=off
```

## Dependencies

## rtrv-spc

Use this command to retrieve an SPC (secondary point code) from the active database.

### Parameters

---

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

---

**spc (optional)**

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:**

*spca*

**Range:**

*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**spc/spca/spci/spcn/spcn24/spcn16 (optional)**

The secondary point code.

**spci (optional)**

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**

*s-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**spcn (optional)**

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

### **spcn24 (optional)**

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

#### **Range:**

*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000-255*

*ssa—000-255*

*sp—000-255*

### **spcn16 (optional)**

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*.

#### **Range:**

*000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000---127*

*sna---000---15*

*mna---000---31*

### **Example**

```
rtrv-spc
```

```
rtrv-spc:spc=5-3-3
```

```
rtrv-spc:spcn24=98-98-98
```

```
rtrv-spc:spcn=s-00345
```

```
rtrv-spc:spcn16:121-10-30
```

### **Dependencies**

The MPC feature must be turned on before this command can be entered.

The SPC table must be accessible.

The value of the **spc** parameter must be a full point code.

### **Notes**

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

### **Output**

This example shows output for all provisioned secondary point codes. SPC-N is a flexible point code format as defined with the **chg-stpopts:npcfmt i** parameter.

**rtrv-spc**

```
rlghncxa03w 03-03-18 08:50:12 EST EAGLE 31.0.0
SPC (Secondary Point Codes)
```

```
SPCA
    001-010-010
    002-010-010
    003-010-010
```

```
SPC-I
    01-253-05
    02-254-06
    03-255-07
```

```
SPC-N
    120-01-0-1
    100-02-1-0
```

```
SPC-N24
    099-099-099
```

Secondary Point Code table is (9 of 40) 25% full

;

This example shows output for all provisioned secondary point codes. Spare point codes are included.

**rtrv-spc**

```
rlghncxa03w 05-01-18 08:50:12 EST EAGLE 31.12.0
SPC (Secondary Point Codes)
```

```

## rtrv-srvsel

Use this command to display a list of administered service selector combinations. The list can be filtered using various parameter combinations.

---

---

**Note:** The `rtrv-srvsel` operation may be lengthy because the service selector table can contain over 1,000 entries.

---

---

### Parameters

---

---

**Note:** Definitions for the feature options specified by the `on` and `off` parameters are located in the Notes section.

---

---

**dfltact (optional)**

The default action ID associated with the service selector entry.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

This parameter can take one of the following values:

- a valid GTT Action ID of type **disc/udts/tcaperr** that must already exist in the GTT Action table
- *fallback* —Fallback to the Relay data. The Relayed MSU is routed as per routing data provided by the service.
- *falltogtt* —Fallback to GTT. If the *gttselid* parameter has a value other than *none*, and the GTT selector search fails, then the GTT selector search is performed again using *gttselid=none*.

**force (optional)**

The *force=yes* parameter must be specified when a *num* parameter value greater than 50 is specified to display more than 50 entries.

**Range:**

*yes*

*no*

**Default:**

*no*

**gti/gtia/gtii/gtin/gtin24 (optional)**

Global title indicator. For all service selector commands, the domain is defined as GTI and GTIA (ANSI), GTII (ITU international), GTIN (ITU national) and GTIN24 (24-bit ITU national). For the service selector commands, GTI and GTIA are equivalent.

**Range:**

Supported value for ANSI: *gti/gtia=2*

Supported values for ITU: *gtii/gtin/gtin24=2, 4*

**Default:**

Display all

**nai (optional)**

Nature of Address indicator.

**Range:**

*sub*

*rsvd*

*natl*

*intl*

**Default:**  
Display all

**naiv (optional)**

Nature of Address indicator value.

**Range:**  
*0 - 127*

**Default:**  
Display all

**np (optional)**

Numbering Plan.

**Range:**

*e164*

*generic*

*x121*

*f69*

*e210*

*e212*

*e214*

*private*

**Default:**  
Display all

**npv (optional)**

Numbering Plan value.

**Range:**  
*0 - 15*

**Default:**  
Display all

**num (optional)**

Number of entries to display. The **force=yes** parameter is required when this parameter value is specified greater than 50 entries.

**Range:**  
*1 - 20992*

**Default:***50***off (optional)**

Disables or turns off the specified feature options. A comma-separated list of feature options that are requested to be turned off. Up to 10 feature options can be specified in the list.

**Range:***gttrqd**force***on (optional)**

Enables or turns on the specified feature options. A comma-separated list of feature options that are requested to be turned on. Up to 10 feature options can be specified in the list.

**Range:***gttrqd**force***serv (optional)**

The Service Module card service.

**Range:***eir*

Equipment Identity Register

*gflex*

GSM flexible numbering

*gport*

GSM number portability

*inpq*

INP query

*inpmr*

INP message relay

*smsmr*

Prepaid SMS Intercept Phase 1, Portability Check for Mobile Originated SMS, MO SMS GSM NP, MO SMS IS41 NP, MO SMS IS41-to-GSM Migration, MO SMS ASD, MO SMS GRN, MO SMS B-Party routing.

*idps*

IDP Screening for Prepaid

*idpr*  
Prepaid IDP Query Relay

*mnp*  
mobile number portability

*vflex*  
Voice Mail Router

*atinp*  
ATI Number Portability Query (ATINP)

*ttr*  
Triggerless TCAP Relay

*aiq*  
ANSI41 Analyzed Information Query

**Default:**  
Display all

**snai (optional)**  
Service nature of address indicator.

**Range:**

**sub**  
Subscriber number

**natl**  
National significant number

**intl**  
International number

**rnidn**  
Routing number prefix and international dialed/directory number

**rnndn**  
Routing number prefix and national dialed/directory number

**rnsdn**  
Routing number prefix and subscriber dialed/directory number

**ccrndn**  
Country code, routing number, and national directory number

**Default:**  
Display all

**snp (optional)**  
Service numbering plan.

**Range:**

**e164**  
E.164 numbering plan

**e212**  
E.212 numbering plan

**e214**  
E.214 numbering plan

**Default:**  
Display all

**ssn (optional)**  
Subsystem number.

**Range:**  
*0 - 255, \**

**tt (optional)**  
Translation type.

**Range:**  
*0 - 255*

**Default:**  
Display all

### Example

```
rtrv-srvsel  
rtrv-srvsel:gtii=2  
rtrv-srvsel:tt=0:np=e164  
rtrv-srvsel:serv=vflex  
rtrv-srvsel:serv=aiq  
rtrv-srvsel:on=gttrqd
```

### Dependencies

The INP or AINPQ feature must be turned on before the `serv=inpmr` or `serv=inpq` parameter can be specified.

The G-Flex feature must be turned on before the `serv=gflex` parameter can be specified.

The G-Port feature must be turned on before the `serv=gport` parameter can be specified.

The `np` and `npv` parameters cannot be specified together in the command.

The `nai` and `naiv` parameters cannot be specified together in the command.

The values 1 and 3 are not valid for the `gti/gtia/gtii/gtin/gtin24` parameters.

The value 4 is not valid for the `gti/gtia` parameters.

If the `gti/gtia/gtii/gtin/gtin24=2` parameter is specified, then no `np(v)` and `nai(v)` parameter combinations can be specified.

If the `serv` parameter has a value of `inpmr`, `inpq`, `gport`, or `eir`, then the `gtia` and `gti` parameters cannot be specified.

If the `serv=inpmr` parameter is specified, then the value of the `snp` parameter must be `e164` if specified.

If the value specified for the `snai` parameter is `rnidn`, `rnndn`, or `rnsdn`, then the value of the `serv` parameter must be `inpmr`, `gport`, or `smsmr` if it is specified.

If the `serv=inpq` parameter is specified, then the `gtii` parameter cannot be specified.

If the value specified for the `snai` parameter is `rnidn`, `rnndn`, or `rnsdn`, then the `serv=gflex` parameter cannot be specified.

If a value of `aiq`, `eir`, `inpq`, or `vflex` is specified for the `serv` parameter then the `snp` and `snai` parameters cannot be specified.

If the `snai=ccrndn` parameter is specified, then the value specified for the `serv` parameter must be `gport` or `smsmr`.

If the value specified for the `num` parameter is greater than 50, then the `force=yes` parameter must be specified.

The Prepaid IDP Query Relay feature must be turned on or the IAR Base feature must be enabled before the `serv=ttr` parameter can be specified.

If a value of `idpr` or `ttr` is specified for the `serv` parameter, then the parameters `NAIV`, `NPV`, `SNP`, or `SNAI` must not be specified.

The IDP Screening for Prepaid feature must be turned on before the `serv=idps` parameter can be specified.

The V-flex feature must be turned on before the `serv=vflex` parameter can be specified.

The Portability Check for Mobile Originated SMS or the PPSMS feature must be turned on, or the MO SMS ASD, MO SMS B-Party Routing, MO SMS GRN, MO SMS IS41-to-GSM Migration, MO-based GSM SMS NP, or MO-based IS41 SMS NP feature must be enabled before the `serv=smsmr` parameter can be specified.

The ATINP feature must be enabled before the `serv=atinp` parameter can be specified.

If a value of `aiq`, `atinp`, or `eir` is specified for the `serv` parameter, then the `gtin24` parameter cannot be specified.

The Prepaid IDP Query Relay feature must be turned on before the `serv=idpr` parameter can be specified.

The ANSI41 AIQ feature must be enabled before the `serv=aiq` parameter can be specified.

If a DSM4G card is active in the system, then the `on=gttrqd` parameter cannot be specified.

The GTT Action table is corrupt or cannot be found.

If a GTT Action ID is specified as the value for the `dfltact` parameter, then the Action ID must already exist in the GTT Action table.

The same values cannot be specified for the `on` and `off` parameters.

The `dfl tact=none` parameter cannot be specified.

The `EGTT` feature must be turned on before the `dfl tact` parameter can be specified.

The GSM DBMM table must be accessible.

The `defactid=none` parameter cannot be specified.

## Notes

### on/off options

- *gttrqd* —GTT required. Specifies whether GTT is required after service execution is complete and the message is relayed by the service. This option is supported for the IDPR, MNP, TTR, GPORT, SMSMR, GFLEX, and INPMR services.
- *force* —Must be specified to display more than 50 entries

## Output

This example shows all service selectors containing the specified GTI value:

```
rtrv-srvsel:gtii=2
```

```

## rtrv-ss-appl

Use this command to retrieve information for all provisioned subsystem applications from the database. The command displays the application type, subsystem number, and application status.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-ss-appl
```

**Dependencies**

The ANSI41 AIQ, EIR, LNP, or V-Flex feature must be enabled, or the AINPQ or INP feature must be turned on before this command can be entered.

The SS-APPL table is corrupt or cannot be found.

The LNP feature must be turned on before the WNP or PLNP feature can be turned on and before LNP information or measurements can be reported on.

A severe system fault has occurred and the command was rejected.

The LNP TT SS-APPL table is corrupt or cannot be found.

**Notes**

None

**Output**

```
rtrv-ss-appl
```

```
tekelecstp 09-12-03 14:42:38 EST  EAGLE 42.0.0
APPL  SSN  STAT
AIQ    12   online
ATINPQ 10   online

SS-APPL TABLE IS 33% FULL (2 OF 6)
;
```

This example shows the output when the EPAP Data Split feature is turned on:

```
rtrv-ss-appl
```

```
tekelecstp 12-01-12 15:08:04 EST  EAGLE 45.0.0

## rtrv-stp

Use this command to retrieve information related to the STP at which the command is entered.

The command can retrieve frame and card power consumption and threshold values (in Amps or milliamps and Watts) for all provisioned frames or for a specified frame. (See the `ent -frm-pwr` command.)

The command can retrieve hardware configuration information (card location, board part number, revision, serial number, card type, card memory, APPL, and GPL version):

- For all provisioned STP frames and shelves
- For a specific provisioned frame
- For a specific provisioned shelf
- For a specific equipped card
- For all cards of the specified card type
- For all cards that contain the specified Board Part Number
- For all cards that are running the specified GPL or GPL version.

### Parameters

#### **display (optional)**

Display the power consumption and power threshold value for all provisioned frames or for one specific provisioned frame.

This parameter must be specified when the `frm` parameter is specified, to display the power information for one frame.

#### **Range:**

*power*

Display frame power information in the command output.

#### **frm (optional)**

Frame ID. Displays information for the specified provisioned frame.

#### **Range:**

*cf00*

Control Frame identifier

*ef00*

Identifier for the first Extension Frame

*ef01*

Identifier for the second Extension Frame

*ef02*

Identifier for the third Extension Frame

*ef03*

Identifier for the fourth Extension Frame

*ef04*

Identifier for the fifth Extension Frame

**gpl (optional)**

Generic program load. Displays hardware configuration information for all card locations equipped with cards that are running the specified GPL.

---

---

**Note:** This parameter must be specified with the **ver** parameter to display information for a specific version of the GPL.

---

---

**Range:***xyyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters. Valid GPLs are:

*atmhc*—Used by E5-ATM and E5-ATM-B cards to allow the card to support up to 3 signaling links

*blixp*—Flash GPL containing a tar image with all code required on E5-E1T1, HC-MIM, E5-ATM, E5-IPSM, E5-TSM, E5-ENET, and E5-SM4G cards

*blmcap*—Flash GPL containing a tar image with all code required on E5-MCAP, E5-E1T1-B, E5-MCPM-B, E5-ATM-B, E5-ENET-B, and E5-SM8G-B cards

*deirhc*—Used by E5-SM8G-B cards to support the S13/S13' EIR feature

*enumhc*—Used by E5-SM8G-B cards to support the ENUM Mobile Number Portability and Tier One Address Resolution application

*erthc*—Used by E5-ENET and E5-ENET-B cards when the card acts as an STC card (E5-STC card) for EAGLE 5 Integrated Monitoring Support functions

*glshc*—Used by E5-TSM cards to download gateway screening to LIM and SCCP cards

*hipr2*—Communication software used on the High Speed IMT Packet Router (HIPR2) card

*ipghc*—Used by E5-ENET and E5-ENET-B cards to support point-to-multipoint IP connectivity for ANSI and ITU point codes

*iplhc*—Used by E5-ENET and E5-ENET-B cards for point-to-point IP connectivity for ANSI and ITU point codes

*ipsg*—Used by E5-ENET, E5-ENET-B and SLIC cards to support the combined functionality of IPLIMx M2PA and IPGWx M3UA

*ipsg32*—Used by SLIC cards to support IPSG application with 64-bit addressing either with GTT functionality or without it.

*ipshc*—Used by E5-IPSM and E5-ENET-B cards to support the IPS application

*mcp hc*—Used by E5-MCPM-B cards for the Measurements Platform feature

*oamhc*—Used by E5-MCAP cards for enhanced OAM functions

*sccphc*—Used by E5-SM4G and E5-SM8G-B cards to support EPAP-based features and the LNP ELAP Configuration feature. If no EPAP-based or LNP ELAP Configuration feature is turned on, and an E5-SM4G or E5-SM8G-B card is present, then the GPL processes normal GTT traffic.

*siphc*—Used by E5-SM8G-B Cards to support the SIP application

*slanhc*—Used by E5-ENET and E5-ENET-B cards to support the STPLAN application

*ss7hc*—Used by HC-MIM, E5-E1T1, and E5-E1T1-B cards. Allows the card to support up to 32 (E5-E1T1) or 64 (HC-MIM and E5-E1T1-B) signaling links for E1 and T1 functions.

### **partnum (optional)**

Display the hardware configuration for all card locations that contain a card with the specified Board Part Number.

#### **Range:**

*zzz-zzzz-zz* or *zzzzzzzz*

Specify the Board Part Number in the format *xxx-xxxx-xx*. See the Hardware Baseline in *Release Notes* for a list of Board Part Numbers that are supported for the release.

### **shelf (optional)**

Display the hardware configuration information for all card locations in the specified EAGLE shelf.

#### **Range:**

*1100*

*1200*

*1300*

*2100*

*2200*

*2300*

*3100*

*3200*

*3300*

*4100*

*4200*

*4300*

*5100*

*5200*

*5300*

*6100*

*6200*

*6300*

**type (optional)**

Display the hardware configuration information for all card locations that contain cards of the specified card type.

**Range:**

*dcm*

*dsm*

*e5appb*

*enet*

*enetb*

*ipsm*

*limatm*

*lime1*

*lime1atm*

*limt1*

*mcpm*

*slic*

*stc*

*telco*

*tsm*

**ver (optional)**

Display the hardware configuration information for all the card locations that have cards with the specified GPL Type and the specified GPL Version. The version format is *major-minor-fix*.

**Range:**

*major-minor-fix*

*major*—Range 0-255

*minor*—Range 0-255

*fix*—Range 0-255

**Example**

Retrieve the frame power information for all provisioned frames of the STP.

```
rtrv-stp:display=power
```

Retrieve the card level power information for the control frame in the STP.

```
rtrv-stp:display=power:frm=cf00
```

Retrieve the hardware configuration information for the STP control shelf (shelf 1100).

```
rtrv-stp:shelf=1100
```

Retrieve the hardware configuration information for all cards equipped in the STP that have the specified Board Part Number.

```
rtrv-stp:partnum=870-1275-01
```

Retrieve the hardware configuration information for all provisioned E5-TSM cards in the STP.

```
rtrv-stp:type=tsm
```

Retrieve the hardware configuration information for all cards in the STP that are running the IMT communication GPL with GPL version 126-039-043.

```
rtrv-stp:gpl=imt:ver=126-039-043
```

Retrieve the hardware configuration information for all provisioned frames in the STP.

```
rtrv-stp
```

Retrieve the hardware configuration information for all cards in the STP that are running the ATMHC GPL.

```
rtrv-stp:gpl=atmhc
```

Retrieve the hardware configuration information for all provisioned E5-APP-B cards in the STP.

```
rtrv-stp:type=e5appb
```

Retrieve the hardware configuration information for all provisioned Telco Switches in the STP.

```
rtrv-stp:type=telco
```

Retrieve the hardware configuration information for all cards in the STP that are running the SIPHC GPL.

```
rtrv-stp:gpl=siphc
```

Retrieve the hardware configuration information for all cards in the STP that are running the DEIRHC GPL.

```
rtrv-stp:gpl=deirhc
```

### Dependencies

A valid value must be specified for the `display` parameter.

A valid value must be specified for the `frm` parameter.

A valid value must be specified for the `shelf` parameter.

The `partnum` parameter value must contain no more than 12 characters.

A valid value must be specified for the `type` parameter.

The `gpl` parameter value must contain no more than 8 characters.

Valid values must be specified for the `ver` parameter subfields (format *major-minor-fix*).

The `display` parameter must be specified when the `frm` parameter is specified.

The `gpl` parameter must be specified when the `ver` parameter is specified.

Only one optional parameter can be specified in the command, except for the following parameter combinations:

- The `display` parameter must be specified when the `frm` parameter is specified.
- The `gpl` parameter must be specified when the `ver` parameter is specified.

The `frm` parameter value must specify a provisioned frame.

The Assembly Power table must be available.

The value specified for the `gpl` parameter must be supported. See the `gpl` definition for a list of supported GPLs.

### Notes

When the power threshold value has not been provisioned for a provisioned frame, the default frame power threshold value is displayed and prefixed with a plus sign (+).

For an un-provisioned card that is present in the frame, the card power consumption value is displayed prefixed with a plus sign (+).

For the E5-TDM and E5-MDAL cards in the Control Frame, "E5-TDM" and "E5-MDAL" are displayed as the Part Number of the card.

If a MUX card is not present, then "Empty" is displayed.

If the Board Part Number received in the BIP response from a card is not present in the Assembly Power table, then the Part Number for the card is displayed with a prefix of a plus sign (+).

If the Card power value is not present in the BIP data and the Assembly Power table, then the default card power value of *1563 milliamps* is displayed for the card.

If board information is not available from a card,

- *BIP Data inv* is displayed as the Part number for the card.
- The default card power value of 1563 milliamps is displayed for the card.

If a card location is empty (no card is present in that slot),

- *Empty* is displayed as the Part Number for the card
- A card power value of 0 is assumed and displayed.

For Standby E5-MASP cards, "Unavailable" is displayed as the Part Number if the card is absent. In this case, the card power of the Active E5-MASP card is shown for the card power of the standby card.

If a flash or communication GPL is specified with the `rtrv-stp` command, then the GPL output displays the version of the application GPL that is running on the card and not the version of the specified flash or communication GPL.

An unequipped MUX location does not have any type of MUX card in the slot. If a MUX card is present in the slot, then the location is equipped. When a location is unequipped, "EMPTY" is displayed for the slots, and an error message is generated. Locations 1109 and 1110, which support the control shelf, must contain MUX cards before the EAGLE is considered to be fully operational.

This command can be used to display the power consumption of MUX cards within a frame. The power consumption displays 0 for an unequipped MUX location. The Part Number, Revision, and Power Consumption obtained from the BIP data associated with the MUX card are displayed.

Because E5-APP-B cards provisioned using the `ent-card` command (type=e5appb) do not connect to the IMT bus and do not have a BIP record, the part number for these cards will be displayed as "870-3096-XX".

## Output

If a flash or communication GPL is specified, then the output displays the GPL version of the application GPL running on the card instead of the GPL version of the specified flash or communication GPL.

The power consumption values that are displayed in the `rtrv-stp:display=power` or the `rtrv-stp:display=power:frm=` commands indicate the maximum calculated power for the frame. The calculation is based on the cards that are populated in the system, and includes a fan tray assembly for every shelf (the system cannot detect the presence or absence of a fan tray, and assumes presence for the calculation). These values are typically much higher than the actual power being drawn; the values cannot be used as a gauge of the actual power consumption of the EAGLE.

Abbreviated output is indicated by 3 vertical dots:

.  
.  
.

This example shows the output for a specific shelf containing a HIPR2 card at location 1109:

`rtrv-stp:shelf=1100`

### Legend

- **Frame**—Frame ID for the control shelf or an extension shelf
- **Power Threshold**—Power threshold (in Amps or Milliamps and Watts) at which an alarm is generated to indicate that power consumption is approaching a maximum allowed level. (See the `ent -frm-pwr` command.)
- **Power Consumption**—Current calculated power consumption (Amps or Milliamps and Watts) of the frame or card
- **Card**—Card Location
- **Part Number**—Board Part Number
- **Rev**—Board Part Number revision
- **Serial Number**—Card serial number
- **Type**—Card type
- **DB**—Daughterboard memory
- **APPL**—Application that has been provisioned on the card
- **GPL Version**—GPL version of the Application GPL being used by the card

## rtrv-stpopts

Use this command to retrieve the current value of the system's node-level processing option indicators maintained in the system's options table.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-stpopts
```

**Dependencies**

The MAS Configuration table must be available.

The STP Options table must be available.

None

**Notes**

The timer output for this command is in milliseconds, even though the timer could have been entered in seconds on the `chg-stpopts` command.

**Output**

The following example displays MTP STP options with no affecting features on. Certain features that are shown in other examples control changes and additional options in this option list:

```
rtrv-stpopts
```

```

### Legend

- **MTPT31CTL**—MTP T31 congestion trigger level. The signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.
- **MTPLTI**—MTP loop test indicator. Specifies whether the MTP loop detection procedures are enabled or disabled at the system.
- **MTPLTCTDPCQ**—MTP loop test congestion trigger DPC quantity. The number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.

- **MTPLTST**—MTP loop test supervision timer. The amount of time, in milliseconds, that the MTP loop test detection procedures run when started.
- **MTPXLQ**—MTP x-list quantity. The number of dynamic status exception list (x-list) entries the system maintains.
- **MTPXLET**—MTP x-list expiration time. The maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry.
- **MTPXLOT**—MTP x-list occupancy threshold. The dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.
- **MTPDPCQ**—MTP destination point code quantity. The maximum number of DPCs that can be provisioned in the system.
- **TFATFRPR**—TFA/TFR pacing rate. The amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather than an alternate route. The STP uses this pacing to prevent congestion on the newly-recovered linksets.
- **MTPRSIT**—MTP Restart isolation timer. The minimum duration of node isolation, in milliseconds, before the MTP Restart procedure is deemed necessary.
- **MTPRSI**—MTP Restart indicator. Specifies whether ANSI or ITU MTP Restart procedures are enabled or disabled at the STP.
- **MTPLPRST**—MTP low priority route set test. Specifies whether low priority route set polling is enabled or disabled at the STP.
- **MTPT10ALT**—MTP T10 alternate timer. Specifies the interval at which the STP performs a route set test on low priority routes.
- **SLSNV**—Per node SLS conversion indicator. Specifies whether SLS conversion is on, off, or performed per linkset (perls).
- **UIMRD**—Unsolicited Information Message (UIM) redirect. Specifies whether specific UIMs are redirected to this output group.
- **CRITALMINH**—Indicates whether the option that allows the inhibiting of critical alarms is enabled (yes) or disabled (no).
- **DISPACTALMS**—Indicates whether to display active or total alarms in the alarm status area of the VT320 screen.
- **NPCFMTI**—Defines how the ITU national point code is entered into the database and how it is displayed in any outputs from the system.
- **GSMDFLT**—Indicates whether the GSM MAP screening default action is set to pass or discard.
- **GSMDECERR**—Indicates whether the GSM MAP screening decode error action is set to pass or discard.
- **DEFCC**—Defines the default country code.
- **DEFNDC**—Defines the default network destination code.
- **DSMAUD**—Indicates whether the DSM audit is running (on) or disabled (off).

- **RANDSLS**—Displays the Random SLS setting.
- **RTPLNPMRSS**—Displays the setting for reporting or suppressing UIM 1049 for LNP MR with missing subsystems.
- **RSTRDEV**—Allow or disable restoration of device states when an `init-sys` command is executed, an OAM role changes, or a card reload occurs.
- **SECMTPMATE**—Indicates Network Security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.
- **SECMTPSID**—Indicates Network Security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the `chg-sid` command) that is not a route-set-congestion-message. The EAGLE should not receive a message with its own OPC unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked).
- **SECMTPSNM**—Indicates Network Security screening for MTP SNM messages. The EAGLE should not receive an MTP network management message unless:
  - The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)
  - The EAGLE has a route to the OPC of the MTP network management message on the linkset which the message was received.
  - The EAGLE has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule is not applicable to RST messages.)
- **SECSCCPSCMG**—Indicates Network Security screening for SCCP SCMG messages. This value applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected. The EAGLE should not receive an SCCP network management message unless:
  - The EAGLE has a route to the OPC of the SCMG message on the linkset on which the message was received.
  - The EAGLE has a route to the Affected Point Code (also called the Concerned Point Code in EAGLE) in the message on the linkset on which the message was received.
- **CNVCGDA**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ANSI, and the PC or ALIAS PC of the destination network type is not defined.
- **CNVCGDI**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ITU-I, and the PC or ALIAS PC of the destination network type is not defined.
- **CNVCGDN**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is ITU-N, and the PC or ALIAS PC of the destination network type is not defined.
- **CNVCGDN24**—Indicates whether or not to discard the CGPA PC in SCCP messages if the destination network type is 24-bit ITU-N, and the PC or ALIAS PC of the destination network type is not defined.

- **ANSIGFLEX**—Indicates enable or disable of ANSI G-Flex to execute at 1700 TPS per DSM card
- **GTCNVDFLT**—Indicates enable or disable of routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion table.
- **HSCLKLL**—High speed master clock line length option (SHORTHAUL, LONGHAUL)
- **HSCLKSRC**—High speed master clock source
- **ARCHBLDID**—Archive build ID
- **MFC**—Indicates that the system is using Message Flow Control (MFC).
- **PCT**—Indicates whether PCT is applied to MSUs
- **GDPC**—MSU duplicated by GWS DUP Stop Action will be routed to the point code configured in GDPC.
- **UITHROTTLE**—Indicates the speed at which output is sent to the terminal. Zero represents the most throttling, or the slowest output. Nine represents the least throttling, or the fastest output.
- **EPAP240M**—Indicates that the E5-SM8G-B card can download the maximum 240M DN/IMSI RTDB data from EPAP.

## rtrv-subnetid

Use this command to retrieve a list of Subnet ID entries from the SUBNETID table, for the ISUP NP with EPAP feature.

**Parameters****subnetnum (optional)**

Subnet Number

**Range:**

1 - 5

**Example**

```
rtrv-subnetid
rtrv-subnetid:subnetnum=1
```

**Dependencies**

The SUBNETID table is corrupt or cannot be found by the system.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

**Notes**

None.

**Output**

This example shows output when the command is entered with no parameter. Subnet IDs for Subnet number 1 are listed in numerical order, followed by the Subnet IDs for Subnet number 2 in numerical order, etc.

**rtrv-subnetid**

```
tekelecstp 04-09-21 16:11:21 EST  EAGLE 31.11.0
      Subnet
ID      Number
-----
886932      1
886936      1
886935      2
886938      2
886939      2

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full

;
```

This example shows output when a Subnet number is specified. Subnet IDs for the specified Subnet number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

**rtrv-subnetid:subnetnum=2**

```
tekelecstp 04-09-21 16:13:54 EST  EAGLE 31.11.0
      Subnet
ID      Number
-----
886935      2
886938      2
886939      2

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full

;
```

**rtrv-t1**

Use this command to retrieve information for a specified T1 interface or for all T1 interfaces that have been defined by the **ent - t1** command for an HC-MIM, E5-E1T1, or E5-E1T1-B card that is used as a T1 or ST-HSL-A card.

## Parameters

### **loc (optional)**

The card location as stenciled on the shelf of the system.

#### **Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

#### **Default:**

all T1 card locations are listed

### **t1port (optional)**

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified T1 card (**loc** parameter).

#### **Range:**

*1 - 8*

#### **Default:**

If not specified, all T1 ports are listed.

## Example

```
rtrv-t1
```

```
rtrv-t1:loc=1307:t1port=2
```

```
rtrv-t1:loc=1311:t1port=1
```

## Dependencies

The **loc** and **t1port** parameters must be specified together, if any parameters are specified for the command.

The T1 interface of the T1 card specified by the **loc** parameter must already be defined before this command can be entered.

The card specified by the **loc** parameter must be a LIMT1 card type.

The Card (IMT) table must be accessible.

The E1/T1 table must be accessible.

The port specified by the **t1port** parameter on the card specified by the **loc** parameter must be already equipped with a T1 interface.

The following card locations (**loc** parameter) are not valid for this command: 1113 - 1118 and all *xy09* and *xy10* locations (where *x* is the frame and *y* is the shelf).

## Notes

None.

## Output

This example shows E5-E1T1 cards used as T1 cards. Cards with unchannelized linksets have ST-HSL-A links.

rtrv-t1

```
tekelecstp 17-03-09 09:34:05 EST  EAGLE 46.5.0.0.0-70.19.0
rtrv-t1
Command entered at terminal #4.
```

|      | T1   |        |         |     | LINK   | MINSU |
|------|------|--------|---------|-----|--------|-------|
| LOC  | PORT | ENCODE | FRAMING | LL  | CLASS  | RATE  |
| 1103 | 1    | B8ZS   | SF      | 133 | CHAN   | ----  |
| 1211 | 1    | ami    | esf     | 10  | UNCHAN | 1000  |

;

## Legend

- **LOC**—T1card location in the shelf
- **T1PORT**—T1 port number on a T1 card
- **ENCODE**—Indicator for use of B8ZS or AMI encoding/decoding
- **FRAMING**—Framing format (SF or ESF)
- **LL**—Line length; T1 cable length in feet between the EAGLE and the connecting node
- **LINKCLASS**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" T1 Card (CHAN) or an "unchannelized" ST-HSL-A card (UNCHAN)
- **MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCLASS field value is UNCHAN.
- **TSx**—Timeslot

## rtrv-tatr-msg

Use this command to display the configured Triggerless ANSI TCAP Relay message parameter values.

## Parameters

### msgn (optional)

Message number. The number of the TATR message.

**Range:***1 - 10***Example**

```
rtrv-tatr-msg:msgn=1
```

**Dependencies**

The TSTMSG table is corrupt or could not be found.

None.

**Notes**

None.

**Output**

```
rtrv-tatr-msg:msgn=1
```

```
tekelecstp 09-06-26 13:46:01 EST 41.1.0
rtrv-tatr-msg:msgn=1

## rtrv-tbl-capacity

Use this command to retrieve table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-tbl-capacity
```

**Dependencies**

None

**Notes**

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

XLIST table information is shown only if the CRMD feature is ON.

Secondary Point Code (SPC) table information is shown only if the MPC feature is ON.

If the EGTT feature is ON then table name is GTA instead of GTT.

Additional information for each listed table can be displayed using the commands listed in [Retrieve Commands for Additional Table Information](#).

Though the ASP table entries are now part of the IPAPSOCK table, command entry and output still appear as though they are separate tables. The `rtrv-tbl-capacity` command shows the number of ASPs in the 4000-entry IPAPSOCK table.

**Table 4-55 Retrieve Commands for Additional Table Information**

| Command                      | Table name | Description of table                     |
|------------------------------|------------|------------------------------------------|
| <code>rept-stat-xlist</code> | XLIST      | Destination - Routeset Extension         |
| <code>rtrv-appl-rtkey</code> | IPRTKEY    | IP Routing Key                           |
| <code>rtrv-as</code>         | AS         | Application Server                       |
| <code>rtrv-assoc</code>      | IPAPSOCK   | IP Socket/ Association                   |
| <code>rtrv-dstn</code>       | DSTN       | Destination Routeset, Exception Routeset |
| <code>rtrv-gta</code>        | GTA        | Global Title Address                     |
| <code>rtrv-gtt</code>        | GTT        | Global Title Translation                 |
| <code>rtrv-ip-host</code>    | IP-HOST    | IP Host                                  |
| <code>rtrv-ip-lnk</code>     | IP-LNK     | Internet Process Link                    |
| <code>rtrv-ls</code>         | LS         | Link Set                                 |
| <code>rtrv-map</code>        | MAP        | Mated Application                        |
| <code>rtrv-mrn</code>        | MRN        | Mated Relay Node                         |
| <code>rtrv-npp-as</code>     | NPP-AS     | Numbering Plan Processor                 |
| <code>rtrv-npp-srs</code>    | NPP-SRS    | Numbering Plan Processor                 |
| <code>rtrv-scrset</code>     | SCRSET     | Gateway Screening Screen Set             |
| <code>rtrv-slk</code>        | SLK        | Signal Link                              |
| <code>rtrv-spc</code>        | SPC        | Secondary Point Code                     |
| <code>rtrv-vflx-cd</code>    | VFLXCD     | V-Flex Call Decision                     |
| <code>rtrv-vflx-rn</code>    | VFLXRN     | V-Flex Routing Number                    |
| <code>rtrv-vflx-vmsid</code> | VFLXVID    | V-Flex VMSID                             |
| <code>rtrv-gttact</code>     | GTT-ACT    | GTT Action                               |
| <code>rtrv-gttaset</code>    | GTT-ASET   | GTT Action Set                           |
| <code>rtrv-gttapath</code>   | GTT-PATH   | GTT Action Path                          |
| <code>rtrv-gtmod</code>      | GTMOD      | GT Modification                          |

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP-SERV reroute service.

V-Flex Call Decision (VFLXCD), Routing Number (VFLXRN) and VMSID (VFLXVID) table information is shown only if the V-Flex feature is enabled.

## Output

This example shows the output for the minimum table sizes in the system when CRMD, MPC, EGTT and VFLEX features are off:

rtrv-tbl-capacity

```
tekelecstp 010-03-06 13:57:06 EST EAGLE 42.0.0

DSTN    table is (      8 of      2000)    1% full

## rtrv-tifopts

Use this command to retrieve the current values of the TIF option indicators from the TIFOPTS table.

### Parameters

This command has no parameters.

### Example

```
rtrv-tifopts
```

### Dependencies

The EGLEOPTS table is corrupt or cannot be found.

None

### Notes

The NSADDLDATA and NSPUBLIC options are displayed only when the TIF Number Substitution feature is enabled.

### Output

```
rtrv-tifopts
```

```

tekelecstp 09-06-10 12:32:21 EST  EAGLE 41.1.0
Command entered at terminal #4.

## rtrv-tps

Use this command to display the total provisioned system TPS for IPGWx, IPLIMx, IPSG and ATM/E5-ATM/E5-ATM-B cards. The total of these four values, and the maximum allowed system TPS value, are also displayed.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-tps
```

**Dependencies**

The Linkset table is corrupt or cannot be found.

The Signaling Link table is corrupt or cannot be found.

None

**Notes**

The maximum total provisioned System TPS is based on whether the HIPR2 High Rate Mode feature is turned on. The maximum total provisioned System TPS is 500,000 if the HIPR2 High Rate Mode feature is turned off, 750,000 if the HIPR2 High Rate Mode feature is turned on, and 1,000,000 if both the HIPR2 High Rate Mode and 1M System TPS features are turned on.

**MAX TPS calculations**

The provisioned (max) system TPS calculation is calculated by summing the SIGTRAN TPS values (values for the IPGW and IPSP linksets + IPLIM cards TPS usage) and the ATM links TPS values. The total provisioned system TPS is calculated by using the following:

- Sum all TPS values for IPGW linksets using the value of the `iptps` parameter (see the `ent/chg-ls` commands).
- Sum all TPS values for IPSP linksets using the  $(\text{num\_ipsg\_links} * \text{the value of the maxslktps parameter (see the ent/chg-ls commands)})$ .
- For each IPLIM card that has at least 1 link provisioned, add 4000 to the provisioned System TPS value, regardless of card type.
- Sum all ATM over T1 links  $((\text{ATM ANSI links}) * \text{per ATM ANSI links TPS (1630)})$
- Sum all ATM over E1 links  $((\text{ATM ITU links}) * \text{per ATM ITU links TPS (2038)})$

### RSVD TPS Calculations

The reserved TPS calculation is calculated by summing the SIGTRAN TPS values (values for the IPGW and IPSP linksets + IPLIM cards TPS usage) and the ATM links TPS values. The total provisioned system TPS is calculated by using the following:

- Sum all TPS values for IPGW linksets using the number of IPGW links provisioned plus the value of the `iptps` parameter (see the `ent/chg-ls` commands).
- Sum all TPS values for IPSP linksets using the  $(\text{num\_ipsg\_links} * \text{the value of the slktps or rsvdslktps parameter (see the ent/chg-ls commands)})$ .
- For each IPLIM card that has at least 1 link provisioned, add 4000 to the provisioned System TPS value, regardless of card type.
- Sum all ATM over T1 links  $((\text{ATM ANSI links}) * \text{per ATM ANSI links TPS (1630)})$
- Sum all ATM over E1 links  $((\text{ATM ITU links}) * \text{per ATM ITU links TPS (2038)})$

### Output

This example shows the output when the HIPR2 High Rate Mode feature is turned off:  
`rtrv-tps`

```
rlghncxa03w 10-02-10 16:20:46 EST EAGLE 42.0.0

## rtrv-trbl

Use this command to display detailed information for one or more troubles that are currently logged into the system.

### Parameters

#### loc (mandatory)

The address of the card that is running the OAM from which logged trouble reports are to be displayed.

#### Range:

1113, 1115

#### mode (optional)

Display mode

#### Range:

*c*

Continuous mode; shows troubles already logged and new troubles as they occur.

*m*

Manual mode; shows troubles on demand only

**Default:***c***num (optional)**

Indicates how many troubles to display.

**Range:***1 - 1023***Default:***99***Example**

```
rtrv-trbl:loc=1113:num=2
```

**Dependencies**

At least one trouble must be in the trouble log, or the command is rejected.

Only one `rtrv-trbl` or `rtrv-obit` command can be in progress at a time.

If the `mode` parameter is specified without the `num` parameter, the entire log is displayed.

The card specified by the `loc` parameter must be 1113 or 1115.

If the `loc` parameter specifies the card that is running the standby OAM, that card must be available.

The `num` parameter must be between 1 - 1023.

**Notes**

When a trouble is generated in the system, it is logged into the RAM storage area of the active OAM. Each OAM can store up to 1023 troubles in a queue. If the OAM resets, logged troubles are lost.

**Output**

The output from this command should be reviewed with a member of the Customer Care Center. See the "My Oracle Support (MOS)" section in Chapter 1 of this reference guide.

```
rtrv-trbl:loc=1113:num=2
```

```

## rtrv-trbltx

Use this command to retrieve Alarm and UIM message information including MRN (message reference number), level (for Alarms), Output Group, and text.

The default report displays all Alarms (in numerical order) and then all UIMs.

The optional parameters can be used to:

- Display a range of Alarms or UIMs (ranges spanning both Alarms and UIMs are not supported)
- Search for Alarms, UIMs, or both message types matching a specific Output Group
- Sort all entries by Output Group

### Parameters

#### **enum (optional)**

The ending Message Reference Number (MRN) when specifying a range.

##### **Range:**

*1 - 1999*

*1-999-UAMs*

*1000-1999 -UIMs*

##### **Default:**

If *snum* is specified, the *enum* value defaults to the specified *snum* value.

If *snum* is not specified and *type=all*, *type=uim*, or *type* is not specified, the *enum* value defaults to 1999

If *snum* is not specified and *type=alarm*, the *enum* value defaults to 999.

#### **outgrp (optional)**

The Output Group to sort or filter the Alarm/UIMs on.

##### **Range:**

*appserv*

Application Server

*appss*

Application Subsystem

*card*

Card

*clk*

Clock

*db*

Database

*dbg*

Debug

*gtt*

GTT Maintenance

*gws*

GWS Maintenance

*link*

Link Maintenance

*meas*

Measurements Maintenance

*mon*

Monitoring (Sentinel or IMF) Maintenance

*mps*

MPS Maintenance

*pu*

Program Update

*sa*

System Administration

*seas*

SEAS (Sentinel or IMF)

*slan*

SLAN Maintenance

*sys*

System Maintenance

*traf*

Traffic

*all*

Retrieve information for all Output Groups

**Default:**

No sorting or filtering is done on Output Groups.

**snum (optional)**

A single Message Reference Number (MRN), or the starting MRN when specifying a range.

**Range:**

*1 - 1999*

*1-999 —UAMs*

*1000-1999—UIMs*

**Default:**

All message entries for the specified type are displayed.

For *type=all*, *type=alarm*, or type not specified the snum value defaults to 1.

For *type=uim*, the snum value defaults to 1000.

**type (optional)**

The type of trouble text entry to display.

**Range:**

*all*

Both types are displayed

*alarm*

Only Alarm entries are displayed

*uim*

Only UIM entries are displayed

**Default:**

*all*

**Example**

```
rtrv-trbltx
```

```
rtrv-trbltx:type=alarm
```

```
rtrv-trbltx:outgrp=sys
```

```
rtrv-trbltx:type=alarm:outgrp=all
```

```
rtrv-trbltx:snum=1002
```

**Dependencies**

If the *enum* parameter is specified, then the *snum* parameter must be specified.

The value specified for the *enum* parameter must be greater than or equal to the value specified for the *snum* parameter.

The specified *enum* value must be in the same range as the specified *snum* value (1-999 for Alarms and 1000-1999 for UIMs). The range cannot span both types.

The values specified for the *snum* and *enum* parameters must be in the range of the specified *type* (1-999 for Alarms and 1000-1999 for UIMs).

