This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context          IN      SYS.RE$NV_LIST          DEFAULT NULL,
    table_values           IN      SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
    column_values          IN      SYS.RE$COLUMN_VALUE_LIST  DEFAULT NULL,
    variable_values        IN      SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
    attribute_values       IN      SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,

    skip_rules             IN      SYS.RE$RULE_NAME_LIST      DEFAULT NULL,

    dop                    IN      NUMBER,

    result_cache           IN      BOOLEAN                  DEFAULT FALSE,
    stop_on_first_hit     IN      BOOLEAN                  DEFAULT FALSE,
    simple_rules_only      IN      BOOLEAN                  DEFAULT FALSE,
    true_rules             OUT     SYS.RE$RULE_HIT_LIST,
    maybe_rules            OUT     SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context          IN      SYS.RE$NV_LIST          DEFAULT NULL,
    table_values           IN      SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
    column_values          IN      SYS.RE$COLUMN_VALUE_LIST  DEFAULT NULL,
    variable_values        IN      SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
    attribute_values       IN      SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,

    skip_rules             IN      SYS.RE$RULE_NAME_LIST      DEFAULT NULL,

    dop                    IN      NUMBER,

    simple_rules_only      IN      BOOLEAN                  DEFAULT FALSE,
    true_rules_iterator    OUT     BINARY_INTEGER,
    maybe_rules_iterator   OUT     BINARY_INTEGER);

```

Parameters

Table 151-3 EVALUATE Procedure Parameters

Parameter	Description
<code>rule_set_name</code>	Name of the rule set in the form <code>[schema_name.]rule_set_name</code> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
<code>event_context</code>	A list of name-value pairs that identify events that cause evaluation
<code>table_values</code>	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
<code>column_values</code>	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> .
<code>variable_values</code>	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
<code>attribute_values</code>	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> .
<code>stop_on_first_hit</code>	If <code>TRUE</code> , then the rules engine stops evaluation as soon as it finds a <code>TRUE</code> rule. If <code>TRUE</code> and there are no <code>TRUE</code> rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to <code>TRUE</code> given more data. If <code>FALSE</code> , then the rules engine continues to evaluate rules even after it finds a <code>TRUE</code> rule.
<code>simple_rules_only</code>	If <code>TRUE</code> , then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If <code>FALSE</code> , then evaluates all rules.

Table 151-3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
<code>true_rules</code>	<p>Receives the output of the <code>EVALUATE</code> procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type.</p> <p>If no rules evaluate to <code>TRUE</code>, then <code>true_rules</code> is empty.</p> <p>If at least one rule evaluates to <code>TRUE</code> and <code>stop_on_first_hit</code> is <code>TRUE</code>, then <code>true_rules</code> contains one rule that evaluates to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>true_rules</code> contains all rules that evaluate to <code>TRUE</code>.</p>
<code>maybe_rules</code>	<p>If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty.</p> <p>If <code>stop_on_first_hit</code> is <code>TRUE</code>, then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code>, then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code>.</p> <p>If <code>stop_on_first_hit</code> is <code>FALSE</code>, then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code> given more data.</p>
<code>true_rules_iterator</code>	Contains the iterator for accessing rules that are <code>TRUE</code>
<code>maybe_rules_iterator</code>	Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL
<code>skip_rules</code>	List of rules to skip within this evaluation.
<code>dop</code>	Degree of parallelism
<code>result_cache</code>	If <code>TRUE</code> , Result Cache will be created. If evaluate procedure is called with either <code>true_rules_iterator</code> or <code>maybe_rules_iterator</code> , then <code>result_cache</code> is not enabled.

Usage Notes

Note:

Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as `TRUE`, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
 - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
 - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

 **Note:**

The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

 **See Also:**

- [GET_NEXT_HIT](#) Function
- [CLOSE_ITERATOR](#) Procedure

151.3.3 EVALUATE_EXPRESSION Procedure

This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, its possible of aging....

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION(
  rule_expression          IN          VARCHAR2,
  table_aliases            IN          SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types          IN          SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  table_values             IN          SYS.RE$TABLE_VALUE_LIST:= NULL,
  column_values           IN          SYS.RE$COLUMN_VALUE_LIST:=NULL,
  variable_values         IN          SYS.RE$VARIABLE_VALUE_LIST:=NULL,
  attribute_values        IN          SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL,
  cache                   IN          BOOLEAN DEFAULT FALSE,
  result_val              OUT         BOOLEAN);
```

Parameters

Table 151-4 EVALUATE_EXPRESSION Procedure Parameters

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Contains alias of tables referred in the expression string.
variable_types	Contains type definitions of variables used in expression.
table_values	Contains ROWID of table row for expression evaluation.
column_values	Contains values of columns referred in the expression.
variable_values	Contains values of variables referred in the expression.
attribute_values	Contains values of attributes referred in the expression.
cache	If TRUE, Result Cache will be created.

Table 151-4 (Cont.) EVALUATE_EXPRESSION Procedure Parameters

Parameter	Description
result_val	Result of the evaluation.

151.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure

This is a user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element.

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(
    rule_expression      IN          varchar2,
    table_aliases        IN          sys.re$table_alias_list:= NULL,
    variable_types       IN          sys.re$variable_type_list:= NULL,
    values               IN          sys.re$value_list,
    cache                IN          boolean DEFAULT FALSE,
    result_val_iter_id   OUT         BINARY_INTEGER)
```

Parameters

Table 151-5 EVALUATE_EXPRESSION_ITERATOR Procedure Parameter

Parameter	Description
rule_expression	Contains an expression string.
table_alias	Alias of tables referred in the above expression string.
variable_types	Type definitions of variables used in expression.
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using value.

151.3.5 EVALUATE_RULE Procedure

The Rule Evaluation API expects that `CREATE_RULE` procedure has been called with an legitimate `EVALUATION_CONTEXT` prior. This API will evaluate the condition defined in the Rule.

Syntax

```
DBMS_RULE.EVALUATE_RULE(
    rule_name           IN          VARCHAR2,
    event_context       IN          SYS.RE$NV_LIST           DEFAULT NULL,
    table_values        IN          SYS.RE$table_value_list  DEFAULT NULL,
    column_values       IN          SYS.RE$column_value_list DEFAULT NULL,
    variable_values     IN          SYS.RE$variable_value_list DEFAULT NULL,
    attribute_values    IN          SYS.RE$attribute_value_list DEFAULT NULL,
```

```

cache          IN  BOOLEAN DEFAULT FALSE,
result_val     OUT BOOLEAN);

```

Parameters

Table 151-6 EVALUATE_RULE Procedure Parameter

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation.
table_values	ROWID of table row for expression evaluation.
column_values	Values of columns referred in the expression
variable_values	Values of variables referred in expression
attribute_values	Values of attributes referred in expression
cache	If TRUE, Result Cache will be created.
result_val	Result of the evaluation

151.3.6 EVALUATE_RULE_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass re\$value_list into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (re\$value_list) element. User can use DBMS_RULE.GET_NEXT_RESULT procedure to iterate through the result list.

Syntax

```

DBMS_RULE.EVALUATE_RULE_ITERATOR(
rule_name      IN      VARCHAR2,
event_context  IN      SYS.RE$NV_LIST DEFAULT NULL,
values         IN      SYS.RE$VALUE_LIST,
cache         IN      BOOLEAN DEFAULT FALSE,
result_val_iter_id OUT  BINARY_INTEGER);

```

Parameters

Table 151-7 EVALUATE_RULE_ITERATOR Procedure Parameter

Parameter	Description
rule_name	Name of the rule previously create using CREATE_RULE procedure.
event_context	A list of name-value pairs that identify events that cause evaluation
values	List of datapoint values for evaluation.
cache	If TRUE, Result Cache will be created.
result_val_iter_id	Contains iterator for result of array of values sent using values

151.3.7 GET_NEXT_HIT Function

This function returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator. The function returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(  
    iterator IN BINARY_INTEGER)  
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 151-8 GET_NEXT_HIT Function Parameter

Parameter	Description
<code>iterator</code>	The iterator from which the rule that evaluated to <code>TRUE</code> or <code>MAYBE</code> is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns `NULL`, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

Note:

This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [EVALUATE Procedure](#)
- [CLOSE_ITERATOR Procedure](#)

151.3.8 GET_NEXT_RESULT Function

This function iterates over result from the expression given in RESULT_VAL_ITERATOR. It returns the expression at iterator evaluated to TRUE or FALSE.

Syntax

```
DBMS_RULE.GET_NEXT_RESULT (
  result_val_iterator_id  IN  BINARY_INTEGER)
RETURN  BOOLEAN;
```

Parameter

Table 151-9 GET_NEXT_RESULT Function Parameter

Parameter	Description
result_val_iterator_id	Iterator returned from EVALUATE_EXPRESSION_ITERATOR

151.3.9 IS_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return TRUE if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

Syntax

```
DBMS_RULE.IS_FAST(
  expression          IN          VARCHAR2,
  table_aliases       IN          SYS.RE$TABLE_ALIAS_LIST:= NULL,
  variable_types      IN          SYS.RE$VARIABLE_TYPE_LIST:= NULL,
  result_val          OUT         BOOLEAN);
```

Parameter

Table 151-10 IS_FAST Procedure Parameter

Parameter	Description
expression	Expression to check
table_aliases	Alias of tables referred in the above expression string
variable_types	Type definitions of variables used in expression
result_val	If the expression can be evaluated as fast

152

DBMS_RULE_ADM

The `DBMS_RULE_ADM` package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_RULE_ADM Subprograms](#)

152.1 DBMS_RULE_ADM Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package
- [DBMS_RULE](#)

152.2 DBMS_RULE_ADM Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group `PUBLIC`

152.3 Summary of DBMS_RULE_ADM Subprograms

This table lists the `DBMS_RULE_ADM` subprograms and briefly describes them.

Table 152-1 `DBMS_RULE_ADM` Package Subprograms

Subprogram	Description
ADD_RULE Procedure	Adds the specified rule to the specified rule set

Table 152-1 (Cont.) DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ALTER_EVALUATION_CONTEXT Procedure	Alters a rule evaluation context
ALTER_RULE Procedure	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure	Creates a rule evaluation context
CREATE_RULE Procedure	Creates a rule with the specified name
CREATE_RULE_SET Procedure	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure	Drops the rule evaluation context with the specified name
DROP_RULE Procedure	Drops the rule with the specified name
DROP_RULE_SET Procedure	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SYSTEM_PRIVILEGE Procedure	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SYSTEM_PRIVILEGE Procedure	Revokes the specified system privilege from the specified user or role

**Note:**

All subprograms commit unless specified otherwise.

152.3.1 ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
  rule_name          IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_comment       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 152-2 ADD_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are adding to the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to add a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set to which you are adding the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to add the rule to a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
<code>rule_comment</code>	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

152.3.2 ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                   DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                   DEFAULT FALSE,
  evaluation_function           IN  VARCHAR2                 DEFAULT NULL,
  remove_evaluation_function    IN  BOOLEAN                   DEFAULT FALSE,
  evaluation_context_comment    IN  VARCHAR2                 DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                   DEFAULT FALSE);
```

Parameters

Table 152-3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to alter an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If <code>NULL</code> and <code>remove_table_aliases</code> is <code>FALSE</code> , then the procedure retains the existing table aliases. If <code>NULL</code> and <code>remove_table_aliases</code> is <code>TRUE</code> , then the procedure removes the existing table aliases. If non- <code>NULL</code> , then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If <code>TRUE</code> and <code>table_aliases</code> is <code>NULL</code> , then the procedure removes the existing table aliases for the evaluation context. If <code>TRUE</code> and <code>table_aliases</code> is non- <code>NULL</code> , then the procedure raises an error. If <code>FALSE</code> , then the procedure does not remove table aliases.

Table 152-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
<code>variable_types</code>	<p>If NULL and <code>remove_variable_types</code> is FALSE, then the procedure retains the variable types. If NULL and <code>remove_variable_types</code> is TRUE, then the procedure removes the existing variable types.</p> <p>If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.</p>
<code>remove_variable_types</code>	<p>If TRUE and <code>variable_types</code> is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and <code>variable_types</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p>
<code>evaluation_function</code>	<p>If NULL and <code>remove_evaluation_function</code> is FALSE, then the procedure retains the existing evaluation function. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.</p> <p>See CREATE_EVALUATION_CONTEXT Procedure for more information about evaluation functions.</p>
<code>remove_evaluation_function</code>	<p>If TRUE and <code>evaluation_function</code> is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and <code>evaluation_function</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p>
<code>evaluation_context_comment</code>	<p>If NULL and <code>remove_eval_context_comment</code> is FALSE, then the procedure retains the existing evaluation context comment. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p>

Table 152-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user
- Have ALTER_ANY_EVALUATION_CONTEXT system privilege

See Also:

[Rule TYPES](#) for more information about the types used with the DBMS_RULE_ADM package

152.3.3 ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
    rule_name           IN  VARCHAR2,
    condition           IN  VARCHAR2          DEFAULT NULL,
    evaluation_context  IN  VARCHAR2          DEFAULT NULL,
    remove_evaluation_context IN  BOOLEAN      DEFAULT FALSE,
    action_context      IN  SYS.RE$NV_LIST    DEFAULT NULL,
    remove_action_context IN  BOOLEAN      DEFAULT FALSE,
    rule_comment        IN  VARCHAR2          DEFAULT NULL,
    remove_rule_comment IN  BOOLEAN      DEFAULT FALSE);
```

Parameters

Table 152-4 ALTER_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are altering, specified as <code>[schema_name.]rule_name</code> . For example, to alter a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>condition</code>	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
<code>remove_evaluation_context</code>	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the <code>evaluation_context</code> parameter is non-NULL, then this parameter should be set to FALSE.
<code>action_context</code>	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
<code>remove_action_context</code>	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the <code>action_context</code> parameter is non-NULL, then this parameter should be set to FALSE.
<code>rule_comment</code>	If non-NULL, then the existing comment of the rule is replaced by the specified comment.
<code>remove_rule_comment</code>	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the <code>rule_comment</code> parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE` privilege on the rule

- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

[Rule TYPES](#) for more information about the types used with the DBMS_RULE_ADM package

152.3.4 CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT (
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                  DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                  DEFAULT NULL);
```

Parameters

Table 152-5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as <i>[schema_name.]evaluation_context_name</i> . For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context

Table 152-5 (Cont.) CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
<code>evaluation_function</code>	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default. See " Usage Notes " for more information about the evaluation function.
<code>evaluation_context_comment</code>	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have `CREATE_EVALUATION_CONTEXT_OBJ` system privilege
- Have `CREATE_ANY_EVALUATION_CONTEXT` system privilege

See Also:

[Rule TYPEs](#) for more information about the types used with the `DBMS_RULE_ADM` package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2,
  event_context      IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values       IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  stop_on_first_hit  IN  BOOLEAN                 DEFAULT FALSE,
  simple_rules_only  IN  BOOLEAN                 DEFAULT FALSE,
  true_rules         OUT SYS.RE$RULE_HIT_LIST,
  maybe_rules        OUT SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

Note:

Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation

obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.

- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

152.3.5 CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE (
  rule_name          IN  VARCHAR2,
  condition          IN  VARCHAR2,
  evaluation_context IN  VARCHAR2          DEFAULT NULL,
  action_context    IN  SYS.RE$NV_LIST  DEFAULT NULL,
  rule_comment      IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 152-6 CREATE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code> . For example, to create a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>condition</code>	The condition to be associated with the rule. A condition evaluates to <code>TRUE</code> or <code>FALSE</code> and can be any condition allowed in the <code>WHERE</code> clause of a <code>SELECT</code> statement. For example, the following is a valid rule condition: <code>department_id = 30</code> Ensure that the proper case is used for text in rule conditions. Note: Do not include the word "WHERE" in the condition.
<code>evaluation_context</code>	An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which is associated with the rule. If the schema is not specified, then the current user is the default. If <code>evaluation_context</code> is not specified, then the rule inherits the evaluation context from its rule set.
<code>action_context</code>	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
<code>rule_comment</code>	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the `CREATE_RULE_OBJ` system privilege
- Have `CREATE_ANY_RULE` system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

152.3.6 CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
    rule_set_name      IN  VARCHAR2,
    evaluation_context IN  VARCHAR2 DEFAULT NULL,
    rule_set_comment   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 152-7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
<code>rule_set_name</code>	The name of the rule set you are creating, specified as <code>[schema_name.]rule_set_name</code> . For example, to create a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context</code>	An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
<code>rule_set_comment</code>	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

152.3.7 DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT (
    evaluation_context_name IN VARCHAR2,
    force                    IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 152-8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
<code>evaluation_context_name</code>	The name of the evaluation context you are dropping, specified as <code>[schema_name.]evaluation_context_name</code> . For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>force</code>	If <code>TRUE</code> , then the procedure removes the rule evaluation context from all rules and rule sets that use it. If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context. If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception. Caution: Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

152.3.8 DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE (
    rule_name IN VARCHAR2,
    force     IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 152-9 DROP_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are dropping, specified as <code>[schema_name.]rule_name</code> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>force</code>	<p>If <code>TRUE</code>, then the procedure removes the rule from all rule sets that contain it.</p> <p>If <code>FALSE</code> and no rule sets contain the rule, then the procedure drops the rule.</p> <p>If <code>FALSE</code> and one or more rule sets contain the rule, then the procedure raises an exception.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have `DROP_ANY_RULE` system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the `REMOVE_RULE` procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

152.3.9 DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
  rule_set_name IN VARCHAR2,
  delete_rules  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 152-10 DROP_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to drop a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If TRUE , then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE , then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have **DROP_ANY_RULE_SET** system privilege
- Be the owner of the rule set

Note:

The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

152.3.10 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
  privilege      IN BINARY_INTEGER,
  object_name    IN VARCHAR2,
  grantee        IN VARCHAR2,
  grant_option   IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 152-11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the object privilege to grant to the grantee on the object. See " Usage Notes " for the available object privileges.
object_name	The name of the object for which you are granting the privilege to the grantee, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, to grant the privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

[Table 152-12](#) lists the object privileges.

Table 152-12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT	Alter and execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE	Alter and execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET	Alter and execute a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT	Alter a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE	Alter a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET	Alter a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT	Execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE	Execute a particular rule in another user's schema

Table 152-12 (Cont.) Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name  => 'strmadmin.hr_dml',
    grantee      => 'hr',
    grant_option => FALSE);
END;
/
```

152.3.11 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
  privilege    IN  BINARY_INTEGER,
  grantee      IN  VARCHAR2,
  grant_option IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 152-13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

[Table 152-14](#) lists the system privileges.

Table 152-14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user

Table 152-14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee   => 'strmadmin',
    grant_option => FALSE);
END;
/
```

152.3.12 REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name           IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2,
  evaluation_context  IN  VARCHAR2  DEFAULT NULL,
  all_evaluation_contexts IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 152-15 REMOVE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are removing from the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to remove a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set from which you are removing the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to remove the rule from a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context_name</code>	<p>The name of the evaluation context associated with the rule you are removing, specified as <code>[schema_name.]evaluation_context_name</code>. For example, to specify an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <code>ADD_RULE</code> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error.</p> <p>Specify <code>NULL</code> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <code>NULL</code> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.</p>
<code>all_evaluation_contexts</code>	<p>If <code>TRUE</code>, then the procedure removes the rule from the rule set with all of its associated evaluation contexts.</p> <p>If <code>FALSE</code>, then the procedure only removes the rule with the specified evaluation context.</p> <p>This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

 **Note:**

This procedure does not drop a rule from the database. To drop a rule from the database, use the `DROP_RULE` procedure.

152.3.13 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE (
  privilege   IN  BINARY_INTEGER,
  object_name IN  VARCHAR2,
  revokee     IN  VARCHAR2);
```

Parameters

Table 152-16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the object privilege on the object to revoke from the revokee. See GRANT_OBJECT_PRIVILEGE Procedure for a list of the object privileges.
object_name	The name of the object for which you are revoking the privilege from the revokee, specified as <code>[schema_name.]object_name</code> . For example, to revoke an object privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

152.3.14 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE (
  privilege IN  BINARY_INTEGER,
  revokee   IN  VARCHAR2);
```

Parameters

Table 152-17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to revoke from the revokee. See GRANT_SYSTEM_PRIVILEGE Procedure for a list of the system privileges.
revokee	The name of the user or role from which the privilege is revoked

DBMS_SCHEDULER

The `DBMS_SCHEDULER` package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SCHEDULER Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information regarding how to use `DBMS_SCHEDULER`

153.1 DBMS_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 12c Release 1 (12.1):

- [CREATE_CREDENTIAL Procedure](#)
- [DROP_CREDENTIAL Procedure](#)

153.2 DBMS_SCHEDULER Security Model

The `DBMS_SCHEDULER` package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

153.3 DBMS_SCHEDULER Rules and Limits

These rules apply when using the `DBMS_SCHEDULER` package.

- Only `SYS` can perform actions on objects in the `SYS` schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first object that returns an

error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If `job3` cannot be stopped, then the jobs that follow it, `jobclass1`, `jobclass2`, and `jobclass3` cannot be stopped. The jobs that preceded `job3`, `job1` and `job2`, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

153.4 DBMS_SCHEDULER Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various parts of the syntax.

In the calendaring syntax, * means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule
```

```
regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause] [";" periods_clause]
[";" byperiod_clause]
```

```
frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
```

```

numofweeks = 1 through 53
numofdays = 1 through 376
minus = "-"

combined_schedule = schedule_list
```

Table 153-1 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.
BYWEEKNO	<p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p>
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.
BYDATE	<p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows:</p> <pre>BYDATE=0115,0315,0615,0915,1215,20060115</pre> <p>The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10:</p> <pre>BYDATE=0110+SPAN:5D</pre> <p>The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of <i>n</i> days or weeks centered around the supplied date. If <i>n</i> is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting <i>n</i> days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET keyword is optional), which is also equivalent to BYDATE=0122.</p>

Table 153-1 (Cont.) Values for repeat_interval

Name	Description
BYMONTHDAY	This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.
BYDAY	This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.
BYHOUR	This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.
BYMINUTE	This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: <code>FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1</code> Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.
INCLUDE	This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure. This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.

Table 153-1 (Cont.) Values for repeat_interval

Name	Description
EXCLUDE	<p>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the <code>CREATE_SCHEDULE</code> procedure.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p>
INTERSECT	<p>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.</p> <p>For example, assume that the named schedule <code>last_sat</code> indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule <code>end_qtr</code> indicates the last day of each quarter in 2005:</p> <pre>3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <p>These calendaring expressions result in the dates that follow:</p> <pre>3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <pre>FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr</pre> <p>In this example, the terms <code>FREQ=MONTHLY; BYMONTHDAY=-1</code> indicate the last day of each month.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p>
PERIODS	<p>This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user-defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year.</p> <pre>FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4</pre>
BYPERIOD	<p>This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.</p>

Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules
 For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.

- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.
- Days that are added by the `INCLUDE` clause follow the hourly/minutes/seconds execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See ["Start Dates and Repeat Intervals"](#), later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY;INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User-Defined Frequencies

Instead of using predefined frequencies like `DAILY`, `WEEKLY`, `MONTHLY`, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are. The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.

- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "`FREQ=YEARLY`" with a start date of `02/15/2003` becomes "`FREQ=YEARLY;BYMONTH=FEB;BYMONTHDAY=15`", which means every year on the 15th of February.

"`FREQ=YEARLY;BYMONTH=JAN,JUL`" with start date `01/21/2003` becomes "`FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21`", which means every year on January 21 and July 21.

- The `byweekno` clause is only allowed if the frequency is `YEARLY`. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a `BYDAY` clause. For example, "`FREQ=YEARLY;BYWEEKNO=2`" with a start date of `01/01/2003` will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "`FREQ=YEARLY;BYWEEKNO=1,53`" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.

- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as 'US/Eastern' in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the `start_date` is set to an absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.
- When `start_date` is NULL, the Scheduler determines the time zone for the repeat interval as follows:
 1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:
 - Issuing an ALTER SESSION statement, for example:

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
 - Setting the ORA_SDTZ environment variable.
 2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the DEFAULT_TIMEZONE Scheduler attribute. For more information, see the [SET_SCHEDULER_ATTRIBUTE Procedure](#).
 3. If the DEFAULT_TIMEZONE attribute is NULL, the Scheduler uses the time zone of `systimestamp` when the job or window is enabled.

BYSETPOS Clause Rules

The following are rules for the BYSETPOS clause.

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY; INTERVAL=3; BYDAY=MON, TUE, WED, THU, FRI; BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which BYSETPOS is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY; BYDAY=MON, TUE, FRI; BYSETPOS=1, 3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules

The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
  exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

OFFSET Rules

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

Example 153-1 Putting It All Together

This example demonstrates the use of user-defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
  dbms_scheduler.create_schedule('year_start', repeat_interval=>
    'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
  dbms_scheduler.create_schedule('retail_fiscal_year',
    to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
    'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
  dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
```

```
'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
  BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

153.5 DBMS_SCHEDULER Data Structures

The `DBMS_SCHEDULER` package defines `OBJECT` types and `TABLE` types.

OBJECT Types

- `JOBARG` Object Type
- `JOB_DEFINITION` Object Type
- `JOBATTR` Object Type
- `SCHEDULER$_STEP_TYPE` Object Type
- `SCHEDULER$_EVENT_INFO` Object Type
- `SCHEDULER_FILEWATCHER_RESULT` Object Type
- `SCHEDULER_FILEWATCHER_REQUEST` Object Type

TABLE Types

- `JOBARG_ARRAY` Table Type
- `JOB_DEFINITION_ARRAY` Table Type
- `JOBATTR_ARRAY` Table Type
- `SCHEDULER$_STEP_TYPE_LIST` Table Type

153.5.1 DBMS_SCHEDULER JOBARG Object Type

This type is used by the `JOB` and `JOBATTR` object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
  arg_position      NUMBER,
  arg_text_value    VARCHAR2(4000),
  arg_anydata_value ANYDATA,
  arg_operation     VARCHAR2(5));
```

Attributes

Table 153-2 JOBARG Object Type Attributes

Attribute	Description
<code>arg_position</code>	Position of the argument
<code>arg_text_value</code>	Value of the argument if the type is <code>VARCHAR2</code>
<code>arg_anydata_value</code>	Value of the argument if the type is <code>AnyData</code>

Table 153-2 (Cont.) JOBARG Object Type Attributes

Attribute	Description
arg_operation	Type of the operation: <ul style="list-style-type: none"> • SET • RESET

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN VARCHAR2)
RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN ANYDATA)
RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_reset         IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;
```

Parameters**Table 153-3 JOBARG Constructor Function Parameters**

Parameter	Description
arg_position	Position of the argument
arg_value	Value of the argument
arg_reset	If arg_reset is TRUE, then the argument at that position is reset. Setting arg_reset to FALSE (which is the default) will create an argument with a NULL value.

JOBARG_ARRAY Table Type**Syntax**

```
TYPE jobarg_array IS TABLE OF jobarg;
```

153.5.2 JOBARG_ARRAY Table Type

The `jobarg_array` type is a table of `jobarg`.

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

153.5.3 DBMS_SCHEDULER JOB_DEFINITION Object Type

This type is used by the `CREATE_JOBS` procedure and represents a job in a batch of jobs.

Syntax

```
TYPE job_definition IS OBJECT (
  job_name                VARCHAR2(100),
  job_class               VARCHAR2(32),
  job_style               VARCHAR2(11),
  program_name           VARCHAR2(100),
  job_action              VARCHAR2(4000),
  job_type               VARCHAR2(20),
  schedule_name          VARCHAR2(65),
  repeat_interval        VARCHAR2(4000),
  schedule_limit         INTERVAL DAY TO SECOND,
  start_date             TIMESTAMP WITH TIME ZONE,
  end_date               TIMESTAMP WITH TIME ZONE,
  event_condition        VARCHAR2(4000),
  queue_spec             VARCHAR2(100),
  number_of_arguments   NUMBER,
  arguments              SYS.JOBARG_ARRAY,
  job_priority           NUMBER,
  job_weight             NUMBER,
  max_run_duration      INTERVAL DAY TO SECOND,
  max_runs              NUMBER,
  max_failures          NUMBER,
  logging_level         NUMBER,
  restartable           VARCHAR2(5),
  stop_on_window_close  VARCHAR2(5),
  raise_events          NUMBER,
  comments              VARCHAR2(240),
  auto_drop             VARCHAR2(5),
  enabled              VARCHAR2(5),
  follow_default_timezone VARCHAR2(5),
  parallel_instances    VARCHAR2(5),
  aq_job               VARCHAR2(5),
  instance_id          NUMBER,
  credential_name      VARCHAR2(65),
  destination          VARCHAR2(4000),
  database_role        VARCHAR2(20),
  allow_runs_in_restricted_mode VARCHAR2(5);
  restart_on_recovery  BOOLEAN;
  restart_on_failure   BOOLEAN;)
```

Object Attributes

Table 153-4 provides brief descriptions of the attributes of the `JOB_DEFINITION` object type. For more complete information about these attributes, see the "[CREATE_JOB Procedure](#)" and the "[SET_ATTRIBUTE Procedure](#)".

Table 153-4 JOB_DEFINITION Object Types

Attribute	Description
<code>job_name</code>	Name of the job
<code>job_class</code>	Name of the job class
<code>job_style</code>	Style of the job: <ul style="list-style-type: none"> REGULAR LIGHTWEIGHT IN_MEMORY_RUNTIME IN_MEMORY_FULL
<code>program_name</code>	Name of the program that the job runs
<code>job_action</code>	Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.
<code>job_type</code>	Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT')
<code>schedule_name</code>	Name of the schedule that specifies when the job has to execute
<code>repeat_interval</code>	Inline time-based schedule
<code>schedule_limit</code>	Maximum delay time between scheduled and actual job start before a job run is canceled
<code>start_date</code>	Start date and time of the job
<code>end_date</code>	End date and time of the job
<code>event_condition</code>	Event condition for event-based jobs
<code>queue_spec</code>	File watcher name or queue specification for event-based jobs
<code>number_of_arguments</code>	Number of job arguments
<code>arguments</code>	Array of job arguments
<code>job_priority</code>	Job priority
<code>job_weight</code>	*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.
<code>max_run_duration</code>	Maximum run duration of the job
<code>max_runs</code>	Maximum number of runs before the job is marked as completed
<code>max_failures</code>	Maximum number of failures tolerated before the job is marked as broken
<code>logging_level</code>	Job logging level
<code>restartable</code>	Indicates whether the job is restartable (TRUE) or not (FALSE)

Table 153-4 (Cont.) JOB_DEFINITION Object Types

Attribute	Description
stop_on_window_close	Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the SET_ATTRIBUTE Procedure .
raise_events	State changes that raise events
comments	Comments on the job
auto_drop	If TRUE (the default), indicates that the job should be dropped once completed
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel. If FALSE, then an event is discarded if it is raised while the job that handles it is already running,
aq_job	For internal use only
instance_id	The instance ID of the instance that the job must run on For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances.
credential_name	The credential to use for a single destination or the default credential for a group of destinations
destination	The name of a single external destination or database destination, or a group name of type external destination or database destination
database_role	In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode
restart_on_recovery	If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered. If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered.
restart_on_failure	If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED. If set to FALSE (the default), a failed job is immediately marked FAILED.

JOB_DEFINITION Constructor Function

This constructor function constructs a `job_definition` object.

Syntax

```

constructor function job_definition (
    job_name          IN          VARCHAR2,
    job_style         IN          VARCHAR2 DEFAULT 'REGULAR',
    program_name     IN          VARCHAR2 DEFAULT NULL,
    job_action        IN          VARCHAR2 DEFAULT NULL,
    job_type          IN          VARCHAR2 DEFAULT NULL,
    schedule_name    IN          VARCHAR2 DEFAULT NULL,
    repeat_interval  IN          VARCHAR2 DEFAULT NULL,
    event_condition  IN          VARCHAR2 DEFAULT NULL,
    queue_spec       IN          VARCHAR2 DEFAULT NULL,
    start_date       IN          TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    end_date         IN          TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_arguments IN      NATURAL DEFAULT NULL,
    arguments        IN          SYS.JOBARG_ARRAY DEFAULT NULL,
    job_class        IN          VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    schedule_limit   IN          INTERVAL DAY TO SECOND DEFAULT NULL,
    job_priority     IN          NATURAL DEFAULT NULL,
    job_weight       IN          NATURAL DEFAULT NULL,
    max_run_duration IN          INTERVAL DAY TO SECOND DEFAULT NULL,
    max_runs         IN          NATURAL DEFAULT NULL,
    max_failures     IN          NATURAL DEFAULT NULL,
    logging_level    IN          NATURALN DEFAULT 64,
    restartable      IN          BOOLEAN DEFAULT FALSE,
    stop_on_window_close IN      BOOLEAN DEFAULT FALSE,
    raise_events     IN          NATURAL DEFAULT NULL,
    comments         IN          VARCHAR2 DEFAULT NULL,
    auto_drop        IN          BOOLEAN DEFAULT TRUE,
    enabled          IN          BOOLEAN DEFAULT FALSE,
    follow_default_timezone IN    BOOLEAN DEFAULT FALSE,
    parallel_instances IN        BOOLEAN DEFAULT FALSE,
    aq_job           IN          BOOLEAN DEFAULT FALSE,
    instance_id      IN          NATURAL DEFAULT NULL,
    credential_name  IN          VARCHAR2 DEFAULT NULL,
    destination      IN          VARCHAR2 DEFAULT NULL,
    database_role    IN          VARCHAR2 DEFAULT NULL,
    allow_runs_in_restricted_mode IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;

```

JOB_DEFINITION_ARRAY Table Type

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

153.5.4 JOB_DEFINITION_ARRAY Table Type

The type `job_definition_array` is a table of `job_definition`.

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

153.5.5 JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
  job_name          VARCHAR2(100),
  attr_name         VARCHAR2(30),
  char_value        VARCHAR2(4000),
  char_value2       VARCHAR2(4000),
  args_value        JOBARG_ARRAY,
  num_value         NUMBER,
  timestamp_value   TIMESTAMP(6) WITH TIME ZONE,
  interval_value    INTERVAL DAY(2) TO SECOND(6));
```

Attributes

Table 153-5 JOBATTR Object Type Attributes

Attribute	Description
job_name	Name of the job
attr_name	Name of the attribute
char_value	Value of the argument if the type is VARCHAR2
char_value2	Second VARCHAR2 attribute value
args_value	Value of the argument if the type is a JOBARG array
num_value	Value of the argument if the type is NUMBER
timestamp_value	Value of the argument if the type is TIMESTAMP WITH TIME ZONE
interval_value	Value of the argument if the type is INTERVAL DAY TO SECOND

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

Syntax

```
constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN VARCHAR2,
  attr_value2       IN VARCHAR2 DEFAULT NULL)
  RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN [NUMBER, BOOLEAN,
                        TIMESTAMP WITH TIME ZONE,
```

```

                                INTERVAL DAY TO SECOND, JOBARG_ARRAY))
RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;

```

Parameters

Table 153-6 JOBATTR Constructor Function Parameters

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

JOBATTR Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

153.5.6 JOBATTR_ARRAY Table Type

The type jobattr_array is a table of jobattr.

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

153.5.7 SCHEDULER\$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a list of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (
  step_name  VARCHAR2(32),
  step_type  VARCHAR2(32));
```

Attributes

Table 153-7 SCHEDULER\$_STEP_TYPE Object Type Attributes

Attribute	Description
step_name	Name of the step
step_type	State of the step

153.5.8 SCHEDULER\$_STEP_TYPE_LIST Table Type

This type is a table of scheduler\$_step_type.

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

153.5.9 SCHEDULER\$_EVENT_INFO Object Type

This is the datatype of the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
    event_type          VARCHAR2(4000),
    object_owner       VARCHAR2(4000),
    object_name        VARCHAR2(4000),
    event_timestamp    TIMESTAMP WITH TIME ZONE,
    error_code         NUMBER,
    error_msg          VARCHAR2(4000),
    event_status       NUMBER,
    log_id             NUMBER,
    run_count          NUMBER,
    failure_count      NUMBER,
    retry_count        NUMBER,
    spare1             NUMBER,
    spare2             NUMBER,
    spare3             VARCHAR2(4000),
    spare4             VARCHAR2(4000),
    spare5             TIMESTAMP WITH TIME ZONE,
    spare6             TIMESTAMP WITH TIME ZONE,
    spare7             RAW(2000),
    spare8             RAW(2000));
```

Attributes

Table 153-8 SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
event_type	One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR". For descriptions of these event types, see Table 153-84 .
object_owner	Owner of the job that raised the event
object_name	Name of the job that raised the event
event_timestamp	Time at which the event occurred
error_code	Applicable only when an error is thrown during job execution. Contains the top-level error code.

Table 153-8 (Cont.) SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
error_msg	Applicable only when an error is thrown during job execution. Contains the entire error stack.
event_status	Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry. If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind. If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE.
log_id	Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.
run_count	Run count for the job when the event was raised.
failure_count	Failure count for the job when the event was raised.
retry_count	Retry count for the job when the event was raised.
spare1 – spare8	Not currently in use.

153.5.10 SCHEDULER_FILEWATCHER_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination          VARCHAR2(4000),
  directory_path       VARCHAR2(4000),
  actual_file_name     VARCHAR2(4000),
  file_size            NUMBER,
  file_timestamp       TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch    NUMBER,
  matching_requests   SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

Attributes

Table 153-9 SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
destination	Destination at which the file was found, expressed as a host name or IP address.
directory_path	Absolute path of directory in which the file was found.

Table 153-9 (Cont.) SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
actual_file_name	Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.
file_size	Size of the file that was found, in bytes.
file_timestamp	Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.
ts_ms_from_epoch	For internal use only.
matching_requests	List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See " SCHEDULER_FILEWATCHER_REQUEST Object Type ".

153.5.11 SCHEDULER_FILEWATCHER_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the `SCHEDULER_FILEWATCHER_RESULT` Object Type. Its attributes are similar to the attributes of a file watcher.

Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner          VARCHAR2(4000),
  name           VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name VARCHAR2(4000),
  min_file_size  NUMBER,
  steady_state_dur NUMBER);
```

Attributes

Table 153-10 SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

Attribute	Description
owner	Owner of the matched file watcher.
name	Name of the matched file watcher.
requested_path_name	Value of the <code>directory_path</code> attribute of the matched file watcher.
requested_file_name	Value of the <code>file_name</code> attribute of the matched file watcher.
credential_owner	Owner of the credential referenced by the matched file watcher.
credential_name	Name of the credential referenced by the matched file watcher.
min_file_size	Value of the <code>min_file_size</code> attribute of the matched file watcher.

Table 153-10 (Cont.) SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

Attribute	Description
steady_state_dur	Value of the steady_state_duration attribute of the matched file watcher.

This is the datatype of a file arrival event message.

153.6 Summary of DBMS_SCHEDULER Subprograms

This table lists the DBMS_SCHEDULER subprograms and briefly describes them.

Table 153-11 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE
ADD_GROUP_MEMBER Procedure	Adds one or more members to an existing group
ADD_JOB_EMAIL_NOTIFICATION Procedure	Adds e-mail notifications for a job for a list of recipients and a list of job state events
ADD_TO_INCOMPATIBILITY Procedure	Adds jobs or programs to an existing incompatibility definition
ALTER_CHAIN Procedure	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure	Alters specified steps of a running chain
CLOSE_WINDOW Procedure	Closes an open window prematurely
COPY_JOB Procedure	Copies an existing job
CREATE_CHAIN Procedure	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_CREDENTIAL Procedure	Creates a credential
CREATE_DATABASE_DESTINATION Procedure	Creates a database destination for use with remote database jobs
CREATE_EVENT_SCHEDULE Procedure	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_FILE_WATCHER Procedure	Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job
CREATE_GROUP Procedure	Creates a group

Table 153-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
CREATE_INCOMPATIBILITY Procedure	Creates an incompatibility definition
CREATE_JOB Procedure	Creates a single job
CREATE_JOB_CLASS Procedure	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_JOBS Procedure	Creates multiple jobs
CREATE_PROGRAM Procedure	Creates a program
CREATE_RESOURCE Procedure	Specifies resources used by jobs or creates a new resource
CREATE_SCHEDULE Procedure	Creates a schedule
CREATE_WINDOW Procedure	Creates a window, which provides a way to automatically activate different resource plans at different times
DEFINE_ANYDATA_ARGUMENT Procedure	Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object
DEFINE_CHAIN_EVENT_STEP Procedure	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: DEFINE_CHAIN_STEP .
DEFINE_CHAIN_RULE Procedure	Adds a rule to an existing chain
DEFINE_CHAIN_STEP Procedure	Defines a chain step, which can be a program or another (nested) chain. See also: DEFINE_CHAIN_EVENT_STEP .
DEFINE_METADATA_ARGUMENT Procedure	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument.
DEFINE_PROGRAM_ARGUMENT Procedure	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure	Disables a program, job, chain, window, database destination, external destination, file watcher, group, or incompatibility
DROP_AGENT_DESTINATION Procedure	Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails.
DROP_CHAIN Procedure	Drops an existing chain
DROP_CHAIN_RULE Procedure	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure	Drops a chain step

Table 153-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DROP_CREDENTIAL Procedure	Drops a credential
DROP_DATABASE_DESTINATION Procedure	Drops one or more database destinations
DROP_FILE_WATCHER Procedure	Drops one or more file watchers
DROP_GROUP Procedure	Drops one or more groups
DROP_INCOMPATIBILITY Procedure	Drops an existing incompatibility definition
DROP_JOB Procedure	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure	Drops a job class
DROP_PROGRAM Procedure	Drops a program
DROP_PROGRAM_ARGUMENT Procedure	Drops a program argument
DROP_SCHEDULE Procedure	Drops a schedule
DROP_WINDOW Procedure	Drops a window
ENABLE Procedure	Enables a program, job, chain, window, database destination, external destination, file watcher, or group
END_DETACHED_JOB_RUN Procedure	Ends a running detached job
EVALUATE_CALENDAR_STRING Procedure	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_CHAIN Procedure	Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied
GENERATE_JOB_NAME Function	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named <code>sally1</code> , <code>sally2</code> , and so on
GET_AGENT_INFO Function	Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected
GET_AGENT_VERSION Function	Returns the version string of a Scheduler agent that is registered with the database and is currently running
GET_ATTRIBUTE Procedure	Retrieves the value of an attribute of an object
GET_FILE Procedure	Retrieves a file from a host
GET_SCHEDULER_ATTRIBUTE Procedure	Retrieves the value of a Scheduler attribute
OPEN_WINDOW Procedure	Opens a window prematurely. The window is opened immediately for the duration
PURGE_LOG Procedure	Purges specific rows from the job and window logs

Table 153-11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
PUT_FILE Procedure	Saves a file to one or more hosts
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure	Unsubscribes a user from the Scheduler event queue <code>SYS.SCHEDULER\$_EVENT_QUEUE</code>
REMOVE_FROM_INCOMPATIBILITY Procedure	Removes jobs or programs from an incompatibility definition
REMOVE_GROUP_MEMBER Procedure	Removes one or more members from a group
REMOVE_JOB_EMAIL_NOTIFICATION Procedure	Removes e-mail notifications for a job
RESET_JOB_ARGUMENT_VALUE Procedure	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedure	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure	Runs a job immediately
SET_AGENT_REGISTRATION_PASS Procedure	Sets the agent registration password for a database
SET_ATTRIBUTE Procedure	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure	Changes an attribute of an object to NULL
SET_JOB_ANYDATA_VALUE Procedure	Sets the value of a job argument encapsulated in an <code>AnyData</code> object
SET_JOB_ARGUMENT_VALUE Procedure	Sets the value of a job argument
SET_JOB_ATTRIBUTES Procedure	Sets the value of a job attribute
SET_RESOURCE_CONSTRAINT Procedure	Specifies the resources used by jobs
SET_SCHEDULER_ATTRIBUTE Procedure	Sets the value of a Scheduler attribute
STOP_JOB Procedure	Stops a currently running job or all jobs in a job class

153.6.1 ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-12 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

153.6.2 ADD_GROUP_MEMBER Procedure

This procedure adds one or more members to an existing group.

Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    member              IN VARCHAR2);
```

Parameters

Table 153-13 ADD_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member	<p>A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated.</p> <p>The keyword LOCAL can be included as a member for database destination or external destination groups. See the "CREATE_GROUP Procedure" for information about this keyword.</p>

Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE_SCHEDULER privilege to add a member to a group of type WINDOW.

See Also:

"CREATE_GROUP Procedure"

153.6.3 ADD_JOB_EMAIL_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
  job_name          IN VARCHAR2,
  recipients        IN VARCHAR2,
  sender            IN VARCHAR2 DEFAULT NULL,
  subject           IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
  body             IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
  events           IN VARCHAR2 DEFAULT 'JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED,
                                     JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR',
  filter_condition IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-14 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job that e-mail notifications are added for. Cannot be NULL.
recipients	Comma-separated list of e-mail addresses to send notifications to. E-mail notifications for all listed events are sent to all recipients. Cannot be NULL.
sender	e-mail address to use as the sender address (the From: address) in the e-mail header. If NULL or omitted, the e-mail address specified in the Scheduler attribute <code>email_sender</code> is used. See <i>Oracle Database Administrator's Guide</i> for more information on this Scheduler attribute.
subject	The subject to use in the e-mail header. Table 153-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>subject</code> is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable: 'Oracle Scheduler Job Notification - %job_owner%.%job_name%.%job_subname% %event_type%'

Table 153-14 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
body	<p>The body of the e-mail message. Table 153-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>body</code> is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable:</p> <pre>'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'</pre>
events	<p>Comma-separated list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. Table 153-84 lists the valid events for this parameter. If <code>events</code> is omitted, notifications are sent for the following default events:</p> <pre>JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR</pre>
filter_condition	<p>Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. <code>filter_condition</code> must be a boolean SQL WHERE clause that may refer to the <code>:event</code> bind variable. This bind variable is automatically bound to an object of type <code>SCHEDULER\$_EVENT_INFO</code> that represents the raised event.</p> <p>For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following <code>filter_condition</code>:</p> <pre>:event.error_code=600 or :event.error_code=700</pre> <p>See "SCHEDULER\$_EVENT_INFO Object Type".</p>

[Table 153-15](#) lists the variables that you can use in the subject and body arguments.

Table 153-15 Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
<code>%job_owner%</code>	Schema in which job was created
<code>%job_name%</code>	Name of the job that e-mail notifications are added for
<code>%job_subname%</code>	Present for event-based jobs with the <code>parallel_instances</code> attribute set and for chain steps
<code>%event_type%</code>	Valid values are listed in Table 153-84
<code>%event_timestamp%</code>	Time at which the event occurred

Table 153-15 (Cont.) Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
%log_id%	Refers to the LOG_ID column in views *_SCHEDULER_JOB_LOG and *_SCHEDULER_JOB_RUN_DETAILS
%error_code%	Number of the error code.
%error_message%	The text of the error message
%run_count%	Run count for the job when the event was raised
%failure_count%	Failure count for the job when the event was raised
%retry_count%	Retry count for the job when the event was raised

Usage Notes

You can call `ADD_JOB_EMAIL_NOTIFICATION` once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the `JOB_FAILED`, `JOB_BROKEN`, `JOB_SCH_LIM_REACHED`, and `JOB_CHAIN_STALLED` events to the principle DBA and all senior DBAs, but send a notification for the `JOB_OVER_MAX_DUR` event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute `email_server` is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

153.6.4 ADD_TO_INCOMPATIBILITY Procedure

This procedure adds jobs or programs to an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.ADD_TO_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 153-16 ADD_TO_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.
<code>object_name</code>	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects already exist in the incompatibility definition.

**See Also:**Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

153.6.5 ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name          IN VARCHAR2,
  step_name          IN VARCHAR2,
  attribute           IN VARCHAR2,
  value              IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name          IN VARCHAR2,
  step_name          IN VARCHAR2,
  attribute           IN VARCHAR2,
  char_value         IN VARCHAR2);
```

Parameters

Table 153-17 ALTER_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step or a comma-separated list of steps to alter. This cannot be NULL.

Table 153-17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
attribute	<p>The attribute of the steps to change. Must be one of the following:</p> <ul style="list-style-type: none"> 'PAUSE' <p>If set to TRUE for a step, after the step has run, its state changes to PAUSED (and the completed attribute remains FALSE).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE.</p> <p>Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps.</p> 'PAUSED_BEFORE' <p>If set to TRUE for a step and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSED_BEFORE is reset to FALSE for a chain step that has paused before starting (using ALTER_RUNNING_CHAIN), then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSED_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> 'SKIP' <p>If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED.</p> 'RESTART_ON_FAILURE' <p>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.</p> <p>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</p> 'RESTART_ON_RECOVERY' <p>If set to TRUE for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered.</p> <p>If set to FALSE, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues.</p> 'DESTINATION_NAME' <p>The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default.</p> 'CREDENTIAL_NAME' <p>The credential to use when running this step. NULL by default.</p>

Table 153-17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
value	The value to set for the attribute (for a boolean attribute).
char_value	The value to set for the attribute (for a character attribute).

Usage Notes

Altering a chain requires `ALTER` privileges on the chain either by being the owner of the chain, or by having the `ALTER` object privilege on the chain or by having the `CREATE ANY JOB` system privilege.

153.6.6 ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
  job_name          IN VARCHAR2,
  step_name         IN VARCHAR2,
  attribute         IN VARCHAR2,
  value             IN {BOOLEAN|VARCHAR2});
```

Parameters**Table 153-18 ALTER_RUNNING_CHAIN Procedure Parameters**

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to <code>NULL</code> and attribute is <code>PAUSE</code> or <code>SKIP</code> , then all steps of the running chain are altered.

Table 153-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
attribute	<p>The attribute of the steps to change. Valid values are:</p> <ul style="list-style-type: none"> <li data-bbox="602 373 1458 663"> <p>• 'PAUSE'</p> <p>If the PAUSE attribute is set TRUE for a step, then after the step runs, its state changes to PAUSED (and the completed attribute remains false).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to completion (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE. Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE is set to TRUE for all steps of this running chain.</p> <li data-bbox="602 674 1458 1058"> <p>• 'PAUSE_BEFORE'</p> <p>If set to TRUE for a step that has not yet run and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting, then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSE_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> <p>If step_name is set to NULL, then PAUSE_BEFORE is set to the specified value for all steps of this running chain.</p>

Table 153-18 (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
attribute CONTINUED	<ul style="list-style-type: none"> 'SKIP' If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED. 'RESTART_ON_FAILURE' If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED. If set to FALSE (the default), a failed chain step is immediately marked FAILED. 'RESTART_ON_RECOVERY' If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. 'STATE' This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code'

Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

When trying to update a step defined with a nested chain, it is necessary to specify the job_name as <SCHEMA>.<JOB_NAME>.<STEP_NAME_IN_TOP_LEVEL_CHAIN> to be able to make reference to the steps inside the subchain.

153.6.7 CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource plan to the

one that is in effect outside the window, or in the case of overlapping windows, to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name          IN VARCHAR2);
```

Parameters

Table 153-19 CLOSE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute `stop_on_window_close` is set to `TRUE` for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type `WINDOW` as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to `TRUE`.

Closing a window requires the `MANAGE SCHEDULER` privilege.

153.6.8 COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
    old_job              IN VARCHAR2,
    new_job              IN VARCHAR2);
```

Parameters

Table 153-20 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the `CREATE JOB` system privilege if it is in your own schema, otherwise, the `CREATE ANY`

JOB system privilege). If the old job is not in the your own schema, then you must also have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

153.6.9 CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, myschema.myname).

A chain is always created as disabled and must be enabled with the [ENABLE Procedure](#) before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
    chain_name          IN VARCHAR2,
    rule_set_name       IN VARCHAR2 DEFAULT NULL,
    evaluation_interval IN INTERVAL DAY TO SECOND DEFAULT NULL,
    comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-21 CREATE_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema.
rule_set_name	In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET{N} and the evaluation context created is of the form SCHED_EVCTX{N}
evaluation_interval	If this is NULL, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-NULL value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at NULL if possible. evaluation_interval cannot be less than a minute or greater than a day.
comments	An optional comment describing the purpose of the chain

Usage Notes

To create a chain in your own schema, you must have the CREATE JOB system privilege. To create a chain in a different schema you must have the CREATE ANY JOB system privilege. If you do not provide a rule_set_name, a rule set and evaluation context is created in the schema that the chain is being created in, so you must have the privileges required to create

these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

153.6.10 CREATE_CREDENTIAL Procedure

This deprecated procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the `CREATE_CREDENTIAL Procedure`.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
  credential_name      IN VARCHAR2,
  username             IN VARCHAR2,
  password             IN VARCHAR2,
  database_role        IN VARCHAR2 DEFAULT NULL,
  windows_domain       IN VARCHAR2 DEFAULT NULL,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-22 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
<code>credential_name</code>	The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks.
<code>username</code>	The user name for logging into to the host operating system or remote Oracle database. This cannot be set to <code>NULL</code> and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.
<code>password</code>	The password for the user name. This cannot be set to <code>NULL</code> and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.
<code>database_role</code>	The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code>
<code>windows_domain</code>	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64.
<code>comments</code>	A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240.

Usage Notes

Credentials reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

153.6.11 CREATE_DATABASE_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
    destination_name      IN VARCHAR2,
    agent                 IN VARCHAR2,
    tns_name              IN VARCHAR2,
    comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-23 CREATE_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
<code>destination_name</code>	The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks.
<code>agent</code>	The external destination name of the Scheduler agent to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.
<code>tns_name</code>	An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a <i>net service name</i> , which is an alias for a connect descriptor. The alias must be resolved in the <code>tnsnames.ora</code> file on the local computer. The maximum size for <code>tns_name</code> is 2000 characters. If <code>tns_name</code> is <code>NULL</code> , the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the <code>ORACLE_HOME</code> and <code>ORACLE_SID</code> parameters in the agent configuration file, <code>schagent.conf</code> , located in the agent home directory. See <i>Oracle Database Net Services Administrator's Guide</i> for more information on connect identifiers.
<code>comments</code>	A text string that describes the database destination. Scheduler does not use this argument.

Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

153.6.12 CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    event_condition    IN VARCHAR2 DEFAULT NULL,
    queue_spec         IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-24 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
<code>schedule_name</code>	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
<code>start_date</code>	This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.
<code>event_condition</code>	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.
<code>queue_spec</code>	This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the source queue). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <i>queue_name, agent name</i> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
<code>end_date</code>	The date and time after which jobs do not run and windows do not open. An event schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> must be after the <code>start_date</code> . If it is not, then an error is generated when the schedule is created.

Table 153-24 (Cont.) CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

You must have the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

**See Also:**

["CREATE_FILE_WATCHER Procedure"](#)

153.6.13 CREATE_FILE_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
  file_watcher_name          IN VARCHAR2,
  directory_path             IN VARCHAR2,
  file_name                  IN VARCHAR2,
  credential_name            IN VARCHAR2,
  destination                 IN VARCHAR2 DEFAULT NULL,
  min_file_size              IN PLS_INTEGER DEFAULT 0,
  steady_state_duration      IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments                   IN VARCHAR2 DEFAULT NULL,
  enabled                    IN BOOLEAN DEFAULT TRUE);
```

Parameters**Table 153-25 CREATE_FILE_WATCHER Parameters**

Parameter	Description
file_watcher_name	The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.

Table 153-25 (Cont.) CREATE_FILE_WATCHER Parameters

Parameter	Description
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.
destination	Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.
min_file_size	Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used. The minimum value is 10 seconds. Oracle recommends similar steady_state_duration values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the steady_state_duration value.
comments	Optional comment.
enabled	If TRUE (the default), the file watcher is enabled.

Usage Notes

You must have the CREATE JOB system privilege to create a file watcher in your own schema. You require the CREATE ANY JOB system privilege to create a file watcher in a schema different from your own (except the SYS schema, which is disallowed).

153.6.14 CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the DESTINATION_NAME parameter of the job.

Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
    group_name          IN VARCHAR2,
    group_type          IN VARCHAR2,
```

```
member          IN VARCHAR2 DEFAULT NULL,
comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-26 CREATE_GROUP Procedure Parameters

Parameter	Description
group_name	The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.
group_type	<p>The type of members in the group. All members must be of the same type. Possible types are:</p> <ul style="list-style-type: none"> 'DB_DEST' Database destination: Members are database destinations, for running remote database jobs. 'EXTERNAL_DEST' External destination: Members are external destinations, for running remote external jobs. 'WINDOW' Members are Scheduler windows. You must have the <code>MANAGE SCHEDULER</code> privilege to create a group of this type. <p>Members in database destination and external destination groups have the following format:</p> <pre>[[schema.]credential@][schema.]destination</pre> <p>where:</p> <ul style="list-style-type: none"> <i>credential</i> is the name of an existing credential. <i>destination</i> is the name of an existing database destination or external destination. <p>The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential.</p> <p>Members in window groups are window names. Because all Scheduler windows reside in the <code>SYS</code> schema, you do not specify a schema name for windows.</p>
member	<p>Optional comma-separated list of group members. The default is NULL. If NULL, use the <code>ADD_GROUP_MEMBER</code> procedure to add members. You can also use <code>ADD_GROUP_MEMBER</code> to add additional members at a later time.</p> <p>The keyword <code>LOCAL</code> can be used as a member in database destination groups and external destination groups.</p> <ul style="list-style-type: none"> In database destination groups, <code>LOCAL</code> represents the source database on which the job is created. It cannot be preceded with a credential. In external destination groups, <code>LOCAL</code> represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential.
comments	A text string that describes the group. Scheduler does not use this argument.

Usage Notes

Groups reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a group in a schema other than your own, you must have the `CREATE ANY JOB` privilege. The group name must be unique among all Scheduler objects.

You can grant the `SELECT` or `READ` privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the `ALTER` privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

Example

The following PL/SQL block creates a group named `production_dest1`, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
    GROUP_NAME => 'production_dest1',
    GROUP_TYPE => 'DB_DEST',
    MEMBER     => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS  => 'All sector1 production machines');
END;
```

153.6.15 CREATE_INCOMPATIBILITY Procedure

This procedure creates an incompatibility definition.

Syntax

```
DBMS_SCHEDULER.CREATE_INCOMPATIBILITY (
  incompatibility_name  IN VARCHAR2,
  object_name          IN VARCHAR2,
  constraint_level     IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  enabled              IN BOOLEAN DEFAULT TRUE,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-27 CREATE_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.
<code>object_name</code>	One or more (comma-separated) programs or jobs.

Table 153-27 (Cont.) CREATE_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>constraint_level</code>	One or more (comma-separated) programs or jobs.
<code>enabled</code>	Specifies whether the constraint is initially enabled (<code>true</code>) or not enabled (<code>false</code>).
<code>comments</code>	Optional descriptive comment.

Usage Notes

If `object_name` contains multiple (comma-separated) values, they must be either all programs or all jobs that are incompatible with each other (that is, they cannot be run at the same time). For jobs, the list must consist of two or more jobs, and `constraint_level` must be 'JOB_LEVEL'. For programs, `constraint_level` can be either 'JOB_LEVEL' or 'PROGRAM_LEVEL'. When set to the default value 'JOB_LEVEL', only a single job that is based on the program (or programs) mentioned in `object_name` can run at the same time. When `constraint_level` is set to 'PROGRAM_LEVEL', the programs are incompatible, but the jobs based on the same program are not incompatible.

For example, if the value of `object_name` is 'P1,P2,P3' and `constraint_level` is 'PROGRAM_LEVEL', many jobs based on P1 can be running at the same time, but if any P1 based job is running, none based on P2 or P3 can be running. Or, similarly, many jobs based on P3 can be running at the same time, but none based on P1 or P2. If `constraint_level` is set to 'JOB_LEVEL', then only a single job out of all the jobs based on programs P1, P2 and P3 can be running at a time.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

153.6.16 CREATE_JOB Procedure

This procedure creates a single job.

If you create the job as enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the [SET_ATTRIBUTE Procedure](#).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    job_type          IN VARCHAR2,
    job_action        IN VARCHAR2,
    number_of_arguments IN PLS_INTEGER          DEFAULT 0,
    start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
```

```

repeat_interval    IN VARCHAR2                                DEFAULT NULL,
end_date          IN TIMESTAMP WITH TIME ZONE      DEFAULT NULL,
job_class         IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
enabled          IN BOOLEAN                          DEFAULT FALSE,
auto_drop        IN BOOLEAN                          DEFAULT TRUE,
comments         IN VARCHAR2                                DEFAULT NULL,
credential_name  IN VARCHAR2                                DEFAULT NULL,
destination_name IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using a named schedule object and a named program object:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name     IN VARCHAR2,
  schedule_name    IN VARCHAR2,
  job_class        IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled          IN BOOLEAN                          DEFAULT FALSE,
  auto_drop        IN BOOLEAN                          DEFAULT TRUE,
  comments         IN VARCHAR2                                DEFAULT NULL,
  job_style        IN VARCHAR2                                DEFAULT 'REGULAR',
  credential_name  IN VARCHAR2                                DEFAULT NULL,
  destination_name IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using a named program object and an inlined schedule:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name     IN VARCHAR2,
  start_date       IN TIMESTAMP WITH TIME ZONE      DEFAULT NULL,
  repeat_interval  IN VARCHAR2                                DEFAULT NULL,
  end_date         IN TIMESTAMP WITH TIME ZONE      DEFAULT NULL,
  job_class        IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled          IN BOOLEAN                          DEFAULT FALSE,
  auto_drop        IN BOOLEAN                          DEFAULT TRUE,
  comments         IN VARCHAR2                                DEFAULT NULL,
  job_style        IN VARCHAR2                                DEFAULT 'REGULAR',
  credential_name  IN VARCHAR2                                DEFAULT NULL,
  destination_name IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using a named schedule object and an inlined program:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  schedule_name    IN VARCHAR2,
  job_type         IN VARCHAR2,
  job_action       IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER                DEFAULT 0,
  job_class        IN VARCHAR2                                DEFAULT 'DEFAULT_JOB_CLASS',
  enabled          IN BOOLEAN                          DEFAULT FALSE,
  auto_drop        IN BOOLEAN                          DEFAULT TRUE,
  comments         IN VARCHAR2                                DEFAULT NULL,
  credential_name  IN VARCHAR2                                DEFAULT NULL,
  destination_name IN VARCHAR2                                DEFAULT NULL);

```

Creates a job using an inlined program and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type         IN VARCHAR2,
  job_action       IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER                DEFAULT 0,
  start_date       IN TIMESTAMP WITH TIME ZONE      DEFAULT NULL,

```

```

event_condition      IN VARCHAR2          DEFAULT NULL,
queue_spec           IN VARCHAR2,
end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
job_class            IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
enabled              IN BOOLEAN          DEFAULT FALSE,
auto_drop            IN BOOLEAN          DEFAULT TRUE,
comments            IN VARCHAR2          DEFAULT NULL,
credential_name      IN VARCHAR2          DEFAULT NULL,
destination_name     IN VARCHAR2          DEFAULT NULL);

```

Creates a job using a named program object and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name            IN VARCHAR2,
  program_name        IN VARCHAR2,
  start_date          IN TIMESTAMP WITH TIME ZONE,
  event_condition     IN VARCHAR2,
  queue_spec          IN VARCHAR2,
  end_date            IN TIMESTAMP WITH TIME ZONE,
  job_class           IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
  enabled             IN BOOLEAN          DEFAULT FALSE,
  auto_drop           IN BOOLEAN          DEFAULT TRUE,
  comments            IN VARCHAR2          DEFAULT NULL,
  job_style           IN VARCHAR2          DEFAULT 'REGULAR',
  credential_name     IN VARCHAR2          DEFAULT NULL,
  destination_name    IN VARCHAR2          DEFAULT NULL);

```

Parameters

Table 153-28 *CREATE_JOB Procedure Parameters*

Parameter	Description
job_name	<p>The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name.</p> <p>If <code>job_name</code> is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the <code>GENERATE_JOB_NAME</code> procedure to generate a name and then use the output in the <code>CREATE_JOB</code> procedure. The <code>GENERATE_JOB_NAME</code> procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" for more information.</p>

Table 153-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_type	<p>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See <code>job_action</code> in the next row for related information.</p> <p>The supported values are:</p> <ul style="list-style-type: none"> 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0. 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. 'EXECUTABLE' This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. <code>Anydata</code> arguments are not supported with a job or program type of <code>EXECUTABLE</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run. 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so <code>number_of_arguments</code> must be 0. 'EXTERNAL_SCRIPT' This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>. 'SQL_SCRIPT' This specifies that the job is a SQL*Plus script. The job must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by the SQL*Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege. 'BACKUP_SCRIPT' This specifies that the job is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege.

Table 153-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_action	<p>This attribute specifies the action of the job. If <code>job_action</code> is not specified for an inline program, then an error is generated when creating the job.</p> <p>The job action is executed inside an autonomous transaction, and all autonomous transaction guidelines and restrictions apply. For example, online DDL operations are not allowed inside an autonomous transaction, and therefore cannot be used in the job action.</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> For a PL/SQL block: <p>The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code></p> <p>Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.</p> <p>See Table 153-40 for details on available metadata attributes.</p> For a stored procedure: <p>The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>job_action_action=>'Schema"."Procedure"</code>.</p> <p>PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported as <code>job_action</code> when the job or program type is <code>STORED_PROCEDURE</code>.</p> For an executable: <p>The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> <p>NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported.</p> For a chain: <p>The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.</p> For an external script: <p>The <code>job_action</code> must be either the path to an operating system script or an inline operating system script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on. The <code>job_action</code> may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password.</p> For a SQL script:

Table 153-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
	<p>The <code>job_action</code> must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</p> <ul style="list-style-type: none"> For a backup script: <p>The <code>job_action</code> is either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.</p>
<code>number_of_arguments</code>	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
<code>program_name</code>	The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.
<code>start_date</code>	<p>This attribute specifies the first date and time on which this job is scheduled to start. If <code>start_date</code> and <code>repeat_interval</code> are left null, then the job is scheduled to run as soon as the job is enabled.</p> <p>For repeating jobs that use a calendaring expression to specify the repeat interval, <code>start_date</code> is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time.</p> <p>The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.</p>
<code>event_condition</code>	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
<code>queue_spec</code>	<p>This argument specifies either of the following:</p> <ul style="list-style-type: none"> The source queue where events that start this particular job are enqueued. If it is secure, then the <code>queue_spec</code> argument is a pair of values of the form <code>queue_name, agent name</code>. If it is not secure, then only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue. A file watcher name. For more information on this option, see <i>Oracle Database Administrator's Guide</i>.
<code>repeat_interval</code>	<p>This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions.</p> <p>The expression specified is evaluated to determine the next time the job should run. If <code>repeat_interval</code> is not specified, the job runs only once at the specified start date. See "Calendaring Syntax" for further information.</p>
<code>schedule_name</code>	The name of the schedule, window, or window group associated with this job.

Table 153-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_class	The class this job is associated with.
end_date	<p>This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p>
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.
job_style	<p>Style of the job being created. This argument can have one of the following values:</p> <ul style="list-style-type: none"> 'REGULAR' creates a regular job. This is the default. 'LIGHTWEIGHT' creates a lightweight job. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain. 'IN_MEMORY_RUNTIME' creates an in-memory runtime job. These jobs are based on lightweight job structures, so the same rules and restrictions apply; however, they further boost performance by keeping an in-memory cache, so they minimize disk access for pre-run and post-run actions. 'IN_MEMORY_FULL' creates an in-memory full job. In-memory full jobs require a program and cannot have a schedule or repeat interval. They run automatically when the job is enabled, and after running they are discarded. They keep all the job information in memory and are not backed up on disk, meaning that they are lost when the instance is rebooted. They are designed to run actions that must be performed immediately with the least amount of overhead possible.
credential_name	<p>The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, script jobs, and event-based jobs that process file arrival events. The credential must exist.</p> <p>For local database jobs, it must be NULL.</p> <p>For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p> <p>See also: "CREATE_CREDENTIAL Procedure"</p>

Table 153-28 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
destination_name	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables).</p> <p>This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist.</p> <p>The following applies to this attribute:</p> <ul style="list-style-type: none"> • If it is a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure. • If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database. • If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "CREATE_GROUP Procedure". <p>destination_name cannot reference a destination group when:</p> <ul style="list-style-type: none"> • The job type is 'CHAIN' • The job style is 'LIGHTWEIGHT', 'IN_MEMORY_RUNTIME', or 'IN_MEMORY_FULL' <p>If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format:</p> <pre>credential.destination</pre> <p>The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.</p> <p>You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL_DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members.</p> <p>*** destination job attribute is deprecated in Oracle Database 11gR2 and superseded by destination_name.</p>
enabled	<p>This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.</p>
auto_drop	<p>This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> • Its end date (or the end date of the job schedule) has passed. Note that a job with a Window schedule will not be auto-dropped when the window closes, because this is not considered to be the end of the Window. • It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. • It is not a repeating job and has run once. <p>A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p>

Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The `JOB_QUEUE_PROCESSES` initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2, `JOB_QUEUE_PROCESSES` applies to `DBMS_SCHEDULER` jobs. Setting this parameter to 0 disables `DBMS_SCHEDULER` jobs.

To create a job in your own schema, you need to have the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires `EXECUTE` privileges for that class or program.

Not all possible job attributes can be set with `CREATE_JOB`. Some must be set after the job is created. For example, job arguments must be set with the [SET_JOB_ARGUMENT_VALUE Procedure](#) or the [SET_JOB_ANYDATA_VALUE Procedure](#). Other job attributes, such as `job_priority` and `max_runs`, are set with the [SET_ATTRIBUTE Procedure](#).

To create multiple jobs efficiently, use the `CREATE_JOBS` procedure.

 **Note:**

The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

153.6.17 CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the `SYS` schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
  job_class_name          IN VARCHAR2,
  resource_consumer_group IN VARCHAR2 DEFAULT NULL,
  service                 IN VARCHAR2 DEFAULT NULL,
  logging_level           IN PLS_INTEGER
                        DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
  log_history             IN PLS_INTEGER DEFAULT NULL,
  comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-29 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	<p>The name to assign to the job class. Job classes can only be created in the SYS schema.</p> <p>This attribute specifies the name of the job class and uniquely identifies the job class. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</p>
resource_consumer_group	<p>This attribute specifies the resource consumer group that this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class.</p> <p>If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group.</p> <p>If no resource consumer group is specified, job classes are associated with the default resource consumer group.</p> <p>If the specified resource consumer group does not exist when creating the job class, an error occurs.</p>
service	<p>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.</p> <p>If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p>
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> • DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. • DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. • DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log.

Table 153-29 (Cont.) CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
comments	This attribute is for an optional comment about the job class. By default, this attribute is NULL.

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE_SCHEDULER system privilege.

153.6.18 CREATE_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
    jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters**Table 153-30 CREATE_JOBS Procedure Parameters**

Parameter	Description
jobdef_array	The array of job definitions. See " Data Structures " for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default. TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back. ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size.

Calling `CREATE_JOBS` with a small array size may not be much faster than calling `CREATE_JOB` once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the `destination` attribute of the `job_definition` object cannot reference a destination group.

Examples

See *Oracle Database Administrator's Guide*.

153.6.19 CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (  
    program_name          IN VARCHAR2,  
    program_type          IN VARCHAR2,  
    program_action        IN VARCHAR2,  
    number_of_arguments  IN PLS_INTEGER DEFAULT 0,  
    enabled               IN BOOLEAN DEFAULT FALSE,  
    comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-31 CREATE_PROGRAM Procedure Parameters

Parameter	Description
<code>program_name</code>	The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.

Table 153-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
<code>program_type</code>	<p>This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for <code>program_type</code>:</p> <ul style="list-style-type: none"> • <code>'PLSQL_BLOCK'</code> This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0. • <code>'STORED_PROCEDURE'</code> This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported. • <code>'EXECUTABLE'</code> This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. <code>AnyData</code> arguments are not supported with job or program type <code>EXECUTABLE</code>. • <code>'EXTERNAL_SCRIPT'</code> project 25230, this bullet and next two This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>. • <code>'SQL_SCRIPT'</code> This specifies that the program is a SQL*Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script. Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. • <code>'BACKUP_SCRIPT'</code> This specifies that the program is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.

Table 153-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_action	<p>This attribute specifies the action of the program. If program_action is not specified, an error is generated.</p> <p>project 25230 last 3 bullets</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code>. <p>Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 153-40 for details on available metadata attributes.</p> <p>If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: job_name, job_owner, job_start, window_start, window_end. For more information, see the "DEFINE_METADATA_ARGUMENT Procedure".</p> <ul style="list-style-type: none"> For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>program_action=>'Schema"."Procedure"'</code>. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign('@') and the job is local, the at sign is replaced with the SID of the current Oracle instance. For an external script, the action must be either the path to an operating system script or an inline operating system script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The program_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points</p>

Table 153-31 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
	<p>to a credential that contains a valid operating system username and password.</p> <ul style="list-style-type: none"> For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session. For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.
<code>number_of_arguments</code>	<p>This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, then this parameter is ignored.</p>
<code>enabled</code>	<p>This flag specifies whether the program should be created as enabled or not. If the flag is set to <code>TRUE</code>, then validity checks are made and the program is created as <code>ENABLED</code> if all the checks be successful. By default, this flag is set to <code>FALSE</code>, meaning not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p>
<code>comments</code>	<p>A comment about the program. By default, this attribute is <code>NULL</code>.</p>

Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the `enabled` parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

["DEFINE_PROGRAM_ARGUMENT Procedure"](#)

153.6.20 CREATE_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

Syntax

```
DBMS_SCHEDULER.CREATE_RESOURCE (
  resource_name  IN VARCHAR2,
  units          IN PLS_INTEGER,
  status         IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  comments       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-32 CREATE_RESOURCE Procedure Parameters

Parameter	Description
resource_name	The name of the resource.
units	The number of units of this resource that the job or program uses.
status	The status of the resource. <ul style="list-style-type: none"> 'ENFORCE_CONSTRAINTS'. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached no additional jobs using this resource will get started. 'IGNORE_CONSTRAINTS'. When set, the scheduler will ignore any constraints on this resource. 'BLOCKED_ALL_JOBS'. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
constraint_level	Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code> . For incompatibilities, for <code>JOB_LEVEL</code> , the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs.
comments	Descriptive comment about the resource.

Usage Notes

The following example creates a new resource.

```
BEGIN
  DBMS_SCHEDULER.CREATE_RESOURCE(
    resource_name => 'my_resource',
    units => 3,
    state => 'ENFORCE_CONSTRAINTS',
    comments => 'Resource1'
  )
END;
/
```

 **See Also:**

- [Creating or Dropping a Resource in *Oracle Database Administrator's Guide*](#)
- [SET_RESOURCE_CONSTRAINT Procedure](#)

153.6.21 CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    repeat_interval    IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-33 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified. If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null.
repeat_interval	This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See " Calendaring Syntax " for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error is generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

153.6.22 CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  schedule_name        IN VARCHAR2,
  duration              IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments              IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name          IN VARCHAR2,
  resource_plan        IN VARCHAR2,
  start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval      IN VARCHAR2,
  end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  duration             IN INTERVAL DAY TO SECOND,
  window_priority      IN VARCHAR2 DEFAULT 'LOW',
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-34 CREATE_WINDOW Procedure Parameters

Parameter	Description
<code>window_name</code>	The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the <code>SYS</code> schema, so the preface 'SYS' is optional.

Table 153-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
resource_plan	<p>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window.</p> <p>Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p>
start_date	<p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</p>
duration	<p>This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</p>
schedule_name	<p>This attribute specifies the name of the schedule associated with the window.</p>
repeat_interval	<p>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See "Calendaring Syntax" for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.</p>
end_date	<p>This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE.</p> <p>A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever.</p> <p>The end_date must be after the start_date. If it is not, then an error is generated when the window is created.</p>

Table 153-34 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
window_priority	This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.
comments	This attribute specifies an optional comment about the window. By default, this attribute is NULL.

Usage Notes

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "[SWITCH_PLAN Procedure](#)".

153.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an `ANYDATA` object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN SYS.ANYDATA,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-35 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique, so it can replace any argument already defined at this position.

Table 153-35 (Cont.) DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure .
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)
- ["SET_JOB_ANYDATA_VALUE Procedure"](#)

153.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_schedule_name IN VARCHAR2,
    timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
```

```

step_name          IN VARCHAR2,
event_condition    IN VARCHAR2,
queue_spec         IN VARCHAR2,
timeout           IN INTERVAL DAY TO SECOND DEFAULT NULL);

```

Parameters

Table 153-36 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue_spec parameter, or use a file watcher schedule for the event_schedule_name parameter.

See Also:

"DEFINE_CHAIN_STEP Procedure"

153.6.25 DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form SCHED_RULE\${N}.

Syntax

```

DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
  chain_name      IN VARCHAR2,
  condition       IN VARCHAR2,
  action          IN VARCHAR2,

```

```
rule_name          IN VARCHAR2 DEFAULT NULL,
comments          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-37 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
condition	<p>A boolean expression which must evaluate to <code>TRUE</code> for the action to be performed. Every chain must have a rule that evaluates to <code>TRUE</code> to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p> <ul style="list-style-type: none"> Scheduler Chain Condition Syntax See "Scheduler Chain Condition Syntax" and <i>Oracle Database Administrator's Guide</i> for details SQL WHERE Clause Syntax Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is <code>:step_name.attribute</code>. (<code>step_name</code> refers to a typed object.) Possible attributes are: <code>completed</code>, <code>state</code>, <code>start_date</code>, <code>end_date</code>, <code>error_code</code>, and <code>duration</code>. Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its completed attribute is set to 'TRUE', otherwise completed is 'FALSE'.
action	<p>The action to be performed when the rule evaluates to <code>TRUE</code>. The action must consist of at least one keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> <code>[AFTER delay_interval] START step_1[,step_2 ...]</code> <code>STOP step_1[,step_2 ...]</code> <code>END [{end_value step_name.error_code}]</code> <p>At the beginning of the START action, a delay clause can specify a delay interval before performing the action. <code>delay_interval</code> is a formatted datetime interval of the form <code>HH:MM:SS</code>.</p> <p>The END action ends the chain with an error code equal to either the supplied <code>end_value</code> or the error code that <code>step_name</code> completes with. The default error code is 0, indicating a successful chain run.</p>
rule_name	The name of the rule being created. If no <code>rule_name</code> is given, one is generated in the form <code>SCHED_RULE\$_{N}</code> .
comments	An optional comment describing the rule. This is stored in the rule object created.

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

```

TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer

```

These boolean operators are available to create more complex conditions:

```

expression AND expression
expression OR expression
NOT (expression)

```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the `NOT` operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

Usage Notes

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```

'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when
any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7

```

Rule Conditions Using SQL Syntax

```
':step1.completed = 'TRUE' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval '5' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not
completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

153.6.26 DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    program_name        IN VARCHAR2);
```

Parameters

Table 153-38 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the chain to alter.
<code>step_name</code>	The name of the step being defined. If a step already exists with this name, the new step replaces the old one.

