Oracle Utilities Customer Cloud Service Release 18.2 Release Notes

Copyright © 2000, 2019 Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Chapter 1

Release Notes

These release notes contain the following sections:

- [About This Release](#)
- [Oracle Utilities Customer To Meter Enhancements](#)
- [Oracle Utilities Application Framework v4.3.0.6 Release Notes](#)

About This Release

This section contains general information about Oracle Utilities Customer Cloud Service Release 18.2.

Oracle Utilities Customer Cloud Service includes the following Oracle Utilities applications:

- Oracle Utilities Customer To Meter v2.7.0.0
- Oracle Utilities Cloud Service Foundation v18.2
- Oracle BI Publisher

Oracle Utilities Customer To Meter Enhancements

This section provides descriptions of enhancements in Oracle Utilities Customer To Meter introduced since the previous release of Oracle Utilities Customer Cloud Service, including:

- [Enhanced Single Instance Deployment Option](#)
- [Data Privacy Enhancements](#)
- [Person Name Format Standardization](#)
- [Enhanced Case Management Validation Processing](#)
- [Enhanced Account Bill/Payment History Page](#)
- [Enhanced Account Financial History Page](#)
- [Enhanced SA \(Service Agreement\) Financial History Page](#)
- [Auto-Canceling Aged Pending and Held Orders](#)
- [Protecting Address Details on Adjustment A/P Requests](#)
- [Capturing Billable Charge Template on Billable Charges](#)
- [Supporting Additional Automated Clearing House \(ACH\) File Extract Source Values](#)
- [Enhanced Point of Sale \(POS\) Printer Integration Support](#)
- [Enhanced Write Off Transfer Processing](#)
- [Enhanced Multi Cancel/Rebill Transaction Processing](#)
- [Merging Billing and Credit & Collections Batch Controls](#)
- [Specific Algorithm Types Converted to Groovy Scripting](#)
- [Batch Control for Renumbering Service Route Sequences](#)
- [Specific Batch Controls Enhanced to Reference File Storage Configuration Extendable Lookup](#)
- [Processing Timetable Types](#)
- [Measuring Component Comparison Periods](#)
- [Interval Proxy Day Estimation](#)
- [Service Point Quantities](#)
- [Standalone Measuring Components](#)
- [Uploading Measurement Data in Comma Separated Values \(CSV\) Format](#)
- [Dynamic Aggregation](#)
- [Usage Calculation Requests](#)
- [Application Flattening](#)
- [Miscellaneous Updates](#)

Enhanced Single Instance Deployment Option

In this release, Oracle Utilities Customer Cloud Service includes Oracle Utilities Operational Device Management (ODM) in the same Oracle Utilities Application Framework instance as the following application components:

- Oracle Utilities Customer Care and Billing (CCB)
- Oracle Utilities Meter Data Management (MDM)
- Oracle Utilities Smart Grid Gateway (SGG)
- Oracle Utilities Service Order Management (SOM)

This release provides implementations with a consistent user experience, simplifies the installation process, and assists in reducing the overall total cost of ownership.

Some of key features of this enhancement include:

- Many objects that are common or overlapping between the application components are internally synchronized without the need for a middleware layer. The processing techniques used for synchronizing additional data include:
 - Merged maintenance (used with service points and administrative data)
 - Master data synchronization (used with assets, contacts, and asset disposition/install events)
- Enhanced **Current Context** dashboard zone to cater for the ODM application component
- Redundant menu and context menu items are hidden from users.

Data Privacy Enhancements

Personally Identifiable Information (PII) is any information that identifies or could be used in combination with other information to identify an individual. Many countries have data privacy laws governing the use of such information. A key aspect of these laws is an organization's obligation to erase personal information when there is no compelling reason to retain it. This obligation can be fulfilled either by deleting the data or altering the data in such a way that it is no longer possible to associate the data with an individual.

Object Erasure is designed to support right to erasure requirements, with a combination of configuration and processes that may be extended to implement the appropriate policies for PII data within Oracle Utilities Customer Cloud Service.

Erasure may be triggered automatically or manually:

- **Automatic Triggering of Erasure:** For example, a person's eligibility for erasure may be automatically evaluated when key events occur on that person's accounts. These events can include:
 - Adding a service agreement
 - Closing a service agreement
 - Canceling a service agreement
 - Reactivating a service agreement
 - Accepting a proposal service agreement
 - Declining a proposal service agreement

- Reopening a proposal service agreement
- Deleting a proposal service agreement
- **Manual Triggering of Erasure:** A customer may call in to request an agent or customer services representative to erase their personal information from the system.

A number of business objects, algorithms, algorithm types, scripts, and background processes are provided to support automatic and/or manual triggering of the erasure process for the following entities:

- Person
- Account
- Service Agreement
- User

For further details, refer to the **Data Privacy** and **Data Privacy Addendum** topics in the Oracle Utilities Customer Cloud Service user documentation.

Person Name Format Standardization

The **Person Name Validation** system event plug-in spot, on **Installation Options – Framework**, has been renamed to **Person Name Format**. The plug-in spot has also been enhanced to enable implementations to specify more than one algorithm for validating and formatting person names.

The existing algorithm type, **NMFM-VALFMT (Person Name Format)**, has been converted and enhanced to groovy scripting with the following capabilities:

- Validates the person's name contains a name separator character if the following conditions are true:
 - Person/Business flag is set to 'Person'
 - Name Type is set to 'Primary' or 'Legal'
 - Use Name Separator Character (Y, N) algorithm parameter is set to 'Y'
- Removes or trims extra spaces between words in a person's name to just one space and removes all spaces around the name separator (if applicable and Name Type is set to 'Primary' or 'Legal').
- Removes specific characters, not a specific string, in a person's name based on the list of defined characters in the applicable Person or Business related algorithm parameter if Name Type is set to 'Primary' or 'Legal'.

Note: Only one algorithm for the above algorithm type is recommended to be plugged in by an implementation.

In addition to the above, a new **Installation - Person Name Format** algorithm type, **C1-NMFMFRS (Person Name Format - Find and Replace String)**, has been provided that searches for and replaces a specific string (or character) in a person's name as defined in the algorithm parameters. This may be configured to apply to the name of a Person and/or Business.

Note: For each string or character to be examined, an algorithm for the above algorithm type may be configured and plugged in by an implementation.

Enhanced Case Management Validation Processing

The case management functionality may be used to manage a variety of multi-step business processes (example: high bill complaints, property inspections, literature request, etc).

Cases may be configured, as defined by their respective Case Type, to be linked to person, account, and/or premise record(s). Case Types hold the business rules that control cases. Previously, validation existed to ensure there was an existing relationship between account and person (if populated on a case).

In this release, implementations can specify on Case Types via the **Entity Relationship** setting, which validations, if any, are enforced. The options include:

- All
- Person and Account Only
- Premise and Account Only
- None

Enhanced Account Bill/Payment History Page

The Account Bill/Payment History user interface has been upgraded to a portal zone, leveraging the Oracle Utilities Application Framework's Configuration Tools capabilities.

A user is now able to download an account's bill and/or payment history to an Excel file format directly from the user interface.

Note: The number of rows to be exported is defaulted to 300. Implementations may override this value via the zone's **Excel Rows** override parameter value.

Enhanced Account Financial History Page

The Account Financial History user interface has been upgraded to multi-query portal zones, leveraging the Oracle Utilities Application Framework's Configuration Tools capabilities.

