1. Preface

1.1 Introduction

This guide would help you to install the OBCLPM UI on designated environment. It is assumed that all the prior setup is already done related with WebLogic managed server creation. It is recommended to use dedicated managed server for OBCLPM UI.

The installation procedure includes a series of steps that are defined in subsequent sections for the deployment of services. Section 2 explains the procedure to perform the domain and cluster configuration. This setup includes the creation of domains and clusters in the weblogic server. After the domain creation is done, the war files of each of the services are deployed. Section 3 covers the procedure to deploy each of the application war files into the servers. Section 4 explains the procedure to restart and refresh the server after final deployments.

1.2 Audience

This document is intended for WebLogic admin or ops-web team who are responsible for installing the OFSS banking products.

1.3 Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

1.4 Organization

This installation user guide would allow you to install following:

- Oracle Banking Corporate Lending Process Management User Interface Application

1.5 Related Documents

- Common Core Services Installation Guide
- Day-0 Setup Guide
- LDAP Setup Guide
- Oracle Banking Corporate Lending Process Management Annexure
- Oracle Banking Corporate Lending Process Management BPMN Process Installation Guide

- Oracle Banking Corporate Lending Process Management Pre-Installation Guide
- Oracle Banking Corporate Lending Process Management Services Installation Guide
- Plato Infrastructure Services Installation Guide
- Process Flow Services Installation Guide
- Process Maintenance and Worklist Guide
- Security Management System Services Installation Guide
- SSL Setup Guide

2. Domain and Cluster Configuration

2.1 OBCLPM UI Domain Configuration

2.1.1 Prerequisites

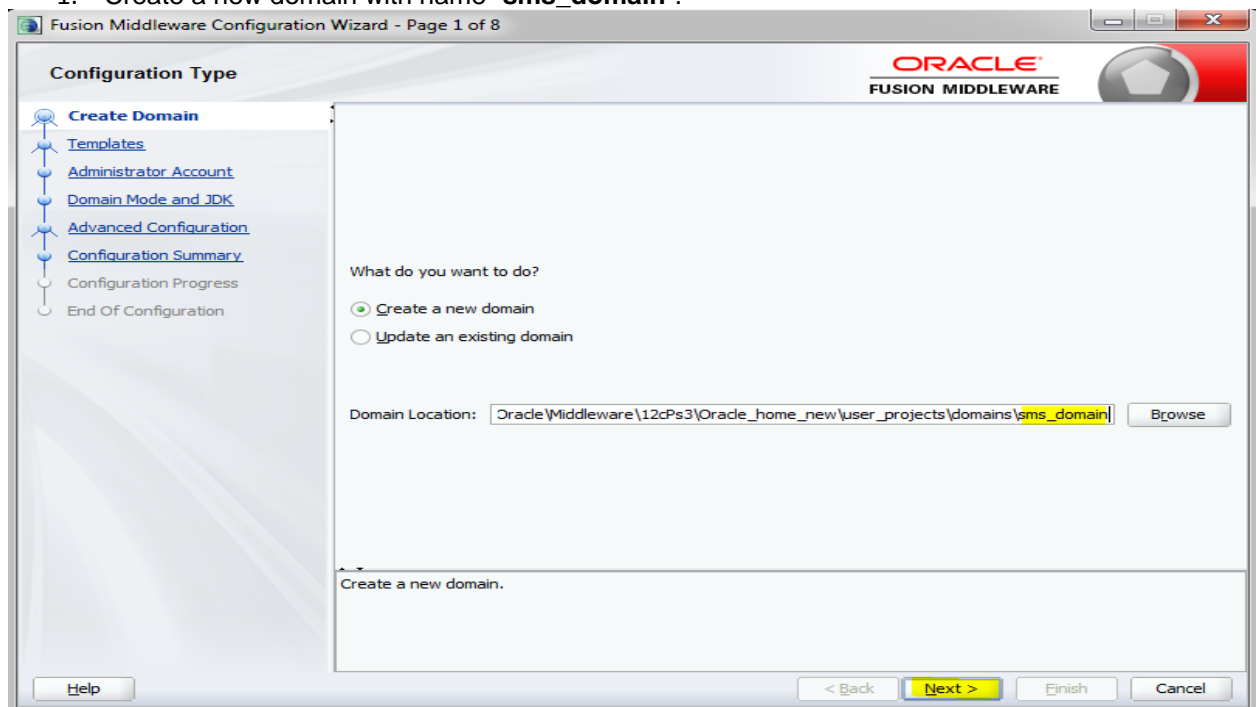

- Machine should have Java JDK1.8.0_171 has installed.
- Oracle Fusion Middleware 12cR2 12.2.1.3 has to be installed on the machine.

2.1.2 Steps to Create Domain

[Note: Name need not to be same as provided in Screen shot and domain name are used for write document]

Go to `/oracle_common/common/bin` and run `config.cmd` (or `.sh` if operating system is linux) and below the below screen shots to create domain with required cluster and server configurations.