Table 153-38 (Cont.) DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
program_name	The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain.

Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

See Also:

- ["ALTER_CHAIN Procedure"](#)
- ["DEFINE_CHAIN_EVENT_STEP Procedure"](#)

153.6.27 DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name          IN VARCHAR2,
  metadata_attribute   IN VARCHAR2,
  argument_position    IN PLS_INTEGER,
  argument_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-39 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table 153-40 describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 153-40 Metadata Attributes

Metadata Attribute	Datatype	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See "SCHEDULER_FILEWATCHER_RESULT Object Type".

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

153.6.28 DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-41 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure .
argument_type	The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses <code>argument_type</code> when deciding what value to assign to the argument. Any valid SQL datatype is allowed.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to <code>FALSE</code> .

Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

`DEFINE_PROGRAM_ARGUMENT` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

See Also:

- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#)
- ["SET_JOB_ARGUMENT_VALUE Procedure"](#)

153.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

Syntax

```
DBMS_SCHEDULER.DISABLE (
    name          IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 153-42 DISABLE Procedure Parameters

Parameter	Description
<code>name</code>	The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.
<code>force</code>	If <code>TRUE</code> , objects are disabled even if other objects depend on them. See the usage notes for more information.
<code>commit_semantics</code>	The commit semantics. The following types are supported: <ul style="list-style-type: none"> <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. <code>TRANSACTIONAL</code>: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>. <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to `disabled`. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue.

No arguments that pertain to the program are affected when the program is disabled.

File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

153.6.30 DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE_SCHEDULER` privilege.

**Note:**

External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
    destination_name      IN VARCHAR2);
```

Parameters**Table 153-43 DROP_AGENT_DESTINATION Procedure Parameters**

Parameter	Description
<code>destination_name</code>	<p>A comma-separated list of external destinations to drop. Because user <code>SYS</code> owns all external destinations, do not prefix them with a schema name.</p> <p>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.</p> <p>Cannot be <code>NULL</code>.</p>

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

153.6.31 DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name      IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-44 DROP_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to drop. Can also be a comma-delimited list of chains.
force	If <code>force</code> is set to <code>FALSE</code> , the chain must not be referenced by any job, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code> , all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped.

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the `DBMS_RULE_ADM.DROP_RULE_SET` and `DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT` procedures for more information.

If `force` is `FALSE`, no jobs may be using this chain. If `force` is `TRUE`, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

153.6.32 DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
    chain_name      IN VARCHAR2,
    rule_name       IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-45 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If <code>force</code> is set to <code>TRUE</code> , the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <code>force</code> is set to <code>FALSE</code> and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

153.6.33 DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-46 DROP_CHAIN_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

153.6.34 DROP_CREDENTIAL Procedure

This deprecated procedure drops a credential.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the DROP_CREDENTIAL Procedure.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
    credential_name      IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-47 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.
force	If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

153.6.35 DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
    destination_name    IN VARCHAR2);
```

Parameters

Table 153-48 DROP_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
destination_name	The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be NULL.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the *_SCHEDULER_JOB_DESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

See Also:

[CREATE_DATABASE_DESTINATION Procedure](#)

153.6.36 DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
    file_watcher_name    IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-49 DROP_FILE_WATCHER Procedure Parameters

Parameter	Description
file_watcher_name	The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.
force	If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

153.6.37 DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
    group_name      IN VARCHAR2,  
    force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-50 DROP_GROUP Procedure Parameters

Parameter	Description
group_name	A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL.
force	If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

See Also:

["CREATE_FILE_WATCHER Procedure"](#)

153.6.38 DROP_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (  
    incompatibility_name  IN VARCHAR2);
```

Parameters

Table 153-51 DROP_INCOMPATIBILITY Procedure Parameters

Parameter	Description
<code>incompatibility_name</code>	The name of the incompatibility definition.

Usage Notes

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

153.6.39 DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
    job_name          IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE,
    defer             IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 153-52 DROP_JOB Procedure Parameters

Parameter	Description
<code>job_name</code>	The name of a job or job class. Can be a comma-delimited list. For a job class, the <code>SYS</code> schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
<code>force</code>	If <code>force</code> is set to <code>TRUE</code> , the Scheduler first attempts to stop the running job instances (by issuing the <code>STOP_JOB</code> call with the <code>force</code> flag set to <code>false</code>), and then drops the jobs.
<code>defer</code>	If <code>defer</code> is set to <code>TRUE</code> , the Scheduler allows the running jobs to complete and then drops the jobs.

Table 153-52 (Cont.) DROP_JOB Procedure Parameters

Parameter	Description
<code>commit_semantics</code>	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> returns on the first error and previous successful drop operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> returns on the first error. Everything that happened before that error is rolled back. This type is not supported when <code>force</code> is set to <code>TRUE</code>. • <code>ABSORB_ERRORS</code> tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. <p>Only <code>STOP_ON_FIRST_ERROR</code> is permitted when job classes are included in the <code>job_name</code> list.</p>

Usage Notes

If both `force` and `defer` are set to `FALSE` and a job is running at the time of the call, the attempt to drop that job fails. The entire call to `DROP_JOB` may then fail, depending on the setting of `commit_semantics`.

Setting both `force` and `defer` to `TRUE` results in an error.

Dropping a job requires `ALTER` privileges on the job either as the owner of the job or as a user with the `ALTER` object privilege on the job or the `CREATE ANY JOB` system privilege.

153.6.40 DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
    job_class_name      IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-53 DROP_JOB_CLASS Procedure Parameters

Parameter	Description
<code>job_class_name</code>	The name of the job class. Can be a comma-delimited list.
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped.</p> <p>Running jobs that belong to the job class are not affected.</p>

Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

153.6.41 DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
  program_name          IN VARCHAR2,
  force                 IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-54 DROP_PROGRAM Procedure Parameters

Parameter	Description
<code>program_name</code>	The name of the program to be dropped. Can be a comma-delimited list.
<code>force</code>	If <code>force</code> is set to <code>FALSE</code> , the program must not be referenced by any job, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , all jobs referencing the program are disabled before the program is dropped. Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call and are allowed to continue.

Usage Notes

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.

153.6.42 DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
  program_name          IN VARCHAR2,
  argument_position     IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
  program_name          IN VARCHAR2,
  argument_name         IN VARCHAR2);
```

Parameters

Table 153-55 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
<code>program_name</code>	The name of the program to be altered. A program with this name must exist.
<code>argument_name</code>	The name of the argument being dropped
<code>argument_position</code>	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program argument if you have the `CREATE ANY JOB` privilege.

153.6.43 DROP_RESOURCE Procedure

This procedure drops a resource.

Syntax

```
DBMS_SCHEDULER.DROP_RESOURCE (
    resource_name IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-56 DROP_RESOURCE Procedure Parameters

Parameter	Description
<code>resource_name</code>	The name of the resource to be dropped. Can be a comma-delimited list.
<code>force</code>	If <code>force</code> is set to <code>FALSE</code> , the resource must not have any existing constraints, otherwise an error occurs. If <code>force</code> is set to <code>TRUE</code> , the resource will be dropped and any constraints defined on this resource will also be dropped.

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the resource.

See Also:

Creating or Dropping a Resource in *Oracle Database Administrator's Guide*

153.6.44 DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (  
    schedule_name    IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-57 DROP_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If <code>force</code> is set to <code>FALSE</code> , the schedule must not be referenced by any job or window, otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code> , any jobs or windows that use this schedule are disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected.

Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

153.6.45 DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (  
    window_name      IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-58 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.

Table 153-58 (Cont.) DROP_WINDOW Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, the window must be not be open or referenced by any job, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule is allowed to continue, unless the <code>stop_on_window_close</code> flag is set to <code>TRUE</code> for the job. If this is the case, the job is stopped when the window is dropped.</p>

Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

153.6.46 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job `RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT` columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
    name           IN VARCHAR2,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 153-59 ENABLE Procedure Parameters

Parameter	Description
name	<p>The name of the Scheduler object being enabled. Can be a comma-delimited list of names.</p> <p>If a job class name is specified, then all the jobs in the job class are enabled.</p> <p>If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.</p>
commit_semantics	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> • <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default. • <code>TRANSACTIONAL</code> - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. • <code>ABSORB_ERRORS</code> - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Window names must be preceded by `SYS`.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.

153.6.47 END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`.

A detached job run does not end until this procedure or the [STOP_JOB Procedure](#) is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
  job_name          IN VARCHAR2,
  error_number      IN PLS_INTEGER DEFAULT 0,
  additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-60 END_DETACHED_JOB_RUN Procedure Parameters

Parameter	Description
job_name	The name of the job to end. Must be a detached job that is running.
error_number	If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number.
additional_info	This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run.

Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

See Also:

Oracle Database Administrator's Guide for information about detached jobs.

153.6.48 EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation.

See the calendaring syntax described in "[Operational Notes](#)".

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
    calendar_string    IN  VARCHAR2,
    start_date         IN  TIMESTAMP WITH TIME ZONE,
    return_date_after  IN  TIMESTAMP WITH TIME ZONE,
    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 153-61 EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
calendar_string	The calendar expression to be evaluated. The string must be in the calendaring syntax described in " Operational Notes ".

Table 153-61 (Cont.) EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
start_date	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.
return_date_after	The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.
next_run_date	The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```

SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date          TIMESTAMP;
return_date_after  TIMESTAMP;
next_run_date      TIMESTAMP;
BEGIN
start_date :=
to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
    DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
        'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
        start_date, return_date_after, next_run_date);
    DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.

```

Usage Notes

No specific Scheduler privileges are required.

153.6.49 EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (`RUN_JOB` can be used to start the job.)

If any of the steps of the chain are themselves running chains, another `EVALUATE_RUNNING_CHAIN` is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
    job_name          IN VARCHAR2);
```

Parameters

Table 153-62 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
<code>job_name</code>	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running `EVALUATE_RUNNING_CHAIN` on a job requires alter privileges on the job (either as the owner, or as a user with `ALTER` privileges on the job or the `CREATE ANY JOB` system privilege).

Note:

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. `EVALUATE_RUNNING_CHAIN` should be used only under the following circumstances:

- After manual intervention of a running chain with the `ALTER_RUNNING_CHAIN` procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, `EVALUATE_RUNNING_CHAIN` may not be needed if you set the `evaluation_interval` attribute when you created the chain.

153.6.50 GENERATE_JOB_NAME Function

This function returns a unique name for a job.

The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB\$_1, JOB\$_2, JOB\$_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 153-63 GENERATE_JOB_NAME Function Parameter

Parameter	Description
prefix	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to NULL, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

153.6.51 GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (
    agent_name      IN VARCHAR2,
    attribute       IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 153-64 GET_AGENT_INFO Function Parameter

Parameter	Description
agent_name	The name of an external destination where the agent is running

Table 153-64 (Cont.) GET_AGENT_INFO Function Parameter

Parameter	Description
attribute	<p>Possible Attributes values</p> <ul style="list-style-type: none"> • VERSION: Returns the agent version number. Requires the <code>CREATE JOB</code> system privilege. • UPTIME: Returns the time the agent has been up and running. Requires the <code>CREATE JOB</code> system privilege. • NUMBER_OF_RUNNING_JOBS: Returns the number of jobs that the agent is currently running. Requires the <code>CREATE JOB</code> system privilege. • TOTAL_JOBS_RUN: Returns the number of jobs run by the agent since it was started. Requires the <code>CREATE JOB</code> system privilege. • RUNNING_JOBS: Returns a comma-separated list of the names of the jobs running currently. Requires the <code>MANAGE SCHEDULER</code> system privilege. • ALL: Returns all the information the previous options return. It requires the <code>MANAGE SCHEDULER</code> system privilege.

Usage Notes

This function returns the same information as the `schagent` utility status option. See *Oracle Database Administrator's Guide*.

153.6.52 GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. `GET_AGENT_VERSION` throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
    agent_host          IN VARCHAR2) RETURN VARCHAR2;
```

Parameters**Table 153-65 GET_AGENT_VERSION Function Parameter**

Parameter	Description
agent_host	Either the hostname and port on which the agent is running in the form <code>hostname:port</code> or the name of the agent as shown in the <code>destination_name</code> column of the <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> view which lists all Scheduler agents registered with the database.

Usage Notes

This function requires the `CREATE EXTERNAL JOB` system privilege.

153.6.53 GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                  TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                  INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT VARCHAR2,
  value2       OUT VARCHAR2);
```

Parameters

Table 153-66 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved. See the SET_ATTRIBUTE Procedure for tables of attribute values.
value	The existing value of the attribute
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

Usage Notes

To run `GET_ATTRIBUTE` for a job class, you must have the `MANAGE_SCHEDULER` privilege or have `EXECUTE` privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have `ALTER` or `EXECUTE` privileges on that object or have the `CREATE ANY JOB` privilege.

See the [SET_ATTRIBUTE Procedure](#) for tables of attribute values that you can retrieve for the various Scheduler object types.

153.6.54 GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_contents        IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    destination_file_name IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-67 GET_FILE Procedure Parameters

Parameter	Description
<code>source_file</code>	<p>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <code>external_log_id_stdout</code>, then the stdout from the designated external job run is returned.</p> <p>If the format of this parameter is <code>external_log_id_stderr</code>, the error text from the designated external job run is returned.</p> <p>You obtain the value of <code>external_log_id</code> from the <code>ADDITIONAL_INFO</code> column of the <code>*_SCHEDULER_JOB_RUN_DETAILS</code> views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the <code>external_log_id</code> name/value pair, and then append either <code> "_stdout"</code> or <code> "_stderr"</code> to its value.</p> <p>The external job must have an associated credential. The <code>credential_name</code> parameter of <code>GET_FILE</code> must name the same credential that is used by the job, and the <code>source_host</code> parameter must be the same as the <code>destination</code> attribute of the job.</p>
<code>source_host</code>	<p>If the file is to be retrieved from a remote host, then this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views <code>*_SCHEDULER_EXTERNAL_DESTS</code>.)</p> <p>If <code>source_host</code> is <code>NULL</code> or set to <code>'localhost'</code>, then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the <code>schagent.conf</code> file, which is located in the Scheduler agent home directory on the remote host.</p>
<code>credential_name</code>	The name of the credential to use for accessing the file system.
<code>file_contents</code>	The variable into which the file contents is read.

Table 153-67 (Cont.) GET_FILE Procedure Parameters

Parameter	Description
destination_file_name	The file to which the file contents is written.
destination_directory_object	The directory object that specifies the path to the destination file, when destination_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the CREATE_EXTERNAL_JOB system privilege and have EXECUTE privileges on the credential.

153.6.55 GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
    attribute    IN VARCHAR2,
    value        OUT VARCHAR2);
```

Parameters

Table 153-68 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the MANAGE_SCHEDULER privilege.

[Table 153-69](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 153-101](#) and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 153-69 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
current_open_window	Name of the currently open window
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows

Table 153-69 (Cont.) Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
email_sender	The default e-mail address of the sender for job state e-mail notifications
email_server	The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.
log_history	Retention period in days for job and window logs. The range of valid values is 0 through 1000000.
max_job_slave_processes	This Scheduler attribute is not used.

153.6.56 OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
    window_name      IN VARCHAR2,
    duration         IN INTERVAL DAY TO SECOND,
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153-70 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.

Table 153-70 (Cont.) OPEN_WINDOW Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, then opening an already open window generates an error.</p> <p>If <code>force</code> is set to <code>TRUE</code>:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the <code>OPEN_WINDOW</code> command was issued.</p> <p>For example: <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If, at this point, you reopen <code>window1</code> using the <code>OPEN_WINDOW</code> call and do not specify a duration, then <code>window1</code> stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p>

Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

153.6.57 PURGE_LOG Procedure

The `PURGE_LOG` procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
    log_history          IN PLS_INTEGER DEFAULT 0,
```

```

which_log          IN VARCHAR2          DEFAULT 'JOB_AND_WINDOW_LOG',
job_name           IN VARCHAR2          DEFAULT NULL);

```

Parameters

Table 153-71 PURGE_LOG Procedure Parameters

Parameter	Description
log_history	This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.
which_log	This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log.
job_name	This specifies which job-specific entries must be purged from the jog log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.

Usage Notes

This procedure requires the `MANAGE SCHEDULER` privilege.

Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

153.6.58 PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,
  file_contents         IN {BLOB|CLOB},
  destination_permissions IN VARCHAR2 DEFAULT NULL);

```

```

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,

```

```
source_file_name          IN VARCHAR2,
source_directory_object  IN VARCHAR2,
destination_permissions  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-72 PUT_FILE Procedure Parameters

Parameter	Description
destination_file	Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The variable from which the file contents is read.
source_file_name	The file from which the file contents is written
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

153.6.59 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-73 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

153.6.60 REMOVE_FROM_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 153-74 REMOVE_FROM_INCOMPATIBILITY Procedure Parameters

Parameter	Description
incompatibility_name	The name of the incompatibility definition.
object_name	One or more (comma-separated) programs or jobs

Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

153.6.61 REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
    group_name             IN VARCHAR2,
    member                 IN VARCHAR2);
```

Parameters

Table 153-75 REMOVE_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member_name	The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

See Also:

["CREATE_GROUP Procedure"](#)

153.6.62 REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name          IN VARCHAR2,
    recipients        IN VARCHAR2 DEFAULT NULL,
    events            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-76 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job to remove e-mail notifications for. Cannot be NULL.

Table 153-76 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
recipients	E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.
events	Job state event to remove e-mail notification for. Comma-separated list of job state events.

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is `NULL`, e-mail notifications for the specified events are removed for all existing recipients. If `events` is `NULL`, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are `NULL`, all e-mail notifications are removed for the job.

For example, if `recipients` is `'jsmith@example.com,rjones@example.com'` and `events` is `'JOB_FAILED,JOB_BROKEN'`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for both `jsmith` and `rjones`. If `recipients` is `NULL`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for `jsmith`, `rjones`, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the `CREATE ANY JOB` system privilege or `ALTER` object privilege on the job.

**See Also:**

["ADD_JOB_EMAIL_NOTIFICATION Procedure"](#)

153.6.63 RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

`RESET_JOB_ARGUMENT_VALUE` is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2);
```

Parameters

Table 153-77 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
<code>job_name</code>	The name of the job being altered
<code>argument_position</code>	The position of the program argument being reset
<code>argument_name</code>	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires `ALTER` privileges on that job. Arguments can be specified by position or by name.

`RESET_JOB_ARGUMENT_VALUE` requires that you be the owner of the job or have `ALTER` privileges on that job. You can also reset a job argument value if you have the `CREATE ANY JOB` privilege.

`RESET_JOB_ARGUMENT_VALUE` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

153.6.64 RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no `job_name` is given, one is generated of the form `RUN_CHAIN$_chainnameN`, where `chainname` is the first 8 characters of the chain name and `N` is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If `start_steps` is `NULL`, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps         IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
```

```

step_state_list      IN SYS.SCHEDULER$_STEP_TYPE_LIST,
job_name             IN VARCHAR2 DEFAULT NULL);

```

Parameters

Table 153-78 RUN_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to run
job_name	The name of the job to create to run the chain
start_steps	Comma-separated list of the steps to start when the chain starts running
step_state_list	List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each. Set the attributes of <code>sys.scheduler\$_step_type</code> as follows: step_name The name of the step step_type 'SUCCEEDED' or 'FAILED' error_number where <i>error_number</i> is a positive or negative integer.

Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the `EXECUTE` privilege on the chain or the `EXECUTE ANY PROGRAM` system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```

declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/

```

153.6.65 RUN_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call `RUN_JOB` to run a job according to its schedule. Use `RUN_JOB` to run a job outside of its normal schedule.

Syntax

```

DBMS_SCHEDULER.RUN_JOB (
  job_name           IN VARCHAR2,
  use_current_session IN BOOLEAN DEFAULT TRUE);

```

Parameters

Table 153-79 RUN_JOB Procedure Parameters

Parameter	Description
job_name	<p>A job name or a comma-separated list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</p> <p>If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.</p>
use_current_session	<p>This specifies whether or not the job run should occur in the same session that the procedure was invoked from. The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> You can test a job and see any possible errors on the command line. state, run_count, last_start_date, last_run_duration, and failure_count of *_scheduler_jobs are not updated. RUN_JOB can be run in parallel with a regularly scheduled job run. <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> You need to check the job log to find error information. All relevant fields in *_scheduler_jobs are updated. RUN_JOB fails if a regularly scheduled job is running. <p>For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE.</p>

Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use_current_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination_name attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

above bug fix 1261887 6.12.11

When `use_current_session` is `TRUE`, the call to `RUN_JOB` blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the `RUN_JOB` procedure.

Using `RUN_JOB` with `use_current_session=TRUE` does not update the job state and the job will not appear in `*_SCHEDULER_RUNNING_JOBS` views.

above bug fix 19185117 9.15.14

When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

Example

The following is an example of using `RUN_JOB`.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB (
    JOB_NAME      => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

153.6.66 SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
  registration_password IN VARCHAR2,
  expiration_date       IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  max_uses              IN NUMBER DEFAULT NULL);
```

Parameters

Table 153-80 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
<code>registration_password</code>	This is the password that remote agents must specify in order to successfully register with the database. If this is <code>NULL</code> , then no agents will be able to register with the database.
<code>expiration_date</code>	If this is set to a non- <code>NULL</code> value, then the <code>registration_password</code> is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.

Table 153-80 (Cont.) SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE SCHEDULER` system privilege.

By default, `max_uses` is set to `NULL`, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to `NULL` if no new agents are being registered.

153.6.67 SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to `NULL`, use the `SET_ATTRIBUTE_NULL` procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value         IN {BOOLEAN|DATE|TIMESTAMP|
                    TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                    INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value         IN VARCHAR2,
    value2       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153-81 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object.
attribute	See Table 153-83 through Table 153-93 .

Table 153-81 (Cont.) SET_ATTRIBUTE Procedure Parameters

Parameter	Description
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

[Table 153-82](#) is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

Table 153-82 Attribute Tables for Scheduler Object Types

Scheduler Object Type	Table of Attributes
Job	Table 153-83
Program	Table 153-85
Schedule	Table 153-86
File Watcher	Table 153-87
Job Class	Table 153-88
Window	Table 153-89
Chain	Table 153-90
Database Destination	Table 153-91
External Destination	Table 153-92
Group	Table 153-93
Credential	Table 153-94
Resource	Table 153-95

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run SET_ATTRIBUTE for a window, a group of type WINDOW, or job class, you must have the MANAGE_SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan.

Job Attribute Values

[Table 153-83](#) lists attribute values for jobs.

Note:

See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

Table 153-83 Job Attribute Values

Name	Description
<code>allow_runs_in_restricted_mode</code>	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. FALSE by default.
<code>auto_drop</code>	<p>This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> • Its end date (or the end date of the schedule) has passed. • It has run <code>max_runs</code> number of times. <code>max_runs</code> must be set with <code>SET_ATTRIBUTE</code>. • It is not a repeating job and has run once. <p>A job is automatically disabled when it has failed <code>max_failures</code> times. <code>max_failures</code> is also set with <code>SET_ATTRIBUTE</code>.</p> <p>If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the <code>DROP_JOB</code> procedure.</p> <p>By default, jobs are created with <code>auto_drop</code> set to TRUE.</p>
<code>comments</code>	An optional comment.
<code>connect_credential_name</code>	<p>feature 25230</p> <p>This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails.</p> <p>Using a <code>connect_credential_name</code> is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script.</p>
<code>credential_name</code>	This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.
<code>database_role</code>	<p>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.</p> <p>Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a <code>database_role</code> of 'PRIMARY', and the other with a <code>database_role</code> of 'LOGICAL STANDBY'.</p>

Table 153-83 (Cont.) Job Attribute Values

Name	Description
destination	<p>*** Deprecated in Oracle Database 11g Release 2. Use <code>destination_name</code> instead.</p> <p>This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format:</p> <p><i>hostname:port</i></p> <p>This attribute is set to <code>NULL</code> by default.</p>
destination_name	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be <code>NULL</code>.</p> <p>See Table 153-28 for details about this attribute.</p>
end_date	<p>Specifies the date and time after which the job expires and is no longer run. After the <code>end_date</code>, if is <code>TRUE</code>, the job is dropped. If <code>auto_drop</code> is <code>FALSE</code>, the job is disabled and the <code>STATE</code> of the job is set to <code>COMPLETED</code>.</p> <p>If no value for <code>end_date</code> is specified, the job repeats forever unless <code>max_runs</code> or <code>max_failures</code> is set, in which case the job stops when either value is reached.</p> <p>The value for <code>end_date</code> must be after the value for <code>start_date</code>. If <code>end_date</code> is less than <code>start_date</code>, then an error will be generated. If <code>end_date</code> is the same as <code>start_date</code>, then the job will not execute and no error will be generated.</p>
event_spec	<p>This attribute takes two values: the <code>value</code> argument specifies the event condition and the <code>value2</code> argument specifies the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments in the "CREATE_JOB Procedure".</p>
follow_default_timezone	<p>If <code>TRUE</code> and if the job <code>start_date</code> is null, then when the <code>default_timezone</code> scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</p> <p>For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone.</p> <p>If the job <code>start_date</code> is not null, then the time zone for the run date and time for the job is always specified by the time zone of the <code>start_date</code>.</p> <p>If <code>FALSE</code>, the next start date and time for the job is not recomputed when the <code>default_timezone</code> scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>Summer and winter transitions do not change the default time zone name.</p>
instance_id	<p>Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.</p>

Table 153-83 (Cont.) Job Attribute Values

Name	Description
instance_stickiness	<p>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to <code>TRUE</code>. If you set <code>instance_stickiness</code> to <code>TRUE</code>, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, <code>instance_stickiness</code> is ignored and the job is handled as if it were a non-sticky job.</p> <p>If <code>instance_stickiness</code> is set to <code>FALSE</code>, each instance of the job runs on the first instance available.</p> <p>For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</p>
job_action	<p>The action that the job performs, depending on the <code>job_type</code> attribute. For example, if <code>job_type</code> is <code>'STORED_PROCEDURE'</code>, <code>job_action</code> contains the name of the stored procedure.</p>
job_class	<p>The class this job is associated with.</p>
job_priority	<p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p>
job_type	<p>The type of this job. Valid values are: <code>'PLSQL_BLOCK'</code>, <code>'STORED_PROCEDURE'</code>, <code>'EXECUTABLE'</code>, <code>CHAIN</code>, <code>'EXTERNAL_SCRIPT'</code>, <code>'SQL_SCRIPT'</code>, and <code>'BACKUP_SCRIPT'</code>.</p> <p>If this is set, <code>program_name</code> must be <code>NULL</code>.</p>
job_weight	<p>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1.</p> <p>Weight of the job for parallel execution.</p>
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <p><code>DBMS_SCHEDULER.LOGGING_OFF</code></p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p><code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code></p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_RUNS</code></p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p><code>DBMS_SCHEDULER.LOGGING_FULL</code></p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with <code>SET_ATTRIBUTE</code>), stop, and so on.</p>

Table 153-83 (Cont.) Job Attribute Values

Name	Description
max_failures	<p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views.</p> <p>max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job are started regardless of how many previous instances have failed.</p>
max_run_duration	<p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.</p>
max_runs	<p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED.</p> <p>max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it repeats forever or until end_date or max_failures is reached.</p>
number_of_arguments	<p>The number of arguments if the program is inlined. If this is set, program_name should be NULL.</p>
parallel_instances	<p>This is a boolean attribute that can be set only for event-based jobs.</p> <p>If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.</p> <p>If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <i>parent job</i>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.</p> <p>The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</p>
program_name	<p>The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.</p>

Table 153-83 (Cont.) Job Attribute Values

Name	Description
raise_events	<p>This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> • job_started CONSTANT PLS_INTEGER := 1 • job_succeeded CONSTANT PLS_INTEGER := 2 • job_failed CONSTANT PLS_INTEGER :=4 • job_broken CONSTANT PLS_INTEGER :=8 • job_completed CONSTANT PLS_INTEGER :=16 • job_stopped CONSTANT PLS_INTEGER :=32 • job_sch_lim_reached CONSTANT PLS_INTEGER :=64 • job_disabled CONSTANT PLS_INTEGER :=128 • job_chain_stalled CONSTANT PLS_INTEGER :=256 • job_all_events CONSTANT PLS_INTEGER := 511 • job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped <p>Table 153-84 describes these event types in detail.</p>
repeat_interval	<p>Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" for more information.</p>
restartable	<p>This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it is restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler stops retrying a job when:</p> <ul style="list-style-type: none"> • One of the retries succeeds. • All of its six retries have failed. • The next retry would occur after the next regularly scheduled run of the job. <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p>

Table 153-83 (Cont.) Job Attribute Values

Name	Description
<code>schedule_limit</code>	<p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.</p>
<code>schedule_name</code>	<p>The name of a schedule, window, or group of type <code>WINDOW</code> to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be <code>NULL</code>.</p>
<code>start_date</code>	<p>The original date and time on which this job started or is scheduled to start. If this is set, <code>schedule_name</code> should be <code>NULL</code>.</p>
<code>stop_on_window_close</code>	<p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to <code>TRUE</code> implies that the job should stop once the associated window is closed. The job is stopped using the <code>stop_job</code> procedure with <code>force</code> set to <code>FALSE</code>.</p> <p>By default, <code>stop_on_window_close</code> is set to <code>FALSE</code>. Therefore, if you do not set this attribute, the job continues after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p>
<code>store_output</code>	<p>This is a boolean attribute. If set to <code>TRUE</code>, then for job runs that are logged, all job output and error messages are stored in the <code>*_JOB_RUN_DETAILS</code> views. If set to <code>FALSE</code>, then the output and messages are not stored. For new jobs, this is set, by default, to <code>TRUE</code>.</p>

The following event types are valid values for the `raise_events` attribute in [Table 153-83](#).

Table 153-84 Event Types Raised by the Scheduler

Event Type	Description
<code>job_all_events</code>	Not an event, but a constant that provides an easy way for you to enable all events
<code>job_broken</code>	The job has been disabled and has changed to the <code>BROKEN</code> state because it exceeded the number of failures defined by the <code>max_failures</code> job attribute
<code>job_chain_stalled</code>	A job running a chain is in the <code>CHAIN_STALLED</code> state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain <code>evaluation_interval</code> is set to <code>NULL</code> . No progress is made in the chain unless there is manual intervention.
<code>job_completed</code>	The job completed because it reached its <code>max_runs</code> or <code>end_date</code>

Table 153-84 (Cont.) Event Types Raised by the Scheduler

Event Type	Description
job_disabled	The job was disabled by the Scheduler or by a call to <code>SET_ATTRIBUTE</code>
job_failed	The job failed, either due to an error or an abnormal termination.
job_over_max_dur	The job exceeded the maximum run duration specified by its <code>max_run_duration</code> attribute. (Note: you do not need to enable this event with the <code>raise_events</code> job attribute; it is always enabled.)
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the <code>schedule_limit</code> job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to <code>STOP_JOB</code>
job_succeeded	The job completed successfully

Program Attribute Values

Table 153-85 lists program attribute values.

Note:

See the "[CREATE_PROGRAM Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-85 Program Attribute Values

Name	Description
comments	An optional comment. This can describe what the program does or give usage details.
detached	If <code>TRUE</code> , the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, indicated by the <code>program_type</code> attribute. For example, if <code>program_type</code> is <code>'STORED_PROCEDURE'</code> , <code>program_action</code> contains the name of the stored procedure.
program_type	The type of program. This must be one of these supported program types: <code>'PLSQL_BLOCK'</code> , <code>'STORED_PROCEDURE'</code> , and <code>'EXECUTABLE'</code> .

Schedule Attribute Values

Table 153-86 lists schedule attribute values.

Note:

See "[CREATE_SCHEDULE Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-86 Schedule Attribute Values

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule does not specify any dates.
event_spec	This attribute takes two values: the <code>value</code> argument should contain the event condition and the <code>value2</code> argument should contain the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments to the " CREATE_JOB Procedure ".
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. See " Calendaring Syntax " for more information.
start_date	The start or reference date and time used by the calendaring syntax.

File Watcher Attribute Values

[Table 153-87](#) lists file watcher attribute values.

Table 153-87 File Watcher Attribute Values

Parameter	Description
destination	Remote host name or IP address where the file is expected to arrive. If <code>NULL</code> , destination is the local host.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbs/log' denotes the rdbs/log subdirectory of the Oracle home directory.
file_name	Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be <code>NULL</code> .
credential_name	Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the <code>EXECUTE</code> privilege on the credential. Cannot be <code>NULL</code> .
min_file_size	Minimum file size in bytes before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If <code>NULL</code> , an internal value is used. The lower limit for this attribute is 10 seconds.
comments	Optional comment.

Job Class Attribute Values

Table 153-88 lists job class attribute values.

Note:

See the "[CREATE_JOB_CLASS Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-88 Job Class Attribute Values

Name	Description
comments	An optional comment about the class.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
logging_level	This attribute specifies how much information is logged. The valid values are: <ul style="list-style-type: none"> DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. DBMS_SCHEDULER.LOGGING_FULL The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.
resource_consumer_group	The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager.
service	The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.

Window Attribute Values

Table 153-89 lists window attribute values.

Note:

See the "[CREATE_WINDOW Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-89 Window Attribute Values

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.
end_date	The date after which the window no longer opens. If this is set, <code>schedule_name</code> must be NULL.
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, <code>schedule_name</code> must be NULL. See " Calendaring Syntax " for more information.
resource_plan	The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the <code>force</code> option, no resource plan switch occurs. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, <code>start_date</code> , <code>end_date</code> , and <code>repeat_interval</code> must all be NULL.
start_date	The next date and time on which this window is scheduled to open. If this is set, <code>schedule_name</code> must be NULL.
window_priority	The priority of the window. Must be either 'LOW' (default) or 'HIGH'.

Chain Attribute Values

[Table 153-90](#) lists chain attribute values.

Note:

See the "[CREATE_CHAIN Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-90 Chain Attribute Values

Name	Description
comments	An optional comment describing the purpose of the chain.
evaluation_interval	If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives) This attribute should only to be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.

Table 153-90 (Cont.) Chain Attribute Values

Name	Description
<code>rule_set_name</code>	<p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code>.</p>

Database Destination Attribute Values

[Table 153-91](#) lists database destination attribute values.

**Note:**

See the "[CREATE_DATABASE_DESTINATION Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-91 Database Destination Attribute Values

Name	Description
<code>agent</code>	<p>The name of the external destination (also known as agent destination) that is used to connect to the remote database.</p> <p>You can obtain valid external destination names from the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code>.</p>
<code>connect_info</code>	<p>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in <code>tnsnames.ora</code> that resolves to the connect descriptor.</p> <p>Note: This corresponds to the <code>tns_name</code> argument of <code>CREATE_DATABASE_DESTINATION</code>.</p>
<code>enabled</code>	If <code>TRUE</code> , the database destination is enabled.
<code>comments</code>	An optional comment about the database destination.

External Destination Attribute Values

[Table 153-92](#) lists external destination attribute values.

Note:

External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 153-92 External Destination Attribute Values

Name	Description
hostname	(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.
port	(GET_ATTRIBUTE only) The TCP port number on which the agent listens.
ip_address	(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.
enabled	If TRUE, the external destination is enabled.
comments	An optional comment about the external destination.

Group Attribute Values

Table 153-93 lists group attribute values.

Note:

See the "[CREATE_GROUP Procedure](#)" for more complete descriptions of the attributes in this table.

Table 153-93 Group Attribute Values

Name	Description
group_type	(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).
member_name	Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the member argument of CREATE_GROUP.
enabled	If TRUE, the group is enabled.
comments	An optional comment about the group.
number_of_members	(GET_ATTRIBUTE only) The number of members in the group.

Credential Attribute Values

Table 153-94 lists credential attribute values.

 **Note:**

Credential attribute values for the `SET_ATTRIBUTE` and `GET_ATTRIBUTE` procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the attribute parameter in the `UPDATE_CREDENTIAL Procedure`.

Table 153-94 Credential Attribute Values

Name	Description
<code>username</code>	The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64.
<code>password</code>	The password for the user name. Maximum length is 128.
<code>comments</code>	A description of the credential. Maximum length is 240.
<code>windows_domain</code>	For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.
<code>database_role</code>	The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code> .

Resource Attribute Values

[Table 153-95](#) lists resource attribute values.

Table 153-95 Resource Attribute Values

Name	Description
<code>resource_name</code>	The name of the resource
<code>units</code>	The number of units of this resource that the job or program uses.
<code>status</code>	The status of the resource. <code>ENFORCE_CONSTRAINTS</code> . This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started. <code>IGNORE_CONSTRAINTS</code> . When set, the scheduler will ignore any constraints on this resource. <code>BLOCKED_ALL_JOBS</code> . No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.
<code>constraint_level</code>	Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code> For incompatibilities, for <code>JOB_LEVEL</code> , the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs.
<code>comments</code>	Descriptive comment about the resource.

153.6.68 SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to `NULL`.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2);
```

Parameters

Table 153-96 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run `SET_ATTRIBUTE_NULL` for a window, group of type `WINDOW`, or job class, you must have the `MANAGE_SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

153.6.69 SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object.

It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_ANYDATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name          IN VARCHAR2,
```

```

argument_position    IN PLS_INTEGER,
argument_value      IN SYS.ANYDATA);

```

Sets a program argument by its name.

```

DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN SYS.ANYDATA);

```

Parameters

Table 153-97 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be assigned to the program argument, encapsulated in an AnyData object

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you own the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- "[SET_JOB_ARGUMENT_VALUE Procedure](#)"
- "[DEFINE_ANYDATA_ARGUMENT Procedure](#)"

153.6.70 SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_PROGRAM_ARGUMENT Procedure](#) or the [DEFINE_METADATA_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER,
  argument_value     IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN VARCHAR2);
```

Parameters

Table 153-98 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- ["SET_JOB_ANYDATA_VALUE Procedure"](#)
- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#)

153.6.71 SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
    jobattr_array    IN JOBATTR_ARRAY,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 153-99 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default. TRANSACTIONAL returns on the first error and rolls back everything that happened before that error. ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

153.6.72 SET_RESOURCE_CONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

Syntax

```
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
    object_name      IN VARCHAR2,
    resource_name    IN VARCHAR2,
    units            IN NUMBER DEFAULT 1);
```

Parameters

Table 153-100 SET_RESOURCE_CONSTRAINT Procedure Parameters

Parameter	Description
object_name	The name of a program or a job, or a comma separated list of these objects.
resource_name	The name of the resource.

Table 153-100 (Cont.) SET_RESOURCE_CONSTRAINT Procedure Parameters

Parameter	Description
<code>units</code>	The number of units of this resource that the job or program uses.