If the `outgrp` parameter is specified, then the `snum` and `enum` parameters cannot be specified.

If the `snum` parameter is specified, the `snum` parameter specified is out of range.

If the `enum` parameter is specified, the `enum` parameter specified is out of range.

### Notes

This command can be canceled using the **F9** function key or the `canc-cmd` command. See `canc-cmd` for more information.

To display a single Alarm or UIM, enter the Alarm or UIM MRN as the value of the `snum` parameter. Either do not specify the `enum` parameter or specify the `enum` parameter with the same value as the `snum` value.

If an unused MRN is specified as an `snum` parameter value, the header information is displayed without any Output Group header or MRN information.

If an `snum/enum` range is specified, and there are unused MRNs within that range, only the used MRNs are displayed.

### Output

This example shows the output when the command has no parameters. All entries are not shown; the list is long.

## rtrv-trm

Use this command to show the port configuration for all TDM terminals or a specified terminal. These ports are used to connect modems, printers, and terminals to the system. This command displays the following information: device type, data transmission rate, parity, type of flow control used, number of stop bits, number of data bits, and the type of unsolicited messages to be received.

### Parameters

#### **trm (optional)**

The ID number of the terminal whose characteristics are to be retrieved and displayed.

#### **Range:**

1 - 40

#### **Default:**

Display all

### Example

```
rtrv-trm
```

```
rtrv-trm:trm=17
```

### Dependencies

The IP User Interface feature must be enabled and turned on, and at least one IPSM card must be equipped, before *telnet* or *emsa lm* type terminals with IDs 17 - 40 can be specified.

The specified terminal must be equipped.

If a value of *telnet*, *seas*, or *emsa lm* was specified for the *type* parameter (see the *chg-trm* command) and a Telnet terminal is specified by the *trm* parameter (IDs 17-40), then an IPSM card must be equipped in the system.

### Notes

None

## Output

This example shows the output for 16 terminal ports (no IPSM cards are equipped):

rtrv-trm

```

;

This example shows the output with the IP User Interface feature enabled, one IPSM card equipped, and the OA&M IP Security Enhancements feature and the parameter SSH in SECUDFLT table are turned on.

- Terminals 17,18 and 19 are of type TELNET.
- Terminals 20,21 and 22 are of type EMSALM.
- Terminal 23 is of type NONE.
- Terminal 24 is of type SEAS.

The *LOGINTMR* and *LOGOUTTMR* fields apply to terminals 17 - 19. The *PNGTIMEINT* and *PNGFAILCNT* fields apply to terminals 17 - 22. None of the fields apply to terminals 23 and 24.

## Legend

Part one of the report contains these fields:

- **TRM**—TDM terminal port number associated with the output device
- **TYPE**—Type of output device that is connected
- **COMM**—This field consists of four communication attributes in the format *baud-dbts-prty-sb*. The parts are:
  - **BAUD**—Serial port baud rate of the output device
  - **DBTS**—Number of data bits used by the output device
  - **PRTY**—Parity of the output device
  - **SB**—Number of stop bits used in communications with the output device
- **FC**—Type of protocol used between the system and the output devices
- **TMOUT**—Maximum amount of time (in minutes) that a login session can remain idle
- **MXINV**—Login/unlock failure threshold
- **DURAL**—Length of time (in seconds, minutes, and hours) the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured with the `mxinv` parameter
- **SECURE**—Shows whether the OA&M IP Security Enhancements feature and the parameter `SSH` in the `SECUDFLT` table are turned on or off for Telnet terminals

Part two of the report contains these fields:

- **LOGINTMR**—Maximum time for logging on to the telnet terminal after selecting the terminal
- **LOGOUTTMR**—Maximum time the telnet session remains open after the user manually or automatically logs out
- **PNGTIMEINT**—Time period after which IPSM card initiates new ping cycle
- **PNGFAILCNT**—Number of consecutive ping fails waited before dropping the telnet connection

Part three of the `rtrv-trm` report contains these fields:

- **TRM**—TDM terminal associated with the output device
- **TRAF**—Shows whether traffic-related unsolicited messages are received by the output device
- **LINK**—Shows whether link-related unsolicited messages are received by the output device
- **SA**—Shows whether security administration-related unsolicited messages are received by the output device
- **SYS**—Shows whether system maintenance-related unsolicited messages are received by the output device
- **PU**—Shows whether program update-related unsolicited messages are received by the output device
- **DB**—Shows whether database-related unsolicited messages are received by the output device
- **UIMRD**—Shows whether Unsolicited Information Messages (UIMs) specific to the group are received by the output device

Part four of the `rtrv-trm` report contains these fields:

- **APP SERV**—Shows whether Application Server unsolicited messages are received by the output device
- **APP SS**—Shows whether Application Subsystem unsolicited messages are received by the output device
- **CARD**—Shows whether Card unsolicited messages are received by the output device
- **CLK**—Shows whether Clock unsolicited messages are received by the output device
- **DBG**—Shows whether Debug unsolicited messages are received by the output device
- **GTT**—Shows whether GTT unsolicited messages are received by the output device
- **GWS**—Shows whether GWS unsolicited messages are received by the output device

- **MEAS**—Shows whether Measurements Maintenance unsolicited messages are received by the output device
- **MON**—Shows whether Monitor unsolicited messages are received by the output device
- **MPS**—Shows whether MPS unsolicited messages are received by the output device
- **SEAS**—Shows whether SEAS Maintenance unsolicited messages are received by the output device
- **SLAN**—Shows whether STP LAN unsolicited messages are received by the output device

## rtrv-tt

Use this command to show the translation types that are currently defined in the system database for global title translations.

---

---

**Note:** If the EGTT feature is turned on, then the GTT Selector (ent/chg/dlt/rtrv-gttset), GTT Set (ent/dlt/rtrv-gttset), and GTA (ent/chg/dlt/rtrv-gta) commands replace the Translation Type (ent/dlt/rtrv-tt) and Global Title Translation (ent/chg/dlt/rtrv-gtt) commands. However, the Translation Type and Global Title Translation commands continue to work according to their original functionality when the EGTT feature is on.

---

---

**Parameters****alias (optional)**

The alias of the global title translation type

**Range:**

0 - 255

**Default:**

Display all

**ovr lapd (optional)**

Overlapped GTT Selectors.

**Range:**

*yes*

**Default:**

none

**ttn (optional)**

Translation type name.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 8 alphanumeric characters

**Default:**

Display all

**type/typea/typei/typen/typen24/typeis/typens (optional)**

Translation type. The translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

The **typeis** parameter specifies an ITU-international spare network.

The **typens** parameter specifies an ITU-national spare network.

A translation type numeric value may be entered as an ANSI type (**type** or **typea**) and as an ITU type (**typei/typen/typen24/typeis/typens**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE protocol processing as ANSI or ITU. ITU applies to ITU-I, ITU-I spare, ITU-N, ITU-N spare, and ITU-N24.

**Range:**

*0 - 255*

**Default:**

No translation type is specified

**Example**

```
rtrv-tt
```

```
rtrv-tt:type=230
```

```
rtrv-tt:ttn=lidb
```

```
rtrv-tt:type=230:ttn=lidb
```

```
rtrv-tt:type=230:ttn=lidb:alias=012
```

```
rtrv-tt:typeis=2
```

`rtrv-tt:overlap=yes`

### Dependencies

If a translation type is specified, it must already exist in the database for the network type and cannot be an alias.

If both translation type and translation type name are specified, the translation type name must correspond to the specified translation type.

If an alias is specified with a translation type and/or translation type name, the alias must exist in the database for the specified network type, and it cannot be a translation type.

If an alias is specified without a translation type or translation type name, the alias must exist in the database for at least one of the network types. If it exists, the entries and the mapped translation type entries that exist in the database for all network types are displayed.

The value specified for the `alias` parameter must be associated with the value specified for the `type/typea/typei/typen/typen24/typeis/typens` parameter and cannot be the value of an existing translation type.

The value specified for the `type/typea/typei/typen/typen24/typeis/typens` parameter cannot be an alias value.

The value specified for the `ttn` parameter must already exist in the database.

The value specified for the `ttn` parameter must correspond to the value specified for the `alias` parameter.

The GTTSET associated with the translation type specified by the `ttn` parameter must have a set type of `cdgta` (see the `ent-gttset` command).

The `ttn=none` parameter cannot be specified.

The network domain of the translation type specified by the `ttn` parameter cannot be `CROSS` (see the `ent-gttset` command).

The Overlapped TT must exist with the specified filter criteria.

### Notes

If a translation type, translation type name, or both, are specified, the translation type entry and all aliases mapped to that translation type are displayed.

This command retrieves only selector entries that were provisioned by GTT Selector commands, have a GTI value of 2, and a set type of `CdGTA`.

If the EGTT feature is turned on, the following occurs for the `rtrv-tt` command:

- For ANSI, if any selector for an entry made by TT commands is deleted using the `dlt-gttset` command, that entry cannot be retrieved.
- For ITU, if the GTT set name of a true selector (GTI=2 or GTI=4) is deleted using the `dlt-gttset` command, then that entry cannot be retrieved.
- If the GTT set name of a true selector is changed using the `chg-gttset` command or if a selector is deleted using the `dlt-gttset` command, none of the selector aliases can be retrieved.
- Any entry where the `selid`, `lsn`, `cgssn`, or `eaglegen` is provisioned for the GTT selector cannot be retrieved.

**Output**  
**rtrv-tt**

**Related Topics:**

[dlt-tt](#)  
[ent-tt](#)

**rtrv-ttmap**

Use this command to display a mapped SS7 message translation type (TT) for a given gateway linkset name. This command can be used to display the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping, see which linkset the mapping applies to, and see whether the mapping applies to incoming or outgoing messages.

**Parameters**

**ett (optional)**

Translation type before mapping. The identification of the type of allowed global title translation in the SS7 message *prior to* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:**  
0 - 255

**Default:**

Display all types allowed

**io (optional)**

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

**Range:**

*i*  
incoming

*o*  
outgoing

**Default:**

Both incoming and outgoing

**lsn (optional)**

Linkset name

**Range:**

*ayyyyyyyyy*  
1 alphabetic character followed by up to 9 alphanumeric characters

**Default:**

Display all

**Example**

```
rtrv-ttmap
```

```
rtrv-ttmap:lsn=nc001
```

```
rtrv-ttmap:lsn=nc001:io=i:ett=128
```

```
rtrv-ttmap:io=i:ett=128
```

```
rtrv-ttmap:ett=128
```

```
rtrv-ttmap:ett=40
```

**Dependencies**

The linkset must be defined.

The Linkset table must be accessible.

The Translation Type Mapping table must be accessible.

The memory space accounting report (MSAR) is not produced if the **io** or **ett** parameter is specified, because the statistics presented may be misleading.

**Notes**

The order of display is by linkset index + I/O + ETT.

**Output****rtrv-ttmap**

## rtrv-ttr-msg

Use this command to display the configured Triggerless TCAP Relay message parameter values.

### Parameters

#### **msgn (mandatory)**

Message number. This parameter specifies the number of the TTR message.

**Range:**

1 - 10

**Default:**

The values for all TTR messages are displayed.

**Example**

```
rtrv-ttr-msg:msgn=1
```

**Dependencies**

The Prepaid IDP Query Relay feature must be enabled before this command is entered.

The TSTMSG table is corrupt or could not be found.

**Output**

10    8           0       8         0
10    9           0       9         0
10   10           0      10         0
TIMER 2: False IP Connection Congestion Timer, max time an
         association can be congested before failing due to false
         congestion. SS7IPGW and IPGWI applications enforce
         0-30000(ms). Not supported on IPSG application.
TVALUE : Valid range = 32-bits

TIMER 3: UA HeartBeat Period Timer T(beat), time (ms) between sending
         of BEAT msgs by NE. IPSG, SS7IPGW and IPGWI applications
         enforce 100(ms)-60000(ms).
TVALUE : Valid range = 32-bits

TIMER 4: UA HeartBeat Received Timer T(beat ack), timeout period for
         response BEAT ACK msgs by NE. IPSG, SS7IPGW and IPGWI
         applications enforce 100(ms)-10000(ms).
TVALUE : Valid range = 32-bits

TIMER 5: Timeout period for SCTP TX buffer full and stuck condition
         during SCTP congestion enforce 200(ms)-15000(ms). TVALUE : Valid
         range = 32-bits

PARM 1: ASP SNM options. Each bit is used as an enabled/disabled
         flag for a particular ASP SNM option. Not supported on IPSG
         application.
```

PVALUE : Valid range = 32-bits

| BIT                                  | BIT VALUE             |
|--------------------------------------|-----------------------|
| 0=Broadcast                          | 0=Disabled, 1=Enabled |
| 1=Response Method                    | 0=Disabled, 1=Enabled |
| 2-5=Reserved                         |                       |
| 6=Broadcast Congestion Status Change | 0=Disabled, 1=Enabled |
| 7-31=Reserved                        |                       |

PARM 2: ASP/AS Notification options. Each bit is used as an enabled/disabled flag for a particular ASP/AS Notification option. Not supported on IPSP application.

PVALUE : Valid range = 32-bits

| BIT                          | BIT VALUE             |
|------------------------------|-----------------------|
| 0=ASP Active Notifications   | 0=Disabled, 1=Enabled |
| 1=ASP Inactive Notifications | 0=Disabled, 1=Enabled |
| 2=ASP AS State Query         | 0=Disabled, 1=Enabled |
| 3-31=Reserved                |                       |

PARM 3: UA Serviceability Options. Each bit is used as an enabled/disabled flag for a particular UA Serviceability option. Supported on IPSP, SS7IPGW, and IPGWI applications. UA Graceful Shutdown supported on IPSP for M3UA only.

PVALUE : Valid range = 32-bits

| BIT                    | BIT VALUE             |
|------------------------|-----------------------|
| 0=UA Heartbeats        | 0=Disabled, 1=Enabled |
| 1=UA Graceful Shutdown | 0=Disabled, 1=Enabled |
| 2-31=Reserved          |                       |

PARM 4: SCTP Payload Protocol Indicator byte order option. Bit indicates PPI value is RCV/TX in Big Endian or Little Endian byte format. Supported on IPSP-M2PA associations only.

PVALUE : Valid range = 32-bits

| BIT                          | BIT VALUE                     |
|------------------------------|-------------------------------|
| 0=Payload Protocol Indicator | 0=Big Endian, 1=Little Endian |
| 1-31=Reserved                |                               |

## rtrv-uim-acthresh

Use this command to query the UIM number, limit, and interval period parameters that are used to report the thresholding of UIM messages.

#### Parameters

##### **uimn (optional)**

The UIM number.

##### **Range:**

1000 - 1999

##### **Default:**

Display all

**Example**

Display UIM number 1333 threshold:

```
rtrv-uim-acthresh:uimn=1333
```

Display the threshold for all UIMs that have been set:

```
rtrv-uim-acthresh
```

**Dependencies**

A valid value must be specified for the `uimn` parameter.

The value specified for the `uimn` parameter must already exist in the system Trouble Text Table.

**Notes**

None

**Output**

```
rtrv-uim-acthresh:uimn=1333
```

```
rlghncxa03w 03-11-01 08:50:12 EST  EAGLE 31.3.0
UIMN    LIMIT    INTRVL
1333     100      5
The UIM Threshold Table is (1 of 499) 1% full.
```

```
rtrv-uim-acthresh
```

```
rlghncxa03w 03-11-01 08:50:12 EST  EAGLE 31.3.0
UIMN    LIMIT    INTRVL
1333     100      5
1444     200     15
1155     50      30
The UIM Threshold Table is (3 of 499) 1% full.
```

[set-uim-acthresh](#)

**rtrv-user**

Use this command to show the information about the user currently logged on to the terminal from which this command was entered.

**Parameters**

This command has no parameters.

**Example**

```
rtrv-user
```

## Dependencies

The CCCNAMES table must be accessible.

None

## Notes

The password is not shown.

This command shows the command class privileges for the user logged onto the system. No other users are shown.

All users have access to this command.

## Output

This example shows the output when the Command Class Management feature is turned on:

rtrv-user

```
rlghncxca03w 09-01-07 09:50:17 EST EAGLE 40.1.0
user id      age page uout rev link sa sys pu db dbg
manny       36 60 60 NO YES YES YES YES YES YES YES

u01 u02 u03 u04 u05 u06 u07 u08 u09 u10 u11 u12 u13 u14 u15 u16
NO NO NO NO YES YES YES YES YES YES YES YES YES YES YES YES

u17 u18 u19 u20 u21 u22 u23 u24 u25 u26 u27 u28 u29 u30 u31 u32
YES YES YES YES YES YES YES YES YES YES YES NO NO NO NO YES
;
```

This example shows the output when the Command Class Management feature is not turned on:

rtrv-user

```
rlghncxca03w 09-01-07 09:50:17 EST EAGLE 40.1.0
USER ID      LINK SA SYS PU DB DBG
eagle       YES YES YES YES YES YES

USER ID      AGE PAGE UOUT REV
eagle       750 0 0 NO
;
```

## Legend

- **USER ID**—Name of the user
- **AGE**—Current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, then 999 is displayed.
- **PAGE**—Maximum password age established for this user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (\*) displayed after the value indicates that the system-wide default page parameter value, (see the `chg-secu-dflt` command), is in effect for the user ID.

- **UOUT**—User ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (\*) displayed after the value indicates that the system-wide default uout parameter value, (see the `chg-secu-dflt` command), is in effect for the user ID.
- **REV**—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.
- **LINK**—Shows whether the user has access to all commands in the Link Maintenance command class
- **SA**—Shows whether the user has access to all commands in the Security Administration command class
- **SYS**—Shows whether the user has access to all commands in the System Maintenance command class
- **PU**—Shows whether the user has access to all commands in the Program Update command class
- **DB**—Shows whether the user has access to all commands in the Database Administration command class
- **DBG**—Shows whether the user has access to all commands in the Debug command class

If the Command Class Management feature is enabled and turned on, the following fields are displayed:

- **U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

## **rtrv-vendid**

Use this command to retrieve a list of Vendor ID entries from the VENDID table, for the GSM MAP SRI Redirect to Serving HLR feature.

## Parameters

### **num (optional)**

Number of Vendor ID entries to be retrieved.

#### **Range:**

*1 - 500*

#### **Default:**

*500*

### **vendnum (optional)**

Vendor Number

#### **Range:**

*1 - 128*

## Example

```
rtrv-vendid
```

```
rtrv-vendid:vendnum=15
```

```
rtrv-vendid:num=100
```

## Dependencies

The VENDID table is corrupt or cannot be found by the system.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

## Notes

None.

## Output

This example shows output when the command is entered with no parameter. Vendor Types are listed in numerical order. Vendor Numbers for each Vendor Type are listed in numerical order, followed by the Vendor ID for each Vendor Number.

```
rtrv-vendid
```

```
tekelecstp 14-09-21 16:11:21 EST  EAGLE 46.1.0
```

```
Vendor  Vendor  Vendor  
Type    Number  ID
```

```
-----

## rtrv-vflx-cd

Use this command to retrieve call decision information.

#### Parameters

**cdn (optional)**

Call decision name. The name of the call decision entry.

**Range:**

*ayyy*

1 alphabetic character followed by 3 alphanumeric characters

**vmdig (optional)**

Voice mail number or voice mail prefix digits. The voice mail number or voice mail digits associated with the call decision entry.

**Range:**

1 - 15 digits

Valid digits are 0-9, A-F, a-f

**Example**

This command retrieves all entries from the Call Decision table.

```
rtrv-vflx-cd
```

This command retrieves a specific Call Decision entry.

```
rtrv-vflx-cd:cdn=cdn1
```

This command retrieves all call decision entries with a specified voice mail number or voice mail prefix digits.

```
rtrv-vflx-cd:vmdig=123456789abcd2
```

**Dependencies**

The **cdn** and **vmdig** parameters cannot be specified together in the command.

The value specified for the **cdn** parameter cannot be a reserved word, such as *none*.

The Call Decision table is corrupt or cannot be found by the system.

The value specified for the **cdn** parameter must already exist in the Call Decision table.

The V-Flex feature must be enabled before this command can be entered.

**Notes**

This command can be cancelled using the **F9** function key or the **canc-cmd** command.

**Output**

```
rtrv-vflx-cd
```

```
tekelecstp 08-05-01 09:36:55 EST EAGLE 39.0.0
```

## rtrv-vflx-opts

Use this command to retrieve the data that is used for number conditioning.

**Parameters**

This command has no parameters.

**Example**

This command displays V-Flex Options Table data.

```
rtrv-vflx-opts
```

**Dependencies**

The V-Flex feature must be enabled before this command can be specified.

**Notes**

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 0.

**Output**

This example shows the output with default V-Flex Options:

```
rtrv-vflx-opts
```

```
tekelecstp 08-05-04 07:53:46 EST  EAGLE 39.0.0

VFLEX OPTIONS
-----
DRANPV      = 0
DRANAIV     = 0
DRA         = RN
NEQUERYONLY = OFF
NETYPE      = VMSID
;
```

This example shows the output with some V-Flex Options provisioned:

```
rtrv-vflx-opts
```

```
tekelecstp 08-05-04 07:55:30 EST  EAGLE 39.0.0

VFLEX OPTIONS
-----
DRANP       = E164
DRANAI      = SUB
DRA         = RN
NEQUERYONLY = ON
```

```

NETYPE      = GRN
;

```

### Legend

- **DRANP**—Numbering plan for the destination routing address
- **DRANAI**—Nature of address indicator for the destination routing address
- **DRA**—Format of the destination routing address
- **NEQUERYONLY**—Network Entity Query Only option
- **NETYPE**—Network Entity Type for the NEQUERYONLY option

## rtrv-vflx-rn

Use this command to retrieve voice mail routing numbers and routing number names and to view the associated reference count. The V-Flex feature must be enabled before this command can be entered.

### Parameters

#### refcnt (optional)

Reference count. This parameter specifies whether to display the reference count.

#### Range:

*yes*  
display the reference count

#### rn (optional)

Routing number. A voice mail routing number.

#### Range:

1-15 digits  
Valid digits are 0-9, A-F, a-f.

#### rnname (optional)

Routing number name. The name associated with a voice mail routing number.

#### Range:

*ayyyyyyy*  
1 alphabetic character followed by 7 alphanumeric characters.

### Example

```

rtrv-vflx-rn:rnname=rn01
rtrv-vflx-rn:rn=123456789ABC
rtrv-vflx-rn

```

```
rtrv-vflx-rn:rnname=rn01:refcnt=yes
rtrv-vflx-rn:rn=123456789ABC:refcnt=yes
```

### Dependencies

The V-Flex feature must be enabled before this command can be entered.

The Routing Number table is corrupt or cannot be found by the system.

The value specified for the `rnname` parameter must already exist in the Routing Number table.

The `rn` and `rnname` parameters cannot be specified together in the command.

The value specified for the `rnname` parameter cannot be a reserved word, such as *none*.

The value specified for the `rn` parameter must already exist in the Routing Number table.

### Notes

This command can be cancelled using the **F9** function key or the `canc -cmd` command. See `canc -cmd` for more information.

### Output

This command shows the output for a routing number name:

```
rtrv-vflx-rn:rnname=rn01

tekelecstp 08-05-29 15:07:01 EST  EAGLE 39.0.0

RN Name      Routing Number
-----
rn01         123456789abcdef

VFLEX Routing Number table is (2 of 10000) 1% full.

;
```

This command shows all of the entries in the Routing Number table:

```
rtrv-vflx-rn

tekelecstp 08-05-29 15:07:01 EST  EAGLE 39.0.0

## rtrv-vflx-vmsid

Use this command to retrieve information for voice mail server IDs.

### Parameters

#### **id (optional)**

The voice mail server ID.

##### **Range:**

1-15 digits, *dflt*

Valid digits are 0-9, A-F, a-f.

*dflt* —a default set of routing numbers used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB

#### **rname (optional)**

A routing number name associated with the voice mail server ID.

##### **Range:**

*ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters.

### Example

```
rtrv-vflx-vmsid
```

```
rtrv-vflx-vmsid:id=123456789012345
```

```
rtrv-vflx-vmsid:rname=rn90
```

### Dependencies

The value specified for the **rname** parameter cannot be a reserved word, such as *none*.

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **rname** parameter must already exist in the Routing Number table.

The value specified for the **id** parameter must already exist in the VMSID table.

The GTT DBMM table is corrupt or cannot be found by the system.

The VMSID table is corrupt or cannot be found by the system.

The **rname** and **id** parameters cannot be specified together in the command.

The Routing Number table is corrupt or cannot be found by the system.

### Notes

This command can be cancelled using the **F9** function key or the **canc -cmd** command. See **canc -cmd** for more information.

### Output

This command shows the output for all the entries from the VMSID table:

## rtrv-vflx-vmsid

```

## rtrv-vlr-prof

Use this command to display entries from the Visitor Location Register (VLR) Profile table.

**Parameters****vlr (mandatory)**

VLR Number: Hexadecimal digit GT Number with variable length (1 to 16).

**Range:**

Hexadecimal digit string 1 to 16 digits

**filter (optional)**

Determines the category in which the number falls into.

**Range:**

*whitelist*

*blacklist*

*graylist*

**Default:**

*graylist*

**num (optional)**

Number of entries in the VLR table which user wants to view.

**Range:**

*1-50000*

**Example**

```
rtrv-vlr-prof
```

```
rtrv-vlr-prof:num=2
```

```
rtrv-vlr-prof:filter=blacklist
```

**Dependencies**

VLR\_PROF table must be accessible.

VLR parameter length must be in the range 1 to 5 digits as per current restriction.

VLR parameter and NUM parameter both cannot be specified together.

## Output

### rtrv-vlr-prof

## rtrv-vlr-roaming

Use this command to display entries from the Visitor Location Register (VLR) Profile table.

**Parameters****oldvlr (optional)**

VLR Number from which mobile subscriber has moved, hexadecimal digit GT number with variable length (1 to 16).

**Range:**

Hexadecimal digit string 1 to 16 digits

**newvlr (optional)**

VLR Number to which mobile subscriber has moved, hexadecimal digit GT number with variable length (1 to 16).

**Range:**

Hexadecimal digit string 1 to 16 digits

**num (optional)**

Number of entries in the VLR table which user wants to view.

**Range:**

1-50000

**Example**

```
rtrv-vlr-roaming
```

```
rtrv-vlr-roaming:num=2
```

```
rtrv-vlr-roaming: newvlr=12345:oldvlr=56780
```

**Dependencies**

VLR\_ROAM table must be accessible.

Both OLDVLR and NEWVLR must be specified

OLDVLR or NEWVLR parameter must be existing in VLR-PROF table

The entry should be existing in VLR\_ROAM table

OLDVLR and NEWVLR parameter length must be in the range 1 to 5 digits as per current restriction.

**Output**

rtrv-vlr-roaming

## set-date

Use this command to set the date in the system.

**Parameters****date (mandatory)**

The system date, to be reflected on all reports and output messages.

**Range:**

000101 - 991231

(in the form *yymdd*, where *yy*=year, *mm*=month, *dd*=day)

**Example**

```
set-date:date = 010307
```

**Dependencies**

The system date day value (the *dd* in the *yymdd* format) must accurately reflect the number of days in the specified month and year. For example, February never has 30 days. The value 050230 is not valid (February 30, 2005).

None

The system date month value (the *mm* in the *yymdd* format) must be in the range 01-12.

**Notes**

None

**Output**

```
set-date:date = 010307
```

```
rlghncxa03w 03-11-07 11:11:28 EST EAGLE 31.3.0  
Date set complete.
```

;

**Related Topics:**[set-time](#)

## set-gtwy-actthresh

Use this command to set or change the level of activity thresholds to be used when reporting gateway screening activity. The STP reports screening activity only if the threshold is set and only if the threshold is reached. The thresholds are set on a linkset basis.

### Parameters

#### **intrvl (mandatory)**

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Range:**

*5, 10, 15, 20, 30*

**System Default:**

*0* -Indicates that thresholds are not set

#### **lsn (mandatory)**

Linkset name

**Range:**

*ayyyyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

#### **recv (optional)**

Received message threshold. The threshold for MSUs received on the gateway linkset.

**Range:**

*0 - 999999*

**Default:**

The current value

**System Default:**

*0*

#### **rej (optional)**

Reject threshold. The threshold for MSUs rejected on the gateway linkset because of screening.

**Range:**

*0 - 999999*

**Default:**

The current value

**System Default:**

*0*

### Example

This example shows how to set the linkset WY644368 rejection threshold to 100, with a 15 minute interval.

```
set-gtwy-acthresh:lsn=wy644368:rej=100:intrvl=15
```

This example shows how to set the linkset WY644368 message threshold to 1000 and the rejection threshold to 300, with an interval of 20 minutes.

```
set-gtwy-acthresh:lsn=wy644368:intrv=20:rej=300:recv=1000
```

This example shows how to set the linkset WY644368 so that no activity messages are produced.

```
set-gtwy-acthresh:lsn=wy644368:intrv=5:rej=0:recv=0
```

### Dependencies

At least one optional parameter must be specified.

The Linkset table must be accessible.

The linkset specified must exist in the gateway linkset entity set of the requesting system.

The Extended Linkset table must be accessible.

The linkset specified must exist in the active database.

A valid value must be specified for the `intrvl` parameter.

### Notes

None

### Output

```
set-gtwy-acthresh:lsn=wy644368:rej=100:intrvl=15
```

```
rlghncxa03w 03-11-18 08:50:12 EST EAGLE 31.3.0
SET-GTWY-TRSHLD: MASP A - COMPLTD
;
```

### Related Topics:

## set-scrrej-prmtrs

Use this command to change the STP values that limit the display of MSUs rejected because of gateway screening notification messages that could become excessive. The new values overwrite the existing values.

### Parameters

#### **intrvl (mandatory)**

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Range:***5, 10, 15, 20, 30***System Default:***5***limit (mandatory)**

Threshold not to be exceeded.

**Range:***0 - 9999***System Default:***9999***Example**

```
set-scrrej-prmtrs:limit=200:intrvl=10
```

**Dependencies**

The Extended STP Options table must be accessible.

A valid value must be specified for the `intrvl` parameter.**Notes**

None

**Output**

```
set-scrrej-prmtrs:limit=200:intrvl=10
```

```
rlghncxa03w 03-11-18 08:50:12 EST  EAGLE 31.3.0

;
```

**Related Topics:**[rtrv-gtwy-acthresh](#)[rtrv-gtwy-prmtrs](#)[set-gtwy-acthresh](#)

## set-time

Use this command to set the system clock. The clock is used to determine when measurements collection takes place as well as several other time-driven events.

**Parameters****time (mandatory)**

The system time that is to be reflected on all reports and output messages.

**Range:**

0000 - 2359

*hhmm* where *hh* = 00-23 (hour) and *mm* = 00-59 (minute)**tz (optional)**

The time zone

**Range:**

*est, edt, cst, cdt, mst, mdt, pst, pdt, hst, hdt, ast, adt, gmt, wet, west, utc, bst, cet, cest, met, mest, fwt, fst, eet, eest, sast, msk, msd, ist, idt, cct, awst, awdt, rok, acst, acdt, aest, aedt, nzst, nzdt, akst, akdt, nst, ndt, bra*

The time zones are described in [Table 4-56](#).**Default:**

## set-uim-acthresh

Use this command to set or change the level-of-activity threshold for reporting UIM messages. The system suppresses the generation of UIM messages when message generation exceeds the threshold that was defined for the interval period. The values are set within five seconds after the command was entered. Any previous count is cleared and the new or changed threshold and limit is enforced. Refer to the *Database Administration Manual – System Management* for additional information.

**Parameters****intrvl (mandatory)**

The monitor interval in minutes.

**Range:**

5, 10, 15, 20, 25, 30

**Default:**

No change to the current value

**uimn (mandatory)**

The UIM number.

**Range:**

1000 - 1999

**force (optional)**

Required to set the `limit` parameter to 0 for a given interval.

---

**Caution:** Setting the limit to 0 turns off all occurrences of the specified UIM. Use this manner of creating thresholds only if you are certain you have specified the correct UIM.

---

**Range:**

*yes*

*no*

**Default:**

none

**limit (optional)**

The message threshold.

---

**Caution:** Setting the limit to 0 turns off all occurrences of the specified UIM. This can be dangerous if the wrong UIM number is specified by mistake. It is highly recommended that thresholds for UIMs are not set in this manner, but the ability is provided for certain extreme cases. The **force** parameter must be specified to specify **limit=0**, and an additional scroll area message is issued.

---

**Range:**

0 - 9999

**Default:**

No change to the current value

**Example**

This example sets UIM number 1333 threshold to 100 in a 5-minute interval:

```
set-uim-acthresh:uimn=1333:limit=100:intrvl=5
```

This example sets UIM number 1444 threshold to 200 in a 15-minute interval:

```
set-uim-acthresh:uimn=1444:limit=200:intrvl=15
```

**Dependencies**

At least one optional parameter must be specified.

A valid value must be specified for the **uimn** parameter.

A valid value must be specified for the **limit** parameter.

A valid value must be specified for the **intrvl** parameter.

The **force=yes** parameter must be specified before the **limit=0** parameter can be specified for a given interval. Specifying **limit=0** turns off all occurrences of the specified UIM. See the cautions under the **force** and **limit** parameters.

When creating a new UIM threshold, the **limit** and **intrvl** parameters must be specified.

The specified `uimn` parameter value must exist in the system Trouble Text table.  
 The UIM Threshold table is corrupt or cannot be found by the system.  
 The system Trouble Text table is corrupt or cannot be found by the system.

### Notes

None

### Output

```
set-uim-acthresh:uimn=1333:limit=100:intrvl=5
```

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
SET-UIM-ACTHRESH: MASP A - COMPLTD
;
```

## tst-bip

Use this command to test each byte of the specified board identification PROM (BIP) by reading and writing to the PROM. The test is performed for the main assembly.

### Parameters

#### **loc (mandatory)**

The card location as stenciled on the shelf of the system.

#### **Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115*

### Example

```
tst-bip:loc=1211
```

### Dependencies

The card location, frame, shelf, or slot must be within the allowed range.

The card location must be valid for the command.

The card specified by the `loc` parameter must be equipped in the database.

The card specified by the `loc` parameter must be in the OOS-MT-DSBLD state prior to BIP testing.

**Notes**

The specified card must be inhibited.

This command verifies that the PROM is good by writing and reading to the PROM. The `rtrv-bip` command show the level of the BIP, as well as the board part number, the revision number, and the serial number. If the `rtrv-bip` command fails, this indicates that communications to the card has failed, and the card should be replaced.

**Output**

tst-bip:loc=1211

```
tekelecstp 10-02-20 17:10:32 CST  EAGLE 42.0.0
Test Board Identification PROM  Location: 1211 - MBD  Packet: 1
-----
BIP Passed
;
```

## tst-disk

Use this command prior to an upgrade, or as a diagnostic tool, to test the integrity of an EAGLE fixed drive or removable media drive, at the specified location. The test is non-intrusive and non-destructive to the disk. A read-only test is executed for all logical blocks (LBAs) used on the specified target disk and a report identifying any bad or questionable LBAs is output.

**Parameters****loc (mandatory)**

The location of the disk to be tested.

**Range:**

**1114**  
TDM

**1116**  
TDM

**1113**  
Latched USB port

**1115**  
Latched USB port

**disk (optional)**

The disk that is being tested

**Range:***remove*

The removable drive

*fixed*

The fixed drive

*usb*

This parameter is to be used by Oracle personnel only.

**partition (optional)**

Portion of disk to be tested. This parameter specifies the individual physical disk partition (1, 2, 3, or 4) or all defined partitions for a given disk size up to a maximum of 4 partitions.

**Range:**

*1, 2, 3, 4* —Tests the specified existing partition on the disk. Only the number or numbers for the partition or partitions that exist on the disk are valid. (For example, if the disk size allows only 2 partitions, *partition=3* and *partition=4* are invalid for that disk.)

*all* —Tests all existing partitions on the fixed disk or removable drive

**Default:***all***Example**

```
tst-disk:loc=1116
```

**Dependencies**

The card in the specified location (*loc*) must be an E5-TDM or E5-MCAP card.

The disk to be tested must be in service.

If a TDM location is specified, the TDM cannot be reserved (as when a copy-disk command is running).

The target drive must have low level format.

This command can be run simultaneously on both TDMs, if entered from different terminals.

The removable drive can be tested simultaneously with the standby TDM but not with the active TDM.

To test the Removable drive when *loc=1113/1115:disk=remove/usb*, the removable media must be inserted in the corresponding removable drive.

The *partition=3* and *partition=4* values are invalid for a 4GB fixed drive. The only valid value for the 2.3 GB and 4.1 GB removable disks is *partition=1*

An error message will be generated for a disk that has been Formatted (*format-disk* command) but does not yet contain a DOS directory structure (created with the *copy-disk* command) when the *partition=* parameter is specified.

This command cannot be entered when other database commands are running.

If an E5-TDM card is installed, then the *disk=fixed* parameter cannot be specified.

The disk to be tested must be available.

### Notes

A physical fixed disk (TDM) or removable drive is formatted and given a DOS directory structure to define the number of physical partitions that the disk size can accommodate. (The logical partitions that contain database, backup, GPL, and measurements files are placed in these physical partitions, with no correlation between the physical numbers and the logical contents.)

For a fixed TDM disk, the `partition` parameter specifies the individual partition (1, 2, 3, or 4) or all existing partitions to be tested.

- One partition = 2 GB.
- The 4 GB drive contains two 2 GB partitions.
- The 9 GB drive and the 18 GB drive each contain four 2 GB partitions.
- The 9 GB drive contains four 2 GB partitions.
- Any disk space beyond the four 2 GB partitions is unused disk space (and always has been due to EAGLE DISK FAT structure used).

The `partition=all` parameter implies that testing starts with the first partition, then second, and so on, until the last existing disk partition is detected without skipping any non-existing or defined partitions.

[Table 4-57](#) outlines execution time estimates based on disk capacity.

**Table 4-57 Test Disk Execution Times**

| Capacity        | Nominal Execution Time                                                                                                     | Maximum Execution Time for 100% Errors |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| 4.0 GB          | 40 minutes                                                                                                                 | 27.5 hours                             |
| 9.0 GB          | 1 hour 45 minutes                                                                                                          | (Not determined)                       |
| 18 GB           | 30 minutes (partition=1)<br>5 hours (partition=disk)<br>depending on amount of disk tested and EAGLE provisioning/activity | (Not determined)                       |
| 507 MB          | 5 minutes                                                                                                                  | 3.4 hours                              |
| 2.0 GB          | 20 minutes                                                                                                                 | 13.5 hours                             |
| 4.0 GB          | 40 minutes                                                                                                                 | 27.5 hours                             |
| Removable Drive | 30 seconds                                                                                                                 | Less than 1 minute                     |

Nominal times for `tst-disk` command execution depend on the capacity of the disk being tested and assume that few or no errors are found. Maximum execution times are based on disk capacity, retry count, and retry delay. Each read error and retry may cause a delay of up to three seconds. If a TDM has 100% error sectors, the MASP will

likely reset, terminating the disk test. A termination and reset will not occur, however, when testing the removable media.

Because of the intense, sustained disk activity created when `tst-disk` is executed, concurrently performing other disk-based activities, such as prolonged LNP command entry or database backups, will result in performance degradation up to twice the usual execution time.

Because of the extended processing time required for large disks, a progress message is displayed every five minutes providing the current LBA and the total LBA count for the partition.

Specific errors are reported for the first 10 error occurrences. Thereafter, only the error count is tracked and summary results are reported upon completion.

### Output

## tst-dlk

Use this command to test the specified TCP/IP data link. The TCP/IP data link is tested with an ethernet test that is an echo test type called ping.

### Parameters

#### **loc (mandatory)**

The card location as stenciled on the shelf of the system.

##### **Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

#### **type (mandatory)**

The type of test to run.

##### **Range:**

*ping*

#### **ipaddr (optional)**

The IP address of the remote host. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number.

##### **Range:**

1-223, 0-255

4 numbers separated by dots

1-223-first number

0-255-the other 3 numbers

##### **Default:**

Host IP

#### **rc (optional)**

The number of times the test is repeated.

##### **Range:**

1 - 15

##### **Default:**

1

### Example

tst-dlk: loc=1206:type=ping

### Dependencies

No other action command can be in progress when this command is entered.

The card location must contain an STPLAN card.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If a test repeat count (rc) is not entered, the test is not repeated.

If a data link test is in progress, another data link test cannot be started.

The card location, frame, shelf, or slot must be within the allowed range.

A card location that is valid and defined in the database must be specified.

The ipaddr parameter must specify a valid IP address.

### Notes

None

### Output

tst-dlk:loc=1206:type=ping

```

## tst-e1

Use this command to test E1 ports. The command is rejected if a loopback test is not compatible with the port type. This command can be used with HC-MIM or E5-E1T1/E5-E1T1-B cards.

### Parameters

**e1port (mandatory)**

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified card.

**Range:**

*1 - 8*

**loc (mandatory)**

Card location. The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**action (optional)**

Indicator of command action to stop or start a test.

**Range:**

*start*

*stop*

**Default:**

*start*

**loopback (optional)**

Select loopback test type.

**Range:**

*line*

*lxvr*

local transceiver

*payload*

**Default:**

*lxvr*

**Example**

tst-e1:e1port=1:loc=1203:loopback=lxvr

tst-e1:e1port=1:loc=1203:action=stop

**Dependencies**

This command cannot be entered during upgrade.

The value specified for the `loc` parameter must indicate an HC-MIM or E5-E1T1/E5-E1T1-B card with card type LIME1.

The card in the specified card location (`loc` parameter) must be equipped.

The card in the specified card location (`loc` parameter) must be in service.

The specified E1 port (`e1port` parameter) on the card (`loc` parameter) must have a defined E1 interface.

All signaling links that provide timeslots serviced by E1 interfaces on the specified card must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (`tst-slk` and `act-cdl`) when this command is entered.

Only one port test can be running on an E1 port (`e1port` parameter) at one time.

When the `action=stop` parameter is specified, the `loopback` parameter cannot be specified.

The E1/T1 table must be accessible.

The `action=stop` parameter can be specified only when a port test is running.

### Notes

Only one port test can be performed at a time on an E1 port. When a port test is in progress on an E1 port, subsequent test requests are rejected.

### Output

```
tst-e1:e1port=1:loc=1203:loopback=lxvr
```

```
rlghncxa03w 05-01-07 16:19:08 EST  EAGLE5 33.0.0

## tst-imt

Use this command to:

- Perform a Fault Isolation test to determine the location of faults on a failed or abnormal IMT bus. The Alternate Bus must be in the IS-NR state. The Target Bus must be in the OOS-MT-DSBLD state.
- Perform an Extended Bit Error Rate Test (BERT) on all IMT Buses. The Target Bus must be in the IS-NR or IS-ANR state. The Alternate Bus must be in the IS-NR state.
- Cancel an Extended BERT

---

---

**Note:** At least one card must be populated in each EAGLE extension shelf provisioned as ent-shlf:type=EXT to allow the command to successfully execute a Fault Isolation Test. See the "Notes" section for this command for more information about executing the command.

---

---

---

---

**Note:** No physical status change can be made to the IMT Bus (e.g., unplugging MUX cards) while an Extended BERT is running.