A user is now able to:

- Search and sort financial history by:
 - Arrears Date
 - Accounting Date
 - GL Extract Date
 - All Dates
- Download an account's financial history to an Excel file format directly from the user interface.

Note: The number of rows to be exported is defaulted to 300. Implementations may override this value via the applicable zone's **Excel Rows** override parameter value.

Enhanced SA (Service Agreement) Financial History Page

The SA Financial History user interface has been upgraded to multi-query portal zones, leveraging the Oracle Utilities Application Framework's Configuration Tools capabilities.

A user is now able to:

- Search and sort financial history by:
 - Arrears Date
 - Accounting Date
 - GL Extract Date
 - All Dates
- Download a service agreement's financial history to an Excel file format directly from the user interface.

Note: The number of rows to be exported is defaulted to 300. Implementations may override this value via the applicable zone's **Excel Rows** override parameter value.

Auto-Canceling Aged Pending and Held Orders

Orders may be used to satisfy many diverse requirements. These can include:

- Enrolling new customers using a single transaction
- Selling new products to existing customers
- Setting up marketing surveys and recording customers' responses
- Quickly creating one-time charges

Orders may be created and saved in an incomplete state (pending or held) due to:

- All information required from a customer not being available to complete an order.
- A Customer Services Representative or Agent wishing to perform further research for the order.

A new batch control, **C1-CNPHO (Cancel Pending/Held Orders)**, is provided to enable an implementation to automatically cancel pending and/or held orders that have been open longer than a pre-configured number of days.

Protecting Address Details on Adjustment A/P Requests

Adjustments may be created to refund money to a customer via an Accounts Payable (A/P) system. These adjustments are based on Adjustment Type(s) that reference an A/P Request Type.

When a refund adjustment is frozen, the related account's billing address is defaulted on the adjustment's A/P Request. The A/P Request details can then be interfaced to an A/P system to create a check to send to the customer.

Previously, users were able to update the adjustment's A/P Request's address details after the A/P request details had been interfaced to an A/P system. This led to potential discrepancy in address information between Oracle Utilities Customer Cloud Service and the A/P system while a refund was being processed.

Adjustments has been enhanced so the address fields are now disabled on an adjustment's A/P Request, and therefore address details cannot be updated, after the A/P Request details have been interfaced to an A/P system (i.e., adjustment's A/P Request's **Payment Selection Status** is not equal to 'Not Selected for Payment'). If a user needs to update the address details after an adjustment's A/P Request details have been interfaced to the A/P system, they will need to:

- Cancel the payment in the A/P system (assuming it has not been sent to the customer).
- Cancel the adjustment in Oracle Utilities Customer Cloud Service.
- Update the account's billing address details.
- Create/freeze a new adjustment to capture the new address details.

Capturing Billable Charge Template on Billable Charges

Billable Charges may be used to charge customers for services that occur outside the normal course of business for an implementation (example: charging a contractor for the repair of a ruptured gas line, tree-trimming charges, etc).

Users may optionally use billable charge templates to create billable charges. Billable charge templates exist to minimize the effort required to create billable charges. A billable charge template contains the default bill lines, amounts and distribution codes used to levy a one-off charge.

Previously, the billable charge template used to create a billable charge was not captured on the billable charge itself. Billable charges has been enhanced to capture the **Billable Charge Template**.

It should be noted that users are still able to override or remove information on a billable charge defaulted from the billable charge template. As a result, the information on the billable charge may not resemble that initially defaulted from the template. Regardless, the billable charge template used to create the billable charge is still captured.

Supporting Additional Automated Clearing House (ACH) File Extract Source Values

The system supports two auto pay extract processes to extract payment information, into flat files, that can be interfaced to automated clearing houses (ACH).

Three new dedicated fields, for storing existing values, have been added to Auto Pay Route Type. The new fields include:

- **Company ID:** This was previously mapped from the Auto Pay Route Type's tender source's bank account's account number.
- **Company Entity Name:** This was previously mapped from the Auto Pay Route Type's tender source's bank's description.
- **Company Entity Description:** This was previously hard coded to "PAYMENTS".

The **Auto Pay Route Type** user interface has been upgraded to a portal and zones, leveraging the Oracle Utilities Application Framework's Configuration Tools capabilities.

Additionally, the above values specified on Auto Pay Route Type can be overridden by CIS Division. The system processes that use these values have been updated to check for CIS Division Override Controls if they exist. The extract processes, **APAYACH (Auto Pay Extract)** and **C1-APACH (Auto Pay Extract - ACH (with offset days parameter))**, have been updated to include an optional parameter for CIS Division. To extract auto pay records by CIS Division, a unique batch control is needed for each CIS Division and the CIS Division must be configured with the Auto Pay Route Type Override Controls.

Enhanced Point of Sale (POS) Printer Integration Support

Oracle Utilities Customer Cloud Service provides support to facilitate the integration with an implementation's Point of Sale (POS)/special cashiering station printers.

The support for integration enables implementations to endorse checks and print receipts. Print functions are available from the following transactions:

- Payment Event
- Payment Quick Add
- Payment Event Quick Add

In this release, the print functions have been enhanced so interfacing to Point of Sale (POS) / special cashiering station printers are initiated using Business Process Assistant (BPA) scripts (previously, this relied on JavaScript code). New user interfaces are also provided for the user to select the required action.

Enhanced Write Off Transfer Processing

In some implementations, deposit and / or payment arrangement service agreements are configured to belong to the 'main' Write Off Debt Class. In such a scenario, there is the possibility that deposit and / or payment arrangement service agreements may be recipients of transfer adjustments from stopped service agreements that are subject to write off processing (example: balances from other service agreements may be transferred to these service agreements).

In this release, the WO TRANSFER (Transfer to Other Active SA) algorithm type has been enhanced to enable almost all of an account's service agreements to belong to the same Write Off Debt Class and the algorithm type to determine which service agreements can:

- Be eligible for write off transfers
- Receive debit transfer balances only
- Receive credit transfer balances only or
- Never be eligible for write off transfers

A new **C1-LWXFR (Limit Write Off Transfer)** Characteristic Type is provided that can be configured on Service Agreement (SA) Types to limit write off transfers to specific service agreements. Examples include:

- Service agreements belonging to Deposit or Payment Arrangement related SA Types should not be recipients of write off transfers

- There are already mechanisms in place for these service agreements to have their balances zeroed out before they are picked up in write off processing
- On these SA Types, the above characteristic should have its value set to 'NEVER'.
- Service agreements belonging to Overpayment related SA Types should only be recipients of credit write off transfers (i.e., no debit balance should be placed on these service agreements)
- On these SA Types, the above characteristic should have its value set to 'CREDIT'.

Refer to the **Detailed Description** on the **WO TRANSFER (Transfer to Other Active SA)** algorithm type for further details.

Enhanced Multi Cancel/Rebill Transaction Processing

In this release, Multi Cancel/Rebill has been enhanced to support the ability to cancel / rebill more than one bill segment at a time, instead of rebilling a long period into one bill segment, when a service agreement's SA Type is configured with its **Special Role Flag** set to "Bill Determinants Required".

Merging Billing and Credit & Collections Batch Controls

In the last release, pairs of batch controls existed for many billing and credit and collection processes.

The newer of each pair utilized the plug-in driven batch functionality (exposing the select record logic only) and an optional batch parameter to support processing by CIS Division.