Usages Notes

`object_name` can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

`units` specifies the number of units of the resource that the program or job can use. If `units` is set to 0, then the program or job does not use this resource anymore, and the resulting constraint is deleted. Setting `units` to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

153.6.73 SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

[Table 153-101](#) provides short attribute descriptions for the `SET_SCHEDULER_ATTRIBUTE` procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (  
  attribute      IN VARCHAR2,  
  value         IN VARCHAR2);
```

Parameters

Table 153-101 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	<p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> • 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See "Calendaring Syntax" for more information. • 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL. • 'email_sender': The default e-mail address of the sender of job state e-mail notifications. • 'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications. • 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: <ul style="list-style-type: none"> – NONE: the default, indicating no encryption used – SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection – STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption • 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours. • 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000. • 'max_job_slave_processes': This Scheduler attribute is not used.
value	The new value of the attribute

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the `MANAGE SCHEDULER` privilege.

See Also:

Oracle Database Administrator's Guide for more detailed descriptions of Scheduler attributes

153.6.74 STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to `STOPPED`, whereas the state of a repeating job is set to `SCHEDULED` or `COMPLETED`, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, `STOP_JOB` stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, `STOP_JOB` uses the `instance_id` attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same `job_name` can in some conditions be used for different jobs on different instances.)

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
  job_name          IN VARCHAR2
  force             IN BOOLEAN DEFAULT FALSE
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 153-102 STOP_JOB Procedure Parameters

Parameter	Description
<code>job_name</code>	<p>Name of a job to stop. Can be a comma-separated list of jobs, where each entry can be one of the following:</p> <ul style="list-style-type: none"> • Job name: the name of an existing job, optionally preceded by a schema name and dot separator. • Job destination ID: a number, obtained from the <code>JOB_DEST_ID</code> column of the <code>*_SCHEDULER_JOB_DESTS</code> views, that represents the unique combination of a job, a credential, and a destination. • Job class: the name of a job class. Must be preceded by the <code>SYS</code> schema name and a dot separator. <p>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its <code>destination_name</code> attribute, all job instances on all destinations are stopped.</p>

Table 153-102 (Cont.) STOP_JOB Procedure Parameters

Parameter	Description
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the Scheduler immediately terminates the job slave. Oracle recommends that <code>STOP_JOB</code> with <code>force</code> set to <code>TRUE</code> be used only after a <code>STOP_JOB</code> with <code>force</code> set to <code>FALSE</code> has failed.</p> <p>Use of the <code>force</code> option requires the <code>MANAGE SCHEDULER</code> system privilege.</p>
<code>commit_semantics</code>	<p>The commit semantics. The following two types are supported:</p> <ul style="list-style-type: none">• <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default.• <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the <code>job_name</code> list. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.

Usage Notes

`STOP_JOB` without the `force` option requires that you be the owner of the job or have `ALTER` privileges on that job. You can also stop a job if you have the `CREATE ANY JOB` or `MANAGE SCHEDULER` privilege.

`STOP_JOB` with the `force` option requires that you have the `MANAGE SCHEDULER` privilege.

Example

The following is an example of using `STOP_JOB`.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB', 984, 1223, SYS.ETL_JOBCLASS');
END;
```

DBMS_SERVER_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Security Model](#)
- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)
- [Summary of DBMS_SERVER_ALERT Subprograms](#)

154.1 DBMS_SERVER_ALERT Security Model

The user needs `DBA` or `IMP_FULL_DATABASE` roles to use the `DBMS_SERVER_ALERT` package.

154.2 DBMS_SERVER_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

Table 154-1 Object Types Defined as Constants

Constant	Description
<code>OBJECT_TYPE_SYSTEM</code>	Metrics collected on the system level for each instance.
<code>OBJECT_TYPE_FILE</code>	Metrics collected on the file level. These are used for <code>AVG_FILE_READ_TIME</code> and <code>AVG_FILE_WRITE_TIME</code> metrics.
<code>OBJECT_TYPE_SERVICE</code>	Metrics collected on the service level. Currently <code>ELAPSED_TIME_PER_CALL</code> and <code>CPU_TIME_PER_CALL</code> are collected.
<code>OBJECT_TYPE_TABLESPACE</code>	Metrics collected on the tablespace level. Note: Dictionary managed tablespaces are not supported.
<code>OBJECT_TYPE_EVENT_CLASS</code>	Metrics collected on wait event class level. Currently supported metrics are <code>AVG_USERS_WAITING</code> and <code>DB_TIME_WAITING</code> .
<code>OBJECT_TYPE_SESSION</code>	Metrics collected on the session level. Currently only <code>BLOCKED_USERS</code> is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.
<code>OBJECT_TYPE_WRCCLIENT</code>	Refers to a group of metrics (<code>WCR_...</code>) used during replay to monitor the replay clients' performance

154.3 DBMS_SERVER_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 154-2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

154.4 DBMS_SERVER_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

Table 154-3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
AVG_FILE_READ_TIME	Average File Read Time	Microseconds
AVG_FILE_WRITE_TIME	Average File Write Time	Microseconds
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses

Table 154-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second

Table 154-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
HARD_PARSSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
LOGONS_CURRENT	Current Number of Logons	Number of Logons
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OS_SCHED_CPU_WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction

Table 154-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort

Table 154-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSSES_SEC	Total Parses (for each second)	Parses for each Second
TOTAL_PARSSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
USER_CALLS_PCT	User Calls (%)	% of all calls
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
WCR_AVG_IO_LAT	Average IO response time (for a WRC client)	Milliseconds
WCR_PCPU	Percentage of replay threads on CPU (for a WRC client)	% of total replay threads
WCR_PIO	Percentage of replay threads doing IOs (for a WRC client)	% of total replay threads

154.5 Summary of DBMS_SERVER_ALERT Subprograms

This table lists the DBMS_SERVER_ALERT subprograms and briefly describes them.

Table 154-4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function	Expands alert messages
GET_THRESHOLD Procedure	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure	Sets the warning and critical thresholds for a specified metric

154.5.1 EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE (
  user_language      IN  VARCHAR2,
  message_id        IN  NUMBER,
  argument_1        IN  VARCHAR2,
  argument_2        IN  VARCHAR2,
  argument_3        IN  VARCHAR2,
  argument_4        IN  VARCHAR2,
  argument_5        IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 154-5 EXPAND_MESSAGE Function Parameters

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

154.5.2 GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD (
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    OUT BINARY_INTEGER,
  warning_value       OUT VARCHAR2,
  critical_operator    OUT BINARY_INTEGER,
  critical_value      OUT VARCHAR2,
  observation_period  OUT BINARY_INTEGER,
  consecutive_occurrences OUT BINARY_INTEGER,
```

```

instance_name      IN  VARCHAR2,
object_type        IN  BINARY_INTEGER,
object_name        IN  VARCHAR2);

```

Parameters

Table 154-6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See " Supported Metrics ".
warning_operator	The operator for the comparing the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid.

154.5.3 SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```

DBMS_SERVER_ALERT.SET_THRESHOLD(
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    IN  BINARY_INTEGER,
  warning_value       IN  VARCHAR2,
  critical_operator   IN  BINARY_INTEGER,
  critical_value      IN  VARCHAR2,
  observation_period  IN  BINARY_INTEGER,
  consecutive_occurrences IN BINARY_INTEGER,
  instance_name       IN  VARCHAR2,
  object_type         IN  BINARY_INTEGER,
  object_name         IN  VARCHAR2);

```

Parameters

Table 154-7 SET_THRESHOLD Procedure Parameters

Parameter	Description
<code>metrics_id</code>	The internal name of the metric. See " Supported Metrics ".
<code>warning_operator</code>	The operator for the comparing the actual value with the warning threshold (such as <code>OPERATOR_GE</code>). See " Relational Operators ".
<code>warning_value</code>	The warning threshold value. This is <code>NULL</code> if no warning threshold is set. A list of values may be specified for <code>OPERATOR_CONTAINS</code> .
<code>critical_operator</code>	The operator for the comparing the actual value with the critical threshold. See " Relational Operators ".
<code>critical_value</code>	The critical threshold value. This is <code>NULL</code> if not set. A list of values may be specified for <code>OPERATOR_CONTAINS</code> .
<code>observation_period</code>	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
<code>consecutive_occurrences</code>	The number of observation periods the metric value should violate the threshold value before the alert is issued.
<code>instance_name</code>	The name of the instance for which the threshold is set. This is <code>NULL</code> for database-wide alerts.
<code>object_type</code>	See " Object Types ".
<code>object_name</code>	The name of the object. This is <code>NULL</code> for <code>SYSTEM</code> .

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing `NULL` for the instance name, the latter being the preferred usage.

DBMS_SERVICE

The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Exceptions](#)
- [Summary of DBMS_SERVICE Subprograms](#)

 **See Also:**

Oracle Real Application Clusters Administration and Deployment Guide for administering services in Oracle Real Application Clusters.

155.1 DBMS_SERVICE Overview

`DBMS_SERVICE` supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through `SRVCTL`. The `DBMS_SERVICE` package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

 **See Also:**

For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

155.2 DBMS_SERVICE Security Model

The `DBMS_SERVICE` package has certain security requirements.

Privileges

The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

Schemas

This package must be installed under `SYS` schema.

Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

155.3 DBMS_SERVICE Constants

The `DBMS_SERVICE` package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in [Table 155-1](#)
- Constants used in connection balancing goal arguments are described in [Table 155-2](#)
- Constants used in TAF failover attribute arguments are described in [Table 155-3](#)

Table 155-1 Constants Used in Calling Arguments

Name	Type	Value	Description
<code>GOAL_NONE</code>	NUMBER	0	Disables Load Balancing Advisory
<code>GOAL_SERVICE_TIME</code>	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
<code>GOAL_THROUGHPUT</code>	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 155-2 Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
<code>CLB_GOAL_SHORT</code>	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either <code>goal_service_time</code> or <code>goal_throughput</code>). When <code>GOAL=NONE</code> (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.

Table 155-2 (Cont.) Constants Used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 155-3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.
FAILOVER_TYPE_NONE	VARCHAR		Server side TAF type is NONE
FAILOVER_TYPE_SESSION	VARCHAR		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_SELECT	VARCHAR		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30.
FAILOVER_RESTORE_NONE	CONSTANT VARCHAR2	NONE	The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS.
FAILOVER_RESTORE_BASIC	VARCHAR2	LEVEL1	This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered.

Table 155-3 (Cont.) Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

Name	Type	Value	Description
FAILOVER_DELAY	NUMBER		Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) is 10s when using Application Continuity. Using FAILOVER_DELAY the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes).
STOP_OPTION_NONE	VARCHAR		Sessions are not disconnected.
STOP_OPTION_IMMEDIATE	VARCHAR		Sessions are disconnected immediately after the drain_timeout expires.
STOP_OPTION_TRANSACTIONAL	VARCHAR		Sessions are disconnected after the transactions during the drain_timeout. The sessions disconnect immediately when drain_timeout expires.
DYNAMIC	NUMBER		For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of DYNAMIC is recommended for all applications. If you are in any doubt, or the application can be customized, you must use DYNAMIC.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.

155.4 DBMS_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- – [CREATE_SERVICE Procedure](#)
- [DELETE_SERVICE Procedure](#)
- [MODIFY_SERVICE Procedure](#)

- [START_SERVICE Procedure](#)
- [STOP_SERVICE Procedure](#)
- With Oracle Database 12c release 1, you are advised to use the parameter interface in all service-related subprograms.
- If you wish to use `DBMS_SERVICE` on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

155.5 DBMS_SERVICE Exceptions

This table lists the exceptions raised by the `DBMS_SERVICE` package.

Table 155-4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
<code>NULL_SERVICE_NAME</code>	44301	Service name argument was found to be NULL
<code>NULL_NETWORK_NAME</code>	44302	Network name argument was found to be NULL
<code>SERVICE_EXISTS</code>	44303	Service name already exists
<code>SERVICE_DOES_NOT_EXIST</code>	44304	Specified service does not exist
<code>SERVICE_IN_USE</code>	44305	Specified service was running
<code>SERVICE_NAME_TOO_LONG</code>	44306	Service name was too long
<code>NETWORK_PREFIX_TOO_LONG</code>	44307	Network name, excluding the domain, was too long
<code>NOT_INITIALIZED</code>	44308	Services layer was not yet initialized
<code>GENERAL_FAILURE</code>	44309	An unknown failure
<code>MAX_SERVICES_EXCEEDED</code>	44310	Maximum number of services has been reached
<code>SERVICE_NOT_RUNNING</code>	44311	Specified service was not running
<code>DATABASE_CLOSED</code>	44312	Database was closed
<code>INVALID_INSTANCE</code>	44313	Instance name argument was not valid
<code>NETWORK_EXISTS</code>	44314	Network name already exists
<code>NULL_ATTRIBUTES</code>	44315	All attributes specified were NULL
<code>INVALID_ARGUMENT</code>	44316	Invalid argument supplied
<code>DATABASE_READONLY</code>	44317	Database is open read-only
<code>MAX_SN_LENGTH</code>	44318	Total length of all running service network names exceeded the maximum allowable length
<code>ERR_AQ_SERVICE</code>	44319	Cannot delete AQ service
<code>ERR_GLB_SERVICE</code>	44320	Cannot delete global service
<code>ERR_INVALID_PDB_NAME</code>	44771	Invalid name for a pluggable database

Table 155-4 (Cont.) DBMS_SERVICE Exceptions

Exception	Error Code	Description
ERR_CRS_API	44772	Cluster ready services (CRS) operation failed
ERR_PDB_CLOSED	44773	Cannot perform requested service operation
ERR_PDB_INVALID	44774	Pluggable database attribute cannot be changed
ERR_PDB_NAME	44775	Pluggable database service cannot be created
ERR_PDB_EXP	44776	Pluggable database service cannot be deleted
ERR_PDB_FAIL	44777	Pluggable database service cannot be started

155.6 Summary of DBMS_SERVICE Subprograms

This table lists the DBMS_SERVICE subprograms and briefly describes them.

Table 155-5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure	Creates service
DELETE_SERVICE Procedure	Deletes service
DISCONNECT_SESSION Procedure	Disconnects sessions running under this service
MODIFY_SERVICE Procedure	Modifies service
START_SERVICE Procedure	Activates service
STOP_SERVICE Procedure	Stops service

155.6.1 CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

Note:

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE (
  service_name          IN VARCHAR2,
  network_name          IN VARCHAR2,
  parameter_array       IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.CREATE_SERVICE (
  service_name          IN VARCHAR2,
  network_name          IN VARCHAR2,
  goal                  IN NUMBER DEFAULT NULL,
  dtp                   IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications  IN BOOLEAN DEFAULT NULL,
  failover_method       IN VARCHAR2 DEFAULT NULL,
  failover_type         IN VARCHAR2 DEFAULT NULL,
  failover_retries      IN NUMBER DEFAULT NULL,
  failover_delay        IN NUMBER DEFAULT NULL,
  clb_goal              IN NUMBER DEFAULT NULL,
  edition               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 155-6 CREATE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary
<code>network_name</code>	Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET <code>service_names</code> character set (see <i>Oracle Database Net Services Reference</i>).

Table 155-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
parameter_array	<p>Associative array with name-value pairs of the service attributes. Supported names:</p> <ul style="list-style-type: none"> • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_retries • failover_restore • failover_delay • clb_goal • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • drain_timeout • stop_option • placement_policy
goal	<p>Workload management goal directive for the service. Valid values:</p> <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	<p>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</p>
aq_ha_notifications	<p>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</p>
failover_method	<p>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</p>
failover_type	<p>TRANSACTION for Application Continuity. SELECT or BASIC for TAF.</p>
failover_retries	<p>Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.</p>

Table 155-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
failover_delay	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available.
edition	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).</p>
drain_timeout	If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, so stopping and relocating drains for this time by default.
stop_option	<p>Provides options to terminate a session. The supported values are:</p> <ul style="list-style-type: none"> TRANSACTIONAL drain_timeout applies to the transactions. After the drain_timeout expire, the sessions are immediately killed. IMMEDIATE The sessions are killed after drain_timeout expires. NONE Sessions are not terminated. <p>However, these parameter values can be overridden using the command line.</p>
commit_outcome	<p>Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the commit_outcome attribute be set. commit_outcome has no effect on active Data Guard and read-only databases. commit_outcome is only allowed on the database service and on user-defined database services
retention_timeout	Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).

Table 155-6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
replay_initiation_timeout	For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.
session_state_consistency	Describes how nontransactional is changed during a request (values are <code>DYNAMIC</code> or <code>STATIC</code>). This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
sql_translation_name	Name of SQL translation unit
clb_goal	Method used for Connection Load Balancing (see Table 155-2)
placement_policy	NUMBER Placement policy for the service. Possible values: <ul style="list-style-type: none"> • 0: PDB-NONE • 1: PDB-SINGLETON • 2: PDB-UNIFORM

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');
```

```
DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('FAILOVER_TYPE')           := 'TRANSACTION';
  params('REPLAY_INITIATION_TIMEOUT') := 1800;
  params('RETENTION_TIMEOUT')       := 86400;
  params('FAILOVER_DELAY')           := 10;
  params('FAILOVER_RETRIES')         := 30;
  params('DRAIN_TIMEOUT')            := 60;
  params('STOP_OPTION')              := 'DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
  params('FAILOVER_RESTORE')         := 'DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
  params('commit_outcome')           := 'true';
  params('aq_ha_notifications')      := 'true';
  DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
```

155.6.2 DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Note:

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(  
    service_name IN VARCHAR2);
```

Parameters

Table 155-7 DELETE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');
```

155.6.3 DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(  
    service_name IN VARCHAR2,  
    disconnect_option IN NUMBER DEFAULT POST_TRANSACTION);
```

Parameters

Table 155-8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
<code>service_name</code>	Name of the service, limited to 64 characters in the Data Dictionary

Table 155-8 (Cont.) DISCONNECT_SESSION Procedure Parameters

Parameter	Description
<code>disconnect_option</code>	<p>The options, package constants, are expressed as NUMBER:</p> <ul style="list-style-type: none"> • <code>POST_TRANSACTION = 0</code>: session disconnects after the current transaction commits or rolls back • <code>IMMEDIATE = 1</code>: session disconnects immediately • <code>NOREPLAY = 2</code>: session disconnects immediately and be flagged to not be replayed by application continuity, that is <code>IMMEDIATE</code> and <code>NOREPLAY</code> together <p>Note: <code>IMMEDIATE</code> or <code>POST_TRANSACTION</code> and <code>NOREPLAY</code> is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION' or 'NOREPLAY') raises an error.</p>

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the `DBMS_JOB` package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with `service_name 'ernie.example.com'`.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');
```

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

```
EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
```

155.6.4 MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Note:

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
    service_name          IN VARCHAR2,
    parameter_array      IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.MODIFY_SERVICE(
    service_name          IN VARCHAR2,
    goal                  IN NUMBER DEFAULT NULL,
    dtp                   IN BOOLEAN DEFAULT NULL,
    aq_ha_notifications  IN BOOLEAN DEFAULT NULL,
    failover_method       IN VARCHAR2 DEFAULT NULL,
    failover_type         IN VARCHAR2 DEFAULT NULL,
    failover_retries     IN NUMBER DEFAULT NULL,
    failover_delay        IN NUMBER DEFAULT NULL,
    clb_goal              IN NUMBER DEFAULT NULL,
    edition               IN VARCHAR2 DEFAULT NULL,
    modify_edition        IN BOOLEAN DEFAULT FALSE;
```

Parameters

Table 155-9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service, limited to 64 characters in the Data Dictionary
parameter_array	Associative array with name/value pairs of the service attributes. Supported names: <ul style="list-style-type: none"> • goal • dtp • aq_ha_notifications • failover_method • failover_type • failover_restore • failover_retries • failover_delay • drain_timeout • stop_option • edition • commit_outcome • retention_timeout • replay_initiation_timeout • session_state_consistency • sql_translation_profile • placement_policy
goal	Workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> • DBMS_SERVICE.GOAL_SERVICE_TIME • DBMS_SERVICE.GOAL_THROUGHPUT • DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)

Table 155-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
aq_ha_notifications	Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity
failover_method	Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.
failover_type	Failover TYPE for the service for Application Continuity and TAF.
failover_restore	For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state. For AC OCI, use NONE for applications that are not STATIC.
failover_retries	Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.
failover_delay	Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.
drain_timeout	When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, to stop and relocate drains for this time by default.
edition	If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).

Table 155-9 (Cont.) MODIFY_SERVICE Procedure Parameters

Parameter	Description
<code>commit_outcome</code>	<p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> Invoking the GET_LTXID_OUTCOME Procedure of the <code>DBMS_APP_CONT</code> package requires that the <code>commit_outcome</code> attribute be set. <code>commit_outcome</code> has no effect on active Data Guard and read-only databases. <code>commit_outcome</code> is allowed only on user-defined database services
<code>retention_timeout</code>	Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).
<code>replay_initiation_timeout</code>	For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.
<code>session_state_consistency</code>	Describes how nontransactional is changed during a request (values are <code>DYNAMIC</code> or <code>STATIC</code>). This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
<code>sql_translation_profile</code>	Name of SQL translation profile.
<code>modify_edition</code>	If <code>TRUE</code> , the edition service attribute is updated to use the edition argument value. If <code>FALSE</code> or <code>NULL</code> , the edition attribute is not updated.
<code>clb_goal</code>	Method used for Connection Load Balancing (see Table 155-2)
<code>placement_policy</code>	<p>NUMBER</p> <p>Placement policy for the service. Possible values:</p> <ul style="list-style-type: none"> 0: PDB-NONE 1: PDB-SINGLETON 2: PDB-UNIFORM

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.
- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

155.6.5 START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.START_SERVICE(
    service_name IN VARCHAR2,
    instance_name IN VARCHAR2);
```

Parameters

Table 155-10 *START_SERVICE Procedure Parameters*

Parameter	Description
<code>service_name</code>	Name of the service limited to 64 characters in the Data Dictionary
<code>instance_name</code>	Name of the instance where the service must be activated (optional). <code>NULL</code> results in starting of the service on the local instance. In single instance, this can only be the current instance or <code>NULL</code> . Specify <code>DBMS_SERVICE.ALL_INSTANCES</code> to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```

155.6.6 STOP_SERVICE Procedure

This procedure stops a service.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

```
DBMS_SERVICE.STOP_SERVICE (
  service_name  IN VARCHAR2,
  instance_name IN VARCHAR2  DEFAULT NULL,
  stop_option   IN VARCHAR2  DEFAULT NULL,
  drain_timeout IN NUMBER    DEFAULT NULL,
  replay        IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 155-11 STOP_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
instance_name	Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances.
stop_option	To specify how sessions are stopped with draining. The possible values are as follows: <ul style="list-style-type: none"> IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout. TRANSACTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated. NONE: sessions are not terminated. These values can be overridden on the command line using SRVCTL.
drain_timeout	The time in seconds for the session to drain.
replay	Enable application continuity replay.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```

DBMS_SESSION

This package provides access to `SQL ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_SESSION Subprograms](#)

156.1 DBMS_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

156.2 DBMS_SESSION Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

156.3 DBMS_SESSION Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

Table Types

- [INTEGER_ARRAY Table Type](#)
- [LNAME_ARRAY Table Type](#)

156.3.1 DBMS_SERVICE INTEGER_ARRAY Table Type

`INTEGER_ARRAY` is a table type of `BINARY_INTEGER`.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

156.3.2 DBMS_SERVICE LNAME_ARRAY Table Type

`LNAME_ARRAY` is a table type of `VARCHAR2`.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

156.4 Summary of DBMS_SESSION Subprograms

This table lists the DBMS_SESSION subprograms in alphabetical order and briefly describes them.

Table 156-1 *DBMS_SESSION Package Subprograms*

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure	Clears all context information
CLEAR_CONTEXT Procedure	Clears the context
CLEAR_IDENTIFIER Procedure	Clears the identifier
CLOSE_DATABASE_LINK Procedure	Closes database link
CURRENT_IS_ROLE_ENABLED Function	Determines if the named role is currently enabled.
FREE_UNUSED_USER_MEMORY Procedure	Lets you reclaim unused memory after performing operations requiring large amounts of memory
GET_PACKAGE_MEMORY_UTILIZATION Procedure	Describes static package memory usage
IS_ROLE_ENABLED Function	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function	Determines if the specified session is active
LIST_CONTEXT Procedures	Returns a list of active namespace and context for the current session
MODIFY_PACKAGE_STATE Procedure	Used to perform various actions (as specified by the <code>action_flags</code> parameter) on the session state of all PL/SQL program units active in the session
RESET_PACKAGE Procedure	De-instantiates all packages in the session
SESSION_IS_ROLE_ENABLED Function	Determines if the named role is enabled at the session level.
SESSION_TRACE_DISABLE Procedure	Resets the session-level SQL trace for the session from which it was called.
SESSION_TRACE_ENABLE Procedure	Enables session-level SQL trace for the invoking session
SET_CONTEXT Procedure	Sets or resets the value of a context attribute
SET_EDITION_DEFERRED Procedure	Requests a switch to the specified edition
SET_IDENTIFIER Procedure	Sets the identifier
SET-NLS Procedure	Sets Globalization Support (NLS)
SET_ROLE Procedure	Sets role
SET_SQL_TRACE Procedure	Turns tracing on or off
SLEEP Procedure	Suspends the session for a specified period of time.
SWITCH_CURRENT_CONSUMER_GROUP Procedure	Facilitates changing the current resource consumer group of a user's current session
UNIQUE_SESSION_ID Function	Returns an identifier that is unique for all sessions currently connected to this database

156.4.1 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

Syntax

```
DBMS_SESSION.ADD_SQL_CONNECTION_TEST (
    connection_test      IN VARCHAR2
    service_name         IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 156-2 ADD_SQL_CONNECTION_TEST Procedure Parameters

Parameter	Description
CONNECTION_TEST	The SQL text used to test and drain connections.
SERVICE_NAME	Optional service name qualifier.

Usage Notes

The `ADD_SQL_CONNECTION_TEST` Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view `DBA_CONNECTION_TESTS`.

This procedure is owned by `SYS` and is granted to users for execution at `CDB$ROOT` or `PDB` levels, or when not multitenant, at dictionary level.

156.4.2 CLEAR_ALL_CONTEXT Procedure

This procedure clears application context information in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
    namespace          VARCHAR2);
```

Parameters

Table 156-3 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

156.4.3 CLEAR_CONTEXT Procedure

This procedure clears application context in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
(namespace          VARCHAR2,
 client_identifier VARCHAR2
 attribute         VARCHAR2);
```

Parameters

Table 156-4 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	Namespace in which the application context is to be cleared. Required. For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context. For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.
client_identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum
attribute	Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.

- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

156.4.4 CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

156.4.5 CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:
`ALTER SESSION CLOSE DATABASE LINK <name>`

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
    dblink VARCHAR2);
```

Parameters

Table 156-5 CLOSE_DATABASE_LINK Procedure Parameters

Parameter	Description
<code>dblink</code>	Name of the database link to close

156.4.6 CURRENT_IS_ROLE_ENABLED Function

This function determines if the named role is currently enabled.

Syntax

```
DBMS_SESSION.CURRENT_IS_ROLE_ENABLED (
    rolename VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 156-6 CURRENT_IS_ROLE_ENABLED Function Parameters

Parameter	Description
<code>rolename</code>	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

156.4.7 FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

Note:

This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies.

They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing indexed table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure FREE_UNUSED_USER_MEMORY.

```
CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;    -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;        -- load data
  END LOOP;
  ...
  store1_table := empty_table;   -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;        -- index tables still declared;
  store2_table(2) := 200;        -- but truncated.
  ...
END;
```

156.4.8 GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the [FREE_UNUSED_USER_MEMORY Procedure](#) is invoked.

Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
  owner_names      OUT NOCOPY LNAME_ARRAY,
  unit_names       OUT NOCOPY LNAME_ARRAY,
  unit_types       OUT NOCOPY INTEGER_ARRAY,
  used_amounts     OUT NOCOPY INTEGER_ARRAY,
  free_amounts     OUT NOCOPY INTEGER_ARRAY);
```

Parameters

Table 156-7 GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

Parameter	Description
owner_name	Owner of package
unit_name	Name of package
unit_types	Value of the type# columns of the dictionary table obj\$
used_amounts	Amount of allocated memory specified in bytes
free_amounts	Amount of available memory specified in bytes

156.4.9 IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Note:

This function is deprecated starting in Oracle Database 19c. Use `DBMS_SESSION.CURRENT_IS_ROLE_ENABLED` or `DBMS_SESSION.SESSION_IS_ROLE_ENABLED` instead.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
  rolename        VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 156-8 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.\

Return Values

Table 156-9 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled

156.4.10 IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
    uniqueid VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 156-10 IS_SESSION_ALIVE Function Parameters

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

Return Values

Table 156-11 IS_SESSION_ALIVE Function Return Values

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active

156.4.11 LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
    value      VARCHAR2(256));
```

```

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
    list OUT AppCtxTabTyp,
    size OUT NUMBER);

```

Parameters

Table 156-12 LIST_CONTEXT Procedure Parameters

Parameter	Description
list	Buffer to store a list of application context set in the current session

Return Values

Table 156-13 LIST_CONTEXT Procedure Return Values

Return	Description
list	A list of (namespace, attribute, values) set in current session
size	Returns the number of entries in the buffer returned

Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because list is a table type variable, its size is dynamically adjusted to the size of returned list.

156.4.12 MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the DBMS_SESSION constants listed in [Table 156-15](#).

Syntax

```

DBMS_SESSION.MODIFY_PACKAGE_STATE (
    action_flags IN PLS_INTEGER);

```

Parameters

Table 156-14 MODIFY_PACKAGE_STATE Procedure Parameters

Parameter	Description
<code>action_flags</code>	<p>Bit flags that determine the action taken on PL/SQL program units:</p> <p><code>DBMS_SESSION.FREE_ALL_RESOURCES</code> (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking <code>MODIFY_PACKAGE_STATE</code> with the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> parameter provides functionality identical to the <code>DBMS_SESSION.RESET_PACKAGE()</code> interface.</p> <p><code>DBMS_SESSION.REINITIALIZE</code> (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the <code>DBMS_SESSION.REINITIALIZE</code> flag is similar to the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> flag in that both have the effect of reinitializing all packages.</p> <p>However, <code>DBMS_SESSION.REINITIALIZE</code> should exhibit better performance than the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> option because:</p> <ul style="list-style-type: none"> • Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. • Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. • The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.

Usage Notes

See the parameter descriptions in [Table 156-17](#) for the differences between the flags and why `DBMS_SESSION.REINITIALIZE` exhibits better performance than `DBMS_SESSION.FREE_ALL_RESOURCES`.

Table 156-15 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
<code>FREE_ALL_RESOURCES</code>	<code>PLS_INTEGER:= 1</code>
<code>REINITIALIZE</code>	<code>PLS_INTEGER:= 2</code>

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2  P.cnt := 111;
  3  open p.c;
  4  P.print_status;
  5  end;
  6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2  dbms_session.modify_package_state(dbms_session.reinitialize);
  3  end;
  4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
  2  P.print_status;
```

```
3 end;  
4 /  
P.cnt = 0  
P.c is CLOSED
```

PL/SQL procedure successfully completed.

156.4.13 RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note:

See "[SESSION_TRACE_ENABLE Procedure](#)". The `MODIFY_PACKAGE_STATE` interface, introduced in Oracle9i, provides an equivalent of the `RESET_PACKAGE` capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

**Note:**

`RESET_PACKAGE` only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls `RESET_PACKAGE`. The `RESET_PACKAGE` effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

156.4.14 SESSION_IS_ROLE_ENABLED Function

This function determines if the named role is enabled for the login user session.

Syntax

```
DBMS_SESSION.SESSION_IS_ROLE_ENABLED (
    rolename    VARCHAR2)
    RETURN BOOLEAN;
```

Parameters**Table 156-16** SESSION_IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

156.4.15 SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

156.4.16 SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(  
    waits      IN   BOOLEAN DEFAULT TRUE,  
    binds      IN   BOOLEAN DEFAULT FALSE,  
    plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 156-17 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
waits	Specifies if wait information is to be traced
binds	Specifies if bind information is to be traced
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

156.4.17 SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of the five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (  
    namespace VARCHAR2,  
    attribute  VARCHAR2,  
    value      VARCHAR2,  
    username   VARCHAR2,  
    client_id  VARCHAR2 );
```

Parameters

Table 156-18 SET_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.
attribute	The attribute of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.
value	Value of the application context to be set, limited to 4 kilobytes.
username	Database username attribute of the application context, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure. The default value is NULL.
client_id	Application-specific client_id attribute of the application context, limited to 64 bytes. The default value is NULL.

Usage Notes

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
- The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.
- If the `namespace` parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
- If the value of the parameter in the namespace has been set, SET_CONTEXT overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

 **See Also:**

Oracle Database Security Guide for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

156.4.18 SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (
    edition    IN    VARCHAR2);
```

Parameters

Table 156-19 SET_EDITION_DEFERRED Procedure Parameters

Parameter	Description
edition	Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have <code>USE</code> privilege on the named edition.

156.4.19 SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (
    client_id VARCHAR2);
```

Parameters

Table 156-20 SET_IDENTIFIER Procedure Parameters

Parameter	Description
client_id	Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, the additional bytes are truncated.

Usage Notes

- `SET_IDENTIFIER` sets the session's client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV','CLIENT_IDENTIFIER')`.
- This procedure is executable by `PUBLIC`.

156.4.20 SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: `ALTER SESSION SET <nls_parameter> = <value>`.

Syntax

```
DBMS_SESSION.SET_NLS (
    param VARCHAR2,
    value VARCHAR2);
```

Parameters

Table 156-21 SET_NLS Procedure Parameters

Parameter	Description
<code>param</code>	Globalization Support parameter. The parameter name must begin with 'NLS'.
<code>value</code>	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, <code>"set_nls (nls_date_format,'DD-MON-YY')</code> .

156.4.21 SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
    role_cmd VARCHAR2);
```

Parameters

Table 156-22 SET_ROLE Procedure Parameters

Parameter	Description
<code>role_cmd</code>	Text is appended to "set role" and then run as SQL

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

156.4.22 SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement `ALTER SESSION SET SQL_TRACE`

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (
    sql_trace boolean);
```

Parameters

Table 156-23 SET_SQL_TRACE Procedure Parameters

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off

156.4.23 SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```
DBMS_SESSION.SLEEP (
    seconds IN NUMBER);
```

Parameters

Table 156-24 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

156.4.24 SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
    new_consumer_group    IN VARCHAR2,
    old_consumer_group    OUT VARCHAR2,
    initial_group_on_error IN BOOLEAN);
```

Parameters

Table 156-25 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
<code>new_consumer_group</code>	Name of consumer group to which you want to switch
<code>old_consumer_group</code>	Name of the consumer group from which you just switched out
<code>initial_group_on_error</code>	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

Note:

- The `old_consumer_group` parameter returns the name of old consumer group only if it were set explicitly. That is, you might get NULL if the old consumer group was set by some mapping rules.
- You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions

Table 156-26 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group
1031	Insufficient privileges
29396	Cannot switch to OTHER_GROUPS consumer group

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
    old_group varchar2(30);
    prev_group varchar2(30);
    curr_user varchar2(30);
BEGIN
    -- switch invoker to privileged consumer group. If we fail to do so, an
    -- error is thrown, but the consumer group does not change
    -- because 'initial_group_on_error' is set to FALSE

    dbms_session.switch_current_consumer_group('tkrogrpl', old_group, FALSE);
    -- set up exception handler (in the event of an error, we do not want to
    -- return to caller while leaving the session still in the privileged
    -- group)

    BEGIN
        -- perform some operations while under privileged group

    EXCEPTION
        WHEN OTHERS THEN
            -- It is possible that the procedure owner does not have privileges
            -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
            -- that the user is moved out of the privileged group in such a
            -- situation

            dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
            RAISE;
        END;

    -- we've succeeded. Now switch to old_group, or if cannot do so, switch
    -- to caller's initial consumer group

    dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

156.4.25 UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID
    RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

Table 156-27 UNIQUE_SESSION_ID Function Return Values

Return	Description
unique_session_id	Returns up to 24 bytes

156.4.26 USE_DEFAULT_EDITION_ALWAYS procedure

This procedure turns a mode 'on' or 'off' that disassociates the session from an edition at the end of each and every client call.

Following each call and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_ALWAYS (
    mode_on IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 156-28 USE_DEFAULT_EDITION_ALWAYS Procedure Parameters

Parameter	Description
mode_on	TRUE to turn on this mode, FALSE to turn off this mode.

Usage Notes

- A choice of session edition that might otherwise occur due to use of ALTER SESSION SET EDITION, SET_EDITION_DEFERRED, USE_DEFAULT_EDITION_DEFERRED, or the edition-choosing aspect of ALTER SESSION SET CONTAINER will be overridden by this mode.
- Turn this mode off before invoking the above mechanisms to avoid the overriding effect.

156.4.27 USE_DEFAULT_EDITION_DEFERRED procedure

This procedure disassociates the session from an edition.

The reset takes effect at the end of the current client call. Following this call, and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_DEFERRED
```

DBMS_SFW_ACL_ADMIN

The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- [DBMS_SFW_ACL_ADMIN Security Model](#)
- [DBMS_SFW_ACL_ADMIN Operational Notes](#)
- [DBMS_SFW_ACL_ADMIN Examples](#)
- [Summary of DBMS_SFW_ACL_ADMIN Subprograms](#)

157.1 DBMS_SFW_ACL_ADMIN Security Model

This package is owned by the DBSFUSER schema. The procedures in this package can be run only by the DBSFUSER user.

157.2 DBMS_SFW_ACL_ADMIN Operational Notes

These operation notes apply to DBMS_SFW_ACL_ADMIN.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the [IP_ADD_ACE Procedure](#) and [IP_ADD_PDB_ACE Procedure](#). After calling these procedures, you call the [COMMIT_ACL Procedure](#) to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the [IP_REMOVE_ACE Procedure](#), [IP_REMOVE_ACL Procedure](#), [IP_REMOVE_PDB_ACE Procedure](#), or [IP_REMOVE_PDB_ACL Procedure](#), you need to call the [COMMIT_ACL Procedure](#) to update the ACL on the listeners.
- Access control must be enabled using the new FIREWALL endpoint attribute and the new LOCAL_REGISTRATION_ADDRESS_listenerName parameter. The configuration can be done manually in listener.ora or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the IP_ACL table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the V\$IP_ACL or GV\$IP_ACL view. The IP_ACL table can contain ACLs that are not in [G]V\$IP_ACL because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the COMMIT_ACL procedure again to send the committed ACLs in the IP_ACL table to the local listeners.

In an Oracle RAC environment, GV\$IP_ACL can be used to query ACLs across the database cluster, and V\$IP_ACL to query ACLs in the connected instance.

157.3 DBMS_SFW_ACL_ADMIN Examples

These three examples show how DBMS_SFW_ACL_ADMIN can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```
## Connect to DBSFUSER
SQL> connect dbsfuser/<password>
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```
SQL> select * from ip_acl;
SERVICE_NAME          HOST
-----
"SVC1.EXAMPLE.COM"    192.168.12.1
"SVC1.EXAMPLE.COM"    192.168.12.2
"SVC1.EXAMPLE.COM"    TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME          HOST          CON_ID
-----
SVC1.EXAMPLE.COM      192.168.12.1      1
SVC1.EXAMPLE.COM      192.168.12.2      1
SVC1.EXAMPLE.COM      TEST02.EXAMPLE.COM 1
```

The following example adds access control entries for pluggable database "PDB1" using various host formats.

```
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

157.4 Summary of DBMS_SFW_ACL_ADMIN Subprograms

This table lists the DBMS_SFW_ACL_ADMIN subprograms and briefly describes them.