---

---

### Parameters

#### **type (mandatory)**

The type of test to perform.

##### **Range:**

*faultttest*

perform a Fault Isolation test

*extbert*

perform an Extended BERT on all MUX cards on an IMT Bus

#### **action (optional)**

Indicator of command action to stop or start a test.

Currently, only the cancellation of an Extended BERT is supported by this parameter.

##### **Range:**

*start*

*stop*

##### **Default:**

*start*

#### **bus (optional)**

IMT bus to test.

**Range:***a**b***maxerr (optional)**

The number of errors allowed for the period during which an Extended BERT is being performed.

---

**Note:** This value is the Bit error threshold.

---

**Range:***0 - 1000***Default:***20***time (optional)**

The time, in minutes, for which an Extended BERT runs in order to determine success or failure.

**Range:***1 - 60***Example**

```
tst-imt:bus=a:type=faultttest
```

```
tst-imt:bus=b:type=extbert:time=50
```

```
tst-imt:bus=b:type=extbert:time=50:maxerr=30
```

```
tst-imt:bus=a:type=extbert:action=stop
```

**Dependencies**

Valid IMT bus entries are "A" or "B".

A related IMT command cannot be in progress. Only one Fault Isolation Test or Extended BERT can be active at a time.

An Extended BERT cannot be performed if the `init-sys`, `act-upgrade`, `init-flash`, `act-flash`, `init-network`, `flash-card`, or `init-card` (when initializing multiple cards using the `appl` parameter) commands are running.

This command cannot be entered if the alternate bus is other than in-service normal (IS-NR).

The target bus must be in the out of service - maintenance disabled (OOS-MT-DSBLD) state before this command can be entered for a Fault Isolation test.

This command cannot be entered during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The target bus must be in the in-service normal (IS-NR) or in-service abnormal (IS-ANR) state before this command can be entered for an Extended BERT.

If the `type=extbert` parameter is specified, then the `time` parameter must be specified.

If the `type=faulttest` parameter is specified, then the `time`, `maxerr`, and `action` parameters cannot be specified.

If the `action=stop` parameter is specified for an extended BERT, then the `time` and `maxerr` parameters cannot be specified.

This command cannot be entered for an Extended BERT, if the target bus contains HMUX or HIPR cards.

The `action=stop` parameter cannot be specified until an Extended BERT acknowledgment from a MUX card is received.

If an Extended BERT is about to complete, then the `action=stop` parameter cannot be specified.

If an Extended BERT is not in progress, then the `action=stop` parameter cannot be specified.

## Notes

### Fault Isolation Test

Probable causes are listed in order of most probable to least probable. The listed components should be replaced in order listed by the output of this command.

Multiple, masking points of failure can occur in the same bus segment. Such faults are reported as a single bus segment fault. Because running this command on a system with no IMT bus faults prints an indication that no faults were found, you can iteratively replace components and run this test until all components in the segment are ruled out.

A detection of an IMT address mismatch indicates a faulty backplane or card.

A detection of an inconsistency with a particular card's IMT card list indicates an error of unknown origin, probably due to one or more lost messages.

When this command completes, either through normal termination of the command or because the command was ended for another reason, you must administratively enable the target bus. If all faults have meanwhile been isolated and corrected, the target bus becomes operational.

When a fault is detected, the possible error sources are listed in order from the most likely to the least likely. This ordering is based on operational experience.

At least one card must be populated in each EAGLE extension shelf provisioned as `ent-shlf:type=EXT` to allow this command to execute successfully. The card does not need to be a provisioned card; the card must be in IS-NR state on both IMT busses before this command is entered. If an empty shelf that is provisioned as `ent-shlf:type = EXT` or an un-provisioned shelf that is IMT enabled does exist, the following text is displayed when this command is entered:

*Notice: IMT Fault test terminated.*

*Non-Standard cabling or IMT Bus-X state change detected.*

### Extended BERT

This command for an Extended BERT allows a BERT to be executed for a longer period of time during installation to verify there are no signal integrity issues. The standard BERT is used as a basic sanity test during bring-up of the ring.

When an Extended BERT is started, the target bus is inhibited. The bus is allowed when the test completes either through normal termination of the command or because the command was ended for another reason.

When the Extended BERT completes, the output is generated as a maintenance report indicating the test passed or failed. An error rate less than or equal to 1 error in 10E12 bits determines whether the test passed.

The `maxerr` parameter allows the Extended BERT to be performed for the longer duration even if the test fails for any of the MUX cards.

An on-going Extended BERT can be cancelled with the `action=stop` parameter.

Hourly report generation is not allowed if the request comes during an Extended BERT. Notification of the hourly boundary is multicast to all IMT processors to age out the least-recent error bucket and advance the current error bucket. The following notice is displayed if the Hourly report is bypassed during Extended BERT:

*Extended BERT: Hourly Report is bypassed*

One of the following notices is displayed if an Extended BERT terminates prematurely:

- *Extended BERT: Test aborted, Loss of Heartbeat*—Failure observed for the Extended BERT Heartbeat communication maintained between the Active OAM and the Control shelf MUX card.
- *Extended BERT: Test aborted, Alternate IMT Bus [A | B] abnormal*—Alternate IMT Bus becomes abnormal.
- *Extended BERT: Test terminated, Command cancelled*—Test is cancelled using `tst-imt` command with `action=stop`.
- *Extended BERT: Error in results retrieval, HIPR2 card(s) failure*—Extended BERT results are not displayed if an error is encountered during results retrieval from HIPR2 card.
- *Extended BERT: Active MASP failed to disconnect on IMT Bus [A | B]*—Active MASP did not disconnect on the IMT Bus undergoing Extended BERT.
- *Extended BERT: Active MASP failed to reconnect on IMT Bus [A | B]*—Active MASP did not reconnect on the IMT Bus undergoing Extended BERT.
- *Extended BERT: ACK for Extended BERT not received from IMT Bus [A | B]*—The acknowledgement for an Extended BERT is not received from MUX card.
- *Extended BERT: Test aborted, Card failure detected at X location*—Failure detected on a card due to both IMT Buses becoming unavailable.

## Output

This example shows the output when the Connectivity test fails for the Fault Isolation test:

```
tst-imt:bus=a:type=faulttest
```

```
rlghncxa03w 09-12-07 12:47:07 EST  EAGLE 42.0.0

Extended BERT: Test terminated, Command cancelled

```

```
;
```

## Legend

- **MAX ERROR**—Bit error threshold. The number of errors allowed for the specific time period during which the BERT is being performed. If this threshold is exceeded in the specified time period, the Extended BERT is prematurely terminated.
- **TIME**—Specified length of time (*hr:min:sec*) to run the test in order to determine success or failure
- **START TIME**—Time at which the test was started (*hr:min:sec*)
- **TEST STATUS**—PASS if the BERT Status is PASS for all the MUX cards, FAIL otherwise
- **CARD**—MUX Card location that contains the BERT being tested
- **TYPE**—MUX Card type
- **SERIAL\_NUMBER**—Serial number of the main assembly board of the MUX card obtained from board identification PROM (BIP) data
- **BERT\_STATUS**—Extended BERT PASS/FAIL status

- **BIT\_ERROR**—Number of bit errors observed during the test
- **ERRORED\_SEC**—Number of seconds that contained bit errors during the test. Bit errors are sampled once per second; each sample that contains bit errors adds one second to this count.
- **DURATION**—Length of time (*hr:min:sec*) that the test runs for the BERT. For a successful test, the TIME and DURATION should be the same. If a test runs for less than the specified amount of time, the DURATION is less than the TIME.

## tst-j1

Use this command to test J1 ports. The command is rejected if a loopback test is not compatible with the port type.

---

---

**Note:** This command can be entered for E5-E1T1/E5-E1T1-B cards.

---

---

**Parameters****loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**Default:**

All T1 card locations having J1 interfaces configured are listed.

**action (optional)**

Indicator of command action to stop or start a test.

**Range:**

start  
stop

**Default:**

start

**Loopback (optional)**

Select loopback test type.

**Range:**

*line*

*lxvr*

local transceiver

*payload*

*feline*

far end line

*far end payload*

far end payload

**Default:**

*line*

**j1port (optional)**

J1 port number. The value must be a J1 port that has already been configured with a J1 interface on the specified card.

**Range:**

1-8

**Example**

```
tst-j1:j1port=1:loc=1102:action=stop
```

**Dependencies**

This command cannot be entered during upgrade.

The value specified for the `loc` parameter must indicate an E5-E1T1 or E5-E1T1-B card with card type LIMT1.

The card in the location specified by the `loc` parameter must be equipped.

The card in the location specified by the `loc` parameter must be in service.

The J1 port specified by the `j1port` parameter must have a defined J1 interface.

All signaling links that provide timeslots serviced by J1 interfaces on the specified card must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (`tst-slk` and `act-cdl` commands) when this command is entered.

Only one port test can be running on the J1 port specified by the `j1port` parameter at one time.

The J1 table must be accessible.

The `action=stop` parameter can be specified only when a port test is running.

If the `action=stop` parameter is specified, a value of `feline` or `fepayload` must be specified for the `loopback` parameter.

If the action=stop parameter is specified, and a value of feline or fepayload is specified for the loopback parameter, then there cannot be an active loopback for the T1 span, or the active loopback must be the one specified in the tst-t1:action=stop command.

### Notes

Only one port test can be performed at a time on a J1 port. When a port test is in progress on a J1 port, subsequent test requests are rejected.

If a loopback type of feline or fepayload is specified, then the loopback requests are sent to the far end. No response is given from the far end indicate if the request was acted upon or received. The local card which hosts the J1 span in the EAGLE does not instrument the loopback locally but maintains a knowledge of the far end loopback request. If the local card boots, this knowledge is lost by the card.

To maintain the far end loopback states, if the J1 card with an active feline or fepayload test boots, the card loses any knowledge of the Far End loopback request, but the OAM retains that knowledge. If the OAM boots, the J1 card updates the OAM with its last known loopback state. If both the J1 card and the active OAM card boots while a Far End Loopback is active, then there is no way of determining the J1 state; however, a `tst-j1:action=stop:action=(feline or fepayload)` command can still be sent.

### Output

```
tst-j1:j1port=1:loc=1102:action=stop
```

```
tekelecstp 13-12-19 19:02:51 EST 46.0.0-65.3.0
Command Accepted: Stop Port test message is sent.
;
tekelecstp 13-12-19 19:02:51 EST 46.0.0-65.3.0
Command Completed.

## tst-msg

Use this command to invoke the Test Tool to test the feature call flow for the specified test message from the TESTMSG table.

The command sends the specified message from the TESTMSG table to an EAGLE feature. The test message that is sent does not create a new raw MSU. The test message is used only to modify the internal data structures of the Feature to study the call flow behavior when a message with the specified parameters is injected into the call path. The test message is never sent out to the network.

### Parameters

**feat (mandatory)**

Feature. The Service Feature where the message is processed on the network card.

**Range:*****ttr***

Service Feature for processing Prepaid IDP Query Relay test messages

***tif***

Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF.

***tif2***

Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF2.

***tif3***

Service Feature for processing ISUP test messages when the provisioned Gateway Screening Stop Action is TIF3.

***mosmsnpp***

Service Feature for processing MO SMS NPP test messages

***gtt***

Service feature for processing GTT test messages.

***iar***

Service Feature for processing IAR test messages

**loc (mandatory)**

Card location. The location of the network card where the message is to be sent.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**msgn (mandatory)**

Message number. The message number of the test message to be sent for feature service processing.

**Range:**

1 - 10

**prot (mandatory)**

Protocol. The protocol of the test message that is sent to the feature for processing.

**Range:*****ttr***

*isup*

*is41*

*gsm*

*sccp*

*tatr*

**mode (optional)**

Output mode. The mode in which output is shown while processing is performed on the specified test message.

---

---

**Note:** The most complete and accurate test results are obtained when mode=debug is used.

---

---

**Range:**

*brief*  
summary format

*full*  
full format

*debug*  
debug format

**Default:**

*brief*

**Example**

```
tst-msg:loc=1103:prot=is41:feat=mosmsnpp:msgn=1:mode=full
```

```
tst-msg:loc=1103:prot=ttr:feat=ttr:msgn=1:mode=full
```

```
tst-msg:loc=1103:prot=gsm:feat=mosmsnpp:msgn=1:mode=debug
```

```
tst-msg:msgn=1:prot=isup:loc=1215:feat=tif:mode=debug
```

```
tst-msg:loc=1103:prot=sccp:feat=gtt:msgn=1
```

**Dependencies**

The Prepaid IDP Query Relay feature must be enabled before the feat=ttr parameter can be specified.

The card in the location that is specified in the loc parameter must be equipped in the system.

The value specified for the loc parameter must indicate a Service Module card running the VSCCP application.

The card in the location specified in the loc parameter must be in the Active state.

The values specified for the prot and feat parameters must be compatible as shown:

- `feat=ttr — prot=ttr`
- `feat=iar — prot=tatr`
- `feat=tif, tif2, tif3 — prot=isup`
- `feat=mosmsnpp — prot=gsm, is41`
- `feat=gtt — prot=sccp`

If the specified test message is defined with `ACTIVE=YES` (see the `chg-isup-msg` command), then the message is sent to the specified network card for test processing. (Test messages are never sent out to the live network.)

The TSTMSG table is corrupt or cannot be found.

The MO SMS ASD, MO SMS GRN, MO SMS IS41-to-GSM Migration, or MO-based IS1 SMS NP feature must be enabled before the `feat=mosmsnpp` and `prot=is41` parameters can be specified.

The MO SMS ASD, MO SMS GRN, Prepaid SMS Intercept Ph1, MO-based GSM SMS NP, or Portability Check for MO SMS feature must be enabled before the `feat=mosmsnpp` and `prot=gsm` parameters can be specified.

At least one TIF feature must be enabled before a value of `tif`, `tif2`, or `tif3` can be specified for the `feat` parameter.

For an ANSI message, the CDPA GTI must be 2 and the CGPA GTI must be 0 or 2 (see the `chg-sccp-msg` command). For an ITU message, the CDPA GTI must be 2 or 4 and the CGPA GTI must be 0, 2, or 4.

The linkset specified by the `lsn` parameter must already exist.

The network domain of the values specified for the `OPC`, `CGPA PC`, `CDPA PC` and `DPC` must match.

The IAR Base feature must be enabled before the `feat=iar` parameter can be specified.

## Notes

The `tst-msg` output for `feat=gtt` with `mode=full` and `debug` will be the same.

## Output

When the `mode=full` or `mode=debug` parameter is specified, the `FORMAT` field indicates whether formatting actions are executed. If formatting actions are not executed, then the `OUTG DIGITS` field displays a value of `UNMODIFIED`. If any digit string is blank, then the associated field displays a value of `EMPTY`.

This example shows the output in brief format:

```
tst-msg:feat=ttr:prot=ttr:msgn=1:mode=brief
```

```
tekelecstp 09-08-05 18:20:46 EST EAGLE 41.1.0
tst-msg:feat=ttr:prot=ttr:msgn=1:mode=brief
Command Accepted: Test message is sent.
;
```

## tst-npp-msg

Use this command to provision and test the NPP provided service, NPPT. The NPP Test Service allows customers to provision NPP Action Sets and Rules associated with the NPPT Service Rule Set. Customers can inject test messages to a provisioned NPPT Service Rule to verify proper digit string processing.

### Parameters

#### **digs (mandatory)**

Digits. The incoming digit string for NPP to process.

##### **Range:**

1 - 32

#### **loc (mandatory)**

The Service Module card to which the test message is issued.

##### **Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

#### **nai (mandatory)**

Incoming digit string Nature of Address Indicator (NAI) mapping value.

##### **Range:**

0 - 255

#### **mode (optional)**

The output format.

##### **Range:**

*brief*  
summary format

*full*  
full format

*debug*  
debug format

**Default:***brief***Example**

```
tst-npp-msg:loc=1101:mode=full:digs=0ab4041234567:nai=3
```

**Dependencies**

None.

**Output**

When the `mode=full` or `mode=debug` parameter is specified, the `FORMAT` field indicates whether formatting actions are executed. If formatting actions are not executed, then the `OUTG DIGITS` field displays a value of `UNMODIFIED`. If any digit string is blank, then the associated field displays a value of `EMPTY`.

The numbers shown to identify Conditioning Actions, Service Actions, and Formatting Actions are the individual parameter numbers or the position of the value in the parameter list when the command was entered. For example, `CA2` identifies either the value for the `ca2` parameter or the second `CA` value in the `ca` parameter list in the command (such as `ac3` in the `ca=cc2, ac3` parameter).

## tst-slk

Use this command for testing signaling links.

- The loopback parameter on the `tst-slk` command provides the ability to select from among the following loopback tests: local transceiver (`lxvr`), oam, line, payload, and either low-speed signaling links or ATM high-speed signaling links (`sltc`).
- The command is not valid on E5-ENET or E5-ENET-B cards with SS7IPGW and IPGWI links.
- For low-speed links, LXVR and SLTC tests are allowed.
- For E5-ATM and E5-ATM-B cards, the LXVR, SLTC, PAYLOAD, LINE, and OAM tests are allowed.
- For E5-ENET or E5-ENET-B cards with IPLHC links, the SLTC test is allowed.
- For E5-E1T1 or E5-E1T1-B cards, only the SLTC test is allowed.
- For E5-ENET, E5-ENET-B or SLIC cards running the IPSG application, the command is only supported for IPSG-M2PA signaling links, and the SLTC test is allowed.

See [Summary of Loopback Testing Commands and Functions](#) in Appendix A.

### Parameters

#### **link (mandatory)**

The signaling link on the card specified in the `loc` parameter. The links can be specified in any sequence or pattern.

#### **Synonym:**

*port*

#### **Range:**

*a, b, a1 - a63, b1 - b63*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

**loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**action (optional)**

Indicator of command action to stop or start a test.

**Range:**

*start*

*stop*

**Default:**

*start*

**force (optional)**

**Range:**

*yes*

*no*

**Default:**

*no*

**loopback (optional)**

The type of loopback test to run

**Range:**

*line*

This test is similar to the payload loopback test, but the data transmitted to the remote system is received by the remote system's ATM driver.

*lxvr*

Loopback at the local transceiver without involving the remote STP. For the ADS0, AINF, AOCU, and AV35 appliques, the MTP-2 protocol stack and ISCC hardware are tested. For AATM applique and DS1 interface, the AATM hardware, ATM level 2 protocol stack, and AAL5CP portion of ATM driver are tested,

***oam***

Messages are passed between local and remote systems to guarantee that the ATMM portion of ATM driver is functioning.

***payload***

This test is similar to the local transceiver loopback test. The wire is also tested because the loopback is at the remote's DS1 interface instead of the local's DS1 interface.

***sltc***

This test can be run on either the low-speed signaling links or the ATM high-speed signaling links. This is the only test that is supported for *m2pa* links on IPLHC cards.

**Default:**

*sltc*

**time (optional)**

The time duration for testing the link.

**Range:**

1 - 240000

*hhmmss*

*hh*=hours ( 00-24)

*mm*=minutes (00-59)

*ss*=seconds (00-59)

For example, *time=1* or *time=000001* is one second; *time=240000* is 24 hours; *time=200* or *time=000200* is 2 minutes.

**Default:**

1

**Example**

```
tst-slk:loc=1203:link=a
```

```
tst-slk:loc=1203:link=a:loopback=lxvr
```

```
tst-slk:loc=1205:link=b:time=000200:force=yes:action=start
```

```
tst-slk:loc=1205:link=b:action=stop
```

```
tst-slk:loc=1205:link=b:time=200
```

**Dependencies**

The card in the location indicated by the *loc* parameter must already be equipped.

A card location that is valid and defined in the database must be specified.

- A card location equipped with an E5-APP-B card cannot be specified.
- A card location equipped with a Telco Switch cannot be specified.

If the signaling link is an ATM HSL signaling link, only the *link=a* parameter can be specified.

This command is not supported for cards running the IPGHC application.

The *payload* and *line* values are not valid for the *loopback* parameter when the card is an E1 ATM.

Only the SLTC test can be run on card types LIME1 and LIMT1.

The card must contain the specified signaling link.

The specified signaling link must be provisioned in the database.

The specified signaling link must be an SS7 signaling link.

The signaling link that is used for LFS (Link Fault Sectionalization) testing cannot be active.

A previously entered command for a link test must be accepted before another link test command can be entered.

This command cannot be entered if the LFS test is running on the specified link.

The specified link cannot be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link. (See the *act/dact-cdl* commands).

The *force=yes* parameter must be specified to start a test when 256 or more tests are already running in the system.

This command cannot be entered if the maximum number of LFS or link tests are already running in the system. At least one active test must complete before the command can be entered again.

Only one link test can be running on a signaling link at one time.

The *action=stop* parameter cannot be specified when there is no active link test running on the specified link.

When the *action=stop* parameter is specified, the *loopback*, *time*, and *force* parameters cannot be specified.

If an IPSPG-M3UA signaling link is used, then this command cannot be entered.

If an IPSPG-M2PA signaling link is used, the *loopback=sltc* parameter must be specified.

The card must be equipped and in service, and must be one of the following cards:

- E5-E1T1, E5-E1T1-B, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPLHC or IPSPG application
- SLIC card running the IPSPG application

## Notes

The *lxvr* and *sltc* loopback tests can be run on low-speed signaling links. All the loopback tests can be run on the ATM high-speed signaling links.

## Output

If the card is inhibited (not in service), this message appears when a link test is attempted:

tst-slk:loc=1203:link=a

rlghncxa03w 03-11-07 16:19:08 EST EAGLE 31.3.0

**Legend**

- **LOC**—Card location that contains the signaling being tested
- **Link**—Signaling link being tested on the card
- **LSN**—Name of the linkset that contains the link being tested
- **Start time**—Time that the test started
- **LOOPBACK**—Type of loopback test being run
- **TIME**—Length of time that the test ran. This value can exceed the value specified in the `time` parameter if the test requires more than the specified time to complete.
- **TEST STATUS**—
  - If the `action=start` (specified or default) is specified, any of the following *TEST STATUS* values can appear:
    - Loopback success
    - Loopback failed
    - Loopback aborted
    - Loopback in-progress
    - Loopback prevented
    - Loopback invalid
  - If the `action=stop` parameter is specified, any of the following *TEST STATUS* values can appear:
    - Loopback cleared
    - Loopback could not be cleared

## tst-t1

Use this command to test T1 ports. The command is rejected if a loopback test is not compatible with the port type.

---

**Note:** This command can be entered for HC-MIM or E5-E1T1/E5-E1T1-B cards.

---

### Parameters

#### **loc (mandatory)**

The card location as stenciled on the shelf of the system.

##### **Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

#### **t1port (mandatory)**

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified card.

##### **Range:**

1 - 8

#### **action (optional)**

Indicator of command action to stop or start a test.

##### **Range:**

*start*

*stop*

##### **Default:**

*start*

#### **loopback (optional)**

Select loopback test type.

##### **Range:**

*line*

*lxvr*

local transceiver

*payload*

*feline*

far end line

*fepayload*

far end payload

**Default:***lxvr***Example**

tst-t1:t1port=1:loc=1203:loopback=lxvr

tst-t1:t1port=1:loc=1203:action=stop

**Dependencies**

This command cannot be entered during upgrade.

The value specified for the `loc` parameter must indicate an HC-MIM or E5-E1T1/E5-E1T1-B card with card type LIMT1.

The card in the location specified by the `loc` parameter must be equipped.

The card in the location specified by the `loc` parameter must be in service.

The T1 port specified by the `t1port` parameter must have a defined T1 interface.

All signaling links that provide timeslots serviced by T1 interfaces on the specified card must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (`tst-slk` and `act-cdl` commands) when this command is entered.

Only one port test can be running on the T1 port specified by the `t1port` parameter at one time.

The E1/T1 Port table must be accessible.

The `action=stop` parameter can be specified only when a port test is running.

If the `action=stop` parameter is specified, a value of *feline* or *fepayload* must be specified for the `loopback` parameter.

If the `action=stop` parameter is specified, and a value of *feline* or *fepayload* is specified for the `loopback` parameter, then there cannot be an active loopback for the T1 span, or the active loopback must be the one specified in the `tst-t1:action=stop` command.

**Notes**

Only one port test can be performed at a time on a T1 port. When a port test is in progress on a T1 port, subsequent test requests are rejected.

If a loopback type of *feline* or *fepayload* is specified, then the loopback requests are sent to the far end. No response is given from the far end to indicate if the request was acted upon or received. The local card which hosts the T1 span in the EAGLE does not instrument the loopback locally but maintains knowledge of the far end loopback request. If the local card boots, this knowledge is lost by the card.

To maintain the far end loopback states, if the T1 card with an active *feline* or *fepayload* test boots, the card loses any knowledge of the Far End loopback request, but the OAM retains that knowledge. If the OAM boots, the T1 card updates the OAM with its

last known loopback state. If both the T1 card and the active OAM card boot while a Far End Loopback is active, then there is no way of determining the T1 state; however, a `tst-t1:action=stop:action=(feline or fepayload)` command can still be sent.

**Output**

```
tst-t1:t1port=1:loc=1203:loopback=lxvr
```

```
rlghncxa03w 05-01-07 16:19:08 EST  EAGLE5 33.0.0

## ublk-slk

Use this command to cancel a local processor outage (LPO) and restore the link to its previous state. Link status signal units (LSSU) with status of processor outage are stopped, and the link begins sending MSUs again. IPSP-M3UA signaling links are allowed to enter service by allowing received AS-ACTIVE messages to be accepted.

---

---

**Note:** The blocked status of the signaling link is not preserved across a LIM reboot.

---

---

**Parameters****link (mandatory)**

The signaling link on the card specified in the `loc` parameter. The signaling links can be specified in any sequence or pattern.

**Synonym:**

*port*

**Range:**

*a, b, a1 - a63, b1 - b63*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

**loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**Example**

```
ublk-slk:loc=2311:link=b
```

**Dependencies**

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPLHC or IPSG application
- E5-E1T1, or E5-E1T1-B card running the SS7ANSI or CCS7ITU application
- SLIC card running the IPSG application

This command is not valid for E5-ENET or E5-ENET-B cards with IPGHC or TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The card in the specified card location cannot be an E5-TDM card, an E5-MDAL card, a MUX card, or the cards running the OAM application.

This command is not valid for links belonging to proxy linksets.

An appropriate value must be specified for the `link` parameter when an ATM card is used:

- *a-a1, b*—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

This command is not supported for links associated with J7 APCs.

**Notes**

Unblocking a signaling link removes a Level 2 failure resulting from a blk-slk of an ATM high-speed signaling link.

The function of this command is the same as the `canc-lpo` command.

*Installation Guide* provides an illustration of card locations.

**Output**

ublk-slk:loc=2311:link=b

```
rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
Local processor outage being cleared.
;
```

ublk-slk:loc=1113:link=a

```
rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
Command Rejected : Location is not valid for command.
;
```

## unhb-alm

Use this command to restore the reporting of alarms for the given device.

**Parameters**

---

---

**Note:** See [Point Code Formats and Conversion](#) for a detailed description of point code formats, rules for specification, and examples.

---

---

**dev (mandatory)**

Device. The device where the reporting of alarms is to be restored.

**Range:**

*applsock*

IP gateway application socket

*as*

IP gateway application. Application Server

*card*

Cards in the database

***cdt***

Customer defined troubles

***clock***

System clock

***dlk***

IP ports on the VSCCP, EROUTE, SLAN, MCPM, and FC-capable cards

***e1port***

E1 port on HC-MIM, E5-E1T1, or E5-E1T1-B cards

***ls***

Linksets

***lsmsconn***

Communication link between the LSMS and the EMS

***route***

Route

***slk***

Signaling links

***t1port***

T1 port on HC-MIM, E5-E1T1, or E5-E1T1-B cards

***trm***

Terminals

***rtx***

Exception Route

***enet***

Ethernet

***tps***

TPS subsystem

**asname (optional)**

Gateway Application Server name. When used with the `dev=as` parameter, this parameter can be used to uninhibit alarms for the named Application Server.

**Range:**

*aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**cic (optional)**

Starting Circuit Identification Code. This parameter is used alone or together with the `ecic` parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

**Range:**

0 - 16383

**dpc (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:**

*dpca*

**Range:**

*p-*, 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

The asterisk value (\*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

**dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)**

Destination point code for inhibiting alarms for routes.

**dpci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**dpcn (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmti* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*-, *p*-, *ps*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

#### **dpcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

##### **Range:**

*p*-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p*

*msa*—000-255

*ssa*—000-255

*sp*—000-255

#### **dpcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

##### **Range:**

*p*--, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*---*p*

*un*---000---127

*sna*---000---15

*mna*---000---31

#### **e1port (optional)**

Port ID. The E1 port on the specified HC-MIM, E5-E1T1, or E5-E1T1-B card. This parameter is mandatory if the *dev=e1port* parameter is specified.

##### **Range:**

1 - 8

#### **ecic (optional)**

Ending Circuit Identification Code. This parameter is used with the *cic* parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

##### **Range:**

0 - 16383

**id (optional)**

Customer Defined Trouble (CDT) ID. Customer Defined Trouble IDs 1 through 4 are generated critical alarms. Because critical alarms cannot be turned off, Customer Defined Trouble IDs 1 through 4 cannot be specified as values for the `id` parameter. This parameter is mandatory if the `dev=cdt` parameter is specified.

**Range:**

5 - 16

**lsn (optional)**

Incoming Link Set Name. The name of the originating linkset. This value is used as part of the exception routing criteria for the specified exception route.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**link (optional)**

Signaling link on the card specified in the `loc` parameter.

**Synonym:**

*port*

**Range:**

*a, b, a1 - a31, b1 - b31*

*a1, a2, b1, b2 — dev=lsmsconn*

*a, b, a1-a31, b1-b31 — dev=slk for an HC-MIM or E5-E1T1-B card*

*a, b, a1-a15, b1-b15 — dev=slk for an E5-E1T1 card*

*a1, b1 — dev=dlk for an FC-capable card*

*a, b — dev=enet for an E5-ENET or E5-ENET-B card*

**loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118*

**lsn (optional)**

Linkset name. The name of the linkset containing the device where alarm reporting is to be restored.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**opc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:***opca***Range:***000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001-005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006-255*.

The point code *000-000-000* is not a valid point code.

**opc/opca/opci/opcn/opcn24/opcn16 (optional)**

Origination point code

**opci (optional)**

ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:***s-, p-, ps-, 0-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**zone—0-7**area—000-255**id—0-7*

The point code *0-000-0* is not a valid point code.

**opcn (optional)**

ITU national origination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:***s-, p-, ps-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps**nnnnn—0-16383**gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**opcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p*

*msa—000–255*

*ssa—000–255*

*sp—000–255*

**opcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

**Range:**

*p--*, 000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix---p*

*un---000---127*

*sna---000---15*

*mna---000---31*

**si (optional)**

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

**Range:**

0 - 15

**sname (optional)**

Gateway application socket. When used with the `dev=appsock` parameter, this parameter can be used to uninhibit alarms for the named IP7 application socket.

**Range:**

*aaaaaaaaaaaaaaaa*

1 to 15 alphanumeric characters

**t1port (optional)**

Port ID. T1 port on the specified HC-MIM, E5-E1T1, or E5-E1T1-B card. This parameter is mandatory if the `dev=t1port` parameter is specified.

**Range:**

1 - 8

**trm (optional)**

Terminal ID. The ID number of the terminal whose alarms are to be uninhibited.

**Range:**

1 - 40

**Default:**

Report displays on the terminal where the command was issued.

**Example**

```
unhb-alm:dev=route:dpc=1-1-1
```

```
unhb-alm:dpc=1-101-1:opc=4-4-4:dev=rtx
```

```
unhb-alm:loc=1102:dev=dlk:port=a1
```

```
unhb-alm:dpcn16=121-10-15:opc16=121-10-15:dev=rtx
```

**Dependencies**

This command is not allowed in the upgrade mode.

No other action command can be in progress when this command is entered.

When the dev=card parameter is specified, the loc parameter must be specified.

When the dev=dlk parameter is specified, the loc parameter must be specified.

When the dev=slk parameter is specified, the loc and link parameters must be specified.

When the dev=e1port parameter is specified, the loc and e1port parameters must be specified.

When the dev=t1port parameter is specified, the loc and t1port parameters must be specified.

When the dev=ls parameter is specified, the lsn parameter must be specified.

When the dev=trm parameter is specified, the trm parameter must be specified.

When the dev=cdt parameter is specified, the id parameter must be specified.

When the dev=lsmsconn parameter is specified, the link parameter must be specified.

When the dev=route parameter is specified, a dpc/dpca/dpci/dpcn/dpcn24/dpcn16 parameter must be specified.

When the dev=applsock parameter is specified, the sname parameter must be specified.

When the dev=as parameter is specified, the asname parameter must be specified.

The linkset specified by the lsn parameter must be equipped in the database.

If the dev=slk or dev=dlk parameter is specified, the specified link must exist in the database.

The STP Options table must be accessible.

The Device Alarm Inhibit table must be accessible.

The parameters that can be specified with the dev parameter vary, depending on the value specified for the dev parameter as shown:

- dev= (any value)— dur or lvl
- dev=asname — as
- dev=dpc/dpca/dpci/dpcn/dpcn24/dpcn16 — route
- dev=id — cdt
- dev=loc — card, dlk, e1port, slk, t1port, enet
- dev=lsn — ls
- dev=e1port — e1port
- dev=link (link=a, b)— dlk, slk, enet
- dev=link ( link=a1, b1)— dlk (For FC-capable cards)
- dev=link ( link=a, b, a1, a2, b1, b2, a3, b3)— slk
- dev=link (link=a1, a2, b1, b2)— lsmsconn
- dev=sname — applsock
- dev=t1port — t1port
- dev=trm — trm

If the sname parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

The card location that is specified in the loc parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be turned on before specifying the dev=rtx parameter.

The link parameter must be valid for the selected device type.

The card specified by the loc parameter must have an IPS, MCP, STPLAN, EROUTE, VSCCP, IPSG, IPLIM, IPLIMI, SS7IPGW, or IPGWI application.

The J7 Support feature must be enabled before the opcn16/dpcn16 parameters can be specified.

### Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

### Output

unhb-alm:dev=route:dpc=1-1-1

```
rlghncxa03w 03-03-23 13:20:59 EST  EAGLE 31.3.0
Alarms are inhibited.

## unhb-slks

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

---

---

**Note:** The inhibited status of the signaling link is not preserved across a LIM reboot.

---

---

#### Parameters

##### Link (mandatory)

The signaling link on the card specified in the loc parameter. The signaling links can be specified in any sequence or pattern.

**Synonym:***port***Range:***a, b, a1 - a63, b1 - b63*

Not all card types support all link parameter values.

See [Table A-1](#) for valid link parameter range values for each type of card that can have a location specified in the `loc` parameter.

**loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**Example**

```
unhb-slk:loc=1301:link=a
```

**Dependencies**

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-E1T1, E5-E1T1-B, or HC-MIM card running the SS7ANSI or CCS7ITU application
- E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application
- E5-ENET or E5-ENET-B card running the IPLIM, IPLIMI, or IPSG application
- SLIC card running the IPSG application

The card must contain signaling links.

The signaling link must be equipped in the database.

The inhibit and uninhibit actions are valid for links on E5-ENET and E5-ENET-B cards running the IPLIMx application.

The card in the specified card location cannot be an E5-TDM card, an E5-MDAL card, a MUX card, or the cards running the OAM application.

This command is not valid on E5-ENET or E5-ENET-B cards with SS7IPGW, IPGWI, or IPSG-M3UA links. IPLIM and IPLIMI links can be uninhibited.

If an IPSG-M3UA signaling link is used, then this command cannot be entered.

An appropriate value must be specified for the `link` parameter when an ATM card is used:

- *a-a1, b*—E5-ATM or E5-ATM-B card running the ATMANSI or ATMITU application

This command is not supported for links associated with J7 APCs.

### Notes

The function of this command is the same as the `canc - lpo` command.

*Installation Guide* provides an illustration of card locations.

### Output

```
unhb-sl k: loc=1301: link=a
```

```
rlghncxa03w 03-03-23 13:20:59 EST EAGLE 31.3.0
Allow Link message sent to card

## unlock

Use this command to unlock a previously locked terminal keyboard. Anyone attempting to use the keyboard is prompted to enter the password of the currently logged-in user.

### Parameters

This command has no parameters.

### Example

```
un lock
```

### Dependencies

You must enter the password of the logged in user to unlock the keyboard.

This command is valid only if the keyboard is locked.

The port must not be in an unlock disabled state because of excessive successive unlock failures.

### Notes

None

### Output

unlock

```
Enter LOGIN password to unlock keyboard :
```

## Debug Commands

This chapter contains information about debug commands used in troubleshooting and debugging the system. These commands are intended only for [My Oracle Support \(MOS\)](#) personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to personnel who have access to the command class Debug.

CAUTION: These commands are to be used precisely as they are described in this chapter, and only under the direction of Customer Care Center personnel. Any other use of these commands can result in a system failure.

This chapter contains the debug commands in alphabetical order.

### act-gedti

Use this command to activate a GEDTI Hub for Eagle Eyes. The state of the GEDTI Hub is changed from DACT(Deactivated) to ACT(Active).

---

**Note:** The GEDTI hub must be Deactivated on the specified card before the command can be executed. If the card boots, then the status of the GEDTI Hub will be reset to DACT.

---

#### Parameters

##### **loc (mandatory)**

The card location as stenciled on the shelf of the system.

##### **Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

##### **Example**

```
act-gedti:loc=1102
```

##### **Dependencies**

The value specified for the `loc` parameter must refer to an equipped card location.

The card at the specified location must be configured as GEDTI Hub.

Activating the state of GEDTI Hub that is already activated has no effect.

The card at the specified location must not be a reserved location.

**Notes**

None.

**Output**

```
act-gedti:loc=1101
```

Command Accepted - Processing

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 46.0.0 act-gedti:loc=1101  
Command entered at terminal #1.;
```

```
tekelecstp 11-08-16 18:35:44 MST  
UNKNOWN EAGLE 46.0.0 Activate GEDTI Hub message sent to card.;
```

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 46.0.0  
Command Completed.;
```

**Related Topics:**

[chg-gedti-card](#)

[dact-gedti](#)

[rept-stat-gedti](#)

## act-ip-lnk

Use this command to activate an IP link and put the link into service. The state of the link is changed from OOS-MT-DSBLD (Out-Of-Service-Maintenance-Disabled) to OOS-MT (Out-Of-Service-Maintenance), IS-ANR (In-Service-Abnormal) or IS-NR (In-Service-Normal).

---

---

**Note:** The specified card must be Active before the command can be executed. If the card boots, then the status of the IP link will be reset.

---

---

**Parameters****loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115*

**port (mandatory)**

Ethernet interface Port ID.

**Range:***a*

IP Port A

*b*

IP Port B

*c*

IP Port C

*d*

IP Port D

*fca*

Fast Copy Port A

*fcb*

Fast Copy Port B

**Example**

```
act-ip-lnk:loc=1102:port=a
```

```
act-ip-lnk:loc=1203:port=fca
```

```
act-ip-lnk:loc=1103:port=c
```

```
act-ip-lnk:loc=1202:port=d
```

**Dependencies**

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ENET or E5-ENET-B card running the EROUTE, IPGWx, IPLIMx, IPSG, or STPLAN application
- IPSM card
- E5-SM4G or E5-SM8G-B card running the VSCCP application
- E5-OAM card running the OAMHC application
- E5-MCPM-B
- SLIC card

A valid value must be specified for the `loc` parameter.

The value specified for the `port` parameter must be supported by the card:

- port A - E5-OAM card running OAMHC application, IPSM card, E5-MCPM-B card, E5-ENET or E5-ENET-B card running the STPLAN application
- port A, B - E5-ENET or E5-ENET-B card running the EROUTE or IPLIMx application, E5-SM4G or E5-SM8G-B card running the VSCCP application
- port A, B, FCA, FCB - E5-ENET or E5-ENET-B card running the IPGWx or IPSG application

- port A, B, C and D are valid for SIP/ENUM/DEIR application running on SLIC card.

The card at the specified location must be configured.

The card in the specified location must be Active before this command can be executed.

2387 E2387 Cmd Rej: Card is not in service

### Notes

The act-ip-lnk/dact-ip-lnk commands were created as debug means - aids to turn off or disable the IP interface to troubleshoot network problems, specifically to allow the operator to troubleshoot IP network flooding issues that can cause EAGLE cards to boot repeatedly while trying to come up. These commands should NOT be used for general maintenance actions since they have not been rigorously tested and their usage should be limited to situations like described above.

Interface A/D is used for ExAP connectivity and interface B/C is used for the signaling network on the SLIC card running the SIP/ENUM/DEIR application.

### Output

```
act-ip-lnk:loc=1101:port=a
```

Command Accepted - Processing

```

```

### Related Topics:

[rtrv-ip-lnk](#)

## act-upgrade

Use this command to perform a software upgrade from a source release to the target release on an in-service system.

---

**Caution:** It is strongly recommended that this command be used only in conjunction with the system Upgrade Procedure for your target release. The Upgrade Procedure provides step-by-step information on performing an upgrade.

---

### Parameters

#### **action (mandatory)**

The action to be performed for the upgrade process.

---

**Caution:** The `converttoam` and `netcomplete` actions should be used only under the direction of My Oracle Support (MOS).

---

#### **Range:**

*yyyyyyyyyy*

Up to 10 alphabetic characters. Valid actions are:

- *chkrel*—Validates the stored upgrade target release on the physical disk as specified by the `src` parameter.
- *converttoam*—Converts the standby OAM database.
- *convertstp*—Performs all OAM and network conversions necessary for an upgrade. This command transitions through all of the upgrade phases to upgrade completion. If measurement collection is turned on, this command automatically inhibits measurements during the upgrade. Upon completion of the upgrade, this command returns the MASPs to full-function mode with measurement collection turned back on.
- *createsets*—Assigns network cards to upgrade-grouping sets.
- *dbstatus*—Reports the status of all database partitions on the TDM fixed disks and the removable drive(s) (similar to the `rept -stat -db:display=version` command).
- *displaysets*—Reports the upgrade-grouping sets of network cards.
- *getrel*—Retrieves the upgrade target release file from either the EAGLE software release distribution server or the plug-in flash drive. It then expands the data on the inactive partition group of the hard disks.
- *netcomplete*—Indicates upgrade completion and places the system in a fully functional mode.
- *oamcomplete*—Sets the upgrade phase number to 3, and enables the beginning of controlled card loading.

- *refreshsets*—Not yet supported.
- *verifysets*—Verifies that the card set list is consistent with the current EAGLE configuration and displays detailed information on any inconsistencies found.

**force (optional)**

Allows the user to override Card Set List verification and perform upgrade when only minor inconsistencies are present.

**Range:**

*yes*

Override the Card Set List verification and perform the upgrade.

**release (optional)**

The name of the software release file to be downloaded.

This file contains the upgrade target release on the software release distribution server or plug-in flash drive.

**Range:**

*xyyyyyyyyyyyyyyyyyyyyyyyyyyyyyyy*

1 alphabetic character followed by up to 29 alphanumeric characters. One or more periods can be used.