The elder of each pair have now been upgraded to the newer functionality mentioned above. These include:

- BILLING – Create Bills Using Bill Cycle
- ADM – Account Debt Monitor (refer below for additional enhancement details)
- CET – Collection Event Trigger
- CPM – Collection Process Monitor
- C1-ADMOV – Overdue Monitor
- SEC – Severance Event Completion
- SED – Severance Event Set Dependency Date
- SET – Severance Event Trigger
- WET – Write off Event Trigger
- WPM – Write off Monitor

The **ADM** (Account Debt Monitor) batch control has also been enhanced to include a new **Include Minimum Days Review (Y/N)** batch parameter. This essentially merges the logic between batch controls **ADM** (Account Deb Monitor) and **ADM2** (Account Debt Monitor, Minimum Days Review). The default setting is set to blank (N); however if configured to 'Y', then the same select criteria/logic in **ADM2** will be executed.

Specific Algorithm Types Converted to Groovy Scripting

The following algorithm types, which are commonly cloned by implementations to include implementation-specific requirements, have been converted to groovy scripting to assist in reducing total cost of ownership:

- Adjustment Type – Adjustment FT Creation: ADJT-TA (Payoff=Adj Amt/Current=0)
- Adjustment Type – Resolve Suspense: C1-CANSUSADJ (Cancel Suspense Adjustment)
- Customer Class – LPC Eligibility Rule: BILPE-ALL (Determine if the Amount is Sufficient to Levy LPCs)
- Distribution Code – GL Account Construction: FGLCNSTR-D (Get the GL Account from the Distribution Code)
- SA Type – SA Renewal: SARN-NB (NBB SA Renewal)
- SA Type – SA Stop: SAST-NB (Stop Non-Billed Budget)

Batch Control for Renumbering Service Route Sequences

In previous releases, the batch control **C1-RMRCS** (Renumber Service Route Sequences) was generally only made available, via patches, from My Oracle Support.

The batch control may be used to renumber the read sequences, on service points, in a given service cycle and service route. It is recommended for use when the service route to re-sequence includes a large number of service points.

The batch control provides similar functionality as the online page for renumbering service route sequences. Refer to the **Renumber Service Route Sequences** section in the Oracle Utilities Customer Cloud Service User Documentation for more details.

Specific Batch Controls Enhanced to Reference File Storage Configuration Extendable Lookup

In this release, a **F1-FileStorage** (File Storage Configuration) Extendable Lookup is available that provides implementations with an alternate option for defining native file storage locations. The following batch controls and associated business components have been enhanced to enable use of new Oracle Utilities Application Framework File Adapter APIs supporting the above extendable lookup.

- Batch Control: DWLDBILC (Download Billable Charge)
- Batch Control: C1-BSYEX (Billing Data Extract for DataConnect)
- Batch Control: C1-TAPDF (Third Party Auto Pay Confirmations)
- Batch Control: C1-TAPCN (Third Party Auto Pay Cancellations)
- Batch Control: C1SAFTPT (SAFT-PT Audit Extract)
- Batch Control: C1-SDDCE (SEPA Direct Debit Payment Extract)
- Batch Control: POSTROUT (Postal Bill Routing)
- Batch Control: FAXROUT (Fax Routing)

Processing Timetable Types

The Processing Timetable Type is a new object that can define a common schedule for executing a process that can be defined once and shared across many processes. It is currently associated to the scheduling of [Dynamic Aggregation](#) and the execution of projection estimations for [Standalone Measuring Components](#). There are two types that are provided with the base package:

- **Daily:** defines the lag or lead before processing should occur and whether or not the processing should be on a business or work day.
- **Defined Dates:** defines specified periods to be processed and the day on which they should be processed.

Measuring Component Comparison Periods

Measuring Component Comparison Periods capture a list of "like days" for a given day of interval measurements. The rules for identifying a "like day" are captured on the Measuring Component Comparison Type. Generally a "like day" is identified by evaluating a few factors:

1. How well correlated the interval curve is with the comparison day
2. Whether the average measurement for the day is within tolerance of the comparison day
3. Does the type of day (day of week, weekday vs weekend, holiday, etc) align with the comparison day

The list of days to be evaluated for "like days" can be selected from a horizon of days adjacent to the comparison day, from the prior year, or both adjacent days and days from the prior year.

These like days are a key input into the [Interval Proxy Day Estimation](#) rule. Although the main use case for these comparison periods is weather related measurements they can be used against any measured value.

Interval Proxy Day Estimation

The Interval Proxy Day Estimation VEE rule drives the estimation of missing intervals by selecting interval data to average from a list of days that are most like the day being estimated through the use of [Measuring Component Comparison Periods](#). A sample use case for this rule would be to estimate missing intervals by finding days in the past or the future that are most like the weather for the day that is being estimated.

Service Point Quantities

Service Point Quantities are a new measured value that can be stored at the service point level. These are intended to store quantities that do not change frequently enough to be captured as measurement data. A sample use case for these quantities is storing the peak load contribution a given Service Point had in relation to the peak load of a deregulated market.

Standalone Measuring Components

The following standalone measuring components have been introduced:

- **Interval Standalone:** can be used for any standalone interval measurement data
- **Interval Standalone Comparison:** can be used for any standalone interval measurement data where Measuring Component Comparison Periods are required
- **Interval Standalone Data Request:** can be used for any standalone interval measurement data where the data is requested from an external system on a schedule

Uploading Measurement Data in Comma Separated Values (CSV) Format

A new option has been enabled on the measuring component context menu that allows for the loading of measurement data using a comma separate values (CSV) file that specifies the date/time of the measurements, the reading value (subtractive only), the measurement value, and the measurement condition. This supports loading data to Scalar, Interval, and Subtractive Interval Measuring Components. Multiple days of can be uploaded at one time:

- **Interval:** an initial measurement will be created for each contiguous set of intervals based on the date/time
- **Scalar:** an initial measurement will be created for each date/time entry

Dynamic Aggregation

Dynamic Aggregation is a new aggregation engine that allows for point and click configuration of aggregations for supported tables:

- Aggregation Groups provide the schedule of aggregation, groups related aggregations, and provides the execution sequence of the aggregation
- Measuring Component Sets define what will be aggregated: dimensions to aggregate by as well as criteria to limit the set of constituent data for the aggregation
- Data Sources define where the data to be aggregated resides: measurement data for physical meters (scalar and interval), measurement data for measuring components associated to a Usage Subscription, Item Data, Usage Transaction Service Quantities, Service Point Quantities, and measurement data from other aggregations
- The Measuring Component Type has been enhanced to include aggregation functions in the definition of value identifiers which
- The Measuring Component maintenance object has been enhanced to include the attributes (aka dimensions) by which an aggregation is being performed

All of these changes together allow for the simple addition of new aggregations.

Usage Calculation Requests

Usage Calculation Requests are a new way to create and calculate an alternate set of usage transactions for an established usage subscription. For example, in a deregulated market there may be an annual process to calculate the peak load contribution of all customers. A new usage transaction business object has been created to be leveraged with usage calculation requests that provides two new benefits:

1. It supports defining multiple usage calculation groups and allowing for each group to be approved separately.
2. It will create [Service Point Quantities](#) using the service point quantity data calculated by the usage calculation groups

A series of batch jobs have been provided to provide the ability to perform bulk operations across all usage transactions for a usage calculation request:

- Create Usage Transactions
- Retry Usage Transactions
- Approve / Reject the results of a given Usage Calculation Group

These have been developed as plug-in driven batches (where appropriate) to allow for easy customization of the driving queries.