1. Create a new domain with name “**sms_domain**”.

2. Use default templates and click next.

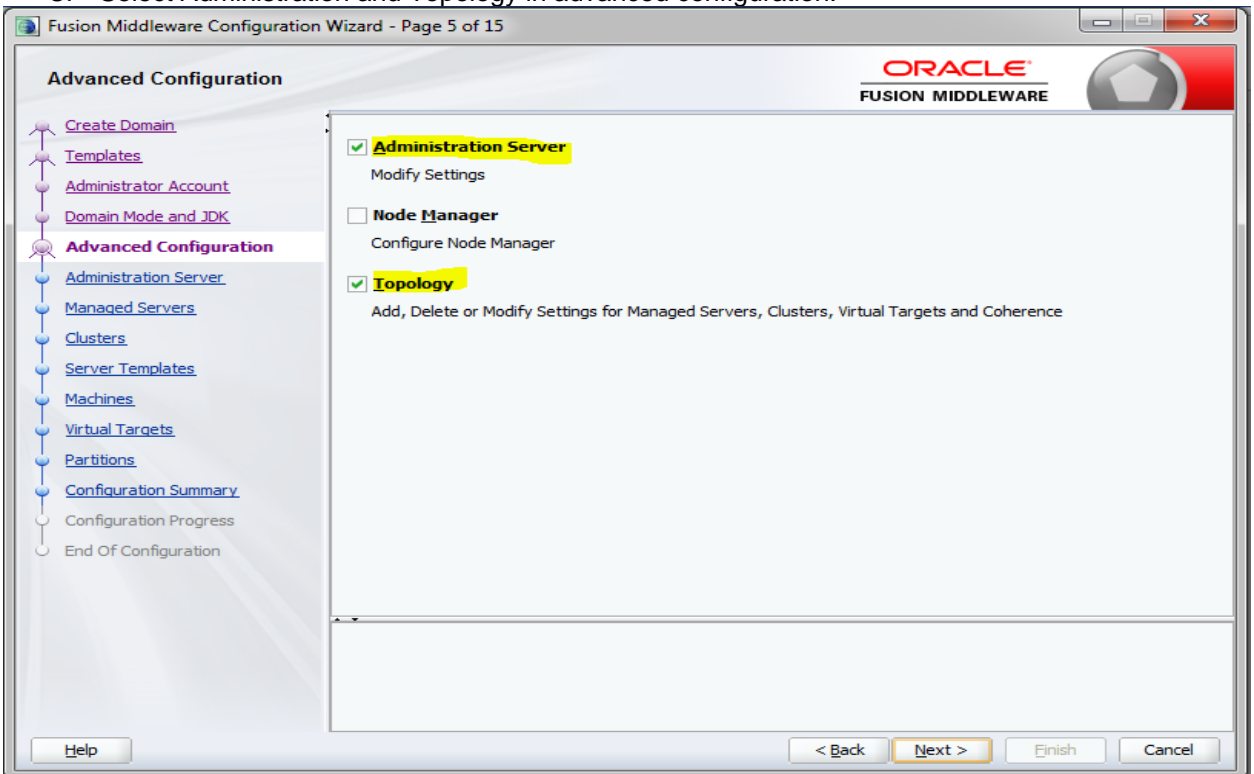

3. Provide password and confirm and click **Next**.

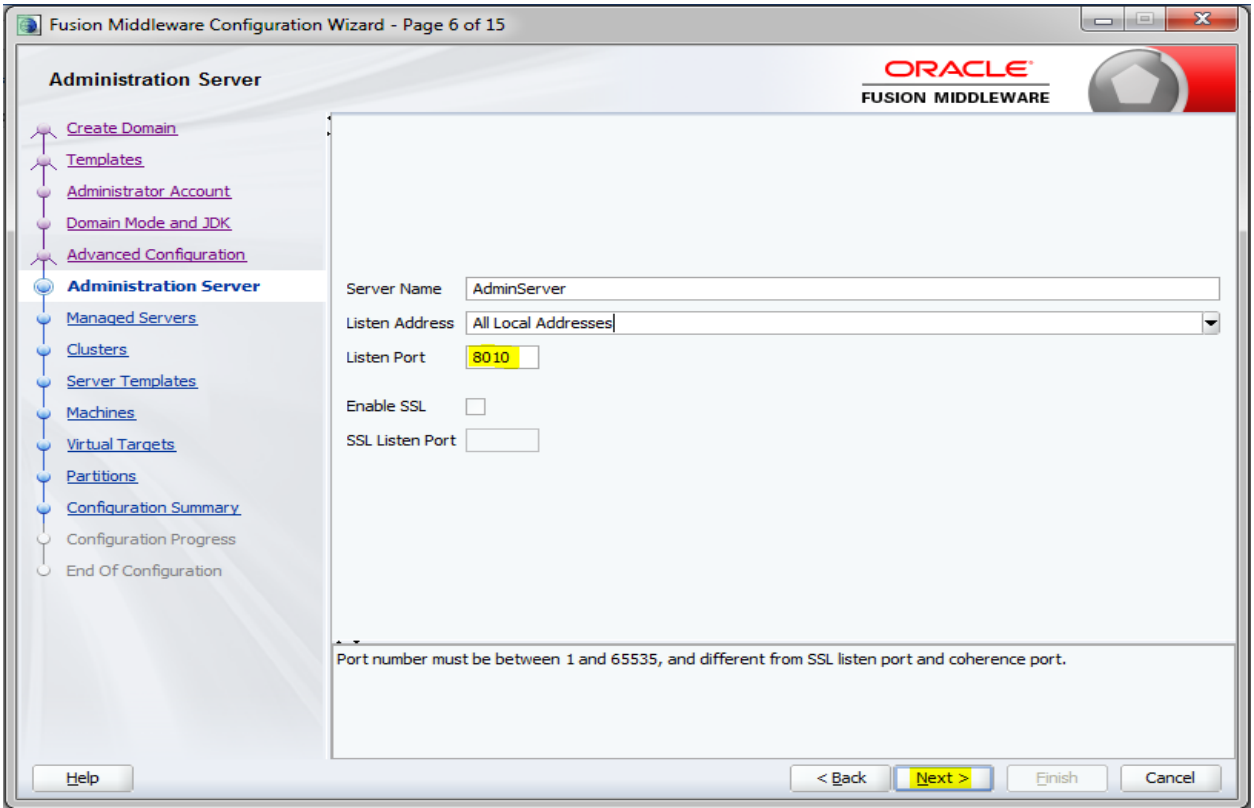

4. Select production mode and jdk and click **Next**.