---

---

**Note:** The value must be at least 11 characters in length and must contain a hyphen (-). The format of the value must be *xx.xx.xx-yy.yy.yy*, where *xx.xx.xx* is the release number, and *yy.yy.yy* is the engineering build number.

---

---

**src (optional)**

The physical disk that contains the upgrade target release.

**Range:**

*fixed*

The upgrade target release is on the fixed disk

*usb*

The upgrade target release is on the removable media inserted in the flush-mount USB port

*server*

The upgrade target release is on the remote server

**thres (optional)**

Network Threshold value. The percentage of signaling links that is to remain in service (IS) during the network conversion phase. This enables SCCP thresholding and flashing on non-provisioned cards during the upgrade.

**Range:**

*50 - 90*

**Default:**

Network cards are updated serially

**Example**

```
act-upgrade:action=convertstp
```

```
act-upgrade:action=dbstatus
```

```
act-upgrade:action=convertstp:thres=75
```

```
act-
```

```
upgrade:action=getrel:release="46.7.0.0-74.2.0.tar.gz":src=usb
```

```
act-upgrade:action=chkrel:src=fixed
```

**Dependencies**

The value specified for the `action` parameter must correspond to a specific upgrade phase:

- `action=converttoam`—upgrade phase=0 and 1
- `action=oamcomplete`—upgrade phase=2
- `action=converttnet`—upgrade phase=3
- `action=netcomplete`—upgrade phase=3
- `action=convertstp`—upgrade phase=0-3

The Measurements Collection function must be turned off (`chg-meas:collect=off`) or the Measurements Platform feature must be turned on (`chg-measopts:platformenable=on`) before a value of *converttoam*, *oamcomplete*, or *netcomplete* can be specified for the `action` parameter.

A valid upgrade release must reside on the plug-in flash drive or the inactive partition of the fixed disk.

The standby OAM database must be the source release.

The current OAM database must be the source release.

The database partition must be coherent.

The database partition must be in the correct functional mode.

The `action=convertstp` and `thres` parameters must be specified together in the command.

Upgrade conversion cannot be initiated from a telnet-type terminal (terminal IDs 17-40).

The DCM cards are obsolete for SS7IPGW, IPGWI, IPLIM, and IPLIMI applications.

The `action=getrel` and `release` parameters must be specified together in the command.

An IPSM card must be provisioned and in service before a value of *getrel* or *chkrel* can be specified for the `action` parameter.

The `ent-ftp-serv:app=dist` command must be entered before a value of *getrel* or *chkrel* can be specified for the `action` parameter.

The `act-upgrade:action=convertstp` cannot be issued with any removable media inserted in any of the USB ports.

Invalid hardware configuration alarms are set or an HMUX alarm must be addressed.

All cards that are in the auto-inhibited state must be removed before this command can be entered.

Cards that prevent the IMT buses from being inhibited during the upgrade cannot exist in the system.

The specified source drive must be at the correct database version for the upgrade to proceed.

The plug-in flash drive cannot contain an EAGLE backup image.

If the `src=usb` parameter is selected, then the plug-in flash drive upgrade media must be inserted in the Active OAM's flush-mounted USB port.

The internal RAM disk must be available for the plug-in flash drive's upgrade image to be unpackaged.

The disk that contains the upgrade target release must be in a known upgrade mode.

If the `src=usb` or `src=server` parameter is specified, then the `action=getrel` parameter must be specified. If the `src=fixed` parameter is specified, then the `action=getrel` parameter cannot be specified.

The EAGLE PVN address in the source database cannot be identical to the EAGLE FCNA or FCNB network address in the target database.

The `icdpnunknx` and `icdpnunkX` and the `gcdpnunknx` and `gcdpnunkX` NPP Action Sets cannot co-exist in the source release.

The value specified for the `release` parameter must be at least 11 characters in length and contain a hyphen (-). The format of the value must be `xx.xx.xx-yy.yy.yy`, where `xx.xx.xx` is the release number, and `yy.yy.yy` is the engineering build number.

The card must have sufficient DRAM memory to perform the GTMOD table Health Check.

The AMGTT data in the GTT table cannot exceed the capacity of the GTMOD table (100 K).

Unable to access GTT table from source drive.

The MFC feature must be ON prior to upgrading to release 46.2 or later.

The `action=refreshsets` and `action=verifysets` parameters are not supported.

The `thres` parameter cannot be specified if the threshold type (`threstype`) has been changed to `set`.

When issuing the `act-upgrade` command with the `threstype` assigned to card sets, the list of card sets needs to be created and valid.

When issuing the `act-upgrade` command with the `threstype` assigned to Card Set, the card set list must be consistent with the current EAGLE configuration, unless **`force=yes`** is allowed and specified. Details of any such inconsistencies and recovery instructions will be reported in a similar manner as `act-upgrade:action=verifysets`.

## Notes

The `act-upgrade:action=convertstp` command executes all four upgrade phases consecutively.

If the `act-upgrade:action=convertstp` command is entered following a command abort, the upgrade processing determines the last upgrade phase that was successfully completed. The upgrade processing then attempts to restart from that point to successful completion. Re-entering the `act-upgrade:action=convertstp` command following a command abort is the recommended method for recovery.

The TDMs and plug-in flash drives have upgrade phase indicators. The upgrade command expects the disks to be in certain phases before executing a specific action. If the disks are not in the correct phases, an error is generated.

The `act-upgrade:action=dbstatus` command generates output similar to that provided by the `rept-stat-db:display=version` command.

The `thres` parameter is used to:

- Allow multiple cards to be upgraded together, as long as the specified percentage of links remains in service. The value is applied to groups of links based upon the link-supporting group or the entire system. The grouping is set by the `chg-upgrade-config:threstype=` command.
- Enable SCCP thresholding, which allows multiple Service Module cards to be upgraded together. The specified `thres` parameter value is not used to determine the number of Service Module cards to upgrade. The peak SCCP load since the last OAM boot is used to determine the number of cards that must remain in service (at least half of the cards must remain in service).
- Enable the non-provisioned flash function, which flash-downloads any boot-prom type card if the card is in the system but not provisioned.

The `act-upgrade:action=getrel` action defaults to getting the release from the provisioned IPSM card using the provisioned FTP Server. If the `src=usb` parameter is specified, then the release is obtained from the plug-in USB flash drive upgrade media.

## Output

---

**Note:** The `act-upgrade:action=convertstp` command performs the OAM conversion and the network conversion. During the conversion, this command broadcasts the current activity in the scroll area. Refer to Appendix B of the EAGLE Release Software Upgrade Procedure for a sample of message output.

---

The action `dbstatus` reports the current database status.

`act-upgrade:action=dbstatus`

```
eaglestp 15-02-13 11:45:51 MST  EAGLE5 45.0.1-64.70.35 Upg Phase 0

rept-stat-db

---

A character string, specifying board identification field data based on the value of the `fld` parameter.

## 5-10 EAGLE Commands User's Guide

**loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1112, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118, 6202 - 6212, 6302 - 6312

**type (optional)**

Type of board.

**Range:**

*mbd*  
main assembly

**Example**

This example shows changing of the **sm** (Software MatchID) field in BIP data of Main assembly:

```
chg-bip-fld:loc=1102:fld=sm:data="001"
```

**Dependencies**

The value of the **loc** parameter cannot specify a location for a fixed disk or removable drive.

**Notes**

The card in the specified location must be inhibited.

**Output**

```
chg-bip-fld:loc=1103:fld=rev:data="B"
```

```
tekelecstp 10-04-01 12:05:44 IST EAGLE 42.0.0
Board ID Prom updated.
;
```

**Related Topics:**

## chg-bip-rec

Use this command to manually update the Board Identification PROM (BIP) data during an upgrade in the field.

---

---

**Note:** Initial programming of the BIP data occurs during manufacturing.

---

---

## Dependencies

The value of the `loc` parameter cannot specify a location for a fixed disk or removable drive.

If the `init=yes` parameter is specified, then the value of the `data` parameter must be a Board IDentification (BID) record.

## Notes

The card in the specified location must be inhibited.

## Output

`chg-bip-rec:loc=1107:data=xxx:init=yes`

```
tekelecstp 10-04-01 12:05:44 IST  EAGLE 42.0.0
Board ID Prom updated.
;
```

# chg-ee-card

Use this command to enter/modify Eagle Eyes Network card data in the Eagle Eyes Card (EE CARD) table. The EE CARD entry consists of Card location and Eagle Eyes specific data.

## Parameters

### **loc (mandatory)**

Eagle Eyes Card location.

#### **Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

### **action (optional)**

Action to be performed on the specified filter ID for the card.

#### **Range:**

*attach*

*detach*

**Default:**

No change to the current value.

**System Default:**

0

**flt id (optional)**

A comma-separated Eagle Eyes Filter ID list to be associated or disassociated with the card. Up to 8 FLT IDs can be specified in the list.

**Range:**

1-200

**Default:**

No change to the current value.

**System Default:**

0

**kb lim (optional)**

Sets the file size limit of the capture file created, in kilobytes.

**Range:**

1-4000000

**Default:**

No change to the current value.

**System Default:**

none

**pkt lim (optional)**

Sets the limit on the number of Ethernet frames to send.

**Range:**

1-10000000

none

**Default:**

No change to the current value.

**System Default:**

none

**sec lim (optional)**

Sets the limit on the amount of time to perform the trace, in seconds.

**Range:**

1-5644800

none

**Default:**

No change to the current value.

**System Default:**

none

**thr (optional)**

Sets the sending rate of the Eagle Eyes throttle task in IMT packets per second. The packets will not be captured unless this parameter is set to a non-zero value for the particular card.

**Range:**

1000--10000

**Default:**

No change to the current value.

**System Default:**

0

**Example**

```
chg-ee-card:loc=1101:fltId=12:action=attach:thr=2000:pktlim=5000
```

```
chg-ee-card:loc=1102:kblim=40000:seclim=3000000
```

```
chg-ee-card:loc=1101:fltId=13:action=detach:pktlim=none
```

**Dependencies**

If the `fltId` parameter is specified, then the `action` parameter must be specified.

The EE CARD table cannot contain more than 256 entries.

The EE CARD table must be accessible.

At least one optional parameter must be specified.

The `fltId` specified should not be already associated with the card.

The value specified for the `fltId` parameter must already exist in the EE FLT table.

Maximum of 16 include filters can be attached to a card.

Maximum of 16 exclude filters can be attached to a card.

The value specified for the `loc` parameter must not be a system reserved location.

The IMT table must be accessible.

The card in the location specified by the `loc` parameter must have Eagle Eyes service capability.

The card `loc` specified to detach a filter must have Eagle Eyes configured.

The card at the specified location must be equipped.

The Filter `appl` and card `appl` should be same.

**Notes**

The value specified for the `loc` parameter must refer to a card running one of the following GPLs, and the referenced card must be equipped:

- IPSTG, IPLHC, IPGHC

- ATMHC
- SS7HC
- SIPHC
- DEIRHC

**Output**

```
chg-ee-card:loc=1101:fltld=12:action=attach:thr=2000:pktlim=5000
```

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0
```

```
EE CARD table is (2 of 256) 1% full
```

```
CHG-EE-CARD: MASP A - COMPLTD
```

## chg-gedti-card

Use this command to configure GEDTI Hub for Eagle Eyes traffic capture.

**Parameters****loc (mandatory)**

IPSM Card location to be configured as GEDTI Hub.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**port (mandatory)**

GEDTI Port to be set.

**Range:**

*1025 - 65354*

**Example**

```
chg-gedti-card:loc=1211:port=1124
```

**Dependencies**

The value specified for the loc parameter must correspond to the location of an IPSM card.

The value specified for the port parameter must not be configured on any other IPSM card.

If the GEDTI Hub is in ACTIVE state then port cannot be changed.

The EE Card table must be accessible.

**Notes**

None.

**Output**

```
chg-gedti-card:loc=1211:port=1245
```

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0  
EE CARD table is (2 of 256) 1% full  
CHG-GEDTI-CARD:MASP A - COMPLTD ;

## chg-tbl

Use this command to create, rename, or reset any table on a fixed disk or removable drive.

---

---

**Caution:** Before entering the `chg -tbl` command, contact My Oracle Support.

---

---

**Parameters****action (mandatory)**

The desired action to perform on the table.

**Range:***create*

Creates a DOS entry in the FAT table and updates the DOS directory table.

*rename*

Changes the name of an existing system table to a new DOS file name (does not update the *dms.cfg* file).

***reset***

Initializes an existing table to the value designated by the `resetchar` parameter.

**disk (mandatory)**

Target disk. The disk that contains the file.

**Range:*****remove***

Removable drive

***fixed***

Fixed disk

***usb***

Argument to be used by Oracle personnel only.

**ext (optional)**

Extension. The three character DOS filename extension.

**Range:**

*azz*

0–3 ASCII characters

**filelength (optional)**

The amount of space the file occupies on the disk.

**Range:**

*1 - 32505856*

**id (optional)**

Table identification number.

**Range:**

*0 - 499*

**name (optional)**

Name of the file.

**Range:**

*azzzzzzz*

1–8 ASCII characters

**prtnggrp (optional)**

Partition group. The disk partition group to be changed.

**Range:**

*active*

*inactive*

**Default:***active***resetchar (optional)**

Reset character. The table reset character that is written to every byte of the table.

**Range:***0 - 255***Example**

```
chg-  
tbl:action=create:disk=remove:name=test:ext=sys:filelength=15000  
0  
  
chg-tbl:action=reset:disk=remove:id=0  
  
chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old
```

**Dependencies**

If the `action=create/rename` parameter is specified, then the `name` parameter must be specified.

If the `action=create` parameter is specified, then the `name`, `ext`, and `filelength` parameters must be specified.

If the file type is a directory, the `filelength` parameter is not required. The directory entry file length is always 1 cluster in length.

The attributes used during file creation are current date and time of the active MASP. Readable/writable files are allocated contiguously from the last free FAT cluster.

If the `action=reset` parameter is specified, then the `id` parameter must be specified.

If the `action=rename` parameter is specified, then the `id`, `name`, and `ext` parameters must be specified.

This command cannot be used to modify the security log.

**Notes**

None

**Output**

```
chg-  
tbl:action=create:disk=remove:name=test:ext=sys:filelength=15000  
0  
  
chg-tbl: CREATE OK : filename = test.sys, byte length = 150000  
chg-tbl: command complete  
;  
  
chg-tbl:action=reset:disk=remove:id=0  
  
chg-tbl: RESET OK : Table 0, DMS.CFG  
chg-tbl: command complete  
;
```

```
chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old
```

```
chg-tbl: RENAME OK : Table 0, DMS.CFG to DMS.OLD  
chg-tbl: command complete  
;
```

**Related Topics:**

[disp-disk-dir](#)

## chg-upgrade-config

Use this command to configure data used by the upgrade software during an upgrade of an in-service EAGLE from a source release to the target release.

---

---

**Note:** This command stores data that will be used during the software upgrade. The command does not start the software upgrade.

---

---

**Parameters****addtblcnv (optional)**

This parameter sets the flag of the corresponding entry in the Table Conversion Definition table that forces the table to be converted during a software upgrade.

---

---

**Caution:** The `addtblcnv` parameter should be used only under the direction of My Oracle Support (MOS).

---

---

**Range:**

0 - 1023

**assignset (optional)**

Assigned Set. The card specified by the `loc` parameter is assigned to the upgrade-grouping set specified by this parameter.

**Range:**

0

removes the card from the set list

2 - 10

assigns the card to that particular set list for the group corresponding to the card type

**deltblcnv (optional)**

This parameter clears the flag of the corresponding entry in the Table Conversion Definition table that forces the table to be converted during a software upgrade.

---

---

**Caution:** The `deltblcnv` parameter should be used only under the direction of My Oracle Support (MOS).

---

---

**Range:**

0 - 1023

**limsets (optional)**

LIM Sets. This parameter sets the number of sets for link cards.

**Range:**

2 - 10

**loc (optional)**

Location. The location of a network card to be assigned to a set specified by the assignset parameter.

**Range:**

1101 - 1113, 1115, 1201 - 1218, 1301 - 1318, 2101 - 2118, 2201 - 2218, 2301 - 2318, 3101 - 3118, 3201 - 3218, 3301 - 3318, 4101 - 4118, 4201 - 4218, 4301 - 4318, 5101 - 5118, 5201 - 5218, 5301 - 5318, 6101 - 6118

**src (optional)**

Source. The disk that physically contains the upgrade target release.

**Range:***fixed*

The upgrade target release is on the fixed disk

*remove*

The upgrade target release is on the removable drive

**srvsets (optional)**

Service Sets. This parameter sets the number of sets for service cards.

**Range:**

2 - 10

**threstype (optional)**

Threshold type. The type of thresholding to be used during the upgrade.

**Range:***group*

upgrade threshold value applied at group level

*set*

network conversion is based on the defined sets of cards

**Example**

```
chg-upgrade-config:addtblcnv=327
```

```
chg-upgrade-config:deltblcnv=327
```

```
chg-upgrade-config:sak=vbjyapdpbtejb:src=fixed
```

```
chg-upgrade-config:threstype=set:srvsets=2:limsets=4
```

**Dependencies**

The `addtblcnv` and `delttblcnv` parameters cannot be specified together in the command.

One of the optional parameters must be specified in the command.

The `srvsets` and `limsets` parameters cannot be specified unless the `threstype` is being changed to or has been changed to `set`.

The `loc` parameter is required when the `assignset` parameter is specified.

The value specified for the `assignset` parameter cannot be greater than the current value of `srvsets` or `limsets` for the specified card.

**Output**

`chg-upgrade-config:addtblcnv=327`

```
rlghncxa03w 07-03-13 08:15:45 EST EAGLE 37.5.0
Command Completed.
;
```

**Related Topics:**

[act-upgrade](#)

## clr-disk-stats

Use this command to clear the disk performance statistics. All associated disk statistics are zeroed.

**Parameters****loc (mandatory)**

Location. The location of the card.

**Range:**

*1113, 1115*

**Default:**

none

**Example**

`clr-disk-stats:loc=1113`

**Dependencies**

The specified card location must contain a card that is running an OAM (1113 or 1115).

A related command must not be in progress.

**Notes**

None

**Output**

```
clr-disk-stats:loc=1113
```

```
rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0
Disk performance statistics cleared.
;
```

**Related Topics:**

[disp-disk-stats](#)

## copy-tbl

Use this command to copy a single table from one source to another. A table can be copied to any verifiable location in the system; however, the source and destination tables must have identical configurations (same number of entries, same entry size, both 1- dimensional and 2-dimensional).

---

---

**Note:** A table cannot be copied onto itself.

---

---

**Parameters****dloc (mandatory)**

Destination location. The location of the destination table.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**1114**

TDM

**1116**

TDM

**1113**

Latched USB port

**1115**

Latched USB port

**sloc (mandatory)**

Source location. The location of the source table.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 -*

5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**1114**  
TDM

**1116**  
TDM

**1113**  
Latched USB port

**1115**  
Latched USB port

**stbl (mandatory)**

Source table. The identifying number of the source table.

**Range:**  
0 - 1023

**ddrv (optional)**

Destination drive. The identification of the disk to which the table is copied.

**Range:**

*fixed*  
The fixed disk

*remove*  
The removable drive

*usb*  
Argument to be used by Oracle personnel only.

**Default:**  
*fixed*

**dprtnggrp (optional)**

Disk partition group. The disk partition group of the destination table.

**Range:**

*active*

*inactive*

**Default:**  
*active*

**dtbl (optional)**

Destination table. The identifying number of the destination table.

**Range:**

0 - 1023

**Default:**

The `stbl` parameter value

**sdrv (optional)**

Source drive. The identification of the disk from which the table is copied.

**Range:**

*fixed*

The fixed disk

*remove*

The removable drive

*usb*

Argument to be used by Oracle personnel only.

**Default:**

*fixed*

**sprtnggrp (optional)**

Source partition group. The disk partition group of the source table.

**Range:**

*active*

*inactive*

**Default:**

*active*

**Example**

```
copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed
```

**Dependencies**

Only one table copy command can be executed at a time.

The source and destination tables must exist and be compatible.

This command cannot be used to modify the security log.

The same value cannot be specified for the `sloc` and `dloc` or the `stbl` and `dtbl` parameters.

If a value of *fixed* is specified for the `sdrv` or `ddrv` parameter, then a value of 1114 or 1116 must be specified for the `sloc` or `dloc` parameter.

**Notes**

None

**Output**

```
copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed
```

```
rlghncxa03w 01-03-04 16:11:53 EST Rel 28.1.0  
Table copy command complete.
```

```
;
```

## dact-ee

Use this command to deactivate an Eagle Eyes Card and stop capturing traffic on it. The state of the card is changed from ACT (Active) to DACT (Deactivated).

---

---

**Note:** If the card boots, then the status of the card would be reset to DACT. This will clear the EE configuration from the card.

---

---

**Parameters****loc (mandatory)**

The Eagle Eyes card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**Example**

```
dact-ee:loc=1203
```

**Dependencies**

The card at the specified location must be equipped.

The card should be configured as an Eagle Eyes card.

**Notes**

The value specified for the loc parameter must refer to a card running one of the following GPLs, and the referenced card must be equipped:

- IPSC, IPLHC, IPGHC
- ATMHC
- SS7HC
- SIPHC
- DEIRHC
- ERTHC

## Output

dact-ee:loc=1101

Command Accepted - Processing

# dact-gedti

Use this command to deactivate a GEDTI Hub. The state of the GEDTI Hub is changed from ACT (Active) to DACT (Deactivated).

---

**Note:** The specified card must be Active before the command can be executed. If the card boots, then the status of the GEDTI Hub will be reset to DACT.

---

## Parameters

### Loc (mandatory)

The card location as stenciled on the shelf of the system.

#### Range:

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

## Example

dact-gedti:loc=1102

## Dependencies

The value specified for the `loc` parameter must refer to an equipped card location.

A valid value must be specified for the `loc` parameter.

The card at the specified location must be configured as a GEDTI Hub.

Deactivating the state of a GEDTI Hub that is already deactivated has no effect.

### Notes

None.

### Output

```
dact-gedti:loc=1101
```

Command Accepted - Processing

```
tekelecstp 11-08-16 18:35:44 MST EAGLE 46.0.0
```

```
dact-gedti:loc=1101
```

```
Command entered at terminal #1.
```

```
;
```

```

## dact-ip-lnk

Use this command to deactivate an IP link and put the link out of service. The state of the link is changed from IS-NR (In-Service-Normal), IS-ANR (In-Service-Abnormal), or OOS-MT (Out-Of-Service-Maintenance), to OOS-MT-DSBLD (Out-Of-Service-Maintenance-Disabled).

---

---

**Note:** The specified card must be Active before the command can be executed. If the card boots, then the status of the IP link will be reset.

---

---

### Parameters

#### **loc (mandatory)**

The card location as stenciled on the shelf of the system.

#### **Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 -*

4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1113, 1115

**port (mandatory)**

Ethernet interface Port ID.

**Range:**

*a*

IP Port A

*b*

IP Port B

*c*

IP Port C

*d*

IP Port D

*fca*

Fast Copy Port A

*fcb*

Fast Copy Port B

**Example**

```
dact-ip-lnk:loc=1102:port=a
```

```
dact-ip-lnk:loc=1203:port=fca
```

```
dact-ip-lnk:loc=1103:port=c
```

```
dact-ip-lnk:loc=1202:port=d
```

**Dependencies**

The value specified for the `loc` parameter must refer to one of the following cards, and the referenced card must be equipped:

- E5-ENET or E5-ENET-B card running the EROUTE, IPGWx, IPLIMx, IPSG, or STPLAN application
- IPSM card
- E5-SM4G or E5-SM8G-B card running the VSCCP application
- E5-OAM card running the OAMHC application
- E5-MCPM-B card
- SLIC card

A valid value must be specified for the `loc` parameter.

The value specified for the `port` parameter must be supported by the card:

- port A-E5-OAM card running OAMHC application, IPSM card, E5-MCPM-B card, E5-ENET or E5-ENET-B card running the STPLAN application
- port A, B-E5-ENET or E5-ENET-B card running the EROUTE or IPLIMx application, E5-SM4G or E5-SM8G-B card running the VSCCP application
- port A, B, FCA, FCB- E5-ENET or E5-ENET-B card running the IPGWx or IPSEG application
- ports A, B, C and D are valid for DEIR/SIP/ENUM applications running on SLIC card

The card at the specified location must be configured.

The card in the specified location must be Active before this command can be executed.

2387 E2387 Cmd Rej: Card is not in service

### Notes

The act-ip-lnk/dact-ip-lnk commands were created as debug means - aids to turn off or disable the IP interface to troubleshoot network problems, specifically to allow the operator to troubleshoot IP network flooding issues that can cause EAGLE cards to boot repeatedly while trying to come up. These commands should NOT be used for general maintenance actions since they have not been rigorously tested and their usage should be limited to situations like described above.

Interface A/D is used for ExAP connectivity and interface B/C is used for the signaling network on the SLIC card running DEIR/SIP/ENUM applications.

### Output

```
dact-ip-lnk:loc=1101:port=a
```

```
Command Accepted - Processing

## dbg-ddb

Use this command to display the checksum, statistics, and wild write audit (WWA) updates of dynamic database (DDB) table entries, audit a specific table, and reset the DDB statistics on the cards.

**Parameters****action (mandatory)**

The action taken by the command.

**Range:*****stats***

display dynamic database statistics

***aud***

audit a specific table

***disp***

display a table entry

***wwa***

display any entries updated by WWA task

***rststat***

reset following DDB audit statistics:

- Number of DDB updates
- Number of consecutive DDB update in progress
- Maximum DDB updates in 100 msec
- Idle period
- Maximum and minimum idle period

**audtype (optional)**

Audit type. This parameter specifies whether a unicast or multicast audit is performed.

**Range:*****mc***

multicast

*uc*  
unicast

**Default:**

*mc*

**dpc (optional)**

The destination point code value. The Route table entry corresponding to the DPC value is displayed.

**Range:**

*p-*, 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p-*

The asterisk value (\*) is not valid for the *ni* subfield.

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code 000-000-000 is not a valid point code.

**dpc/dpca/dpci/dpcn/dpcn24/dpcn16 (optional)**

**dpci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255, *none*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

Enter *none* to delete the point code.

**dpcn (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, *p-*, *ps-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**dpcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:**

*p-*, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p*

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**Default:**

No change to current value.

**dpcn16 (optional)**

16-bit ITU national point code with subfields *unit number sub number area main number area (un-sna-mna)*. The *prefix* subfield indicates a private point code (*prefix-un-sna-mna*).

**Range:**

*p--*, 000--127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix--p*

*un---*000---127

*sna---*000---15

*mna---*000---31

**Default:**

No change to the current value.

**Link (optional)**

The entry in the Link table that corresponds to the specified link value.

**Range:**

*a*, *b*, *a1 -a31*, *b1 - b31*

**loc (optional)**

The location of the MTP card that is being debugged.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**lsn (optional)**

Linkset name. The entry in the Linkset table that corresponds to the specified linkset name.

**Range:**

*ayyyyyyyyy*

**r loc (optional)**

Reference card location. This parameter audits the table where the reference card is located.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

**tbl (optional)**

The table used as the source of the audit data.

**Range:**

*lnk*

Link table

*ls*

Linkset table

*rte*

Route table

**tidx (optional)**

Table index. This parameter displays the corresponding table entry.

**Range:**

0 - 16000

**System Default:**

0

**Example**

This command displays the 126th entry in the Link table.

```
dbg-ddb: loc=1105:tbl=lnk:action=disp:tidx=126
```

This command displays the entry in the Link table corresponding to link=a and rloc=1107.

```
dbg-ddb: loc=1105:tbl=lnk:action=disp:rloc=1107:link=a
```

This command audits the Link table in multicast mode.

```
dbg-ddb: loc=1105:tbl=lnk:action=aud:audtype=mc
```

This command audits the Link table in unicast mode.

```
dbg-ddb: loc=1105:tbl=lnk:action=aud:audtype=uc
```

This command audits the Link table at the card location 1105 using the reference card 1107.

```
dbg-ddb: loc=1105:tbl=lnk:action=aud:audtype=uc:rloc=1107
```

This command displays the statistics of a specified card.

```
dbg-ddb: loc=1201:action=stats
```

This command displays the WWA entries on a specified card.

```
dbg-ddb: action=wwa:loc=1201
```

This command resets the statistics of a specified card.

```
dbg-ddb: action=rststat:loc=2100
```

This command resets the statistics of all active MTP cards.

```
dbg-ddb: action=rststat
```

**Dependencies**

The `dpc`, `tidx`, `lsn`, and `rloc` parameters cannot be specified together in the command.

The `dpc`, `tidx`, `lsn`, and `link` parameters cannot be specified together in the command.

The `action=disp` and `tbl=rte` parameters must be specified before the `dpc` parameter can be specified.

The `action=disp` and `tbl=ls` parameters must be specified before the `lsn` parameter can be specified.

The `action=disp` and `tbl=lnk` parameters must be specified before the `link` parameter can be specified.

The `action=disp` parameter must be specified before the `tidx` parameter can be specified.

The `action= aud` parameter must be specified before the `audtype` parameter can be specified.

The `action=disp` and `tbl=lnk` parameters or the `action=aud` and `audtype=uc` parameters must be specified before the `rloc` parameter can be specified.

If the `action` parameter has a value of *wwa*, *stats*, or *rststat*, then the `loc` parameter is the only other parameter that can be specified.

If the `action=disp` and `tbl=lnk` parameters are specified, then the `r loc` and `link` parameters must be specified together in the command.

The card location specified by the `loc` or `r loc` parameter must be equipped.

The value specified for the `loc` or `r loc` parameter must indicate an MTP card.

The status of the card at the location specified by the `loc` or `r loc` parameter must be active.

The linkset specified by the `lsn` parameter must already exist in the Linkset table.

The link specified by the `link` parameter must already be equipped.

The value specified for the `dpc` parameter must already exist in the Route table.

The Link table is corrupt or cannot be found.

The value specified for the `dpc` parameter must be a full point code, network point code, or a cluster point code.

Values of 1113 - 1118 cannot be specified for the `loc` or `r loc` parameters.

If the `action` parameter has a value of *disp*, *aud*, *stats*, or *wwa*, then the `loc` parameter must be specified.

If the `action=aud` parameter and the `r loc` parameter are specified, then the `audtype` parameter must be specified.

If the `action` parameter has a value of *disp* or *aud*, then the `tbl` parameter must be specified.

The J7 support feature must be enabled before the `opc16/dpc16` parameters can be specified.

## Notes

For a multicast audit, the card that receives the message sends the audit request to all other MTP cards simultaneously. For a unicast audit, the card that receives the message sends the audit request to another MTP card, which sends the request to next MTP card, etc. This process continues until the last MTP card in the system receives the request.

A maximum of the last 10 entries of WWA updates are displayed.

## Output

A maximum of 20 entries with mismatched card values can be displayed as necessary.

If mismatched card entries occur, the *SeqNo* field can be used to correlate the entries between two cards (e.g. *SeqNo: 1* of card 1 can be compared against *SeqNo: 1* of card 2.)

### Legend

- **WWA**—Wild Write Audit
- **DDB**—Dynamic Database
- **Time stamp**—Card time stamp when the checksum was detected and updated by wild write audit. The time stamp is in *YY-MM-DD hh:mm:ss:msec* format.
- **TABLE**—Table where the checksum is being performed
- **Entry Idx**—Index of entry that is updated by wild write audit
- **Orig Chksum**—Original Checksum
- **Upd Chksum**—Checksum after update by wild write audit
- **Idle Period**—Time elapsed, in milliseconds, since the last DDB update was received by this card. All idle periods are displayed in *dd:hh:mm:ss:msec* format.
- **Number of WWA Updated Entries**—Number of entries updated by the WWA

## disp-bip

Use this command to display the Board Identification PROM (BIP) hex and ASCII data for the specified card type and location. The PROM data consists of the board ID, part number, revision, date of manufacture, power, serial number, software match ID, and check sums.

### Parameters

#### **loc (mandatory)**

The card location as stenciled on the shelf of the system.

#### **Range:**

*1101 - 1108, 1111 - 1112, 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110*

#### **type (optional)**

The board type to be displayed.

**Range:***mbd*

Displays the main assembly.

**Example**

This example displays the BIP data for the main assembly of the specified card location.

```
disp-bip:loc=1105
```

**Dependencies**

The value of the `loc` parameter cannot specify the location of a fixed disk or removable drive.

**Notes**

None.

**Output**

This example displays the BIP data for the main assembly:

```
disp-bip:loc=1105
```

```

## disp-bp

Use this command to display currently active breakpoints in the communication and application processors.

**Parameters****card (optional)**

This parameter specifies the card location, in the form of *GPLID-Subsystem ID*.

**Range:** *GPLID-Subsystem ID*

***GPLID***

*atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility*

***Subsystem ID***

*a, b, act, stb, all*

The *oamhc* GPL can be specified with any of the subsystem IDs. For all other GPLs, only the *all* subsystem ID is valid.

**imt (optional)**

The IMT address of the card.

**Range:**

*0 - 254*

**loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**proc (optional)**

This parameter specifies the processor type.

**Range:**

*appl*

Application processor

*com*

Communication processor

**Default:**

*appl*

**ueng (optional)**

The microengine number.

This parameter is valid only on IXP-based cards. If this parameter is not specified for IXP-based cards, then the command is assumed to be intended for the ARM processor in the IXP chip.

**Range:**

0 - 5

**Example**

```
disp-bp: loc=1109:ueng=3
```

**Dependencies**

The *loc*, *imt*, or *card* parameter must be specified.

Only one of the *loc*, *imt*, and *card* parameters can be specified in the command.

The *imt* parameter allows this command to be entered for a card that has not been configured in the system.

The *ueng* parameter can be specified only for IXP-based cards.

The *oamhc* GPLID accepts all subsystem values; all other GPLIDs accept only the *all* subsystem value.

The card location specified by the *loc* parameter must be in the database.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the *loc* parameter.

**Notes**

None

**Output**

These examples are for x86-based cards:

disp-disk-dir

Use this command to display the DOS directory on the specified disk. This command can display the creation date for each file or for selected files and applies to fixed disks and removable drives.

---

**Note:** This command can be used to verify that the correct version of a file is on the disk.

---

Parameters

**file (optional)**

The name of the file to be displayed.

**Range:**

zzzzzzzzzzzzzz

1–12 ASCII characters

**Default:**

All files are displayed

**loc (optional)**

The card location in the system.

**Range:**

**1114**

TDM

**1116**

TDM

**1117**

Removable cartridge drive

**1113**

Latched USB port

**1115**

Latched USB port

**prtnggrp (optional)**

Partition group. The disk partition group to be displayed.

**Range:**

*active*

*inactive*

**Default:**

*active*

**src (optional)**

Source. The identification of the disk containing the files to be displayed.

**Range:**

*fixed*

The fixed disk

*remove*

The removable drive in the latched USB port of the E5-MCAP

*usb*

The plug-in USB flash drive in the flush-mounted USB port of the E5-MCAP

**Default:**

The fixed disk

**Example**

```
disp-disk-dir:loc=1117:file="dms.cfg"
```

```
disp-disk-dir:src=remove:file="fta"
```

```
disp-disk-dir:src=remove:file="*.*"
```

**Dependencies**

Valid filenames must be in the format *filename.extension* with the following requirements:

- File name—1–8 ASCII Characters
- Extension—0–3 ASCII Characters

Wildcards (asterisks) are allowed when the wildcard pattern is enclosed in parentheses.

- \*—Matches all characters in either filename or extension
- ?—Matches one character in either filename or extension
- file="\*.\*"—Matches all files on disk
- file="\*.tbl"—Matches all files on disk with *.tbl* as the extension

The SRC parameter must be specified.

The 1113 and 1115 locations are used by E5-MCAP cards. The 1114 and 1116 locations are used by E5-TDM cards.

A removable drive must be inserted in the slot indicated by the value specified for the LOC or SRC parameter.

The card specified by the LOC parameter must be connected to at least one IMT bus.

## Legend

- **Filename**—Name of the file in the directory
- **Ext**—Extension of the file name (for example, for the file MFC.BIN, MFC is the file name and BIN is the extension of the file name)
- **Length**—Amount of space, in bytes, the file occupies on the disk
- **Last Modified**—Date and time the file was changed
- **Cluster**—A 2-byte, 16-digit binary number that represents the first section of the disk occupied by the file
- **LBA**—Starting logical block address that corresponds to the cluster
- **File(s)**—Number of files on the disk that match the search criteria
- **Bytes**—Amount of space, in bytes, the displayed files occupy on the disk
- **Volume**—11-character name for the disk
- **Bytes free**—Number of bytes that are available on the disk for file storage
- **Disk Size**—Total capacity of the specified disk

## disp-disk-stats

Use this command to display the disk performance statistics.

---

---

**Note:** The OAMs maintain disk read/writer access times as well as per table and per application statistics on the number of disk accesses and cache accesses. Per application and per table statistics that have zero values are not displayed if an application ID or table ID is not specified; only nonzero statistics are displayed in the default report.

---

---

## Parameters

### **loc (mandatory)**

The card location in the system.

**Range:**  
*1113, 1115*

**applid (optional)**

Application ID. The application IDs used to define tasks.

**Range:**  
*0 - 255*

**Default:**  
*all*

**tblid (optional)**

Table ID. The table IDs used to define tables.

**Range:**  
*0 - 1023*

**Default:**  
*all*

**Example**

```
disp-disk-stats:loc=1113:applid=29
```

```
disp-disk-stats:loc=1113:applid=93
```

```
disp-disk-stats:loc=1113
```

**Dependencies**

The specified card location must contain a card that is running an OAM (1113 or 1115).

GPSM-II and E5-MCAP cards cannot co-exist in the system.

**Notes**

None

**Output**

```
disp-disk-stats:loc=1113:applid=29
```

```
rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0

# disp-mem

Use this command to display memory in communication and application processors. This display is in byte format.

## Parameters

**addr (optional)**  
The address in the form of *segment–offset*.

**Range:**  
*segment–offset*

*segment— h'00-h'ffff*

*offset— h'00-h'ffff*

**bc (optional)**

Byte count. The number of data bytes to display.

**Range:**

*1 - 65535*

**Default:**

*96*

**card (optional)**

Card location. The card location in the form of *GPLID-Subsystem ID*.

**Range:**

*GPLID-Subsystem ID*

*GPLID— atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility*

*Subsystem ID— a, b, act, stb, all*

**dformat (optional)**

The memory dump format.

**Range:**

*byte*

*word*

*dword*

**Default:**

*byte*

**imt (optional)**

The IMT address.

**Range:**

*0 - 254*

**loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210,*

2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309,  
4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**paddr (optional)**

The physical offset of the memory address.

**Range:**

*h'00–h'ffffff*

**proc (optional)**

The processor type.

**Range:**

*appl*

Application processor

*com*

Communication processor

**Default:**

*appl*

**Example**

```
disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word
```

```
disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=dword
```

```
disp-mem:card=ss7ansi-all:addr=h'03a-h'001:bc=8
```

**Dependencies**

The `loc`, `imt`, or `card` parameter must be specified.

Only one of the `loc`, `imt`, and `card` parameters can be specified in the command.

The `card` location specified by the `loc` parameter must be in the database.

All of the subsystem values can be specified with the *oamhc* GPLID. The other GPLID values can be specified only with the *all* subsystem value.

Card locations 1114, 1116, 1117, and 1118 are not valid for memory commands.

The GPL specified in the `card` parameter must be supported.

The `addr` and `paddr` parameters cannot be specified together in the command.

**Notes**

The `imt` parameter allows this command to be entered for a card that has not been configured in the system.

**Output**

```
disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word
```

```
rlghncxa03w 01-03-22 21:13:50 EST Rel 28.1.0

## disp-trace

Use this command to display trace entries.

**Parameters****traceid (optional)**

Trace ID. The trace entry to be displayed.

**Range:**

*1 - 10*

**Example**

```
disp-trace
```

```
disp-trace:traceid=5
```

**Dependencies**

A valid value must be specified for the `traceid` parameter.

None

**Output**

```
disp-trace
```

```
stdcfg2b 07-10-05 12:55:32 EST  EAGLE 37.5.0

## dlt-bp

Use this command to delete breakpoints in the communication or application processors.

### Parameters

#### addr (optional)

The address in the form of *segment–offset*.

##### Range:

*segment–offset*

*segment*— *h'00–h'ffff*

*offset*— *h'00–h'ffff*

#### card (optional)

The card location in the form of *GPLID–Subsystem ID*.

##### Range:

*GPLID–Subsystem ID*

*GPLID*— *atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility*

*Subsystem ID*— *a, b, act, stb, all*

The OAMHC GPL can be specified with any of the subsystem IDs. For all other GPLs, only the *all* subsystem ID is valid.

#### imt (optional)

The IMT address of the card.

##### Range:

*0 - 254*

#### loc (optional)

The card location as stenciled on the shelf of the system.

##### Range:

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115*

#### paddr (optional)

The physical offset of the memory address.

##### Range:

*h'00-h'ffffff*

**proc (optional)**

The processor type.

**Range:**

*appl*

Application processor

*com*

Communication processor

**Default:**

*appl*

**ueng (optional)**

The microengine number.

---

---

**Note:** This parameter is valid only on IXP-based cards. If this parameter is not specified for IXP-based cards, then the command is assumed to be intended for the ARM processor in the IXP chip.

---

---

**Range:**

0 - 5

**Example**

dlt-bp:loc=1209:ueng=2

dlt-bp:card=hipr2-all

dlt-bp:loc=6312

**Dependencies**

The *loc*, *imt*, or *card* parameter must be specified.

Only one of the *loc*, *imt*, and *card* parameters can be specified in the command.

The *ueng* parameter can be specified only for IXP-based cards.

The card location specified by the *loc* parameter must be in the database.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the *loc* parameter.

All of the subsystem values can be specified with the *oamhc* GPLID. The other GPLID values can be specified only with the *all* subsystem value.

The *addr* and *paddr* parameters cannot be specified together in the command.

**Notes**

The *imt* parameter allows this command to be entered for a card that has not been configured in the system.

**Output**

```
dlt-bp:card=oam-all:proc=com
```

```

**dlt-ee-flt**

Use this command to delete an Eagle Eyes Filter from the Eagle Eyes Filter (EE FLT) table. The EE FLT entry consists of a Filter ID and Filter specific data. It can be used to delete a filter only when it is not associated with any card.

**Parameters****flt\_id (mandatory)**

Eagle Eyes Filter ID.

**Range:**

*1-200*

**Example**

```
dlt-ee-flt:flt_id=20
```

**Dependencies**

The specified Filter ID must exist in the EE FLT table.

The Eagle Eyes Filter table must be available.

The specified filter should not be associated with any network card.

**Notes**

None.

**Output**

```
dlt-ee-flt:flt_id=3
```

```

tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0

## dlt-trace

Use this command to delete provisioned MSU tracing criteria from the database.

**Parameters****traceid (optional)**

Trace ID. Identifier of the trace entry to be deleted.