Application Flattening

The application components used by Oracle Utilities Meter Data Management and Oracle Utilities Smart Grid Gateway (designated by D2, D3, D4, D5, D6, D7, D8, and DG) have been merged into a single application component, designated D1 (formerly known as the Service and Measurement Data Foundation). When this merged application component is installed, all metadata, database records, and Java classes for each of the previously separated components are also installed. This simplifies installation of the Oracle Utilities meter data products.

Notes:

- **Owner and Prefixes:** The owner flag of all records and objects in this merged application component have been changed to "D1" (Oracle Utilities Meter Data Management), but retain their old prefixes (D2, D3, D4, etc.).
- **Custom Code:** Any custom ("CM") Java code or scripts that directly reference objects previously owned by individual application components may need to be changed to reflect this change.

Miscellaneous Updates

Updating Batch Category

In a previous release, a number of Batch Controls were either missing Batch Category values or they were set incorrectly.

In this release, the following updates are applied to upgrading implementations only:

- C1-TAPCN (Third Party Auto Pay Cancellations): Batch Category set to 'Process What's Ready'

- C1-TAPDF (Third Party Auto Pay Confirmations): Batch Category set to 'Process What's Ready'
- C1-TOPPP (Third Party One Time Payment Controls Pre-Processing): Batch Category set to 'Process What's Ready'
- C1-TCRNB (Transition OCBG for Replacement Read Process): Batch Category set to 'Monitor'
- C1-RMRCS (Renumber Service Route Sequences): Batch Category set to 'Ad Hoc'
- C1-BLACC (Create Bill for a Single Account): Batch Category set to 'Ad Hoc'

The Batch Category values may be updated by an implementation.

Updating Batch Default Parameter Values

In a previous release, the **C1-TCRNB** (Transition OCBG for Replacement Read Process) batch control did not have default parameter values set.

In this release for upgrading implementations only, default parameter values will be applied if implementation-specific values have not been set already.

Updating Algorithm Entity / System Event Descriptions

A number of **Algorithm Type - Algorithm Entity** descriptions have been updated as follows:

- From 'Installation – Online Field Order Image' to 'Installation – Online Field Order Display'
- From 'Installation – Online Letter Image' to 'Installation – Online Letter Display'
- From 'Installation – Online Statement Image' to 'Installation – Online Statement Display'
- From 'SA Type – Determine Proration' to 'SA Type – Override Proration Days'

A number of **Installation Options - Framework system event** (Install Algorithm Entity) descriptions have been updated as follows:

- From 'Online Field Order Image' to 'Online Field Order Display'
- From 'Online Letter Image' to 'Online Letter Display'
- From 'Online Quote Image' to 'Online Quote Display'
- From 'Online Statement Image' to 'Online Statement Display'

One **SA Type- Algorithm system event** (SA Type Algorithm Entity) description has been updated as follows:

- From 'Determine Proration' to 'Override Proration Days'

Oracle Utilities Application Framework v4.3.0.6 Release Notes

This section describes enhancements, system data details and deprecation notices in Oracle Utilities Application Framework v4.3.0.6.0 including:

- [System Wide Enhancements](#)
- [File Access Enhancements](#)
- [Batch Enhancements](#)
- [DBMS Scheduler Integration Enhancements](#)
- [To Do Enhancements](#)
- [Configuration Tools Enhancements](#)
- [Analytics Configuration Enhancements](#)
- [Web Service Enhancements](#)
- [Configuration Migration Assistant Enhancements](#)
- [Mobile Framework Enhancements](#)
- [Security Enhancements](#)
- [Miscellaneous Enhancements](#)
- [Oracle Utilities Application Framework System Data Details](#)
- [Oracle Utilities Application Framework Deprecation Notices](#)

Note: The **Steps To Enable** sections provide guidelines for enabling each feature, where applicable.

System Wide Enhancements

Change to the About Box for Cloud Implementation

In the About Box, you can see simplified product information for Cloud implementations. The About Box shows the Cloud product name and the Cloud version. It does not display all the products in the "stack". This information is still visible in the **Installation Options - Installed Products** page.

Steps To Enable

No steps are required to enable this feature.

Required Indicator Added to Fixed Pages

You will see asterisks next to fields that are required as defined in the table / field metadata. Business objects are not considered for these types of pages. In the previous release, portal-based pages were enhanced to automatically display an asterisk adjacent to fields that are required as defined in either the table / field metadata or in the business object schema.

Steps To Enable

No steps are required to enable this feature.

File Access Enhancements

The following sections highlight enhancements related to accessing files.

Support for Defining File Alias Using Extendable Lookup

In a previous release, we provided the ability for you to define substitution variables for a file location definition using a properties file. This allowed you to configure file locations in the application in places like Batch Control "File Path" parameters and in various master configuration options to reference a "token" rather than the full file path. For this release, an alternate option has been provided that allows you to define native file storage locations using an extendable lookup.

Note: Any code that references file paths for reading or writing must be updated to reference a new API in order to support this functionality. Contact customer support for more information.

Steps To Enable

The **F1-FileStorage** (File Storage Configuration) extendable lookup has been provided to support this feature. Using this extendable lookup, you can define a value referencing the "Native File Storage" file adapter option, and then define the file path that this value represents. The file path field follows the same rules as any other file path. For example, it can reference "@SPLOUTPUT@" or any other value defined in the Substitution Variables properties file. In addition, if the system has been configured to validate the value against a whitelist, this is also enforced.

A new syntax has been defined for referencing file locations during configuration. For example, in "File Path" parameters for a batch control: `file-storage:// {ExtendableLookupValue}`.

Key Resources

Refer to the online help for more information about the supported syntax.

Support for Cloud Storage Access

For Cloud product releases, the system allows you to create code that reads or writes files to reference an Oracle Cloud Storage location rather than the native file system.

Steps To Enable

The **F1-FileStorage** (File Storage Configuration) extendable lookup has been provided to support this. Using this extendable lookup, a value may be defined referencing the "Oracle Cloud Object Storage" file adapter option, which allows for the details on how to connect to cloud storage to be entered.

Using this configuration, the same syntax described above may then be used when defining a File Path in the application (for example, a parameter for a batch control).

`file-storage://{ExtendableLookupValue}/{bucket name}`

Note: Any code that references file paths for reading or writing must be updated to reference a new API in order to support this functionality. This is the same API

mentioned above for supporting defining a Native File Storage location using the F1-FileStorage extendable lookup. Contact customer support for more information.

Key Resources

Refer to the online help for more information about the supported syntax.

Batch Enhancements

Enhanced Bind Variable Support for Plug-In Drive Batch

The Plug-in Driven Batch functionality in the system supports product-specified bind variables for known batch related attributes like batch business date and batch run number. In previous releases, the mnemonic you used to specify the bind variables used a prefix of "f1.". This causes an issue in certain system configurations. In this release, the system has been enhanced to support the prefix "f1_". This is the recommended prefix you should use going forward. The prefix "f1." continues to be supported for backward compatibility.

Steps To Enable

No steps are required to enable this feature.

Key Resources

Refer to the online help for plug-in driven batch programs for more information.

