Index ........................................................................................................ 79
Preface

This document is part of the documentation library for Oracle Private Cloud Appliance (PCA) Release 2.4, which is available at:

https://docs.oracle.com/cd/F15038_01.

The documentation library consists of the following items:

**Oracle Private Cloud Appliance Release Notes**

The release notes provide a summary of the new features, changes, fixed bugs and known issues in Oracle PCA.

**Oracle Private Cloud Appliance Licensing Information User Manual**

The licensing information user manual provides information about the various product licenses applicable to the use of Oracle PCA.

**Oracle Private Cloud Appliance Installation Guide**

The installation guide provides detailed instructions to prepare the installation site and install Oracle PCA. It also includes the procedures to install additional compute nodes, and to connect and configure external storage components.

**Oracle Private Cloud Appliance Safety and Compliance Guide**

The safety and compliance guide is a supplemental guide to the safety aspects of Oracle PCA. It conforms to Compliance Model No. ESY27.

**Oracle Private Cloud Appliance Administrator's Guide**

The administrator's guide provides instructions for using the management software. It is a comprehensive guide to how to configure, monitor and administer Oracle PCA.

**Oracle Private Cloud Appliance Quick Start Poster**

The quick start poster provides a step-by-step description of the hardware installation and initial software configuration of Oracle PCA. A printed quick start poster is shipped with each Oracle PCA base rack, and is intended for data center operators and administrators who are new to the product.

The quick start poster is also available in the documentation library as an HTML guide, which contains alternate text for ADA 508 compliance.

**Oracle Private Cloud Appliance Expansion Node Setup Poster**

The expansion node setup poster provides a step-by-step description of the installation procedure for an Oracle PCA expansion node. A printed expansion node setup poster is shipped with each Oracle PCA expansion node.

The expansion node setup poster is also available in the documentation library as an HTML guide, which contains alternate text for ADA 508 compliance.

**Audience**

The Oracle Private Cloud Appliance (PCA) documentation is written for technicians, authorized service providers, data center operators and system administrators who want to install, configure and maintain a
private cloud environment in order to deploy virtual machines for users. It is assumed that readers have
experience installing and troubleshooting hardware, are familiar with web and virtualization technologies
and have a general understanding of operating systems such as UNIX (including Linux) and Windows.

The Oracle PCA makes use of Oracle Linux and Oracle Solaris operating systems within its component
configuration. It is advisable that administrators have experience of these operating systems at the very
least. Oracle PCA is capable of running virtual machines with a variety of operating systems including
Oracle Solaris and other UNIXes, Linux and Microsoft Windows. The selection of operating systems
deployed in guests on Oracle PCA determines the requirements of your administrative knowledge.

Related Documentation

Additional Oracle components may be included with Oracle PCA depending on configuration. The
documentation for such additional components is available as follows:

• Oracle Rack Cabinet 1242
  https://docs.oracle.com/cd/E85660_01/index.html
• Oracle Server X8-2
  https://docs.oracle.com/cd/E93359_01/index.html
• Oracle ZFS Storage Appliance ZS7-2
  https://docs.oracle.com/cd/F13758_01/index.html
• Oracle Integrated Lights Out Manager (ILOM)
  https://docs.oracle.com/cd/E81115_01/index.html
• Oracle VM

</tbody>
</table>
Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

### Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit [http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info](http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info) or visit [http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs](http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs) if you are hearing impaired.
Chapter 1 Introduction to Oracle Private Cloud Appliance Installation

### 1.2 About Oracle Private Cloud Appliance

Oracle Private Cloud Appliance is an integrated hardware and software system engineered to enable rapid deployment of a converged compute, network, and storage infrastructure for hosting most applications and workloads, whether running on Linux, Oracle Solaris, or Microsoft Windows.

In combination with customer-provided storage from Oracle or other storage vendors, Oracle Private Cloud Appliance incorporates Oracle server and network hardware with Oracle operating system, virtualization, and orchestration software to automate the discovery, configuration, deployment, and management of converged infrastructure for hosting virtual machines (VMs).

Oracle Private Cloud Appliance incorporates high-speed Ethernet or InfiniBand connectivity to provide a converged, wire-once, software-defined networking and storage fabric for all servers and storage in the appliance. Leveraging software-defined networking (SDN) technology, users can rapidly and dynamically create or modify private or public networks without having to manually re-cable connections, saving time and reducing the risk of human error. The consolidation of network connections results in up to 70 percent fewer cables and cards.

In addition to rapid infrastructure provisioning, Oracle Private Cloud Appliance also accelerates complete application stack deployment through support for Oracle VM Templates and Assemblies. Oracle VM Templates and Assemblies are preconfigured applications, middleware, and databases packaged as ready-to-run virtual machines (VMs) that can be dynamically configured at deployment time. The result is an unparalleled ability to go from “bare-metal” infrastructure power on to logging in to a newly deployed, running application within days or even hours, instead of weeks or months.

### 1.3 Features of Oracle Private Cloud Appliance

Oracle Private Cloud Appliance offers the following features:

- **Converged infrastructure orchestration software**: Automated discovery, configuration, and management of included server, network, and storage resources for rapid infrastructure provisioning.

- **Unified, software-defined network fabric**: Incorporated high-speed Ethernet or InfiniBand hardware provides a single, consolidated fabric allowing new networks to be dynamically added and existing networks to be modified without the need to manually modify cabling.

- **Rapid application stack deployment, not just infrastructure**: Support for ready-to-run Oracle VM Templates and Assemblies enables users to rapidly deploy not only the infrastructure, but also the applications that are hosted on the infrastructure.

- **Support for a wide variety of guest operating systems**: Support for Linux, Oracle Solaris, and Windows operating systems and applications.

- **Support for customer-provided storage**: Oracle PCA can be configured with external storage from Oracle or existing storage from other storage vendors.

- **Unified management**: Browser-based orchestration software provides at-a-glance status for all hardware components. A plugin is available to integrate appliance management and monitoring into
Oracle Enterprise Manager. Role-based access control permits secure administration of the appliance across multiple administrators.

1.4 Oracle Private Cloud Appliance Rack Components

Oracle Private Cloud Appliance systems consist of virtualization compute nodes, storage appliances, as well as required Ethernet networking components. Table 1.1 lists the quantity and description of each component in an Oracle PCA system.

**Note**

Oracle Private Cloud Appliance base racks are factory installed with the latest supported generation of server nodes. When you order expansion compute nodes, you receive the latest available generation. The Oracle Private Cloud Appliance Controller Software version must match the hardware versions installed in your environment.

1.5 Server Components

Table 1.2 lists the components of the server models that may be installed in an Oracle Private Cloud Appliance rack and which are supported by the current software release.

**Note**

Oracle Private Cloud Appliance Controller Software release 2.4.1 supports only Oracle Server X8-2, in the role of either management node or compute node.

### 1.6 Operational Procedures for Oracle Private Cloud Appliance

This section provides important operational instructions to help you minimize the risk of injury or damage.

#### 1.6.1 Emergency Power-off Considerations

If there is an emergency, then power to Oracle PCA should be halted immediately. The following emergencies might require powering off the system:

- Natural disasters such as an earthquake, flood, hurricane, tornado or cyclone
- Abnormal noise, smell or smoke coming from the system
- Threat to human safety

##### 1.6.1.1 Emergency Power-off Procedure

To perform an emergency power-off procedure for Oracle PCA, turn off power at the circuit breaker or pull the emergency power-off switch in the computer room.

##### 1.6.1.2 Emergency Power-off Switch

Emergency power-off (EPO) switches are required in a computer room when computer equipment contains batteries capable of supplying more than 750 volt-amperes for more than five minutes. Systems that have these batteries include internal EPO hardware for connection to a site EPO switch or relay. Use of the EPO switch will remove power from the Oracle PCA.

#### 1.6.2 Cautions and Warnings

The following cautions and warnings apply to Oracle PCA:

- Do not touch the parts of this product that use high-voltage power. Touching them might result in serious personal injury.
- Do not power off Oracle PCA unless there is an emergency. In that case, follow the Section 1.6.1.1, "Emergency Power-off Procedure".
- Keep the front and rear cabinet doors closed. Failure to do so might cause system failure or result in damage to hardware components.
- Keep the top, front, and back of cabinets clear to allow proper airflow and prevent overheating of components.
• Use only the supplied hardware.
Chapter 2 Site Requirements

Table of Contents

2.1 Space Requirements ................................................................. 7
   2.1.1 Receiving and Unpacking Requirements ........................................ 7
   2.1.2 Maintenance Access Requirements ............................................... 8
2.2 Flooring Requirements .......................................................... 8
2.3 Electrical Power Requirements ................................................ 9
   2.3.1 Facility Power Requirements ...................................................... 10
   2.3.2 Circuit Breaker Requirements .................................................... 10
   2.3.3 Grounding Guidelines .............................................................. 10
2.4 Temperature and Humidity Requirements ..................................... 11
2.5 Ventilation and Cooling Requirements ......................................... 12

This chapter describes the site requirements for the Oracle Private Cloud Appliance (PCA).

**Note**

For site checklists, refer to Appendix C, Site Checklists.

2.1 Space Requirements

Oracle PCA racks have the following space requirements:

- Height: 42U - 2000 mm (78.74 inches)
- Width: 600 mm with side panels (23.62 inches)
- Depth (front door handle to rear door handle): 1197 mm (47.12 inches)
- Depth (doors removed): 1112 mm (43.78 inches)
- Weight (base rack, fully populated): 1000 kg (2204 lbs)

The minimum ceiling height for the cabinet is 2914 mm (114.72 inches), measured from the true floor or raised floor, whichever is higher. This includes an additional 914 mm (36 inches) of space required above the rack height for maintenance access. The space surrounding the cabinet must not restrict the movement of cool air between the air conditioner and the front of the systems within the cabinet, or the movement of hot air coming out of the rear of the cabinet.

2.1.1 Receiving and Unpacking Requirements

Before your Oracle PCA arrives, ensure that the receiving area is large enough for the package. The following are the package dimensions and weights for an Oracle PCA system:

- Shipping height: 2159 mm (85 inches)
- Shipping width: 1219 mm (48 inches)
- Shipping depth: 1575 mm (62 inches)
- Shipping weight (base rack, fully populated): 1118 kg (2465 lbs)
If your loading dock meets the height and ramp requirements for a standard freight carrier truck, then you can use a pallet jack to unload the rack. If the loading dock does not meet the requirements, then you must provide a standard forklift or other means to unload the rack. You can also request that the rack be shipped in a truck with a lift gate.