**Range:**

1 - 10

**Example**

```
dlt-trace:traceid=5
```

```
dlt-trace
```

**Dependencies**

Only values between 1 and 10 are valid for the `traceid` parameter.

None

**Output**

```
dlt-trace:traceid=1
```

```
stdcfg2b 07-10-05 13:03:29 EST  EAGLE 37.5.0  
dlt-trace:traceid=1  
Command entered at terminal #4.
```

```
;
```

**Related Topics:**[disp-trace](#)[ent-trace](#)

## ent-bp

Use this command to add breakpoints in communications and application processors in the system.

**Parameters****access (optional)**

The access type, in the form of *access type-format*.

Use the `data` parameter to set the format on IXP-based cards.

**Range:***access type-format**access type*—*r, w, rw* (read, write, read-write)*format*—*byte, word, dword, any***Default:**For x86-based cards—*rw-byte*For IXP-based cards—*rw-any***addr (optional)**The memory location in the form of *segment-offset*.**Range:***segment-offset**segment*—*h'00-h'ffff**offset*—*h'00-h'ffff***bc (optional)**

The number of data bytes to display.

For IXP-based cards, *bc* represents the number of bytes of memory. The number of bytes of stack to be displayed is  $255 - bc$ . For example, if *bc*=128, then 128 bytes of memory and 127 bytes of stack are displayed. If *bc*=0, then 0 bytes of memory and 255 bytes of stack are displayed. The exception to this rule is that 1 byte of stack is never displayed.

**Range:***0 - 255*

For x86-based cards, the maximum number of bytes is 96.

For IXP-based cards, the maximum number of bytes is 255.

**ca (optional)**Condition “a” in the form of *register-condition-integer*.The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, greater than, less than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.**Range:***register-condition-integer**register*—*sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r1-r15**condition*—*eq, neq, gt, lt, gte, lte**integer*—*h'00-h'ffffff***card (optional)**The card location, in the form of *GPLID-Subsystem ID*.

**Range:***GPLID-Subsystem ID**GPLID—atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility**Subsystem ID— a, b, act, stb, all*

The OAMHC GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the *all* subsystem ID is valid.

**cb (optional)**

Condition b in the form of *register-condition-integer*.

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, greater than, less than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

**Range:***register-condition-integer**register—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r0-r15**condition—eq, neq, gt, lt, gte, lte**integer—h'00–h'ffffff***ctx (optional)**

The bit-mapped microengine context mask.

**Range:***1 - 15***da (optional)**

The dump address, in the form of *segment-offset*.

**Range:***segment-offset**segment—h'00–h'ffff**offset—h'00–h'ffff***data (optional)**

This parameter instructs a data breakpoint to qualify on a match of the data.

---

---

**Note:** This parameter is valid only on IXP-based cards.

---

---

**Range:***value-mask**value—0-0xFFFFFFFF**mask—0-0xFFFFFFFF*

**Default:***0***dformat (optional)**

Memory dump format (byte, doubleword, word).

**Range:***byte**dword**word***Default:***byte***dpaddr (optional)**

Memory dump address (physical offset).

**Range:***h'00–h'ffffff***dr (optional)**

The data register indirect memory dump, in the form *register-register-integer*.

The *register-register* value is the CPU internal register.

The *integer* value is the offset value.

**Range:***register-register-integer**register—sp, bp, ss, ds, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx**register—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx**integer—h'00–h'ffffff***drarm (optional)**

ARM register indirect memory dump.

**Range:***ARM register-integer**arm register- r0-r15, sp, lr, pc**mask- 0-65535*

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

**Default:***0*

**dur (optional)**

Breakpoint duration.

**Range:**

*temp*

*perm*

**Default:**

*temp*

**imt (optional)**

IMT address of the card.

**Range:**

0 - 254

**ind (optional)**

Indirection count.

**Range:**

0 - 3

**Default:**

0

**loc (optional)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**paddr (optional)**

The physical offset of the memory address.

**Range:**

*h'00-h'ffffff*

**proc (optional)**

Processor type.

**Range:**

*appl*

Application processor

**com**

Communication processor

**Default:***appl***rep (optional)**

Repetitions for this breakpoint.

**Range:**

0 - 255

**Default:**

0

**type (optional)**

Breakpoint type in the form of processor type-breakpoint type

**Range:***processor type-breakpoint type**processor type—p186, p286, p486, arm, ixp**breakpoint type—code, codehw, codesw, data***Default:**For x86-based cards—*p486-code*For IXP-based cards—*arm-codesw***ueng (optional)**

Microengine number. This parameter is valid only on IXP-based cards.

---

---

**Note:** If this parameter is not specified for an IPX-based card, then the command is assumed to be intended for the ARM processor in the IXP chip.

---

---

**Range:**

0 - 5

**Example**

ent-bp: loc=1204: paddr=h'27c3c: type=p486-data: access=rw-word

ent-bp: loc=1113: addr=h'03a-0001

## Dependencies

All of the subsystem values can be specified with the OAMHC GPLID. The other GPLID values can be specified only with the *all* subsystem value.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the *loc* parameter.

The *loc*, *imt*, or *card* parameter must be specified.

Only one of the *loc*, *imt*, and *card* parameters can be specified in the command.

The *dr* parameter and the *da* parameter cannot be specified together in the command.

The *dur=perm* parameter and the *rep* parameter cannot be specified together in the command.

The *dur=perm* parameter cannot be specified when the value of the processor type portion of the *type* parameter is *p186* or *p286*.

When the *da*, *dr*, or *drarm* parameter is specified, the *dpaddr* parameter cannot be specified.

For the *type* parameter (which is in the form of *processor type-breakpoint type*), a breakpoint type of *data* cannot be specified in combination with a processor type of *P186*, *P286*, or *IXP*.

When the *paddr* parameter and the *bc* parameter are specified, either the *dpaddr* or *dr* parameter must be specified in the command.

The *access* parameter can be specified only when the *type* parameter value is *p486-data* or *arm-data*.

The *bc* parameter value cannot be greater than 96 for x86-based cards.

The *ind* parameter value cannot be greater than 3.

The specified card must be in use.

For 80286 processors, registers for 80386 processors cannot be specified.

For 80286 processors, *integer* values for registers and conditions must be less than 65535.

The *ueng* parameter is valid only on IXP-based cards (the value *ixp* is specified for the processor type portion of the *type* parameter).

The *cts* parameter is valid only on IXP-based cards (the value *ixp* is specified for the processor type portion of the *type* parameter).

The *data* parameter is valid only on IXP-based cards.

The *data* parameter is valid only when the value is *data* for the breakpoint type portion of the *type* parameter.

The register values *sp*, *lr*, *pc*, and *r0-r15* for the *ca* or *cb* parameters are valid only on IXP-based (ARM processor) cards.

The *ca* and *cb* parameters cannot be specified when the value *ixp* is specified for the processor type portion of the *type* parameter.

The *drarm* parameter can be specified only on IXP-based cards.

The *drarm* parameter can be specified only when the value *arm* is specified for the processor type portion of the *type* parameter.

The *dr* parameter cannot be specified for IXP-based cards.

The *data* and *codesw* values for the breakpoint type portion of the *type* parameter cannot be specified when the value *ixp* is specified for the processor type portion of the *type* parameter.

The *arm* and *ixp* values for the processor type portion of the *type* parameter are valid only on IXP-based cards.

The value *any* for the format portion of the *access* parameter can be specified only on IXP-based cards. The format value must be set to *any* on IXP-based cards.

When the value *ixp* is specified for the processor type portion of the *type* parameter, the *ueng* and *cts* parameters must be specified.

The *addr* parameter can be specified only when the *proc=com* parameter is specified for DS0 cards with PROM-based COM processors (such as TSMs).

When the *ca*, *cb*, and *dr* parameters are used with 80186 and 80286 processors, the register values *ip*, *fs*, *gs*, *esi*, *edi*, *ebp*, *esp*, *eip*, *efl*, *eax*, *ebx*, *ecx*, and *edx* cannot be specified. These registers can be used only with 80486 processors. The integer values for these parameters when used with 80186 and 80286 processors must be less than *h'ffff* (65535).

The *data* value for the breakpoint type portion of the *type* parameter cannot be specified with the values *p186*, *p286*, and *ixp* for the processor type portion of the *type* parameter.

The *da* parameter cannot be specified for IXP-based cards.

An ARM register value must be specified for an IXP-based card with an ARM processor.

The *addr* or *paddr* parameter must be specified in the command. Both parameters cannot be specified in the command.

## Notes

The *imt* parameter allows this command to be entered for a card that has not been configured in the system.

## Output

```
ent-bp: loc=1113:addr=h'03a-0001
```

```
rlghncxa03w 04-08-22 21:14:41 EST EAGLE 33.0.0
SDS Response Code 22 from IMT Address H'00f6 - command complete.

rlghncxa03w 04-08-22 21:14:41 EST EAGLE 33.0.0

## ent-ee-flt

Use this command to enter Eagle Eyes Filter data in the Eagle Eyes Filter (EE FLT) table. The EE FLT entry consists of a Filter ID and Filter specific data. After the FLT ID is provisioned, it can be used in the `dlt-ee-flt` and `chg-ee-card` commands.

### Parameters

#### **type (mandatory)**

Eagle Eyes Filter Type.

##### **Range:**

*inc*  
*exl*

#### **appl (mandatory)**

Card Application Type

##### **Range:**

*atm*  
*ip*  
*e1t1*

#### **ipprot (optional)**

Filter based on IP sub-protocol

##### **Range:**

*sctp*  
*tcp*  
*udp*

#### **ipsrc (optional)**

Filter based on IP source address

##### **Range:**

*4 numbers separated by dots, with each number in the range of 0-255*

#### **ipdst (optional)**

Filter based on IP destination address

##### **Range:**

*4 numbers separated by dots, with each number in the range of 0-255*

#### **ssport (optional)**

Filter based on SCTP source port

##### **Range:**

*0-65535*

#### **sdport (optional)**

Filter based on SCTP destination port.

**Range:***0-65535***sctype (optional)**

Filter based on SCTP chunk type

**Range:***abrt**data**err**hbak**htbt**inak**init**sack***sctppld (optional)**

Filter based on SCTP data payload identifier.

**Range:***diam**m2pa**m3ua**sua**unspec***sctpstr (optional)**

Filter based on SCTP data stream identifier

**Range:***0-65535***sscopsu (optional)**

Filter based on SSCOP sub-protocol or SU type.

**Range:***all**ctrl**data***mtp3si (optional)**

Filter MTP3 user.

**Range:***bicc**isup**sccp**snm**tup*

**port (optional)**

Filter based on port.

**Range:**

*a-b*

*a1-a31*

*b1-b31*

*all*

**sutype (optional)**

Filter based on SU type.

**Range:**

*allsu*

*lsu*

*msu*

**Example**

```
ent-ee-  
flt:appl=ip:type=inc:ipprot=sctp:ssport=2048:stype=data:sctpstr=  
100
```

```
ent-ee-flt:appl=atm:type=exl:port=a:sscopsu=data:mtp3si=sccp
```

```
ent-ee-flt:appl=e1t1:type=exl:port=a1:sutype=msu:mtp3si=tup
```

**Dependencies**

If the `appl=ip` then `ipprot`, `ipsrc` or `ipdst` parameters must be specified.

If the `ssport`, `sdport` or `stype` parameters are specified, then the `ipprot=sctp` parameter must be specified.

At least one optional parameter (`ipprot` or `port`) must be specified.

If the `sctpld` parameter is specified, then the `stype=data` and `ipprot=sctp` parameters must be specified.

If the `sctpstr` parameter is specified, then the `stype=data` and `ipprot=sctp` parameters must be specified.

The Eagle Eyes Filter table cannot contain more than 200 entries.

The Eagle Eyes Filter table must be available.

If the `appl=ip` parameter is specified, then the `appl=atm` and `appl=e1t1` parameters must not be specified.

If the `appl=atm` parameter is specified, then the `appl=ip` and `appl=e1t1` parameters must not be specified.

If the `appl=e1t1` parameter is specified, then the `appl=atm` and `appl=ip` parameters must not be specified.

If the `appl=atm` parameter is specified, then the `port` parameter can only be either `a`, `b` or `a1`.

If the `appl=atm` and `port=a1` or `port=all` parameters are specified, then the 3 Links per E5-ATM feature must be on.

## Notes

IP7 parameters:

- *ipprot, ipsrc, ipdst, ssport, sdport, style, sctpld, sctpstr*

ATM parameters:

- *sscopsu, mtp3si, port*

E1T1 parameters:

- *sutype, mtp3si, port*

## Output

ent-ee-flt:appl=atm:type=inc:port=a:sscopsu=data

```
tekelecstp 10-03-08 14:43:31 EST EAGLE 46.0.0
EE FLT table is (1 of 200) 1% full
ENT-EE-FLT: MASP A - COMPLTD
;
```

# ent-trace

Use this debug command to trace MSUs sent to Service Module cards or to LIM cards running the SS7ANSI, CCS7ITU, VSCCP, ATMITU, ATMANSI, IPLIM, IPLIMI, SS7IPGW, IPGWI, or IPSP applications.

The EAGLE traps MSUs that meet the provisioned tracing criteria, and the MSU remains in the trapped state for the life span of that MSU. The life span varies depending on the type of MSU. For MTP-Routed or GTT MSUs, the life span lasts until the MSU travels out of the EAGLE or is discarded. For LNP MSUs, the life span lasts until the request is processed. The response is not part of the LNP MSU. Trapping a response requires the provisioning of another MSU trace.

This command uses different parameters depending on the card type sending the MSU as shown:

- Service Module— *error, gt, lrn, tn, ssp/sspa/sspi/sspn/sspn24/sspn16, dn, entityid, imei, and imsi*
- LIM card running ANSI applications— *error, ssp/sspa, opc/opca, dpc/dpca, tlnpisuptype, and gt*
- LIM card running ITU applications— *error, sspi/sspn/sspn24/sspn16, opci/opcn/opcn24/opcn16, dpci/dpcn/dpcn24/dpcn16, and gt*

The *lrn, tn, dn, entityid, imsi, imei*, and *error* parameters are mutually exclusive.

The following parameters can be used once in a single MSU trace request with ONE of the mutually exclusive parameters specified above: *opc, dpc, ilsn, si, gt, ssp, h0h1, cpc, or cic/ecic*.

The **cic/ecic** parameters can be used only for ISUP traffic. The **ecic** parameter must be specified with the **cic** parameter.

For all cards supported by this command, the **error** parameter can be provisioned as the only optional parameter or in addition to any other optional parameter to trace any messages that fail verification or processing. If the **error** parameter not specified, the default value is **error=no**.

---

**Caution:** If the system configuration approaches the maximum number of provisioned Service Module cards, then entering this command might cause an OAM to reset because of the amount of information that may be returned.

---

## Parameters

### **card (mandatory)**

The card location in the form of *APPL CLASS-Subsystem ID*.

#### **Range:**

*APPL CLASS-Subsystem ID*

*APPL CLASS— atmansi, atmitu, ccs7itu, iplim, iplimi, ss7ansi, ss7ipgw, ipgwi, ipsg, vsccp*

*Subsystem ID— all*

### **brief (optional)**

This parameter specifies whether all information is provided for each MSU as it moves through the EAGLE.

#### **Range:**

*no*

All information, including data sections for the MSU, is displayed.

*yes*

The data sections for the MSU are not displayed.

### **cic (optional)**

The beginning value for a CIC range.

#### **Range:**

*0 - 16383*

### **cpc (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

#### **Synonym:**

*cpca*

#### **Range:**

*000-255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001–005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006–255`.

The point code `000-000-000` is not a valid point code.

### **cpci (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

#### **Range:**

*0–255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*zone—0–7*

*area—000–255*

*id—0–7*

The point code `0-000-0` is not a valid point code.

### **cpcn (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt.i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnnngc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

#### **Range:**

*s-, 0-16383, aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

### **cpcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

#### **Range:**

*000–255*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa—000–255*

*ssa—000–255*

*sp—000–255*

**cpcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

**Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

**dn (optional)**

Directory Number. This parameter is used for the ANSI41 AIQ, ATINP, G-Flex, G-Port, INP, PPSMS, or V-Flex features.

The *tn* parameter is used as the directory number for LNP.

**Range:**

5-15 digits

Valid digits are 0-9, a-f, A-F.

**dpc (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*)

**Synonym:**

*dpca*

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

**dpcli (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

### **dpcn (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmi` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

#### **Range:**

*s*-, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

### **dpcn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

#### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

### **dpcn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

#### **Range:**

000---127

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

### **ecic (optional)**

The end value for a CIC range.

#### **Range:**

0 - 16383

**entityid (optional)**

The entity ID.

**Range:**

1-15 digits

Valid digits are 0-9, a-f, A-F

**error (optional)**

This parameter specifies whether to perform a trace on any message verification error and message processing error

**Range:**

*yes*

*no*

**Default:**

*no*

**gt (optional)**

Global title. The CdPA global title digits.

**Range:**

1-21 digits

Valid digits are 0-9, a-f, A-F

**h0h1 (optional)**

A combination of values contained in some MSUs. The *h0* value is the code for a message group, and the *h1* value is the code for a message within that group.

**Range:**

0 - 255

**ilsn (optional)**

The incoming linkset name.

**Range:**

*ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**imei (optional)**

The International Equipment Identifier.

**Range:**

Exactly 14 digits; valid digits are 0-9, a-f, A-F

**imsi (optional)**

The International Mobile Station Identifier.

**Range:**

5-15 digits

Valid digits are 0-9, a-f, A-F

### **loc (optional)**

The card location of the card as stenciled on the shelf of the system.

#### **Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118

### **lrn (optional)**

The local routing number.

#### **Range:**

Exactly 14 digits: Valid digits are 0-9.

### **mode (optional)**

The type of output displayed.

#### **Range:**

##### *default*

The default value of this parameter.

##### *detail*

Detailed information is displayed when an MSU matches the request.

##### *debug*

Complete information is displayed when an MSU matches the request.

### **opc (optional)**

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

#### **Synonym:**

*opca*

#### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, `ni = 000` is not valid.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is not valid if `ni = 001-005`.

When `chg-sid:pctype=ansi` is specified, `nc = 000` is valid if `ni = 006-255`.

The point code `000-000-000` is not a valid point code.

**opci (optional)**

ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**opc (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the `chg-stpopts:npcfmt i` flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnngc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*

*nnnnn*—0-16383

*gc*—*aa-zz*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**opc24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**opc16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area* (*un-sna-mna*).

**Range:***000---127*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*un---000--127**sna--000---15**mna---000--31***rep (optional)**

The number of MSUs to trap.

**Range:***0 - 255***service (optional)**

The service offered by the EAGLE.

**Range:***gflex**gport**inpmr**inpq**smsmr**mnpsms**eir**idpr**idps**tif**tif2**tif3**tobr**aiq***si (optional)**

Service indicator.

**Range:***0 - 15*

**s ls (optional)**

Signaling link selector.

**Range:**

0 - 255

**ssp (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym**

*sspa*

**Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When *chg-sid:pctype=ansi* is specified, *ni = 000* is not valid.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is not valid if *ni = 001–005*.

When *chg-sid:pctype=ansi* is specified, *nc = 000* is valid if *ni = 006–255*.

The point code *000-000-000* is not a valid point code.

**sspi (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**

*s-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code *0-000-0* is not a valid point code.

**sspn (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the *chg-stpopts:npcfmt.i* flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnngc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnnn*, *prefix-nnnnnngc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**

*s-*, 0-16383, *aa-zz*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

### **sspn24 (optional)**

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

#### **Range:**

000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

### **sspn16 (optional)**

16-bit ITU national point code with subfields *unit number-sub number area-main number area (un-sna-mna)*.

#### **Range:**

000---127

Specify a valid value for each subfield of the point code, and the separate the subfields with a dash (-).

*un*---000---127

*sna*---000---15

*mna*---000---31

### **tlnpisuptype (optional)**

The ISUP message type.

#### **Range:**

0 - 255

### **tn (optional)**

The directory number.

#### **Range:**

Exactly 10 digits. Valid digits are 0-9

### **Example**

```
ent-trace:opc=1-1-1:card=SS7ANSI-ALL:rep=2
```

```
ent-trace:tlnpisuptype=01:card=SS7ANSI-ALL
```

```
ent-trace:dn=12345:card=VSCCP-ALL
```

```
ent-trace:imsi=c122d:card=VSCCP-ALL
```

```
ent-trace:card=ccs7itu-all:dpc=2-7-5:error=no
```

```
ent-trace:card=vsccp-all:error=yes
ent-trace:card=ccs7itu-
all:sspn24=10-11-12:opcn24=10-10-10:dpcn24=10-101-11
ent-trace:imei=123456789101234:card=VSCCP-ALL
ent-trace:entityid=c123:card=VSCCP-ALL
ent-trace:loc=1305:si=5:brief=yes
ent-trace:dn=98912345:loc=1105
ent-trace:card=ccs7itu-
all:sspn16=121-10-12:opcn16=121-10-13:dpcn16=121-10-14
```

## Dependencies

The `card` parameter or the `loc` parameter must be specified.

At least one optional parameter must be specified. The `error` parameter can be specified as the only optional parameter or with any of the other optional parameters in the command.

The `gt`, `entityid`, `dn`, `imei`, and `imsi` parameters cannot have a value of *none*.

A valid value must be specified for the `card` parameter.

The only qualifier allowed for the `card` parameter is *all*.

The `gt`, `entityid`, `dn`, `imei`, `imsi`, `lrn`, and `tn` parameters are invalid for LIM cards running the SS7ANSI, ATMANSI, IPLIM or SS7IPGW applications.

The `opci/opcn/opcn24/opcn16`, `dpci/dpcn/dpcn24/dpcn16`, and `sspi/sspn/sspn24/sspn16` ITU point code parameters are invalid for LIM cards running the SS7ANSI, ATMANSI, IPLIM, or SS7IPGW applications.

The `gt`, `entityid`, `dn`, `imei`, `imsi`, `lrn`, `tn`, and `tlnpisuptype` parameters are invalid for LIM cards running the ATMITU or IPLIMI applications.

The `opc/opca`, `dpc/dpca`, and `ssp/sspa` ANSI point code parameters are invalid for LIM cards running the IPLIMI application.

The `opc`, `dpc`, and `tlnpisuptype` parameters cannot be specified for Service Module cards.

The G-Flex feature or the Equipment Identity Register feature must be turned on before the `imsi` parameter can be specified.

If the ITUDUPPC feature is turned on, the ITU national point code must be specified as a full point code.

The EIR feature must be turned on before the `imei` parameter can be specified.

The AINPQ, G-Flex, G-Port, IDP Relay, INP, PPSMS, or V-Flex feature must be turned on or the ANSI41 AIQ or ATINP feature must be enabled before the `dn` parameter can be specified.

The G-Flex, G-Port, INP, or V-Flex feature must be turned on or the ATINP, IDP Relay or any TIF feature must be enabled before the `entityid` parameter can be specified.

The `loc` and `card` parameters are mutually exclusive.

Only one of the `lrn`, `tn`, `dn`, `entityid`, `imsi`, `imei`, or `error` parameters can be specified in a single MSU trace request.

A maximum of 10 traces can be entered in the system at a time.

Values 1113 - 1118 cannot be specified for the loc parameter.

The J7 Support feature must be enabled before the sspn16/opcn16/dpcn16 parameters can be specified.

## Output

This example shows the output for an MTP trace:

ent-trace:loc=1101:dpc=7-1-0

## rept-stat-ee

Use this command to generate the status report of Eagle Eyes on network cards.

### Parameters

#### **loc (optional)**

Eagle Eyes Card location.

#### **Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

### Example

```

rept-stat-ee
rept-stat-ee:loc=1102

```

### Dependencies

The card location specified in the 'loc' parameter must be configured to use Eagle Eyes.

The shelf and card must be equipped.

The specified card location must not be a reserved card location.

### Notes

This command can be canceled using the F9 function key or the `canc-cmd` command. See `canc-cmd` for more information

### Output

This example generates the Eagle Eyes status report for the specified Network Card.

```

rept-stat-ee:loc=1101

```

```

tekelecstp 10-03-08 14:43:31 EST  EAGLE 46.0.0
LOC          STATE

```

```
-----  
1101      ACTIVE
```

Command Completed.

This example generates the Eagle Eyes status report for all the EE configured Network Cards.

**rept-stat-ee**

```
tekelecstp 10-03-08 14:43:31 EST  EAGLE 46.0.0  
LOC      STATE  
-----  
1101      ACTIVE  
1103      INACTIVE  
Command Completed.
```

## rept-stat-gedti

Use this command to generate a report of the GEDTI Hub's status.

#### Parameters

##### **loc (optional)**

GEDTI Hub Card location.

##### **Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

#### Example

```
rept-stat-gedti
```

```
rept-stat-gedti:loc=1111
```

#### Dependencies

The value specified for the loc parameter must correspond to the location of an IPSM card which is configured as a GEDTI Hub.

## Notes

This command can be canceled using the F9 function key or the `canc-cmd` command. See `canc-cmd` for more information.

## Output

This example generates the report of all the IPSM cards configured as GEDTI Hubs.

`rept-stat-gedti`

## rtrv-ee-card

Use this command to display Eagle Eyes Card Configuration data from the Eagle Eyes Card (EE CARD) table. The EE CARD entry consists of a Card Loc and Eagle Eyes Card specific data.

**Parameters****loc (optional)**

Eagle Eyes Card location.

**Range:**

*1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118*

**Example**

```
rtrv-ee-card
```

```
rtrv-ee-card:loc=1102
```

**Dependencies**

The EE CARD table must be available.

The card location specified in the 'loc' parameter must be configured to use Eagle Eyes.

The Eagle Eyes Filter table must be available.

**Notes**

None.

**Output**

This example displays the Eagle Eyes parameters for all the EE configured network cards.

```
rtrv-ee-card
```

```

### Legend

- **LOC---** Card location as stenciled on the shelf of the system.
- **THR---** The sending rate of the Eagle Eyes throttle task in IMT packets per second.
- **SECLIM---** The limit on the amount of time to perform the trace, in seconds.
- **PKTLIM---** The limit on the number of Ethernet frames to send.
- **KBLIM---** The file size limit of the capture file created, in kilobytes.
- **PORT---** Port being filtered.
- **ID---** Eagle Eyes Filter ID.
- **TYPE---** Eagle Eyes Filter Type.
- **SSCOPSU---** SSCOP sub-protocol or SU type filter.
- **MTP3SI---** MTP3 user filter.

**Related Topics:**[chg-ee-card](#)[dact-ee](#)[rept-stat-ee](#)**rtrv-ee-flt**

Use this command to retrieve Eagle Eyes Filter data from the Eagle Eyes Filter (EE FLT) table. The EE-FLT entry consists of a Filter ID and Filter specific data. It can be used to obtain the Filter ID of the filter to be associated to a card using the CHG-EE-CARD command.

**Parameters****appl (optional)**

Card Application Type

**Range:**

*ATM*

*IP*

*E1T1*

**fltId (optional)**

Eagle Eyes Filter ID

**Range:**

*1-200*

**Example**

```
rtrv-ee-flt:appl=ip
```

```
rtrv-ee-flt:fltId=16
```

**Dependencies**

The Eagle Eyes Filter table must be available.

The specified Filter ID must exist in the EE FLT table.

The Filter ID and APPL are mutually exclusive parameters.

**Notes**

None.

**Output**

This example displays the Filter parameters for the specified Filter ID.

```
rtrv-ee-flt:fltId=85
```

```

## rtrv-upgrade-config

Use this command to retrieve provisioned data used by the upgrade software during an upgrade of an in-service EAGLE from a source release to the target release.

### Parameters

#### display (optional)

Display Indicator. This parameter indicates what type of output is to be displayed.

#### Range:

##### *tblcnv*

Displays a list of DMS tables that will be converted during the next upgrade. These tables are selected for conversion using the `chg-upgrade-config` command.

##### *prtnstat*

This parameter is not implemented at this time.

##### *all*

Display all upgrade configuration data.

#### Default:

*all*

### Example

Display a list of DMS tables that will be converted during the next upgrade.

```
rtrv-upgrade-config:display=tblcnv
```

```
rtrv-upgrade-config
```

### Dependencies

None

### Output

```
rtrv-upgrade-config:display=tblcnv
```

```
rlghncxa03w 07-03-13 08:15:45 EST EAGLE 37.5.0
The following tables will be converted:
  FEAT_CTRL Table, ID=327
Command Completed.
;

## send-msg

Use this command to manually simulate a system generated message from a user terminal. The parameters (not entered by the user) are defaulted to:

- Origination subsystem = *cam\_active*
- Destination subsystem = *orig application ID=appl\_ID\_ui*
- Violation= *no report*
- Bus = *imt choice*
- Message length = *computed*

**Parameters****da (mandatory)**

The destination application ID.

**Range:**

0 - 255

**ds (mandatory)**

The destination subsystem.

**Range:**

0 - 255

**f (mandatory)**

The function ID.

**Range:**

0 - 255

**loc (mandatory)**

The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1113, 1115, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318,  
2101 - 2108, 2111 - 2118 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 -  
3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 -  
4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 -  
5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 -  
6108, 6111 - 6118

**alt (optional)**

This parameter specifies whether to use the alternate bus bit.

**Range:***on**off***Default:***on***bus (optional)**

The IMT bus.

**Range:***a**b***Default:***a***d0 (optional)**

The application data.

**Range:***0 - 255***d1 (optional)**

The application data.

**Range:***0 - 255***d2 (optional)**

The application data.

**Range:***0 - 255***d3 (optional)**

The application data.

**Range:***0 - 255***d4 (optional)**

The application data.

**Range:***0 - 255***d5 (optional)**

The application data.

**Range:**

*0 - 255*

**d6 (optional)**

The application data.

**Range:**

*0 - 255*

**d7 (optional)**

The application data.

**Range:**

*0 - 255*

**d8 (optional)**

The application data.

**Range:**

*0 - 255*

**d9 (optional)**

The application data.

**Range:**

*0 - 255*

**len (optional)**

The message length in bytes.

**Range:**

*0 - 65535*

**Default:**

Calculated

**oa (optional)**

The originating application ID.

**Range:**

*0 - 255*

**Default:**

2

**os (optional)**

The originating subsystem.

**Range:**

*0 - 255*

**Default:**

0

**si (optional)**

This parameter allows the service ID field in the violation indicator to be set.

**Range:**

0 - 31

**Default:**

0

**sut (optional)**

The signal unit type.

**Range:**

0 - 9

**Default:**

2

**Example**

```
send-msg: loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7
```

```
send-msg: loc=1113:ds=2:oa=h'17:da=h'30:f=11
```

```
send-msg: loc=1116:ds=2:oa=h'17::da=h'30:f=12
```

```
send-msg: loc=1101:ds=1:da=65:f=27:d0=78:si=3
```

```
send-msg: loc=6212:ds=2:oa=h'17:da=h'30:f=11
```

```
send-msg: loc=6312:ds=1:da=64:f=171
```

**Dependencies**

The value of the *da* parameter must be valid.

The destination location must be equipped to receive messages.

Card locations *xy09* and *xy10* cannot be used with bus *b* and bus *a*, respectively.

The value of the *ds* parameter must be valid.

**Notes**

The *bus* and *sut* parameters must be used when sending a message to a MUX card.

If the *bus* parameter is not specified with a MUX card location on imt B (such as *xy10*), the bus *b* value is used instead of the bus *a* value.

**Output**

```
send-msg: loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7
```

```

## set-mem

Use this command to set values in memory in the communication and application processors. If a card is reloaded, these memory changes are lost.

## Parameters

### **addr (optional)**

The address, in the form of *segment–offset*.

#### **Range:**

*segment–offset*

*segment—h'00–h'ffff*

*offset—h'00–h'ffff*

### **byte (optional)**

The byte value to write to the specified memory location(s).

#### **Range:**

*0–h'00–h'ff*

### **card (optional)**

The card location, in the form of *GPLID–Subsystem ID*.

#### **Range:**

*GPLID–Subsystem ID*

*GPLID— atmhc, deirhc, erthc, glshc, hipr2, ipghc, iplhc, ipsg, ipshc, mcphc, oamhc, pktgen, sccphc, siphc, slanhc, ss7hc, utility*

*Subsystem ID— a, b, act, stb, all*

The OAMHC GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the *all* subsystem ID is valid.

### **dword (optional)**

A double word value to write to the specified memory location(s).

#### **Range:**

*0–h'00–h'ffffffff*

### **fill (optional)**

The number of times that the value is to be written to successive addresses.

#### **Range:**

*0 - 65535*

#### **Default:**

*1*

### **imt (optional)**

The IMT address.

#### **Range:**

*0 - 254*

### **loc (optional)**

Location. The card location as stenciled on the shelf of the system.

**Range:**

1101 - 1108, 1111 - 1112, 1201 - 1208, 1211 - 1218, 1301 - 1308, 1311 - 1318, 2101 - 2108, 2111 - 2118, 2201 - 2208, 2211 - 2218, 2301 - 2308, 2311 - 2318, 3101 - 3108, 3111 - 3118, 3201 - 3208, 3211 - 3218, 3301 - 3308, 3311 - 3318, 4101 - 4108, 4111 - 4118, 4201 - 4208, 4211 - 4218, 4301 - 4308, 4311 - 4318, 5101 - 5108, 5111 - 5118, 5201 - 5208, 5211 - 5218, 5301 - 5308, 5311 - 5318, 6101 - 6108, 6111 - 6118, 1109, 1110, 1209, 1210, 1309, 1310, 2109, 2110, 2209, 2210, 2309, 2310, 3109, 3110, 3209, 3210, 3309, 3310, 4109, 4110, 4209, 4210, 4309, 4310, 5109, 5110, 5209, 5210, 5309, 5310, 6109, 6110, 1113, 1115

**mask (optional)**

The mask that selects the bits that are to be included in the operation (op).

**Range:**

0-0xFFFFFFFF

**Default:**

0xFFFFFFFF

**op (optional)**

Operation. The operation performed in order to arrive at the final value in the memory location.

**Range:**

*replace*

*and*

*or*

*x*

**Default:**

*replace*

**paddr (optional)**

The physical offset of the memory address.

**Range:**

*h'00-h'ffffff*

**proc (optional)**

The processor type.

**Range:**

*appl*

Application processor

*com*

Communication processor

**Default:***appl***word (optional)**

A word value to write to the specified memory location(s).

**Range:***h'00-h'ffff***Example**

```
set-mem:loc=1109:paddr=h'201000:byte=0:fill=1024
```

```
set-mem:card=hipr2-
```

```
all:paddr=h'202000:word=h'2a:op=and:mask=h'fff
```

**Dependencies**

The *loc*, *imt*, or *card* parameter must be specified.

Only one of the *loc*, *imt*, and *card* parameters can be specified in the command.

The *card* location specified by the *loc* parameter must be in the database.

All of the subsystem values can be specified with the OAMHC GPLID. The other GPLID values can be specified only with the *all* subsystem value.

Values of 1114, 1116, 1117, and 1118 cannot be specified for the *loc* parameter.

The *byte*, *word*, or *dword* parameter must be specified.

Only one of the *byte*, *word*, and *dword* parameters can be specified in the command.

The *paddr* parameter cannot be specified for an SS7 LIM card.

Memory Type of FWORD is NOT supported at this time.

The *addr* and *paddr* parameters cannot be specified together in the command.

The value specified for the *fill* parameter cannot exceed 65535.

**Notes**

The *imt* parameter allows this command to be entered for a card that has not been configured in the system.

**Output**

```
set-mem:loc=6205:paddr=h'0345fe:byte=2
```

```

## Pass-Through Commands

This chapter introduces the pass-through commands and describes the command conventions. The pass-through commands are listed in alphabetical order.

These commands are intended for use by My Oracle Support (MOS) personnel and authorized engineering personnel in the operating companies. Documentation might not include all options and/or definitions of these commands.

---

**Caution:** These commands are to be used precisely as they are described in this chapter, and only under the direction of My Oracle Support (MOS) personnel. Any other use of these commands can result in a system failure.

---

### Command Conventions

Pass-through commands are passed through the OAM and sent to individual cards for processing.

An example of a pass command is:

```
pass:loc=1201:cmd="connmgr -c"
```

The `cmd` parameter contains the pass-through command (`connmgr -c`) within the double quotes.

Pass-through commands consist of two types of tokens: command name and command options. Tokens are whitespace-delimited and null-terminated. The generalized format of a pass-through command is:

```
command_name option1 option2....option n-1.... option n
```

In the example, the *command\_name* is `connmgr` and the option is `-c`.

Options and option parameters are made up of a specific character string or a variable. The variable is to be replaced with a value selected from a range of values. Option variables and option parameter variables are underlined. For example, the `arp` command option `-d` has the parameter variable IPaddress. Specify the IP address as in the command `arp -d 192.9.200.44`. Do not enter the underlined text; enter a value instead.

Help information for each pass-through command can be obtained by using the option `-h` on any command.

### arp

This command is used to display and modify the internet to ethernet address translation tables used by the address resolution protocol.

## Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the arp command option *-d* has the parameter IP address. The IP address must be specified for which an ARP entry will be deleted, as in the command `arp -d 192.9.200.44`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

*-a*

This option displays all entries in the ARP table.

*-d IP address*

This option deletes an ARP entry for the specified IP address.

The IP address is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. An example IP address is *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine's host number.

## Range:

4 numbers separated by dots, with each number in the range of 0-255.

*-f*

This option flushes all entries from the ARP table.

*-h*

This option displays help (usage) information for the command.

*-s IP addressMAC address*

This option creates an ARP entry for the specified IP address and ethernet address.

## Range:

4 numbers separated by dots, with each number in the range of 0-255.

The IP address is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. For example, *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine's host number.

## Range:

6 hexadecimal numbers separated by colons; each number in the range 0 - FF.

The MAC (media access control) address is an ethernet address with the format *x:x:x:x:x:x*, where *x* is a hexadecimal integer from 0 to FF. For example, *08:00:20:1b:0f:f2*.

## Example

```
arp -a
```

```
arp -s 192.9.200.44 08:00:20:1b:0f:f2
```

```
arp -d 192.9.200.44
```

```
arp -f
```

## Dependencies

Only one of the options can be specified at a time.

The arp command with no options displays all of the current ARP cache entries.

## Notes

The arp command is executed through the pass command.

## Output

```
pass:loc=1105:cmd="arp" or
```

```
pass:loc=1105:cmd="arp -h"
```

```

## aslog

This command is used to display the state changes for a specified Application Server (AS).

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `as log` command has the parameter asname. The Application Server name must be specified for which the log will be displayed, as in the command `as log as1`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asname

This option specifies the Association Server name for the display.

`-h`

This option displays help (usage) information for the command.

**Example**

```
aslog as1
```

**Dependencies**

None

**Notes**

None

**Output**

```
pass:loc=1105:cmd="aslog as1"
```

Command Accepted - Processing

```
rlghncxa03w 00-01-27 08:10:00 EST EAGLE5 31.6.0

ASLOG command complete
;
```

## assocrtt

This command is used to display the SCTP round trip times for a specified association. Minimum, maximum, and average times are kept for each open association. The Retransmission Mode (RFC or LIN) and the configured Minimum and Maximum Retransmission Timeout limits are also displayed.

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `assocrtt` command has the parameter aname. The association name must be specified for which the information will be displayed, as in the command `assocrtt c7000`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

**-r**

This option resets all statistics for the specified association name.

### Example

```
assocrtt c7000
```

```
assocrtt c7000 -r
```

### Dependencies

None

### Notes

This command does not indicate whether or not the socket is congested.

### Output

```
pass:loc=1105:cmd="assocrtt" or
```

```
pass:loc=1105:cmd="assocrtt -h"
```

```

    Command entered at terminal #1.

## connmgr

This command is used to generate reports about the status of the connection manager.

### Options

-d

This option displays a connection manager data summary. For IPSC cards, this report contains summary information and does not contain information for individual signaling links.

-h

This option displays help (usage) information for the command.

-i

This option displays SCTP instance and association data.

-l

This option displays the connection manager event log.

-n

This option displays the SCTP notification log.

-r

This option resets the connection manager event log.

### Example

```
connmgr -r
```

```
connmgr -c
```

```
connmgr -s
```

### Dependencies

Only one of the options can be specified at a time.

If no options are specified, usage information is displayed.

### Notes

The connmgr command is executed through the pass command.

### Output

```
pass:loc=1107:cmd="connmgr" or
```

```
pass:loc=1304:cmd="connmgr -h"
```

```
Command Accepted - Processing
```

```
rlghncxa03w 08-01-21 15:29:46 EST EAGLE5 38.0.0
pass:loc=1304:cmd="connmgr -h"
Command entered at terminal #1.
;
rlghncxa03w 08-01-21 15:29:46 EST EAGLE5 38.0.0
PASS: Command sent to card
;
rlghncxa03w 04-07-02 15:29:46 EST EAGLE5 31.6.0
Usage: CONNMGR [-d] [-h] [-i] [-l] [-n] [-r]
Options:
  -d  Display connection manager data summary
  -h  Displays this message
  -i  Displays instance data
  -l  Display the connection manager event log
  -n  Display the SCTP notification log
```

```
-r      Reset the connection manager event log
;
```

```
pass:loc=1107:cmd="connmgr -d"
```

The Connection Manager Data Summary displays all provisioned signaling link ports. In this example, signaling link port (slk) B is valid only for IPLIMx cards:

Command Accepted - Processing

```
rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
pass:loc=1107:cmd="connmgr -d"
Command entered at terminal #1.
;
rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
PASS: Command sent to card
;
rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
CONNMGR: command being processed
;
rlghncxa03w 04-07-02 15:37:12 EST  EAGLE5 31.6.0
CONNMGR: Connection Manager Data Summary
slk link state srv cli  opn sock  inst  opn assoc
---
A   active      1   0      1   0      0
B   active      0   0      0   1      1

CONNMGR command complete
;
```

In this example, a summary data report is requested for an IPSP card:

```
pass:loc=1304:cmd="connmgr -d"
```

Command Accepted - Processing

```
eagle10110 08-01-15 16:09:24 EST  EAGLE 38.0.0

CONNMGR: command complete

Event descriptions for `connmgr -l`

- `lnk-act`-The signaling link (slk) was activated.
- `lnk-deact`-The signaling link (SLK) was deactivated.
- `adptr-cls`-An association was closed.
- `admin-open`-An association was opened via admin and available for connection.
- `admin-cls`-An association was closed via admin and not available for connection.
- `conn-rcvd`-A connection request has been received from a client.
- `conn-rfsd`-Connection request was refused by the server.
- `conn-grnt`-Connection was granted by the server.
- `conn-fail`-Connection request made by the client has failed.
- `conn-made`-A connection has been made between the client and server.
- `pause-rcv`-A connection received a pause event.
- `resume-rcv`-A connection received a resume event.
- `conn-cngsd`-An association has become congested.
- `conn-uncng`-An association is no longer congested.
- `host-unreslvd`-A remote host is unresolved.
- `undef-evnt`-An undefined event has come in.

Event reasons for `connmgr -l`

- `lnk-not-actv`-The SLK (signaling link) is not active.
- `no-sock-avail`-No association is available.
- `unknown-sock`-Unknown association.
- `addr-in-use`-Address is in use.
- `net-unreach`-The network is unreachable.
- `net-reset`-Network dropped connection on reset.
- `sw-abort`-Software caused connection abort.
- `conn-reset`-The connection was reset by the peer.
- `no-buffers`-No buffer space available.
- `is-connected`-Association is already connected.
- `not-connected`-Association not connected.
- `shutdown`-Can't send after association shutdown.

- too-many-refs-Too many references : can't splice.
- timed-out-Connection timed out.
- refused-connection refused.
- net-down-The network is down.
- txt-busy-Text file is busy.
- loop-Too many levels of symbolic links.
- host-unreachb-Host unreachable.
- not-blk-Block device required.
- host-down-Host is down.
- host-unreslvd-Host is unresolved.
- host-mismatch-Remote Host validation rule fails.
- undef-reason-Undefined reason.

Notification descriptions for connmgr -n

- init-recvd-An INIT chunk was received to start an association.
- assoc-up-An association is up.
- assoc-down-An association is taken out of service.

- intf-down-Interface on an association is down and out of consideration for selection.
- intf-up-Interface on an association is up and now back in consideration for selection.
- dg-fail-The given datagram can not be delivered to the peer.
- sdata-err-A datagram was sent on a non-open stream.
- assoc-abrt-An association has been taken down ungracefully.
- peer-strm-Peer opened stream notification.
- strm-ok-Notification that the stream opened ok.
- assoc-rst-A Notification was received that an association was restarted.
- hb-resp-A response to a heartbeat request.
- data-msg-A DATA message has arrived. An SCTP packet includes user data encapsulated within SCTP DATA chunks.
- host-mismatch-Remote Host validation rule fails.
- host-unreslvd-Host is unresolved.
- rem-unreslvd-Remote host is unresolved.
- invalid-Invalid/Unknown event.

## ftptest

Use this command to send a test file to a configured FTP server that is used for the Measurements Platform feature

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `ftptest` command option `-a`

has the parameter appl. The FTP registered application to be tested can be specified, as in the command `ftptest -a meas`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-h`

This option provides help information for the command.

`-a appl`

This option specifies the FTP registered application to be tested.

**Range:**

*meas*

The Measurements Platform application

**Example**

`ftptest`

`ftptest -h`

`ftptest -a meas`

**Dependencies**

None

**Notes**

The `ftptest` command is executed through the `pass` command.

The specified card location must have an IP port configured to an FTP server using the `ent-ftp-serv` command, and the card must have its IP port configured using the `chg-ip-lnk` command.

**Output**

`pass:loc=1105:cmd="ftptest -h"`

or

`pass:loc=1105:cmd="ftptest"`

Command Accepted - Processing

```
rlghncxa03w 04-07-29 11:31:09 EST  EAGLE5 31.6.0
pass:loc=1215:cmd="ftptest -h"
Command entered at terminal #3.