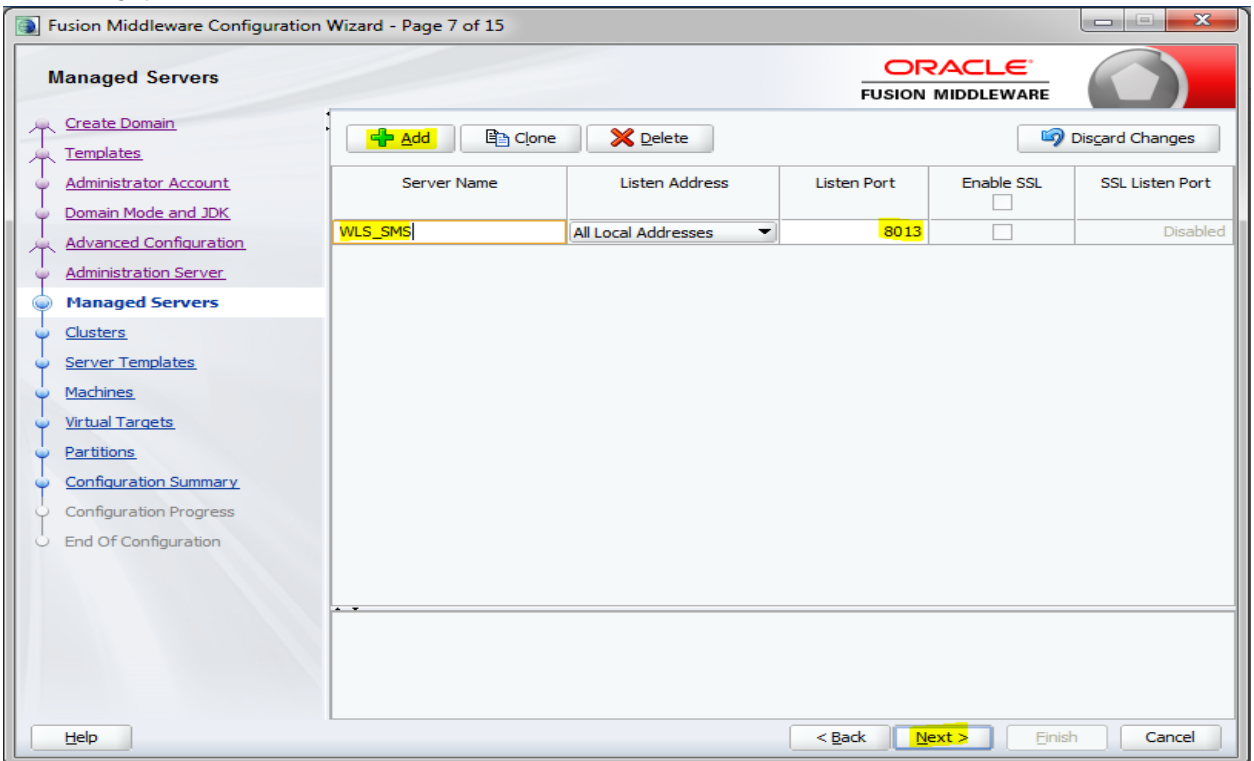

5. Select Administration and Topology in advanced configuration.

6. Configure port and listen addresses and Click next.

7. Create new Managed Server 'WLS_SMS', configure listen port and address and click next.