Table 157-1 DBMS_SFW_ACL_ADMIN Package Subprograms

Subprogram	Description
COMMIT_ACL Procedure	Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances.
IP_ADD_ACE Procedure	Adds an access control entry to the ACL for a database service.
IP_ADD_PDB_ACE Procedure	Adds an access control entry to the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_ACE Procedure	Removes an entry from the ACL for a database service.
IP_REMOVE_ACL Procedure	Removes all entries from the ACL for a database service.
IP_REMOVE_PDB_ACE Procedure	Removes an access control entry from the ACL for all the database services in a pluggable database (PDB).
IP_REMOVE_PDB_ACL Procedure	Removes all entries from the ACL for all the database services in a pluggable database (PDB).

157.4.1 COMMIT_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT_ACL procedure again.

This procedure returns when the operation has completed successfully.

Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

Parameters

None

157.4.2 IP_ADD_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN VARCHAR2);
```

Parameters

Table 157-2 IP_ADD_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service for which you want to add an access control entry.
p_host	The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

157.4.3 IP_ADD_PDB_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN VARCHAR2);
```

Parameters

Table 157-3 IP_ADD_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.

157.4.4 IP_REMOVE_ACE Procedure

This procedure removes an entry from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (
  p_service_name IN VARCHAR2,
  p_host         IN VARCHAR2);
```

Parameters

Table 157-4 IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_service_name	The name of the database service from which you want to remove an access control entry.

Table 157-4 (Cont.) IP_REMOVE_ACE Procedure Parameters

Parameter	Description
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service.

157.4.5 IP_REMOVE_ACL Procedure

This procedure removes all entries from the ACL for a database service.

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (
  p_service_name IN VARCHAR2);
```

Parameters

Table 157-5 IP_REMOVE_ACL Procedure Parameters

Parameter	Description
p_service_name	The name of the database service whose ACL you want to clear.

157.4.6 IP_REMOVE_PDB_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (
  p_pdb_name IN VARCHAR2,
  p_host     IN VARCHAR2);
```

Parameters

Table 157-6 IP_REMOVE_PDB_ACE Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.
p_host	The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service.

157.4.7 IP_REMOVE_PDB_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL (  
    p_pdb_name IN VARCHAR2);
```

Parameters

Table 157-7 IP_REMOVE_PDB_ACL Procedure Parameters

Parameter	Description
p_pdb_name	The name of the PDB.

DBMS_SODA

The `DBMS_SODA` package is a `PL/SQL` package implementing Simple Oracle Document Access (`SODA`). `SODA` allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by `SODA` is that of document collections. The `DBMS_SODA` package allows you to create, list, and delete document collections from `PL/SQL`, and to perform `CRUD` (create, replace, update, delete) operations on documents. All `DDL` functions are encapsulated within this package.

This chapter contains the following topics:

- [DBMS_SODA Security Model](#)
- [Summary of DBMS_SODA Subprograms](#)

See Also:

- *Oracle Database SODA for PL/SQL Developer's Guide*
- [SODA Types](#)

158.1 DBMS_SODA Security Model

This package is available to users with the `SODA_APP` role.

All `SODA` types (packages and types) are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the `DBMS_SODA` described in this chapter.

158.2 Summary of DBMS_SODA Subprograms

This table lists the `DBMS_SODA` subprograms in alphabetical order and briefly describes them.

Table 158-1 DBMS_SODA Package Subprograms

Subprogram	Purpose
CREATE_COLLECTION Function	Creates a collection using the collection name and metadata.
DROP_COLLECTION Function	Drops an existing collection from the user's schema. This also removes all the documents in the collection.
GET_AS_OF_SCN Function	This function returns the current database SCN number.
GET_AS_OF_TIMESTAMP Function	This function returns the current database timestamp value.

Table 158-1 (Cont.) DBMS_SODA Package Subprograms

Subprogram	Purpose
LIST_COLLECTION_NAMES Function	Lists the collection names in the user's schema as a table of NVARCHAR2.
OPEN_COLLECTION Function	Opens an existing collection.
TO_UUID Function	This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the REMAP_DATA feature of Data Pump.

158.2.1 CREATE_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to NULL, a collection is created with default metadata. The returned collection is open for `read` and/or `write` operations. If a collection already exists, the function just opens and returns the collection object.

Syntax

```
DBMS_SODA.CREATE_COLLECTION (
    collection_Name      IN NVARCHAR2,
    metadata             IN VARCHAR2 DEFAULT NULL,
    create_Mode         IN PLS_INTEGER DEFAULT CREATE_MODE_DDL)
RETURN SODA_Collection_T;
```

Parameters

Table 158-2 CREATE_COLLECTION Parameters

Parameter	Description
<code>collection_Name</code>	The name of the collection. The value of <code>collection_Name</code> is case-sensitive.
<code>metadata</code>	The metadata of the collection in VARCHAR2 format.

Table 158-2 (Cont.) CREATE_COLLECTION Parameters

Parameter	Description
create_Mode	<p>Valid values are:</p> <ul style="list-style-type: none"> DBMS_SODA.CREATE_MODE_DDL (default). First attempts to create a new table for the collection. If table exists already, tries to map that existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned). DBMS_SODA.CREATE_MODE_MAP. Tries to map an existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned).

Return Values

The function returns a `Soda_Collection_T` object representing the collection.

Exceptions

- Descriptor Error—if the input descriptor is invalid
- Error—if an error occurs while creating the collection

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

158.2.2 DROP_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

Syntax

```
DBMS_SODA.DROP_COLLECTION (
    collection_Name    IN NVARCHAR2,
    purge              IN BOOLEAN DEFAULT FALSE,
    drop_Mapped_Table  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 158-3 DROP_COLLECTION Parameters

Parameter	Description
collection_Name	The name of the collection. The value of collection_Name is case-sensitive.
purge	The default value is FALSE.
drop_Mapped_Table	The default value is FALSE.

Return values

This function returns the following values:

- 1—if the collection was dropped successfully
- 0—if the collection does not exist

Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

See Also:

Oracle Database SODA for PL/SQL Developer's Guide

158.2.3 GET_AS_OF_SCN Function

This function returns the current database SCN number.

Syntax

```
DBMS_SODA.GET_AS_OF_SCN ( )
RETURN NUMBER;
```

Return values

This function returns the current database SCN number.

158.2.4 GET_AS_OF_TIMESTAMP Function

This function returns the current database timestamp value.

Syntax

```
DBMS_SODA.GET_AS_OF_TIMESTAMP ( )
RETURN NUMBER;
```

Return values

This function returns the current database timestamp value.

158.2.5 LIST_COLLECTION_NAMES Function

This function returns a list of collection names in the user's schema as a table of NVARCHAR2.

Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ()
RETURN SODA_CollName_List_T;
```

Return Values

This function returns a list of collection names as a table of NVARCHAR2 (255). The collection list is empty if there are no collections in the schema.

Exceptions

Error—if an error occurs while listing the collection names.

**See Also:**

Oracle Database SODA for PL/SQL Developer's Guide

158.2.6 OPEN_COLLECTION Function

Opens an existing collection for read and/or write operations.

Syntax

```
DBMS_SODA.OPEN_COLLECTION (
    collection_Name    IN NVARCHAR2)
RETURN SODA_Collection_T;
```

Parameters**Table 158-4 OPEN_COLLECTION Parameters**

Parameter	Description
collection_Name	The name of the collection. The value of collection_Name is case-sensitive.

Return Values

This function returns the following values:

- a collection object which is open
- NULL, if the collection does not exist

Exceptions

`Error`—if an error occurs while creating the collection

See Also:

- Opening an Existing Document Collection with SODA for PL/SQL
- Checking Whether a Given Collection Exists with SODA for PL/SQL

158.2.7 TO_UUID Function

This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the `REMAP_DATA` feature of Data Pump.

Syntax

```
DBMS_SODA.TO_UUID (  
    placeholder      IN   NVARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 158-5 TO_UUID Parameters

Parameter	Description
placeholder	This parameter is not used and can be ignored. It is used due to the syntactic constraints for the Data Pump <code>REMAP_DATA</code> function.

Return values

This function returns a hexadecimal string that can be used as a `UUID` value.

See Also:

`REMAP_DATA` in the *Oracle® Database Utilities Guide*.

DBMS_SHARED_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_SHARED_POOL Subprograms](#)

159.1 DBMS_SHARED_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

`DBMS_SHARED_POOL` is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, `DBMS_SHARED_POOL` supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. `DBMS_SHARED_POOL` is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

159.2 DBMS_SHARED_POOL Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

159.3 Summary of DBMS_SHARED_POOL Subprograms

This table lists the `DBMS_SHARED_POOL` subprograms and briefly describes them.

Table 159-1 *DBMS_SHARED_POOL Package Subprograms*

Subprogram	Description
ABORTED_REQUEST_THRESHOLD Procedure	Sets the aborted request threshold for the shared pool
KEEP Procedure	Keeps an object in the shared pool
MARKHOT Procedure	Marks a library cache object as a hot object

Table 159-1 (Cont.) DBMS_SHARED_POOL Package Subprograms

Subprogram	Description
PURGE Procedure	Purges the named object or specified heap(s) of the object
SIZES Procedure	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure	Unkeeps the named object
UNMARKHOT Procedure	Unmarks a library cache object as a hot object

159.3.1 ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
    threshold_size NUMBER);
```

Parameters

Table 159-2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
threshold_size	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than thresh_hold size. This user gets the 'out of memory' error without attempting to search the LRU list.

159.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for

frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');

DBMS_SHARED_POOL.KEEP (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.KEEP (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 159-3 KEEP Procedure Parameters

Parameter	Description
name	The name of the object to keep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. <ul style="list-style-type: none"> • Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. • Set to 'Q' or 'q' to specify that the input is the name of a sequence. • Set to 'R' or 'r' to specify that the input is the name of a trigger. • Set to 'T' or 't' to specify that the input is the name of a type. • Set to 'JS' or 'js' to specify that the input is the name of a java source. • Set to 'JC' or 'jc' to specify that the input is the name of a java class. • Set to 'JD' or 'jd' to specify that the input is the name of a java shared data. • Set to 'C' or 'c' to specify that the input is the name of a cursor.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to keep.
namespace	A number indicating the library cache namespace in which the object has to be searched for.
heaps	The heaps to keep. For example, if heap 0 and heap 6 are to be kept.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

An exception is raised if the named object is not found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, types, and Java objects, which are specified by name.
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by DBMS_SHARED_POOL.KEEP('0034CFFF, 20348871', 'C'), 0034CFFF being the ADDRESS and 20348871 the HASH_VALUE. Note that the complete hexadecimal address must be in the first 8 characters.

159.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.MARKHOT (
  schema          VARCHAR2,
  objname         VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE,
  edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.MARKHOT (
  hash            VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 159-4 MARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched. Views, such as USER_OBJECTS and DBA_OBJECTS, reflect the namespace as a number column, as do most dictionary tables such as OBJ\$.
global	If TRUE (default), mark the object hot on all Oracle RAC instances
hash	16-byte hash value for the object

Table 159-4 (Cont.) MARKHOT Procedure Parameters

Parameter	Description
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

Users can examine column, `V$DB_OBJECT_CACHE.PROPERTY`, to see whether or not the object has been marked hot. The values for `PROPERTY` are:

- `HOTCOPYnnn`- An object that is a hot copy with integer identifier of 'nnn'. For example, `HOTCOPY5`, `HOTCOPY94`, and `HOTCOPY125`.
- `HOTCOPY-As` above but the identifier is unknown
- `HOT`-The "root" kgl object that has been marked as hot
- `NULL`-A normal object

159.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P',
    heaps         NUMBER DEFAULT 1);
```

```
DBMS_SHARED_POOL.PURGE (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.PURGE (
    hash          VARCHAR2,
    namespace     NUMBER,
    heaps         NUMBER);
```

Parameters

Table 159-5 PURGE Procedure Parameters

Parameter	Description
name	Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default value is 1, that is, heap 0 which means the whole object would be purged
schema	User name or the schema to which the object belongs
objname	Name of the object to purge
namespace	Parameter is a number indicating the library cache namespace in which the object is to be searched
hash	16-byte hash value for the object
edition_name	The name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

159.3.5 SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
    minsize NUMBER);
```

Parameters

Table 159-6 SIZES Procedure Parameters

Parameter	Description
<code>minsize</code>	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the `SQLDBA` or `SQLPLUS` `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

159.3.6 UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (
    name          VARCHAR2,
    flag          CHAR DEFAULT 'P');

DBMS_SHARED_POOL.UNKEEP (
    schema        VARCHAR2,
    objname       VARCHAR2,
    namespace     NUMBER,
    edition_name  VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.UNKEEP (
    hash          VARCHAR2,
    namespace     NUMBER);
```

WARNING:

This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 159-7 UNKEEP Procedure Parameters

Parameter	Description
name	The name of the object to unkeep.
flag	A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.
schema	The user name or the schema to which the object belongs to.
objname	The name of the object to unkeep.
namespace	A number that indicates the library cache namespace in which the object has to be searched for.
edition_name	The name of the edition that the target object resides in. This parameter is optional.
hash	A 16-byte hash value for the object.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found

159.3.7 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (
  schema          VARCHAR2,
  objname         VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE,
  edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.UNMARKHOT (
  hash            VARCHAR2,
  namespace       NUMBER DEFAULT 1,
  global          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 159-8 UNMARKHOT Procedure Parameters

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object

Table 159-8 (Cont.) UNMARKHOT Procedure Parameters

Parameter	Description
namespace	Number indicating the library cache namespace in which the object is to be searched
global	If TRUE, unmark the object hot on all Oracle RAC instances. The default value of this parameter is TRUE.
hash	A 16-byte hash value for the object
edition_name	Denotes the name of the edition that the target object resides in. This parameter is optional.

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

160

DBMS_SPACE

The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Security Model](#)
- [Data Structures](#)
- [Summary of DBMS_SPACE Subprograms](#)

160.1 DBMS_SPACE Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

160.2 DBMS_SPACE Data Structures

The `DBMS_SPACE` package defines an `OBJECT` type, a `RECORD` type, and a `TABLE` type.

OBJECT Types

[CREATE_TABLE_COST_COLINFO](#) Object Type

RECORD Types

[ASA_RECO_ROW](#) Record Type

TABLE Types

[ASA_RECO_ROW_TB](#) Table Type

160.2.1 DBMS_SPACE CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(  
    col_type    VARCHAR(200),  
    col_size    NUMBER)
```

Attributes**Table 160-1 CREATE_TABLE_COST_COLINFO Object Type**

Attribute	Description
col_type	Column type
col_size	Column size

160.2.2 DBMS_SPACE ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
  tablespace_name    VARCHAR2(30),
  segment_owner     VARCHAR2(30),
  segment_name      VARCHAR2(30),  segment_type      VARCHAR2(18),
  partition_name    VARCHAR2(30),
  allocated_space   NUMBER,
  used_space        NUMBER,
  reclaimable_space NUMBER,
  chain_rowexcess  NUMBER,
  recommendations   VARCHAR2(1000),
  c1                VARCHAR2(1000),
  c2                VARCHAR2(1000),
  c3                VARCHAR2(1000),
  task_id           NUMBER,
  mesg_id           NUMBER);
```

Attributes**Table 160-2 ASA_RECO_ROW Attributes**

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation

Table 160-2 (Cont.) ASA_RECO_ROW Attributes

Field	Description
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

Related Topics

- [DBMS_SPACE ASA_RECOMMENDATIONS Function](#)
This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

160.2.3 DBMS_SPACE ASA_RECO_ROW_TB Table Type

The type `asa_reco_row_tb` is a table of `asa_reco_row`.

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

160.3 Summary of DBMS_SPACE Subprograms

This table lists the `DBMS_SPACE` subprograms and briefly describes them.

Table 160-3 DBMS_SPACE Package Subprograms

Subprogram	Description
ASA_RECOMMENDATIONS Function	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures	Determines the size of the table given various attributes
FREE_BLOCKS Procedure	Returns information about free blocks in an object (table, index, or cluster)
ISDATAFILEDROPPABLE_NAME Procedure	Checks whether a datafile is droppable
OBJECT_DEPENDENT_SEGMENTS Function	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function	A table function where each row describes the space usage of the object at a specific point in time
SPACE_USAGE Procedures	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure	Returns information about unused space in an object (table, index, or cluster)

160.3.1 DBMS_SPACE ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
    all_runs          IN    VARCHAR2 DEFAULT := TRUE,
    show_manual       IN    VARCHAR2 DEFAULT := TRUE,
    show_findings     IN    VARCHAR2 DEFAULT := FALSE)
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 160-4 ASA_RECOMMENDATIONS Procedure Parameters

Parameter	Description
all_runs	Returns the results of all the auto advisor runs or only the results of the latest run. The valid values are TRUE and FALSE. The default value is TRUE. If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
show_manual	This parameter is used to indicate if the results of manual jobs should be included. If TRUE, results of manual tasks are shown. If FALSE, results of manual tasks are not shown. Specifying manual=true does not negate the specification of auto advisor tasks. However, the all_runs settings may override manual. If all_runs is FALSE, implying we only want to see the latest of auto advisor job, then manual may not be specified as TRUE. The valid values are TRUE and FALSE. The default value is TRUE.
show_findings	Shows only the findings instead of the recommendations. The valid values are TRUE and FALSE. The default value is FALSE.

Table 160-5 Parameter Usage

all_runs	show_manual	show_findings	Outcome
TRUE	TRUE	TRUE	All findings from auto advisor and manual tasks.
TRUE	TRUE	FALSE	All recommendations from auto advisor and manual tasks.
TRUE	FALSE	TRUE	All findings from auto advisor tasks.
TRUE	FALSE	FALSE	All recommendations from all auto advisor tasks.

Table 160-5 (Cont.) Parameter Usage

all_runs	show_manual	show_findings	Outcome
FALSE	TRUE	TRUE	N/A
FALSE	TRUE	FALSE	N/A
FALSE	FALSE	TRUE	Findings for the latest auto advisor task.
FALSE	FALSE	FALSE	Recommendations from the latest auto advisor task.

160.3.2 CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
    ddl          IN   VARCHAR2,
    used_bytes   OUT  NUMBER,
    alloc_bytes  OUT  NUMBER,
    plan_table   IN   VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (create_index_cost,WNDS);
```

Parameters

Table 160-6 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

160.3.3 CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE    VARCHAR(200),
    COL_SIZE    NUMBER);
```

Parameters

Table 160-7 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, `pctfree` etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  c1 sys.create_table_cost_columns;
BEGIN
  c1 := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',c1,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

160.3.4 FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See [SPACE_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
  segment_owner  IN  VARCHAR2,
  segment_name   IN  VARCHAR2,
  segment_type   IN  VARCHAR2,
```

```
freelist_group_id IN NUMBER,
free_blks          OUT NUMBER,
scan_limit         IN NUMBER DEFAULT NULL,
partition_name    IN VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 160-8 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note:

An error is raised if `scan_limit` is not a positive number.

160.3.5 ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
    filename    IN    VARCHAR2,
    value       OUT   NUMBER);
```

Pragmas

```
pragma restrict_references (free_blocks, WNDS);
```

Parameters

Table 160-9 ISDATAFILEDROPPABLE_NAME Procedure Parameters

Parameter	Description
filename	Name of the file
value	Values: 0 if the file is not droppable, 1 if the file is droppable.

Examples

```
DECLARE fname    VARCHAR2(100); retval NUMBER;
BEGIN SELECT file_name INTO
fname FROM dba_data_files WHERE file_name like
'%empty%';
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname,
retval);
DBMS_OUTPUT.PUT_LINE (retval);
END;
```

160.3.6 OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS (
    objowner    IN    VARCHAR2,
    objname     IN    VARCHAR2,
    partname    IN    VARCHAR2,
    objtype     IN    NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 160-10 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition

Table 160-10 (Cont.) OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objtype	Type of the object: <ul style="list-style-type: none"> • OBJECT_TYPE_TABLE constant positive := 1; • OBJECT_TYPE_NESTED_TABLE constant positive := 2; • OBJECT_TYPE_INDEX constant positive := 3; • OBJECT_TYPE_CLUSTER constant positive := 4; • OBJECT_TYPE_TABLE_PARTITION constant positive := 7; • OBJECT_TYPE_INDEX_PARTITION constant positive := 8; • OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; • OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; • OBJECT_TYPE_MV constant positive := 13; • OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
  segment_owner      VARCHAR2(100),
  segment_name       VARCHAR2(100),
  segment_type       VARCHAR2(100),
  tablespace_name    VARCHAR2(100),
  partition_name     VARCHAR2(100),
  lob_column_name    VARCHAR2(100));
```

Table 160-11 OBJECT_DEPENDENT_SEGMENT Type Parameters

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segment_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

160.3.7 OBJECT_GROWTH_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
  object_owner      IN   VARCHAR2,
  object_name       IN   VARCHAR2,
  object_type       IN   VARCHAR2,
  partition_name    IN   VARCHAR2 DEFAULT NULL,
  start_time        IN   TIMESTAMP DEFAULT NULL,
  end_time          IN   TIMESTAMP DEFAULT NULL,
  interval          IN   DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
  skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
  timeout_seconds   IN   NUMBER DEFAULT NULL,
  single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 160-12 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
object_owner	The schema containing the object
object_name	The name of the object
object_type	The type of the object
partition_name	The name of the partition
start_time	Statistics generated after this time will be used in generating the growth trend
end_time	Statistics generated until this time will be used in generating the growth trend
interval	The interval at which to sample
skip_interpolated	Whether interpolation of missing values should be skipped
timeout_seconds	The time-out value for the function in seconds
single_data_point_flag	Whether in the absence of statistics the segment should be sampled

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
  timepoint      TIMESTAMP,
  space_usage    NUMBER,
  space_alloc    NUMBER,
  quality        VARCHAR(20));
```

Table 160-13 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
timepoint	The time at which the statistic was recorded
space_usage	The space used by data
space_alloc	The size of the segment including overhead and unused space

Table 160-13 (Cont.) OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
quality	The quality of result: "GOOD", "INTERPOLATED", "PROJECTION"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

160.3.8 SPACE_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBS, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBS.

Note:

For LOB segments, the number of blocks that is returned from `full_blocks` and `unformatted_blocks` is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBS in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBS.

Syntax

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes  OUT NUMBER,
    fs1_blocks         OUT NUMBER,
    fs1_bytes          OUT NUMBER,
    fs2_blocks         OUT NUMBER,
    fs2_bytes          OUT NUMBER,
    fs3_blocks         OUT NUMBER,
    fs3_bytes          OUT NUMBER,
    fs4_blocks         OUT NUMBER,
    fs4_bytes          OUT NUMBER,
    full_blocks        OUT NUMBER,
    full_bytes         OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner      IN  VARCHAR2,
```

```

segment_name      IN   VARCHAR2,
segment_type      IN   VARCHAR2,
segment_size_blocks OUT  NUMBER,
segment_size_bytes OUT  NUMBER,
used_blocks       OUT  NUMBER,
used_bytes        OUT  NUMBER,
expired_blocks    OUT  NUMBER,
expired_bytes     OUT  NUMBER,
unexpired_blocks  OUT  NUMBER,
unexpired_bytes   OUT  NUMBER,
partition_name    IN   VARCHAR2 DEFAULT NULL);

```

Parameters

Table 160-14 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
unformatted_blocks	For LOB segments, the number of blocks that is returned from unformatted_blocks is actually the number of chunks for the LOB segment.
unformatted bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
full_blocks	The number of blocks that is returned from full_blocks is actually the number of chunks for the LOB segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment

Table 160-14 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                      'TABLE',
                      :unf, :unfb,
                      :fs1, :fs1b,
                      :fs2, :fs2b,
                      :fs3, :fs3b,
                      :fs4, :fs4b,
                      :full, :fullb);

end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

160.3.9 UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
    segment_owner      IN VARCHAR2,
    segment_name      IN VARCHAR2,
    segment_type      IN VARCHAR2,
    total_blocks      OUT NUMBER,
    total_bytes      OUT NUMBER,
    unused_blocks     OUT NUMBER,
    unused_bytes      OUT NUMBER,
    last_used_extent_file_id OUT NUMBER,
    last_used_extent_block_id OUT NUMBER,
    last_used_block   OUT NUMBER,
    partition_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 160-15 UNUSED_SPACE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • INDEX • INDEX PARTITION • INDEX SUBPARTITION • CLUSTER • LOB • LOB PARTITION • LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,  
:total_bytes, :unused_blocks, :unused_bytes, :lastextf,  
:last_extb, :lastusedblock);
```

DBMS_SPACE_ADMIN

The `DBMS_SPACE_ADMIN` package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS_SPACE_ADMIN Subprograms](#)

See Also:

Oracle Database Administrator's Guide for an example and description of using `DBMS_SPACE_ADMIN`.

161.1 DBMS_SPACE_ADMIN Security Model

This package runs with `SYS` privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

161.2 DBMS_SPACE_ADMIN Constants

The `DBMS_SPACE_ADMIN` package provides constants that can be used for specifying parameter values.

Table 161-1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
<code>SEGMENT_VERIFY_EXTENTS</code>	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
<code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code>	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
<code>SEGMENT_MARK_CORRUPT</code>	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)

Table 161-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the block range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the block range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks high water mark (HWM)
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option

Table 161-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

161.3 DBMS_SPACE_ADMIN Operational Notes

Before migrating the `SYSTEM` tablespace, certain conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

161.4 Summary of DBMS_SPACE_ADMIN Subprograms

This table lists the `DBMS_SPACE_ADMIN` subprograms and briefly describes them.

Table 161-2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure	Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces
ASSM_TABLESPACE_VERIFY Procedure	Verifies ASSM tablespaces
DROP_EMPTY_SEGMENTS Procedure	Drops segments from empty tables or table fragments and dependent objects
GET_SEGADV_ATTRIB Procedure	returns the values of attributes of <code>DBSM_SPACE_ADMIN</code> package
MATERIALIZER_DEFERRED_SEGMENTS Procedure	Materializes segments for tables and table fragments with deferred segment creation and their dependent objects
SEGMENT_CORRUPT Procedure	Marks the segment corrupt or valid so that appropriate error recovery can be done
SEGMENT_DROP_CORRUPT Procedure	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure	Verifies the consistency of the extent map of the segment

Table 161-2 (Cont.) DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
SET_SEGADV_ATTRIB Procedure	Sets/changes the values of attributes of DBSM_SPACE_ADMIN package
TABLESPACE_FIX_BITMAPS Procedure	Marks the appropriate block range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STAT ES Procedure	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure	Migrates a locally managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure	Migrates a tablespace from dictionary-managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure	Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized

161.4.1 ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN VARCHAR2,
  partition_name IN VARCHAR2,
  verify_option  IN POSITIVE DEFAULT SEGMENT_VERIFY_BASIC,
  attrib         IN POSITIVE DEFAULT NULL);
```

Parameters

Table 161-3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	Schema that owns the segment
segment_name	Name of the segment to be verified
segment_type	Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	One of the following options: <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default) SEGMENT_VERIFY_DEEP := 10. Performs deep verification SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment
attrib	When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: <ul style="list-style-type: none"> HWM_CHECK := 12. Checks whether high water mark information is accurate BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

161.4.2 ASSM_TABLESPACE_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name    IN VARCHAR2,
    ts_option          IN POSITIVE,
    segment_option     IN POSITIVE DEFAULT NULL);
```

Parameters

Table 161-4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace to verify. The tablespace must be an ASSM tablespace.
ts_option	<ul style="list-style-type: none"> TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file\$ and control file. TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments. TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY.
segment_option	<p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> SEGMENT_VERIFY_BASIC := 9 SEGMENT_VERIFY_DEEP := 10 <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified.</p>

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the `USER_DUMP_DEST` initialization parameter.

161.4.3 DROP_EMPTY_SEGMENTS Procedure

This procedure drops segments from empty tables or table fragments and dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (  
  schema_name      IN      VARCHAR2  DEFAULT NULL,  
  table_name       IN      VARCHAR2  DEFAULT NULL,  
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 161-5 DROP_EMPTY_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

161.4.4 GET_SEGADV_ATTRIB Procedure

This procedure returns the values of attributes of `DBMS_SPACE_ADMIN` package.

Syntax

```
DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(  
  attribute IN NUMBER,  
  value     OUT NUMBER);
```

Parameters

Table 161-6 GET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: <ul style="list-style-type: none"> COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
value	Supported values: <ul style="list-style-type: none"> ATTR_ENABLE : 1 ATTR_DISABLE : 0

161.4.5 MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (
  schema_name      IN      VARCHAR2  DEFAULT NULL,
  table_name       IN      VARCHAR2  DEFAULT NULL,
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 161-7 MATERIALIZE_DEFERRED_SEGMENTS Procedure Parameters

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned

- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

161.4.6 SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER,
    corrupt_option       IN    POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 161-8 SEGMENT_CORRUPT Procedure Parameters

Parameter	Description
<code>tablespace_name</code>	Name of tablespace in which segment resides
<code>header_relative_file</code>	Relative file number of segment header
<code>header_block</code>	Block number of segment header
<code>corrupt_option</code>	<code>SEGMENT_MARK_CORRUPT</code> (default) or <code>SEGMENT_MARK_VALID</code>

Usage Notes

You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

161.4.7 SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER);
```

Parameters

Table 161-9 SEGMENT_DROP_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Usage Notes

- The space for the segment is not released, and it must be fixed by using the [TABLESPACE_FIX_BITMAPS Procedure](#) or the [TABLESPACE_REBUILD_BITMAPS Procedure](#).
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

161.4.8 SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
    tablespace_name      IN    VARCHAR2,
    header_relative_file IN    POSITIVE,
    header_block         IN    NUMBER,
    dump_option          IN    POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 161-10 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Table 161-10 (Cont.) SEGMENT_DUMP Procedure Parameters

Parameter	Description
dump_option	One of the following options: <ul style="list-style-type: none"> SEGMENT_DUMP_EXTENT_MAP SEGMENT_DUMP_BITMAP_SUMMARY

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS.HEADER_FILE`. If `HEADER_FILE` is greater than 1023 then use `DBA_DATA_FILES.RELATIVE_FNO`.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

161.4.9 SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
  tablespace_name      IN      VARCHAR2,
  header_relative_file IN      POSITIVE,
  header_block         IN      NUMBER,
  verify_option        IN      POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters**Table 161-11 SEGMENT_VERIFY Procedure Parameters**

Parameters	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
verify_option	What kind of check to do: <code>SEGMENT_VERIFY_EXTENTS</code> or <code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code>

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not

considered free, used space considered free, and the same space considered used by multiple segments.

- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33,
DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

161.4.10 SET_SEGADV_ATTRIB Procedure

This procedure sets the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```
DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB (
    attribute IN NUMBER,
    value     IN NUMBER);
```

Parameters

Table 161-12 SET_SEGADV_ATTRIB Procedure Parameters

Parameter	Description
attribute	Supported attributes: <ul style="list-style-type: none"> • COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor. • COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.
value	Supported values: <ul style="list-style-type: none"> • ATTR_ENABLE : 1 • ATTR_DISABLE : 0

161.4.11 TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
    tablespace_name IN VARCHAR2,
    dbarange_relative_file IN POSITIVE,
    dbarange_begin_block IN POSITIVE,
```

```
dbarange_end_block    IN    POSITIVE,
fix_option            IN    POSITIVE);
```

Parameters

Table 161-13 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbarange_relative_file	Relative file number of block range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	One of the following options: <ul style="list-style-type: none"> TABLESPACE_EXTENT_MAKE_FREE TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as `USED` in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83,
DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of `TABLESPACE_EXTENT_MAKE_FREE` marks the bits free in bitmaps. The `BEGIN` and `END` blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

161.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by `SMON` when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
    tablespace_name    IN    VARCHAR);
```

Parameters

Table 161-14 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace whose segments must be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

161.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
    tablespace_name      IN      VARCHAR2);
```

Parameter

Table 161-15 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

161.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name      IN      VARCHAR2,
    unit_size            IN      POSITIVE DEFAULT NULL,
    rfno                 IN      POSITIVE DEFAULT NULL);
```

Parameters

Table 161-16 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace to be migrated

Table 161-16 (Cont.) TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
unit_size	Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks
rfno	Relative File Number of the file where the bitmap blocks are placed

Usage Notes

- Before you migrate the SYSTEM tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the SYSTEM tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

 **See Also:**
Oracle Database Administrator's Guide

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the MINIMUM EXTENT for the tablespace (5 if MINIMUM EXTENT is not specified). Thus, the calculated value will not be larger than the MINIMUM EXTENT for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the unit_size calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

161.4.15 TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
    tablespace_name      IN      VARCHAR2,
    bitmap_relative_file IN      POSITIVE  DEFAULT NULL,
    bitmap_block         IN      POSITIVE  DEFAULT NULL);
```

Parameters

Table 161-17 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the `USERS` tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

161.4.16 TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
    tablespace_name      IN      VARCHAR2);
```

Parameters

Table 161-18 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

161.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (  
    tablespace_name    IN    VARCHAR2,  
    filno              IN    POSITIVE,  
    blkno              IN    POSITIVE);
```

Parameters

Table 161-19 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Description
tablespace_name	Name of tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination range

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of `SPACE HEADER` segment that contains the bitmap blocks. The `SPACE HEADER` segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the `TABLESPACE_RELOCATE_BITMAPS` command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the `SYSTEM` tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

Note:

The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

161.4.18 TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
    tablespace_name      IN    VARCHAR2,  
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 161-20 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	One option is supported: TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

DBMS_SPD

The `DBMS_SPD` package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS_SPD Subprograms](#)

See Also:

- [DBMS_STATS](#)
- *Oracle Database SQL Tuning Guide* regarding SQL plan directives

162.1 DBMS_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

162.2 DBMS_SPD Security Model

`DBMS_SPD` is an invoker-rights package. The invoker requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

162.3 DBMS_SPD Views

The DBA view `DBA_SQL_PLAN_DIRECTIVES` shows all the directives created in the system and the view `DBA_SQL_PLAN_DIR_OBJECTS` displays the objects that are included in the directives.

162.4 Summary of DBMS_SPD Subprograms

This table lists and briefly describes the `DBMS_SPD` package subprograms.

Table 162-1 DBMS_SPD Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_DIRECTIVE Procedure	Changes different attributes of a SQL plan directive
CREATE_STGTAB_DIRECTIVE Procedure	Creates a staging table into which to pack (export) SQL plan directives.
DROP_SQL_PLAN_DIRECTIVE Procedure	Drops a SQL plan directive
FLUSH_SQL_PLAN_DIRECTIVE Procedure	Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.
GET_PREFS Function	Gets the values for preferences for SQL plan directives
PACK_STGTAB_DIRECTIVE Function	Packs (exports) SQL plan directives into a staging table.
SET_PREFS Procedure	Allows the setting of different preferences for SQL plan directives
UNPACK_STGTAB_DIRECTIVE Function	Unpacks (imports) SQL plan directives from a staging table.

162.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

Syntax

```
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (
    directive_id      IN      NUMBER,
    attribute_name    IN      VARCHAR2,
    attribute_value   IN      VARCHAR2);
```

Parameters

Table 162-2 ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
directive_id	SQL plan directive ID
attribute_name	<ul style="list-style-type: none"> ENABLED AUTO_DROP
attribute_value	<p>Possible values:</p> <ul style="list-style-type: none"> ENABLED: <ul style="list-style-type: none"> - If YES directive is enabled and may be used - If NO directive is not enabled and will not be used AUTO_DROP: <ul style="list-style-type: none"> - If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior. - If NO directive will not be dropped automatically

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

162.4.2 CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

Syntax

```
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (
  table_name          IN VARCHAR2,
  table_owner         IN VARCHAR2 := USER,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 162-3 *CREATE_STGTAB_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>table_name</code>	Name of staging table
<code>table_owner</code>	Name of schema owner of staging table. Default is current schema.
<code>tablespace_name</code>	Name of tablespace. Default <code>NULL</code> means create staging table in the default tablespace:

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-44001 `INVALID_SCHEMA`: The input schema does not exist.
- ORA-13159 `TABLE_ALREADY_EXISTS`: The specified table already exists.
- ORA-29304 `TABLESPACE_MISSING`: The specified tablespace does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

162.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

```
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (  
    directive_id      IN      NUMBER);
```

Parameters

Table 162-4 *DROP_SQL_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
directive_id	SQL plan directive ID

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN  
    DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);  
END;
```

162.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

Exceptions

ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.

Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

162.4.5 GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

```
DBMS_SPD.GET_PREFS (
  pname      IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 162-5 *GET_PREFS Function Parameters*

Parameter	Description
pname	Preference name. The procedure supports the preference <code>SPD_RETENTION_WEEKS</code> .

Return Values

Preference value

Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.

Usage Notes

- The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.
- `SPD_RETENTION_WEEKS` - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```

162.4.6 PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := USER,
    directive_id    IN NUMBER    := NULL,
    obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 162-6 *PACK_STGTAB_DIRECTIVE* Function Parameters

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.
directive_id	SQL plan directive ID. Default NULL means all directives in the system.
obj_list	Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list.

Return Values

Number of SQL plan directives packed.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
```

```

-- Pack directives relevant to objects in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := NULL;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt NUMBER;
BEGIN
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

```

162.4.7 SET_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

Syntax

```

DBMS_SPD.SET_PREFS (
  pname      IN  VARCHAR2,
  pvalue     IN  VARCHAR2);

```

Parameters

Table 162-7 *SET_PREFS Procedure Parameters*

Parameter	Description
pname	Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.

Table 162-7 (Cont.) SET_PREFS Procedure Parameters

Parameter	Description
pvalue	<p>Preference value.</p> <ul style="list-style-type: none"> SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.

Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

```
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

162.4.8 UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

Syntax

```
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER,
  directive_id    IN NUMBER    := NULL,
  obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

Table 162-8 UNPACK_STGTAB_DIRECTIVE Function Parameters

Parameter	Description
table_name	Name of staging table
table_owner	Name of schema owner of staging table. Default is current schema.

Table 162-8 (Cont.) UNPACK_STGTAB_DIRECTIVE Function Parameters

Parameter	Description
directive_id	SQL plan directive ID. Default NULL means all directives in the system.
obj_list	Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list.

Return Values

Number of SQL plan directives unpacked.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
-- Unack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt NUMBER;
begin
  my_list.extend(2);
```

```
-- SALES table
my_list(1).owner := 'SH';
my_list(1).object_name := 'SALES';
my_list(1).object_type := 'TABLE';

-- CUSTOMERS table
my_list(2).owner := 'SH';
my_list(2).object_name := 'CUSTOMERS';
my_list(2).object_type := 'TABLE';

dir_cnt :=
  DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

DBMS_SPM

The `DBMS_SPM` package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SPM Subprograms](#)

See Also:

For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*

163.1 DBMS_SPM Overview

The `DBMS_SPM` package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production

configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

163.2 DBMS_SPM Security Model

The package is owned by `SYS`. The `EXECUTE` package privilege is required to execute its procedures. Any user granted the `ADMINISTER SQL MANAGEMENT OBJECT` privilege is able to execute the `DBMS_SPM` package.

163.3 DBMS_SPM Constants

The `DBMS_SPM` package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the `time_limit` parameter of the `EVOLVE_SQL_PLAN_BASELINE` Function.

Table 163-1 DBMS_SPM Constants

Constant	Type	Value	Description
<code>AUTO_LIMIT</code>	<code>INTEGER</code>	<code>2147483647</code>	Oracle determines the appropriate time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function.
<code>NO_LIMIT</code>	<code>INTEGER</code>	<code>2147483647 -1</code>	There is no limit to the time spent by the <code>EVOLVE_SQL_PLAN_BASELINE</code> Function.

163.4 DBMS_SPM Examples

These examples will help you understand use of `DBMS_SPM`.

Detailed examples are located under the following topics:

- [Migrating Stored Outlines to SQL Plan Baselines](#)
- [Migrating Outlines to Utilize SQL Plan Management Features](#)
- [Migrating Outlines to Preserve Stored Outline Behavior](#)
- [Performing Follow-Up Tasks After Stored Outline Migration](#)

163.5 DBMS_SPM Data Structures

The `DBMS_SPM` package defines a `TABLE` type.

Table Types

- [DBMS_SPM NAMELIST Table Type](#)

163.5.1 DBMS_SPM NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);
```

163.6 Summary of DBMS_SPM Subprograms

This table lists and briefly describes the DBMS_SPM package subprograms.