When your Oracle PCA arrives, leave the rack in its shipping packaging until it arrives at its installation site. Use a conditioned space to remove the packaging material to reduce particles before entering the data center. The entire access route to the installation site should be free of raised-pattern flooring that can cause vibration.

Allow enough space for unpacking the system from its shipping cartons. Ensure that there is enough clearance and clear pathways for moving the Oracle PCA from the unpacking location to the installation location. Table 2.1 lists the access route requirements for the Oracle PCA.

### Table 2.1 Access Route Requirements

<table>
<thead>
<tr>
<th>Access Route Item</th>
<th>With Shipping Pallet</th>
<th>Without Shipping Pallet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum door height</td>
<td>2184 mm (86 inches)</td>
<td>2000 mm (78.74 inches)</td>
</tr>
<tr>
<td>Minimum door width</td>
<td>1220 mm (48 inches)</td>
<td>600 mm (23.62 inches)</td>
</tr>
<tr>
<td>Minimum elevator depth</td>
<td>1575 mm (62 inches)</td>
<td>1058.2 mm (41.66 inches)</td>
</tr>
<tr>
<td>Maximum incline</td>
<td>6 degrees</td>
<td>6 degrees</td>
</tr>
<tr>
<td>Maximum elevator, pallet jack, and floor loading capacity</td>
<td>1145 kg (2520 lbs)</td>
<td>1145 kg (2520 lbs)</td>
</tr>
</tbody>
</table>

#### 2.1.2 Maintenance Access Requirements

The maintenance area must be large enough for Oracle PCA, and have the required access space. For example, the required space to remove the side panels is 675.64 mm (26.6 inches). Table 2.2 lists the maintenance access requirements for the Oracle PCA.

### Table 2.2 Maintenance Access Requirements

<table>
<thead>
<tr>
<th>Location</th>
<th>Maintenance Access Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rear maintenance</td>
<td>914 mm (36 inches)</td>
</tr>
<tr>
<td>Front maintenance</td>
<td>1232 mm (48.5 inches)</td>
</tr>
<tr>
<td>Top maintenance</td>
<td>914 mm (36 inches)</td>
</tr>
</tbody>
</table>

#### 2.2 Flooring Requirements

Oracle recommends that the Oracle PCA be installed on raised flooring. The site floor and the raised flooring must be able to support the total weight of the system as specified in Section 2.1, “Space Requirements”.

### Table 2.3 Floor Load Requirements

<table>
<thead>
<tr>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum allowable weight of installed rack equipment</td>
<td>952.54 kg (2100 lbs)</td>
</tr>
</tbody>
</table>
2.3 Electrical Power Requirements

The Oracle PCA can operate effectively over a wide range of voltages and frequencies. However, it must have a reliable power source. Damage might occur if the ranges are exceeded. Electrical disturbances such as the following might damage the system:

- Fluctuations caused by brownouts
- Wide and rapid variations in input voltage levels or in input power frequency
- Electrical storms
- Faults in the distribution system, such as defective wiring

To protect your system from such disturbances, you should have a dedicated power distribution system, power-conditioning equipment, as well as lightning arresters or power cables to protect from electrical storms.

Each rack has two pre-installed power distribution units (PDUs). The PDUs accept different power sources. You must specify the type of PDU that is correct for your data center.

Table 2.4 lists the PDU low-voltage requirements.

</tbody>
</table>
2.3.1 Facility Power Requirements

Electrical work and installations must comply with applicable local, state, or national electrical codes. Contact your facilities manager or qualified electrician to determine what type of power is supplied to the building.

To prevent catastrophic failures, design the input power sources to ensure adequate power is provided to the power distribution units (PDUs). Use dedicated AC breaker panels for all power circuits that supply power to the PDU. When planning for power distribution requirements, balance the power load between available AC supply branch circuits. In the United States and Canada, ensure that the overall system AC input current load does not exceed 80 percent of the branch circuit AC current rating.

PDU power cords are 4 meters (13.12 feet) long, and 1 to 1.5 meters (3.3 to 4.9 feet) of the cord will be routed within the rack cabinet. The installation site AC power receptacle must be within 2 meters (6.6 feet) of the rack.

2.3.2 Circuit Breaker Requirements

To prevent catastrophic failures, the design of your power system must ensure that adequate power is provided to all of the compute nodes. Use dedicated AC breaker panels for all power circuits that supply power to the compute nodes. Electrical work and installations must comply with applicable local, state, or national electrical codes. Compute nodes require electrical circuits to be grounded to the Earth.

In addition to circuit breakers, provide a stable power source, such as an uninterruptable power supply (UPS) to reduce the possibility of component failures. If computer equipment is subjected to repeated power interruptions and fluctuations, then it is susceptible to a higher rate of component failure.

Note

Circuit breakers are supplied by the customer. One circuit breaker is required for each power cord.

2.3.3 Grounding Guidelines

The cabinets for the Oracle PCA are shipped with grounding-type power cords (three-wire). Always connect the cords to grounded power outlets. Because different grounding methods are used, depending on location, check the grounding type, and refer to documentation, such as IEC documents, for the correct grounding method. Ensure that the facility administrator or qualified electrical engineer verifies the grounding method for the building, and performs the grounding work.
2.4 Temperature and Humidity Requirements

Airflow through the Oracle PCA is from front to back. For information, see Section 2.5, “Ventilation and Cooling Requirements”.

Studies have shown that temperature increases of 10 degrees Celsius (18 degrees Fahrenheit) above 20 degrees Celsius (68 degrees Fahrenheit) reduce long-term electronics reliability by 50 percent. Excessive internal temperatures might result in full or partial shutdown of the Oracle PCA.

Table 2.5 lists the temperature, humidity and altitude requirements for operating and non-operating systems.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Operating Requirement</th>
<th>Non-operating Requirement</th>
<th>Optimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>5 ° to 32 ° Celsius (41 ° to 89.6 ° Fahrenheit)</td>
<td>-40 ° to 68 ° Celsius (-40 ° to 154 ° Fahrenheit)</td>
<td>For optimal rack cooling, data center temperatures from 21 ° to 23 ° Celsius (69.8 ° to 73.4 ° Fahrenheit)</td>
</tr>
<tr>
<td>Relative humidity</td>
<td>10 to 90 percent relative humidity, non-condensing</td>
<td>Up to 93 percent relative humidity</td>
<td>For optimal data center rack cooling, 45 to 50 percent non-condensing</td>
</tr>
<tr>
<td>Altitude</td>
<td>3,000 meters (9,840 feet) maximum</td>
<td>12,000 meters (39,370 feet)</td>
<td>Ambient temperature is reduced by 1 ° Celsius per 300 meters above 900 meters altitude above sea level</td>
</tr>
</tbody>
</table>

Set conditions to the optimal temperature and humidity ranges to minimize the chance of downtime due to component failure. Operating an Oracle PCA for extended periods at or near the operating range limits, or installing it in an environment when it remains at or near non-operating range limits could significantly increase hardware component failure.

The ambient temperature range of 21 ° to 23 ° Celsius (69.8 ° to 73.4 ° Fahrenheit) is optimal for server reliability and operator comfort. Most computer equipment can operate in a wide temperature range, but near 22 ° Celsius (71.6 ° Fahrenheit) is desirable because it is easier to maintain safe humidity levels. Operating in this temperature range provides a safety buffer in the event that the air conditioning system goes down for a period of time.

The ambient relative humidity range of 45 to 50 percent is suitable for safe data processing operations. Most computer equipment can operate in a wide range (20 to 80 percent), but the range of 45 to 50 percent is recommended for the following reasons:

- Optimal range helps protect computer systems from corrosion problems associated with high humidity levels.
- Optimal range provides the greatest operating time buffer in the event of air conditioner control failure.
- This range helps to avoid failures or temporary malfunctions caused by intermittent interference from static discharges that may occur when relative humidity is too low.

**Note**

Electrostatic discharge (ESD) is easily generated, and hard to dissipate in areas of low relative humidity, such as below 35 percent. ESD becomes critical when
humidity drops below 30 percent. It is not difficult to maintain humidity in a data center because of the high-efficiency vapor barrier and low rate of air changes normally present.

2.5 Ventilation and Cooling Requirements

Always provide adequate space in front of and behind the rack to allow for proper ventilation. Do not obstruct the front or rear of the rack with equipment or objects that might prevent air from flowing through the rack. Rack-mountable servers and equipment typically draw cool air in through the front of the rack and let warm air out the rear of the rack. There is no airflow requirement for the left and right sides due to front-to-back cooling.

If the rack is not completely filled with components, then cover the empty sections with filler panels. Gaps between components can adversely affect airflow and cooling within the rack.

Relative humidity is the percentage of the total water vapor that can exist in the air without condensing, and is inversely proportional to air temperature. Humidity goes down when the temperature rises, and goes up when the temperature drops. For example, air with a relative humidity of 45 percent at a temperature of 24 ° Celsius (75.2 ° Fahrenheit) has a relative humidity of 65 percent at a temperature of 18 ° Celsius (64.4 ° Fahrenheit). As the temperature drops, the relative humidity rises to more than 65 percent, and water droplets are formed.

Air conditioning facilities usually do not precisely monitor or control temperature and humidity throughout an entire computer room. Generally, monitoring is done at individual points corresponding to multiple exhaust vents in the main unit, and other units in the room. Special consideration should be paid to humidity when using underfloor ventilation. When underfloor ventilation is used, monitoring is done at each point close to an exhaust vent. Distribution of the temperature and humidity across the entire room is uneven.

The Oracle PCA has been designed to function while installed in a natural convection air flow. The following requirements must be followed to meet the environmental specification:

- Ensure that there is adequate airflow through the system.
- Ensure that the system has front-to-back cooling. The air intake is at the front of the system, and the air outlet is at the rear of the system.
- Allow a minimum clearance of 1219.2 mm (48 inches) at the front of the system, and 914 mm (36 inches) at the rear of the system for ventilation.