## linkinfo

This command is used to display the state of a signaling link and to retrieve/clear a specified event log for a signaling link. The signaling link is any valid signaling link provisioned for the card. For IPLIMx cards, the *a:a7 - b:b7* signaling links are supported. For IPSG ENET cards, the *a:a15 - b:b15* signaling links are supported. For IPSG SLIC cards, the *a:a63 - b:b63* signaling links are supported.

For the E5-E1T1 cards, the *a:a15 - b:b15* signaling links are supported. For HC-MIM and E5-E1T1-B cards, the *a:a31 - b:b31* signaling links are supported. For E5-ATM/E5-ATM-B cards, the *a, a1, b* links are supported. E5-E1T1/E5-E1T1-B and E5-ATM-E5-ATM-B cards only support the *-c* option, the output will display the buffer information and congestion levels information.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `linkinfo` command option *-i* has the parameter *event*. The event to be included in the report can be specified, as in the command `linkinfo a -a -i m2pa`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

---

---

**Note:** For E5-E1T1/E5-E1T1-B and E5-ATM/E5-ATM-B cards, *-c* and *-h* are the only valid options.

---

---

*-h*

This option provides help information for the command.

*port*

This option specifies the signaling link port.

### Range:

*a, A1: A63-B, B1:B63*

*-a*

This option displays the adapter layer interface (ALI) log for the specified signaling link. For M3UA associations the `link -a` option is used to display the UA event log. This command logs information on an association basis. The **link** parameter is used to obtain this report on IPSG instead of the association name. This information is currently provided by the `ualog` command on IPGWx cards.

*-c*

This option displays congestion tuning parameters for M3UA and M2PA links. The report is enhanced to include card level congestion thresholds and the high-water mark for IPSG cards.

This option also displays congestion levels for E5-E1T1/E5-E1T1-B and E5-ATM/E5-ATM-B cards.

*-i event*

This option includes (does not filter) a link event in the log. For IPSP cards, this option may be used to include or exclude events for the ali and link logs. Valid events for the ALI event log are *ua* and *service*.

**Range:**

*ali, all, data, l2l3, l3l2, m2pa, state, ua, service*

*all*-include all events

- *l*

This option displays the IPLIM ALI event log for the specified signaling link

- *m*

This option displays acknowledgment times on an M2PA connection (minimum, maximum, weighted average, last recorded). For IPSP cards, this measurement is supported for only IPSP-M2PA links.

- *r*

This option resets (clears) the event log for the specified signaling link. This option is valid only with the - *a* option or - *l* option.

- *s*

This option displays the state information for the specified signaling link. For the IPSP cards, this option is enhanced to display M3UA signaling link status.

- *v*

This option displays the link event filter configuration.

- *x* *event*

This option excludes (filters) a link event in the log. For IPSP cards, this option may be used to include or exclude events for the ali and link logs. Valid events for the ALI event log are *ua* and *service*.

**Range:**

*ali, all, data, l2l3, l3l2, m2pa, state, ua, service*

*all*-exclude all events

**Example**

Provide help information for the command.

```
pass:loc=1301:cmd="linkinfo -h"
```

Set the filter to include ua events in the ua log report.

```
pass:loc=1304:cmd="linkinfo a -i ua"
```

Set the filter to include service events in the ua log report.

```
pass:loc=1304:cmd="linkinfo a -i service"
```

Display the ua log report for signaling link *a*.

```
pass:loc=1304:cmd="linkinfo a -a"
```

Display the ALI event log for signaling link *a1*.

```
pass:loc=1301:cmd="linkinfo a1 -a"
```

Display the IPLIM application event log for signaling link *a1*.

```
pass:loc=1301:cmd="linkinfo a1 -l"
```

Reset/clear the link event log for signaling link *a1*.

```
pass:loc=1301:cmd="linkinfo a1 -l -r"
```

Clear the ua log report for signaling link *a*.

```
pass:loc=1304:cmd="linkinfo a -a -r"
```

Display the state information for signaling link *a1*.

```
pass:loc=1301:cmd="linkinfo a1 -s"
```

Display acknowledgement times for an M2PA connection on signaling link *b1*.

```
pass:loc=3315:cmd="linkinfo b1 -m"
```

Display congestion tuning information for an IPSPG-M3UA signaling link and Display congestion levels and buffer information for signaling links on E5-E1T1/E5-E1T1-B and E5-ATM /E5-ATM-B cards.

```
pass:loc=1301:cmd="linkinfo a -c "
```

## Dependencies

None

## Notes

None

## Output

This example shows the output for the help command on IPSPG cards:

```
pass:loc=1301:cmd="linkinfo" or
```

```
pass:loc=1301:cmd="linkinfo -h"
```

```
tekelecstp 16-05-25 12:38:16 EST  EAGLE5 46.4.0.0.0-69.3.1

PASS: Command sent to card
;

tekelecstp 16-05-25 12:38:16 EST  EAGLE5 46.4.0.0.0-69.3.1

Usage: LINKINFO port [-a [-r]] [-h] [-l [-r]]
        [-m [-r]] [-s] [-v] [-x event]
Options:
  link      Signaling link port: a, b, a1, b1,.....a63, b63
  -a        Display the ALI event log for a signaling link
  -c        Display Congestion Tuning Information for a signaling link
  -h        Displays this message
  -i event  Include (do not filter) a link event type in the log
  -l        Displays the event log for a signaling link
  -m        Display Link Measurements
  -r        Resets the specified event log for a signaling link
  -s        Displays the state information for a signaling link
  -v        View the link event filter configuration
  -x event  Exclude (filter) a link event type from the log

Valid 'event' for link event log is ali, all, data, 1213, 1312, m2pa, state

end of report

## msucount

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and IP connections. These counts can be reported and reset at the same time to get accurate counts for longer periods of time. In addition to MSUs transmitted and received, the command also reports statistics on packets related to MTP Primitives and on discarded transmit and receive data.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `msucount` command option `-l` has the parameter port. The link for which counts will be displayed can be specified, as in the command `msucount -l a1`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-a`

This option is used to display IP connection statistics for a specific association. When `-a` aname is specified on the same line as `-k` rtkey, the output is assumed to be routing

key output. When `-a aname` is specified on the command line without `-k rtkey`, association statistics output is generated.

For IPSP cards, this option is enhanced to include receive and transmit counts for M3UA SSNMs (DAUD messages and M3UA SSNM PDUs) and replicated M3UA PDUs.

`-b`

This option is used to display signaling link bytes statistics. The signaling link bytes report displays data for measurements on a per-signaling-link basis for both the transmit and receive directions. The report can display link statistics for a specified signaling link number. If a link is not specified, the report displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx and IPSP cards. If a signaling link is valid for the card and application type, but is unequipped, then the report displays all zeros.

`-h`

This option is used to provide help information for the command.

`-f`

This option is used to display a full report (IPGWx application only).

`-k rtkey`

This option is used to specify the routing key for which the counts will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

This option is not supported for the IPSP cards.

The `-p` modifier can be specified to identify the point code type of the routing key that follows the `-k` option in the command.

The `-p` modifier is not supported for IPLIMx and IPSP cards.

The `rtkey` variable is optional when used with `-t default`, and mandatory for all other cases.

The following formats are valid for the routing key that follows the `-k` option in the command:

- `n-c-m:s:n`-For DPC, SI, SSN type routing keys. The network, cluster and member (`n-c-m`) are in the range 0-255. The service indicator (`s`) is 3 or *sccp*. The subsystem (`n`) is in the range 0-255.
- `n-c-m:s`-For DPC, SI, type routing keys. The network, cluster and member (`n-c-m`) are in the range 0-255. The service indicator (`s`) is in the range 0-2, 4, or 6-15. There is no subsystem. As a default, counts for all routing keys within the option combination are displayed.
- `n-c-m:s:no-co-mo:cs:ce`-For DPC, SI, CIC type routing keys. The DPC network, cluster and member (`n-c-m`) are in the range 0-255. The service indicator (`s`) is 5 or *isup*. There is no subsystem. The OPC network, cluster and member (`no-co-mo`) are in the range 0-255. The starting circuit identification code (`cs`) and ending circuit identification code (`ce`) are in the range 0 to 16363.

`-l`

For IPSP cards, this option displays the link report for all equipped signaling links on the card.

**-l link**

This option is used to display counts for links. The link report optionally allows display of link statistics for a specified port.

The link report contains data, per link, for MSUs (tx/rcv), MSU bytes (tx/rcv), MGMT msg (tx/rcv), and discarded data (tx/rcv).

For the IPSG card, the M2PA link report is the same as the IPLIMx M2PA report. The M3UA link report contains an additional detail line for non-discard pgs for SS7 SNM and Replicated M3UA PDU counts.

**Range:**

*a, b, a1, b1, a2, b2, a3, b3a:a63-b:b63*

If a port is not specified, msucount displays link statistics for port *a* for IPGWx links, and port *a* and port *b* for IPLIMx links.

The msucount link statistics report contains all zeros for a port that is valid for the card and application type but is unequipped.

The range *a:a15-b:b15* is valid for IPSG ENET cards.

The range *a:a63-b:b63* is valid for IPSG ENET cards.

-l

link -f

This option displays the full link report. For IPSG-M2PA links, this option displays the same report as the -l <link> option. For IPSG-M3UA links the report includes the data from the -l <link> report and includes an additional detail line displaying tx/rx discards counts and discard data.

**-p point code type**

This option modifier can be specified along with the -k option to identify the point code type (ANSI, ITU international, ITU-national, 24-bit ITU national, 16-bit ITU national, ITU international spare, and ITU national spare) in the routing key that follows the -k option in the command.

**Range:**

*ansi, itui, itun, itun24, itun16, ituis, ituns*

-r

This option is used with other options to reset counts at the same time of reporting them.

**-t keytype**

This option is used to display the routing key type (IPGWx only).

-x

The routing context is an index that uniquely defines a routing key associated with an SUA or M3UA AS. For the IPSG card, the option displays a link report for all signaling links on the card that are members of the linkset that contains the specified routing context value (equivalent to the **msucount -l** report. The -x option is used as an alternative to the -k option to identify the routing key by specifying its routing context in the command line.

---

**Note:** The `-x rc` option can only be used to specify routing keys containing M3UA/SUA associations.

---

### Example

Link counts only. Displays brief count for signaling link *a* for IPGW<sub>x</sub>. Displays counts for all equipped signaling links for IPLIM<sub>x</sub>.

```
msucount -l
```

Link counts only, for signaling link port *a1*.

```
msucount -l a1
```

Full/detail report for signaling link *a* for IPGW<sub>x</sub>.

```
msucount -l -f
```

Counts for the specified association only.

```
msucount -a association name
```

Counts for first matching routing key

```
msucount -k 10-10-10:3:16
```

Counts for the routing key report using the routing context.

```
msucount -x 5
```

Counts for first matching routing key and an associated association.

```
msucount -a association name -k rtkey
```

Counts for the default routing key

```
msucount -k -t default
```

Counts for a matching partial routing key.

```
msucount -k 3-3-3 -t partial
```

Counts for counts for link only. Displays brief report for signaling link *a* for IPGW<sub>x</sub>. Displays counts for all equipped signaling links for IPLIM<sub>x</sub>.

```
msucount
```

Resets the signaling link count measurements.

```
msucount -r
```

Brief version of help text.

```
msucount -h
```

Full version of help text.

```
msucount -h full
```

Counts for link and first matching routing key

```
msucount -b
```

Byte report for signaling link *A* for IPGW<sub>x</sub> cards. Byte report for all equipped signaling links for IPLIM<sub>x</sub> cards.

```
msucount -b -link
```

Byte report for specified signaling link.

```
msucount -l -k 10-10-10:3:16
```

Use with other parameters to display and reset counts. Valid with the above combinations.

```
msucount -l -r
```

```
msucount -r
```

```
msucount -x 5 -r
```

Examples showing the correct syntax to specify partial or default keys, or to specify a key by routing context:

```
pass:loc=1105:cmd="msucount -k 5-5-1:5:6-6-6 -t partial
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:5 -t partial"
```

```
pass:loc=1105:cmd="msucount -p ITUI -t partial -k 1-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351"
```

```
pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351-gr
```

```
pass:loc=1105:cmd="msucount -t partial -k :2 "
```

```
pass:loc=1105:cmd="msucount -k -t default"
```

```
pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN16 -t partial -k 1-2-1"
```

Examples of other valid routing key inputs:

```
pass:loc=1105:cmd="msucount -r -k 5-5-6:5:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:4:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:3:5 -a assoc1"
```

```
pass:loc=1105:cmd="msucount -r -p ITUN24 -k  
15-105-16:5:15-105-17:1:1000"
```

## Dependencies

At least one option must be specified.

## Notes

The `msucount` command is executed through the `pass` command.

Combinations of the `-l`, `-a`, `-k`, `-t`, `-x` and `-b` options provide count information based on the entered combination.

If no parameters are specified, then the `-l` brief report is output.

Multiple reports are not supported with the IP Signaling Serviceability feature.

For the SS7IPGW and IPGWI GPLs, 4 types of reports can be generated: the link report, the routing key report, the IP connection statistics report, and the signaling link bytes report. For the IPLIM/IPLIMI card, the routing key report is not supported.

The 4 reports are:

1. The link report (-l option) contains statistics per link about MSUs (transmit/receive), MSU bytes (transmit/receive), MGMT messages (transmit/receive), and discarded data (transmit/receive).
2. The routing key report (-k option) contains statistics for a specific routing key about MSUs (transmit), MSU bytes (transmit), and discards on the transmit path for the routing key.

A list of one or more IP connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also displayed. If -a aname is in the same input command with -k rtkey, only the connection association data for the specified connection is displayed. If -a aname is not specified with -k rtkey, all connection associations are listed. If -x rc is specified, only the connection association data for the specified routing context is displayed.

The -p (point code type) modifier option can be used with the -k option to specify the point code type of the routing key that follows the -k option in the command.

For the -k options, the routing key must be an exact match of a routing key that exists in the static Routing Key table.

3. The IP connection statistic report (-a aname option) contains statistics for a specified IP connection about MSUs (transmit/receive), MSU bytes (transmit/receive), and discarded data (transmit/receive).

When the -a aname option is specified in the command with the -k option, the output type is assumed to be routing key output.

When the -a aname option is specified in the command without the -k option, association statistics output is generated.

4. The signaling link bytes report (-b option) provides the following information for both IPGWx and IPLIMx cards: bytes/sec for the last second, average MSU size during the last second, and maximum one-second average MSU size since card load time or reset. For the IPLIMx cards, the report also provides the following information: sum of bytes/sec for the last second for all signaling link, average MSU size for last second for all signaling links, maximum average MSU size since load time or reset for all signaling links, and maximum MSU size since load time or reset for all signaling links.

The link report, routing key report, and IP connection statistics report (IPGWx only) can display individual transmit MSUs that were discarded at layer 2. The first 32 bytes of the MSU transmit data that is discarded is stored beginning at the SIO bytes. If the MSU is not 32 bytes long, the remaining bytes are set to 0.

The signaling link bytes report optionally allows display of link statistics for a specified signaling link number. If a link is not specified for the bytes report, the *msucount* command displays link statistics for signaling link A for IPGWx cards and for all equipped signaling links for IPLIMx cards.

The signaling link bytes report contains all zeros for a signaling link that is valid for the card and application type but that is unequipped.

The link and IP connection statistics reports can display individual receive packets that were discarded at layer 2. If the storage space is larger than the service data, the extra bytes are set to 0.

The reset option (-r) resets the specified measurements. This option can be added to any command.

## Output

In these examples, the hexadecimal output for discarded *transmit* data represents data stored beginning at the SIO bytes through the first 32 bytes of the MSU. If the MSU was less than 32 bytes, the remaining bytes are represented by zeros.

Stored *receive* data takes the following format:

- Bytes 13-x = Service data. If the storage space is greater than the size of the service data, the remaining bytes are zeroed.

## Output Specific to SS7IPGW and IPGW

Either brief or full help reports can be displayed. A full help report is generated by adding the `full (-f)` option to the command line.

This example shows a brief help report:

```
pass:loc=1105:cmd="msucount -h"
```

```

```

#### -k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGW default pctype is ITUI.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| -----   | -----     | -----                                  |
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUN16  | U-S-M     | Non-Spare ITU National, 16-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

| SS7 Traffic Partition             | RTKEY Parameter Example      |
|-----------------------------------|------------------------------|
| -----                             | -----                        |

```

tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0
MSUCOUNT command complete

```

A brief version for the link measurement report can be specified for IPGWx. If no parameters are specified for a link measurements report, then a brief report is displayed. The brief report does not display the transmit/receive discard counts.

This example shows a brief link measurements report:

```
pass:loc=1305:cmd="msucount"
```

or

```
pass:loc=1305:cmd="msucount -l"
```

tekelecstp 10-08-17 11:50:34 EST EAGLE 42.0.0

MSUCOUNT: command complete

### Routing Key Report Output Examples

The routing key report contains data about MSUs (tx), MSU bytes (tx), and discards on the transmit path for the routing key. A list of one or more connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also presented. If `-a aname` is in the same input command with `-k rtkey`, only the connection association data for the specified connection is displayed. If `-a aname` is not specified with `-k rtkey`, all connection associations are listed. If `-x rc` is specified, only the connection association data for the specified routing context is displayed.

---

**Note:** For IPGWx, `-k rtkey` is optional when used with `-t default`, and mandatory for all other cases.

---

The report output itself does not display the routing key that was entered, other than an exact copy of the command line being generated as part of the output.

Partial routing keys (where some fields in the MSU are ignored with respect to finding a routing key to use for the MSU) and default keys can be specified in the command. The output does not change for these key types; the only difference is the routing key syntax (`-p`) that must be processed as part of identifying the partial and default keys. (See the Example section of this command description for syntax examples).

This example shows a routing key report for an ANSI routing key that specifies the Routing Key table:

```
pass:loc=1105:cmd="msucount -k 5-5-1:3: -t partial"
```

```
tekelecstp 10-09-10 11:50:34 EST EAGLE 43.0.0
```

## Output Specific to IPLIM and IPLIMI

---

**Note:** The routing key report is not supported for IPLIMx applications. The -k, -t, -p, -x options are not supported because the IPLIMx card does not use routing keys.

---

---

**Note:** The IPLIMx reports include all equipped signaling links instead of just ports A and B. These reports include the transmit/receive counts alongside each other for the link case.

---

This example shows help for using the command:

```
pass:loc=1103:cmd="msucount -h" or
```

```
pass:loc=1103:cmd="msucount"

MSUCOUNT command complete
```

```
;
```

This example shows a link report for an IPLIMx card with 2 M2PA links.

The report does not contain MTPP or RKRP MGMT statistics, because those capabilities are not supported on the IPLIMx applications. The report also does not contain tx/rcv discard data, because there are no discards performed at layer 2 of the IPLIMx applications. The IPLIMx card can also contain 2 links per card; the output contains link data for each link.

```
pass:loc=1301:cmd="msucount"
```

```

### Enhanced Reset Option

The reset option resets the specified measurements without displaying msucount output. The default is to reset the link measurements report.

This example shows resetting link measurements:

pass:loc=1305:cmd="msucount -l -r"

or

pass:loc=1305:cmd="msucount -r"

eagle10212 06-06-01 08:50:47 EST EAGLE 35.0.0

MSUCOUNT: MSU Count Report

Link measurements have been reset.

MSUCOUNT: command complete

This example shows resetting Routing Key measurements:

pass:loc=1305:cmd="msucount -x -5 -r"

eagle10212 06-01-05 08:50:47 EST EAGLE 35.0.0

MSUCOUNT: MSU Count Report

Routing Key measurements have been reset.

MSUCOUNT: command complete

### Output specific to IPSPG Cards

The option to display a full help report is not supported for IPSPG cards.

pass:loc=1304:cmd="msucount -h"

rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0

```
Usage: msucount [ [-l [link]] | [-b [link]] | [-l link -f] ] |
               [ [-a aname] ]
               [ [-x rc] ]
               [-r] [-h]
```

```
Options: -l display signaling link report
         -b display signaling link bytes report
         -a display association report
         -x display routing context report
         -f display full report
         -r resets the specified counts
         -h display command help
```

```
;
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
```

```
MSUCOUNT: command complete
```

For link reports on IPSPG signaling links, if a specific link is not requested, then counts for all equipped signaling links on the card are displayed. The report includes counts for up to 32 links per card. The `-l <link>` report adds counts for *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, and *SS7 SNM Counts sent* for M3UA links.

This example shows a brief measurements report:

```
pass:loc=1303:cmd="msucount -l"
```

```
tekelecstp 16-05-25 12:38:16 EST EAGLE5 46.4.0.0.0-69.3.1
pass:loc=1303:cmd="msucount -l"
```

```
MSUCOUNT: MSU Count Report
```

| rate  | msus | bytes |
| ----- |      |       |
| 0     | 62   | 1916  |

MSUCOUNT: command complete

The `msucount -l <link> -f` report displays the same information as the brief report (`msucount -l <link>`) for IPSG-M2PA links. For IPSG-M3UA links, the `msucount -l <link> -f` report displays both the information from the brief report and the *discarded tx due to M3UA Conversion Error*, *discarded rcv due to M3UA PDU Error*, *discarded rcv due to Management Blocking*, and *discarded rcv due to Lrg BICC not supported* discard counts.

This example shows a full report for an IPSG-M3UA signaling link when discard counts are not received:

pass:loc=1303:cmd=msucount -l a -f

rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0

MSUCOUNT: MSU Count Report

### Routing Context Report

The `msucount -x <routing context>` report for an IPSP card displays the equivalent of the `msucount -l` report for all signaling links on the card that are members of the linkset containing the specified routing context.

This example shows a routing context report:

```
pass:loc=1303:cmd="msucount -x 74565"
```

```
rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0
MSUCOUNT: MSU Count Report
```

#### Routing Context Measurements

| SLK Transmit counts |      |      |       | SLK Receive counts |      |       |
|---------------------|------|------|-------|--------------------|------|-------|
| slk                 | rate | msus | bytes | rate               | msus | bytes |
| A                   | 0    | 3    | 72    | 0                  | 0    | 0     |
|                     | 0    | 3    | 72    | 0                  | 0    | 0     |

MSUCOUNT: command complete

;

### IP Connection Report

The IP connection statistic report for an IPSP card contains data regarding MSUs (tx/rcv), MSU bytes (tx/rcv), and discarded data (tx/rcv) for a specific socket or an association. The `-a <aname>` report for M3UA links adds the *Replicated M3UA PDU sent*, *Replicated M3UA PDU rcvd*, *SS7 SNM sent*, *Discarded rcv due to SS7 SNM not supported*, and *Discarded rcv due to no SS7 SNM capacity*.

The existing *Discarded rcv due to M3UA PDU error* and *Invalid rcontext counts* are also supported.

This example shows an aname report:

```
pass:loc=1303:cmd="msucount -a a1303a"
```

rlghncxa03w 08-01-29 11:31:09 EST EAGLE 38.0.0

 MSUCOUNT command complete

### Link Reports

The link report contains the statistics of the equipped links (TDM/ATM) on the SS7HC/ATMHC cards collected on a per link basis.

An SS7HC/ATMHC generic link report is reported if the MSUCOUNT command is entered without any parameters. The output contains data regarding MSU bytes (tx/rcv), %bandwidth used (tx/rcv), MSUs (tx/rcv) collected during the last full second per link. Total MSU counts (tx/rcv) per link since the card load time or the last reset are also displayed.

If the `-l slk` option is specified, then the statistics for the specified link is shown (if the link is equipped).

On cards running SS7HC GPL, in addition to the information shown in the Generic and Full reports, data is collected for the error counts (MSUs and SUs) and retransmits pegged during the last full second. Averages for the MSUs, percent bandwidth, bytes transmitted and received for the last rolling sampling period, and the maximum of these averages since the card was loaded or the data was reset is also displayed.

## msuroute

This command is used to provide a list of all routing keys currently configured on an SS7IPGW/IPGWI card that could be used to route a particular MSU. With 3 types of routing keys (fully specified, partial and default) the complexity associated with figuring out how a particular MSU would be routed at any point in time is not trivial. This command provides output to help determine how MSUs will be routed based on current conditions.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `msuroute` command option `-k` has the parameter `rtkey`. The full routing key must be specified for the MSU for which the summary will be displayed, as in the command `msuroute -k`

5-5-5:5:6-6-6:1100. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-h

This option is used to provide help information for the command.

-k rtkey

This option is mandatory in the command to specify the full routing key for the MSU for which the summary will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

The -p point code type modifier is used to identify the format of the routing key that follows the -k option in the command.

The following are valid formats for the routing key that follows the -k option in the command:

- n-c-m:s:n—For DPC, SI, SSN type routing keys. The network, cluster and member (n-c-m) are in the range 0-255. The service indicator (s) is 3 or *sccp*. The subsystem (n) is in the range 0-255.
- n-c-m:s—For DPC, SI, type routing keys. The network, cluster and member (n-c-m) are in the range 0-255. The service indicator (s) is in the range 0-2, 4, or 6-15. There is no subsystem.
- n-c-m:s:no-co-mo:cs:ce—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (n-c-m) are in the range 0-255. The service indicator (s) is 5 or *isup*. There is no subsystem. The OPC network, cluster and member (no-co-mo) are in the range 0-255. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range 0 to 16363.

-p point code type

This option modifier is used to identify the point code type (ANSI, ITU international, ITU national, 24-bit ITU national, 16-bit ITU national, ITU international spare, ITU national spare) in the routing key that follows the -k option in the command.

**Range:**

*ansi, itui, itun, itun24, itun16, ituis, ituns*

**Default:**

*ansi*

-x routing context

This option modifier is used to display the routing key report using routing context.

**Example**

msuroute -h

msuroute -p ansi -k 5-5-5:5:6-6-6:1100

msuroute -p ansi -k 5-5-5:5:6-6-6:1100:1100

msuroute -k 5-5-5:5:6-6-6:1100

msuroute -k 5-5-5:5:6-6-6:1100:1100

msuroute -p ansi -k 5-5-5:8

msuroute -p itun -k 345:5:678:100:200

```
msuroute -p itun -k 345-gr:5:678-gr:100:200
msuroute -p itun24 -k 10-200-10:5:10-200-1:1:100
msuroute -p itun16 -k 1-2-1:5:1-2-1:1:100
```

### Dependencies

The `-k` option must be specified in the command, and must specify a full routing key. This command is not supported for IPLIM/IPLIMI cards.

### Notes

The `msuroute` command is executed through the `pass` command.

The `-ppoint code type` modifier option can be used with the `-k` option to specify the format of the routing key that follows the `-k` option in the command.

### Output

The output for each `msuroute` command consists of a list of all of the routing keys that exist on the IPGWx card that could be used to route the MSU. The list of routing keys is presented in the hierarchical search order in which the keys would be used. The list of routing keys indicates keys that have IP connections available for traffic, and indicates which routing key would currently be used to route the MSU (marked with \*\*\*).

For the routing key that is selected to route the MSU, the list of IP connections associated with the key is also displayed.

---

**Note:** Most of the following output examples show command entries for ANSI MSUs. Because, other than echoing the input command back to the screen, there is nothing in the output that contains specific fields from any configured keys. The output would not be different if the user entered ITUI MSUs instead of ANSI MSUs.

---

Either brief or full help reports can be displayed. A full help report is generated by adding the `-h full` option to the command line.

This example shows a brief help report:

```
pass:loc=1105:cmd="msuroute -h"
```

```
Command Accepted - Processing
```

```
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] ] ]
           [-h [full]]
```

```
Options: -x routing key report using routing context
          -k routing key report using MTP3 parameters
            rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
          -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
          -h display command help (brief or full)
```

```
;
```

This example shows a full help report:

```
pass:loc=1305:cmd="msuroute -h full"
```

```

0          1          2          3          4          5          6          7

Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] ] ]
              [-h [full]]

```

Options: -x routing key report using routing context  
 -k routing key report using MTP3 parameters  
       rtkey :: dpc:si:opc:cics:cice | dpc:si:ssn | dpc:si  
 -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS, ITUNS)  
 -h display command help (brief or full)

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGW default pctype is ITUI.

| Network | PC Format | Notes                                  |

MSURROUTE command complete

;

These examples show output for an ITUN and an ITUN24 MSU with SI=5. The output format is the same for all four commands.

The ITUDUPPC feature is OFF (default):

pass:loc=1105:cmd="msuroute -p itun -k 345:5:678:100:200"

The ITUDUPPC feature is ON (the 2-letter group code must be specified with the DPC and OPC)

pass:loc=1105:cmd="msuroute -p itun -k 345-gr:5:678-gr:100:200"

An ITUN24 MSU with SI=5:

```
pass:loc=1105:cmd="msuroute -p itun24 -k
10-200-10:5:10-200-1:1:100"
```

An ITU-I Spare MSU with SI=5:

```
msuroute -p ituis -k 3-11-1:5:4-11-1:5:5
```

Command Accepted - Processing

## msutrace

This command provides filter and trace capability for MSUs passing through the IP7 GPLs. This command provides a view of MSU data as it exists in the PSTN network and its corresponding format as it exists in the IP network.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `msutrace` command option -

**a** has the parameter action. The action that the command is to take can be specified, as in the command `msutrace -a acttrace`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-a action

Action option.

**Range:**

*acttrace*

Activate (turn on) MSU tracing

*clrtrace*

Clear all data from trace buffers

*dacttrace*

Deactivate (turn off) MSU tracing

*chgfilter*

Change filter used to indicate which MSUs are placed in the trace buffers

-g get option

Get option.

**Range:**

*config*

Displays the current command settings: trace ON/OFF status, filter settings, and trace buffers used/available

*trace*

Displays contents of trace buffers containing captured MSU data

-h help

This option displays help information about the command.

**Range:**

*full*

If *full* is specified, the detailed version of the help information is displayed.

If *full* is not specified (just -h), the simple version of the help information is displayed.

-m mode

This option specifies which MSUs are captured.

**Range:**

*normerr*

trace only MSUs with normalization errors

*all*

trace all MSUs regardless of MSU contents

-p point code type

This option specifies which type of point code is contained in the filter key, when the key contains a DPC or OPC.

**Range:**

*ansi, itui, itun, itun24, itun16, ituis, ituns*

**Default:**

*ansi*

**-k filter key**

The -k, -c, and -p options are used to specify the filter key used to determine which MSUs will have data placed in the trace buffers.

**Range:**

**-k filter key [-p] [-c pcType]**

The syntax for the filter key portion of the -kfilter key option is specified as a single string parameter with up to five colon-separated fields. The filter key can contain one or more of the following fields:

- *n-c-m*—ANSI DPC in the format *network-cluster-member*
- *no-co-mo*—ANSI OPC in the format *network-cluster-member*
- *z-a-i*—ITU-I DPC in the format *zone-area-id*
- *zo-ao-io*—ITU-I OPC in the format *zone-area-id*
- *un-sna-mna---*16-bit ITU-N DPC in the format *unit number-sub number area-main number area*
- *msa-ssa-sp*—24-bit ITU-N DPC in the format *main sigaling area-sub signaling area-signaling point*
- *nnnnn*—ITU-N DPC
- *nnnnn-gc*—ITU-N DPC with Group Code when the Duplicate Point Code feature is ON
- *no*—ITU-N OPC
- *no-gc*—ITU-N OPC with Group Code when the Duplicate Point Code feature is ON
- *s*—SI (Service Indicator)
- *cs*—CIC Start value (start of the CIC range)
- *ce*—CIC End value (end of the CIC range)
- *n*—SSN (Subsystem Number)

These examples show valid formats:

- *n-c-m:s:n*—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is 3 or sccp. The subsystem (*n*) is in the range 0-255.
- *n-c-m:s*—For DPC, SI type routing keys. The network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (*s*) is in the range 0-2, 4, or 6-15. There

is no subsystem number. As a default, counts for all routing keys within the option combination are displayed.

- *n-c-m:s:no-co-mo:cs:ce*—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range 0-255. The service indicator (s) is 5 or isup. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range 0-255. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range 0 - 16363.
- *z-a-i*—For DPCN and DPCI routing keys, the zone, area and ID (*z-a-i*) are in the range of 000-007 (zone and ID) and 000-255 (area).
- *msa-ssa-sp*—For 24-bit DPCN routing keys, the main signaling area, sub signaling area and signaling point (*msa-ssa-sp*) are in the range of 000-255.
- *un-sna-mna---*For 16-bit DPCN routing keys, the unit number, sub number area and main number area (*un-sna-mna*) are in the range of 0-127, 0-15, 0-31 respectively.

-t

This option specifies the routing key type (IPGWx only).

-x rc

This option generates a routing key report using routing context.

### Example

```
pass:loc=1105:cmd="msutrace -h"
pass:loc=1105:cmd="msutrace -h full"
pass:loc=1105:cmd="msutrace -g config"
pass:loc=1315:cmd="msutrace -g trace"
pass:loc=1105:cmd="msutrace -a clrtrace"
pass:loc=1105:cmd="msutrace -a acttrace"
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k
3-3-3:5:4-4-4:10:1000"
pass:loc=1105:cmd="msutrace -a chgfilter -p itui -t partial -k
1-3-3:5:2-4-4"
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -t partial -k
1536:5"
pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
pass:loc=1105:cmd="msutrace -a chgfilter -m all"
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k
1-1-1:5:2-2-2:10:1000"
```

### Dependencies

If no options are specified, the simple version of the help information is displayed.

The point code type defaults to ANSI when the -p option is not specified.

The -p option is allowed only on key types that contain a DPC or OPC.

## Notes

The `msutrace` command is executed through the `pass` command.

The `mustrace` command captures the data portion of the PSTN packet, starting at the SIO bytes.

The `msutrace` command captures the entire M3UA or SUA packet. This includes the M3UA or SUA header and additional data stored inside system buffer chain elements. The `msutrace` command currently does not support the trace and capture of M3UA / SUA SSNM (Class 2) messages.

The `msutrace` command captures data in trace buffers. If the set of trace buffers becomes full with captured MSU data after MSU tracing is activated, no more data capturing will take place. The `-aclrttrace` option must be specified to reset (clear) the content of the trace buffers. After the trace buffers are empty again, `msutrace` will restart capturing qualified MSUs.

If MSU tracing is activated with the `-a acttrace` option before a properly formatted filter key is entered, the `msutrace` command will not capture any data due to lack of a proper filter. When the `-a chgfilter` option is specified to enter a properly formatted filter, the `msutrace` command will start capturing qualified MSUs.

## Output

---

**Note:** The `msutrace` `pass` command exists on the IPLIM/IPLIMI cards as a debug-only `pass` command. All command syntax and output are identical to the `SS7IPGW` and `IPGWI` commands described in this section.

---

Both brief and full versions of IPGW reports can be requested. A full report is requested by including the `-f` in the command line.

This example shows a brief help report:

```
pass:loc=1305:cmd="msutrace -h"
```

```
Usage: msutrace [-a action_cmd] [-g get_cmd]
               [ [-x rc] | [-k rtkey] [-p pctype] [-t keytype]] ]
               [-m mode] [-h [full]]
```

### Options:

```
-a  action_cmd: an Action Command
-g  get_cmd: a Get Command
-x  routing key report using routing context
-k  routing key report using MTP3 parameters
    rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
-p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS, ITUNS)
-t  routing key type
    keytype :: (<full>, partial, default)
-m  mode: mode for qualifying MSUs captured=[normerr | all]
-h  displays this message (brief or full)
```

```
get_cmd:      [config | trace]
config       config
trace        trace
```

```
action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace]
acttrace     acttrace
chgfilter    chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
                                   (valid fltrkey should be present either before
```

```
                                specifying mode or in the same command)
        clrtrace    clrtrace
        dacttrace   dacttrace

<fltrkey>:    [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              (see 'msutrace -h full' for complete description)

MSUTRACE command complete
;
```

This example shows a full help report:

```
pass:loc=1305:cmd="msutrace -h full"
```

```
Usage: msutrace [-a action_cmd] [-g get_cmd]
              [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              [-m mode] [-h [full]]

Options:
  -a  action_cmd: an Action Command
  -g  get_cmd: a Get Command
  -x  routing key report using routing context
  -k  routing key report using MTP3 parameters
      rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
  -p  pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUN16, ITUIS, ITUNS)
  -t  routing key type
      keytype :: (<full>, partial, default)
  -m  mode: mode for qualifying MSUs captured = [normerr | all]
  -h  displays this message (brief or full)

get_cmd:    [config | trace]
  config    Display the current MSUTRACE settings:
            trace On/Off status, filter settings, and
            trace buffers used/available.
            ex: msutrace -g config
  trace     Display content of trace buffers containing captured
            MSU data
            ex: msutrace -g trace

action_cmd: [acttrace | chgfilter | clrtrace | dacttrace ]
  acttrace  Activate (turn-on) MSU-tracing.
            ex: msutrace -a acttrace
  chgfilter chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
            (valid fltrkey should be present either before
            specifying mode or in the same command)
            Change filter used to qualify which MSUs are placed in
            trace buffers:
            Flow of command should be
            Either entering filter key before specifying mode :
            ex: To trace MSUs based on MSU content:
                  msutrace -a chgfilter <fltrkey>
            ex: To only trace MSUs with Normalization errors:
                  msutrace -a chgfilter -m normerr
            ex: To trace all MSUs regardless of error conditions:
                  msutrace -a chgfilter -m all
            Or entering filter key along with mode:
            ex: To trace MSUs based on MSU content
                  with Normalization errors:
                  msutrace -a chgfilter <fltrkey> -m normerr
            ex: To trace MSUs based on MSU content
                  regardless of error conditions:
```

```
msutrace -a chgfilter <fltrkey> -m all
```

clrtrace    Clear all data from trace buffers.  
ex: msutrace -a clrtrace

dacttrace   Deactivate (turn-off) MSU-tracing.  
ex: msutrace -a dacttrace

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW and IPLIM default pctype is ANSI. The IPGWI and IPLIMI default pctype is ITUI.

For IPSG both ANSI and ITU network point code formats are eligible for trace when the default filter or an SI only filter is specified. The IPSG default pctype is ANSI when the filter contains OPC or DPC and the -p option is not specified.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| -----   | -----     | -----                                  |
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUN16  | U-S-M     | Non-Spare ITU National, 16-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key or LS.

| SS7 Traffic Partition             | RTKEY/MTP3 Parameter  | Example     |
|-----------------------------------|-----------------------|-------------|

### Examples for Entering a Filter Key

The output shown at the end of these command examples is the same for each example, except for the echo of the entered command.

Command with the *-a chgfilter* option to insert a fully specified ANSI PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 5
- OPC = 4-4-4 (ANSI)
- CIC = [10..1000]

```
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k
3-3-3:5:4-4-4:10:1000"
```

Command with the *-a chgfilter* option to insert a fully specified ANSI SCCP filter.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 3
- SSN = 230

```
pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:3:230"
```

Command with the *-a chgfilter* option to insert a fully specified ANSI DPC SI filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 6

```
pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:6"
```

Command with the *-a chgfilter* option to insert a fully specified ITUN24 PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-103-3 (ITUN24)
- SI = 5
- OPC = 14-104-4 (ITUN24)
- CIC = [10..1000]

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k  
13-103-3:5:14-104-4:10:1000"
```

Command with the *-a chgfilter* option to insert a partial ITUI DPC SI OPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1-3-3 (ITUI)
- SI = 5
- OPC = 2-4-4 (ITUI)

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itui -k  
1-3-3:5:2-4-4"
```

Command with the *-a chgfilter* option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned off:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536 (ITUN)
- SI = 5

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536:5"
```

Command with the *-a chgfilter* option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned on:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536-bb (ITUN)
- SI = 5

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536-bb:5"
```

Command with the *-a chgfilter* option to insert a partial ANSI DPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)

```
pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3"
```

Command with the *-a chgfilter* option to insert a partial SI filter key. Because no DPC or OPC field is specified, point code type does not have to be indicated.

This filter key qualifies for capture MSUs with the following properties:

- SI = 5

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-113-3 (ITUN24)

```
pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-113-3"
```

Command Accepted - Processing

```
eagle20003 06-06-01 10:16:57 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
Command entered at terminal #1.
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
PASS: Command sent to card
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command in progress
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command completed
;
```

These commands include the *-m mode* option to change the trace capture mode.