Table 163-2 DBMS_SPM Package Subprograms

Subprogram	Description
ACCEPT_SQL_PLAN_BASELINE Procedure	Accepts a plan based on the recommendation of an evolve task
ALTER_SQL_PLAN_BASELINE Function	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CANCEL_EVOLVE_TASK Procedure	Cancels a currently executing evolve task
CONFIGURE Procedure	Sets configuration options for SQL management base, in parameter/value format
CREATE_EVOLVE_TASK Function	Creates an advisor task and sets its parameters
CREATE_STGTAB_BASELINE Procedure	Creates a staging table that used for transporting SQL plan baselines from one system to another
DROP_EVOLVE_TASK Procedure	Drops an evolved task
DROP_SQL_PLAN_BASELINE Function	Drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BASELINE Function	Evolves SQL plan baselines associated with one or more SQL statements
EXECUTE_EVOLVE_TASK Function	Executes a previously created evolve task
IMPLEMENT_EVOLVE_TASK Function	Implements a plan based on the recommendation of an evolve task
INTERRUPT_EVOLVE_TASK Procedure	Interrupts a currently executing evolve task
LOAD_PLANS_FROM_CURSOR_CACHE Functions	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_AWR Function	Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded
LOAD_PLANS_FROM_SQLSET Function	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
MIGRATE_STORED_OUTLINES Functions	Migrates existing stored outlines to SQL plan baselines

Table 163-2 (Cont.) DBMS_SPM Package Subprograms

Subprogram	Description
PACK_STGTAB_BASELINE Function	Packs (exports) SQL plan baselines from SQL management base into a staging table
RESET_EVOLVE_TASK Procedure	Resets an evolve task to its initial state
RESUME_EVOLVE_TASK Procedure	Resumes a previously interrupted task
REPORT_AUTO_EVOLVE_TASK Function	Displays the results of an execution of an automatic evolve task.
REPORT_EVOLVE_TASK Function	Displays the results of an evolved task
SET_EVOLVE_TASK_PARAMETER Procedure	Sets a parameter of an evolve task
UNPACK_STGTAB_BASELINE Function	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

163.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

Syntax

```
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  task_owner     IN  VARCHAR2    := NULL,
  force         IN  BOOLEAN      := FALSE);
```

Parameters

Table 163-3 ACCEPT_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Identifier of task to implement
object_id	Identifier of the advisor framework object that represents a single plan. If <code>NULL</code> , the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
force	Accept the plan even if the advisor did not recommend such an action. The default is <code>FALSE</code> requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

163.6.2 ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    attribute_name  IN VARCHAR2,
    attribute_value IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 163-4 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

Table 163-5 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30 characters
description	Plan description.	String of up to 500 bytes

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

163.6.3 CANCEL_EVOLVE_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 163-6 CANCEL_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to cancel

163.6.4 CONFIGURE Procedure

This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

Syntax

```
DBMS_SPM.CONFIGURE (
    parameter_name     IN VARCHAR2,
    parameter_value    IN VARCHAR2 := NULL,
    allow              IN BOOLEAN := TRUE);
```

Parameters

Table 163-7 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Name of parameter to set (see table below).
parameter_value	Value of parameter to use (see table below). The maximum length of parameter_value is 1000 characters.
allow	Whether to include (true) or exclude (false) matching SQL statements and plans for the auto_capture_* parameters. If null, then the procedure ignores the specified parameter.

Table 163-8 Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
auto_capture_action	Action to include (=) or exclude (<>) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.	Action name, for example, R%
auto_capture_module	Module to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Module name, for example, LOGGER
auto_capture_parsing_schema_name	Parsing schema to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Schema name, for example, HR
auto_capture_sql_text	Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.	Text of a SQL statement, for example, SELECT a%
auto_spm_evolve_task	Setting to enable or disable the high-frequency SPM Evolve Advisor task. The high-frequency task runs every hour and runs for no longer than 30 minutes. These settings are not configurable. The frequent executions mean that the optimizer has more opportunities to find and evolve better performing plans. The default value is OFF, which means the high-frequency SPM Evolve Advisor task is disabled. In this release, AUTO is equivalent to OFF. The value of allow is ignored. Note: See <i>Oracle Database Licensing Information User Manual</i> for details on which features are supported for different editions and services.	ON, OFF, AUTO
plan_retention_weeks	Number of weeks to retain unused plans before the database purges them. A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of allow is ignored.	5–523 (default is 53)

Table 163-8 (Cont.) Names and Values for CONFIGURE Procedure Parameters

Parameter Name	Description	Possible Values
space_budget_percent	Maximum percent of SYSAUX space that can be used for SQL management base. The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of allow is ignored.	1–50 (default is 10)

Exceptions

Table 163-9 CONFIGURE Exceptions

Error Number	Description
ORA-38133	Invalid parameter name
ORA-38134	Invalid parameter value
ORA-38150	Not enough space for new filter
ORA-38151	Module name too long
ORA-38152	Action name too long
ORA-38304	Missing or invalid user name

Usage Notes

- When `parameter_name` is `auto_capture_sql_text`, the `parameter_value` is an automatic search filter. The filter uses the search pattern of `LIKE parameter_name` when `allow=>>true`. The filter uses the pattern `NOT LIKE parameter_name` when `allow=>>false`.

For all other non-null `parameter_name` values, the search pattern depends on the `allow` setting. The parameter uses an equal sign (=) when `allow=>>true`. The parameter uses a not-equal sign (<>) when `allow=>>false`.
- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying `auto_capture_sql_text` to be `'%TABLE1%'`, `TRUE`, and `'%TABLE2%'`, `FALSE` will result in matching SQL text `LIKE '%TABLE1%'` and `NOT LIKE '%TABLE2%'`. The database uses these configuration settings only when the initialization parameter `OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES` is set to `TRUE`.
- A null value for `parameter_value` removes the filter for `parameter_name` entirely. By using `parameter_value=>''` in combination with `allow=FALSE`, you can filter out all values for a parameter, and then create a separate filter to include only specified values. The `DBA_SQL_MANAGEMENT_CONFIG` view shows the current filters.
- The default space budget for SQL management base is no more than ten percent of the size of `SYSAUX` tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a

year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).

- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

Examples

The following example creates a filter for SQL text that is like `SELECT a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the `HR` parsing schema:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR', 'FALSE');
```

The following example removes any existing filters for SQL text:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any `LIKE` or `NOT LIKE` filters for the SQL text `select a%`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate `(action LIKE 'R%') OR (action LIKE '%E_')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate `NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL_')`:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL_', 'FALSE');
```

163.6.5 CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (
    sql_handle      IN  VARCHAR2  := NULL,
    plan_name       IN  VARCHAR2  := NULL,
    time_limit      IN  NUMBER     := DBMS_SPM.AUTO_LIMIT,
    task_name       IN  VARCHAR2  := NULL,
    description     IN  VARCHAR2  := NULL)
RETURN VARCHAR2;
```

```
DBMS_SPM.CREATE_EVOLVE_TASK (
    plan_list      IN  DBMS_SPM.NAME_LIST,
    time_limit     IN  NUMBER      := DBMS_SPM.AUTO_LIMIT,
    task_name      IN  VARCHAR2    := NULL,
    description    IN  VARCHAR2    := NULL)
RETURN VARCHAR2;
```

Parameters

Table 163-10 CREATE_EVOLVE_TASK Function Parameters

Parameter	Description
sql_handle	Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans.
plan_list	List of plan names. The plans may belong to different SQL statements.
plan_name	Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.
time_limit	Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit.
task_name	Evolve task name
description	Description of the task (maximum 256 characters)

Return Values

SQL evolve task unique name

163.6.6 CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
    table_name      IN  VARCHAR2,
    table_owner     IN  VARCHAR2 := NULL,
    tablespace_name IN  VARCHAR2 := NULL);
```

Parameters

Table 163-11 CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
table_name	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
table_owner	Name of owner of the staging table. Default NULL means current schema is the table owner.
tablespace_name	Name of tablespace. Default NULL means create staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

163.6.7 DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 163-12 DROP_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to drop

163.6.8 DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle        IN VARCHAR2 := NULL,
    plan_name         IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 163-13 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.

Return Values

The number of plans dropped

163.6.9 EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  sql_handle   IN VARCHAR2 := NULL,
  plan_name    IN VARCHAR2 := NULL,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  plan_list    IN DBMS_SPM.NAME_LIST,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

Table 163-14 EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement identifier. Unless plan_name is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.
plan_name	Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if sql_handle is NULL.
plan_list	A list of plan names. Each plan in the list can belong to same or different SQL statement.
time_limit	Time limit in number of minutes. This applies only if verify = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> DBMS_SPM.AUTO_LIMIT (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. DBMS_SPM.NO_LIMIT means there is no time limit. A positive integer value represents a user specified time limit.
verify	Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. <ul style="list-style-type: none"> 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans
commit	Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'. <ul style="list-style-type: none"> 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = 'YES'. 'NO' - generate a report without any updates. Note that commit = 'NO' together with verify = 'NO' represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

163.6.10 EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK (
    task_name      IN VARCHAR2,
    execution_name IN VARCHAR2 := NULL,
    execution_desc IN VARCHAR2 := NULL);
RETURN VARCHAR2;
```

Parameters

Table 163-15 EXECUTE_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Evolve task name
execution_name	Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function.
execution_desc	Description of the execution (maximum 256 characters)

Return Values

Name of the new execution

163.6.11 IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```
DBMS_SPM.IMPLEMENT_EVOLVE_TASK (
    task_name      IN VARCHAR2,
    task_owner     IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL,
    force          IN BOOLEAN   := FALSE)
RETURN NUMBER;
```

Parameters

Table 163-16 IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.

Table 163-16 (Cont.) IMPLEMENT_EVOLVE_TASK Function Parameters

Parameter	Description
force	Accept all plans even if the advisor did not recommend such an action. The default is <code>FALSE</code> requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.

Return Values

The number of plans accepted

163.6.12 INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters**Table 163-17 INTERRUPT_EVOLVE_TASK Procedure Parameters**

Parameter	Description
task_name	Identifier of task to interrupt

163.6.13 LOAD_PLANS_FROM_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_AWR
    begin_snap      IN  NUMBER,
    end_snap        IN  NUMBER,
    basic_filter    IN  VARCHAR2 := NULL,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES',
    commit_rows     IN  NUMBER := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 163-18 LOAD_PLANS_FROM_AWR Function Parameters

Parameter	Description
begin_snap	Begin snapshot
end_snap	End snapshot
basic_filter	SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected. Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.
fixed	Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded.
enabled	Default 'YES' means the loaded plans will be considered by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit.
dbid	The DBID that is used for imported or PDB-level AWR data.

Usage Notes

Requires the `Administer SQL Management Object` privilege

See Also:

For information on the `SQLSET_ROW` objects, see [SQLSET_ROW Object Type](#).

163.6.14 LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using `attribute_name` and `attribute_value` pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_text        IN CLOB,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
```

```

    sql_handle      IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER   := NULL,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;

```

Parameters

Table 163-19 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: <ul style="list-style-type: none"> SQL_TEXT" 'PARSING_SCHEMA_NAME' 'MODULE' 'ACTION'

Table 163-19 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

163.6.15 LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sqlset_owner     IN  VARCHAR2 := NULL,
    basic_filter     IN  VARCHAR2 := NULL,
    fixed            IN  VARCHAR2 := 'NO',
    enabled          IN  VARCHAR2 := 'YES'
    commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 163-20 LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.

Table 163-20 (Cont.) LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
<code>basic_filter</code>	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any <code>WHERE</code> clause predicate that can specified against the view <code>DBA_SQLSET_STATEMENTS</code> . For example <code>basic_filter => 'sql_text like 'select /*LOAD_STS*/%'</code> or <code>basic_filter => 'sql_id='b62q7nc33gzwx''</code> .
<code>fixed</code>	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
<code>enabled</code>	Default 'YES' means the loaded plans are enabled for use by the optimizer
<code>commit_rows</code>	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

163.6.16 MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
  attribute_name      IN  VARCHAR2,
  attribute_value     IN  CLOB,
  fixed               IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
  outln_list         IN  DBMS_SPM.NAME_LIST,
  fixed              IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

Parameters

Table 163-21 MIGRATE_STORED_OUTLINE Function Parameters

Parameter	Description
<code>attribute_name</code>	Specifies the type of parameter used in <code>attribute_value</code> to identify the migrated stored outlines. It is case insensitive. Possible values: <ul style="list-style-type: none"> <code>outline_name</code> <code>sql_text</code> <code>category</code> <code>all</code>
<code>attribute_value</code>	Based on <code>attribute_name</code> , this can be: <ul style="list-style-type: none"> Name of stored outline to be migrated SQL text of stored outlines to be migrated Category of stored outlines to be migrated NULL if <code>attribute_name</code> is <code>all</code>
<code>fixed</code>	NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.
<code>outln_list</code>	List of outline names to be migrated

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate `all`, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

163.6.17 PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  sql_text        IN CLOB      := NULL,
  creator         IN VARCHAR2 := NULL,  origin          IN VARCHAR2 := NULL,
  enabled         IN VARCHAR2 := NULL,
  accepted        IN VARCHAR2 := NULL,
  fixed           IN VARCHAR2 := NULL,
  module          IN VARCHAR2 := NULL,
  action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 163-22 PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

163.6.18 RESET_EVOLVE_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters

Table 163-23 RESET_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to reset

163.6.19 RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```
DBMS_SPM.RESUME_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

Parameters

Table 163-24 RESUME_EVOLVE_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of task to resume

163.6.20 REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK (
    type          IN  VARCHAR2 := TYPE_TEXT,
    level         IN  VARCHAR2 := LEVEL_TYPICAL,
    section       IN  VARCHAR2 := SECTION_ALL,
    object_id     IN  NUMBER   := NULL,
    execution_name IN  VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 163-25 REPORT_AUTO_EVOLVE_TASK Function Parameters

Parameter	Description
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

163.6.21 REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

Syntax

```
DBMS_SPM.REPORT_EVOLVE_TASK (
    task_name      IN  VARCHAR2,
    type           IN  VARCHAR2  := TYPE_TEXT,
    level          IN  VARCHAR2  := LEVEL_TYPICAL,
    section        IN  VARCHAR2  := SECTION_ALL,
    object_id      IN  NUMBER    := NULL,
    task_owner     IN  VARCHAR2  := NULL,
    execution_name IN  VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 163-26 REPORT_EVOLVE_TASK Function Parameters

Parameter	Description
task_name	Identifier of task to report
type	Type of the report. Possible values are TEXT, HTML, XML
level	Format of the report. Possible values are BASIC, TYPICAL, ALL.
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.
object_id	Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.
task_owner	Owner of the evolve task. Defaults to the current schema owner.
execution_name	Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.

Return Values

The report

163.6.22 SET_EVOLVE_TASK_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a VARCHAR2 or a NUMBER.

Syntax

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2,
    parameter      IN  VARCHAR2,
    value          IN  NUMBER);
```

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2 := NULL,
    parameter      IN  VARCHAR2,
    value          IN  VARCHAR2);
```

Parameters

Table 163-27 SET_EVOLVE_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Evolve task name
parameter	Name of the parameter to set (see following table)
value	Value of the parameter (see following table)

The following table describes parameters for the SET_EVOLVE_TASK_PARAMETER procedure.

Table 163-28 DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
alternate_plan_source	<p>Determines which sources to search for additional plans:</p> <ul style="list-style-type: none"> AUTO (the database selects the source automatically) AUTOMATIC_WORKLOAD_REPOSITORY CURSOR_CACHE SQL_TUNING_SET <p>You can combine multiple values with the plus sign (+).</p>	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is AUTO. If manual, the default is CURSOR_CACHE+AUTOMATIC_WORKLOAD_REPOSITORY.

Table 163-28 (Cont.) DBMS_SPM.SET_EVOLVE_TASK_PARAMETER Parameters

Parameter	Description	Default
alternate_plan_baseline	<p>Determines which alternative plans should be loaded:</p> <ul style="list-style-type: none"> AUTO lets Autonomous Database choose whether to load plans for statements with or without baselines. EXISTING loads alternate plans with for statements with existing baselines. NEW loads alternative plans for statements without a baseline, in which case a new baseline is created. <p>You can combine multiple values with the plus sign (+), as in EXISTING+NEW.</p>	EXISTING
alternate_plan_limit	Specifies the maximum number of plans to load in total (that is, not the limit for each SQL statement).	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is UNLIMITED. If manual, the default is 10.
accept_plans	<p>Specifies whether to accept recommended plans automatically.</p> <p>When ACCEPT_PLANS is true, SQL plan management automatically accepts all plans recommended by the task.</p> <p>When ACCEPT_PLANS is false, the task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.</p>	true (regardless of whether the advisor is run automatically or manually)
time_limit	Global time limit in seconds. This is the total time allowed for the task.	<p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> If automated, the default is 3600. If manual, the default is 2147483646.

See Also:

Oracle Database Licensing Information User Manual for details on which features are supported for different editions and services

163.6.23 UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  sql_text        IN CLOB      := NULL,
  creator         IN VARCHAR2 := NULL,  origin          IN VARCHAR2 := NULL,
  enabled         IN VARCHAR2 := NULL,
  accepted        IN VARCHAR2 := NULL,
  fixed           IN VARCHAR2 := NULL,
  module          IN VARCHAR2 := NULL,
  action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 163-29 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of plans unpacked

DBMS_SQL

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the [PARSE Procedures](#) supplied with the `DBMS_SQL` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_SQL Subprograms](#)

See Also:

For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

164.1 DBMS_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using `DBMS_SQL`. For tasks that require `DBMS_SQL`, see *Oracle Database PL/SQL Language Reference*.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

 **See Also:**

Oracle Call Interface Programmer's Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI binds by address and the `DBMS_SQL` package binds by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULLs` are fully supported as values of a PL/SQL variable.

164.2 DBMS_SQL Security Model

`DBMS_SQL` is a `SYS`-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_SQL` subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

 **See Also:**

Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, `ORA-29471`, is raised when any `DBMS_SQL` subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and `DBMS_SQL` becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS_OPEN Function](#) denotes a cursor currently open in the session, the return value is `TRUE`. If the actual value is `NULL`, then the return value is `FALSE`. Otherwise, this raises an `ORA-29471` error.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single `DBMS_SQL` subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.

- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.
- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an `ORA-29470` error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram, which takes a formal parameter, `security_level`, with allowed values `NULL`, `1` and `2`.

- When `security_level = 1` (or is `NULL`), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in the previous releases. As a consequence, users of `DBMS_SQL` may encounter runtime errors on upgrade.

164.3 DBMS_SQL Constants

The `DBMS_SQL Constants` package provides constants that are used with the `language_flag` parameter of the `PARSE` Procedures.

These constants are described in the following table.

Table 164-1 DBMS_SQL Constants

Name	Type	Value	Description
V6	INTEGER	0	Specifies Oracle database version 6 behavior
NATIVE	INTEGER	1	Specifies normal behavior for the database to which the program is connected
V7	INTEGER	2	Specifies Oracle database version 7 behavior
FOREIGN_SYNTA X	INTEGER	4294967295	Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set.

Related Topics

- [PARSE Procedures](#)
This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

164.4 DBMS_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE_COLUMN Procedures](#), the [DEFINE_COLUMN_LONG Procedure](#), or the [DEFINE_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call [COLUMN_VALUE Procedure](#) or [COLUMN_VALUE_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables.

Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the [LAST_ERROR_POSITION Function](#) immediately after calling one of the [PARSE Procedures](#).

164.5 DBMS_SQL Execution Flow

These functions comprise the `DBMS_SQL` execution flow.

1. [OPEN_CURSOR](#)
2. [PARSE](#)
3. [BIND_VARIABLE](#), [BIND_VARIABLE_PKG](#) or [BIND_ARRAY](#)
4. [DEFINE_COLUMN](#), [DEFINE_COLUMN_LONG](#) or [DEFINE_ARRAY](#)
5. [EXECUTE](#)

6. [FETCH_ROWS](#) or [EXECUTE_AND_FETCH](#)
7. [VARIABLE_VALUE](#), [VARIABLE_PKG](#), [COLUMN_VALUE](#) or [COLUMN_VALUE_LONG](#)
8. [CLOSE_CURSOR](#)

164.5.1 OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the `OPEN_CURSOR` Functions, you receive a cursor `ID` number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

Related Topics

- [OPEN_CURSOR Functions](#)
This function opens a new cursor.

164.5.2 PARSE

Every SQL statement must be parsed by calling the `PARSE` procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of `DBMS_SQL` is shown in [Figure 164-1](#).

Figure 164-1 DBMS_SQL Execution Flow

illustration: arpls008
 release: 9
 caption: DBMS_SQL Execution Flow
 date: 7/31/01
 platform: pc
 ref: ADG8013

Related Topics

- [PARSE Procedures](#)
 This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

164.5.3 BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the [BIND_ARRAY Procedures](#), or [BIND_VARIABLE Procedures](#), or the [BIND_VARIABLE_PKG Procedure](#) to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The `BIND_ARRAY` procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each `EXECUTE`. This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

164.5.4 DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The `DEFINE_COLUMN`, `DEFINE_COLUMN_LONG`, and `DEFINE_ARRAY` procedures specify the variables that receive `SELECT` values on a query.

The columns of the row being selected in a `SELECT` statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures ([DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), or [DEFINE_ARRAY Procedure](#)) to specify the variables that are to receive the `SELECT` values, much the way an `INTO` clause does for a static query.

Use the `DEFINE_COLUMN_LONG` procedure to define `LONG` columns, in the same way that `DEFINE_COLUMN` is used to define non-`LONG` columns. You must call `DEFINE_COLUMN_LONG` before using the [COLUMN_VALUE_LONG Procedure](#) to fetch from the `LONG` column.

Use the `DEFINE_ARRAY` procedure to define a PL/SQL collection into which you want to fetch rows in a single `SELECT` statement. `DEFINE_ARRAY` provides an interface to fetch multiple rows at one fetch. You must call `DEFINE_ARRAY` before using the `COLUMN_VALUE` procedure to fetch the rows.

164.5.5 EXECUTE

Call the `EXECUTE` Function to run your SQL statement.

Related Topics

- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.

164.5.6 FETCH_ROWS or EXECUTE_AND_FETCH

The `FETCH_ROWS` Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling `EXECUTE` Function and then `FETCH_ROWS`, you may find it more efficient to call `EXECUTE_AND_FETCH` Function if you are calling `EXECUTE` for a single execution.

Related Topics

- [FETCH_ROWS Function](#)
This function fetches a row from a given cursor.
- [EXECUTE Function](#)
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.
- [EXECUTE_AND_FETCH Function](#)
This function executes the given cursor and fetches rows.

164.5.7 VARIABLE_VALUE, VARIABLE_VALUE_PKG, COLUMN_VALUE, or COLUMN_VALUE_LONG

The type of call determines which procedure or function to use.

For queries, call the [COLUMN_VALUE Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#).

For anonymous blocks containing calls to `PL/SQL` procedures or DML statements with `returning` clause, call the [VARIABLE_VALUE Procedures](#) or the [VARIABLE_VALUE_PKG Procedure](#) to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a `LONG` database column (which can be up to two gigabytes in size), use the [DEFINE_COLUMN_LONG Procedure](#). You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

164.5.8 CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the `CLOSE_CURSOR` Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

Related Topics

- [CLOSE_CURSOR Procedure](#)
This procedure closes a given cursor.

164.6 DBMS_SQL Exceptions

This exception is raised by the `COLUMN_VALUE` Procedure or the `VARIABLE_VALUE` Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

```
inconsistent_type EXCEPTION;  
pragma exception_init(inconsistent_type, -6562);
```

Related Topics

- [COLUMN_VALUE Procedure](#)
This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.
- [VARIABLE_VALUE Procedures](#)
This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

164.7 DBMS_SQL Examples

These example procedures use the `DBMS_SQL` package.

Example : Using DBMS_SQL Demo

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS  
    cursor_name INTEGER;  
    rows_processed INTEGER;  
BEGIN  
    cursor_name := dbms_sql.open_cursor;  
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',  
                   DBMS_SQL.NATIVE);  
    DBMS_SQL.BIND_VARIABLE(cursor_name, 'x', salary);  
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);  
    DBMS_SQL.CLOSE_CURSOR(cursor_name);  
EXCEPTION  
WHEN OTHERS THEN  
    DBMS_SQL.CLOSE_CURSOR(cursor_name);  
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS  
    cursor_name INTEGER;  
    ret INTEGER;  
BEGIN
```

```
cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
ret := DBMS_SQL.EXECUTE(cursor_name);
DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id          of type NUMBER
name        of type VARCHAR2(30)
birthdate  of type DATE
```

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN

    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor,
        'SELECT id, name, birthdate FROM ' || source,
        DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

    -- Prepare a cursor to insert into the destination table:
```

```

destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
               'INSERT INTO ' || destination ||
               ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
               DBMS_SQL.NATIVE);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
  IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
    -- get column values of the row
    DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
    DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

    -- Bind the row into the cursor that inserts into the destination table. You
    -- could alter this example to require the use of dynamic SQL by inserting an
    -- if condition before the bind.
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
    DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                           birthdate_var);

    ignore := DBMS_SQL.EXECUTE(destination_cursor);
  ELSE
    -- No more rows to copy:
    EXIT;
  END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
  WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(source_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(source_cursor);
    END IF;
    IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
      DBMS_SQL.CLOSE_CURSOR(destination_cursor);
    END IF;
    RAISE;
END;
/

```

Example 4: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use DBMS_SQL.BIND_VARIABLE to bind these outbinds. To get the values in these bind variables, call DBMS_SQL.VARIABLE_VALUE

Note:

This process is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an outbind inside DBMS_SQL.

i) Single-row insert

```

CREATE OR REPLACE PROCEDURE single_Row_insert
  (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

ii) Single-row update

```

CREATE OR REPLACE PROCEDURE single_Row_update
  (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
  c NUMBER;
  n NUMBER;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
      'WHERE rownum < 2 ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

iii) Single-row delete

```

CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) IS
  c NUMBER;
  n number;
  BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
      'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
  END;
/

```

iv) Multiple-row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
(c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
 r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

v) Multiple-row update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
(c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

Note:

bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.

vi) Multiple-row delete

```

CREATE OR REPLACE PROCEDURE multi_row_delete
(c1 DBMS_SQL.NUMBER_TABLE,
 r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
n := DBMS_SQL.EXECUTE(c);
DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable

```

```

        DBMS_SQL.CLOSE_CURSOR(c);
    END;
/

```

vii) outbind in bulk PL/SQL

```

CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
    (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
    DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
    r := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/

```

Note:

DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 5: Binds and Defines of User-defined Types in DBMS_SQL

```

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia',
dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
    some_dnames dnames_var;
    c          NUMBER;
    r          NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
        INTO :b3';

BEGIN

    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

```

```

DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

r := DBMS_SQL.EXECUTE(c);

-- Get value of outbind variable
DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- select dept_names
sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

r := DBMS_SQL.EXECUTE_AND_FETCH(c);

DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- loop through some_dnames collections
FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
    DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
END LOOP;
END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;
/

```

164.8 DBMS_SQL Data Structures

The `DBMS_SQL` package defines `RECORD` type and `TABLE` type data structures.

RECORD Types

- [DBMS_SQL DESC_REC Record Type](#) (deprecated)
- [DBMS_SQL DESC_REC2 Record Type](#)
- [DBMS_SQL DESC_REC3 Record Type](#)
- [DBMS_SQL DESC_REC4 Record Type](#)

TABLE Types for DESCRIBE_COLUMNS Procedures

- [DBMS_SQL DESC_TAB Table Type](#)

- [DBMS_SQL DESC_TAB2 Table Type](#)
- [DBMS_SQL DESC_TAB3 Table Type](#)
- [DBMS_SQL DESC_TAB4 Table Type](#)

TABLE Types For Scalar and LOB Collections

DBMS_SQL bulk operations are only supported with these predefined DBMS_SQL TABLE types.

- [BFILE_TABLE Table Type](#)
- [BINARY_DOUBLE_TABLE Table Type](#)
- [BINARY_FLOAT_TABLE Table Type](#)
- [BLOB_TABLE Table Type](#)
- [CLOB_TABLE Table Type](#)
- [DATE_TABLE Table Type](#)
- [INTERVAL_DAY_TO_SECOND_TABLE Table Type](#)
- [INTERVAL_YEAR_TO_MONTH_TABLE Table Type](#)
- [NUMBER_TABLE Table Type](#)
- [TIME_TABLE Table Type](#)
- [TIME_WITH_TIME_ZONE_TABLE Table Type](#)
- [TIMESTAMP_TABLE Table Type](#)
- [TIMESTAMP_WITH_LTZ_TABLE Table Type](#)
- [TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type](#)
- [UROWID_TABLE Table Type](#)
- [VARCHAR2_TABLE Table Type](#)
- [VARCHAR2A Table Type](#)
- [VARCHAR2S Table Type](#)

164.8.1 DBMS_SQL DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

Note:

This type has been deprecated in favor of the [DESC_REC2 Record Type](#).

It is the element type of the [DESC_TAB](#) table type and the [DESCRIBE_COLUMNS Procedure](#).

Syntax

```
TYPE desc_rec IS RECORD (  
    col_type          BINARY_INTEGER := 0,  
    col_max_len      BINARY_INTEGER := 0,
```

```

col_name          VARCHAR2(32)  := '',
col_name_len      BINARY_INTEGER := 0,
col_schema_name   VARCHAR2(32)  := '',
col_schema_name_len BINARY_INTEGER := 0,
col_precision     BINARY_INTEGER := 0,
col_scale         BINARY_INTEGER := 0,
col_charsetid     BINARY_INTEGER := 0,
col_charsetform   BINARY_INTEGER := 0,
col_null_ok       BOOLEAN       := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;

```

Fields

Table 164-2 DESC_REC Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

164.8.2 DBMS_SQL DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```

TYPE desc_rec2 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32)   := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean        := TRUE);

```

Fields

Table 164-3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

Related Topics

- [DESCRIBE_COLUMNS2 Procedure](#)
This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

164.8.3 DBMS_SQL DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```
TYPE desc_rec3 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32) := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean := TRUE,
  col_type_name     varchar2(32767) := '',
  col_type_name_len binary_integer := 0);
```

Fields

Table 164-4 DESC_REC3 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set ID
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible
col_type_name	User-define type column type name, this field is valid when col_type is 109
col_type_name_len	Length of user-define type column type name, this field is valid when col_type is 109

Related Topics

- [DESCRIBE_COLUMNS3 Procedure](#)
This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

164.8.4 DBMS_SQL DESC_REC4 Record Type

DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC4 is identical to DESC_REC3 except that it supports longer identifiers in the fields that hold the schema name (col_schema_name) and type name (col_type_name) of a column in a dynamic query.

Syntax

```
TYPE desc_rec4 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   DBMS_ID := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean := TRUE,
```

```
col_type_name      DBMS_ID      := '',
col_type_name_len  binary_integer := 0);
```

See Also:

Oracle Database PL/SQL Language Reference for more information about the predefined subtype `DBMS_ID`.

Fields

Table 164-5 DESC_REC4 Fields

Field	Description
<code>col_type</code>	Type of column
<code>col_max_len</code>	Maximum column length
<code>col_name</code>	Name of column
<code>col_name_len</code>	Length of column name
<code>col_schema_name</code>	Column schema name
<code>col_schema_name_len</code>	Length of column schema name
<code>col_precision</code>	Precision of column
<code>col_scale</code>	Scale of column
<code>col_charsetid</code>	Column character set ID
<code>col_charsetform</code>	Column character set form
<code>col_null_ok</code>	NULL column flag; TRUE, if NULL possible
<code>col_type_name</code>	User-define type column type name, this field is valid when <code>col_type</code> is 109
<code>col_type_name_len</code>	Length of user-define type column type name, this field is valid when <code>col_type</code> is 109

- [DESCRIBE_COLUMNS3 Procedure](#)
This procedure describes the specified column. This is an alternative to `DESCRIBE_COLUMNS` Procedure.

164.8.5 DBMS_SQL BFILE_TABLE Table Type

This is a table of `BFILE`.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

164.8.6 DBMS_SQL BINARY_DOUBLE_TABLE Table Type

This is a table of BINARY_DOUBLE.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

164.8.7 DBMS_SQL BINARY_FLOAT_TABLE Table Type

This is a table of BINARY_FLOAT.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

164.8.8 DBMS_SQL BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

164.8.9 DBMS_SQL CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

164.8.10 DBMS_SQL DATE_TABLE Table Type

This is a table of DATE.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

164.8.11 DBMS_SQL DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC Record Type](#)
This record type holds the describe information for a single column in a dynamic query.

164.8.12 DBMS_SQL DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC2 Record Type](#)
DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

164.8.13 DBMS_SQL DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC3 Record Type](#)
DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

164.8.14 DBMS_SQL DESC_TAB4 Table Type

This is a table of DBMS_SQL DESC_REC4 Record Type.

Syntax

```
TYPE DESC_TAB4 IS TABLE OF DESC_REC4 INDEX BY BINARY_INTEGER;
```

Related Topics

- [DBMS_SQL DESC_REC4 Record Type](#)
DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

164.8.15 DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of DSINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF  
DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

164.8.16 DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of `YMINTERVAL_UNCONSTRAINED`.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;
```

164.8.17 DBMS_SQL NUMBER_TABLE Table Type

This is a table of `NUMBER`.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

164.8.18 DBMS_SQL TIME_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

164.8.19 DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;;
```

164.8.20 DBMS_SQL TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

164.8.21 DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF  
TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

164.8.22 DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

164.8.23 DBMS_SQL UROWID_TABLE Table Type

This is a table of `UROWID`.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

164.8.24 DBMS_SQL VARCHAR2_TABLE Table Type

This is table of `VARCHAR2(2000)`.

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

164.8.25 DBMS_SQL VARCHAR2A Table Type

This is table of `VARCHAR2(32767)`.

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

164.8.26 DBMS_SQL VARCHAR2S Table Type

This is table of `VARCHAR2(256)`.

Note:

This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

164.9 Summary of DBMS_SQL Subprograms

This table lists the DBMS_SQL subprograms and briefly describes them.

Table 164-6 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures	Binds a given value to a given collection.
BIND_VARIABLE Procedures	Binds a given value to a given variable.
BIND_VARIABLE_PKG Procedure	Binds a given value to a given package variable.
CLOSE_CURSOR Procedure	Closes given cursor and frees memory.
COLUMN_VALUE Procedure	Returns value of the cursor element for a given position in a cursor.
COLUMN_VALUE_LONG Procedure	Returns a selected part of a LONG column, that has been defined using DEFINE_COLUMN_LONG .
DEFINE_ARRAY Procedure	Defines a collection to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN Procedures	Defines a column to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_CHAR Procedure	Defines a column of type CHAR to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_LONG Procedure	Defines a LONG column to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_RAW Procedure	Defines a column of type RAW to be selected from the given cursor, used only with SELECT statements.
DEFINE_COLUMN_ROWID Procedure	Defines a column of type ROWID to be selected from the given cursor, used only with SELECT statements.
DESCRIBE_COLUMNS Procedure	Describes the columns for a cursor opened and parsed through DBMS_SQL.
DESCRIBE_COLUMNS2 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure .
DESCRIBE_COLUMNS3 Procedure	Describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure .
EXECUTE Function	Executes a given cursor.
EXECUTE_AND_FETCH Function	Executes a given cursor and fetch rows.
FETCH_ROWS Function	Fetches a row from a given cursor.
GET_NEXT_RESULT Procedures	Gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.
IS_OPEN Function	Returns TRUE if given cursor is open.
LAST_ERROR_POSITION Function	Returns byte offset in the SQL statement text where the error occurred.
LAST_ROW_COUNT Function	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function	Returns ROWID of last row processed.

Table 164-6 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
LAST_SQL_FUNCTION_CODE Function	Returns SQL function code for statement.
OPEN_CURSOR Functions	Returns cursor ID number of new cursor.
PARSE Procedures	Parses given statement.
RETURN_RESULT Procedures	Returns the result of an executed statement to the client application.
TO_CURSOR_NUMBER Function	Takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.
TO_REFCURSOR Function	Takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.
VARIABLE_VALUE Procedures	Returns value of named variable for given cursor.
VARIABLE_VALUE_PKG Procedure	Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification.

164.9.1 BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
  c           IN INTEGER,
  name        IN VARCHAR2,
  <table_variable> IN <datatype>
  [,index1    IN INTEGER,
  index2      IN INTEGER] );
```

Where the <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>      Blob_Table
<bfile_tab>     Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
<tm_tab>       Time_Table
<ttz_tab>      Time_With_Time_Zone_Table
<tms_tab>      Timestamp_Table
<tstz_tab>     Timestamp_With_ltz_Table
<tstz_tab>     Timestamp_With_Time_Zone_Table
```

```
<ids_tab>      Interval_Day_To_Second_Table
<iym_tab>      Interval_Year_To_Month_Table
```

Notice that the `BIND_ARRAY` procedure is overloaded to accept different datatype.

Parameters

Table 164-7 BIND_ARRAY Procedure Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind a value.
<code>name</code>	Name of the collection in the statement.
<code>table_variable</code>	Local variable that has been declared as <code><datatype></code> .
<code>index1</code>	Index for the table element that marks the lower bound of the range.
<code>index2</code>	Index for the table element that marks the upper bound of the range.