Monitor Batch Programs Support Restricting By Date

The monitor batch program now supports a **Restrict by Date** parameter. If you populate this parameter with the name of a date field on the primary table of the maintenance object, this limits the records selected to those whose data value is on or before the current date. This allows you to use business objects that have a business rule where a given state transition should only occur many weeks, months or even years in the future. If the record supports a date to mark the future event, the business object can be configured to monitor only the records whose date has arrived. This ensures that, when the monitor is run, it is not constantly picking up records that are not ready (just to check the date and move on).

Optionally, the parameter may include + / - a number of days to support. For example: "all records whose DATE is on or before 3 days from now" or "all records whose DATE is on or before yesterday".

Steps To Enable

Edit the batch control for the monitor process that you wish to restrict using dates and add the restrictToDate parameter using the syntax described above.

Add Start and End Date / Time to Batch Run

In previous releases, the system did not capture the start and end date and time for a batch run. The start and end of each thread was captured through messages linked to the thread.

Since many use cases are requiring information about the start and end of the whole batch run, you can see that the **Start Date / Time** and **End Date / Time** have been added to the batch run table. The system now stamps this information onto newly created batch runs.

Steps To Enable

No steps are required to enable this feature.

Tips and Considerations

Backward compatibility: Note that due to the sheer volume of batch runs that would exist for upgrading clients, an upgrade script to populate the new start date / time and end date / time has not been provided. Instead, the system includes a business service and java methods to retrieve the start / end date / time for a batch run. This code will first check the columns on the batch run and use those, if populated. Otherwise, it will derive the information using earliest thread's start date / time and the latest thread's end date / time. Note that the business service provided is F1-GetBatchRunStartEnd.

Enhanced Level of Service Support

The "Level of Service" plug-in spot used with batch controls has been enhanced to support multiple algorithms. As a result, you will see that various user interfaces and services that support retrieving level of service information have been enhanced accordingly. In all cases, if the batch control has a single algorithm, the existing behavior continues where the results from that algorithm are returned. If multiple algorithms are found, an overall response is set based on the detailed responses from each algorithm. In addition, the detailed responses are available.

The overall response is set to Error if any of the algorithms returned an error. Otherwise, it is set to Warning if any of the algorithms returned a warning. Otherwise, it is set to Normal.

The following functionality has been enhanced as follows:

- The Health Check business service (F1-HealthCheck). The BS schema still includes a single overall response. In addition, a new collection of detailed responses are included.
- The **Health Check** portal has been enhanced to show the overall response when multiple algorithms exist along with the message, "See results for details". An icon is also provided to expand the section to see the details.
- The **Batch Control** main page has been enhanced to show the overall response for Level of Service when multiple algorithms exist along with the message, "See results for details". An icon is also provided to expand the section to see the details.

Steps To Enable

No steps are required to enable this feature.

DBMS Scheduler Integration Enhancements

This section provides information about enhancements to various APIs provided to integrate with the DBMS Scheduler.

Job Details Service Includes Error Details

The **F1-DBMSGetJobDetails** (DBMS Scheduler Job Details) business service returns an additional element in the Steps collection: error details. If the step's status is Error, you will be able to review the information about the error.

Steps To Enable

No steps are required to enable this feature.

Separate Business Services Provided for Adding / Changing Entries

In a previous release, "maintenance" business services were provided to support maintaining the various objects in the DBMS data model: Program, Chain, and Schedule. In this release, you can use additional business services for maintaining Program, Chain and Schedule when the required elements have been configured appropriately. The new business services are recommended for use when adding or changing a given object. The existing business services are still appropriate when reading or deleting an object.

Steps To Enable

No steps are required to enable this feature.

Support a Job Scope for Defining Options

In previous releases, the DBMS integration supported setting options globally or setting options for a specific program (batch code). In this release, you can now set options for a Job. The option applies to all the programs in the chain for that job.

This gives you the ability to set a **Batch Business Date** for all programs in the chain for a given job.

Steps To Enable

No steps are required to enable this feature.

Additional Configuration Options for Job List Service

The **F1-DBMSGetJobs** (DBMS Scheduler Job List) business service returns information about running or completed runs (based on an input parameter) for a job stream. In previous releases, when requesting completed jobs, the service returned the most recent completed run for each distinct job stream for the input date range.

In this release, you can use additional input parameters to tailor the information returned about running or completed jobs.

- **Return Type** indicator. This is only applicable for completed runs. Using this indicator you can specify if the most recent run of each job stream should be returned or if all completed jobs should be returned for the date range.
- **Job Name**. If a job name is supplied only the details for that Job Name are returned. This is applicable for both running or completed jobs and works in conjunction with the new **Return Type** indicator.

Steps To Enable

No steps are required to enable this feature.

To Do Enhancements

This section provides information about enhancements to To Do Entry functionality.

Recalculate To Do Priority

The system supports an algorithm to calculate a To Do Entry's priority by considering specific factors related to an entry. The Calculate Priority algorithms are executed when the To Do entry is created and updated.

To Do priority calculation logic has been enhanced as follows:

- A new batch control is provided to execute the Calculate Priority algorithms for non-closed To Do Entries (F1-TDCLP). This allows you to implement priority algorithms that use factors that may change over time.
- A log entry is created when the To Do Entry has been updated as a result of a Calculate Priority algorithm. It uses a new log entry type: "Calculated Priority". This is distinct from the log entry type that indicates you have overridden the priority.

Steps To Enable

No steps are required to enable this feature.

Monitor a To Do Entry

A new "To Do Monitor" system event has been added to To Do Type. You can use To Do Monitor algorithms to periodically review information related to a To Do entry and take action, if appropriate. For example, To Do Monitor algorithms may be used to detect if the situation that caused the To Do Entry to be generated has been remedied in the meantime, allowing for the To Do Entry to be completed. Along with the new plug-in spot, a batch process has also been provided (F1-TDMON) that selects non-final To Do entries whose To Do type is configured with at least one monitor algorithm and executes the monitor algorithms.

A new base algorithm type has also been provided to close a To Do entry if more than X days have passed since its creation (where X is a configurable parameter). You can use this algorithm for To Do Types that create entries that may become obsolete if some number of days have passed with no action.

Steps To Enable

No steps are required to enable this feature.

Expand Ability to Add Logs and Enter Comments on To Do

Previously, the ability to update To Do Entries is limited to users that are either assigned to the To Do Entry (for "being worked on" records) or are in a role for a record in "open" status.

The validation has been relaxed to allow other users to add comments or to add a User Log entry for any To Do Entry that is in Open or Being Worked On status. For example, if a call center user is speaking to a customer about an issue and the user finds a To Do that is related to the issue, the call center user can add information to the To Do Entry from the conversation with the customer even if the user is not authorized to work on the To Do.

Steps To Enable

No steps are required to enable this feature.

Configuration Tools Enhancements

The following sections highlight enhancements to the configuration tools functionality.

New Schema Editor

You can use the new schema editor on schema-based objects (Business Objects, Business Services, Service Scripts / BPA Scripts, UI Maps, and Data Areas).

Some of the features are highlighted below:

- The default view of the schema editor is a **Tree** view of the elements on the leftmost column and a tabular view of some of the most common attributes of each element.
- You can toggle to a **Label** view, which shows field labels or referenced objects' descriptions. For example, for any included business objects, data areas, UI maps, etc., toggling to the **Label** view shows the description of these objects.
- The edit button shows a more detailed panel to configure all the attributes of the element. This is the same panel used in previous releases.
- The user can toggle to the **Text** view. This view has been enhanced to use colors to distinguish element names from attribute labels from attribute values.