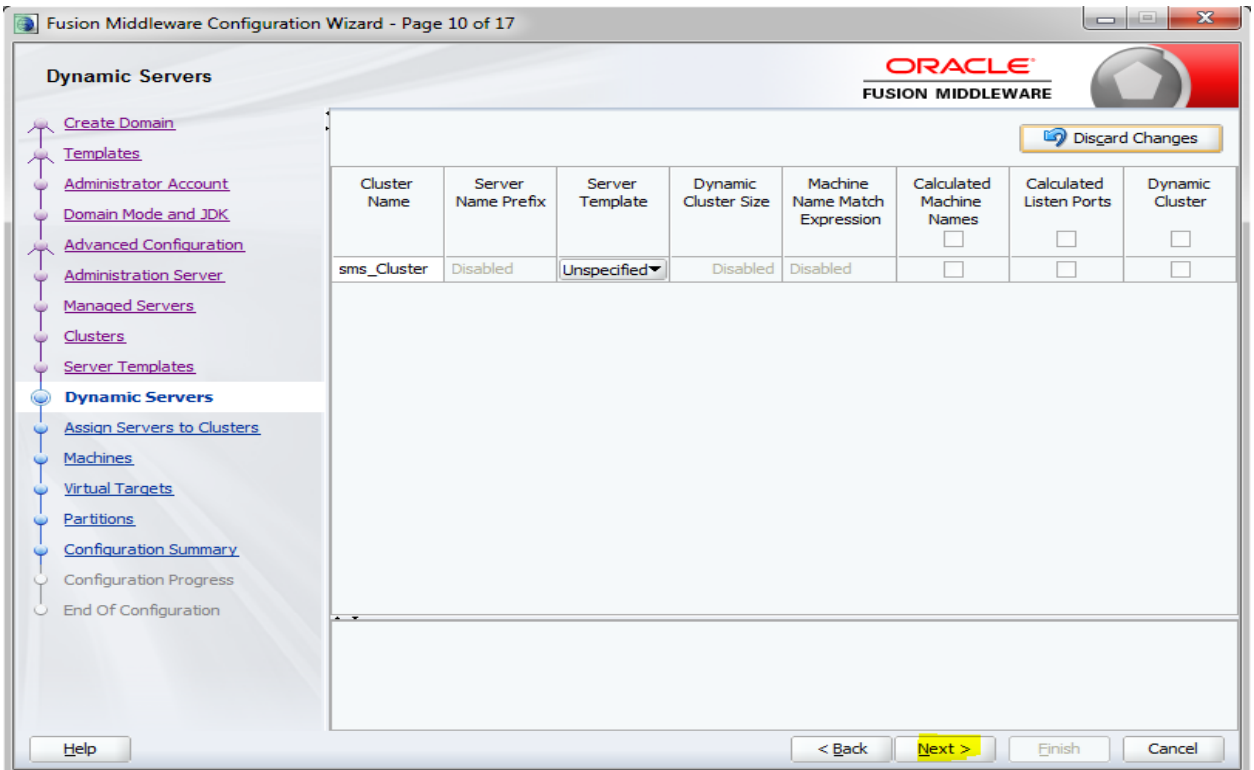

8. Create cluster 'sms_Cluster' for the managed server for one to one node mapping.

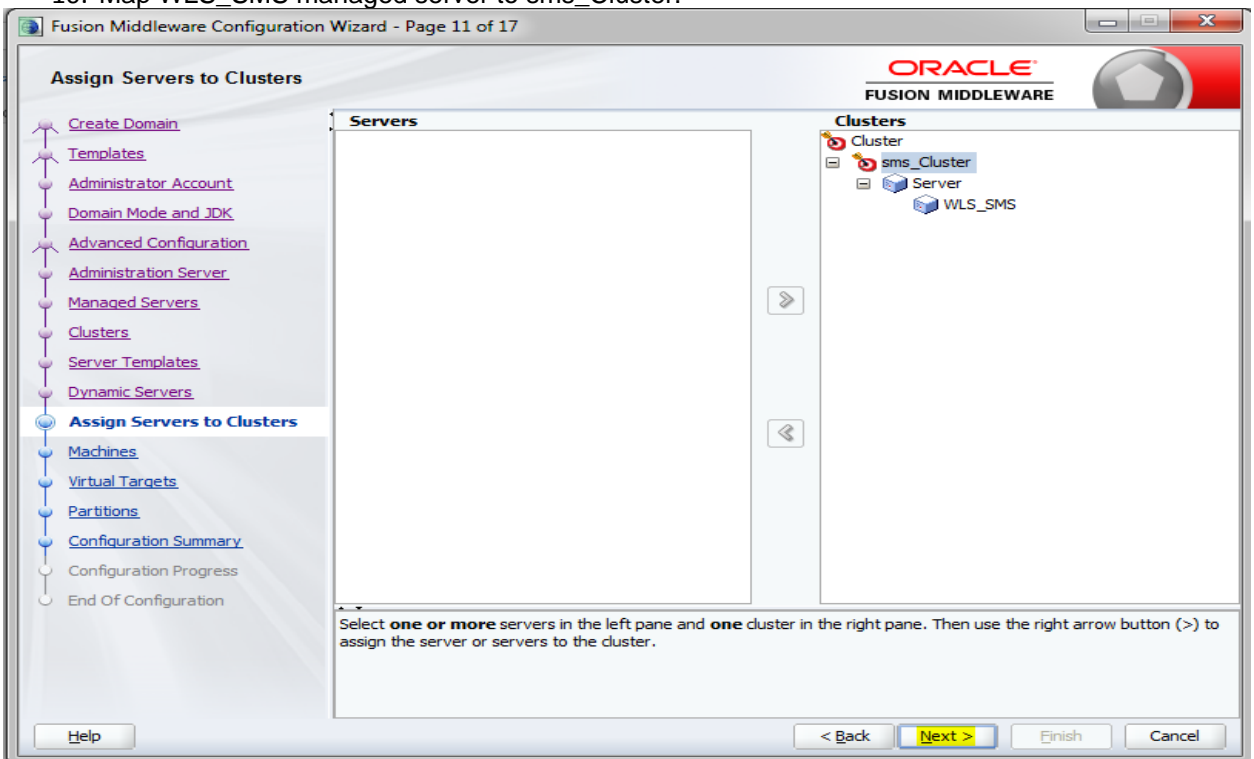

9. Skip Server templates and dynamic Servers or configure as required.

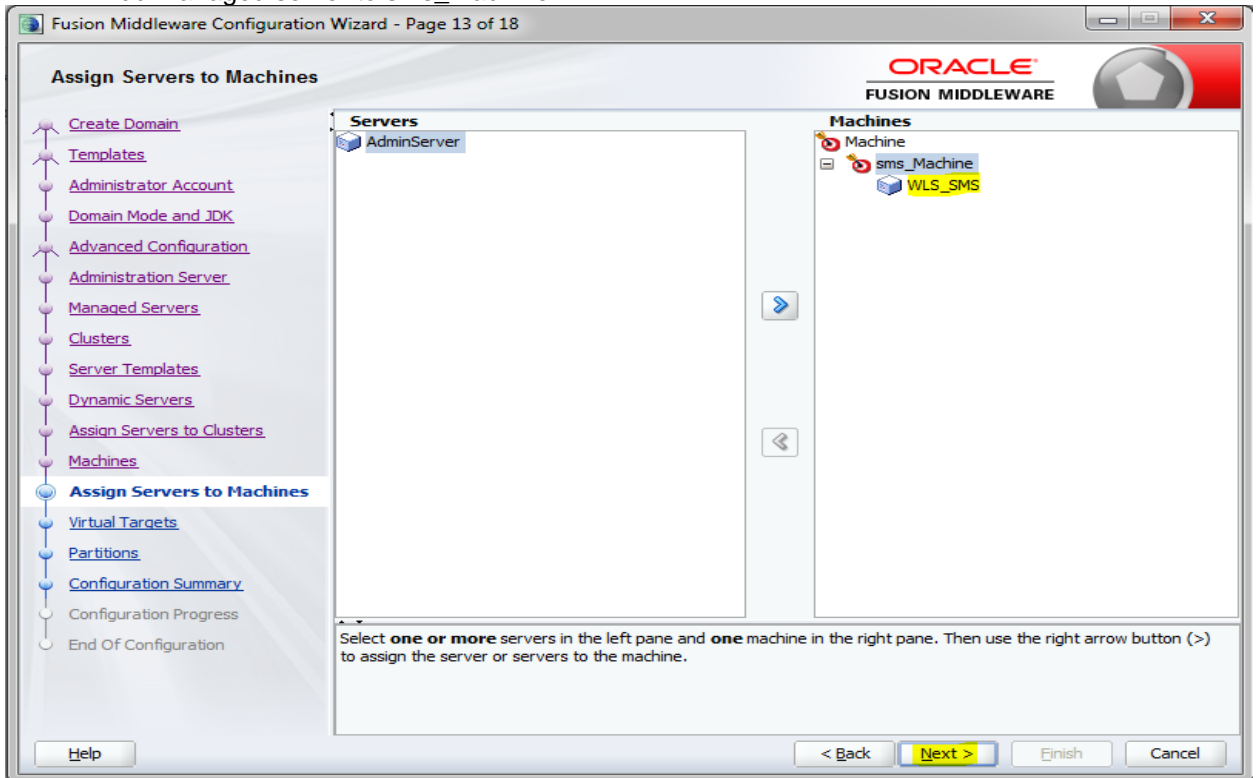

