1. Introduction

1.1 Background

Oracle Financial Services Lending and Leasing (OFSLL) suite is a comprehensive, end-to-end solution that supports full lifecycle of direct and indirect consumer lending business with Origination, Servicing and Collections modules. This enables financial institutions to make faster lending decisions, provide better customer service and minimize delinquency rates through a single integrated platform. It addresses each of the lending processes from design through execution. Its robust architecture and use of leading-edge industry standard products ensure almost limitless scalability.

To extend OFSLL SaaS, OAuth2 can be used for securing OFSLL web services user access Authentication. This document details the process of web services authentication using OAuth services and enabling OAuth setup configurations.

1.2 Purpose

The purpose of this document is to provide detailed information for consulting and partner teams to implement an OAuth2 based REST API access authentication mechanism for OFSLL customers.

1.3 Abbreviations

Abbreviation	Detailed Description
OFSLL	Oracle Financial Services Lending and Leasing
IDM	Identity Management
OAuth	Open Authorization
SaaS	Software as a service
PaaS	Product as a service
OAM	Oracle Access Management
API	Application Program Interface
URL	Uniform Resource Locator
XML	Extensible Markup Language
JWT	JSON Web Token
CSF	Critical success factor

2. Web services authentication using OAuth2

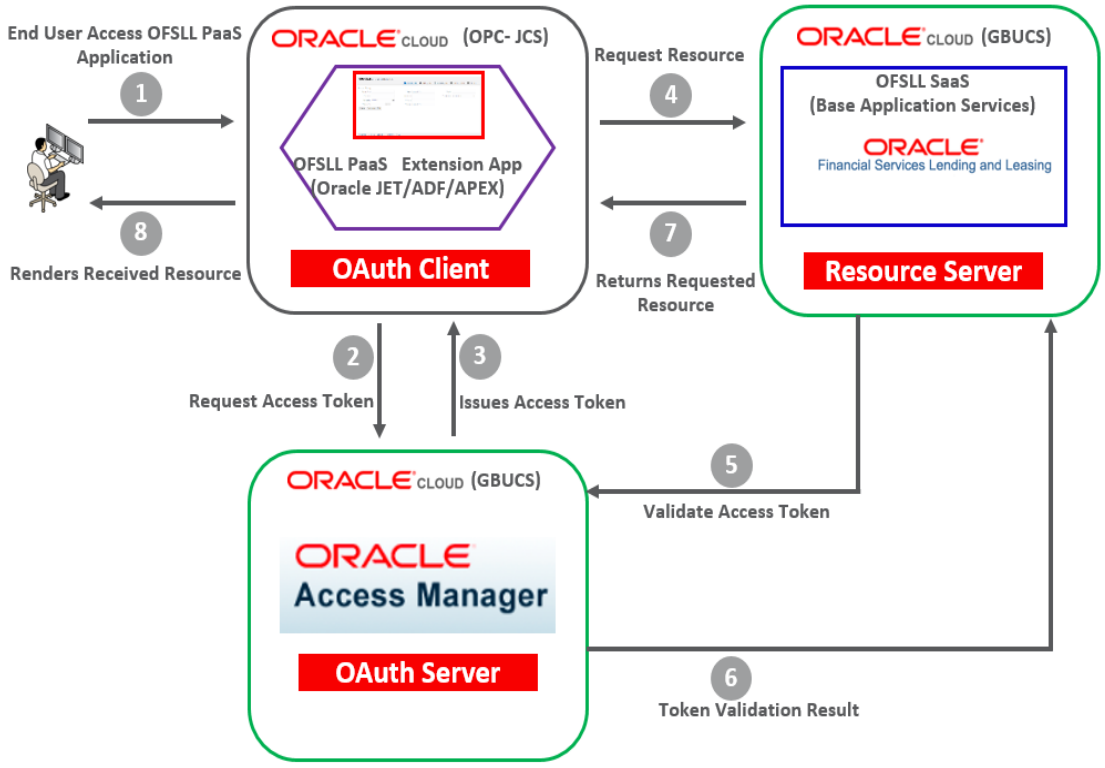
Web services authentication using OAuth2 is one of the best approach for securing user authentication to extend OFSLL SaaS. This uses Oracle / Non-Oracle PaaS to authenticate service access request from an external partner application without sharing OFSLL environment access credentials (UID / Password) and leverages the built-in support for OAuth 2.0.

OAuth 2.0 is an open standard token-exchange technology for verifying a user's identity across multiple systems and domains without risking the exposure of a password.