Mode to have a 'capture-on-normalization error' property such that only MSUs with normalization processing errors are traced:

```
pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
```

Set a default filter key and the filter's mode at the same time:

```
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"
```

Command Accepted - Processing

```
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"
Command entered at terminal #1.

eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command in progress
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command completed
;
```

These commands insert a partial DPC-SI filter key with ITU-I spare point code and show the *msutracegetfilter* command output with the filter key after the *chgfilter* command is processed to completion.

This filter key will qualify MSUs with at least the following properties:

- DPCI = (ITU-I Spare) 2-11-1
- SI=5

```
pass:loc=1317:cmd="msutrace -a chgfilter -p ituis -k 2-11-1:5"
```

Command Accepted - Processing

```
eagle20003 06-06-01 10:16:03 EST EAGLE5 35.5.0
pass:loc=1317:cmd="msutrace -a chgfilter -p ituis -k 2-11-1:5"

## netstat

This command is used to display network statistics from the TCP/IP stack. This command allows troubleshooting of network interface and routing configuration problems within the private EPAP-Service Module IP network.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `netstat` command option `-m` has the parameter buffer pool. The pool for which information will be displayed can be specified, as in the command `netstat -m sys`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

`-a`

This option displays socket information for all protocols.

`-d`

This option displays driver measurement data.

The `-m` modifier displays multicast information. The `-p` modifier displays PHY registers. The `-z` modifier clears driver measurements. The `-h` modifier displays history measurements for the past 24 hours or the measurements collected a user defined hour ago. The `-f` modifier displays driver measurement data in full format (for GPLs that are loaded on E5-based cards only).

The `-m`, `-p`, and `-h` modifiers are not supported for GPLs that are loaded on E5-based cards.

`-e`

This option displays DPL driver measurement data. This option is supported only for GPLs that are loaded on E5-based cards.

`-f, -h`

These options provide help information for the command.

`-i`

This option displays interface information for all interfaces.

`-m buffer pool`

This option displays buffer pool information for the specified pool.

### Range:

*data*

SENS protocol stack data buffer pool

*sys*

system buffer pool

*dd*

Ethernet device driver buffer pool

**Default:**

All three buffer pools are displayed.

**-p protocol**

This option displays information for the specified protocol.

**Rnage:**

*tcp*

transmission control protocol

*udp*

user datagram protocol

*ip*

internet protocol

*icmp*

internet control message protocol

*sctp*

stream control transmission protocol

**Default:**

None

**-r**

This option displays the Route table.

**Example**

```
pass:cmd="netstat -i":loc=1105
```

```
pass:cmd="netstat -a":loc=1111
```

```
pass:cmd="netstat -p tcp":loc=1111
```

```
pass:cmd="netstat -m data":loc=1105
```

```
pass:cmd="netstat -r":loc=1105
```

```
pass:cmd="netstat -e":loc=1111
```

```
pass:cmd="netstat -d 0 -f":loc=1111
```

**Dependencies**

Only one of the options can be specified at a time.

**Notes**

The netstat command is executed through the pass command.

The options {-m,-p,-h} are not supported for GPLs that are loaded on E5-based cards.

**Output for GPLs that are NOT loaded on E5-based cards**

```
pass:loc=1107:cmd="netstat"
```

or

```
pass:loc=1107:cmd="netstat -h"
```

```
Command Accepted - Processing

tekelecstp 08-02-02 12:16:34 EST  EAGLE 38.0.0
PASS: Command sent to card

Usage: netstat [-a] [-h] [-m data|sys|dd] [-p icmp|igmp|ip|sctp|tcp|udp]
        [-i] [-r] [-d 0|1 [-m] [-p] [-z] [-h 1..24]]

Options:
  -a      display socket information for all protocols
  -h      Displays this message
  -m      display buffer pool information for 1 of the system pools
  -p      display socket information for 1 of the protocols
  -i      display interface information for all interfaces
  -r      display the route table information
  -d      display driver measurement data

The interfaces listed in the `netstat -i` output correspond to the card's ports as follows:

- `seeq 0` = IP interface A
- `seeq 1` = IP interface B
- `DPLend` = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring
- `LO` = local loopback interface

Output for the `netstat -i` command varies based on the card type. The GEI interfaces are the ports that carry signaling and monitoring traffic external to the EAGLE. The number of these ports varies with the IP connection. Information for all 4 GEI interfaces is displayed on only FC Capable cards as shown below.

The interfaces listed in the `netstat -i` output correspond to a card's ports as follows:

- For Signaling GPLs (IPSG, IPLIMx, IPGWx):
- gei 2 = IP signaling interface A
- gei 0 = IP signaling interface B
- gei 3 = Fast Copy interface A
- gei 1 = Fast Copy interface B
- DPLend = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring
- LO = local loopback interface

For SCCPx GPLs:

- gei 0 = IP interface A
- gei 1 = IP interface B
- DPLend = pseudo-IP interface used only by network cards for STC-style Integrated Monitoring

- LO = local loopback interface
- BOND = interface formed by bonding the two IP interfaces

```

## nslookup

This command returns the IP address for a given hostname, or returns a hostname for a given IP address.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `nslookup` command has the option destination. An IP address or hostname can be specified for the destination, as in the commands `nslookup 192.168.100.3` and `nslookup dcm1107a`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### destination

The destination can be either an IP address or hostname.

#### IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine’s host number.

#### **Range:**

4 numbers separated by dots, with each number in the range of 0-255.

#### hostname

Hostname. The logical name assigned to the device with the IP address indicated.

#### **Range:**

*a-z, A-Z, 0-9, -, .*

(any string of characters beginning with a letter and comprising up to 60 characters in length)

-h

This option provides help information for the command.

### Example

```
nslookup 192.9.200.44
```

```
nslookup nc.tekelec.com
```

```
nslookup 2005:1a3c:2a3e:12ef:9064:8b6c:567a:78fd
```

## Dependencies

The actual nslookup text string must be followed by a destination (either a hostname or IP address).

Whether a host is found depends on the configuration of the host table and domain name servers.

## Notes

The nslookup command is executed through the pass command.

## Output

```
pass:loc=1105:cmd="nslookup"
```

or

```
pass:loc=1105:cmd="nslookup -h"
```

```

## pct

This command is used to maintain per-translation statistics and to test Point Code and CIC Translation (PCT) functionality. The command can use Stats mode to reset or display per-translation statistics or Test mode to test PCT behavior.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

-h

This option is used to provide help information for the command.

The following options are common to both Stats mode and Test mode:

-p pctype

Point Code Type. This option applies to all point codes in the option list.

### Range:

*ansi, itui, itun*

### Default

*ansi*

The following options apply to only Stats mode:

-a realpc

Real Point Code

-c cicr

CIC range. This option can be specified only if SI is 4, 5, or 13.

### Range:

The option can be in one of these forms:

- wildcard(\*)
- *ecics-ecice:rcics-rcice*, e.g., 5-10:15-20
- *ecics:rcics* (e.g., 5:6, which is equivalent to 5-5:6-6)

-e epc

Emulated Point Code

-f fpc

Filter Point Code. This option can be a wildcard (\*).

-l

List the stats for the selected rules. The -e or -a option must be supplied. Both of these options can be specified.

-r

Resets the stats for selected rules. If no other options are specified, then this option resets stats on all rules. If other options are specified, then the **-e** or **-a** option must be specified.

**-s si**

**Range:**

0, 3, 4, 5, 13, or wildcard (\*)

**-u ssn**

Subsystem Number. The **si=3** option must be specified before this option can be specified. This option can be a wildcard (\*)

The following options apply only to Test mode.

**-c cic**

CIC in simulated MSU. If a value of 4, 5, or 13 is specified for the **si** option, then the **-c** must be specified.

**-d dpc**

Destination Point Code in simulated MSU.

**-o opc**

Originating Point Code in simulated MSU.

**-s si**

SI in simulated MSU.

**-u ssn**

Subsystem number in CgPA and CdPA in simulated MSU. The **si=3** option must be specified before the **-u** option can be specified. If the **-u** is not specified, and the **si=3** is specified, then the route on SSN is off.

```
pass:loc=1201:cmd="pct -h"
```

```
pass:loc=1201:cmd="pct -m stats -r -e 4-3-1"
```

```
pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 7-2-30 -s 3 -u 26"
```

## Dependencies

None

## Notes

None

## Output

This example shows a help report:

```
pass:loc=1201:cmd="pct -h"
```

Command Accepted - Processing

Usage:

```
pct -m stats [-l | -r] [-p pctype] [-e epc] [-f fpc] [-a realpc] [-s si] [-u ssn] [-c cicr]
```

```
pct -m test [-p pctype] -d dpc -o opc -s si [-c cic] [-u ssn]
```

```
pct -h
```

Modes:

```

stats - reset or display per-rule stats
test  - test PCT behavior for a message with the specified field values
Common Options:
  -p  pctype is ANSI, ITUI, or ITUN
stats Mode Options:
  -r  reset the stats for selected rules
      with no other options, resets stats on all rules
      if other options present, -e or -a must be supplied
  -l  list the stats for selected rules (default)
      the -e or -a option must be supplied
      both -e and -a may be supplied
  -e  emulated point code
  -a  real point code
  -c  cicr is in these forms:
      * (see Note 1)
      ecics-ecice:rcics-rcice, e.g., 5-10:15-20
      ecics:rcics, e.g., 5:6 which is equiv to 5-5:6-6
      allowed only if SI is 4, 5, or 13
  -f  filter pc; may be * (see Note 1)
  -s  si; can be 0, 3, 4, 5, 13, or * (see Note 1)
  -u  ssn; may be * (see Note 1)
      allowed only if SI is 3
test Mode Options:
  -d  DPC in simulated MSU
  -o  OPC in simulated MSU
  -s  SI in simulated MSU
  -u  SSN in CgPA and CdPA in simulated MSU;
      if absent and si is 3, indicates that route on SSN is off;
      allowed only if SI is 3
  -c  CIC in simulated MSU;
      required if SI is 4, 5, or 13
Notes:
  1. an explicit * will match only with rule containing a wildcard; to match
     on wildcard or a specific value, do not specify the associated option

```

### Stats Mode

With the -l option, all matching translations are displayed along with the following three statistics for each translation:

- DPCLKP – Number of successful translations of the DPC and/or CIC of a message (the number of successful DPC lookups).
- OPCLKP – Number of successful translations of the OPC and/or CIC of a message (the number of successful OPC lookups).
- MSUDISC – Number of messages discarded after successfully translating the DPC of a message from an emulated point code to a real point code, but where the real point code is unreachable.

The IDX (index) column is the unique row number of the entry in the PCT table. The index for a particular translation is the same across all cards.

The output for a single translation consists of two or three lines.

For translations with an SI of 4, 5, or 13, the CIC range field is displayed only for translations with a specific value for the CIC range.

This example lists all translations with an EPC of 4-3-1 (ANSI):

```
pass:loc=1201:cmd="pct -m stats -l -e 4-3-1"
```

Command Accepted - Processing

|     | dpclkp: 0 opclkp: 0 msudisc: 0 |             |             |    |     |

This example resets counters for all translations with an EPC of 4-3-1 (ANSI):

```
pass:loc=1201:cmd="pct -m stats -r -e 4-3-1"
```

Command Accepted - Processing

Stats reset on 20 rules

### Test Mode

Test mode allows determination of whether an incoming message with the specified field values would result in a match on an entry in the PCT table. Output includes the content of the message, as specified on the command line, the lookup result, and the matching entry if a match exists.

This example shows a match on the DPC lookup:

```
pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 7-2-30 -s 3 -u 26"
```

Command Accepted - Processing

```
Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    007-002-030
  DPC:    004-003-001
  SI:      3
  SSN:     26
Lookup result:
  Match on DPC was found
Matching entry:
idx      epc      rpc      fpc si ssn
  7      004-003-001  007-003-002  007-002-030  3  26
```

This example shows a match on the OPC lookup:

```
pass:loc=1201:cmd="pct -m test -d 7-2-30 -o 7-3-2 -s 3 -u 26"
```

Command Accepted - Processing

```
Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    007-003-002
  DPC:    007-002-030
  SI:      3
  SSN:     26
Lookup result:
  Match on OPC was found
Matching entry:
idx      epc      rpc      fpc si ssn
  7      004-003-001  007-003-002  007-002-030  3  26
```

This example shows a match on a DPC lookup where the matching translation has a wildcard Filter PC and a wildcard SI:

```
pass:loc=1201:cmd="pct -m test -d 4-3-1 -o 9-9-9 -s 4 -c 106"
```

Command Accepted - Processing

```
Point Code and CIC Translation Lookup Test
MSU content:
  OPC:    009-009-009
  DPC:    004-003-001
  SI:      4
  CIC:     106
Lookup result:
  Match on DPC was found
Matching entry:
idx      epc      rpc      fpc si ssn
  25      004-003-001  007-003-001  ----- * ---
```

## ping

This command is used to test for the presence of hosts on the network. This command is invoked with a destination (either a hostname or IP address).

## Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `ping` command has the option destination. An IP address or hostname can be specified for the destination, as in the commands `ping 192.9.200.44` and `ping nc.tekelec.com`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

### destination

The destination can be either an IP address or hostname.

#### **IP address**

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is *192.9.200.44*, where *192.9.200* is the network number and *44* is the machine’s host number.

#### **Range:**

4 numbers separated by dots, with each number in the range of 0-255.

#### **hostname**

Hostname. The logical name assigned to the device with the IP address indicated.

#### **Range:**

any string of characters beginning with a letter and comprising (*a..z*, *A..Z*, *0..9*, *'-'*, or *'.'*) up to 120 characters in length.

#### **-i**

The number of ping requests to send.

#### **Range:**

*1 - 5*

#### **Default:**

*3*

#### **-n**

The size of message to use in test.

#### **Range:**

*12 - 2048*

#### **Default:**

*64*

#### **-h**

This option provides help information for the command.

#### **-f**

This option sets the DF (Don't Fragment) bit in the IP header of ICMP packet.

### **Example**

`ping 192.9.200.44`

```
ping nc.tekelec.com
ping 192.9.200.44 -i 5 -n 2048
ping 10.254.111.21 -f -n 1480
```

### Dependencies

The actual ping text string must be followed by a destination (either a hostname or IP address) prior to the options.

### Notes

The ping command is executed through the pass command.

### Output

```
pass:loc=1105:cmd="ping" or
pass:loc=1105:cmd="ping -h"
```

Command Accepted - Processing

```

## sctp

This command is used to provide a view of SCTP instance and association information.

### Options

**-a aname**

This option is used to retrieve the measurements and information for a specific association.

**-l**

This option is used to display logging details for associations. The logging details are independent of the association state (close or open).

**-p <port>**

This option is used to retrieve the measurements for a specified SCTP port.

**-r**

This option is used to reset specified measurements. The associated report is not displayed.

**-h**

This option is used to display help information for the command. Either brief or full help reports can be generated.

**-m**

This option is used to display SCTP incoming/outgoing (IO) header audit reports for common and dedicated IO header pools. The IO header is a transmission sequence number (TSN) control block used in processing SCTP chunks. The report shows total, currently available, and minimum IO header counts for the IO header pool shared by all associations (common pool) and the IO header pool for each association (dedicated pool).

### Example

```
pass:cmd="sctp -a aname":loc=1307
```

```
pass:cmd="sctp -l":loc=1307
```

```
pass:cmd="sctp -l aname":loc=1307
```

```
pass:cmd="sctp -p port":loc=1307
pass:cmd="sctp -r -a aname":loc=1307
pass:cmd="sctp -r -l aname":loc=1307
pass:cmd="sctp -m"
pass:cmd="sctp"
```

### Dependencies

The `-r` option can be specified in the same command as the `-a`, `-p`, or `-l` option. Otherwise, only one option can be specified at a time.

### Notes

None

### Output

Either brief or full help reports can be displayed. A full help report is generated by adding the `-h full` option to the command line.

This example shows a brief help report:

```
pass:loc=1305:cmd="sctp -h"
```

```
Usage: [ [[-a aname] | [-p port] | [-l [aname]]] [-r [-s]] | [-m] | [-h
[full]] ]
```

Options:

|                 |                                       |
|-----------------|---------------------------------------|
| (no parameters) | display list of SCTP ports            |
| -a aname        | display association report            |
| -p port         | display SCTP port report              |
| -r              | reset specified SCTP measurements     |
| -m              | display IO header usage report        |
| -l aname        | display association event log         |
| -l              | display all event logs                |
| -r -l           | reset all SCTP event logs             |
| -r -s           | reset all SCTP measurements and pegs  |
| -h              | displays command help (brief or full) |

```
;
```

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0
```

```
SCTP command complete
```

```
;
```

This example shows a full help report:

```
pass:loc=1307:cmd="sctp -h full"
```

```
Usage: sctp [ [[[-a aname] | [-p port] | [-l [aname]]] [-r [-s]] | [-m] | [-h

```

Options:

|                 |                            |
|-----------------|----------------------------|
| (no parameters) | display list of SCTP ports |
| -a aname        | display association report |
| -p port         | display SCTP port report   |

---

```

-r          reset specified SCTP measurements
-m          display IO header usage report
-l aname    display association event log
-l          display all event logs
-r -l       reset all SCTP event logs
-r -s       reset all SCTP measurements and pegs
-h          displays command help (brief or full)

```

#### no parameters option

Summary list of all SCTP instances. To list all the SCTP ports issue the following command:

```
sctp
```

#### -a aname option details

Retrieves detailed information and measurements for a specific association. For example the following SCTP command will get the measurements and detailed information for the association with association name = assoc1.

```
sctp -a assoc1
```

In remote address field of output configured RHOST or ARHOST or both IP address will be displayed based on the presence in association remote

network  
array

#### -p port option details

Retrieves detailed information for a specified SCTP port. For example the following SCTP command will get the detailed information for the SCTP port with a local port of 200.

```
sctp -p 200
```

In remote address field of output configured RHOST or ARHOST or both IP address will be displayed based on the presence in association remote

network  
array

#### -r option details

Resets specified SCTP Measurements. See examples below.

Resets measurements for specified association:

```
sctp -r -a assoc
```

Resets measurements for all associations on port 2000:

```
sctp -r -p 2000
```

Resets measurements and event logs for all ports/associations:

```
sctp -r
```

Resets event logs for specified association:

```
sctp -r -l assoc
```

Resets event logs for all associations:

```
sctp -r -l
```

Resets measurements for all associations:

```
sctp -r -s
```

#### -m

This option displays SCTP IO header audit report for common and dedicated IO header pools. The report shows total, currently available and minimum (low water mark) IO header counts for common and each association's dedicated pool.

IO header is a TSN control block used in processing SCTP chunks.

Common pool is IO header pool shared by all associations.

Dedicated pool is a per-association IO header pool.

```
sctp -m;
```

#### -l option details

This option displays logging details for associations. The logging

details are independent of the association state (close or open).

See examples below:

The following Sctp command will get the logging details for all associations on the specified card.

```
sctp -l
```

The following Sctp command will get the logging details for the association with association name = assoc1.

```
sctp -l assoc1
```

```
;
```

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0
```

Sctp command complete

```
;
```

This example shows a summary list of all Sctp ports. All Sctp ports and number of associations associated with each port is displayed.

```
pass:loc=1307:cmd="sctp"
```

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE5 38.0.0
```

| Local Port | Local IP Address | Num of Assoc |
|------------|------------------|--------------|
| 7001       | 192.168.110.35   | 1            |
| 2222       | 192.168.110.12   | 3            |

#### Field Descriptions for sctp -a Output

- Local Address-IP Address of the near end. The address that the local SCTP endpoint should bind.
- Local Port-SCTP port number, if ULP wants it to be specified.
- Remote Address-IP Address of the far end/destination. Destination address for transporting DATA.
- Remote Port-Port number of the destination.

#### Configuration:[Following rows are SCTP configured values]

- Retransmission Mode-Configured retransmission mode. Values are "LIN" or "RFC".
- Min. Retransmission Timeout-Minimum Retransmission Timeout value configured.
- Max. Number of Retries-Configured maximum number of retries.
- Min. Congestion Window-Minimum and initial congestion window.
- Inbound Streams-The maximum number of inbound streams this association allows the peer end to create. The value can not be 0.
- Outbound Streams-The maximum number of outbound streams this association allows the peer end to create. The value can not be 0.

#### State: [Following rows are association state values]

- State-State of the association.
- ULP association id-Upper Layer Protocol association id.
- Number of nets-Number of networks.
- Inbound Streams-Number of Inbound streams the far end can support.  
Min(requested,offered)
- Outbound Streams-Number of Outbound streams the far end can support.  
Min(requested,offered)
- Checksum Algorithm-32 bit checksum field that is included in the SCTP common header. The CRC32c checksum should be set by the sender of each SCTP packet to provide additional protection against data corruption in the network.
- Send/Rcv Buffer Size-The maximum size of data to be transmitted/received in bytes.
- Nets Data-All of the available remote IP addresses and if they are reachable or not.
- Last Net Sent To-IP address of the last network sent on.
- Last Net Rcvd From-IP address of the last network received on.
- Over All Error Count-Total error count on the association.

- Peers Rwnd-The peers receive window.
- My Rwnd-My receive window.
- Max Window-Maximum receive window (the peers receive window is set to this value until it is learned).
- Initial Seq Number-Initial sequence number started at.
- Next Sending Seq Number-Next Sending sequence number.
- Last Acked Seq Number-Highest consecutive TSN that has been Acked.
- Maximum Outbound Char Count-Maximum outbound byte count (high water mark).
- Current Outbound Char Count-Current outbound byte count.
- Number Unsent Char Count-Number of unsent bytes.
- Outbound Data Chunk Count-Number of data chunks that were sent.
- ip datagrams rcvd-Number of IP packets received.
- ip datagrams with data chunks rcvd-Number of IP packets containing SCTP data chunks received.
- data chunks rcvd-Number of SCTP data chunks received.
- data chunks read-Number of SCTP data chunks read.
- dup tsns rcvd-Number of duplicate data chunks received.
- sacks rcvd-Number of selective acknowledgements received.
- gap ack blocks rcvd-Indicates the number of GAP Ack Blocks included in a SACK. This value informs the peer endpoint of gaps in the received sequences of DATA chunks as represented by their TSNs.
- heartbeat requests rcvd-Number of heartbeat requests received.
- heartbeat acks rcvd-Number of heartbeat acknowledges received.
- heartbeat requests sent-Number of heartbeat requests sent.
- ip datagrams sent-Number of IP packets transmitted.
- ip datagrams with data chunks sent-Number of IP packets containing SCTP data transmitted.
- data chunks sent-Number of data chunks sent.
- retransmit data chunks sent-Number of retransmitted data chunks for this association.
- sacks sent-Number of selective acknowledgements sent.
- send failed-Number of selective acknowledgements failed.
- retransmit timer count-Reports the retransmit timer count. Number of times the transmit timer has expired.

- consecutive retransmit timeouts-Count of the number of times consecutive timeouts occurred.
- RTO between RMIN and RMAX inclusive-If the calculated RTO is between the configured RMIN value and the RMAX value inclusively, then increment this peg count. This peg serves as an indication that the RMIN value may be configured incorrectly and will possibly cause frequent retransmits to occur due to RTO fluctuations.
- RTT greater than RMAX-If the calculated RTT is above the configured RMAX value, then increment this peg count. This peg serves as an indication that the RMAX value is configured incorrectly and will possibly cause frequent retransmits to occur due to RTO fluctuations.
- fast retransmit count-Number of retransmits due to fast retransmit.
- recv timer count-Number of times the receive timer has expired.
- heartbeat timer count-Number of times the heartbeat timer has expired.
- none left tosend-Number of times a transmit is attempted and there is no data chunks to send.
- none left rwnd gate-Number of times a transmit is denied due to no receive window space at peer.
- none left cwnd gate-Number of times a transmit is denied due to exceeding the local congestion window.
- UNKNOWN-Number of retransmit Datagrams for this assoc for error monitoring.

SCTP: command complete

;

Event descriptions for the `sctp -l` command

- **Shutdwn ACK tmr exp**-No shutdown complete was received in response to the shutdown acknowledgement within the timer's limits.
- **PathMTU tmr expr**-Indicates the PathMTU daemon timer has expired. At the expiration of this timer, path MTU for each path of each association that is not at the default of 1500 bytes is marked for retesting by raising that path's MTU. The MTU will be adjusted accordingly when the next frame that exceeds the updated MTU occurs, thereby allowing the path MTU to reflect dynamic network conditions.
- **INIT tmr expr**-If the T1-initialized timer expires, the endpoint must retransmit INIT and restart the T1-init timer without changing state.
- **RECV tmr expr**-If the receive timer expires, then a stand alone SACK is sent to the peer and this timer is moved back to idle.
- **Send tmr expr**-This retransmission timer will expire when outstanding data sent to an address has not been acknowledged.
- **Shutdwn tmr expr**-No shutdown acknowledgement was received in response to the transmitted shutdown within the timer's limits.
- **HB tmr expr**-No heartbeat acknowledgement was received in response to the transmitted heartbeat within the timer's limits.
- **Cookie tmr expr**-No cookie acknowledgement was received in response to the transmitted cookie echo within the timer's limits.
- **New Cookie tmr expr**-When this occurs, time to schedule another timer for the cookie change.
- **Tx CHK tmr expr**-Transmit check timer expired.
- **Unknwn tmr expr**-An unknown timer expired.
- **INIT Rcv**-An INIT was received for an association.
- **Datagram Ignored**-When an unrecognized chunk time is encountered.
- **Assoc Down**-An association is taken out of service.
- **INTF Down**-Interface on an association is down and out of consideration for selection.
- **INTF Up**-Interface on an association is up and now back in consideration for selection.
- **Datagram Send Fail**-IP Packet failed to send.
- **Ignore Cookie**-Happens when the cookie is not received first.

- Ignore INIT-If the INIT message is not received first, is not the only chunk, is received with a non-zero Verification tag, if the T bit value is 1 or if mandatory parameters are missing then the INIT message is discarded/ignored.
- Ignore INIT ACK-If the INIT ACK is not first, not the only chunk or too small (missing mandatory parameters), then the INIT ACK chunk is ignored.
- Ignore Shutdown ACK-The SHUTDOWN Complete MUST be the only chunk, otherwise the packet is ignored.
- Ignore HB ACK-The received HB acknowledgement was ignored due to asymmetric routing (HBA not received on the same interface the original HB was transmitted on).
- Op Error Rcv-Occurs when the peer notifies that we are using an invalid stream or we received a Stale cookie.
- Assoc UP-Association up notification was generated for the upper layer.
- Assoc Restart-Association restart notification was generated for the upper layer.
- Shutdn ack send fail-Attempt to transmit a shutdown acknowledgement chunk failed.
- Shutdown ack send-A shutdown acknowledgement chunk was transmitted to the far end.
- Cookie ack send fail-An attempt to send a Cookie ACK to a specified address failed.
- Cookie ack send-A Cookie ACK was sent to a specified address.
- Stale Cookie send fail-Attempt to send a stale cookie error to the far end failed.
- Stale Cookie send-A stale cookie error was sent to the far end.
- HB req send fail-Attempt to send a HB to the far end failed.
- HB resp send fail-Attempt to send a HB acknowledgement to the far end failed.
- Shutdown send fail-The Shutdown chunk sent to a specified association failed.
- Shutdown send-A Shutdown chunk was sent to a specified association.
- Abort send fail-The Abort chunk sent to a specified association failed.
- Abort send-An Abort chunk was sent to a specified association.
- Abt W cause snd fail-The Abort chunk sent with the Cause parameter to a specified association failed.
- Abort wth cause send-An Abort chunk was sent to a specified association with the Cause parameter.
- SACK send fail-Attempt to send a SACK to the far end failed.
- Initiate send fail-An INIT chunk is used to initiate a SCTP association between two endpoints. This event occurs when an INIT send has failed.
- Initiate send-An INIT chunk is used to initiate a SCTP association between two endpoints. This event occurs when an INIT was successfully sent.

- OprErr send-An endpoint sends this chunk to its peer endpoint to notify it of certain error conditions. It contains one or more error causes. This event occurs when the OPPErr was successfully sent.
- OprErr send Fail-This event occurs when the OPPErr send failed.
- Init ack send fail-This event occurs when an INIT ACK send has failed.
- Init ack sent-This event occurs when an INIT ACK was successfully sent.
- Ck echo ack snd fail-An attempt to send a Cookie-Echo has failed.
- Cookie echo ack send-A cookie echo was sent to the far end in response to an accepted init-ack.
- Chunks send fail-This event occurs when a chunk that was sent has failed.
- Chunks send-This event occurs when a chunk has been successfully sent.
- Cookie send fail-Attempt to transmit a cookie to the far end during the four-way handshake failed.
- Init ack rcv-Init acknowledgement chunk was received.
- Shutdown ack rcv-Shutdown ack chunk was received.
- Shutdown ack sent-Shutdown ack chunk was transmitted to the far end in response to a received shutdown chunk.
- Abort sent-An Abort message was sent to ungracefully shutdown an association.
- Shutdn complete sent-Shutdown complete chunk was transmitted to the far end.

This example clears the logged events for an association:

```
pass:loc=1307:cmd="sctp -r -l assoc1"
```

```
Command Accepted - Processing
```

```
rlghncxa03w 08-02-01 08:32:09 EST EAGLE 38.0.0
```

```
All event logs for specified association have been reset.
```

```

## sockrft

This command is used to report and reset the round-trip time statistics for application sockets. Minimum, maximum, and average times are kept for each open socket. The Retransmission Mode (BSD, FIXED, or MOD) and the Fixed Round Trip Time are also displayed.

## Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `sockrtt` command has the option socket\_name. The socket name must be specified for which statistics will be displayed, as in the command `sockrtt socyellow`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

### socket\_name

This option is **mandatory** and specifies the socket name for which statistics are to be displayed.

### Range:

up to 15 alphanumeric characters.

-r

This option resets all statistics for the given socket name.

-h

This option provides help information for the command.

## Example

`sockrtt`

`sockrtt -h`

`sockrtt socyellow`

`sockrtt socyellow -r`

## Dependencies

None

## Notes

The `sockrtt` command is executed through the `pass` command.

## Output

`pass:loc=1105:cmd="sockrtt" or`

`pass:loc=1105:cmd="sockrtt -h"`

## soipdata

This command is used to display the SOIP operational data captured for the last 24 hours.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

-f

This option displays full operational data (all counts).

-s

This option displays the number of errors received with error type Bad Source.

-d

This option displays the number of of errors received with error type Bad Destination.

-v

This option displays the number of errors received with error type Bad Version.

-g

This option displays the number of Good Day messages received.

-e

This option displays the number of error messages sent (Sum of Bad Version, Bad Source and Bad Destination).

-u

This option displays the number of UPL messages received.

-t

This option displays the number of UPL messages transmitted.

-r

This option resets the specified error count.

-h

This option displays help for the command.

### Example

```
soipdata -h
```

```
soipdata -f
```

```
soipdata -r
```

soipdata -u

## Dependencies

None

## Notes

None

## Output

pass:loc=1305:cmd= "soipdata -h"

```
Usage: soipdata [[-f ] | [[-s] [-d] [-v] [-g] [-e] [-u] [-t] [-r] [-h]]
```

```
Options:
-f  Display Full Operational data (all the counts)
-s  Display number of SR-5129 Messages received with Bad Source
-d  Display number of SR-5129 Messages received with Bad Destination
-v  Display number of SR-5129 Messages received with Bad Version
-g  Display number of Good Day Messages Received.
-e  Display number of error messages sent (Sum of BadVersion, BadSource and
BadDestination)
-u  Display number of Number of UPL messages received
-t  Display number of Number of UPL messages transmitted.
-r  Reset the Specified Error Count
-h  display command help
```

pass:loc=1305:cmd=" soipdata -f"

SOIPDATA: SR-5129 Operational Data Report

Operational Data

| reason                               |       | count |
|--------------------------------------|-------|-------|
| -----                                |       | ----- |
| Message Recived with Bad Source      | 1     |       |
| Message Recived with Bad Destination | 2     |       |
| Message Recived with Bad Version     | 0     |       |
| Number of Goodday Messages Received  | 1     |       |
| Number of Error Messages Sent        | 10    |       |
| Number of UPL Messages Received      | 12000 |       |
| Number of UPL Messages Sent          | 19000 |       |

pass:loc=1105:cmd=pass:loc=1305:cmd="soipdata -r"

SOIPDATA : All SOIP Operational data has been reset

pass:loc=1305:cmd="soipdata -r -u"

SOIPDATA: Number of UPL Messages Received has been reset.

```
pass:loc=1305:cmd="soipdata -u"
```

#### SOIP Operational Data

---

| reason                          |   | count |
|---------------------------------|---|-------|
| -----                           |   | ----- |
| Number of UPL Messages Received | 0 |       |

## soiplog

This command is used to display the logs for the SR-5129 messages for a particular SEAS terminal.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter.

-l

This option enables and disables logging.

-d

This option displays live message logs

-n X

This option displays the last X number of messages.

-h

This option displays the help for this command.

### Example

```
soiplog -h
```

```
soiplog -l enable":loc=XXXX
```

### Dependencies

None

### Notes

With two active connections to the CCS MR, logging must be enabled on each IPSM card that has an active SEAS terminal in order to properly log all SR-5129 communication data.

Assuming a message size of 500 bytes, each IPSM card can log approximately 2000 messages.

If an attempt is made to enable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

**"Warning: SOIP Logging Enabled from Terminal: <New logging enabled terminal>"**

If an attempt is made to disable logging on a terminal when logging is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal

**“Warning: SOIP Logging disabled from Terminal: <New logging enabled terminal>”**

If an attempt is made to turn on logging on a terminal when it is already enabled on a different terminal, then the following warning message appears in the previously enabled terminal.

**“Warning: SOIPLOG Started on Terminal: <New logging enabled terminal>”**

### Output

pass:loc=1305:cmd= "soiplog -h"

```
Usage: SOIPL0G [[-l option] |
                                [-d] [-n] [-h]]

Options:
  -l <enable/disable>    Enable/Disable the logs
  -d                      Display live message logs
  -n <num>                Display last <num> number of messages.
Range=1..2000
  -h                      Display Command Help
```

To Enable Real time logging and display, the following commands must be entered one after the other:

pass:cmd="soiplog -l enable":loc=XXXX

pass:cmd="soiplog -d":loc=XXXX

To enable logging and to display the last N number of logged messages, the following commands must be entered one after the other:

pass:cmd="soiplog -l enable":loc=XXXX

pass:cmd="soiplog -n N":loc=XXXX

```

```

## tracert

This command is used to determine the path taken by a UDP message to a specified remote host. The command can be invoked with either a hostname or IP address.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the `tracert` command has the option destination. The IP address can be specified for the remote host to which the UDP message is sent, as in the command `tracert 208.55.20.177`. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### IP address

The IP address is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. An example IP address is `192.9.200.44`, where `192.9.200` is the network number and `44` is the machine's host number.

#### Range:

4 numbers separated by dots, with each number in the range of 0-255.

#### hostname

Hostname. The logical name assigned to the device with the IP address indicated.

#### Range:

String of characters, beginning with a letter, up to 120 characters in length. Valid characters are *a-z*, *A-Z*, *0-9*, - (hyphen), . (period)

-h

This option provides help information for the command.

-m maximum\_hops

This option specifies the maximum number of hops before the trace is terminated.

#### Range:

1-30

#### Default:

10

-n

This option specifies that only the IP Address of each host will be displayed (not the hostname).

-p port

This option provides the user port number.

**Range:**

1-65535

**Default:**

33434

**Example**

traceroute

traceroute www.remotedest.com

traceroute www.remotedest.com -m 20

traceroute www.remotedest.com -m 20 -n

traceroute 208.55.20.177

traceroute 208.55.20.177 -m 20 -p 40000

**Dependencies**

If a Domain Name is specified, the Domain Name must exist in the IP Host table or the Domain Name Server A or B must be provisioned.

**Notes**

The traceroute command is executed through the pass command.

**Output**

This example shows the help information for the command:

```
pass:loc=1103:cmd="traceroute" or
```

```
pass:loc=1103:cmd="traceroute -h"
```

```

    Command entered at terminal #1.
;

    rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0
    PASS: Command sent to card
;

    rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0

Usage: traceroute <hostname | ipaddr> [-h] [-m maxhops] [-n] [-p port]
Options:
    -h           Displays this message
    -m maxhops   Maximum number of hops to destination.  Range=1..30. Default=
10.
    -n names     Inhibits the display of intermediate host names
    -p port      Port number. Range=1..65535. Default=33434.
    hostname     Name of machine to trace
    ipaddr
Errors:
    *           Timeout
    !N          Unreachable Network
    !H          Unreachable Host
    !?nn        Unknown Failure (nn = ICMP Code)

;

    rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0
```

TRACEROUTE command complete

This example shows output for a request to host *www.remotedest.com*. A maximum of 20 hops has been specified. Three packets are sent to each hop, with the time for each sample displayed. Intermediate host names are also displayed.

```
pass:loc=1103:cmd="traceroute www.remotedest.com -m 20"
```

```
Command entered at terminal #1.

## ualog

Use this command to report on the user adapter (UA) state machine history for a specified association name. State machine history is kept in a circular buffer in memory. The **-i** and **-x** options are used to include or exclude groups of events from the state machine history.

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ua log** command has the parameter aname. The association name must be specified for which the user adapter log will be displayed, as in the command **ua log s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

**-h**

This option displays help (usage) information for the command.

**-i event group**

This option includes groups of events in the state machine history.

**Range:**

*service*

*ua*

-xevent\_group

This option excludes groups of events from the state machine history.

**Range:**

*service*

*ua*

**Example**

pass:loc=1105:cmd="ualog s7000"

**Dependencies**

None

**Notes**

None

**Output**

pass:loc=1105:cmd="ualog s7000"

## Error Codes

---

**Note:** Error codes 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18 are not used in M3UA

---

Error codes that can appear in the error messages:

- **0x01—Invalid Version**  
A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.
- **0x03—Unsupported Message Class**  
A message was received with an unexpected or unsupported Message Class.
- **0x04—Unsupported Message Type**  
A message was received with an unexpected or unsupported Message Type.
- **0x05—Unsupported Traffic Handling Mode**  
This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode

Type or a Traffic Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

- **0x06—Unexpected Message**

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

- **0x07—Protocol Error**

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

- **0x09—Invalid Stream Identifier**

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

- **0x0d—Refused - Management Blocking**

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

- **0x0e—ASP Identifier Required**

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

- **0x0f—Invalid ASP Identifier**

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier

- **0x11—Invalid Parameter Value**

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

- **0x12—Parameter Field Error**

A message is received with a parameter that has a wrong length field.

- **0x13—Unexpected Parameter**

A message contains an invalid parameter.

- **0x14—Destination Status Unknown**

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.

- **0x15—Invalid Network Appearance**

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.

- **0x16—Missing Parameter**

A message is received, and a mandatory parameter is not included in the message.

- **0x19—Invalid Routing Context**

A message is received from a peer with an invalid (unconfigured) Routing Context value. The invalid Routing Context is included in the error message.

- **0x1a—No Configured AS for ASP**

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

## Reference Information

This Appendix contains information that is used by multiple commands.

### Summary of Range Values for :link Parameter

[Table A-1](#) lists the valid *link* parameter range values for signaling links assigned to each type of card for which a location can be specified in the command's *loc* parameter. The commands that use these values refer to this table in their *link* parameter description.

---

**Note:** The *port* parameter is a synonym for the *link* parameter in signaling link definitions for EAGLE commands. The *port* parameter will be removed in a future EAGLE release.

---

**Table A-1 Summary of Ranges for link Parameter**

| Card                          | Link         | Supported Application                                                                         |
|-------------------------------|--------------|-----------------------------------------------------------------------------------------------|
| HC-MIM/E5-E1T1-B              | A-A31, B-B31 | SS7ANSI or CCS7ITU application.<br>A maximum of 64 links can be assigned to each HC-MIM card. |
| HC-MIM/E5-E1T1-B for SE-HSL   | A, B         | SS7ANSI or CCS7ITU application.<br>The card can support a maximum of 2 SE-HSL links.          |
| HC-MIM/E5-E1T1-B for ST-HSL-A | A, B         | SS7ANSI application.<br>The card can support a maximum of 2 ST-HSL-A links.                   |
| E5-ATM/E5-ATM-B               | A, A1, B     | ATMANSI or ATMITU application. The card can support up to 3 signaling links.                  |
| E5-ENET/E5-ENET-B             | A-A7, B-B7   | IPLIM or IPLIMI application with sockets, M2PA/SCTP associations, or M3UA/SCTP associations.  |

**Table A-1 (Cont.) Summary of Ranges for link Parameter**

| Card                 | Link         | Supported Application                                                             |
|----------------------|--------------|-----------------------------------------------------------------------------------|
| E5-ENET/E5-ENET-B    | A-A15, B-B15 | IPSG application.                                                                 |
| E5-E1T1              | A-A15, B-B15 | SS7ANSI or CCS7ITU application.<br>The card can support up to 32 links.           |
| E5-E1T1 for SE-HSL   | A            | SS7ANSI or CCS7ITU application<br>Only 1 SE-HSL link can be assigned to a card.   |
| E5-E1T1 for ST-HSL-A | A            | SS7ANSI application. Only 1 ST-HSL-A link can be assigned to a card.              |
| SLIC                 | A-A63, B-B63 | IPSG application, SLIC card running IPSG application can support up to 128 links. |

## Commands Listed by Class

## Possible Values for PST/SST/AST

This section lists the possible values for the primary state (PST), secondary state (SST), and associated state (AST) shown in the output of the Report Status (rept-stat-) commands.

### PST

Primary state possible values are the following:

#### **IS-ANR**

(IN SERVICE - ABNORMAL) The entity is in service but only able to perform a limited subset of its normal service functions.

#### **IS-NR**

(IN SERVICE - NORMAL) The entity is in service and handling all its normal service functions.

**OOS-MA**

(OUT OF SERVICE - MEMORY ADMINISTRATION) The entity is out of service because it has not been equipped.

**OOS-MT**

(OUT OF SERVICE - MAINTENANCE) The entity is out of service and is not available to perform its normal service function. The maintenance system is actively working to restore the entity to service.

**OOS-MT-DSBLD**

(OUT OF SERVICE - MAINTENANCE - DISABLED) The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

## SST

Secondary state possible values are the following:

**Active**

(ACTIVE) The entity is currently in use and is handling its normal service function as the primary service provider. (MASTER) The entity is currently in a master state in relation to its redundant unit.

**Allowed**

(ALLOWED) The entity is handling its normal service function.

**Avail**

(AVAILABLE) Entity service is available to another entity.

**Blocked**

(BLOCKED) The entity has been manually prohibited from handling traffic.

**Busy**

(BUSY) The entity is handling the maximum traffic capacity and has no spare capacity for new service requests.

**Conn**

(CONNECT) The card's entity status is in connected state.

**DDL Hunt**

(DDL HUNTING) The entity is currently in a state where the DDL is hunting for crossload info.

**DDL Inhib**

(DDL INHIBITED) The entity is currently in a state where the DDL is inhibited from crossload.

**DDL NoXld**

(DDL Unable to XLOAD) The entity is currently in a state where the DDL is unable to crossload.

**DDLunstab**

(DDL UNSTABLE) The entity is currently in DDL unstable state.

**Disc**

(Disconnect) The card's entity status is in disconnected state.