10. Map WLS_SMS managed server to sms_Cluster.

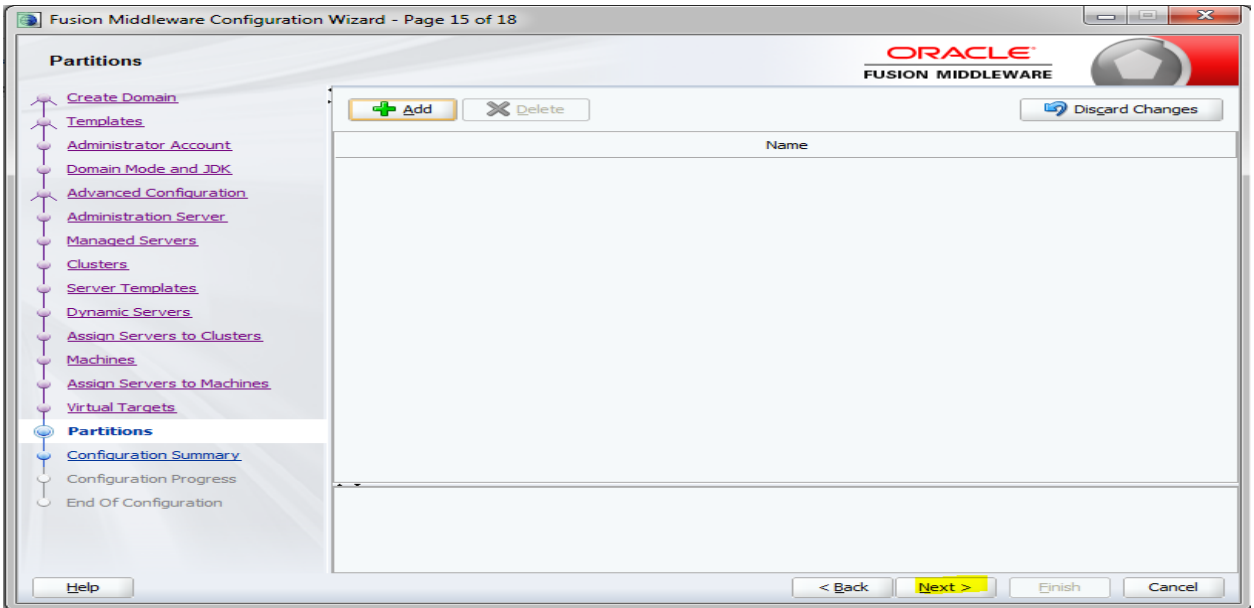

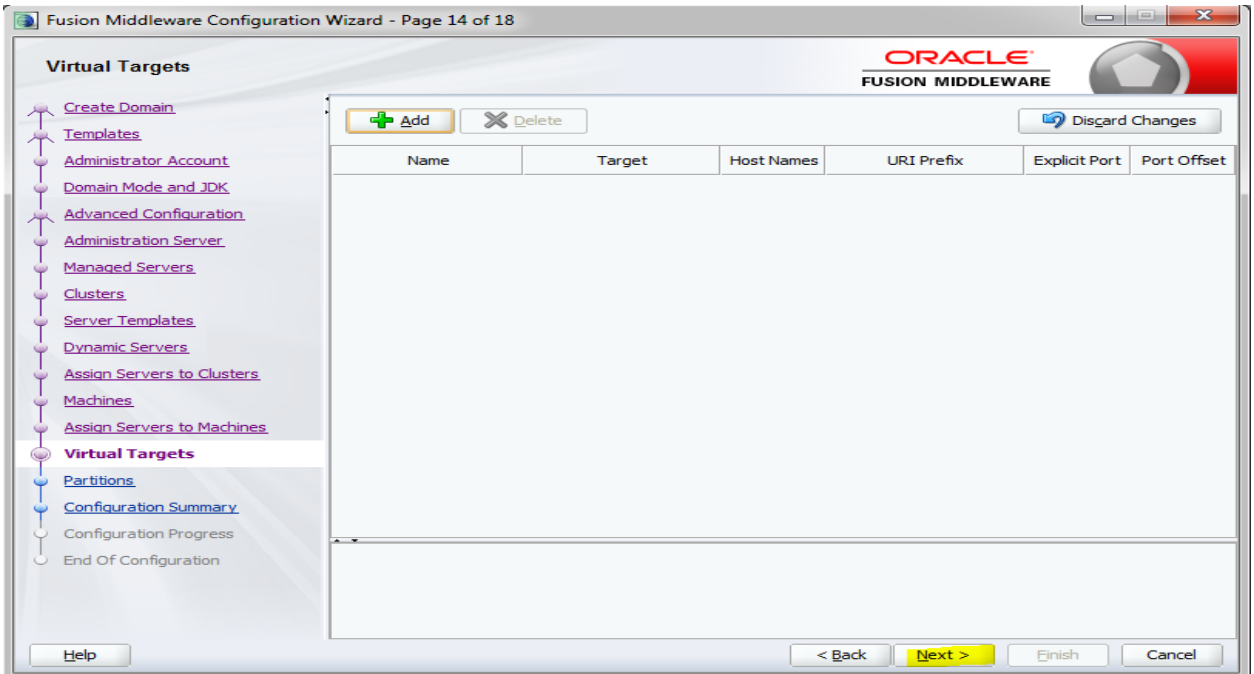

11. Add new machine (unix machine if operating system is Unix) with name sms_Machine and configure node manager listen port.