Use perforated tiles, approximately 400 CFM/tile, in front of the rack for cold air intake. The tiles can be arranged in any order in front of the rack, as long as cold air from the tiles can flow into the rack. Inadequate cold airflow could result in a higher intake temperature in the system due to exhaust air recirculation. The following is the recommended number of floor tiles:

- Four floor tiles for an Oracle PCA with up to 25 compute nodes (fully loaded)
- Three floor tiles for an Oracle PCA with up to 16 compute nodes (half loaded)
- One floor tile for an Oracle PCA with 8 compute nodes (quarter loaded)

Figure 2.1 shows a typical installation of the floor tiles in a data center for Oracle PCA with more than 16 compute nodes.
Figure 2.1 Typical Data Center Configuration for Perforated Floor Tiles
Chapter 3 Network Requirements

Table of Contents

3.1 Network Connection and IP Address Requirements ................................................................. 15
  3.1.1 Network Connection Requirements .................................................................................... 15
  3.1.2 IP Address Requirements .................................................................................................... 17
3.2 General Network Configuration ................................................................................................. 18

This chapter describes the network requirements for the Oracle Private Cloud Appliance.

3.1 Network Connection and IP Address Requirements

This section describes the network connection requirements and IP address requirements to connect the Oracle Private Cloud Appliance to your existing network infrastructure.

3.1.1 Network Connection Requirements

Before installation, you must run network cables from your existing network infrastructure to the Oracle Private Cloud Appliance installation site.

You must connect 2 high-speed Ethernet ports on each spine Cisco Nexus 9336C-FX2 Switch to your data center public Ethernet network. These are ports 5/1 and 5/2, which are configured at 10Gbit and intended as the default connection for appliance management and setup.

Ports 1-4 on the spine switches are also reserved for customer use. They can optionally be split into 4 ports with 10Gbit or 25Gbit transceivers. Ports are always configured and cabled in pairs, and enable a maximum of 8 custom external networks. For additional information, refer to Configuring Appliance Uplinks in the Oracle Private Cloud Appliance Administrator's Guide.

Caution

The Cisco Nexus 9336C-FX2 Switch ports are of the QSFP28 100Gbit type. Depending on your data center network infrastructure, each of the customer-reserved ports can be used at maximum bandwidth or split into 25Gbit (SFP28) or 10Gbit (SFP+). External Ethernet connections from the Oracle Private Cloud Appliance require a minimum speed of 10Gbit/s.

Figure 3.1 shows the location of the two 10 GbE breakout ports on the spine switches, which must be connected to the data center network.
Network Connection Requirements

Figure 3.1 Default 10GbE Breakout Ports on Spine Cisco Nexus 9336C-FX2 Switch

Caution

It is critical that both spine switches have two 10GbE connections each to a pair of next-level data center switches. This configuration with four cable connections provides redundancy and load splitting at the level of the spine switches, the 10GbE ports and the data center switches. This outbound cabling from the pair of spine Cisco Nexus 9336C-FX2 Switches should be crossed: each spine switch must be connected to two next-level data center switches. The cabling pattern plays a key role in the continuation of service during failover scenarios.

Caution

All uplinks, default and customer, are configured to use link aggregation (LACP).

The spine switches operate in Virtual Port Channel (VPC) mode. Therefore, Spanning Tree Protocol (STP) is not supported in the data center network topology involving Oracle Private Cloud Appliance.

Auto-negotiation is not available for uplink ports. Transfer speed must be specified on the customer switches’ end. For the default uplink ports, this is 10Gbit/s.

Optional Data Center Administration Network Uplink

In addition to the public Ethernet connection, you may connect the Cisco Nexus 9348GC-FXP Switch to a management or machine administration network at your installation site. If you choose to use such an uplink, consider it as a long-term alternative to the temporary workstation connection described in Section 3.1.2, “IP Address Requirements”. Configure the administration uplink after the initialization of the appliance, when the appliance network settings have been applied.
IP Address Requirements

Caution

Connect port 2 on the Cisco Nexus 9348GC-FXP Switch.

Make sure that the data center Ethernet switch used in this connection is configured to prevent DHCP leakage to the 192.168.4.0/24 subnet used by Oracle Private Cloud Appliance.

For the bastion host, which is the name used to describe the machine that is permanently connected to the data center administration network, use the IP address 192.168.4.199 and assign it statically to its network interface. Make sure there is no other machine on the same subnet using the same IP address and causing IP conflicts.

A connection to the appliance internal management network, either directly into the Cisco Nexus 9348GC-FXP Switch or through an additional Ethernet switch in the data center, is not required to access the appliance management functionality of the Oracle Private Cloud Appliance Dashboard. The primary role of the appliance internal management network is to allow the controller software on the management nodes to interact with the compute nodes and other rack components. Connecting to this network from outside the appliance allows you to gain direct administrator access to each component, for example to control the ILOMs.

The Oracle Private Cloud Appliance Dashboard, in contrast, is not accessed over the internal management network, but through the management node cluster's virtual IP address. The virtual IP address is public, in the sense that it should be accessible from within your data center network. You reserve this IP address in your data center network in advance, as described in Section 3.2, “General Network Configuration”, and then configure it in the appliance network settings during software initialization. Instructions for first access to the Oracle Private Cloud Appliance Dashboard are provided in Section 5.3.5, “Connect the Appliance to the Network”.

3.1.2 IP Address Requirements

The Oracle Private Cloud Appliance requires a large number of private IP addresses. These are reserved for the normal operation and future expansion of the system and cannot be reconfigured. While system-level subnets and IPs should be avoided, the customer is allowed to choose the network configuration for external and virtual machine traffic that suits their requirements.

For lists of default IP addresses that are preassigned to your Oracle PCA, see Appendix A, Default IP Addresses.

To gain initial access to the Oracle Private Cloud Appliance Dashboard, you must connect a terminal or workstation with a web browser directly to the internal management network. Connect an Ethernet cable to the available port 48 in the Cisco Nexus 9348GC-FXP Switch, and statically configure the wired network connection of the workstation to use the IP address 192.168.4.254.

Caution

The IP address 192.168.4.254 and switch port 48 have been reserved specifically for the purpose of connecting a workstation during the first boot, initialization and provisioning of the appliance.

During the initial software configuration of the Oracle Private Cloud Appliance, you configure the network settings of the management nodes. For this purpose, you should reserve three IP addresses in the public (data center) network: one for each management node, and one to be used as virtual IP address shared by both management nodes. If the data center network traffic is tagged, make sure that the VLAN ID is also
provided as part of the configuration. The virtual IP address provides access to the Dashboard once the software initialization is complete.

To avoid network interference and conflicts, you must ensure that the data center network does not overlap with any of the infrastructure networks of the Oracle Private Cloud Appliance internal configuration. These are the subnets and VLANs you should keep clear:

Subnets:

- 192.168.4.0/24 – internal machine administration network: connects ILOMs and physical hosts
- 192.168.32.0/21 – internal management network: traffic between management and compute nodes
- 192.168.64.0/21 – underlay network for east/west traffic within the appliance environment
- 192.168.72.0/21 – underlay network for north/south traffic, enabling external connectivity
- 192.168.40.0/21 – storage network: traffic between the servers and the ZFS storage appliance

**Note**

Each /21 subnet comprises the IP ranges of eight /24 subnets or over 2000 IP addresses. For example: 192.168.32.0/21 corresponds with all IP addresses from 192.168.32.1 to 192.168.39.255.

VLANs:

- 1 – the Cisco default VLAN
- 3040 – the default service VLAN
- 3041-3072 – a range of 31 VLANs reserved for customer VM and host networks
- 3073-3099 – a range reserved for system-level connectivity

**Note**

VLANs 3090-3093 are already in use for tagged traffic over the /21 subnets listed above.

- 3968-4095 – a range reserved for Cisco internal device allocation

### 3.2 General Network Configuration

Table 3.1 is a general network configuration worksheet to help you configure your Oracle Private Cloud Appliance. Oracle requests that you collect the information in preparation of the installation in your data center. The parameters entered in this worksheet are used as input during the initialization of the appliance.

4.2 Prepare to Install Oracle Private Cloud Appliance

This section describes the preparation steps to perform before installing your Oracle Private Cloud Appliance.

4.2.1 Before You Begin

Before installing your Oracle Private Cloud Appliance, or installing any server equipment into the rack, read the Important Safety Information for Oracle’s Hardware Systems (7063567) document that is shipped with the system.

Observe all safety notices printed on the packaging and listed in the Oracle Rack Cabinet 1242 Safety and Compliance Guide (Part No: E87279) and the Oracle Rack Cabinet 1242 Power Distribution Units User’s
Review Safety Guidelines

Guide (Part No: E87281). Go to https://docs.oracle.com/cd/E85660_01/index.html to download these guides.

4.2.2 Review Safety Guidelines

Before your Oracle Private Cloud Appliance arrives, review the following safety precautions to ensure that the site is safe, as well as ready for delivery. Failure to observe these precautions can result in personal injury, equipment damage, or malfunction.

- Do not block ventilation openings.
- Do not install the system in a location that is exposed to direct sunlight or near a device that may become hot.
- Do not install the system in a location that is exposed to excessive dust, corrosive gases, or air with high salt concentrations.
- Do not install the system in a location that is exposed to frequent vibrations. Install the system on a flat, level surface.
- Use a power outlet that uses proper grounding. When using shared grounding, the grounding resistance must not be greater than 10 ohms. Ensure that your facility administrator or a qualified electrical engineer verifies the grounding method for the building, and performs the grounding work.
- Ensure that each grounding wire used for the system is used exclusively for the Oracle Private Cloud Appliance. Also observe the precautions, warnings, and notes about handling that appear on labels on the equipment.
- Do not place cables under the equipment or stretch the cables too tightly.
- Do not disconnect power cords from the equipment while its power is on.
- Do not place anything on top of the system or perform any work directly above it.
- If you cannot reach the connector lock when disconnecting LAN cables, then press the connector lock with a flathead screwdriver to disconnect the cable. You could damage the system board if you force your fingers into the gap rather than using a flathead screwdriver.
- Do not let the room temperature rise sharply, especially in winter. Sudden temperature changes can cause condensation to form inside the system. Allow for a sufficient warm-up period prior to server operation.
- Do not install the system near a photocopy machine, air conditioner, welding machine, or any other equipment that generates loud, electronic noises.
- Avoid static electricity at the installation location. Static electricity transferred to the system can cause malfunctions. Static electricity is often generated on carpets.
- Confirm that the supply voltage and frequency match the electrical ratings indicated on your Oracle Private Cloud Appliance.
- Do not insert anything into any Oracle Private Cloud Appliance opening, unless doing so is part of a documented procedure. The system contains high-voltage parts. If a metal object or other electrically conductive object enters an opening in the system, then it could cause a short circuit. This could result in personal injury, fire, electric shock, and equipment damage.