**Fault**

(FAULT) The entity has failed.

**Idle**

(IDLE) The entity is in use and has spare capacity for service.

**Inhibited**

(INHIBITED) The entity has been manually prevented from performing its normal service function.

**Isolated**

(ISOLATED) The entity cannot be detected through software or hardware.

**LPBK**

(LOOPBACK) The entity is currently in the Loopback state.

**Manual**

(MANUAL) The entity has manually been removed from service and is not carrying any traffic.

**MEA**

(Maintenance Equipment Administration) The entity has been auto-inhibited and has been restricted from functioning because it has not met the minimum hardware requirements for the current configuration.

**MPS Unavl**

(MPS unavailable). MPS is required, but unavailable for the entity.

**Ovflw-1**

(OVERFLOW) One entity cannot provide service to another entity due to service denial.

**Prohibit**

(PROHIBITED) The entity is not handling traffic because of a failure in the network.

**Proh-Blk**

(PROHIBITED and BLOCKED) The entity has been prohibited and blocked from handling traffic.

**Restart**

(RESTART) The entity is in MTP Restart.

**Restrict**

(RESTRICTED) Normal operation for the entity is restricted. The normal capacity or configuration is not being used because of a failure in the network. The normal capacity, functionality or configuration of an entity may be restricted during loading or synching of data. This can occur when the Measurements Platform has not yet been enabled.

**Standby**

(STANDBY) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. (SLAVE) The entity is currently in a slave state in relation to its redundant unit.

**Test**

(TEST) The entity is currently in a test state.

**Unavail**

(UNAVAILABLE) Entity service is unavailable to another entity.

**Ueq**

(UNEQUIPPED) The entity is not equipped.

**Unblocked**

(UNBLOCKED) The entity is handling its normal service function.

## AST

Associated state possible values are the following:

-----

(BLANK) The field may be left blank.

**ACCESS**

(ACCESSIBLE) Traffic is being carried between the local entity and an adjacent, or remote, service provider. A full connection has been completed.

**ALMINH**

(ALARM INH) The alarms on the entity are inhibited.

**BRDG MSTR**

(MASTER) The E1/T1 channel bridge is in Master mode.

**BRDG SLAVE**

(SLAVE) The E1/T1 channel bridge is in Slave mode when the adjacent odd-numbered channel bridge is provisioned in Master mode.

**CDL**

(COMMAND DRIVEN LOOPBACK) The entity is in command driven loopback state.

**DB DIFF**

(DATABASE DIFFERENT) The entity has a database difference.

**ENET FLT**

(ETHERNET FAULT) An Ethernet fault exists.

**EXT BERT**

(EXTENDED BERT TEST) The entity is undergoing Extended BERT.

**FE LINE**

(FAR END LINE LOOPBACK) The entity is in far end line loopback.

**FE PAYLD**

(FAR END PAYLOAD LOOPBACK) The entity is in far end payload loopback.

**FLT CHK**

(FAULT ISOLATION TEST) The entity is undergoing a fault isolation test.

**INACCESS**

(INACCESSIBLE) Traffic is not being carried from the local entity to another service provider. A breakdown in a complete circuit has been detected.

**LFS**

(LINK FAULT SECTIONALIZATION) The entity is in Link Fault State.

**LINE**

(LINE LOOPBACK) The entity is in line loopback state.

**LOCAL**

(LOCAL) The entity has become locally isolated.

**LXVR**

(LXVR LOOPBACK) The entity is in local transceiver loopback state.

**M BIP ERR**

(MOTHERBOARD IDENTITY PROM) The entity has a motherboard prom error.

**NOT BRDGD**

(NOT BRIDGED) The E1/T1 port channel is not bridged.

**OAM F5 FM**

(OAM LOOPBACK) The entity is in OAM initiated loopback state.

**PAYLOAD**

(PAYLOAD LOOPBACK) The entity is in payload loopback state.

**SLTM**

(SPECIAL MAINTENANCE TEST MESSAGES) The entity is in SLTM testing state.

## Point Code Formats and Conversion

Many of the commands used for database configuration use point codes. This section describes the point code formats that the system supports. If you need additional information or procedural information, refer to the *Database Administration Manual - SS7*.

The system supports four different point code formats:

- ANSI point codes
- ITU International point codes
- ITU National point codes
- ITU National 24-bit point codes

Each format is described in further detail in the following sections.

### ANSI Point Codes

ANSI point codes are made up of three groups of digits called the network indicator (*ni*), network cluster (*nc*), and network cluster member (*ncm*). The values for ANSI point codes depend on the value of the `pctype` parameter of the `chg-sid` command, either *ansi* or *other*.

If the `pctype=ansi` command is entered, the range of values for an ANSI point code is as follows:

- *ni-001-255*

- *nc-001-255* (if *ni* = 001-005)
- *-000-255, \** (if *ni* = 006-255)
- *ncm-000-255*

The following rules apply to provisioning ANSI point codes if the `pctype=ansi` parameter is specified:

- An *ni* value of 0 is not allowed (e.g., *dpc=0-1-1* and *dpc=0-0-0* are not valid point codes).
- If the *ni* value is 1, 2, 3, 4, or 5, then the *nc* value cannot be 0 (e.g., *dpc=5-0-1* is rejected).
- If the *ni* value is 1, 2, 3, 4, or 5, then network routing point codes are not allowed (e.g., *dpc=4-\*-\** is rejected).

If the `pctype=other` parameter is specified, the ANSI point codes do not meet ANSI standards. The range of values for these ANSI point codes is as follows:

- *ni-000-255*
- *nc-000-255, \**
- *ncm -000-255, \**

The following rules apply to provisioning ANSI point code if the `pctype=other` parameter is specified:

- An *ni* value of 0 is allowed, however *dpc=0-0-0* is rejected (e.g., *dpc=0-1-1* is accepted).
- The *nc* value can be 0 for all values of *ni* (e.g., *dpc=5-0-1* is accepted).
- Network routing point codes are allowed for all values of *ni* (e.g., *dpc=4-\*-\** is accepted).

An ANSI point code containing all zeros (0-0-0) is not a valid point code and cannot be entered into the database.

ANSI point codes support the Private (Internal) Point Code subtype prefix (p-). The prefix can be specified before the point code subfield values to indicate a Private Point Code (i.e p-5-0-1). See [Spure and Private Point Code Subtype Prefixes](#).

---

---

**Note:** Point codes specified by many commands, including those for site identification, routing keys, and LNP, are required to be full point codes. The asterisk values are not valid in the commands that specify these point codes. The command Dependencies sections identify the point codes that must be full point codes in the commands.

---

---

A range of values for a subfield is specified by separating the values that define the range by two ampersands (&&); for example, *ni=025&&100* specifies all network indicators for ANSI point codes from 25 - 100.

The asterisk (\*) point code value indicates a single cluster address for a cluster point code (e.g., 20-2-\*) or a network routing destination (20-\*-\*). If \* is used for the *nc* subfield, then \* must be also be used for the *ncm* subfield.

A double asterisk (\*\*) and a triple asterisk (\*\*\*) can also be used for the *nc* and *ncm* subfields of the ANSI point code, but only for the *rtrv-dstn*, *rept-stat-dstn*, *rtrv-rte*, and *rept-stat-rte* commands. If \*, \*\*, or \*\*\* is used for the *nc* subfield, then \*, \*\*, or \*\*\* must be used for the *ncm* field

For examples of all of these point code values, see the *rtrv-dstn* command output.

## ITU International Point Codes

The ITU international point codes are made up of three groups of digits called *zone*, *area*, and *id*. The range of varnames for ITU International point codes are:

- *zone-0-7*
- *area-000-255*
- *id-0-7*

An ITU international point code containing all zeros (0-000-0) is not a valid point code and cannot be entered into the database.

ITU international point codes support the Spare Point Code subtype prefix (s-). The prefix can be specified before the point code subfield varnames to indicate a Spare Point Code (s-5-222-1, for example). See [Spare and Private Point Code Subtype Prefixes](#).

## ITU National Point Codes

The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or two, three, or four numbers (members) separated by dashes.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is on, ITU national point codes can have group codes assigned to them. The point code is a 1- to 5-digit number. The group code is a two-character field ranging from *aa* to *zz* that is entered as the last subfield of the point code and is separated by a dash from the rest of the point code. An example is *12345-az*.

If the flexible point codes option is enabled (see the *chg-stpopts* command, *:npcfmt i* parameter), an ITU national point code format consists of 2, 3, or 4 numbers separated by dashes (formatted as *m1-m2-m3-m4*). When the ITUDUPPC feature is also on, the format is *m1-m2-m3-m4-gc* with a group code. If one of the *m1*, *m2*, *m3*, *m4* members is set to zero bits, no value is entered for that position in the point code. For example, if the *npcfmt i* parameter value is set to 3-8-3-0, valid point codes would be *1-100-1-aa* with a group code, or *7-255-7* with no group code. See the tables in the *chg-stpopts* command description for valid member values and additional examples.

The following ranges of values are valid:

- *nnnnn016383*
- *nnnnn-gc0-16363*; group code is *aa-zz* (the ITUDUPPC feature must be on)
- *m1-m2-m3-m4* Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from 0 - 14. Each member must be specified; the member value of 0 indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14.

- *m1-m2-m3-m4-gc* Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from 0 to 14. Each member must be specified; the member value of 0 indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14. Group code is *aa-zz* (the ITUDUPPC feature must be on).

An asterisk value (\*) is allowed only for the `rtrv-dstn` and `rtrv-rte` commands to retrieve ITU-N DPCs if the ITUDUPPC feature is on (for point codes with group codes). The node and group code cannot both be \*. For example, `dpcn=12345-*` and `dpcn=**aa` are allowed, but `dpcn=*-*` is not allowed.

If flexible point codes are also used, all valid *m1*, *m2*, *m3*, and *m4* must all be either a number or an \*. For example, `1-100-1-aa` and `*-*-*-aa` are allowed, but `1-*-*-aa` is not allowed.

ITU national point codes support the Spare Point Code subtype prefix (s-). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (`s-12345` or `s-1-3-5-5-gc`, for example). See [Spare and Private Point Code Subtype Prefixes](#).

## Converting ITU National Point Code Formats

Gateway screening only allows ITU national point codes to be provisioned in the database by the enter, delete, or change gateway screening commands, and displayed by the gateway screening retrieve commands as a single number. If a format other than a single number (14-0-0-0) for the ITU national point code has been defined by the `npcfmti` parameter of the `chg-stpopts` command, the ITU national point code must be converted into a single number so that it can be used by gateway screening.

For example, the format of the ITU national point code is 4-4-4-2 and you would like to add point code 7-7-7-1 into the allowed OPC screen. The point code 7-7-7-1 would have to be converted to a single number so that the point code can be added to the allowed OPC screen. To determine what multiple-part ITU national point code is represented by the single number ITU national point code in the gateway screening table, the single number point code must be converted to a multiple-part point code.

To convert a single number ITU national point code to a multiple-part point code, go to [Converting Single Number ITU National Point Codes](#).

To convert a multiple-part ITU national point code to a single number point code, go to [Converting Multiple-Part ITU National Point Codes](#).

For a definition of the different formats that can be used for ITU national point codes, see [ITU National Point Codes](#).

When the ITU national point codes are converted from single numbers to multiple-part point codes, the resulting value of the multiple-part point code depends on the point code format specified by the `npcfmti` parameter of the `chg-stpopts` command. When converting the single number point code 14781 to the point code format 3-8-3-0, the resulting point code value is 7-55-5. If point code 14781 is converted to the point code format 4-4-4-2, the resulting point code value is 14-6-15-1.

### Converting Single Number ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the `NPCFMTI` field of the `rtrv-stpopts` command output. For this example, the ITU national point codes 14781 and 695 are converted to point codes using the 3-8-3-0 format.

Convert a single number ITU national point code to a multiple-part ITU national point code as follows.

### Converting a Single Number ITU national point code to a multiple-part ITU national point code

1. Convert the point code to a binary number. This can be done with most scientific calculators.

The number **14781** converts to the binary number 11100110111101.

The number **695** converts to the binary number 1010110111.

---

**Note:** Make sure the binary number contains 14 digits. If it does not, add leading zeros to the binary number to bring the total number of digits in the number to 14.

---

In this example, the binary equivalent for the decimal number 695 (1010110111) contains 10 digits; four zeros must be added to the beginning of the binary number. The resulting binary number is now 00001010110111.

2. Divide the binary number into the number of parts required by the format of the ITU national point code. For this example, the format is 3-8-3-0. Because the last part of the point code format is 0, the point code format contains only three parts. Divide the point code into three parts, the first part of the point code contains the first three digits of the 14-digit binary number, the second part of the point code contains the next eight digits of the 14-digit binary number, and the third part of the point code contains the last three digits of the 14-digit binary number.

For this example, the binary numbers would be divided like this:

11100110111101 = 111 00110111 101

00001010110111 = 000 01010110 111

3. Convert each part of the point code into a decimal number using the same scientific calculator used in step 1 and separate each part of the point code with dashes. The results are as follows.

111 00110111 101 = **7-55-5**

000 01010110 111 = **0-86-7**

### Converting Multiple-Part ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the `npcfmt.i` field of the `rtrv-stpopts` command output. For this example, the ITU national point codes 7-55-5 and 0-86-7, using the 3-8-3-0 point code format, are converted into a single number.

Convert multiple-part ITU national point codes to a single number as follows.

#### Converting Multiple-Part ITU National Point Codes to a Single Number

### Converting Multiple-Part ITU National Point Codes to a Single Number

1. Convert each part of the point code into a binary number using a scientific calculator. The results are as follows.

7-55-5 = 111 00110111 101

**0-86-7** = 000 01010110 111

2. Combine each part of the point code into a single binary number as follows.

111 00110111 101 = 11100110111101

000 01010110 111 = 00001010110111

---

---

**Note:** If the binary number has any zeros at the beginning of the number, remove these zeros as they are not necessary.

---

---

In this example, the binary equivalent for the point code **0-86-7** (00001010110111) contains four zeros at the beginning of the binary number. When the leading zeros are removed from the binary number, the resulting binary number is now 1010110111.

3. Convert the binary number to a decimal number using the same scientific calculator used in step 1.

The binary number 11100110111101 converts to the decimal number 14781.

The binary number 1010110111 converts to the decimal number 695.

### 24-bit ITU-National Point Codes

The 24-bit ITU national point codes are made up of three groups of digits called *main signaling area*, *sub signaling area*, and *signaling point*. The valid values for 24-bit ITU national point codes are:

- *main signaling area-000-255*
- *sub signaling area-000-255*
- *signaling point-000-255*

24-bit ITU national point codes support the Private (Internal) Point Code subtype prefix (p-). The prefix can be specified before the point code field values to indicate a Private Point Code (p-2055-222-2011, for example). See [Spare and Private Point Code Subtype Prefixes](#).

### Spare and Private Point Code Subtype Prefixes

The Spare Point Code Support feature and the Internal Point Code Support feature provide optional point code subtype prefixes. The Spare Point Code feature must be enabled before a point code subtype prefix can be specified for a point code.

---

---

**Note:** The SEAS interface does not support point code subtype prefixes.

---

---

The values *p-*, *s-*, and *ps-* are valid point code subtype prefixes. The dash- separates the point code subtype prefix from the remainder of the point code. The prefixes are displayed in lower case. The syntax for the remainder of the point code remains the same.

The Spare Point Code prefix (*s-*) applies only to ITU-I and ITU-N point code domains (ITU-N24 point codes do not support the Spare Point Code prefix), to allow the EAGLE to fully support ITU National and International Spare Point Codes. [Table A-2](#) lists the commands that support the Spare Point Code subtype prefix.

The Private (Internal) Point Code prefix (*p-*) applies to all point code domain types (including ITU-N24 point codes), to allow messages destined to the End Office Node to be routed from the inbound LIM to the outbound IPGWx. [Table A-3](#) lists the commands that support the Private Point Code subtype prefix.

The subtype prefix *ps-* can be specified when the point code parameter supports both the spare and private point code prefixes.

**Table A-2 Commands that support the Spare Point Code Prefix**

| Command                   | Description                                      | Applicable Point Code Parameters                                                                                                                  |
|---------------------------|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>alm</code>          | Alarm                                            | <i>dpci</i> and <i>dpcn</i>                                                                                                                       |
| <code>appl-rtkey</code>   | Application Route Key                            | <i>dpci</i> and <i>dpcn</i> ; <i>opci</i> and <i>opcn</i>                                                                                         |
| <code>cspc</code>         | Concerned Signaling Point Code                   | <i>pci</i> and <i>pcn</i>                                                                                                                         |
| <code>dstn</code>         | Destination                                      | <i>spci</i> and <i>spcn</i> ; <i>dpci</i> and <i>dpcn</i> ; and Alias combinations.                                                               |
| <code>ent-trace</code>    | Enter Trace                                      | <i>dpci</i> and <i>dpcn</i> ; <i>opci</i> and <i>opcn</i>                                                                                         |
| <code>gsmap-scrn</code>   | GSM MAP Screening                                | <i>npci</i> and <i>npcn</i>                                                                                                                       |
| <code>gsmopts</code>      | GSM Options                                      | <i>ppmspci1</i> , <i>ppmspci2</i> , <i>ppmspcn1</i> , <i>ppmspcn2</i>                                                                             |
| <code>gsm-s-opcode</code> | GSM Short Message Services OP-Code               | <i>pci</i> and <i>pcn</i>                                                                                                                         |
| <code>gtt/gta</code>      | Global Title Translation/Global Title Address    | <i>pci</i> and <i>pcn</i>                                                                                                                         |
| <code>ls</code>           | Linkset                                          | <i>apci</i> and <i>apcn</i>                                                                                                                       |
| <code>map</code>          | Mated Application                                | <i>pci</i> and <i>pcn</i> ; <i>mpci</i> and <i>mpcn</i>                                                                                           |

**Table A-2 (Cont.) Commands that support the Spare Point Code Prefix**

| Command     | Description                                                     | Applicable Point Code Parameters                                                               |
|-------------|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| scr-blkopc  | Gateway Screening Blocked Origination Point Code                | <i>pcst</i> and <i>pctype</i>                                                                  |
| scr-cdpa    | Gateway Screening Called Party (CDPA PC Destination) Point Code | <i>pcst</i> and <i>pctype</i>                                                                  |
| scr-cgpa    | Gateway Screening Calling Party (Origination) Point Code        | <i>pcst</i> and <i>pctype</i>                                                                  |
| scr-destfld | Gateway Screening Affected Destination (Concerned) Point Code   | <i>pcst</i> and <i>pctype</i>                                                                  |
| scr-dpc     | Gateway Screening Destination Point Code                        | <i>pcst</i> and <i>pctype</i>                                                                  |
| scr-opc     | Gateway Screening Origination Point Code                        | <i>pcst</i> and <i>pctype</i>                                                                  |
| sid         | Site ID                                                         | True <i>pci</i> and <i>pcn</i> ; <i>cpci</i> and <i>cpcn</i> ; <i>ncpci</i> and <i>ncpcn</i> . |
| spc         | Secondary Point Code                                            | <i>spci</i> and <i>spcn</i>                                                                    |

**Table A-3 Commands that support the Private Point Code Prefix**

| Command           | Description               | Applicable Point Code Parameters                                                                                 |
|-------------------|---------------------------|------------------------------------------------------------------------------------------------------------------|
| dstn              | Destination               | <i>spci</i> and <i>spcn</i> ; <i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i> Does not apply to Aliases |
| ls                | Linkset                   | If <i>ipgwapc=yes</i> , <i>apc</i> , <i>apcn</i> , <i>apci</i> , and <i>apcn</i>                                 |
| gtt/gta           | Global Title Translation  | <i>pc</i> , <i>pca</i> , <i>pci</i> , and <i>pcn</i>                                                             |
| inh/unhb-alm      | Destination alarm inhibit | <i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i>                                                         |
| rept-stat-cluster | Report Cluster Status     | <i>dpc</i> and <i>dpca</i>                                                                                       |
| rept-stat-dstn    | Report Destination Status | <i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i>                                                         |
| rmt-appl          | Remote Application        | <i>ipc</i> , <i>ipca</i> , <i>ipci</i> , and <i>ipcn</i>                                                         |
| rst-dstn          | Restore Destination       | <i>dpc</i> and <i>dpca</i>                                                                                       |
| rte               | Route                     | <i>dpc</i> , <i>dpca</i> , <i>dpci</i> , and <i>dpcn</i>                                                         |

## Valid CIC Ranges for SI and MSU Types in Routing Key Static Entries

Table A-4 lists the valid CIC ranges for use with SI and MSU types in Routing Key table static entries.

**Table A-4 Valid CIC Ranges for SI and MSU Types**

| SI         | MSU for ANSI DPC                          | MSU for ITU DPC                     | Comments                                       |
|------------|-------------------------------------------|-------------------------------------|------------------------------------------------|
| 4 (TUP)    | N/A                                       | CIC is 12 bits.<br>Range is 0-4095. | The TUP protocol is used only in ITU networks. |
| 5 (ISUP)   | CIC is 14 bits.<br>Range is 0-16383.      | CIC is 12 bits.<br>Range is 0-4095. |                                                |
| 13 (QBICC) | CIC is 32 bits.<br>Range is 0-4294967295. |                                     |                                                |

## DRANAIV/DRANAI Mapping

Table A-5 shows the mapping between the *drainaiv* and *dranai* parameters.

**Table A-5 DRANAIV/DRANAI Mapping**

| DRANAIV | DRANAI  | Description                 |
|---------|---------|-----------------------------|
| 1       | sub     | Subscriber Number           |
| 2       | unknown | Unknown                     |
| 3       | natl    | National significant number |
| 4       | intl    | International number        |
| 5       | ntwk    | Network                     |

## DRANPV/DRANP Mapping

Table A-6 shows the mapping between the *dranpv* and *dranp* parameters.

**Table A-6 DRANPV/DRANP Mapping**

| DRANPV | DRANP | Description                   |
|--------|-------|-------------------------------|
| 1      | E164  | ISDN/telephony numbering plan |
| 3      | X121  | Data numbering plan           |
| 4      | F69   | Telex Numbering Plan          |

## NAIV/NAI Mapping

[Table 58: NAIV/NAI Mapping](#) shows the mapping between the *naiv* and the *nai* parameters.

**Table A-7 NAIV/NAI Mapping**

| NAIV  | NAI  | Description                 |
|-------|------|-----------------------------|
| 0     | –    | Unknown                     |
| 1     | Sub  | Subscriber Number           |
| 2     | Rsvd | Reserved for national use   |
| 3     | Natl | National significant number |
| 4     | Intl | International number        |
| 5–127 | –    | Spare                       |

## NPV/NP Mapping

[Table A-8](#) shows the mapping between the *npv* and the *np* parameters.

**Table A-8 NPV/NP Mapping**

| NPV  | NP      | Description                                        |
|------|---------|----------------------------------------------------|
| 0    | –       | Unknown                                            |
| 1    | E164    | ISDN/telephony numbering plan                      |
| 2    | Generic | Generic numbering plan                             |
| 3    | X121    | Data numbering plan                                |
| 4    | F69     | Telex numbering plan                               |
| 5    | E210    | Maritime mobile numbering plan                     |
| 6    | E212    | Land mobile numbering plan                         |
| 7    | E214    | ISDN/mobile numbering plan                         |
| 8    | Private | Private network or network-specific numbering plan |
| 9–15 | -       | Spare                                              |

## Cards that use the ent-card Command

Table 60 contains information about cards that use the ent - card command for provisioning.

**Table A-9 Valid Card Applications and Types**

| Card Name<br>(as shown on<br>card label) | Part Number     | Card Type<br>(:type) | Application<br>Type (:appl) | Maximum Cards<br>in the Database                                                                                                             |
|------------------------------------------|-----------------|----------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| E5-APP-B                                 | 870-3096-01     | e5appb               | epap                        | 2                                                                                                                                            |
|                                          |                 |                      | elap                        | 2                                                                                                                                            |
| E5-APP-B                                 | 870-3096-02     | e5appb               | lsms                        | 2                                                                                                                                            |
|                                          |                 |                      | nas                         | 1                                                                                                                                            |
|                                          |                 |                      | imf                         | 255                                                                                                                                          |
| E5-ATM                                   | 870-1872-01 (R) | limatm               | atmansi                     | 180 if only one<br>link is<br>provisioned per<br>card. A<br>maximum of 180<br>links for either<br>application can<br>exist in the<br>system. |

\* Though the system allows 250 MCPM cards, practical usage is 2.

\*\*\* If any MPS-based features are running in the system, up to 25 Service Modules are allowed in the system. If only GTT is running, up to 32 Service Modules can be used in the system with the 50,000 GTT feature.

† † For the E1 or T1 interface, either SS7 application (SS7ANSI or CCS7ITU) can be assigned to these cards. For more information on the E1 or T1 interface go to Appendix A "E1 Interface" or Appendix B "T1 Interface" in the *Database Administration - SS7 User's Guide*.

Part numbers followed by (R) are ROHS numbers. These numbers are equivalent to the non-ROHS numbers that they are paired with.

\*\*\*Connectivity to a TekServer 3 (T1200) with EPAP 13.0 or higher or connectivity to an E5-APP-B card with EPAP 15.0 or higher is required for more than 25 Service Module cards.

## Summary of Loopback Testing Commands and Functions

Table A-10 and Figure A-1 summarize the loopback testing commands and functions in the system.

The `tst -slk` command provides several methods for testing signaling links. The `loopback` parameter provides the ability to select *lxvr* (local transceiver), *oam*, *line*, *payload*, and *sltc* loopback tests. The command will be rejected if a loopback test is not compatible with the link type.

- For low-speed links, the *lxvr* and *sltc* tests are allowed.
- For high-speed links (ATM, E5-ATM, E5-ATM-B), the *lxvr*, *oam*, *line*, *payload*, and *sltc* tests are allowed.
- For SS7IPGW and IPGWI DCMs, the `tst -slk` command is not supported.
- For LIME1 or LIMT1 cards, or for the E5-ENET or E5-ENET-B cards running the IPSG application, only the `loopback=sltc` test is allowed.
- The E5-E1T1, E5-E1T1-B, and HC-MIM cards can function as either an E1 MIM card or a T1 MIM card, depending on how the card is provisioned. The `loopback=sltc` test is allowed.

The **act - lbp** command activates test on one or more loopback points for testing data signaling link elements in one CCS7 transmission path. The maximum number of loopback points is 32.

For a single loopback point test, the parameters can be entered on the command line. If the parameters are not entered at the command line, the LFS database is used. For multiple loopback point tests, the LFS database must be used.

The **ent - lbp** command is used to create the loopback points in the LFS database. The LBPs may be entered in any order.

See the command descriptions in this manual for details on entering parameters and using the commands.

## Acronyms and Abbreviations

### Acronyms and Abbreviations

**A-Port**

ANSI-41 Mobile Number Portability

**AINPQ**

ANSI-41 INP Query

**AAL**

ATM Adaptation Layer

**AAL5**

ATM Adaptation Layer 5

**AAL5CP**

ATM Adaptation Layer 5 Common Port

**AATM**

ATM Applique

**ACG**

Automatic Call Gapping

**ADJ DPC**

Adjacent Destination Point Code

**AI**

Address Indicator

**AIN**

Advanced Intelligent Network

**AINF**

Application Interface Applique

**ANSI**

American National Standards Institute

**AP**

Application Processor

**APC**

Adjacent Point Code

**ARP**

Address Resolution Protocol

**AS**

Application Server; a logical entity serving a specific Routing Key

**ASP**

Application Server Process

**ATI**

Any Time Interrogation

**ATM**

Asynchronous Transfer Mode

**ATMANSI**

The application software for the ATM (high-speed) SS7 signaling links

**ATM HSL**

Asynchronous Transfer Mode High Speed Link

**ATMM**

ATM Layer Management

**AVL**

Availability Measurements report

**AVLD**

Daily Availability measurements report

**AVLDTH**

Day-to-Hour Availability measurements report

**BCSM**

Basic Call State Model

**BIP**

Board Identification PROM

**BITS**

Building Integrated Timing System

**BLM**

Bulk Load Module

**BSD**

Berkeley Software Distribution

**BSN**

Backward Sequence Number

**CAS**

Channel Associated Signaling

**CCM**

Command Class Management

|                |                                                          |
|----------------|----------------------------------------------------------|
| <b>CCS</b>     | Common Channel Signaling                                 |
| <b>CCS7</b>    | Common Channel Signaling System #7                       |
| <b>CCS7ITU</b> | The application software for the ITU SS7 signaling links |
| <b>CDPA</b>    | Called Party Address                                     |
| <b>CDPN</b>    | Called Party Number                                      |
| <b>CGPA</b>    | Calling Party Address                                    |
| <b>CF</b>      | Control Frame                                            |
| <b>CIC</b>     | Circuit Identification Code                              |
| <b>CLLI</b>    | Common Language Location Identifier                      |
| <b>CLU</b>     | Network Cluster                                          |
| <b>CM</b>      | Cluster Management                                       |
| <b>CNCF</b>    | Calling Name Conversion Facility                         |
| <b>CP</b>      | Communication Processor                                  |
| <b>CPU</b>     | Central Processing Unit                                  |
| <b>CRC</b>     | Cyclic Redundancy Check                                  |
| <b>CRMD</b>    | Cluster Routing and Management Diversity                 |
| <b>CRP</b>     | Circular Route Prevention                                |
| <b>CSL</b>     | Common Screening List                                    |
| <b>CSPC</b>    | Concerned Signaling Point Code Group                     |

**CSU**

Channel Service Unit

**DB**

Database

**DCM**

Database Communications Module

**DIP**

Dual In-Line Package

**DIX**

Digital/Intel/Xerox de facto standard for Ethernet Media Access Control Type

**DN**

Dialed or Directory Number

**DPC**

Destination Point Code

**DRAM**

Dynamic Random Access Memory

**DSM**

Database Services Module

**DSU**

Data Service Unit

**DTA**

Database Transport Access

**E5-E1T1**

EPM-based E1/T1 Multi-Channel Interface Module

**E5-ENET**

EPM-based Ethernet card

**E5IS**

EAGLE 5 Integrated Monitoring Support

**EBDA**

Enhanced Bulk Download and Audit

**EDR**

Efficient Data Representation

**EF**

Extension Frame

**EGTT**

Enhanced Global Title Translation

**EIA**

Electronic Industries Association

**EIR**

Equipment Identity Register

**ELAP**

EAGLE LNP Application Processor

**EMP**

EAGLE Monitoring Protocol

**EMSALM**

Element Management System Alarm Monitor

**ENET**

Ethernet

**EOAM**

Enhanced Operations, Administration, and Maintenance

**EOAP**

Enhanced OSS Application Process

**EPAP**

EAGLE Provisioning Application Processor

**EPM**

Embedded Processor Module (E5-E1T1 and E5-ENET cards are EPM-based cards)

**EPROM**

Erasable PROM

**ESP**

Extended Services Platform

**FAK**

Feature Access Key

**FAP**

Fuse and Alarm Panel

**FAS**

Frame Alignment Signal

**FISU**

Fill In Signal Unit

**FPBA**

Frame Power Budget Alarm

**FPCR**

Full Point Code Routing

**FPT**

Frame Power Threshold

**FSN**

Forward Sequence Number

**FTA**

File Transfer Area

**FTP**

File Transfer Protocol

**FTRA**

FTP-based Table Retrieve Application

**GDB**

GSM Real-Time Database

**G-Flex**

GSM Flexible Numbering

**G-Port**

GSM Mobile Number Portability

**GLS**

Generic Loading Service

**GMSC**

Gateway MSC

**GPL**

Generic Program Load

**GPSM**

General Purpose Service Module

**GSL**

Generic Software Load

**GSM**

Global System for Mobile Communications

**GTA**

Global Title Address

**GTI**

Global Title Indicator

**GTT**

Global Title Translation

**GTWY**

Gateway Administration measurements report

**GWS**

Gateway Screening

**GWSA**

Gateway Screening Application

**GWSM**

Gateway Screening Messages

**HC-MIM**

High Capacity Multi-Channel Interface Module

**HDB3**

High Density Bipolar 3 encoding

**HIPR**

High Speed IMT Packet Router

**HLR**

Home Location Register

**HOMERN**

Home Network Routing Number Prefix

**HMUX**

High-Speed Multiplexer

**HRN**

Home Routing Number

**HSL**

High-Speed Links

**IAM**

Initial Address Message

**IC**

Integrated Circuit

**ICMP**

Internet Control Message Protocol

**ID**

Identity

**IDP**

Initial Detection Point

**IEC**

International Escape Code

**IETF**

Internet Engineering Task Force

**IGM**

IS41 GSM Migration

**IGTTLS**

Intermediate Global Title Translation Load Sharing

**IL**

Incremental loading

**ILA**

Integrated LIM Applique

**IMEI**

International Mobile Equipment Identifier

**IMF**

Integrated Message Feeder

**IMSI**

International Mobile Station Identifier

**IMT**

Inter-processor Message Transport

**IN**

Intelligent Network

**INAP**

Intelligent Network Application Part

**INET**

Internet

**INH**

Inhibit

**INP**

INAP-based Number Portability

**INSL**

In-Network Subscriber List

**IP**

Internet Protocol

**IPGWI**

An ITU version of SS7IPGW

**IPGWx**

Point to multi-point IP Transport GPL, referring to SS7IPGW (ANSI) and IPGWI (ITU)

**IPLIM**

The application software used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

**IPLIMI**

The application software used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**IPLIMx**

Point to point IP Transport GPL, referring to IPLIM (ANSI) and IPLIMI (ITU)

**IPMX**

IMT Power and Multiplexer

**IPS**

Internet Protocol Services

**IS-41**

Interim Standard 41, same as and interchangeable with ANSI-41

**IS-ANR**

In Service - Abnormal

**ISDN**

Integrated Services Digital Network

**IS-NR**

In Service - Normal

**ISUP**

ISDN User Part

**ITU**

International Telecommunications Union

**ITUDUPPC**

ITU National Duplicate Point Code

**JIP**

Jurisdiction Indicator Parameter

**LAN**

Local Area Network

**LB**

Load Balancing

**LBP**

Loop Back Point

**LC**

Logical channel

**LED**

Light Emitting Diode

**LFS**

Link Fault Sectionalization

**LNP**

Local Number Portability

**LNPMR**

LNP Message Relay

**LN PQS**

LNP Query Service

**LNP SMS**

LNP Short Message Service

**LPE**

Logical Processing Element

**LPO**

Link Processor Outage

**LRN**

Location Routing Number

**LS**

Link Set

**LSA**

Link Status Alignment

**LSB**

Least Significant Bit (bit 1)

**LSL**

Low-Speed Link

**LSMS**

Local Service Management System

**LSN**

Link Set Name

**LSO**

Link Status out of Service

**LSPE**

Link Status Proving Emergency

**LSPN**

Link Status Proving Normal

**LSR**

Link Status Ready

**LSSU**

Link Status Signal Unit

**M2PA**

SS7 MTP2-User Peer-to-Peer Adaptation Layer

**M3UA**

SS7 MTP3-User Adaptation Layer

**MAAL**

Management ATM Adaptation Layer

**MAP**

Mobile Application Part

**MAPSCRN**

GSM MAP Screening measurements report

**MCAP**

MAS Communication Application Processor Card

**MCC**

Mobile Country Code

**MCM**

Maintenance Communication Module

**MCP**

Measurement Collection Processor

**MCPM**

Measurement Collection and Polling Module

**MDAL**

Maintenance Disk and Alarm (card)

**MDN**

Mobile Dialed Number

**MGT**

Mobile Global Title

**MGTT**

Modified Global Title Translation

**MF**

Miscellaneous Frame

**MFC**

Message Flow Control

**MIM**

Multi-Channel Interface Module

**MIN**

Mobile Identification Number

**MLPRST**

MTP Low Priority Route Set

**MNP**

Mobile Number Portability

**MNP SMS**

Portability Check for Mobile Originated SMS

**MNP-SRF**

Signaling Relay Function for support of Mobile Number Portability

**MOBR**

Origin-based MTP Routing feature

**MPC**

Multiple Point Code feature

**MPL**

Multi-port LIM

**MPS**

Multi-Purpose Server

**MR**

Message Relay

**MRN**

Mated Relay Node

**MRN**

Message Reference Number

**MS**

Mobile Station

**MSB**

Most Significant Bit

**MSC**

Mobile Switching Center

**MSAR**

Memory space accounting reporting

**MSISDN**

Mobile Station ISDN Number or Mobile Switching ISDN Number

**MSRN**

Mobile Station Roaming Number

**MSU**

Message Signal Unit

**MTCD**

Maintenance Daily measurements report

**MTCDTH**

Maintenance Day-to-Hour measurements report

**MTCH**

Maintenance Hourly (marginal) measurements report

**MTCS**

Maintenance Status (link/link set) measurements report

**MTP**

Message Transfer Part

**MTP2**

Message Transfer Part, Level 2

**NAI**

Nature of Address Indicator

**NCAI**

Nested Cluster Allowed Indicator

**NCR**

Nested Cluster Routing

**NEC**

National Escape Code

**NFAS**

Non-Frame Alignment Signal

**NI**

Network Indicator

**NIC**

Network Information Center

**NID**

Network Identification

**NM**

Network Management

**NP**

Number Plan

**NPA**

Numbering Plan Area

**NPAC**

Number Portability Administration Center

**NPANXX**

Numbering Plan Area and Exchange

**NRT**

Network Routing

**NSAP**

Network Service Access Point

**NSE**

Network Security Enhancement

**NSFI**

Next Screening Function Indicator

**NSP**

Network Services Part

**NSPC**

New Secondary Point Code

**OAM**

Operations, Administration, and Maintenance

**OAP**

Operation System Support Application Processor

**OAMP**

Operations, Administration and Maintenance Part

**OBSR**

Origin-based SCCP Routing feature

**OCU**

Office Channel Unit

**OOS-MA**

Out of Service - Memory Administration

**OOS-MT**

Out of Service - Maintenance

**OOS-MT-DSBLD**

Out of Service - Maintenance Disabled

**OPC**

Origination Point Code

**OPCODE**

Operation Code

**OPNAME**

Operation Name

**OSI**

Open Systems Interconnection

**OSS**

Operations Systems Support

**PC**

Point Code

**PCR**

Preventive Cyclic Retransmission

**PCS**

Personal Communications Service (North American GSM)

**PDBA**

Provisioning Database Application

**PDBI**

Provisioning Database Interface

**PDN**

Packet Data Network

**PDS**

Persistent Device States

**PLNP**

PCS 1900 LNP

**PLNPQS**

LNPQS support provided for PLNP

**PPSMS**

Prepaid Short Message Service Intercept

**PROM**

Programmable Read-Only Memory

**PSEL**

Presentation Selector

**PST**

Primary State for Maintenance

**PSTN**

Public Switched Telephone Network

**PVC**

Permanent Virtual Circuit

**PVN**

Private Virtual Network

**Q3**

Q.3 Protocol

**RAM**

Random Access Memory

**RBASE**

Record Base measurements report

**RC**

Relative Cost

**RI**

Routing Indicator

**RFC**

Request for Comments

**RMC**

Remote Maintenance Center

**RMTP**

Reliable Multicast Transport Protocol

**RN**

Routing Number

**RTDB**

DSM Real-time database

**RTT**

Round Trip Time

**SAAL**

Signaling ATM Adaptation Layer

**SAPC**

Secondary Adjacent Point Code

**SCCP**

Signaling Connection Control Part

**SCM**

System Configuration Manager

**SCMG**

SCCP Management

**SCP**

Service Control Point

**SCRSET**

Screen Set

**SCSI**

Small Computer System Interface

**SCTP**

Stream Control Transmission Protocol

**SE-HSL**

Synchronous E1 High Speed Link

**SEAS**

Signaling Engineering and Administration System

**SFAPP**

Stateful Applications

**SIB**

Status Indication "Busy"

**SIE**

Status Indication "Emergency" Alignment

**SIN**

Status Indication "Normal Alignment"

**SIO**

Service Information Octet

**SIO**

Status Indication "Out of Alignment"

**SIOS**

Status Indication "Out of Service"

**SK**

Service Key

**SKTS**

Service Key /TeleService List

**SLIC**

Service and Link Interface Card

**SLK**

Signaling Link

**SLS**

Signaling Link Selection

**SLSCI**

Signaling Link Conversion Indicator

**SLTA**

Signaling Link Test Acknowledgement

**SLTM**

Signaling Link Test Message

**SMS**

Short Message Service

**SMSC**

Short Message Service Center

**SMSMR**

Prepaid Short Message Service

**SNAI**

Service Nature of Address Indicator

**SNM**

Signaling Network Management

**SNR**

Subsystem Normal Routing

**SOR**

Support for Optimal Routing

**SORP**

Socket Option Registration Primitive

**SPC**

Secondary Point Code Signaling Point Code

**SRF**

Signaling Relay Function

**SRI**

Send Routing Information

**SRVSEL**

Service Selector

**SS7**

Signaling System #7

**SS7ANSI**

The application software for the ANSI SS7 signaling links

**SSA**

Subsystem Allowed (An SCCP management message)

**SSEL**

Session Selector

**SSN**

SS7 Subsystem Number

**SSP**

Service Switching Point

**SSU**

Status Signal Unit

**ST**

Stop Digit—BCD value 15 (0xF)—used to indicate the end of dialing in some applications

**STC**

Signaling Transport Card

**STP**

Signal Transfer Point

**STP LAN**

The application software for the STP LAN feature

**SUA**

SS7 SCCP-User Adaptation Layer

**SVC**

Switched Virtual Circuit

**TALI**

Transport Adapter Layer Interface (RFC 3094)

**TCP**

Transmission Control Protocol

**TCAP**

Transaction Capabilities Application Part

**TDM**

Terminal Disk Module

**TFA**

Transfer Allowed

**TFC**  
Transfer Congested (traffic)

**TFP**  
Transfer Prohibited

**TFR**  
Transfer Restricted

**TLNP**  
Triggerless LNP

**TOS**  
Type of Service

**TPS**  
Transactions Per Second

**TRA**  
Traffic Restarting Allowed

**TRBL**  
Trouble

**TRW**  
Traffic Restarting Waiting

**TSC**  
Time Slot Counter Synchronization

**TSM**  
Translation Services Module

**TT**  
Translation Type

**TUP**  
Telephone User Part

**TV**  
Ticket Voucher

**UA**  
IETF User Adaptation Layers

**UAM**  
Unsolicited Alarm Message

**UART**  
Universal Asynchronous Receiver - Transmit

**UDP**  
User Datagram Protocol

**UDTS**  
Unit Data Transfer Service

**UI**

User Interface

**UID**

User ID

**UIM**

Unsolicited Informational Message

**UPD**

Update

**VGTT**

Variable Length GTT

**VLR**

Visitor Location Register

**VMSC**

Voice Mail Service Center Visited Mobile Switching Center

**VSCCP**

VxWorks Signaling Connection Control Part

**WNP**

Wireless Number Portability

**WNPQS**

Wireless Number Portability Query Service

**X.25 DE**

X.25 Destination Entity

**XGTT**

Expanded GTT (GTT Table Expansion)

**XMAP**

Expanded MAP Table