Third-party applications (those not hosted on Oracle Cloud PaaS) can use OAuth for making calls into OFSLL Cloud REST APIs. PaaS / On-Premise application can pass a user's authentication information and request an OAuth token from OFSLL Cloud, and then use the token to interact with an OFSLL Cloud API. PaaS or On-Premise and SaaS components can be with different ID Domains and security is managed with Shared IDM.

2.1 Understanding OAuth Services

Oracle Access Management (OAM) implemented the OAuth core 2.0 specifications to offer OAuth services. OAuth is an open standard authorization protocol that provides authentication and access control between a Client (such as Web services) and a Resource Owner (Service Provider) on the web.



2.1.1 Identity Domains

The Identity domains are entities that contain all artifacts required to provide standard OAuth services. Identity domains are independent entities and the primary use of this is to provide multi tenants deployments. Each Identity domain will correspond to a tenant. This will also be useful for cloud deployments where each Identity domain can correspond to a separate tenant or entity.

Following are some of the components configured within an OAuth services Identity domain.

- One or More Clients
- One or More Resource Servers

2.1.2 Clients

The client is an application which makes protected resource requests on behalf of the resource owner using its authorization. For example, OFSLL. The Client initiates the OAuth Protocol by invoking the OAuth services. The client may be public or confidential.

There are two types of clients:

- **Confidential Clients**: Web Applications are of confidential client types assigned with a client ID and secret key. These clients can interact with the OAuth services server by sending the Client ID and secret as part of an authorization header.
- **Public Clients**: Public Clients or untrusted clients are assigned with a client ID but no secret key. These are the type of external applications that are not capable of keeping a client password confidential.

2.1.3 Resource Server

The Resource server is the machine on which protected resource is hosted. The Resource server is deployed in a different location from OAM and Client. The Resource server needs to be capable of accepting and responding to protected resource requests using access tokens.

2.1.4 Resource Owner

This is an entity capable of granting access to a protected resource. When the resource owner is a person, it is referred as an end-user.

2.1.5 Types of OAuth REST API

OAuth services are enabled as part of OAM version 12c Installation process. OAM provides an API based approach for configuring OAuth Services. There are 2 types of API OAuth services providers namely Admin API and Runtime API.

The Admin API provides capability to create mandatory admin components like Identity domain, Resource Server and client etc. They must be configured before the client makes the token request.

Note: To Execute Admin API, you can refer to Oracle OAM OAuth REST API documentation available at https://docs.oracle.com/en/middleware/idm/access-manager/12.2.1.3/oroau/api-admin-identity-domain.html.

3. Enabling OAuth Setup Configurations

3.1 Enabling OAuth support for OFSLL REST APIs

The OAuth support for OFSLL REST API can be enabled with the following steps:

1. Add context Parameters in web.xml
2. Remove URL Security constraint tags in web.xml

   Add the below configuration in web.xml of OfsllRestWS.ear:

   <context-param>
   <description>This parameter will decide the jersey filter to be loaded</description>
   <param-name>OAUTH_AND_BASIC_ENABLED</param-name>
   <param-value>Y</param-value>
   </context-param>

3. Remove Security configuration from weblogic.xml as well.

Note: If this context parameter is not set, only the existing basic authentication flow is supported.

3.2 Identity Domain Creation

To create identity domain, any valid reliable REST client application/tool can be used to invoke the REST API. For example, Postman tool

http:<AdminServerHost:Port>/oam/services/rest/ssa/api/v1/oauthpolicyadmin/oauthidentitydomain

Request JSON payload

```
{
"name":"OFSLL_OAUTH_DOMAIN",
"identityProvider":"OUD_LDAP",
"description":"OFSLL_OAUTH_DOMAIN",
"tokenSettings":[{
"tokenType":"ACCESS_TOKEN",

"refreshTokenExpiry":86400,
"refreshTokenLifeCycleEnabled":false}],
ConsentPageURL - oam/pages/consent.jsp,
ErrorPageURL - /oam/pages/error.jsp,
CustomAttrs - Attribute of user in IDStore to store the encrypted secretkey for TOTP

3.3 Resource Server Creation

Resource Server Name: OFSLL_OAUTH_SERVER

Identity Domain: OFSLL_OAUTH_DOMAIN

Request JSON payload