4.2.3 Prepare the Installation Site
The following procedure describes how to prepare the site prior to unpacking and situating your Oracle Private Cloud Appliance.

1. Thoroughly clean and vacuum the area in preparation for the installation.
2. Note problems or peculiarities at the site that require special equipment.
3. Verify that the installation site flooring has a strength rating to withstand the combined weight of the Oracle Private Cloud Appliance and any other installed equipment.
   For more information, see Section 2.1, “Space Requirements”.
4. Install all necessary electrical equipment and ensure that sufficient power is provided.
   See also the Oracle Rack Cabinet 1242 Power Distribution Units User’s Guide for the system Power Distribution Unit (PDU) power requirements.
5. Ensure that the installation site provides adequate air conditioning.
   For details, see Chapter 2, Site Requirements.
6. Operate the air conditioning system for 48 hours to bring the room temperature to the appropriate level.

4.2.4 Tools Required for Unpacking and Installation

The following tools and equipment are required for installation and service:

• Unpacking tools (provided in rack ship kit)
  • 17mm and 13mm open-ended double-sided wrench
  • Allen L-key 6mm hex wrench, 5-3/4 inches in length
  • Allen L-key 8mm hex wrench, 6-3/8 inches in length
• Rack setup tools and accessories (provided in rack ship kit)
  • 32 M6 cage nuts and washers
  • 32 M6 pan head screws
  • 8 M5 screws
  • 8 self-tapping Torx screws
  • 4 PDU brackets
  • 4 M5 cage nuts
  • 4 grounded power cables
  • 18mm and 16mm open-ended double-sided wrench
  • T-40 Torx screwdriver
  • T-25 Torx screwdriver
  • T-15 Torx screwdriver
Unpack the System

- 8mm and 6mm Allen wrench
- Cage nut tool
- Keys to the front door, rear door, and side panel locks
- 17mm and 13mm open-ended double-sided wrench
- Customer-supplied tools (not provided in rack ship kit)
  - No. 2 Phillips screwdriver
  - Diagonal cutter
  - Antistatic wrist strap

4.2.5 Unpack the System

Before unpacking the rack from the shipping carton, refer to the labels on the carton and to the instructions that they provide. After unpacking the rack, follow local laws and guidelines to recycle the packaging properly.

Caution

Carefully unpack the rack from the packaging and shipping pallet. Rocking or tilting the rack can cause it to fall over and cause serious injury or death. You should always use professional movers when unpacking and installing this rack.

Note

After unpacking the rack from the packaging, save the shipping brackets used to secure the rack to the shipping pallet. You can use these shipping brackets to secure the rack permanently to the installation site floor. Do not dispose of these brackets, because you cannot order replacement brackets.

Caution

Shipping brackets are not for use for bracing or anchoring the rack during seismic events.

4.3 Install Oracle Private Cloud Appliance in Its Allocated Space

This section describes each phase of the hardware installation procedure for the Oracle Private Cloud Appliance.

4.3.1 Move the System

The following procedure describes how to move the Oracle Private Cloud Appliance:

1. Ensure that the rack doors are closed and secured.
2. Ensure that the leveling and stabilizing feet on the rack are raised and out of the way.
3. Push the system from the back of the rack to the installation site.
Stabilize the Appliance Rack

Warning

Never attempt to move an Oracle Private Cloud Appliance by pushing on the rack side panels. Pushing on the rack side panels can tip over the rack. This action can cause serious personal injury or death, as well as damage to the equipment.

The front casters of the rack are fixed; they do not pivot. When moving your Oracle Private Cloud Appliance to the installation site, you must steer the unit using the rear casters. You can safely maneuver the system by carefully pushing it from behind. See Figure 4.1.

It is preferred that at least three people push and guide the rack: one person in front and two persons in back to help guide the rack and keep people out of the path of the moving rack. When transporting configured racks from one location to another, take care to move them slowly, 0.65 meters per second (2.13 feet per second) or slower.

Carefully examine the transportation path. Avoid obstacles such as doorways or elevator thresholds that can cause abrupt stops or shocks. Go around obstacles by using ramps or lifts to enable smooth transport.

Caution

Never tip or rock the Oracle Private Cloud Appliance because the rack can fall over.

Figure 4.1 Carefully Push the Oracle PCA From the Back of the Rack

4. When the rack is at the installation site, verify that no components or connections have become dislodged or disconnected during transport. If necessary, re-attach components and cables properly.

4.3.2 Stabilize the Appliance Rack

After moving the Oracle Private Cloud Appliance to the installation site, stabilize the rack to ensure that it does not move or tip over. You can stabilize the rack permanently by extending the rack leveling feet, and optionally using the shipping brackets to secure the rack permanently to the floor.

Caution

Shipping brackets are not for use for bracing or anchoring the rack during seismic events.
To secure the rack to the installation floor using the shipping brackets, you must drill the appropriate holes in the floor, re-attach the shipping brackets to the rack, position the rack over the mounting holes, and attach the shipping brackets to the floor firmly with bolts and washers that suit the specific environment. Oracle does not provide mounting bolts and washers for the shipping brackets, because different floors require different bolt types and strengths.

(Optional) If you plan to route data or power distribution unit (PDU) power cords down through the bottom of the rack, you will need to cut a hole in the installation site floor. Cut a rectangular hole below the rear portion of the rack, between the two rear casters and behind the RETMA (Radio Electronics Television Manufacturers Association) rails.

**Caution**

Do not create a hole where the rack casters or leveling feet brackets will be placed.

When the rack is in position, the leveling feet must be deployed. The rack contains four leveling feet that can be lowered to share the load with the casters. This increases the footprint of the rack, which improves stability and helps prevent rack movement. The leveling feet must be used even when the rack is permanently secured to the floor. To adjust the leveling feet, do the following:

1. Locate the four leveling feet at the bottom four corners of the rack. See Figure 4.2.

**Figure 4.2 Location of Leveling Feet on Rack**

2. Using a 6mm hex wrench, lower the leveling feet to the floor. See Figure 4.4.

**Figure 4.3 Lowering the Leveling Feet**

3. Lock the four leveling feet using an 18mm open wrench. See Figure 4.4.
4.3.3 Attach a Ground Cable (Optional)

Oracle Private Cloud Appliance power distribution units (PDUs) achieve earth ground through their power cords. Final chassis ground is achieved by way of the ground prong when you connect the power cord to a socket. For additional grounding, attach a chassis earth ground cable to the system. The additional ground point enables electrical current leakage to dissipate more efficiently.

Caution

The PDU power input lead cords and the ground cable must reference a common earth ground. If they do not, then a difference in ground potential can be introduced. If you are unsure of your facility’s PDU receptacle grounding, then do not install a ground cable until you confirm that there is a proper PDU receptacle grounding. If a difference in ground potential is apparent, then you must take corrective action.

Note

A grounding cable is not shipped with the Oracle Private Cloud Appliance.

1. Ensure that the installation site has a properly grounded power source in the data center. The facility PDU must have earth ground.

2. Ensure that all grounding points, such as raised floors and power receptacles, reference the facility ground.

3. Ensure that direct, metal-to-metal contact is made for this installation. During manufacturing, the ground cable attachment area might have been painted or coated.

4. Attach the ground cable to one of the attachment points located at the bottom rear of the system frame. See Figure 4.5.
The attachment point is an adjustable bolt that is inside the rear of the system cabinet on the right side.

**Figure 4.5 Earth Ground Attachment Bolt Location**

### 4.4 What’s Next?

After installing the Oracle Private Cloud Appliance rack at your site, continue the installation process by powering on the system and performing the initial configuration. For instructions, see Chapter 5, *Powering On Oracle Private Cloud Appliance.*
Chapter 5 Powering On Oracle Private Cloud Appliance

This chapter explains how to power on the Oracle Private Cloud Appliance for the first time at your site.

Warning

Before starting the system and applying the initial configuration, read and understand the Oracle Private Cloud Appliance Release Notes. The section Known Limitations and Workarounds provides information that is critical for correctly executing the procedures in this document. Ignoring the release notes may cause you to configure the system incorrectly. Bringing the system back to normal operation may require a complete factory reset.

5.1 Power On Task Map

Table 5.1 describes the steps for powering on the Oracle Private Cloud Appliance at your site.

5.2 Before Initial Power On

Before you power on the Oracle Private Cloud Appliance for the first time, ensure that you have made the necessary external network connections according to the instructions provided in Section 3.1, “Network Connection and IP Address Requirements”.

In addition, you need to connect a workstation with a monitor to the available Ethernet port 48 in the Cisco Nexus 9348GC-FXP Switch, and statically configure its IP address to 192.168.4.254. Start a web browser session in order to initially administer your Oracle Private Cloud Appliance using the pre-defined IP address (192.168.4.216). For more information, see Section 5.3.5, “Connect the Appliance to the Network”.

5.3 Power On for the First Time

This section provides instructions for each phase of the initial power-on sequence.

5.3.1 Review Safety Guidelines

Before powering on the system or installing any server equipment into the rack, read the Important Safety Information for Oracle’s Hardware Systems (7063567) document included with the system.

Before powering on the system, review the following safety precautions. Failure to observe these precautions can result in personal injury, equipment damage, or malfunction.

- Do not block ventilation openings.
- Do not place cables under the equipment or stretch the cables too tightly.
- Do not disconnect power cords from the equipment while its power is on.
- If you cannot reach the connector lock when disconnecting LAN cables, then press the connector lock with a flathead screwdriver to disconnect the cable. You could damage the system board if you force your fingers into the gap rather than using a flathead screwdriver.
- Do not place anything on top of the system or perform any work directly above it.
- Do not let the room temperature rise sharply, especially during winter. Sudden temperature changes can cause condensation to form inside the system. Allow for a sufficient warm-up period prior to system operation.
- Avoid static electricity at the installation location. Static electricity transferred to the system can cause malfunctions. Static electricity is often generated on carpets.
- Confirm that the supply voltage and frequency match the electrical ratings indicated on your Oracle Private Cloud Appliance.
- Do not insert anything into any system opening, unless doing so is part of a documented procedure. The system contains high-voltage parts. If a metal object or other electrically-conductive object enters an opening in the system, then it could cause a short circuit. This could result in personal injury, fire, electric shock, and equipment damage.