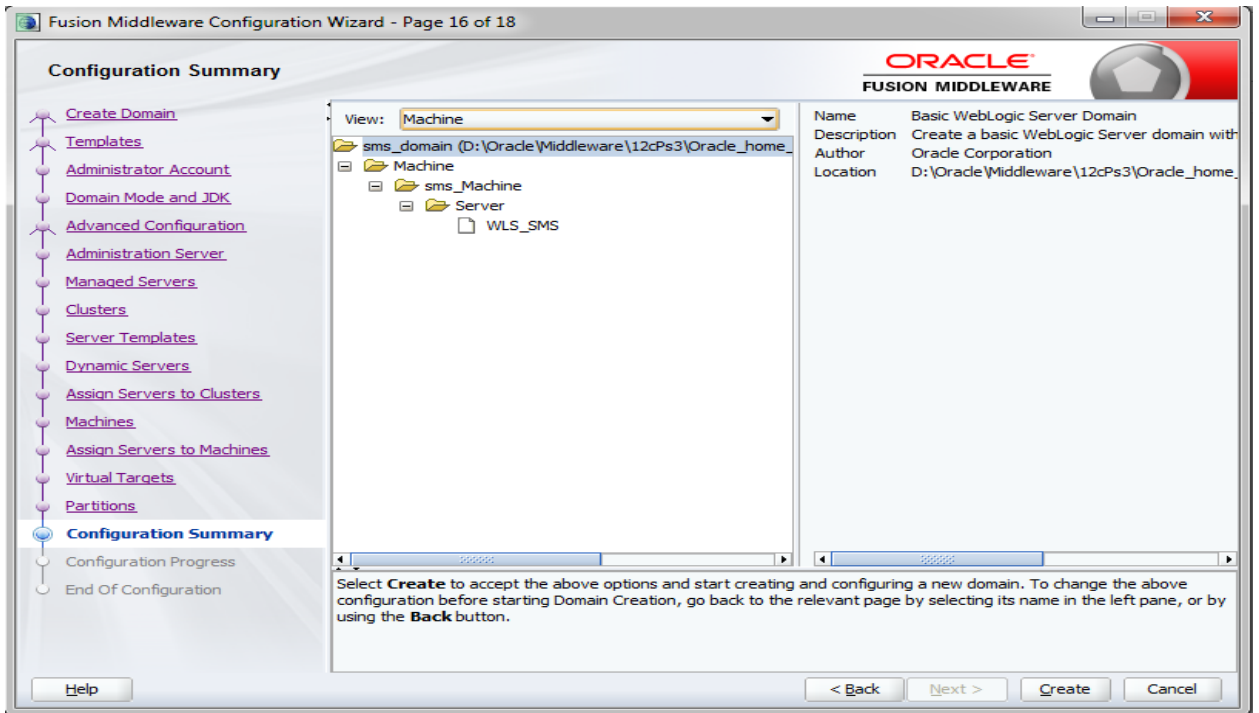

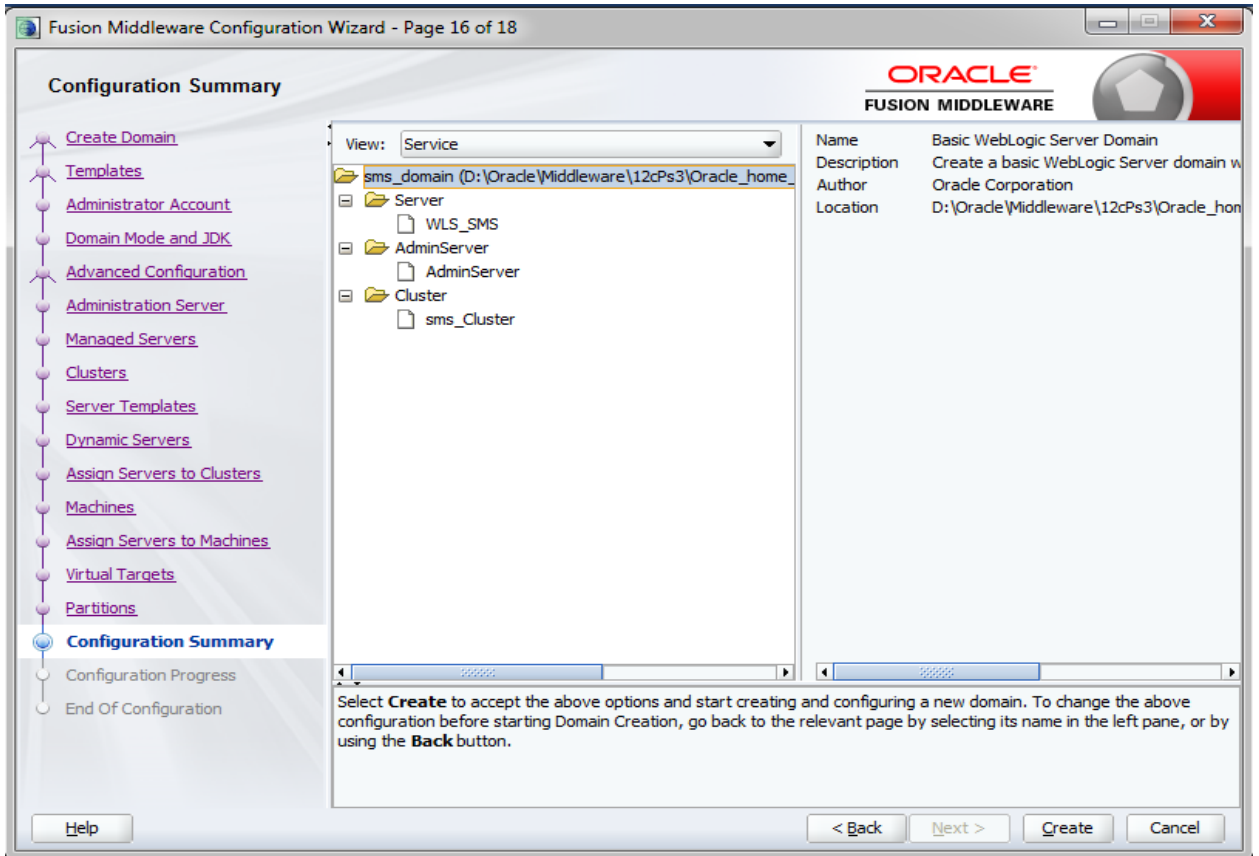

12. Add managed server to sms_Machine

13. Skip virtual targets and partitions or configure as required.

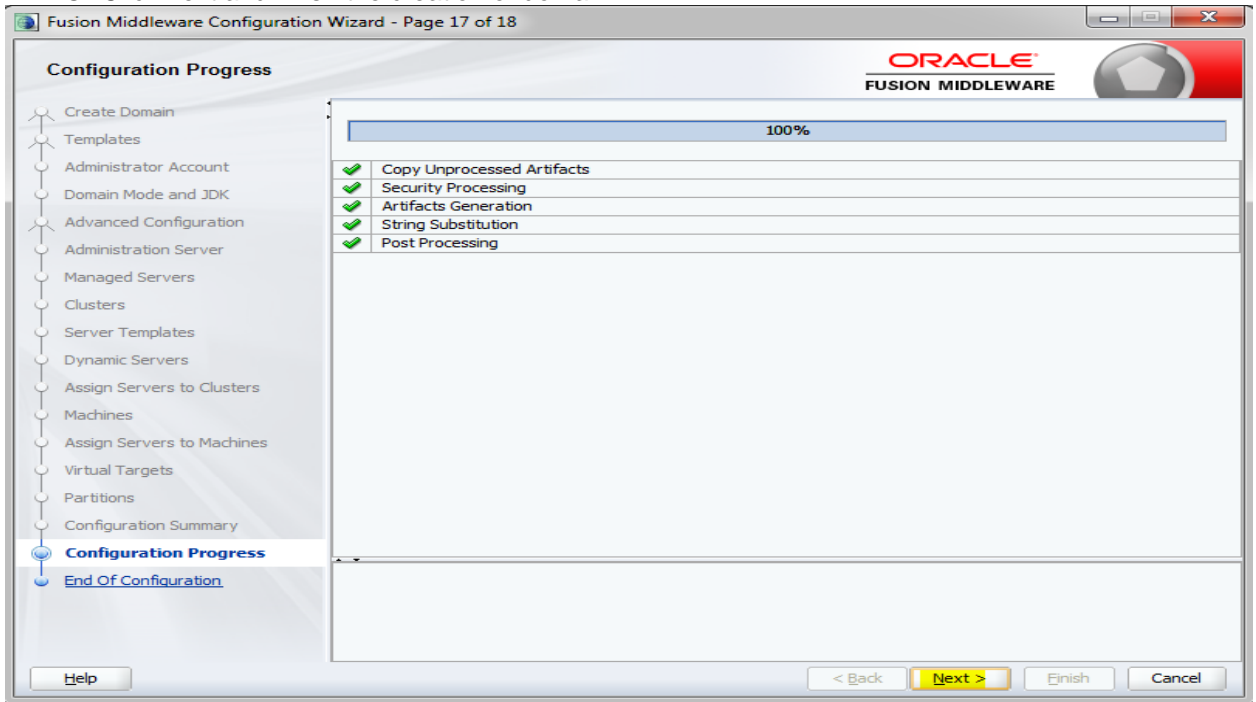

14. Check the configuration summary, confirm and click create

15. Click next and finish the creation of domain.

2.1.3 Post Domain Creation Configurations

1. Once finished, refer oracle fusion middleware documents for more details on how to start admin server, node manager and managed servers.
2. Create boot.properties file under
/user_projects/domains/XXXXdomainNameXXX/servers/AdminServer/security
3. Edit boot.properties and give username and password details.
4. Go to /user_projects/domain/sms_domain/bin
5. Run startWeblogic.cmd (or .sh if operating system is linux)
6. Go to /user_projects/domains/ sms _domain/bin
7. Run setNMJavaHome.cmd (.sh)
8. Go to /user_projects/domains/ sms _domain/nodemanager
9. And edit nodemanager.properties as required (securelistner = false if ssl and keystore is not given) and in admin console also Go to Machines > sms_Machine > Node Manager > Type > Plain > Save.
10. Go to /user_projects/domains/ sms _domain/bin
11. Run startNodeManager.cmd (or .sh if operating system is linux)
12. Start all managed servers.
13. Login console and verify servers and clusters

Click the *Lock & Edit* button to modify, add or delete items in this domain.

Summary of Servers

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration. This page summarizes each server that has been configured in the current WebLogic Server domain.

Customize this table

Servers (Filtered - More Columns Exist)

Click the *Lock & Edit* button in the Change Center to activate all the buttons on this page.