Note that this was also added to 4.3.0.5.0 as a hot fix. (Bug 27077859)

Steps To Enable

No steps are required to enable this feature.

Process Flow Configuration Tool

You can now use a new Process Flow Configuration tool. A process flow is an interface guiding a user through a series of actions in order to accomplish a specific task. The task can be as simple as the collection of information in order to update business data or involve more complex logic such as submitting and tracking batch processes, exchanging messages with an external system, etc. You can easily implement these user interfaces using the Process Flow Configuration tool. A process flow type defines the entire metadata needed to control the behavior of process flows of a given type. This includes the sequence of steps, the panel, the rules associated with each step, and more.

Steps To Enable

1. Create the components, such as UI maps and scripts, to be used for displaying and managing each step in the process.
2. Configure a Process Flow type for that process.
3. Set up the appropriate navigation method for process flows of that type.

Key Resources

Refer to online help for detailed information on how to design and configure a process flow.

Terminology Change in Add Element Dialog

You will see new terminology when adding an element in the scheme editor. In the previous release, the option for including a Map in the schema via UI Hints was called **Embedded HTML** in the **Add** dialogue. When viewing the configuration details, the section heading was **Embedded HTML Attributes**. However, the schema element generated (and visible in the **Tree** view of the schema editor) is `uiHint:includeMap`. In this release, the text in the **Add** dialogue has been changed to **Include Map Fragment**. When viewing the configuration details, the section heading is now **Included Map Fragment Attributes**.

Steps To Enable

No steps are required to enable this feature.

Optional Display of State Transition UI Map

There may be circumstances in which the status pre-processing logic can determine the value of the elements to be captured in the state transition map, and you may not find it necessary for the map to be invoked. A new data area (F1-StateTransitionCommon) has been provided that can be included in your pre-processing script. The data area contains a Boolean element called `skipStateTransitionMap` that you can set in your script logic. If this element is set to "true", F1-MainProc will bypass the state transition map processing step.

Steps To Enable

No steps are required to enable this feature.

Analytics Configuration Enhancements

This section provides information about enhancements to analytics configuration functionality.

Cube Views

You can now perform data analysis using Cube Views. Data cubes are multi-dimensional representations of data sets that can be "sliced" using various filters.

The Cube View enhancement includes the following features:

- A new Cube Type maintenance object to capture the configuration of a cube view, including a data explorer zone and corresponding business service that retrieve the data set for a specific cube view type.
- A new Cube View maintenance object and business object that captures various attributes of a cube view instance.
- A generic UI map and supporting service script for displaying a cube view.
- A portal for viewing and maintaining cube view instances.

Steps To Enable

If your product provides business services that support pre-defined Cube Views you wish to use for analysis, you will need to define Cube Types for those views. If you wish to design new Cube Views, you will need to create a supporting business service and zone that follow specific technical guidelines in addition to the corresponding Cube Types.

Key Resources

Refer to the online help for Cube Views for more information.

Web Service Enhancements

The following sections highlight changes to the web service functionality.

Support Configuration for REST Web Services

You can configure REST web services by leveraging the existing inbound web service metadata. A new **Web Service Class** field, with values of REST and SOAP, has been added to inbound web services. The existing inbound web service functionality is now referred to as inbound SOAP web services, or SOAP IWS. Inbound web service deployment is specific to SOAP functionality.

The following points highlight some of the features:

- In this release, only the POST HTTP method is supported.
- Inbound REST web services reference a resource category. The categories are defined using an extendable lookup. The resource category is a type of grouping attribute. This allows an implementation to associate multiple inbound web service records with a common resource.
- A REST inbound web service may define one or more operations. Each operation defines the business object, business service, or service script that is invoked when the REST service is invoked. For each operation, you configure a Resource URI, which along with the inbound web service name is used to compose the URL for the REST service.
- REST inbound web service records, like SOAP inbound web service records, may be associated with a Web Service Category, which is used to describe the functionality that uses the web service.
- The product uses OpenAPI Specification (formerly Swagger Specification) for viewing the REST API.
- A new REST servlet is provided that supports a new URI format that includes the inbound web service name and resource URI.

The web service catalog functionality used for the integration with Oracle Integration Cloud supports a REST catalog in addition to the existing SOAP catalog.

Steps To Enable

No steps are required to enable this feature.

Key Resources

Backward Compatibility: In previous releases, the product supported a REST servlet that allowed for a business service or service script to be referenced in the URI. This servlet is still supported; however, it now does a check that the business service or service script is referenced in operation for an inbound web service record. This provides an extra layer of security, allowing the product to limit the business service or service script records that are exposed via REST. For backward compatibility, the product provides inbound web service records out of the box for each business service and service script that is part of an existing integration that uses the existing REST servlet. New integrations should use the new REST servlet functionality specified using inbound web service metadata.

Explicitly Define Owner in Service Catalog Configuration

The integration with the Oracle Integration Cloud includes an owner flag for each web service using the owner flag of the main installed product. By using this functionality in the catalog, you can distinguish, for example, web services from Oracle Utilities Customer Care and Billing from web services from Oracle Utilities Work and Asset Management. You can now explicitly choose the owner value to include in the catalog for the web services for your installation using the Owner attribute added to the Service Catalog master configuration. Previously, the owner flag was taken from the **Installed Products** collection using the product marked to "display". When there were implementations where multiple installed products were marked for "display", the integration would potentially choose one that may not be appropriate for that web service integration.

Steps To Enable

If the "display" product in **Installed Products** is not the correct product to include, edit the Service Catalog master configuration record and select the appropriate owner flag.

Improve Performance for Outbound Messages

In previous releases, implementations were required to use the Outbound Message Dispatcher business services to send an outbound message without instantiating it (but where the outbound message business object pre-processing algorithms need to be executed). This business service orchestrated a creation and deletion of the outbound message, which is not desired for performance reasons.

The alternate Outbound Message Mediator business service routes a message without instantiating anything. This business service is preferred when the outbound message should not be instantiated. However, this did not execute the business object pre-processing algorithms. In this release, the Mediator business service has been enhanced to also execute the business object pre-processing algorithms.

Steps To Enable

No steps are required to enable this feature.

Configuration Migration Assistant Enhancements

This section provides information about enhancements to configuration migration assistant (CMA) functionality.

Algorithm to Purge Unchanged Transactions

If desired, you can use a new business object exit algorithm to purge "unchanged" migration objects for a migration data set. This algorithm is meant to be used on the Migration Data Set Import BO (F1-MigrDataSetImport). The algorithm is not plugged in by default.

Steps To Enable

Edit the lifecycle of the F1-MigrDataSetImport business object and configure F1-MGDPURGE as an Exit algorithm for the Ready to Compare status.

Mobile Framework Enhancements

This section provides information about enhancements to mobile framework functionality.

Note: The mobile framework is used only with Oracle Utilities Work and Asset Management.

Support to Activate Deployment Upon Creation

You can use a new parameter in the Create Deployment background process (F1-DPLOY) that indicates if the deployment should be activated after creation. By setting this parameter to "Y", you can save the extra step of manually activating the deployment after the background process finishes.

Steps To Enable

When submitting the batch job, set the new parameter to "Y".

Restrict Mobile Image Attachment File Size

You can configure different attachment size limits for different types of mobile devices. If such a limit is not specified for the mobile device type, the mobile application does not restrict the size of images captured in the field.

Steps To Enable

Edit your MDT type records to set a maximum attachment storage size (defined in MB).