5.3.2 Inspect the Appliance

The following procedure describes how to visually inspect your Oracle Private Cloud Appliance after it is physically installed at your site, and prior to power being applied to the system.
1. Check for rack damage.

2. Check the rack for loose or missing screws.

3. Check your Oracle Private Cloud Appliance for the ordered configuration. Refer to the Customer Information Sheet (CIS) on the side of the packaging.

   **Note**

   Oracle Private Cloud Appliance is preconfigured by Oracle as a self-contained system. You should not move any equipment or add any unsupported hardware to the system.

4. Check that all cable connections are secure and firmly in place as follows:
   a. Check the power cables. Ensure that the correct connectors have been supplied for the data center facility power source.
   b. Check the network data cables.

5. Check the site location tile arrangement for cable access and airflow.

6. Check the data center airflow that leads in to the front of the system.

   For more information, see Section 2.5, “Ventilation and Cooling Requirements”.

### 5.3.3 Connect the Power Cords

The following procedure describes how to connect power cords to your Oracle Private Cloud Appliance.

1. Open the rear cabinet door.

2. Ensure that the correct power connectors have been supplied.

3. Unfasten the power cord cable ties.

   The ties are for shipping only and are no longer needed.

4. Route the power cords to the facility receptacles either above the rack or below the flooring. See Figure 5.1 and Figure 5.2.

5. Secure the power cords in bundles. See Figure 5.1.

**Figure 5.1 Power Cord Routing From the Bottom of the Rack**
5.3.4 Power On the Appliance

The following procedure describes how to power on your Oracle Private Cloud Appliance.

1. Ensure that the three main power cords are connected to a reliable power source.

   For more information, see Section 2.3, “Electrical Power Requirements”.

2. Switch on the power distribution unit (PDU) circuit breakers located on the rear of PDU A and B inside the Oracle Private Cloud Appliance.

   The circuit breakers are on the rear of the system cabinet as shown in Figure 5.3. Press the ON (|) side of the toggle switch.

   Note

   Ensure that the PDU switches have had power applied for approximately two minutes to complete power-on configuration before starting the management nodes.
3. Make sure that the circuit breakers located on the rear left and right side power supplies of the Oracle ZFS Storage Appliance ZS5-ES are in the ON (\(\text{ON}\)) position.

4. Press the Power button located on the front of the first (bottom) management node. See Figure 5.5.

The first management node is located in rack unit 5 (U5). The second management node is located in rack unit 6 (U6). It is switched on and configured automatically during the initial power-on sequence.

A management nodes take approximately five to ten minutes to power on completely. Once complete, the Power/OK LED illuminates and remains a steady green.
5. After powering on the first management node, wait while the second management node and all compute nodes are powered on and discovered.

### Note

After power is applied, the LEDs on all compute nodes and storage server heads will start to blink after approximately two minutes. From the rear of the rack, you can see the green LEDs on the power supply units (PSUs) on the compute nodes turn on instantly after power is applied. In addition, from the rear of the rack, you can see the display on the power distribution units (PDUs) illuminate once power is available.

The management nodes will verify all components within the system. The management nodes ensure that the correct networking switches and storage devices are installed in the system, and search for compute nodes to add to the compute fabric. Once compute nodes are located, the management software automatically installs the proper drivers and the Oracle VM Server version on each compute node.

Depending on your system configuration, the Oracle Private Cloud Appliance power-on process should take approximately five to ten minutes before the system becomes available for initialization, and up to several hours for the entire configuration to be ready. When initialization is completed, use the Oracle Private Cloud Appliance Dashboard web interface to configure initial system settings (for example: network properties and passwords). For instructions on connecting to the Oracle Private Cloud Appliance and accessing the Dashboard UI, see Section 5.3.5, “Connect the Appliance to the Network”.

### 5.3.5 Connect the Appliance to the Network
Connect the Appliance to the Network

For initial access to Oracle Private Cloud Appliance, you must connect a workstation with a monitor to the available Ethernet port 48 in the Cisco Nexus 9348GC-FXP Switch. The Oracle Private Cloud Appliance Dashboard can be reached by means of a web browser.

Note
You can connect to the Ethernet port at any time during the system power-on process. However, you should wait approximately two to three minutes after starting the power-on process to allow the IP address to become active. If you connect too soon to the port, you will see an HTTP error code 404 or similar code. If this occurs, wait a few minutes and try to connect again.

You can connect your Oracle PCA to the network as follows:

1. Ensure that the Cisco Nexus 9336C-FX2 Switches are connected to your data center (public) network. For details, see Section 3.1.1, “Network Connection Requirements”.

2. Connect a workstation with a web browser directly to the management network using an Ethernet cable connected to port 48 of the Cisco Nexus 9348GC-FXP Switch.

3. Configure the wired network connection of the workstation to use the static IP address 192.168.4.254.

4. Using the web browser on the workstation, connect to the Oracle Private Cloud Appliance Dashboard on the master management node at https://192.168.4.216.

192.168.4.216 is the predefined virtual IP address of the management node cluster for configuring Oracle Private Cloud Appliance. If there is another device on your network that is using this IP address, you should change the conflicting device's IP address prior to connecting to the Oracle Private Cloud Appliance.

5. Log into the Dashboard using the user name admin and default password Welcome.

Note
For security reasons, you must set a new password at your earliest convenience.

The Dashboard opens in the Hardware View tab. This view indicates the status of the appliance as it is being powered on. All the networking and storage should be green. As the compute nodes are discovered, they will change from yellow to green. Wait until all compute nodes have been discovered and provisioned before making configuration changes in the Dashboard interface.

6. Using the Dashboard, configure the system environment parameters, including: domain name, NTP and DNS servers.

Warning
Before reconfiguring the system network settings, make sure that no provisioning or upgrade processes are running. For details, refer to the section “Do Not Reconfigure Network During Compute Node Provisioning or Upgrade” in the Oracle Private Cloud Appliance Release Notes.

7. Go to the Network Settings tab and replace the default IP configuration of the management nodes with the reserved IP addresses in your data center network. Enter the default gateway of your data center network.
Note

During the initial configuration of the Oracle Private Cloud Appliance, you change the predefined configuration IP address to the reserved virtual IP address in your data center network. For details, see Section 3.1.2, “IP Address Requirements”.

For details about the software configuration process, and for advanced configuration and update options, refer to the Oracle Private Cloud Appliance Administrator’s Guide.

5.4 What’s Next?

After powering on your Oracle Private Cloud Appliance and performing the initial system configuration, the environment is ready for virtual machine deployment. Refer to the Oracle Private Cloud Appliance Administrator’s Guide for information about working with an operational environment:

- See Monitoring and Managing Oracle Private Cloud Appliance for instructions to work with the Oracle Private Cloud Appliance Dashboard.
- See Managing the Oracle VM Virtual Infrastructure for instructions to work with virtual machines within Oracle VM.
- See Servicing Oracle Private Cloud Appliance Components for instructions to service customer-replaceable components in the Oracle Private Cloud Appliance.

Note

Optionally, you can extend Oracle Private Cloud Appliance by adding more compute nodes to the system, by installing extra memory in the compute nodes, or by connecting the appliance to additional external storage. For more information and instructions, refer to the following chapters:

- Chapter 6, Extending Oracle Private Cloud Appliance - Additional Compute Nodes
- Chapter 7, Extending Oracle Private Cloud Appliance - Server Memory Kits
- Chapter 8, Extending Oracle Private Cloud Appliance - External Storage
Chapter 6 Extending Oracle Private Cloud Appliance - Additional Compute Nodes

   6.5.5 Cable the Server ......................................................................................... 52
   6.5.6 Replace the Rack Doors ............................................................................. 54

Extension of Oracle Private Cloud Appliance involves increasing the number of compute nodes within a rack to maximize the number of virtual machines that are capable of running on the appliance and to increase the processing power and memory available to existing virtual machines. The process of extending the Oracle Private Cloud Appliance in this way requires that you install additional servers into the rack. This operation does not require that the system is powered down, but physical changes are made to the system. Therefore you should review the task map provided in Section 6.1, “Extending Compute Capacity Task Map” before continuing. Each step to perform the operation is described in detail in this chapter.

This chapter explains how to extend your Oracle PCA by adding compute nodes to the system. After hardware installation, when compute node provisioning has completed, the servers are automatically added to the default tenant group Rack1_ServerPool. Depending on the tenant group configuration in the environment, you should add each newly provisioned server to the appropriate tenant group.

6.1 Extending Compute Capacity Task Map

Table 6.1 describes the steps for extending the Oracle Private Cloud Appliance at your site by installing additional compute nodes within the rack.

Table 6.1 Steps for Extending Oracle Private Cloud Appliance By Adding Compute Nodes

### 6.2 Review Safety Guidelines

Before expanding Oracle Private Cloud Appliance, read the following important safety information:

- *Important Safety Information for Oracle's Hardware Systems (7063567)*
- *Section 2.3, “Electrical Power Requirements”*
- *Section C.5, “Facility Power Checklist”*

### 6.3 Rack-mount Safety Precautions

This section describes rack-mount safety precautions you must follow when installing a compute node into your Oracle Private Cloud Appliance.

<table>
<thead>
<tr>
<th>Caution</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Leveling feet position:</strong> When unpacking at the installation site, or when repackaging and moving the rack to a new location, verify that the leveling feet are up before moving the rack.</td>
<td></td>
</tr>
<tr>
<td><strong>Stabilize rack:</strong> Deploy the anti-tilt bar on the equipment rack before starting an installation.</td>
<td></td>
</tr>
<tr>
<td><strong>Shipping brackets:</strong> The rack shipping brackets are not for use for bracing or anchoring the rack during seismic events.</td>
<td></td>
</tr>
<tr>
<td><strong>Equipment loading:</strong> Always load equipment into a rack from the bottom up so that the rack does not become top-heavy and tip over. Deploy your rack anti-tilt bar to prevent the rack from tipping during equipment installation.</td>
<td></td>
</tr>
<tr>
<td><strong>Lifting equipment:</strong> Oracle Server X8-2 weighs approximately 45 lbs (20.41 kg). Two people are needed to mount the server into the rack enclosure.</td>
<td></td>
</tr>
</tbody>
</table>
6.4 Prepare to Add a Server

This section describes the preparation steps to perform before installing an additional compute node as part of your Oracle Private Cloud Appliance.