New Clone Delete Showing 1 to 2 of 2 Previous | Next

Summary of Machines

A machine is the logical representation of the computer that hosts one or more WebLogic Server instances (servers). WebLogic Server uses configured machine names to determine the optimum server in a cluster to which certain tasks, such as HTTP session replication, are delegated. The Administration Server uses the machine definition in conjunction with Node Manager to start remote servers. This page displays key information about each machine that has been configured in the current WebLogic Server domain.

3. Deployments

3.1 Steps to Deploy as Application

[Note: Server names and Domain names need not be the same as this document provides.]

Steps to Deploy archives as application on weblogic is same for all the above except for managed server and domain where we deploy will differ. Find the screenshots to see how deployment of archive as application is done on weblogic.

1. Extract the zip file under “UI” folder.
2. Open Weblogic console and navigate to the Deployments

Summary of Deployments

Configuration Control Monitoring

This page displays the list of Java EE applications and standalone application modules installed to this domain.

You can update (redeploy) or delete installed applications and modules from the domain by selecting the checkbox next to the application name and then using the controls on this page.

To install a new application or module for deployment to targets in this domain, click **Install**.

Customize this table

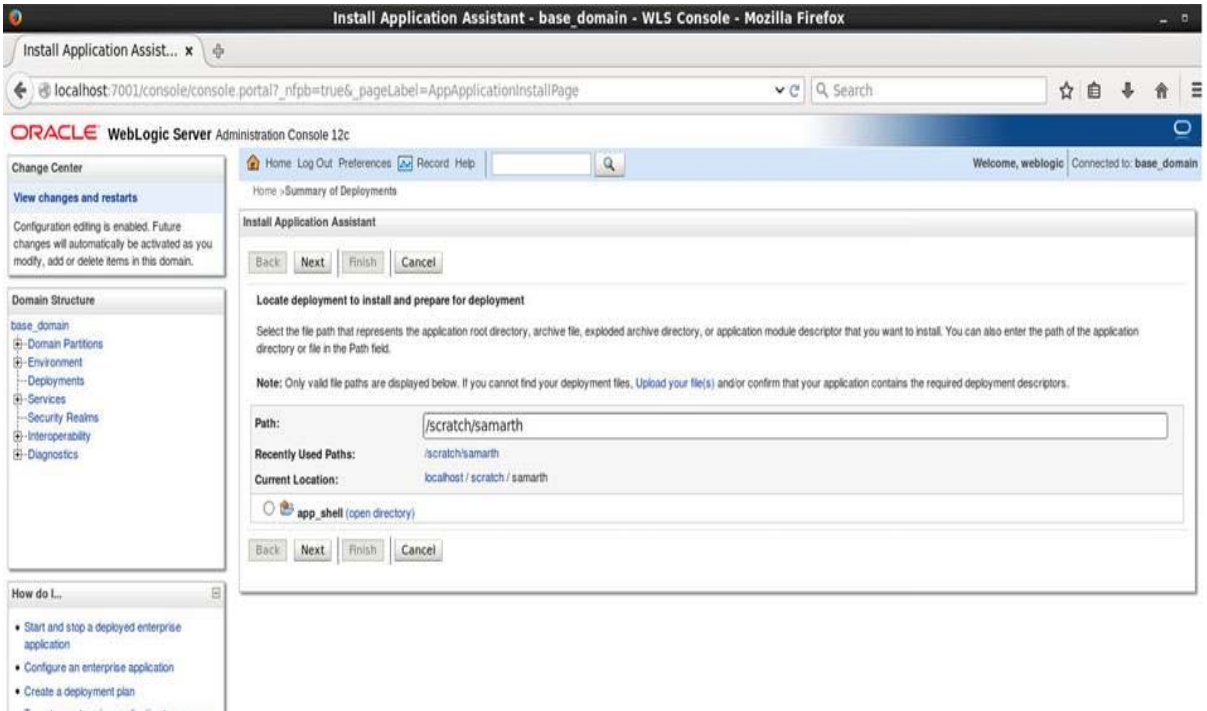

<input type="checkbox"/>	Name	State	Health	Type	Targets	Scope	Domain Partitions	Deployment Order
<input type="checkbox"/>	app_shell	Active	OK	Web Application	AdminServer	Global		100