Usage Notes

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local `DBMS_SQL` buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```

TYPE binary_double_table
           IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
           IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
           IS TABLE OF dsinterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
           IS TABLE OF yminterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
           IS TABLE OF time_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_table
           IS TABLE OF timestamp_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
           IS TABLE OF timestamp_ltz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
           IS TABLE OF timestamp_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

Example 164-1 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```

DECLARE
  stmt VARCHAR2(200);
  empno_array DBMS_SQL.NUMBER_TABLE;
  empname_array DBMS_SQL.VARCHAR2_TABLE;
  jobs_array DBMS_SQL.VARCHAR2_TABLE;
  mgr_array DBMS_SQL.NUMBER_TABLE;
  hiredate_array DBMS_SQL.VARCHAR2_TABLE;
  sal_array DBMS_SQL.NUMBER_TABLE;
  comm_array DBMS_SQL.NUMBER_TABLE;
  deptno_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
BEGIN
  empno_array(1) := 9001;
  empno_array(2) := 9002;
  empno_array(3) := 9003;

```

```
empno_array(4) := 9004;
empno_array(5) := 9005;
empno_array(6) := 9006;
empno_array(7) := 9007;

empname_array(1) := 'Dopey';
empname_array(2) := 'Grumpy';
empname_array(3) := 'Doc';
empname_array(4) := 'Happy';
empname_array(5) := 'Bashful';
empname_array(6) := 'Sneezy';
empname_array(7) := 'Sleepy';

jobs_array(1) := 'Miner';
jobs_array(2) := 'Miner';
jobs_array(3) := 'Miner';
jobs_array(4) := 'Miner';
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
deptno_array(6) := 11;
deptno_array(7) := 11;
```

```

stmt := 'INSERT INTO emp VALUES(
      :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
      :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/
SHOW ERRORS;

```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```

DECLARE
  stmt VARCHAR2(200);
  empno_array DBMS_SQL.NUMBER_TABLE;
  salary_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
BEGIN

  empno_array(1) := 7369;
  empno_array(2) := 7876;
  empno_array(3) := 7900;
  empno_array(4) := 7934;

  salary_array(1) := 10000;
  salary_array(2) := 10000;
  salary_array(3) := 10000;
  salary_array(4) := 10000;

  stmt := 'update emp set sal = :salary_array
    WHERE empno = :num_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
  DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;

```

```
END;
/
```

In a `DELETE` statement, for example, you could bind an array in the `WHERE` clause and have the statement be run for each element in the array:

```
DECLARE
  stmt VARCHAR2(200);
  dept_no_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
begin
  dept_no_array(1) := 10; dept_no_array(2) := 20;
  dept_no_array(3) := 30; dept_no_array(4) := 40;
  dept_no_array(5) := 30; dept_no_array(6) := 40;
  stmt := 'delete from emp where deptno = :dept_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In the preceding example, only elements 1 through 4 are used as specified by the `BIND_ARRAY` call. Each element of the array potentially deletes a large number of employees from the database.

164.9.2 BIND_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_VARIABLE (
  c           IN INTEGER,
  name       IN VARCHAR2,
  value      IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

```
ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
```

```
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED
```

Notice that `BIND_VARIABLE` is overloaded to accept different datatype.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets `[]` indicate an optional parameter for the `BIND_VARIABLE` procedure.

```
DBMS_SQL.BIND_VARIABLE (
    c          IN INTEGER,
    name       IN VARCHAR2,
    value      IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
    c          IN INTEGER,
    name       IN VARCHAR2,
    value      IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (
    c          IN INTEGER,
    name       IN VARCHAR2,
    value      IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (
    c          IN INTEGER,
    name       IN VARCHAR2,
    value      IN ROWID);
```

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 164-8 BIND_VARIABLE Procedures Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind a value.
<code>name</code>	Name of the variable in the statement. The length of the bind variable name must be <=30 bytes.
<code>value</code>	Value that you want to bind to the variable in the cursor. For <code>IN</code> and <code>IN/OUT</code> variables, the value has the same type as the type of the value being passed in for this parameter.

Table 164-8 (Cont.) BIND_VARIABLE Procedures Parameters

Parameter	Description
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

164.9.3 BIND_VARIABLE_PKG Procedure

This procedure binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.BIND_VARIABLE_PKG (
    c          IN INTEGER,
    name       IN VARCHAR2,
    value      IN <datatype>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Table 164-9 BIND_VARIABLE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable in the statement for which you are retrieving the value.
value	<ul style="list-style-type: none"> Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. Array option: Local variable that has been declared <code><table_type></code>

Example 164-2 Dynamic SQL using DBMS_SQL.BIND_VARIABLE_PKG to Bind a Package Variable

The variables types are declared in the package specification. The `BIND_VARIABLE_PKG` is used to bind the variable `v1` in the cursor SQL statement.

```

CREATE OR REPLACE PACKAGE ty_pkg AS
    TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
    TYPE trec IS TABLE OF REC INDEX BY BINARY_INTEGER;
    TYPE trect IS TABLE OF NUMBER;
    TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
    dummy NUMBER;
    cur NUMBER;
    v1 ty_pkg.trec;
    str VARCHAR2(3000);
    n1 NUMBER;
    n2 NUMBER;
BEGIN
    FOR i in 1..3 LOOP
        v1(i).n1 := i*10;
        v1(i).n2 := i*20;
    END LOOP;
    str := 'SELECT * FROM TABLE(:v1)';
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
    DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);

    LOOP
        IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
            -- get column values of the row

```

```

        DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
        DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
        DBMS_OUTPUT.PUT_LINE('n1 = '||n1||' n2 = '||n2);
    ELSE
        -- No more rows
        EXIT;
    END IF;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60

```

164.9.4 CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```

DBMS_SQL.CLOSE_CURSOR (
    c      IN OUT INTEGER);

```

Pragmas

```

pragma restrict_references(close_cursor,RNDS,WNDS);

```

Parameters

Table 164-10 CLOSE_CURSOR Procedure Parameters

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

164.9.5 COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling FETCH_ROWS.

Syntax

```

DBMS_SQL.COLUMN_VALUE (
    c                IN  INTEGER,
    position         IN  INTEGER,
    value            OUT <datatype>
    [,column_error   OUT NUMBER]
    [,actual_length  OUT INTEGER]);

```

Where square brackets [] indicate optional parameters and <datatype> can be any one of the following types:

```

BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types

```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```

DBMS_SQL.COLUMN_VALUE_CHAR (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT CHAR CHARACTER SET ANY_CS
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER]);

```

```

DBMS_SQL.COLUMN_VALUE_RAW (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT RAW
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER]);

```

```

DBMS_SQL.COLUMN_VALUE_ROWID (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT ROWID
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER]);

```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```

DBMS_SQL.COLUMN_VALUE (
    c           IN           INTEGER,
    position    IN           INTEGER,
    <param_name> IN OUT NOCOPY <table_type>);

```

Where the <param_name> and its corresponding <table_type> can be any one of these matching pairs:

```

bdbl_tab      Binary_Double_Table
bflt_tab      Binary_Float_Table

```

```

bf_tab      Bfile_Table
bl_tab      Blob_Table
cl_tab      Clob_Table
d_tab       Date_Table
ids_tab     Interval_Day_To_Second_Table
iym_tab     Interval_Year_To_Month_Table
n_tab       Number_Table
tm_tab      Time_Table
ttz_tab     Time_With_Time_Zone_Table
tms_tab     Timestamp_Table
tstz_tab    Timestamp_With_ltz_Table
tstz_tab    Timestamp_With_Time_Zone_Table
ur_tab      Urowid_Table
c_tab       Varchar2_Table

```

Pragmas

```
pragma restrict_references (column_value, RNDS, WNDS);
```

Parameters

Table 164-11 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception <code>ORA-06562, inconsistent_type</code> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code> .
column_error	Returns any error code for the specified column value.
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 164-12 COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
<param_name>	Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the <code>cnt</code> parameter) of 10 rows was specified and a start index (<code>lower_bound</code>) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

`INCONSISTENT_TYPE` (ORA-06562) is raised if the type of the given `OUT` parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

164.9.6 COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
  c           IN  INTEGER,
  position    IN  INTEGER,
  length      IN  INTEGER,
  offset      IN  INTEGER,
  value       OUT VARCHAR2,
  value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references (column_value_long, RNDS, WNDS);
```

Parameters

Table 164-13 COLUMN_VALUE_LONG Procedure Parameters

Parameter	Description
<code>c</code>	Cursor ID number of the cursor from which to get the value.
<code>position</code>	Position of the column of which to get the value.
<code>length</code>	Number of bytes of the long value to fetch.
<code>offset</code>	Offset into the long field for start of fetch.
<code>value</code>	Value of the column as a <code>VARCHAR2</code> .
<code>value_length</code>	Number of bytes actually returned in value.

164.9.7 DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a `FETCH_ROWS` call). This procedure lets you do batch fetching of rows from a single `SELECT` statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using `DBMS_SQL`. (These are the same types as you can specify for the `BIND_ARRAY` procedure.)

```

TYPE binary_double_table
           IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
           IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
           IS TABLE OF dsinterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
           IS TABLE OF yminterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
           IS TABLE OF time_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_table
           IS TABLE OF timestamp_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
           IS TABLE OF timestamp_ltz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
           IS TABLE OF timestamp_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

Syntax

```

DBMS_SQL.DEFINE_ARRAY (
    c           IN INTEGER,
    position    IN INTEGER,
    <table_variable> IN <datatype>
    cnt         IN INTEGER,
    lower_bnd   IN INTEGER);

```

Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs, DEFINE_ARRAY being overloaded to accept different datatypes:

```

<clob_tab>      Clob_Table
<bflt_tab>     Binary_Float_Table
<bdbl_tab>     Binary_Double_Table
<blob_tab>    Blob_Table
<bfile_tab>    Bfile_Table
<date_tab>    Date_Table
<num_tab>     Number_Table
<urowid_tab>  Urowid_Table
<vchr2_tab>   Varchar2_Table
<tm_tab>      Time_Table
<ttz_tab>     Time_With_Time_Zone_Table
<tms_tab>     Timestamp_Table
<tstz_tab>    Timestamp_With_ltz_Table
<tstz_tab>    Timestamp_With_Time_Zone_Table
<ids_tab>     Interval_Day_To_Second_Table
<iym_tab>     Interval_Year_To_Month_Table

```

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent `FETCH_ROWS` call fetch "count" rows. When the `COLUMN_VALUE` call is made, these rows are placed in positions `lower_bnd`, `lower_bnd+1`, `lower_bnd+2`, and so on. While there are still rows coming, the user keeps issuing `FETCH_ROWS/COLUMN_VALUE` calls. The rows keep accumulating in the table specified as an argument in the `COLUMN_VALUE` call.

Parameters

Table 164-14 DEFINE_ARRAY Procedure Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind an array.
<code>position</code>	Relative position of the column in the array being defined. The first column in a statement has position 1.
<code>table_variable</code>	Local variable that has been declared as <code><datatype></code> .
<code>cnt</code>	Number of rows that must be fetched.
<code>lower_bnd</code>	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (`cnt`) must be an integer greater than zero; otherwise an exception is raised. The `lower_bnd` can be positive, negative, or zero. A query on which a `DEFINE_ARRAY` call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
  TYPE namelist IS TABLE OF employees.last_name%TYPE;
  TYPE sallist IS TABLE OF employees.salary%TYPE;
  names    namelist;
  sals     sallist;
  c        NUMBER;
  r        NUMBER;
  sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

  DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

  DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
  DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

  r := DBMS_SQL.EXECUTE(c);

LOOP
  r := DBMS_SQL.FETCH_ROWS(c);
  DBMS_SQL.COLUMN_VALUE(c, 1, names);
```

```

        DBMS_SQL.COLUMN_VALUE(c, 2, sals);
        EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/

```

Example 164-3 Example: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```

declare
    c          NUMBER;
    d          NUMBER;
    n_tab     DBMS_SQL.NUMBER_TABLE;
    indx      NUMBER := -10;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

    d := DBMS_SQL.EXECUTE(c);
    loop
        d := DBMS_SQL.FETCH_ROWS(c);

        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

        EXIT WHEN d != 10;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

Each time the preceding example calls [FETCH_ROWS Function](#), it fetches 10 rows that are kept in `DBMS_SQL` buffers. When the [COLUMN_VALUE Procedure](#) is called, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` time and is updated every time `COLUMN_VALUE` is called. If you reexecute at any point, then the current index for each `DEFINE` is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table `MULTI_TAB` defined as:

```
CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
DECLARE
  c          NUMBER;
  d          NUMBER;
  n_tab     DBMS_SQL.NUMBER_TABLE;
  d_tab1    DBMS_SQL.DATE_TABLE;
  v_tab     DBMS_SQL.VARCHAR2_TABLE;
  d_tab2    DBMS_SQL.DATE_TABLE;
  indx      NUMBER := 10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  LOOP
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

    EXIT WHEN d != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  /*

  The four tables can be used for anything. One usage might be to use BIND_ARRAY to
  move the rows to another table by using a statement such as 'INSERT into SOME_T
  values (:a, :b, :c, :d);

  */

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
  END;
  /
```

164.9.8 DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN (  
    c           IN INTEGER,  
    position   IN INTEGER,  
    column     IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE  
BINARY_FLOAT  
BFILE  
BLOB  
CLOB CHARACTER SET ANY_CS  
DATE  
DSINTERVAL_UNCONSTRAINED  
NUMBER  
TIME_UNCONSTRAINED  
TIME_TZ_UNCONSTRAINED  
TIMESTAMP_LTZ_UNCONSTRAINED  
TIMESTAMP_TZ_UNCONSTRAINED  
TIMESTAMP_UNCONSTRAINED  
UROWID  
YMINTERVAL_UNCONSTRAINED  
user-defined object types  
collections (VARRAYs and nested tables)  
REFs  
Opaque types
```

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (  
    c           IN INTEGER,  
    position   IN INTEGER,  
    column     IN VARCHAR2 CHARACTER SET ANY_CS,  
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 164-15 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of type VARCHAR2.

Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type VARCHAR2 is calculated as: `column_size * maximum character byte size for the current character set`. For example, specifying the `column_size` as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

164.9.9 DEFINE_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_LONG Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN CHAR CHARACTER SET ANY_CS,
    column_size IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 164-16 DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected

Table 164-16 (Cont.) DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in characters for columns of type CHAR.

164.9.10 DEFINE_COLUMN_LONG Procedure

This procedure defines a `LONG` column for a `SELECT` cursor. The column being defined is identified by its relative position in the `SELECT` list of the statement for the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_RAW Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (
    c           IN INTEGER,
    position    IN INTEGER);
```

Parameters

Table 164-17 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

164.9.11 DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type `RAW` to be selected from the given cursor.

This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_ROWID Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
    c           IN INTEGER,
    position    IN INTEGER,
```

```
column          IN RAW,
column_size     IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 164-18 DEFINE_COLUMN_RAW Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of RAW type.

164.9.12 DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type `ROWID` to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE_COLUMN Procedures](#), [DEFINE_COLUMN_CHAR Procedure](#), [DEFINE_COLUMN_LONG Procedure](#) and [DEFINE_COLUMN_RAW Procedure](#).

Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
    c          IN INTEGER,
    position   IN INTEGER,
    column     IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 164-19 DEFINE_COLUMN_ROWID Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.

164.9.13 DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
  c           IN  INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB);
```

Parameters

Table 164-20 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

Example 164-4 Describe Columns

This code can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT * query on the table that you want to describe.

```
DECLARE
  c          NUMBER;
  d          NUMBER;
  col_cnt    INTEGER;
  f          BOOLEAN;
  rec_tab    DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type           = ' || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen        = ' || rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name         = ' || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len     = ' || rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name  = ' || rec.col_schema_name);
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len = ' ||
rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision    = ' || rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale        = ' || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok          = ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
    ELSE
      DBMS_OUTPUT.PUT_LINE('false');
    END IF;
  END;
BEGIN
```

```

c := DBMS_SQL.OPEN_CURSOR;

DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

d := DBMS_SQL.EXECUTE(c);

DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
* Following loop could simply be for j in 1..col_cnt loop.
* Here we are simply illustrating some of the PL/SQL table
* features.
*/
col_num := rec_tab.first;
IF (col_num IS NOT NULL) THEN
  LOOP
    print_rec(rec_tab(col_num));
    col_num := rec_tab.next(col_num);
    EXIT WHEN (col_num IS NULL);
  END LOOP;
END IF;

DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

164.9.14 DESCRIBE_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```

DBMS_SQL.DESCRIBE_COLUMNS2 (
  c           IN  INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT DESC_TAB2);

```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 164-21 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Related Topics

- [DESCRIBE_COLUMNS Procedure](#)

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

164.9.15 DESCRIBE_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
    c           IN  INTEGER,
    col_cnt    OUT INTEGER,
    desc_t     OUT DESC_TAB3);
```

```
BMS_SQL.DESCRIBE_COLUMNS3 (
    c           IN  INTEGER,
    col_cnt    OUT INTEGER,
    desc_t     OUT DESC_TAB4);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 164-22 DESCRIBE_COLUMNS3 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
    ( projname    VARCHAR2(20),
      mgr         VARCHAR2(20) )
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
    curid      NUMBER;
    desctab    DBMS_SQL.DESC_TAB3;
    colcnt    NUMBER;
    sql_stmt   VARCHAR2(200) := 'select * from projecttab';
```

```

BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 109 THEN
            DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
            DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                desctab(i).col_type_name);
        END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

Related Topics

- [DESCRIBE_COLUMNS Procedure](#)
This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

164.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.

The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and must be ignored.

Syntax

```

DBMS_SQL.EXECUTE (
    c    IN INTEGER)
RETURN INTEGER;

```

Parameters

Table 164-23 EXECUTE Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to execute.

Return Values

Returns number of rows processed

Usage Notes

The `DBMS_SQL` cursor that is returned by the `TO_CURSOR_NUMBER` Function performs in the same way as a `DBMS_SQL` cursor that has already been executed. Consequently, calling `EXECUTE` for this cursor will cause an error.

164.9.17 EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling `EXECUTE` and then calling `FETCH_ROWS`. Calling `EXECUTE_AND_FETCH` instead, however, may reduce the number of network round-trips when used against a remote database.

The `EXECUTE_AND_FETCH` function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
    c           IN INTEGER,
    exact      IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (execute_and_fetch, WNDS);
```

Parameters

Table 164-24 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to execute and fetch.
<code>exact</code>	Set to <code>TRUE</code> to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch <code>TRUE</code> option with <code>LONG</code> columns. Even if an exception is raised, the rows are still fetched and available.

Return Values

Returns designated rows

164.9.18 FETCH_ROWS Function

This function fetches a row from a given cursor.

You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
    c          IN INTEGER)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 164-25 FETCH_ROWS Function Parameters

Parameter	Description
c	ID number.

Return Values

Returns a row from a given cursor

164.9.19 GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the [RETURN_RESULT Procedures](#).

Syntax

```
DBMS_SQL.GET_NEXT_RESULT (
    c          IN          INTEGER,
    rc         OUT        SYS_REFCURSOR);
```

```
DBMS_SQL.GET_NEXT_RESULT (
    c          IN          INTEGER,
    rc         OUT        INTEGER);
```

Parameters

Table 164-26 GET_NEXT_RESULT Procedure Parameters

Parameter	Description
c	Recursive statement cursor
rc	Cursor or ref cursor of the statement of the next returned result

Exceptions

ORA-01403 no_data_found: This is raised when there is no further returned statement result.

Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

Examples

```

DECLARE
  c INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c          => c,
                 statement   => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
    EXCEPTIONS
      WHEN no_data_found THEN
        EXIT;
    END;
    LOOP
      FETCH rc INTO ...
      ...
    END LOOP;
  END LOOP;
END;

```

164.9.20 IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```

DBMS_SQL.IS_OPEN (
  c          IN INTEGER)
  RETURN BOOLEAN;

```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 164-27 IS_OPEN Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to check.

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE_CURSOR Procedure](#) Procedure `NULLS` out the cursor variable passed to it.

Exceptions

ORA-29471 `DBMS_SQL access denied`: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent `DBMS_SQL` call in the same session will raise this error, meaning that `DBMS_SQL` is non-operational for this session.

164.9.21 LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a `PARSE` call, before any other `DBMS_SQL` procedures or functions are called.

164.9.22 LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

164.9.23 LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID  
    RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Return Values

Returns the ROWID of the last row processed

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.

164.9.24 LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement.

These codes are listed in the *Oracle Call Interface Programmer's Guide*.

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values

Returns the SQL function code for the statement

Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

164.9.25 OPEN_CURSOR Functions

This function opens a new cursor.

The `security_level` parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax

```
DBMS_SQL.OPEN_CURSOR (  
    treat_as_client_for_results    IN    BOOLEAN    DEFAULT FALSE)  
    RETURN INTEGER;
```

```
DBMS_SQL.OPEN_CURSOR (
    security_level          IN    INTEGER,
    treat_as_client_for_results IN    BOOLEAN    DEFAULT FALSE)
RETURN INTEGER;
```

Parameters

Table 164-28 OPEN_CURSOR Function Parameters

Parameter	Description
security_level	<p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the security_level parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"> Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. Level 1 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. Level 2 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.
treat_as_client_for_results	<p>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.</p>

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the [CLOSE_CURSOR Procedure](#).
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

164.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the `PARSE` procedure:

- Taking a `VARCHAR2` statement as an argument
- Taking a segmented string, one taking `VARCHAR2A`, a `TABLE OF VARCHAR2(32767)`, and another, taking `VARCHAR2S`, a `TABLE OF VARCHAR2(256)`, as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single `VARCHAR2` variable by splitting up the statement.
- Taking a `CLOB` statement as an argument. You can use the `CLOB` overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

Each version has multiple overloads.

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2,
    language_flag   IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    CLOB,
    language_flag   IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2A,
    lb              IN    INTEGER,
    ub              IN    INTEGER,
    lfflg          IN    BOOLEAN,
    language_flag   IN    INTEGER[
[,edition          IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN DEFAULT TRUE]
[,schema          IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2]);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2s,
    lb              IN    INTEGER,
```

```

ub                IN    INTEGER,
lfflg             IN    BOOLEAN,
language_flag     IN    INTEGER[
[,edition         IN    VARCHAR2 DEFAULT NULL],
  apply_crossedition_trigger IN  VARCHAR2 DEFAULT NULL,
  fire_apply_trigger   IN    BOOLEAN DEFAULT TRUE]
[,schema         IN    VARCHAR2 DEFAULT NULL]
[,container       IN    VARCHAR2)];

```

Parameters

Table 164-29 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	<p>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs.</p> <p>Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example:</p> <pre>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</pre> <pre>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</pre>
lb	Lower bound for elements in the statement
ub	Upper bound for elements in the statement
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see DBMS_SQL Constants
edition	<p>Specifies the edition in which to run the statement under the following conditions:</p> <ul style="list-style-type: none"> • If NULL and container is NULL, the statement will be run in the current edition. • If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition. • Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition. <p>The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.</p>

Table 164-29 (Cont.) PARSE Procedure Parameters

Parameter	Description
<code>apply_crossedition_trigger</code>	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the <code>edition</code> and <code>current_schema</code> setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming <code>fire_apply_trigger</code> is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's <code>dml_event_clause</code> , any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased.
<code>fire_apply_trigger</code>	Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the <code>apply_crossedition_trigger</code> would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The <code>apply_crossedition_trigger</code> and <code>fire_apply_trigger</code> parameters are ignored if the statement is not a DML.
<code>schema</code>	Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema.
<code>container</code>	Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles.

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client

- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload.
- If the container parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

Exceptions

If you create a type, procedure, function, or package using DBMS_SQL that has compilation warnings, an ORA-24344 exception is raised, and the PL/SQL unit is still created.

164.9.27 RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using DBMS_SQL
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```
DBMS_SQL.RETURN_RESULT(
  rc          IN OUT    SYS_REFCURSOR,
  to_client   IN        BOOLEAN          DEFAULT TRUE);
```

```
DBMS_SQL.RETURN_RESULT(
  rc          IN OUT    INTEGER,
  to_client   IN        BOOLEAN          DEFAULT TRUE);
```

Parameters

Table 164-30 RETURN_RESULT Procedure Parameters

Parameter	Description
rc	Statement cursor or ref cursor
to_client	Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller.

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because EXECUTE IMMEDIATE statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the EXECUTE IMMEDIATE statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use DBMS_SQL to execute the recursive statement.

Examples

```
CREATE PROCEDURE proc AS
  rc1 sys_refcursor;
  rc2 sys_refcursor;
BEGIN
  OPEN rc1 FOR SELECT * FROM t1;
  DBMS_SQL.RETURN_RESULT(rc1);
  OPEN rc2 FOR SELECT * FROM t2;
  DBMS_SQL.RETURN_RESULT(rc2);
END;
/
```

164.9.28 TO_CURSOR_NUMBER Function

This function takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER (
  rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

Parameters

Table 164-31 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENED, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```

CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  desctab      DBMS_SQL.DESC_TAB;
  colcnt       NUMBER;
  namevar      VARCHAR2(50);
  numvar       NUMBER;
  datevar      DATE;
  empno        NUMBER := 100;
BEGIN

  -- sql_stmt := 'select ..... from employees where employee_id = :b1';
  OPEN src_cur FOR sql_stmt USING empno;

  -- Switch from native dynamic SQL to DBMS_SQL
  curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

  DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

  -- Define columns
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 2 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
    ELSIF desctab(i).col_type = 12 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
    .....
  ELSE
    DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
  END IF;
  END LOOP;

  -- Fetch Rows
  WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
      IF (desctab(i).col_type = 1) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
      ELSIF (desctab(i).col_type = 2) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
      ELSIF (desctab(i).col_type = 12) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
      ....
    END IF;
  END LOOP;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);

```

```
END;
/
```

164.9.29 TO_REFCURSOR Function

This function takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with SELECT cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
    cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
```

Parameters

Table 164-32 TO_REFCURSOR Function Parameters

Parameter	Description
cursor_number	Cursor number of the cursor to be transformed into REF CURSOR

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number

Usage Notes

- The cursor passed in by the cursor_number has to be OPENED, PARSED, and EXECUTED; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a REF CURSOR.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
    TYPE CurType IS REF CURSOR;
    src_cur          CurType;
    curid            NUMBER;
    sql_stmt         VARCHAR2(200);
    ret              INTEGER;
    empnos           DBMS_SQL.Number_Table;
    depts            DBMS_SQL.Number_Table;
BEGIN

    -- DBMS_SQL.OPEN_CURSOR
    curid := DBMS_SQL.OPEN_CURSOR;

    sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID
```

```

= :b1';

DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
ret := DBMS_SQL.EXECUTE(curid);

-- Switch from DBMS_SQL to native dynamic SQL
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;
-- Close cursor
CLOSE src_cur;
END;
/

```

164.9.30 VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with **returning clause**.

Syntax

```

DBMS_SQL.VARIABLE_VALUE (
  c          IN  INTEGER,
  name      IN  VARCHAR2,
  value     OUT NOCOPY <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID

```

```
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
  c          IN  INTEGER,
  name      IN  VARCHAR2,
  value     OUT CHAR CHARACTER SET ANY_CS);
```

```
DBMS_SQL.VARIABLE_VALUE_RAW (
  c          IN  INTEGER,
  name      IN  VARCHAR2,
  value     OUT RAW);
```

```
DBMS_SQL.VARIABLE_VALUE_ROWID (
  c          IN  INTEGER,
  name      IN  VARCHAR2,
  value     OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
  c          IN  INTEGER,
  name      IN  VARCHAR2,
  value     OUT NOCOPY <table_type>);
```

For bulk operations, <table_type> must be a supported DBMS_SQL predefined TABLE type.

See [DBMS_SQL Data Structures](#)

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 164-33 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>. Array option: Local variable that has been declared <table_type>. For bulk operations, value is an <code>OUT NOCOPY</code> parameter.

164.9.31 VARIABLE_VALUE_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with `returning` clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

```
DBMS_SQL.VARIABLE_VALUE_PKG (
  c          IN   INTEGER,
  name      IN   VARCHAR2,
  value     OUT NOCOPY <table_type>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE

Parameters

Table 164-34 VARIABLE_VALUE_PKG Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>. • Array option: Local variable that has been declared <table_type>.

Example 164-5 Dynamic SQL using DBMS_SQL.VARIABLE_VALUE_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The `VARIABLE_VALUE_PKG` is used to get the value of the bind variable `v2` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
TYPE rec IS RECORD
  ( n1 NUMBER,
```

```

        n2 NUMBER);
TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt AS
    dummy NUMBER;
    cur    NUMBER;
    v1 ty_pkg.trect;
    v2 ty_pkg.trect;
    str VARCHAR2(3000);
BEGIN
    v1 := ty_pkg.trect(1000);
    str := 'declare v1 ty_pkg.trect; begin v1:=v1; v1(1) := 2000; :v2 :=
v1; end;' ;
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
    DBMS_OUTPUT.PUT_LINE('n = '
    || v2(1));
    DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_nt;
/
EXEC dyn_sql_nt;

n = 2000

```

DBMS_SQL_MONITOR

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- [DBMS_SQL_MONITOR Overview](#)
- [DBMS_SQL_MONITOR Security Model](#)
- [DBMS_SQL_MONITOR Constants](#)
- [Summary of DBMS_SQL_MONITOR Subprograms](#)

See Also:

[DBMS_SQLTUNE](#)

165.1 DBMS_SQL_MONITOR Overview

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views.

The following subprograms begin and end monitoring of a composite database operation:

- [BEGIN_OPERATION Function](#)
- [END_OPERATION Procedure](#)

The following subprograms report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`:

- [REPORT_SQL_MONITOR Function](#)
- [REPORT_SQL_MONITOR_XML Function](#)
- [REPORT_SQL_MONITOR_LIST Function](#)
- [REPORT_SQL_MONITOR_LIST_XML Function](#)

165.2 DBMS_SQL_MONITOR Security Model

This package is available to `PUBLIC` and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role `SELECT_CATALOG_ROLE`.

165.3 DBMS_SQL_MONITOR Constants

The `DBMS_SQL_MONITOR` package uses the constants shown in the following table.

Table 165-1 DBMS_SQL_MONITOR Constants

Constant	Type	Value	Description
<code>FORCE_TRACKING</code>	<code>VARCHAR2(30)</code>	<code>'Y'</code>	Force track the composite database operation when the operation starts
<code>NO_FORCE_TRACKING</code>	<code>VARCHAR2(30)</code>	<code>'N'</code>	Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time.

165.4 Summary of DBMS_SQL_MONITOR Subprograms

This table lists and describes the `DBMS_SQL_MONITOR` package subprograms.

Table 165-2 DBMS_SQL_MONITOR Package Subprograms

Subprogram	Description
BEGIN_OPERATION Function	This function starts a database operation in the current session.
END_OPERATION Procedure	This function ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.
REPORT_SQL_MONITOR Function	This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.
REPORT_SQL_MONITOR_XML Function	This function is identical to the <code>REPORT_SQL_MONITOR</code> function, except that the return type is <code>XMLType</code> .
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.
REPORT_SQL_MONITOR_LIST_XML Function	This function is identical to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code> .

165.4.1 BEGIN_OPERATION Function

This function starts a database operation in the current session.

Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (
  dbop_name      IN VARCHAR2,
  dbop_eid      IN NUMBER   := NULL,
  forced_tracking IN VARCHAR2 := NO_FORCE_TRACKING,
  attribute_list IN VARCHAR2 := NULL,
  session_id    IN NUMBER   := NULL,
  session_serial IN NUMBER   := NULL)
iRETURN NUMBER;
```

Parameters

Table 165-3 *BEGIN_OPERATION Procedure Parameters*

Parameter	Description
dbop_name	Name for the composite database operation.
dbop_eid	Unique identifier for the current execution of the composite database operation.
forced_tracking	Whether tracking is forced. Possible values are: <ul style="list-style-type: none"> FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable Y. NO_FORCE_TRACKING - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable N. See " DBMS_SQL_MONITOR Constants ".
attribute_list	List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load').
session_id	Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session.
session_serial	Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session.

Return Values

This function returns the database operation execution ID. If the value is null for dbop_eid, then the database generates a unique value.

165.4.2 END_OPERATION Procedure

This procedure ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.

Syntax

```
DBMS_SQL_MONITOR.END_OPERATION (
    dbop_name      IN VARCHAR2,
    dbop_eid       IN NUMBER);
```

Parameters

Table 165-4 END_OPERATION Procedure Parameters

Parameter	Description
dbop_name	Name of a composite database operation
dbop_eid	Unique identifier for the current execution of the composite database operation

165.4.3 REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its `sql_id`.
- A specific execution of a database operation identified by the combination `sql_id`, `sql_exec_start`, and `sql_exec_id`.
- The last execution of a specific database operation identified by `dbop_name`.
- The specific execution of a database operation identified by the combination `dbop_name`, `dbop_exec_id`.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
    sql_id          IN VARCHAR2 DEFAULT NULL,
    dbop_name       IN VARCHAR2 DEFAULT NULL,
    dbop_exec_id    IN NUMBER   DEFAULT NULL,
    session_id      IN NUMBER   DEFAULT NULL,
    session_serial  IN NUMBER   DEFAULT NULL,
```

```

sql_exec_start      IN DATE      DEFAULT NULL,
sql_exec_id         IN NUMBER    DEFAULT NULL,
inst_id             IN NUMBER    DEFAULT NULL,
start_time_filter   IN DATE      DEFAULT NULL,
end_time_filter     IN DATE      DEFAULT NULL,
instance_id_filter  IN NUMBER    DEFAULT NULL,
parallel_filter     IN VARCHAR2  DEFAULT NULL,
plan_line_filter    IN NUMBER    DEFAULT NULL,
event_detail        IN VARCHAR2  DEFAULT 'YES',
bucket_max_count    IN NUMBER    DEFAULT 128,
bucket_interval     IN NUMBER    DEFAULT NULL,
base_path           IN VARCHAR2  DEFAULT NULL,
last_refresh_time   IN DATE      DEFAULT NULL,
report_level        IN VARCHAR2  DEFAULT 'TYPICAL',
type                IN VARCHAR2  DEFAULT 'TEXT',
sql_plan_hash_value IN NUMBER    DEFAULT NULL,
con_name            IN VARCHAR2  DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 165-5 *REPORT_SQL_MONITOR Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed
session_id	Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
sql_exec_start	Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
sql_exec_id	A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.
inst_id	Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.
start_time_filter	If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.

Table 165-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

Parameter	Description
end_time_filter	If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing.
instance_id_filter	Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel.
parallel_filter	Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be: <ul style="list-style-type: none"> • NULL - target all parallel execution servers as wells as the query coordinator • ['qc'] [servers (<svr_grp>[,] <svr_set>[,] <svr_num>)] where any NULL value is interpreted as ALL
plan_line_filter	Selects activity and execution statistics for the specified line number in the plan of a SQL.
event_detail	When set to NO, the activity is aggregated by wait_class only. Use YES (default) to aggregate by wait_class, event_name.
bucket_max_count	Specifies the maximum number of buckets to create in the report
bucket_interval	Represents the exact time interval, in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
base_path	URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash swf file).
last_refresh_time	If not NULL (default), the time when the report was last retrieved (SYSDATE attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized: <ul style="list-style-type: none"> • SQL text will not be returned when this option is specified • Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket

Table 165-5 (Cont.) REPORT_SQL_MONITOR Procedure Parameters

Parameter	Description
report_level	<p>Level of detail for the report. Of the following, only one can be specified:</p> <ul style="list-style-type: none"> NONE: Minimum possible BASIC: This is equivalent to <code>sql_text-plan-xplan-sessions-instance-activity_histogram-plan_histogram-metrics</code> where the token "-" implies that report section will not be included in the report. TYPICAL: Everything but <code>plan_histogram</code> ALL: Everything <p>In addition, individual report sections can also be enabled or disabled by using a <code>±section_name</code>. Several sections are defined:</p> <ul style="list-style-type: none"> XPLAN: Shows explain plan. ON by default. PLAN: Shows plan monitoring statistics. ON by default. SESSIONS: Show session details. Applies only to parallel queries. ON by default. INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default. PARALLEL: An umbrella parameter for specifying sessions as well as instance details ACTIVITY: Shows activity summary at global level, plan line level and session INSTANCE LEVEL: (If applicable). ON by default. BINDS: Shows bind information when available. ON by default. METRICS: Shows metric data (such as CPU and IOs) over time. ON by default ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default. PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default. OTHER: Other information. ON by default. <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT: No SQL text in report +SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in <code>GV\$SQL_MONITOR</code> SQL_FULLTEXT: No full SQL text, that is, <code>+sql_text</code> +SQL_FULLTEXT: Show full SQL text (default)
type	<p>Report type:</p> <ul style="list-style-type: none"> TEXT: text report (default) HTML: simple HTML report ACTIVE: database active report. Some information (explain plan, <code>activity_histogram</code>, <code>metrics</code> and <code>plan_histogram</code>) is only shown when this type is selected XML: raw data for the report
sql_plan_hash_value	Targets only those with the specified plan hash value. Default is NULL.
con_name	Container name in a multitenant database.

Return Values

SQL monitor report, an XML document.

Usage Notes

The user invoking this function must have privilege to access the following fixed views:

- GV\$SQL_MONITOR
- GV\$SQL_PLAN_MONITOR
- GV\$ACTIVE_SESSION_HISTORY
- GV\$SESSION_LONGOPS
- GV\$SQL if SQL full text is requested and its length is greater than 2 KB

165.4.4 REPORT_SQL_MONITOR_XML Function

This function is identical to the `REPORT_SQL_MONITOR` function, except that the return type is `XMLType`.

Related Topics

- [REPORT_SQL_MONITOR Function](#)
This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

165.4.5 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
  sql_id           IN VARCHAR2 DEFAULT NULL,
  dbop_name       IN VARCHAR2 DEFAULT NULL,
  monitor_type    IN NUMBER   DEFAULT MONITOR_TYPE_ALL,
  session_id      IN NUMBER   DEFAULT NULL,
  session_serial  IN NUMBER   DEFAULT NULL,
  inst_id         IN NUMBER   DEFAULT NULL,
  active_since_date IN DATE     DEFAULT NULL,
  active_since_sec IN NUMBER   DEFAULT NULL,
  last_refresh_time IN DATE     DEFAULT NULL,
  report_level    IN VARCHAR2 DEFAULT 'TYPICAL',
  auto_refresh    IN NUMBER   DEFAULT NULL,
  base_path       IN VARCHAR2 DEFAULT NULL,
  type            IN VARCHAR2 DEFAULT 'TEXT',
  con_name       IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 165-6 *REPORT_SQL_MONITOR_LIST Procedure Parameters*

Parameter	Description
sql_id	SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle Database.
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
monitor_type	Monitor type: <ul style="list-style-type: none"> MONITOR_TYPE_SQL returns only simple database operations MONITOR_TYPE_DBOP returns composite database operations MONITOR_TYPE_ALL returns all types
session_id	Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.
session_serial	In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.
inst_id	Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default).
active_since_date	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.
active_since_sec	If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour.
last_refresh_time	If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned.
report_level	Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL.
auto_refresh	Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.

Table 165-6 (Cont.) REPORT_SQL_MONITOR_LIST Procedure Parameters

Parameter	Description
base_path	URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash swf file).
type	Report type: <ul style="list-style-type: none"> • TEXT: text report (default) • HTML: simple HTML report • ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics, and plan_histogram) is only shown when this type is selected. • XML: raw data for the report
con_name	Container name in a multitenant database.

Return Values

A report in text, XML, or HTML format that contains the list of the database operations monitored.

Usage Notes

- Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views GV\$SQL_MONITOR and GV\$SQL.

165.4.6 REPORT_SQL_MONITOR_LIST_XML Function

This function is identical to the REPORT_SQL_MONITOR_LIST function, except that it returns XMLType.

Related Topics

- [REPORT_SQL_MONITOR_LIST Function](#)
This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

DBMS_SQL_TRANSLATOR

The `DBMS_SQL_TRANSLATOR` package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS_SQL_TRANSLATOR Subprograms](#)

See Also:

SQL Translation Framework Architecture and Overview in *Oracle Database Migration Guide*

166.1 DBMS_SQL_TRANSLATOR Security Model

`DBMS_SQL_TRANSLATOR` is a invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the `TRANSLATE SQL` user privilege on the current user.

Additionally, the current user must be granted the `EXECUTE` privilege on the translator package.

166.2 DBMS_SQL_TRANSLATOR Constants

`DBMS_SQL_TRANSLATOR` defines several constants to use when specifying parameter values.

These are shown in the following table.