```
{
"name":"OFSLL_OAUTH_SERVER",
"description":"OFSLL_OAUTH_SERVER",
"scopes":[{
"scopeName":"OFSLL_REST_ALL",
"description":"ALLOW_ALL"
},
{
"scopeName":"OFSLL_REST_NONE",
"description":"ALLOW_NONE"
}],
"tokenAttributes":
[{"attrName":"sessionId",
"attrValue":"$session.id",
"attrType":"DYNAMIC"
},
{
"attrName":"resSrvAttr",
"attrValue":"RESOURCECONST",
"attrType":"STATIC"
}],
"idDomain":"OFSLL_OAUTH_DOMAIN",
"audienceClaim":{"subjects":["OFSLL_B2B_OAUTH_CLIENT"]}
}
```

Response JSON payload

```
Sucessfully created entity - OAuthResourceServer, detail -
IdentityDomain="OFSLL_OAUTH_DOMAIN,
Name="OFSLL_OAUTH_SERVER", Description="OFSLL_OAUTH_SERVER",
resourceServerId="99a3e782-ce6d-467c-baec-df687fe326a6",
resourceServerNameSpacePrefix="OFSLL_OAUTH_SERVER.",
audienceClaim="{
"subjects":["OFSLL_B2B_OAUTH_CLIENT"]}",
resServerType="CUSTOM_RESOURCE_SERVER",
Scopes="[{
"scopeName":"OFSLL_REST_ALL",
"description":"ALLOW_ALL"},
{
"scopeName":"OFSLL_REST_NONE",
"description":"ALLOW_NONE"},
{
"scopeName":"DefaultScope",
"description":"DefaultScope"}]",
tokenAttributes="[{
"attrName":"sessionId",
```

"attrValue":"$session.id",
"attrType":DYNAMIC},
{"attrName":"resSrvAttr","attrValue":"RESOURCECONST","attrType":STATIC}]

3.4 Client Creation

Name: OFSLL_B2B_OAUTH_CLIENT

idDomain: OFSLL_OAUTH_DOMAIN

```
{
"attributes":[{
"attrName":"customeAttr1",
"attrValue":"CustomValue",
"attrType":"static"
}],
"secret":"welcome1",
"id":"OFSLL_B2B_OAUTH_CLIENT",
"scopes":[
"OFSLL_OAUTH_SERVER.OFSLL_REST_ALL",
"OFSLL_OAUTH_SERVER.OFSLL_REST_NONE"
],
"clientType":"CONFIDENTIAL_CLIENT",
"idDomain":"OFSLL_OAUTH_DOMAIN",
"description":"Client Description",
"name":"OFSLL_B2B_OAUTH_CLIENT",
"grantTypes":[
"PASSWORD","CLIENT_CREDENTIALS",
"JWT_BEARER","REFRESH_TOKEN",
"AUTHORIZATION_CODE"
],
"defaultScope":"OFSLL_OAUTH_SERVER.OFSLL_REST_ALL"
}
```

Response JSON payload

Sucessfully created entity - OAuthClient, detail - OAuth Client - uid = 236936a6-ed77-4d6a-bcee-c0282554a1a0,

name = OFSLL_B2B_OAUTH_CLIENT, id = OFSLL_B2B_OAUTH_CLIENT, identityDomain = OFSLL_OAUTH_DOMAIN,

description = Client Description, secret = welcome1, clientType = CONFIDENTIAL_CLIENT,

grantTypes = [PASSWORD, CLIENT_CREDENTIALS, JWT_BEARER, REFRESH_TOKEN, AUTHORIZATION_CODE],

attributes = [{

"attrName":"customeAttr1",

"attrValue":"CustomValue",

"attrType":STATIC

},

{

"attrName":"sessionId",

"attrValue":"$session.id",

"attrType":DYNAMIC

},

{

"attrName":"resSrvAttr",

"attrValue":"RESOURCECONST",

"attrType":STATIC

}],

scopes = [OFSLL_OAUTH_SERVER.OFSLL_REST_ALL, OFSLL_OAUTH_SERVER.OFSLL_REST_NONE],

defaultScope = OFSLL_OAUTH_SERVER.OFSLL_REST_ALL, redirectURIs = []

3.5 Getting Access Token

A client application which wants to obtain an access token from OAuth server can access OFSLL Authentication API which in turn accesses the OAM OAuth API and generates token. The authentication REST service OFSLL provides a wrapper around OAM OAuth API.

3.5.1 How OFSLL API works with access token?

1. Client calls OFSLL authentication API (OFSLL REST API) with required headers along with body and obtains the token as response.
2. OFSLL REST API validates the token and retrieves the user ID from access token.
3. If the token is valid, then provides access to the protected resource.

Note: To use OAM OAuth API, update the following OFSLL system parameters with valid values.

OFSLL System Parameter Name	Default Value	Actual Value Required to configure OAuth Feature
OAM_OAUTH_ENABLED_IND	SETME	Y

OFSLL System Parameter Name	Default Value	Actual Value Required to configure OAuth Feature
OAM_OAUTH_TOKEN_URL	SETME	http://<hostname>:<port>/oauth2/rest/token
OAM_OAUTH_TOKEN_VALID_URL	SETME	http://<hostname>:<port>/oauth2/rest/token/info?access_token=<AccessToken>

While client applications are allowed to access OAM OAuth REST API directly, it is recommended for clients to access OFSLL Authentication REST API for all token generation and token validation features.

Authentication Resource URL:

http://<<hostname>>:<<port>>/<<context_path>>/service/api/resources/auth/token

3.5.2 Access Token for CLIENT_CREDENTIALS grant type

Request JSON payload