Caution

When adding expansion nodes, always populate the compute rack units starting from the bottom most open slot, and work your way up. If you do not populate the rack units in the right order, the controller software may no longer report the correct status of the rack components.

6.4.1 ESD Precautions
Electronic equipment is susceptible to damage by static electricity. To prevent electrostatic discharge (ESD) when you install or service the server:

- Use a grounded antistatic wrist strap, foot strap, or equivalent safety equipment.
- Place components on an antistatic surface, such as an antistatic discharge mat or an antistatic bag.
- Wear an antistatic grounding wrist strap connected to a metal surface on the chassis when you work on system components.

Caution

Equipment damage: Electrostatic damage can permanently disable the system or require repair by authorized service technicians.

Before installing the server, read the safety information in the Oracle Server X8-2 Safety and Compliance Guide, as well as the Important Safety Information for Oracle's Hardware Systems.

6.4.2 Unpack the Server Upgrade Kit

Perform the following procedure to unpack the server upgrade kit.

1. Inspect the shipping cartons for evidence of physical damage. If a shipping carton appears damaged, request that the carrier agent be present when the carton is opened. Keep all contents and packing material for the agent inspection.

2. Remove the packaging from the Oracle Private Cloud Appliance Expansion Node upgrade kit.

3. Verify that all items are included. The upgrade kit should contain the following:
   - Oracle Server
   - Cable management arm assembly with installation instructions
   - Rackmount kit including rack rails, mounting brackets, screws and Rackmounting Template
   - Getting Started Guide
   - Legal and safety documents

Note

Cables are not included in the server upgrade kit. Oracle Private Cloud Appliance comes with pre-installed and labeled cables for all rack units. These should not be unplugged or removed from the rack.

6.4.3 Prepare the Appliance Rack

Perform the following procedure to prepare the rack.

Caution

To reduce the risk of personal injury, stabilize the rack cabinet and extend all anti-tilt devices before performing this procedure.

1. Remove the Oracle Private Cloud Appliance front and rear rack doors, as follows:
Prepare the Appliance Rack

a. Unlock and open the front and rear rack doors.

b. Detach the top and bottom grounding straps by separating the banana jacks (1).

c. Unlatch the bottom hinge, then the top hinge.
   • Pinch the two studs on the hinge towards the center of the hinge (2).
   • Rotate the studs away from the door (3) so that they stay in place and the hinge remains unlatched.

d. Lift the door away from the cabinet (4).

e. Repeat these steps for the two rear doors.

These steps are illustrated in Figure 6.1.

Caution

The doors are heavy. Have one person hold the door in place while the other operates the hinge latching mechanism. Execute the steps carefully and in the correct order, to avoid damage to the hinges.

Figure 6.1 Removing the Rack Doors

Table 6.2 Figure Legend

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Detaching the grounding cables.</td>
</tr>
<tr>
<td>2</td>

</tr>
<tr>
<td>3</td>
<td>Rotating the studs away from the door.</td>
</tr>
<tr>
<td>4</td>
<td>Lifting the door away from the cabinet.</td>
</tr>
</tbody>
</table>

2. Remove the filler panel(s) where the upgrade server will be installed.

The filler panels have snap-in attachments. No screwdriver is required to remove them.

3. Remove the cable tray that holds the pre-installed cables in place at the rear side of the rack. See Figure 6.2
a. Detach the pre-installed cables from the cable tray on the rack unit for the new expansion node.
b. Use a No. 2 Phillips screwdriver to remove the M6 screws from the cable tray.
c. Remove the cable tray from the rack. Save cable tray and screws for future use.

Figure 6.2 Removing the Cable Tray

6.5 Install the Server Into the Rack

This section describes the steps to install an additional compute node as part of your Oracle Private Cloud Appliance.

6.5.1 Install Mounting Brackets

Perform the following procedure to install mounting brackets onto the sides of the server.

1. Position a mounting bracket against the chassis so that the slide-rail lock is at the server front, and the five keyhole openings on the mounting bracket are aligned with the five locating pins on the side of the chassis. See Figure 6.3.
Figure 6.3 Aligning the Mounting Bracket With the Server Chassis

Table 6.3 Figure Legend

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Chassis front</td>
</tr>
<tr>
<td>2</td>
<td>Slide-rail lock</td>
</tr>
<tr>
<td>3</td>
<td>Mounting bracket</td>
</tr>
<tr>
<td>4</td>
<td>Mounting bracket clip</td>
</tr>
</tbody>
</table>

2. With the heads of the five chassis locating pins protruding through the five keyhole openings in the mounting bracket, pull the mounting bracket toward the front of the chassis until the mounting bracket clip locks into place with an audible click.

3. Verify that the rear locating pin has engaged the mounting bracket clip.

4. Repeat these steps to install the remaining mounting bracket on the other side of the server.

6.5.2 Attach Slide-Rail Assemblies

Perform the following procedure to attach slide-rail assemblies to the rack.

1. Orient the slide-rail assembly so that the ball-bearing track is forward and locked in place.
Figure 6.4 Orienting the Slide-Rail With the Ball-Bearing Track

Table 6.4 Figure Legend

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Slide-rail</td>
</tr>
<tr>
<td>2</td>
<td>Ball-bearing track</td>
</tr>
<tr>
<td>3</td>
<td>Locking mechanism</td>
</tr>
</tbody>
</table>

2. Starting with either the left or right side of the rack, align the rear of the slide-rail assembly against the inside of the rear rack rail, and push until the assembly locks into place with an audible click. See Figure 6.5.
3. Align the front of the slide-rail assembly against the outside of the front rack rail, and push until the assembly locks into place with an audible click. See Figure 6.5.

4. Repeat these steps to attach the slide-rail assembly to the other side of the rack.

6.5.3 Install the Server Into the Slide-Rail Assemblies

Perform the following procedure to install the server, with mounting brackets, into the slide-rail assemblies that are mounted to the rack.

**Caution**

This procedure requires a minimum of two people because of the weight of the server. Attempting this procedure alone could result in equipment damage or personal injury.

**Caution**

Always load equipment into a rack from the bottom up so that the rack will not become top-heavy and tip over. Extend your rack's anti-tilt bar to prevent the rack from tipping during equipment installation.
1. Push the slide-rails as far as possible into the slide-rail assemblies in the rack.

2. Position the server so that the rear ends of the mounting brackets are aligned with the slide-rail assemblies that are mounted in the rack. See Figure 6.6.

3. Insert the mounting brackets into the slide-rails, and then push the server into the rack until the mounting brackets encounter the slide-rail stops (approximately 30 cm, or 12 inches).

**Figure 6.6 Inserting the Server With Mounting Brackets Into the Slide-Rails**

![Figure 6.6 Inserting the Server With Mounting Brackets Into the Slide-Rails](image)

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Inserting mounting bracket into slide-rail</td>
</tr>
<tr>
<td>2</td>
<td>Slide-rail release button</td>
</tr>
<tr>
<td>3</td>
<td>Slide-rail lock</td>
</tr>
</tbody>
</table>

4. Simultaneously push and hold the green slide-rail release buttons on each mounting bracket while you push the server into the rack. Continue pushing the server into the rack until the slide-rail locks (on the front of the mounting brackets) engage the slide-rail assemblies. See Figure 6.7.

You will hear an audible click.
6.5.4 Install the Cable Management Arm

Perform the following procedure to install the cable management arm (CMA) to rear of the server.

1. Unpack the CMA.

2. To make it easier to install the CMA, extend the server approximately 13 cm (5 inches) out of the front of the rack.

3. Take the CMA to the back of the equipment rack, and ensure that you have adequate room to work at the back of the server.

Note

References to “left” or “right” in this procedure assume that you are facing the back of the equipment rack.

Note

Throughout this installation procedure, support the CMA and do not allow it to hang under its own weight until it is secured at all four attachment points.

4. Insert the CMA’s connector A into the front slot on the left slide-rail until it locks into place with an audible click. See Figure 6.8, frames 1 and 2.

The connector A tab (see call-out 1) goes into the slide-rail’s front slot (call-out 2).

Gently tug on the left side of the front slide bar to verify that connector A is properly seated.
Install the Cable Management Arm

Figure 6.8 Installing Connector A Into the Left Slide-Rail

![Figure 6.8 Installing Connector A Into the Left Slide-Rail](image)

<td>Left slide-rail front slot</td>
</tr>
</tbody>
</table>

5. Insert the CMA’s connector B into the front slot on the right slide-rail until it locks into place with an audible click. See Figure 6.9, frames 1 and 2.

The connector B tab (call-out 1) goes into the slide-rail front slot (call-out 2).

Gently tug on the right side of the front slide bar to verify that connector B is properly seated.

Figure 6.9 Installing Connector B Into the Right Slide-Rail

![Figure 6.9 Installing Connector B Into the Right Slide-Rail](image)

Table 6.7 Figure Legend

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connector B tab</td>
</tr>
</tbody>
</table>
6. To install the CMA's connector C into the right slide-rail, perform the following steps:

   a. Align connector C with the slide-rail so that the locking spring (call-out 1) is positioned inside (server side) of the right slide-rail. See Figure 6.10, frame 1.

   b. Insert connector C into the right side-rail until it locks into place with an audible click (frames 2 and 3).

   c. Gently tug on the right side of the CMA's rear slide bar to verify that connector C is properly seated.

7. To prepare the CMA's connector D for installation, remove the tape that secures the slide-rail latching bracket to connector D and ensure that the latching bracket is properly aligned with connector D. See Figure 6.11, frames 1 and 2.
Note
The CMA is shipped with the slide-rail latching bracket taped to connector D. You must remove the tape before you install this connector.