Security Enhancements

This section provides information about enhancements to application security functionality.

Introduce Cryptography Key Support

You can use cryptograph keys for cloud implementations. Signature keys are required for connecting to cloud object storage. The system provides an object called key ring, which allows for a key pair to be generated. To support key rotation, new key pairs can be generated over time. When configuring the Cloud object storage details, you configure the key ring to use for the signature.

Steps To Enable

Define Key Ring codes and generate keys to be used for cloud storage.

Key Resources

Refer to **Support for Cloud Storage Access** on page 1-17 for more information.

Introduction of Object Erasure

You can use an enhanced framework to manage erasure of personally identifiable information (PII). A person's right to erasure of their information is an important data privacy issue.

This release of the object erasure functionality supports the following:

- The ability to mark a maintenance object as eligible for erasure and define the retention period for the data.
- A new Object Erasure Schedule maintenance object to capture the key fields and erasure date for records whose PII must be removed.
- Support for creating and monitoring the erasure schedule, including the method to be used for erasure.
- A portal for viewing erasure configuration and a context-sensitive zone to view erasure status for an object.
- Support for erasing an object by purging its records and for erasing user PII through obfuscation.

Steps To Enable

1. Identify the maintenance objects that have personally identifiable information that you need to erase or obfuscate.
2. Configure each maintenance object with appropriate values for the Erasure BO and Erasure Period options.
3. Configure the appropriate Manage Erasure Schedule algorithms on each of the maintenance objects.

Key Resources

Refer to the online help for data privacy and object erasure for more information.

Miscellaneous Enhancements

Country Enhancements

You can use new drop-down values of Optional and Not Allowed when indicating that a particular address component is enabled instead of using the Boolean checkboxes that used to be used. This allows edge products to introduce additional values, if desired. For example, if an edge product wants to support marking an address component as Required, that value can be added to the list of valid values.

Steps To Enable

No steps are required to enable this feature.

Tips and Considerations

Backward compatibility: The Boolean values are still maintained so that any code relying on those values will still work as before. The user interface has been updated to display the dropdown instead of the checkbox.

Attachment Enhancements

You can reference two new columns in the Attachment table:

- **External Reference ID:** This value is available when attachments are added from another system with IDs. The system supports capturing this value in the record and it is displayed in the user interface when populated.
- **Comments:** You can add additional information when creating an attachment.

The system has also introduced a setting to limit the size of the attachment. A new option, **Maximum Attachment Size**, has been added to the General System Configuration feature type. You can define a value here to issue an error if an attachment greater than this size is uploaded.

Steps To Enable

No steps are required to enable this feature.

Customization Setting for Extended Data Area Removed

The **Extended Data Area** field on the Data Area table was incorrectly defined as customizable (or "CMable"). This was incorrect and has been fixed in this release. If your implementation has populated the **Extended Data Area** column on any base-owned data area, that information will be overwritten when this field is corrected.

Note: You can achieve the same functionality by simply including the base-owned data area in the custom data area's schema.

Steps To Enable

No steps are required to enable this feature.

F1-RetrieveCharValDescription Business Service Updated

The Retrieve Characteristic Value Description business service has been updated to use logic that does an exact match on the input characteristic type and characteristic value. In previous releases, the business service to Retrieve Characteristic Value Description was "wrapping" the online characteristic value search. This supported a "likeable" search on the characteristic value. This is not correct behavior for a business service, which is usually used by code that expects one and only one result.

Steps To Enable

No steps are required to enable this feature.

Master Configuration List Usability Enhancements

Master configuration list now provide the following enhancements:

- You are only shown the master configuration business objects for which you have appropriate security rights.
- A filter by Description has been added to support the ability to limit the rows based on the input value. The filter area is collapsed by default.

Steps To Enable

No steps are required to enable this feature.

New ILM Algorithms - Proactively Update ILM Switch

The ILM Eligibility algorithm on a maintenance object, invoked by the ILM crawler batch control, has the responsibility of reviewing records whose **ILM Date** has arrived and marking the **ILM Archive** switch to "Y" based on specific criteria. A common criterion for marking the ILM Archive switch to "Y" is that the record is in a final status.

You can use two new business object level plug-ins:

- A business object Enter Status plug-in to set the **ILM Archive** switch to "Y". You can use this for records that are configured for ILM and have a business object with a lifecycle. You can plug this into the final state(s) to proactively set the switch to "Y". This will reduce the number of records to be reviewed by the ILM Eligibility algorithm when the crawler is run.
- A business object Exit Status plug-in to set the switch back to "N". This is provided for those final states where the record may transition back to a non-final state and where you have plugged in the above Enter status.

Steps To Enable

No steps are required to enable this feature.

Support Including Column Headers in Sync Request Extract

There is a new "Add Column Header" parameter on the Sync Request Extract batch process (F1-SYNEF). If you indicate "Y" for the parameter value, a header record with the column names taken from the data area referenced in the snapshotDA element of the Sync record is included.

Note: This was also added to 4.3.0.5.0 as a hot fix. (Bug 27472229)

Steps To Enable

No steps are required to enable this feature.

Return All Errors on COBOL SQL Updates

All errors encountered during a COBOL update will be returned as an error. In previous releases, only the duplicate error was handled and returned a duplicate error. All other errors were ignored and returned OK.

Note: The hot fix was done in 4.3 SP1.

Steps To Enable

No steps are required to enable this feature.

Removal of Product-Specific Domain Templates

In past releases, Oracle Utilities Application Framework domain templates were shipped with each product to allow for a standard installation experience using the Oracle WebLogic Configuration Wizard. The use of the domain template with the wizard automates the creation of the WebLogic domain used to house the Oracle Utilities products. Due to the standardization efforts between Oracle Utilities Application Framework and the Oracle WebLogic team, you can now use the standard Oracle WebLogic domain templates supplied with Oracle WebLogic with Oracle Utilities Application Framework products. As a result, product-specific templates are no longer necessary and are no longer shipped with the products. You can use the standard templates with a few minor post installation steps.

This enhancement allows greater flexibility when creating the domain for the product in terms of the domain setup as well when in the installation process the domain creation can occur.

Steps To Enable

No steps are required to enable this feature.

Tips and Considerations

If necessary, you can continue to use the WebLogic Domain Builder as in previous releases (post installation to create custom domains).

Key Resources

Details of the new process are documented in the Installation Guide and a new whitepaper covering optimization of the Oracle WebLogic domain for Oracle WebLogic 12.2.x.

Oracle Utilities Application Framework System Data Details

This section provides information about new and updated system data delivered in this release that may need to be reviewed for possible impact by implementations.

New/Updated Application Services

The following application services were added or updated. Review and determine which user groups, if any, should be granted access to the application service/access mode.