Showing 1 to 1 of 1 Previous | Next

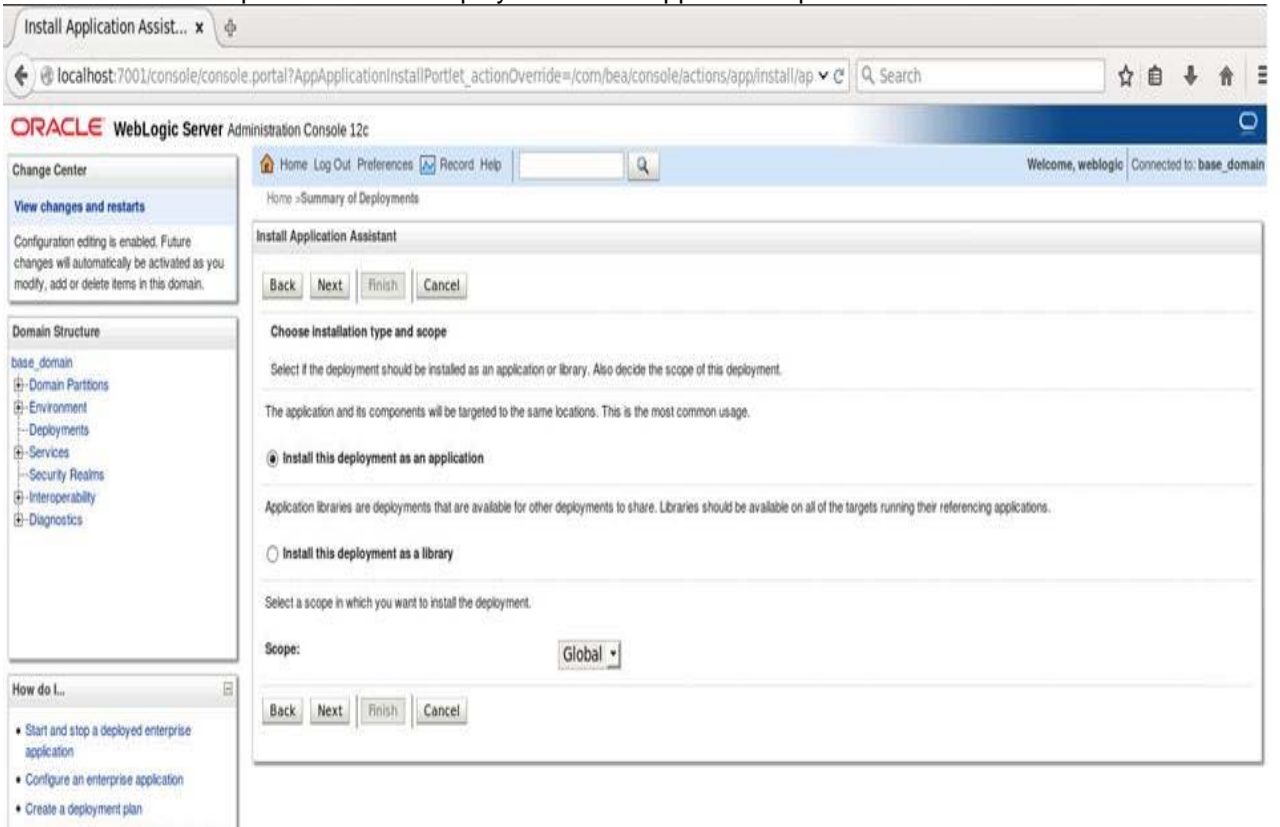

How do I...

- Install an enterprise application
- Configure an enterprise application
- Update (redeploy) an enterprise application
- Monitor the modules of an enterprise application
- Deploy EJB modules
- Install a Web application

3. Click on install and click on Upload your files, locate the extracted folder and select it, click on next

4. Check the option install this deployment as an application option and click Next.

5. Name the deployment and click Next.

6. Check the option "No i will review the configuration later" and click Finish.

7. Navigate to the control tab click on start and select the option "servicing all requests".

Change Center

View changes and restarts

Configuration editing is enabled. Future changes will automatically be activated as you modify, add or delete items in this domain.

Start Stop Showing 1 to 1 of 1 Previous Next

4. Restarts and Refresh

Once everything is deployed, restart all the managed servers. And for each application call path “/refresh” for refreshing the configuration properties.

4.1 Restarting Servers

1. Go to Environment > Servers

The screenshot shows the Oracle WebLogic Server console interface. At the top, there is a panel titled "View changes and restarts" with the instruction "Click the *Lock & Edit* button to modify, add or delete items in this domain." Below this instruction are two buttons: "Lock & Edit" and "Release Configuration". Below the panel is the "Domain Structure" tree, which is expanded to show the "Environment" folder, and within it, the "Servers" folder is highlighted in yellow.

2. Click on Control and select servers to shutdown and click yes to confirm shutdown.

The screenshot shows the Oracle WebLogic Server console interface. The "View changes and restarts" panel is visible on the left. The main area displays the "Summary of Servers" page. The "Control" tab is selected. The page contains a table of servers with the following data:

Name	Type	Cluster	Machine	State	Health	Listen Port
AdminServer(admin)	Configured			RUNNING	OK	7001
WLS_CONFIG	Configured	config_cluster	platoinfra_Machine	RUNNING	OK	7004
WLS_DISCOVERY	Configured	discovery_cluster	platoinfra_Machine	RUNNING	OK	7003
WLS_GATEWAY	Configured	gateway_cluster	platoinfra_Machine	RUNNING	OK	7006
WLS_ZIPKINUI	Configured	zipkinui_cluster	platoinfra_Machine	RUNNING	OK	7005