Figure 6.11 Aligning the CMA Slide-Rail Latching Bracket With Connector D

8. While holding the slide-rail latching bracket in place, insert connector D and its associated slide-rail latching bracket into the left slide-rail until connector D locks into place with an audible click. See Figure 6.12, frames 1 and 2.

Note
When inserting connector D into the slide-rail, the preferred and easier method is to install connector D and the latching bracket as one assembly into the slide-rail.

Gently tug on the left side of the CMA’s rear slide bar to verify that connector D is properly seated.

Figure 6.12 Installing Connector D Into the Left Slide-Rail
9. Gently tug on the four CMA connection points to ensure that the CMA connectors are fully seated before you allow the CMA to hang by its own weight.

10. To verify that the slide-rails and the CMA are operating properly before routing cables through the CMA, perform the following steps:

   a. Extend the server from the front of the rack until the CMA is fully extended.

   b. Simultaneously pull and hold the two green release tabs (one on each side of the server) toward the front of the server (see the following figure) while you push the server into the rack. As you push the server into the rack, verify that the CMA retracts without binding. See Figure 6.13.

   c. Continue pushing the server into the rack until the slide-rail locks (on the front of the server) engage the slide-rail assemblies.

      You will hear an audible click when the server is in the normal rack position.
11. Connect the cables to the server, as required.

Instructions for connecting server cables are provided in Section 6.5.5, “Cable the Server”.

6.5.5 Cable the Server

After the server is installed in the rack and proper cable management arm (CMA) operation is verified, perform the procedures in this section to cable the server.

Note

If you are installing more than one server into the rack, perform the procedures in the previous sections for each server before performing the cabling steps in this section.

You should observe the following guidelines when attaching cables to a newly rack-mounted server:

• Do not remove existing cable connections in the rack.

• Attach and route cables in the CMA and rear panel one server at a time. Do not slide out more than one server at a time.

• Start from the bottom of the rack, and work upward. Route cables through the CMA with the dongle on the top and power cables on the bottom.

Note

The Oracle Private Cloud Appliance rack is entirely pre-cabled for all components, including future compute nodes. Cable bundles are cable-tied to the correct rack unit for each future server. You should not modify any of the cabling on the various Ethernet switches or the Oracle ZFS Storage Appliance ZS7-2. For detailed cabling information, see Appendix B, Cabling Reference.

1. Connect the pre-installed power and data cables of the appropriate rack unit to the back of the expansion node. The cables are labeled for your convenience, and should be connected according to Figure 6.14.

**Figure 6.14 Server Cabling Requirements**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Power supplies</td>
</tr>
<tr>
<td>B</td>
<td>Ethernet QSFP28 connectors</td>
</tr>
</tbody>
</table>
2. Open the CMA cable covers, route server cables through the CMA's cable troughs, close the cable covers, and secure the cables with the six Velcro straps. See Figure 6.15.
   
a. First through the front-most cable trough.
   
b. Then through the small cable trough.
   
c. Then through the rear-most cable trough.

   **Note**
   When securing the cables with the Velcro straps located on the front slide bar, ensure that the Velcro straps do not wrap around the bottom of the slide bar; otherwise, expansion and contraction of the slide bar might be hindered when the server is extended from the rack and returned to the rack.

   **Figure 6.15 CMA With Cables Installed**

   ![CMA With Cables Installed](image)

3. Ensure that the secured cables do no extend above the top or below the bottom of the server to which they are attached; otherwise, the cables might snag on other equipment installed in the rack when the server is extended from the rack or returned to the rack.

   **Note**
   If necessary, bundle the cables with additional Velcro straps to ensure that they stay clear of other equipment. If you need to install additional Velcro straps, wrap the straps around the cables only, not around any of the CMA components; otherwise, expansion and contraction of the CMA slide bars might be hindered when the server is extended from the rack and returned to the rack.

4. Verify the operation of the CMA with all cables installed.
Replace the Rack Doors

Note
Oracle recommends that two people execute this step. One person to move the server in and out of the rack, and another person to observe the cable and CMA operation.

a. Slowly pull the server out of the rack until the slide rails reach their stop.
b. Inspect the attached cables for any binding or kinks.
c. Verify that the CMA extends fully from the slide rails.

5. Push the server back into the rack.

a. Simultaneously pull and hold the two green release tabs (one on each side of the server) toward the front of the server while you push the server into the rack. See Figure 6.13.

Note
To pull the green release tabs, place your finger in the center of each tab, not on the end, and apply pressure as you pull the tab toward the front of the server.

b. Verify that the CMA retracts without binding.

6. Repeat the previous steps for each additional server that you add to the rack.

The Oracle Private Cloud Appliance controller software detects that one or more new compute nodes are present in the rack. It automatically powers on the new hardware and executes the provisioning procedure. The expansion compute nodes are incorporated seamlessly into the active system. This requires no further interventions by an administrator.

6.5.6 Replace the Rack Doors

Perform the following procedure to replace the rack front and rear doors:

1. Lift the door into place, and align the pins on the door with the sleeve on the cabinet (1).
2. On the top hinge, rotate the two studs on the hinge away from the center of the hinge (2). The pins snap into place (3). Do the same with the bottom hinge.
3. Repeat these steps to reinstall the other rack doors.
4. Reconnect all grounding straps on all doors (4).
5. Close the doors. Optionally, lock the doors.

These steps are illustrated in Figure 6.1.

Caution
The doors are heavy. Have one person hold the door in place while the other operates the hinge latching mechanism. Execute the steps carefully and in the correct order, to avoid damage to the hinges.

Chapter 7 Extending Oracle Private Cloud Appliance - Server Memory Kits

Table of Contents

7.1 Extending Server Memory Task Map ................................................................. 57
7.2 Selecting a Server Memory Kit ................................................................. 57
7.3 Installing the Memory Upgrade Kit .............................................................. 58

Extending the Oracle Private Cloud Appliance by installing additional physical RAM can enhance the product by providing more resources for virtual machines performing memory-intensive tasks beyond the capacity already available in the default compute node configuration. This process requires the server to be powered down, but virtual machines can be migrated to other compute nodes temporarily to avoid unnecessary downtime.

There are different memory kits available for the different generations of server hardware that may be installed in an Oracle Private Cloud Appliance environment. Be sure to select the RAM that matches your server model.

7.1 Extending Server Memory Task Map

Table 7.1 describes the steps for extending the Oracle Private Cloud Appliance at your site by installing additional RAM to upgrade the compute nodes.

Table 7.1 Steps for Extending Oracle Private Cloud Appliance By Installing Additional Memory

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Links</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Identify the servers to upgrade. Depending on the base memory configuration and the desired amount of RAM, select the memory kit to install.</td>
<td>Section 7.2, “Selecting a Server Memory Kit”</td>
</tr>
<tr>
<td>3</td>
<td>Install the memory upgrade kit. This involves migrating running virtual machines to avoid service interruptions, and powering down the compute node.</td>
<td>Section 7.3, “Installing the Memory Upgrade Kit”</td>
</tr>
<tr>
<td>4</td>
<td>When the upgraded compute nodes are back online, verify in Oracle VM Manager that the amount of RAM is correct.</td>
<td>No manual reconfiguration required.</td>
</tr>
</tbody>
</table>

When the compute node reboots after a memory upgrade, dom0 memory settings are adjusted automatically to the new total amount of RAM. The settings are persistent across future (re-)provisioning and controller software updates.

7.2 Selecting a Server Memory Kit

Oracle Private Cloud Appliance with Controller Software Release 2.4.1 is available only as a factory-installed system. Its compute nodes are all Oracle Server X8-2, available in 3 different memory configurations:
Installing the Memory Upgrade Kit

- 384GB – 12x 32GB DDR4-2666 DIMMs
- 768GB – 12x 64GB DDR4-2666 DIMMs
- 1.5TB – 24x 64GB DDR4-2666 DIMMs

The default memory configuration can be extended up to the maximum of 1.5TB. Consult your Oracle representative for the latest information about available memory kits.

⚠️ Caution

Be sure to select the RAM modules with the correct speed rating that matches your server model.

7.3 Installing the Memory Upgrade Kit

In general, installing or replacing memory modules are tasks performed by an Oracle-qualified service technician. DIMMs are not hot-swappable parts, so the server must be powered down for this procedure. This section provides a high-level overview of the steps required for a server memory extension. Links to more detailed information are included for your reference.

<tr>
<td>6</td>
<td>Install the server top cover, and then close the server fan door.</td>
<td>Follow the steps in the section entitled “Install a DIMM”. Consult the Service Manual for your server model. Follow the steps in the section “Install the Server Top Cover”, which is near the start of the chapter referenced in step 7.</td>
</tr>
<tr>
<td>7</td>
<td>Return the server to its normal rack position, and then reconnect all data cables and power cords.</td>
<td>Consult the Service Manual for your server model. Refer to the chapter “Returning the Server to Operation” in the Oracle Server X8-2 Service Manual (part no. E93386).</td>
</tr>
<tr>
<td>8</td>
<td>Power on the server. When it comes back online, take the compute node out of maintenance mode and verify that it resumes all normal operations in the server pool.</td>
<td>Refer to the applicable section in the Oracle Private Cloud Appliance Administrator’s Guide: <strong>Powering Down Oracle Server X8-2 for Service (When Required)</strong> The steps in this procedure are identical to placing the compute node in maintenance mode, except that you must clear the check box you selected previously.</td>
</tr>
</tbody>
</table>
Extending the Oracle Private Cloud Appliance by connecting and configuring additional external storage can enhance the product by providing the disk space required for large repositories, for backup and recovery storage, and to provision virtual machines with virtual disks beyond the capacity already available on the appliance. This process does not require that the system is powered down, but cabling and configuration must match the Oracle Private Cloud Appliance requirements.

External storage with Oracle Private Cloud Appliance is a typical use case of a custom network with external connectivity. Each external network corresponds with an isolated tunnel; the Ethernet-based external storage hardware must be made accessible over the data center network.

For instructions to set up a custom network, refer to Network Customization in the Oracle Private Cloud Appliance Administrator’s Guide. For information about discovering and using storage resources within Oracle VM, refer to Viewing and Managing Storage Resources, and the Oracle VM documentation.
This appendix lists the default IP addresses assigned to the Oracle Private Cloud Appliance components during manufacturing.

### A.1 Default Management IP Addresses

The management IP address represents a component's connection to the internal administration network.