```
{
"AuthRequest": { "GrantType": "CLIENT_CREDENTIALS" }
}
```

Mandatory Request Headers

Headers	Expected Value
X-OAUTH-IDENTITY-DOMAIN-NAME	OFSLL_OAUTH_DOMAIN
Authorization	Bearer <Base64encoded value of client credentials>

Response JSON payload

}

3.5.4 Access Token for JWT_BEARER grant type

This is the grant type is to achieve the seamless SSO between the different mixes of application. This grant type provides facility to link the mainstream application SSO session with OAuth token.

When the SSO session is generated, JWT User token also generated. The generated JWT user token has the SSO “session_id” as part of its claims. The consumer client application must call OFSLL Authentication API with JWT_BEARER token grant type to get access token to access the protected resource.

Note: The rules of SSO session are applied to the OAuth Access token.

3.5.6 How to get access token through Basic Authentication

Mandatory CSF Key

CSF Map name	Key
ofsll.int.common	ofsll.jwt.JwtSecretKey

The Ofsll.jwt.JwtSecretKey refers to the secret that must be associated at the time of token generation. This is the key would be used to validate the token.

Mandatory Request headers

Headers	Expected Value
Content-Type	application/json
Authorization	Bearer <Base64encoded value of resource owner credentials>

Request JSON payload

```
{ "AuthRequest": {
                "GrantType" : "PASSWORD"
}}
```

Response JSON payload

```
{
"AuthResponse": {
"Token":
"eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzUxMiJ9.eyJzdWIiOiJPRlNMTFNVUFIiLCJpc3MiOiJ
PRlNMTF9SRVNUX0FQSSIsImV4cCI6MTU0NTY3MjEyMSwiaWF0IjoxNTQ1NjcxMjIxfQ.

yvRgU1OSXhovdyw8zMl_ajqDLdESc_lZv3w",
"Result": {
"Status": "SUCCESS",
"StatusDetails": "Token Generated Successfully"
}
}
}
```

3.5.7 How to access the REST API using the access token

In Every OFSLL REST API request, please send the following headers with correct values

Mandatory Request headers

Headers	Expected Value
ofsll_access_token	The valid access token received from any of the above mention flow
X-OAUTH-IDENTITY-DOMAIN-NAME	Valid OAuth Identity domain associated with access token

3.6 Embedding External Application within OFSLL

As part of subsequent releases of OFSLL, to embed external application within OFSLL base application, we would provide one external link each under origination, servicing and collection modules. The associated menu links can be enabled through access screens.

Menu Access Keys
FLL.ORG.EXT.ONE.MENU
FLL.SER.EXT.ONE.MENU
FLL.COL.EXT.ONE.MENU

The URLs for External Link will be defined through System parameters. The following URL keys need to be defined with proper external link.

URL Keys	Example
FLL.ORG.EXT.ONE.URL	http://<<hostname>>:<<port>>/<<contextpath>>/index.html
FLL.SER.EXT.ONE.URL	http://<<hostname>>:<<port>>/<<contextpath>>/index.html
FLL.COL.EXT.ONE.URL	http://<<hostname>>:<<port>>/<<contextpath>>/index.html

Note: The base OFSLL SSO application would send the user identity token called 'authorizedCode' through the URL query parameter which should be read by external application to generate the actual access token (by calling authentication service) in order to access protected OFSLL Rest API.