The following application services are used with the cryptography key support feature..

| Application Service | Description | Access Mode |
|---------------------|-----------------|-------------|
| F1-CRYPTOKEYRING | Key Ring MO | A, C, D, R |
| F1KEYRNG | Key Ring Portal | R |

The following application services are used with the Cube View feature.

| Application Service | Description | Access Mode |
|---------------------|------------------------|------------------------|
| F1-CUBETYPE | Cube Type MO | A, C, D, R |
| F1-CUBEVIEW | Cube View MO | A, C, D, R |
| F1-CUBEVIEWBOAS | Cube View BO | A, C, D, F1AC, F1IN, R |
| F1CUVWM | Cube View Portal | R |
| F1CUVWQ | Cube View Query Portal | R |
| F1CVTYPE | Cube Type Portal | R |

The following application service is used by the object erasure feature.

| Application Service | Description | Access Mode |
|---------------------|--------------------------------|-------------|
| F1ESRCFG | Erasure Configuration Portal | R |
| F1OBERSC | Object Erasure Schedule Portal | R |

| | | |
|-----------------|---------------------------------------|----------------------------|
| F1-OBJERSRSCH | Object Erasure Schedule MO | A, C, D, R |
| F1-OBJERSRSCHBO | Object Erasure Schedule BO | A, C, D, F1DC, F1ED, PE, R |
| F1-OBJESRSCD | Object Erasure Schedule Zone | R |
| F1-OESCRL | ILM Crawler - Object Erasure Schedule | F1EX |
| F1-OESMN | Object Erasure Schedule Monitor | F1EX |

The following application services are used with REST Web Services.

| Application Service | Description | Access Mode |
|---------------------|---|-------------|
| F1-GETWSDL | Retrieve Inbound SOAP Web Service WSDL BS | F1EX |
| F1-MOBILESWS | Mobile Web Services | F1EX |

The following application services are used by the Process Flow feature.

| Application Service | Description | Access Mode |
|---------------------|---------------------------|-------------|
| F1PROC | Process Flow Type Portal | R |
| F1_PROC | Process Flow Portal | R |
| F1-PROCDEFN | Process Flow Type MO | A, C, D, R |
| F1-PROCSTORE | Process Flow MO | A, C, D, R |
| F1-PROCSTOREBOAS | Process Flow BO | A, C, D, R |
| F1PRSTRQ | Process Flow Query Portal | R |

The following application services are used with To Dos.

| Application Service | Description | Access Mode |
|---------------------|----------------------------|-------------|
| F1-TDCLP | Recalculate To Do Priority | F1EX |
| F1-TDMON | To Do Monitor | F1EX |

Oracle Utilities Application Framework Deprecation Notices

This section provides information on functionality that has been removed, is no longer supported by Oracle Utilities Application Framework v4.3.0.5, or is planned for removal.

Deprecated Functionality

This section lists the functionality has been deprecated at the time of this release.

XML Application Integration (XAI) and Multi-Purpose Listener

The XML Application Integration (XAI) Servlet and Multi-Purpose Listener (MPL) have been removed. Customer migrating to this release should migrate to the recommended alternatives as recommended in the Oracle Service Bus Integration (Doc Id: 1558279.1) and Migrating from XAI to IWS (Doc Id: 1644914.1) whitepapers available from My Oracle Support.

As part of this effort, the user documentation has been updated to remove all the topics related to the XAI servlet and MPL.

Batch on WebLogic

Batch on Weblogic node is no longer supported. Note that this was an implementation that was possibly usable for GBUCS; however, the implementation is no longer viable used in the new OCI (Oracle Cloud Infrastructure/BMC).

Ability to Add Child Rows for Several Maintenance Objects

There are several maintenance objects where base delivered entries are supplied by the product. In some use cases, implementations can extend the base functionality by adding child rows to the base delivered configuration. For example, implementations may add algorithms to a base delivered business object. However, there are some use cases where implementations are not able to extend base functionality by adding child rows. For example, implementations are not able to add additional algorithm type parameters to a base delivered algorithm type. For several use cases, there was validation missing and has been added in this release. If your implementation has added child rows for the maintenance objects in this list, they will be removed at upgrade time:

- Algorithm Type - Parameters
- App Service - Access Mode
- Maintenance Object - Table.
- Navigation Option - Context Fields.
- Script - Step Prompt
- Table - Field
- Table - Constraint / Field
- To Do Type - Sort Keys
- To Do Type - Drill Keys
- Zone Type - Parameters

Items Planned for Future Deprecation

This is a list of functionality / system data that Oracle plans to deprecate in a future release.

Support for Master / Subordinate Services for Web Services Catalog

The Service Catalog Configuration (master configuration) supports defining subordinate servers. This functionality is no longer applicable for the Oracle Integration Cloud and will be removed in a future release.

Miscellaneous System Data

- Environment Reference. This administrative MO was related to ConfigLab and Archiving, which are no longer supported. In a future release, the following will be removed:
 - Migration Plan F1-EnvironmentRef. Note that no base migration request references this plan. Implementations should ensure that no custom migration request references this plan.
 - F1-EnvironmentRefPhysicalBO business object
 - ENV REF maintenance object
- The To Do Type F1-SYNRQ (Sync Request Error) is not in use and will be deleted in a future release. Errors for the Sync Request Monitor (that also has the name F1-SYNRQ) are reported using the To Do Type F1-SYNTD (Sync Request Monitor Errors).
- The following algorithm types and algorithms provided for the current LDAP import functionality do not include any logic. They will be removed in a future release.
 - Algorithm Type / Algorithm F1-LDAPIMPRT
 - Algorithm Type / Algorithm F1-LDAPPREPR
- The lookup value CHAR_ENTITY_FLG / F1SE (Characteristic Entity / Sync Request Inbound Exception) is not in use and will be removed in a future release.
- The database table F1_IWS_SVC_OPER_L will be removed in a future release.
- The zone F1-MGRREQDSP will be removed in a future release.

Support for HTTP Proxy Functionality

HTTP Proxies are a common technique for firewalling outbound communications within and outside an enterprise.

In past releases, the configuration of a HTTP Proxy was done on individual senders and other connections. This increased the amount of duplication across the implementations with multiple places to update proxy settings. In this release, these settings have been delegated to the JVM level using proxy features at the JVM level rather than individual connections. This will reduce the amount of configuration and maintenance of proxy functionality by allowing implementations to use the inbuilt proxy support from Java directly. This will require additional command line settings to be configured on the online WebLogic Servers and command lines within our configuration for batch.

For more information about the settings, refer to the Java Networking and Proxy documentation

CMA Migration Requests

The migration requests F1-FrameworkAdmin (Framework Admin) and F1-SchemaAdmin (Schema Admin) are no longer recommended and are not going to be updated with new administration / control tables in future releases. The product may deprecate them in a future release.

CMA Import Algorithm

In a future release, the CMA Import algorithm plug-in spot will be deprecated. As an alternative, review any existing algorithms and create appropriate Pre-Compare algorithms.

Business Object Read in F1-MainProc When Pre-Processing Exists

In the original implementation of configuration tools, if a pre-processing script was linked to the business object via options, the main framework maintenance BPA (F1-MainProc) would not perform a Read of the business object (leaving it to the responsibility of the pre-processing script).

In a subsequent release, to solve a UI Hints issue related to child business objects, a business object Read was included in F1-MainProc even if a pre-processing script existed. This solution introduced a problem only visible for specific scenarios and a different fix has been introduced. In the meantime, the business object Read is no longer necessary in F1-MainProc. Since there are many pre-processing scripts that are properly performing the Read of the business object, ideally the business object Read should be removed from F1-MainProc so that multiple reads are not performed.

However, there may have been pre-processing scripts introduced after the business object Read was included in F1-MainProc that were coded to not perform a business object read in the pre-processing script. Due to this situation, the business object Read is still performed as part of the processing of F1-MainProc.

The product plans to remove the business object Read from F1-MainProc logic when a pre-processing script exists. Review your custom pre-processing scripts that are linked to your business object options to ensure that it properly performs a Read of your business object.