#### Caution

For hardware management, Oracle Private Cloud Appliance uses a network internal to the system. It is not recommended to connect the management ports or the internal administration network switches to the data center network infrastructure.

Table A.1 lists the default management IP addresses assigned to servers and other hardware components in an Oracle Private Cloud Appliance base configuration rack.

<td>ILOM: 192.168.4.101</td>
<td></td>
</tr>
</tbody>
</table>
Compute nodes are assigned an IP address in the internal administration network during the provisioning process. The system IP address is DHCP-based; the ILOM is assigned the system IP plus 100. For example: if a compute node receives IP 192.168.4.17, then its ILOM has IP 192.168.4.117. Once assigned to a host, these IP addresses are stored and persisted in the DHCP database.

### A.2 Default Storage Network IP Addresses

![Caution]

The storage network is internal to the Oracle Private Cloud Appliance. You should not create additional connections to this network.

Storage traffic between appliance components uses a subnet that is separate from the administration network and virtual machine connectivity. **Table A.2** lists the default storage network IP addresses assigned to hardware components in your Oracle Private Cloud Appliance.

Appendix C Site Checklists

Table of Contents

C.1 System Components Checklist ........................................................................................................ 71
C.2 Data Center Room Checklist ........................................................................................................ 71
C.3 Data Center Environmental Checklist .......................................................................................... 72
C.4 Access Route Checklist .................................................................................................................. 73
C.5 Facility Power Checklist .................................................................................................................. 75
C.6 Safety Checklist .............................................................................................................................. 76
C.7 Logistics Checklist .......................................................................................................................... 76
C.8 Network Specification Checklist .................................................................................................... 78

This appendix contains site checklists to help you ensure that your site is prepared for installing the Oracle PCA.

C.1 System Components Checklist

Complete the following checklist to ensure that the systems component considerations have been addressed.

Table C.1 System Component Checklist

<table>
<thead>
<tr>
<th>System Components Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Will more than one base rack be installed?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the rack installation a new system or an addition to an existing system?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will the base rack be connected to an expansion rack?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are all machine racks adjacent to each other?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>If the connecting racks are not within the specified proximity, then have the following been done:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Purchased approved longer InfiniBand cables from an approved third-party vendor?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Asked Oracle Support Services to provide and schedule the custom multi-rack cabling service with the installation?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

C.2 Data Center Room Checklist

Complete the following checklist to ensure that the data center room requirements are met. For information about the data center requirements, see Section 2.2, “Flooring Requirements”.

71
### Table C.2 Data Center Room Checklist

<table>
<thead>
<tr>
<th>Data Center Room Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Has the Oracle PCA location been allocated?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there a vacant location for the new equipment?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the floor layout meet the equipment maintenance access requirements?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there adequate space available for maintenance?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will the equipment be positioned so that the exhaust air of one rack does not enter the air inlet of another rack?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Have cabinet stabilization measures been considered?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the raised floor satisfy the weight requirements for the new hardware?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Can floor tiles be removed without permission to accommodate service?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are there cable routing channels or cutouts?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are you providing any additional hardware?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the hardware you are providing fully compatible with the Oracle PCA?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will the new hardware location require any non-standard cable lengths?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the floor to ceiling height a minimum of 3214 mm or 3.2 m (10.5 feet)?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the depth of the raised floor a minimum of 46 cm (18 inches)?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### C.3 Data Center Environmental Checklist

Complete the following checklist to ensure that the data center environment requirements are met. For information, see Section 2.5, “Ventilation and Cooling Requirements”.
Table C.3 Data Center Environmental Checklist

<table>
<thead>
<tr>
<th>Data Center Environmental Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Does the computer room air handling meet temperature and humidity requirements?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the installation floor layout satisfy the ventilation requirements?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will the equipment be positioned so the exhaust air of one rack does not enter the air intake of another rack?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are the perforated floor tiles each rated at 400 CFM or greater?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do the data center air conditioners provide sufficient front to back airflow?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is airflow adequate to prevent hot spots?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Can the data center continuously satisfy environmental requirements?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Can more vented floor tiles be obtained if required?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

C.4 Access Route Checklist

Complete the following checklist to ensure that the access route requirements are met. For information about preparing your data center access route, see Section 4.2, “Prepare to Install Oracle Private Cloud Appliance”.

Table C.4 Access Route Checklist

<table>
<thead>
<tr>
<th>Access Route Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Has the access route been checked for clearances of the packaged equipment?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do all the doors and entry ways conform to the width and height requirements for transportation, including the width of the unpacked unit?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do all the doors meet the height requirement of minimum 218 cm (86 inches) for packaged delivery?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the access route provide sufficient space for transport of the packed devices?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are there any ramps or thresholds that are of concern? If yes, then provide details.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Access Route Considerations</td>
<td>Yes</td>
<td>No</td>
<td>N/A</td>
<td>Comment</td>
</tr>
<tr>
<td>---------------------------------------------------------------------------------------------</td>
<td>-----</td>
<td>----</td>
<td>-----</td>
<td>---------</td>
</tr>
<tr>
<td>Are there any stairs or ramps in the path when moving the new hardware?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Have you confirmed that all route incline angles are within the permitted range?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Have you confirmed that the access route is free of any obstacles that would expose the device to shock?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are all the surfaces acceptable for rolling the new unpacked and packed equipment?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>If a pallet jack is to be used, then have you confirmed the following:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The pallet jack supports the device weight?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The pallet jack tines are compatible with the shipping pallet?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>If there are stairs, then is a loading elevator accessible for the equipment?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>If an elevator is to be used, then have you confirmed the following:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The elevator car is wide enough for the device to be carried into it?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The elevator car is high enough for the device to be carried into it?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The load limit of the elevator is greater than the device weight?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Are elevators available to handle up to 996 kg (2197 lbs) fully-loaded rack capacity?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The elevator door meets the minimum height requirement of 218 cm (86 inches) for packaged rack delivery?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the path from the receiving location to the designated data center area support the weight of the unpacked equipment?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the path onto the raised floor rated for dynamic loading of the</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
C.5 Facility Power Checklist

Complete the following checklist to ensure that the facility power requirements are met. For information about power requirements, see Section 2.3, “Electrical Power Requirements”.

<table>
<thead>
<tr>
<th>Facility Power Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do you know the required operating voltage and electric current level of the device and peripherals?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will you be using single-phase (low-voltage or high-voltage) or 3-phase (low-voltage or high-voltage) power?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are enough power outlets provided within 2 meters (6.5 feet) for each rack?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do the power outlets have appropriate socket receptacles for the PDU option ordered? Options are low voltage or high voltage, single-phase or 3-phase.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will optional ground cables be attached to the rack?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are the circuit breakers for the equipment suitable in terms of voltage and current-carrying capacities?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the power frequency meet the equipment specifications?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are power outlets available for the new equipment at the designated location?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will system power be delivered from two separate grids?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there a UPS to power the equipment?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do you have the minimum required power sources to support the power load for the new hardware? Use kilowatt (kW) /kilovolt (kVA) to express power load.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
C.6 Safety Checklist

Complete the following checklist to ensure that the safety requirements are met. For information about safety, see Section 1.6, “Operational Procedures for Oracle Private Cloud Appliance” and Section 2.5, “Ventilation and Cooling Requirements”.

Table C.6 Safety Checklist

<table>
<thead>
<tr>
<th>Safety Checklist Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is there an emergency power shut off?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there a fire protection system in the data center room?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the computer room adequately equipped to extinguish a fire?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is antistatic flooring installed?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the floor below the raised floor free of obstacles and blockages?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

C.7 Logistics Checklist

Complete the following checklist to ensure that the logistics requirements are met. For information about unpacking and space requirements, see Section 2.1, “Space Requirements”.

Table C.7 Logistics Checklist

<table>
<thead>
<tr>
<th>Logistics Checklist Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do you have contact information for the data center personnel?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there security or access control for the data center?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are there any security background checks or security clearances required for vendor personnel to access the data center? If yes, then do you have a recommended agency?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>How many days in advance must background checks be completed?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are there any additional security access issues?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is computer room access available for installation personnel?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are laptops, cell phones, and cameras allowed in the data center?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the building have a delivery dock?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there a delivery/unpacking/staging area?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Logistics Checklist Considerations</td>
<td>Yes</td>
<td>No</td>
<td>N/A</td>
<td>Comment</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----</td>
<td>----</td>
<td>-----</td>
<td>---------</td>
</tr>
<tr>
<td>Is the delivery inside?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>If the delivery is not inside, then is the site prepared for uncrating?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the unpacking/staging area protected from the elements?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the building have adequate receiving space?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is the unpacking area air-conditioned to avoid thermal shock for various hardware components?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will sufficient moving personnel be available to install the hardware?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is union labor required for any part of the delivery or installation?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are you prepared for uncrating and trash removal?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is uncrating of cabinet and cabinet trash removal required?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Are there any restrictions on delivery truck length, width, or height?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the customer allow cardboard boxes and other packing material in the computer room? If no, then do ground level deliveries require a truck with a side rail lift?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is there a time constraint on dock access? If yes, then provide time constraints.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Is tail lift required on delivery carrier to unload the equipment at the delivery dock?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Will any of the following be required to place equipment in computer room?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Stair walkers</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Lifters</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Ramps</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Steel plates</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Floor covers</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the delivery carrier require any special equipment, such as non-</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
C.8 Network Specification Checklist

Complete the following checklist to ensure that the network specification requirements are met. For information about IP addresses, see Chapter 3, Network Requirements and Appendix A, Default IP Addresses.

Table C.8 Network Specification Checklist

<table>
<thead>
<tr>
<th>Network Specification Considerations</th>
<th>Yes</th>
<th>No</th>
<th>N/A</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Did you complete the networking worksheet, which is included in Section 3.2, “General Network Configuration”?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Have you received the site-specific installation template from your Oracle technical representative?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did you review the installation template and consult with your Oracle technical representative regarding any site-specific changes, if any?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did you verify that IP addresses in the installation template are currently not in use?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Have you performed the required configuration within your network infrastructure to allow the Oracle PCA to use the IP addresses specified in the template?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Have you registered IP addresses in the installation template with DNS?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did you run the required network cables from your network equipment to the location where the Oracle PCA will be installed?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did you label the network cables that will connect to the Oracle PCA?</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