Table 166-1 DBMS_SQL_TRANSLATOR Constants

Constant	Value	Type	Description
ATTR_EDITIONABLE	'EDITIONABLE'	VARCHAR2 (30)	Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see Operational Notes)
ATTR_FOREIGN_SQL_SYNTAX	'FOREIGN_SQL_SYNTAX'	VARCHAR2 (30)	Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes)
ATTR_LOG_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes)
ATTR_RAISE_TRANSLATION_ERROR	'TRANSLATION_ERROR'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes)
ATTR_TRANSLATE_NEW_SQL	'TRANSLATE_NEW_SQL'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes)
ATTR_TRACE_TRANSLATION	'TRACE_TRANSLATION'	VARCHAR2 (30)	Name of the SQL translation profile attribute that controls tracing (see Operational Notes)
ATTR_TRANSLATOR	'TRANSLATOR'	VARCHAR2 (30)	Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes)
ATTR_VALUE_TRUE	'TRUE'	VARCHAR2 (30)	Value to set a SQL translation profile attribute to true (see Operational Notes)
ATTR_VALUE_FALSE	'FALSE'	VARCHAR2 (30)	Value to set a SQL translation profile attribute to false (see Operational Notes)

166.3 DBMS_SQL_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

ATTR_EDITIONABLE Constant

Editionable is true by default.

ATTR_FOREIGN_SQL_SYNTAX Constant

Foreign SQL syntax is true by default.

ATTR_LOG_TRANSLATION_ERROR Constant

- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

ATTR_RAISE_TRANSLATION_ERROR Constant

Raise translation error is false by default.

ATTR_TRANSLATE_NEW_SQL Constant

- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error
- Translate new SQL statements and errors is true by default.

ATTR_TRACE_TRANSLATION Constant

- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.
- Tracing is disabled by default.

ATTR_TRANSLATOR Constant

- The translator package must be a PL/SQL package with the following three procedures. The [TRANSLATE_SQL Procedure](#) and the [TRANSLATE_ERROR Procedure](#) are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```
PROCEDURE TRANSLATE_SQL(
    sql_text          IN CLOB,
    translated_text   OUT CLOB);
```

```
PROCEDURE TRANSLATE_ERROR(
    error_code        IN BINARY_INTEGER,
    translated_code    OUT BINARY_INTEGER,
    translated_sqlstate OUT VARCHAR2);
```

Parameters:

```
profile_name        - profile name
sql_text            - SQL statement to be translated
translated_text     - translated SQL statement
error_code          - Oracle error code
translated_code     - translated error code
translated_sqlstate - translated SQLSTATE
```

- When NULL is returned in translated_text, translated_code, or translated_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.
- The name of the translator package follows the naming rules for database packages of the form [schema.]package_name. When the schema and package names are used, they

are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, `translator => 'dbms_tsqL_translator'` is the same as `translator => 'Dbms_Tsql_Translator'` and `translator => 'DBMS_TSQ_L_TRANSLATOR'`, but not the same as `translator => "dbms_tsqL_translator"`. The default schema name is the profile owner.

- The translator attribute is not set by default.

ATTR_VALUE_TRUE Constant

The value to set a SQL translation profile attribute to true.

ATTR_VALUE_FALSE Constant

The value to set a SQL translation profile attribute to false.

166.4 DBMS_SQL_TRANSLATOR Exceptions

This table lists the exceptions raised by the `DBMS_SQL_TRANSLATOR` package.

Table 166-2 Exceptions Raised by DBMS_SQL_TRANSLATOR

Exception	Error Code	Description
BAD_ARGUMENT	29261	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	1031	User has insufficient privilege for the operation
NO_SUCH_PROFILE	24252	Profile does not exist
NO_SUCH_USER	1918	Profile owner does not exist
NO_TRANSLATION_FOUND	24253	No translation of the SQL statement or error code found
PROFILE_EXISTS	955	Profile already exists

166.5 DBMS_SQL_TRANSLATOR Examples

This is an example of basic SQL translation using `DBMS_SQL_TRANSLATOR`.

Basic SQL Translation

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
    profile_name => 'tsql_application');
  DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
    profile_name => 'tsql_application',
    attribute_name => DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
    attribute_value => 'migration_repo.sybase_tsqL_translator');
END;
```

166.6 Summary of DBMS_SQL_TRANSLATOR Subprograms

This table lists the DBMS_SQL_TRANSLATOR subprograms and briefly describes them.

Table 166-3 DBMS_SQL_TRANSLATOR Package Subprograms

Subprogram	Description
CREATE_PROFILE Procedure	Creates a SQL translation profile
DEREGISTER_SQL_TRANSLATION Procedure	Deregisters the custom translation of a SQL statement in a SQL translation profile
DEREGISTER_ERROR_TRANSLATION Procedure	Deregisters the translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile
DROP_PROFILE Procedure	Drops a SQL translation profile and its contents
ENABLE_ERROR_TRANSLATION Procedure	Enables or disables a custom translation of an Oracle error code in a SQL translation profile
ENABLE_SQL_TRANSLATION Procedure	Enables or disables a custom translation of a SQL statement in a SQL translation profile
EXPORT_PROFILE Procedure	Exports the content of a SQL translation profile
IMPORT_PROFILE Procedure	Imports the content of a SQL translation profile
REGISTER_ERROR_TRANSLATION Procedure	Registers a custom translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile
REGISTER_SQL_TRANSLATION Procedure	Registers a custom translation of a SQL statement in a SQL translation profile
SET_ATTRIBUTE Procedure	Sets an attribute of a SQL translation profile
SQL_HASH Function	Computes the hash value of a SQL statement in a SQL translation profile
SQL_ID Function	Computes the SQL identifier of a SQL statement in a SQL translation profile
TRANSLATE_ERROR Procedure	Translates an Oracle error code and an ANSI <code>SQLSTATE</code> using a SQL translation profile
TRANSLATE_SQL Procedure	Translates a SQL statement using a SQL translation profile

166.6.1 CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
    profile_name    IN VARCHAR2);
```

Parameters

Table 166-4 CREATE_PROFILE Procedure Parameters

Parameter	Description
profile_name	Name of profile

Exceptions

Table 166-5 CREATE_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form [schema.]name. When the schema and profile names are used in the DBMS_SQL_TRANSLATOR package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile profile_name => 'tsql_application' is the same as profile_name => 'Tsql_Application' and profile_name => 'TSQL_APPLICATION', but not the same as profile_name => 'tsql_application'.
- A SQL translation profile is an editionable object type.
- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).
- To destroy a SQL translation profile, use the [DROP_PROFILE Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```

166.6.2 DEREGISTER_SQL_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB);
```

Parameters

Table 166-6 *DEREGISTER_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement

Exceptions

Table 166-7 *DEREGISTER_SQL_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
PROFILE_EXISTS	Profile already exists

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp');
END;
```

166.6.3 DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code        IN  PLS_INTEGER);
```

Parameters

Table 166-8 *DEREGISTER_ERROR_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
error_code	Oracle error code

Exceptions

Table 166-9 Deregister_Error_Translation Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    error_code   => 1);
END;
```

166.6.4 DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

```
DBMS_SQL_TRANSLATOR.DROP_PROFILE (
  profile_name IN VARCHAR2);
```

Parameters

Table 166-10 DROP_PROFILE Procedure Parameters

Parameter	Description
profile_name	Name of profile

Exceptions

Table 166-11 DROP_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DROP_PROFILE (
```

```

        profile_name => 'tsql_application');
END;
```

166.6.5 ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (
    profile_name    IN VARCHAR2,
    sql_text        IN CLOB,
    enable          IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 166-12 ENABLE_ERROR_TRANSLATION Procedure Parameters

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 166-13 ENABLE_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```

BEGIN
    DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        sql_text     => 'SELECT TOP 5 * FROM emp'
        enable       => TRUE);
END;
```

166.6.6 ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
    profile_name    IN VARCHAR2,
```

```
sql_text      IN CLOB,
enable        IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 166-14 *ENABLE_SQL_TRANSLATION Procedure Parameters*

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
enable	Enable or disable the translation

Exceptions

Table 166-15 *ENABLE_SQL_TRANSLATION Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    enable       => TRUE);
END;
```

166.6.7 EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (
  profile_name IN VARCHAR2,
  content      OUT NOCOPY CLOB);
```

Parameters

Table 166-16 *EXPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 166-17 EXPORT_PROFILE Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```
SQLTranslationProfile Translator="translator package name"
                      ForeignSQLSyntax="TRUE|FALSE"
                      TranslateNewSQL="TRUE|FALSE"
                      RaiseTranslationError="TRUE|FALSE"
                      LogTranslationError="TRUE|FALSE"
                      TraceTranslation="TRUE|FALSE"
                      Editionable="TRUE|FALSE">
  <SQLTranslations>
    <SQLTranslation Enabled="TRUE|FALSE">
      <SQLText>original SQL text</SQLText>
      <TranslatedText>translated SQL text</TranslatedText>
    </SQLTranslation>
    ...
  </SQLTranslations>
  <ErrorTranslations>
    <ErrorTranslation Enabled="TRUE|FALSE">
      <ErrorCode>Oracle error code</ErrorCode>
      <TranslatedCode>translated error code</TranslatedCode>
      <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
    </ErrorTranslation>
    ...
  </ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the [IMPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

166.6.8 IMPORT_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
  profile_name      IN   VARCHAR2,
  content           IN   CLOB);
```

Parameters

Table 166-18 *IMPORT_PROFILE Procedure Parameters*

Parameter	Description
profile_name	Name of profile
content	Content of profile

Exceptions

Table 166-19 *IMPORT_PROFILE Procedure Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Usage Notes

- The content of the SQL translation profile must be in XML format as used by the [EXPORT_PROFILE Procedure](#). All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the [EXPORT_PROFILE Procedure](#).

Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

166.6.9 REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code       IN  PLS_INTEGER,
  translated_code   IN  PLS_INTEGER DEFAULT NULL,
  translated_sqlstate IN VARCHAR2 DEFAULT NULL,
  enable           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 166-20 REGISTER_ERROR_TRANSLATION Procedure Parameters

Parameter	Description
<code>profile_name</code>	Name of profile
<code>error_code</code>	Oracle error code
<code>translated_code</code>	Translated error code
<code>translated_sqlstate</code>	Translated <code>SQLSTATE</code>
<code>enable</code>	Enable or disable the translation

Exceptions

Table 166-21 REGISTER_ERROR_TRANSLATION Procedure Exceptions

Exception	Description
<code>BAD_ARGUMENT</code>	Bad argument is passed to the PL/SQL interface
<code>INSUFFICIENT_PRIVILEGE</code>	User has insufficient privilege for the operation
<code>NO_SUCH_USER</code>	Profile owner does not exist
<code>NO_SUCH_PROFILE</code>	Profile does not exist

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and `SQLSTATE`, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_ERROR_TRANSLATION Procedure](#).

Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        error_code   => 1,
        translated_code => 2601);
END;
```

166.6.10 REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name     IN VARCHAR2,
    sql_text         IN CLOB,
    translated_text  IN CLOB DEFAULT NULL,
    enable           IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 166-22 REGISTER_SQL_TRANSLATION Procedure Parameters

Parameter	Description
profile_name	Name of profile
sql_text	SQL statement
translated_text	Translated SQL statement
enable	Enable or disable the translation

Exceptions

Table 166-23 REGISTER_SQL_TRANSLATION Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.

- When `translated_text` is `NULL`, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER_SQL_TRANSLATION Procedure](#).

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

166.6.11 SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
  profile_name  IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  attribute_value IN VARCHAR2;)
```

Parameters

Table 166-24 *SET_ATTRIBUTE Procedure Parameters*

Parameter	Description
<code>profile_name</code>	Name of profile
<code>attribute_name</code>	Name of attribute
<code>attribute_value</code>	Value of attribute

Exceptions

Table 166-25 *SET_ATTRIBUTE Procedure Exceptions*

Exception	Description
<code>BAD_ARGUMENT</code>	Bad argument is passed to the PL/SQL interface
<code>INSUFFICIENT_PRIVILEGE</code>	User has insufficient privilege for the operation
<code>NO_SUCH_USER</code>	Profile owner does not exist
<code>NO_SUCH_PROFILE</code>	Profile does not exist

Usage Notes

See [Constants](#)

166.6.12 SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_HASH (
    sql_text          IN CLOB)
RETURN NUMBER DETERMINISTIC;
```

Parameters

Table 166-26 SQL_HASH Function Parameters

Parameter	Description
sql_text	SQL statement

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

Table 166-27 SQL_HASH Function Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```
DECLARE
    sqltext CLOB;
    txltext CLOB;
    sqlhash NUMBER;
BEGIN
    sqltext := 'SELECT TOP 1 * FROM emp';
    sqlhash := DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
    SELECT translated_text INTO txltext
    FROM user_sql_translations
    WHERE sql_hash = sqlhash
    AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;
END;
```

166.6.13 SQL_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.SQL_ID (
    sql_text          IN CLOB)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 166-28 *SQL_ID Function Parameters*

Parameter	Description
sql_text	SQL statement

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

Table 166-29 *SQL_ID Function Exceptions*

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface

Examples

```

DECLARE
  sqltext CLOB;
  sqlid   VARCHAR2(13);
BEGIN
  sqltext := 'SELECT TOP 1 * FROM emp';
  sqlid   := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;

```

166.6.14 TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (
  error_code          IN          PLS_INTEGER,
  translated_code     OUT         PLS_INTEGER,
  translated_sqlstate OUT NOCOPY VARCHAR2);

```

Parameters

Table 166-30 *TRANSLATE_ERROR Procedure Parameters*

Parameter	Description
error_code	Oracle error code
translated_code	Translated error code
translated_sqlstate	Translated SQLSTATE

Exceptions

Table 166-31 TRANSLATE_ERROR Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist
NO_SUCH_PROFILE	Profile does not exist
NO_TRANSLATION_FOUND	No translation of the SQL statement or error code is found

Examples

```

DECLARE
    translated_code      BINARY_INTEGER;
    translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
        error_code       => 1,
        translated_code  => translated_code,
        translated_sqlstate => translated_sqlstate);
END;
```

166.6.15 TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
    sql_text           IN          CLOB,
    translated_text    OUT NOCOPY CLOB);
```

Parameters

Table 166-32 TRANSLATE_SQL Procedure Parameters

Parameter	Description
sql_text	SQL statement
translated_text	Translated SQL statement

Exceptions

Table 166-33 TRANSLATE_SQL Procedure Exceptions

Exception	Description
BAD_ARGUMENT	Bad argument is passed to the PL/SQL interface
INSUFFICIENT_PRIVILEGE	User has insufficient privilege for the operation
NO_SUCH_USER	Profile owner does not exist

Table 166-33 (Cont.) TRANSLATE_SQL Procedure Exceptions

Exception	Description
NO_SUCH_PROFILE	Profile does not exist

Examples

```
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;
```

```
DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text      => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```

DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- [DBMS_SQLDIAG Overview](#)
- [DBMS_SQLDIAG Security Model](#)
- [DBMS_SQLDIAG Constants](#)
- [Summary of DBMS_SQLDIAG Subprograms](#)

See Also:

Oracle Database Administrator's Guide for more information about "Managing Diagnostic Data"

167.1 DBMS_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement by using the DBMS_SQLDIAG package subprograms.

The SQL Repair Advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

See Also:

Oracle Database Administrator's Guide for more information about how to run the SQL Repair Advisor using the DBMS_SQLDIAG package subprograms.

167.2 DBMS_SQLDIAG Security Model

You must have the `ADVISOR` role to execute the DBMS_SQLDIAG package.

167.3 DBMS_SQLDIAG Constants

DBMS_SQLDIAG defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- [Table 167-1](#) describes the name of SQL repair advisor as seen by the advisor framework

- [Table 167-2](#) describes SQLDIAG advisor task scope parameter values
- [Table 167-3](#) describes SQLDIAG advisor `time_limit` constants
- [Table 167-4](#) describes possible formats for a report
- [Table 167-5](#) describes possible levels of detail in the report
- [Table 167-6](#) describes possible report sections (comma delimited)
- [Table 167-7](#) describes possible values for the `problem_type` parameter of the `CREATE_DIAGNOSIS_TASK` Functions
- [Table 167-8](#) describes possible values for the `_sql_findings_mode` parameter

Table 167-1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
ADV_SQL_DIAG_NAME	VARCHAR2 (18)	SQL Repair Advisor	Name of SQL repair advisor as seen by the advisor framework

Table 167-2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
SCOPE_COMPREHENSIVE	VARCHAR2 (13)	COMPREHENSIVE	Detailed analysis of the problem which may take more time to execute
SCOPE_LIMITED	VARCHAR2 (7)	LIMITED	Brief analysis of the problem

Table 167-3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
TIME_LIMIT_DEFAULT	NUMBER	1800	Default time limit for analysis of the problem

Table 167-4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2 (4)	HTML	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form
TYPE_TEXT	VARCHAR2 (4)	TEXT	Report from the REPORT_DIAGNOSIS_TASK Function in text form

Table 167-4 (Cont.) DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_XML	VARCHAR2 (3)	XML	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 167-5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2 (3)	ALL	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2 (5)	BASIC	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2 (7)	TYPICAL	Simple report shows only information about the actions taken by the advisor.

Table 167-6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2 (3)	ALL	All statements
SECTION_ERRORS	VARCHAR2 (6)	ERRORS	Statements with errors
SECTION_FINDINGS	VARCHAR2 (8)	FINDINGS	Tuning findings
SECTION_INFORMATION	VARCHAR2 (11)	INFORMATION	General information
SECTION_PLANS	VARCHAR2 (5)	PLANS	Explain plans
SECTION_SUMMARY	VARCHAR2 (7)	SUMMARY	Summary information

Table 167-7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation

Table 167-7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_EXECUTION_ERR OR	NUMBER	4	User sees a crash in execution
PROBLEM_TYPE_ALT_PLAN_GEN	NUMBER	5	User to explore all alternative plans

Table 167-8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDAT ION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURE S	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_ PLANS	NUMBER	4	Show the alternative plans generated by the advisor
SQLDIAG_FINDINGS_CR_DIFF	NUMBER	5	Show difference between two plans
SQLDIAG_FINDINGS_MASK_VA RIANT	NUMBER	6	Mask info for testing
SQLDIAG_FINDINGS_OBJ_FEA TURES	NUMBER	7	Show features usage history
SQLDIAG_FINDINGS_BASIC_I NFO	NUMBER	8	Show the alternative plans generated by the advisor

167.4 Summary of DBMS_SQLDIAG Subprograms

This table lists the DBMS_SQLDIAG subprograms and briefly describes them.

Table 167-9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure	Alters specific attributes of an existing SQL patch object
CANCEL_DIAGNOSIS_TASK Procedure	Cancels a diagnostic task
CREATE_DIAGNOSIS_TASK Functions	Creates a diagnostic task in order to diagnose a single SQL statement

Table 167-9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
CREATE_SQL_PATCH Function	Creates an SQL patch based on a set of user specified hints for specific statements identified by SQL text.
CREATE_STGTAB_SQLPATCH Procedure	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure	Drops a diagnostic task
DROP_SQL_PATCH Procedure	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_DIR_BY_INC Function	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_FIX_CONTROL Function	Returns the value of fix control for a given bug number
GET_SQL Function	Imports a SQL test case
IMPORT_SQL_TESTCASE Procedures	Imports a SQL test case into a schema
INCIDENTID_2_SQL Procedure	Initializes a <code>sql_setrow</code> from an incident ID
INTERRUPT_DIAGNOSIS_TASK Procedure	Interrupts a diagnostic task
LOAD_SQLSET_FROM_TCB Function	Loads a <code>SQLSET</code> from Test Case Builder (TCB) file
PACK_STGTAB_SQLPATCH Procedure	SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure
REPLAY_SQL_TESTCASE Function	Reports on a diagnostic task
REPORT_DIAGNOSIS_TASK Function	Reports on a diagnostic task
RESET_DIAGNOSIS_TASK Procedure	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_PARAMETER Procedure	Sets a diagnosis task parameter
SQL_DIAGNOSE_AND_REPAIR Function	Diagnoses a given SQL statement for a given SQL ID for the given problem type.
UNPACK_STGTAB_SQLPATCH Procedure	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure , using the patch data stored in the staging table to create patches on this system

167.4.1 ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description    IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 167-10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.
category	Category name which must match the value of the <code>SQLDIAGNOSE_CATEGORY</code> parameter in a session for the session to use this patch. It defaults to the value <code>DEFAULT</code> . This is also the default of the <code>SQLDIAGNOSE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.

Table 167-10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
replace	If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires CREATE ANY SQL PROFILE privilege

167.4.2 ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
    name           IN VARCHAR2,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2);
```

Parameters

Table 167-11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
name	Name of SQL patch to alter.
attribute_name	Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"> STATUS -> can be set to ENABLED or DISABLED NAME -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). DESCRIPTION -> can be set to any string of size no more than 500 CATEGORY -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.

Table 167-11 (Cont.) ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
attribute_value	New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

Usage Notes

Requires ALTER ANY SQL PATCH privilege

167.4.3 CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 167-12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

167.4.4 CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN  CLOB,
    bind_list         IN  sql_binds := NULL,
    user_name         IN  VARCHAR2 := NULL,
    scope             IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN  NUMBER    := TIME_LIMIT_DEFAULT,
    task_name         IN  VARCHAR2 := NULL,
    description       IN  VARCHAR2 := NULL,
    problem_type      IN  NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id            IN  VARCHAR2,
    plan_hash_value   IN  NUMBER    := NULL,
    scope             IN  VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN  NUMBER    := TIME_LIMIT_DEFAULT,
```

```

task_name          IN  VARCHAR2  := NULL,
description        IN  VARCHAR2  := NULL,
problem_type      IN  NUMBER     := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;

```

Prepares the diagnosis of a Sqlset:

```

DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter    IN VARCHAR2 := NULL,
  rank1            IN VARCHAR2 := NULL,
  rank2            IN VARCHAR2 := NULL,
  rank3            IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := NULL,
  result_limit     IN NUMBER   := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL,
  plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner     IN VARCHAR2 := NULL,
  problem_type     IN NUMBER   := PROBLEM_TYPE_PERFORMANCE) RETURN VARCHAR2;

```

Parameters

Table 167-13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: <ul style="list-style-type: none"> PROBLEM_TYPE_WRONG_RESULTS PROBLEM_TYPE_COMPILATION_ERROR PROBLEM_TYPE_EXECUTION_ERROR
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	Sqlset name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL

Table 167-13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> • LAST_GENERATED: plan with most recent timestamp • FIRST_GENERATED: opposite to LAST_GENERATED • LAST_LOADED: plan with most recent first_load_time stat info • FIRST_LOADED: opposite to LAST_LOADED • MAX_ELAPSED_TIME: plan with maximum elapsed time • MAX_BUFFER_GETS: plan with maximum buffer gets • MAX_DISK_READS: plan with maximum disk reads • MAX_DIRECT_WRITES: plan with maximum direct writes • MAX_OPTIMIZER_COST: plan with maximum optimum cost
sqlset_owner	Owner of the sqlset, or null for current schema owner

167.4.5 CREATE_SQL_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

Syntax

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_text      IN  CLOB,
    hint_text     IN  CLOB,
    name          IN  VARCHAR2  := NULL,
    description   IN  VARCHAR2  := NULL,
    category      IN  VARCHAR2  := NULL,
    validate      IN  BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_id        IN  VARCHAR2,
    hint_text     IN  CLOB,
    name          IN  VARCHAR2  := NULL,
    description   IN  VARCHAR2  := NULL,
    category      IN  VARCHAR2  := NULL,
    validate      IN  BOOLEAN    := TRUE)
RETURN VARCHAR2;
```

Parameters

Table 167-14 CREATE_SQL_PATCH Function Parameters

Parameter	Description
sql_text	Text of the SQL statement
sql_id	The SQL identifier for the SQL statement
hint_text	Hints to include in the SQL patch
name	Optional SQL patch name
description	Description of the SQL patch
category	Category name
validate	Whether to validate the provided hints

Return Values

Both functions return the SQL patch name.

167.4.6 CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
    table_name      IN  VARCHAR2,
    schema_name     IN  VARCHAR2 := NULL,
    tablespace_name IN  VARCHAR2 := NULL);
```

Parameters

Table 167-15 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

167.4.7 DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (
    taskname      IN  VARCHAR2);
```

Parameters**Table 167-16 DROP_DIAGNOSIS_TASK Procedure Parameters**

Parameter	Description
taskname	Name of task

167.4.8 DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
    name      IN VARCHAR2,  ignore  IN BOOLEAN := FALSE);
```

Parameters**Table 167-17 DROP_SQL_PATCH Function & Procedure Parameters**

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires `DROP ANY SQL PATCH` privilege

167.4.9 EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname      IN VARCHAR2);
```

Parameters**Table 167-18 EXECUTE_DIAGNOSIS_TASK Procedure Parameters**

Parameter	Description
taskname	Name of task

167.4.10 EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase      IN  CLOB)
RETURN CLOB;
```

Parameters

Table 167-19 EXPLAIN_SQL_TESTCASE Function Parameters

Parameter	Description
sqlTestCase	XML document describing the SQL test case

167.4.11 EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    sql_text           IN          CLOB,
    user_name          IN          VARCHAR2 := NULL,
    bind_list          IN          sql_binds := NULL,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER := 0,
    testcase_name      IN          VARCHAR2 := NULL,
    testcase           IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE,
    version            IN          VARCHAR2 := 'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    incident_id        IN          VARCHAR2,
    exportEnvironment  IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER :=
        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name      IN          VARCHAR2 := NULL,
```

```

testcase          IN OUT NOCOPY  CLOB,
preserveSchemaMapping  IN          BOOLEAN := FALSE)
version           IN          VARCHAR2 := 'COMPATIBLE');

```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory          IN          VARCHAR2,
  sql_id             IN          VARCHAR2,
  plan_hash_value    IN          NUMBER := NULL,
  exportEnvironment  IN          BOOLEAN := TRUE,
  exportMetadata     IN          BOOLEAN := TRUE,
  exportData         IN          BOOLEAN := FALSE,
  exportPkgbody      IN          BOOLEAN := FALSE,
  samplingPercent    IN          NUMBER := 100,
  ctrlOptions        IN          VARCHAR2 := NULL,
  timeLimit          IN          NUMBER :=
                                DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
  testcase_name      IN          VARCHAR2 := NULL,
  testcase           IN OUT NOCOPY CLOB,
  preserveSchemaMapping  IN          BOOLEAN := FALSE)
  version           IN          VARCHAR2 := 'COMPATIBLE');

```

Parameters

Table 167-20 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
exportPkgbody	TRUE if the body of the packages referenced in the SQL are exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file

Table 167-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> name="capture" - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <p>BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p> <p>Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures.</p> name="mexec_count"—Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name="stat_history_since"—Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported. name="compress"—This option is used to compress the SQL Test Case Builder output files into a zip file. The possible values are: <ul style="list-style-type: none"> YES NO <p>The default value is NO.</p> name="diag_event"—This option is used to specify the level of trace information to include in the SQL Test Case Builder output. The possible values are: <ul style="list-style-type: none"> ADS COMPILER SQLEXEC_LOW SQLEXEC_MEDIUM SQLEXEC_HIGH SQLEXEC_HIGHEST <p>The default value is ADS + COMPILER.</p> name="problem_type"—This option is used to assign an issue type for a SQL Test Case Builder test case. For example, if a test case is related to performance regression issue, then you can assign the value of PERFORMANCE to the problem_type option. The possible values are : <ul style="list-style-type: none"> PERFORMANCE WRONG_RESULTS COMPILATION_ERROR EXECUTION_ERROR <p>The default value is PERFORMANCE.</p>

Table 167-20 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcase	Resulting testcase
preserveSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment
version	Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted. <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal.

To export data, call `EXPORT_SQL_TESTCASE` with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
- This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the `ctrlOptions` encapsulated either by using the `<parameters>` parent tag or without the parent tag.

Using the `<parameters>` tag

```
<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
</parameters>
```

Without the `<parameters>` tag

```
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
```

The `compress` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

The `diag_event` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

The `problem_type` option that you can specify in the `ctrlOptions` parameter:

```
opt := '<parameters>
      <parameter name="capture">with_runtime_info</parameter>
      <parameter name="compress">yes</parameter>
      </parameters>';
```

167.4.12 EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
  incident_id      IN  NUMBER,
  directory        IN  VARCHAR2,
  exportEnvironment IN  VARCHAR2 := 'TRUE',
  exportMetadata  IN  VARCHAR2 := 'TRUE',
  exportData      IN  VARCHAR2 := 'FALSE',
  samplingPercent IN  VARCHAR2 := '100',
  ctrlOptions     IN  VARCHAR2 := NULL,
  version         IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 167-21 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL. For more information about Incidents, see <i>Oracle Database Performance Tuning Guide</i> .
directory	Directory path to the generated files
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file

Table 167-21 (Cont.) EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
version	<p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.

167.4.13 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    sql_text         IN    CLOB,
    user_name        IN    VARCHAR2 := 'SYS',
    exportEnvironment IN    VARCHAR2 := 'TRUE',
    exportMetadata   IN    VARCHAR2 := 'TRUE',
    exportData       IN    VARCHAR2 := 'FALSE',
    samplingPercent  IN    VARCHAR2 := '100',
    ctrlOptions      IN    VARCHAR2 := NULL
    version          IN    VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

Parameters

Table 167-22 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to explain
username	Name of the user schema to use to parse the SQL, defaults to SYS
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <ul style="list-style-type: none"> BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information. WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode. name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution. name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.
version	<p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. LATEST - the version of the metadata that specifies the current database version. A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database Release 10.0.0.

167.4.14 GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (
    bug_number IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 167-23 GET_FIX_CONTROL Function Parameters

Parameter	Description
bug_number	Bug number

167.4.15 GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id IN VARCHAR2)
RETURN SQLSET_ROW;
```

Parameters

Table 167-24 GET_SQL Function Parameters

Parameter	Description
incident_id	Identifier of the incident

167.4.16 IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory          IN VARCHAR2,
    sqlTestCase        IN CLOB,
    importEnvironment  IN BOOLEAN := TRUE,
    importMetadata     IN BOOLEAN := TRUE,
    importData         IN BOOLEAN := TRUE,
    importPkgbody      IN BOOLEAN := FALSE,
    importDiagnosis    IN BOOLEAN := TRUE,
    ignoreStorage      IN BOOLEAN := TRUE,
    ctrlOptions        IN VARCHAR2 := NULL,
    preserveSchemaMapping IN BOOLEAN := FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
  directory          IN  VARCHAR2,
  filename           IN  VARCHAR2,
  importEnvironment IN  BOOLEAN := TRUE,
  importMetadata    IN  BOOLEAN := TRUE,
  importData        IN  BOOLEAN := TRUE,
  importPkgbody     IN  BOOLEAN := FALSE,
  importDiagnosis   IN  BOOLEAN := TRUE,
  ignoreStorage     IN  BOOLEAN := TRUE,
  ctrlOptions       IN  VARCHAR2 := NULL,
  preserveSchemaMapping IN BOOLEAN := FALSE);
```

Parameters

Table 167-25 IMPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
importEnvironment	TRUE if the compilation environment should be imported
importMetadata	TRUE if the definition of the objects referenced in the SQL should be imported
importData	TRUE if the data of the objects referenced in the SQL should be imported
importPkgbody	TRUE if the body of the packages referenced in the SQL are imported
importDiagnosis	TRUE if the diagnostic information associated to the task should be imported
ignoreStorage	TRUE if the storage attributes should be ignored
ctrlOptions	Opaque control parameters, of which only <code>capture</code> is valid for this subprogram. <ul style="list-style-type: none"> <code>capture</code> - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture. <p>BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</p> <p>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</p>
preserveSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with <code>preservesSchemaMapping</code> set to TRUE, if the objects in the schemas exists then the import will overwrite the existing objects.

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
 - a dump file containing schemas objects and statistics (.dmp)
 - the explain plan for the statements (in advanced mode)
 - diagnostic information gathered on the offending statement
 - an import script to execute to reload the objects
 - a SQL script to replay system statistics of the source
 - a table of contents file describing the SQL test case
 - metadata. (xxxxxmain.xml)
 - a README.txt file that explain the usage of the TCB
 - the outlines used by the statement (ol.xml)
 - a list of parameters set in the exporting db/env (prmimp.sql)
 - a SQL monitor report, if any (smrpt.html)
 - an AWR report, if any (awrrpt.html)
 - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call [EXPORT_SQL_TESTCASE Procedures](#) with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT_SQL_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- The `capture` value used when invoking the [EXPORT_SQL_TESTCASE Procedures](#) must be used when calling this procedure.

167.4.17 INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
  incident_id  IN      VARCHAR2,
  sql_stmt    OUT     SQLSET_ROW,
  problem_type OUT     NUMBER,
  err_code    OUT     BINARY_INTEGER,
  err_mesg    OUT     VARCHAR2);
```

Parameters

Table 167-26 INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
incident_id	Identifier of the incident
sql_stmt	Resulting SQL
problem_type	Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)
err_code	Error code if any otherwise it is set to NULL
err_msg	Error message if any otherwise it is set to NULL

167.4.18 INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 167-27 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

167.4.19 LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory          IN  VARCHAR2,
    filename           IN  VARCHAR2,
    sqlset_name        IN  VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 167-28 LOAD_SQLSET_FROM_TCB Function Parameters

Parameter	Description
directory	Name of directory
filename	Name of file

Table 167-28 (Cont.) LOAD_SQLSET_FROM_TCB Function Parameters

Parameter	Description
sqlset_name	Name of SQLSET

167.4.20 PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category      IN  VARCHAR2 := 'DEFAULT',
  staging_table_name  IN  VARCHAR2,
  staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 167-29 PACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to pack (% wildcards acceptable, case-sensitive)
patch_category	Category to which to pack patches (% wildcards acceptable, case-insensitive)
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- **Requires:** ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

Related Topics

- [CREATE_STGTAB_SQLPATCH Procedure](#)
This procedure creates the staging table used for transporting SQL patches from one system to another.

167.4.21 REPLAY_SQL_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

Syntax

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
    directory      IN   VARCHAR2,
    filename       IN   VARCHAR2,
    ctrlOptions    IN   VARCHAR2 := NULL,
    format         IN   VARCHAR2 := 'TEXT')
RETURN CLOB;
```

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (
    directory      IN   VARCHAR2,
    sqlTestCase    IN   CLOB,
    ctrlOptions    IN   VARCHAR2 := NULL,
    format         IN   VARCHAR2 := 'TEXT')
RETURN CLOB;
```

Parameters

Table 167-30 REPLAY_SQL_TESTCASE Function Parameters

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
ctrlOptions	<p>Opaque control parameters. For example, to execute three times, set <code>ctrlOptions</code> with the following string: '<parameter name="mexec_count">3</parameter>'.</p> <ul style="list-style-type: none"> replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality. <ul style="list-style-type: none"> EXPLAIN: Replay explains the statement without using outlines OUTLINE: Replay uses outlines mode and explains the statement using outlines EXECUTION: Replay executes the statement without using outlines OUTLINE EXECUTION: Replay executes the statement using outlines <p>Note that if the user gives an incorrect parameter value, then the <code>replay</code> runs in default mode and no error is thrown.</p> name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.
sqlTestCase	SQL test case
format	Format of the replay report. Possible formats are: TEXT, XML and HTML..

Examples

TCB Replay Mode: Execute

```
SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp where
emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal > 1000 /*
tcbdynpl_1 */
```

Explain Plan

Plan Hash Value : 2219294842

Id	Operation	Name	Rows
0	SELECT STATEMENT		13
* 1	HASH JOIN		13
2	NESTED LOOPS		
3	NESTED LOOPS		13
4	STATISTICS COLLECTOR		
5	TABLE ACCESS FULL	DEPT	4
* 6	INDEX RANGE SCAN	EMP_IDX_DEPTNO	
* 7	TABLE ACCESS BY INDEX ROWID	EMP	3
* 8	TABLE ACCESS FULL	EMP	13

Predicate Information (identified by operation id):

```
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 6 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 7 - filter("EMP"."SAL">1000)
* 8 - filter("EMP"."SAL">1000)
```

Runtime Plan

Plan Hash Value : 2219294842

Id	Operation	Name	E-Card	A-Card
0	SELECT STATEMENT			0
* 1	HASH JOIN		13	0
2	TABLE ACCESS FULL	DEPT	4	0
* 3	TABLE ACCESS FULL	EMP	13	0

Predicate Information (identified by operation id):

```
* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")
* 3 - filter("EMP"."SAL">1000)
```

REPLAY Note:

```
- Replay used dynamic sampling
- Replay forced Dynamic plan
```

167.4.22 REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
    taskname          IN   VARCHAR2,
    type              IN   VARCHAR2  := TYPE_TEXT,
    level             IN   VARCHAR2  := LEVEL_TYPICAL,
    section           IN   VARCHAR2  := SECTION_ALL,
    object_id         IN   NUMBER    := NULL,
    result_limit      IN   NUMBER    := NULL,
    owner_name        IN   VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 167-31 REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
taskname	Name of task to report
type	Type of the report. Possible values are: TEXT, HTML, XML (see Table 167-4).
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 167-5).
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 167-6).
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

167.4.23 RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
    taskname          IN   VARCHAR2);
```

Parameters

Table 167-32 RESET_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

167.4.24 RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
    taskname          IN  VARCHAR2);
```

Parameters

Table 167-33 RESUME_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

167.4.25 SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- `MODE`: diag scope (comprehensive, limited)
- `_SQLDIAG_FINDING_MODE`: findings in the report (see "Table 167-8" for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname          IN  VARCHAR2,
    parameter         IN  VARCHAR2,  value          IN  NUMBER);
```

Parameters

Table 167-34 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

167.4.26 SQL_DIAGNOSE_AND_REPAIR Function

Diagnoses a given SQL statement for a given SQL ID for the given problem type. This function creates an incident, populate incident metadata with required information like, SQL ID, SQL text, compilation environment, and so on. It also creates a diagnostic task, executes it and accepts SQL PATCH recommendation for a given SQL ID.

Syntax

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
  sql_text          IN   CLOB,
  bind_list         IN   sql_binds := NULL,
  scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
  problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
  auto_apply_patch  IN   VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
  sql_id            IN   VARCHAR2,
  plan_hash_value   IN   NUMBER    := NULL,
  scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
  problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
  auto_apply_patch  IN   VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
  incident_id       IN   VARCHAR2,
  scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
  problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE,
  auto_apply_patch  IN   VARCHAR2 := YES)
RETURN NUMBER;
```

Parameters

Table 167-35 SQL_DIAGNOSE_AND_REPAIR Function Parameters

Parameter	Description
sql_text	Text of the SQL statement.
sql_id	SQL ID of the SQL query.
plan_hash_value	The plan to be used for diagnosis. The default value is NULL.
bind_list	Binds to be used for diagnosis. The default value is NULL.
scope	The scope of diagnostic advisor. Possible values are: <ul style="list-style-type: none"> SCOPE_LIMITED—only index and plan analyze are invoked for a given SQL. SCOPE_COMPREHENSIVE—besides index and plan analyze, auto-tune is called first to tune the statement. The default value is SCOPE_COMPREHENSIVE.
time_limit	Time limit for diagnostic task. The default value is TIME_LIMIT_DEFAULT.

Table 167-35 (Cont.) SQL_DIAGNOSE_AND_REPAIR Function Parameters

Parameter	Description
<code>problem_type</code>	<p>Problem type that is being diagnosed. The following problem type are supported:</p> <ul style="list-style-type: none"> <code>PROBLEM_TYPE_PERFORMANCE</code>—performance problem. <code>PROBLEM_TYPE_WRONG_RESULTS</code>—incorrect results. <code>PROBLEM_TYPE_COMPILATION_ERROR</code>—crash during compilation of the statement. <code>PROBLEM_TYPE_EXECUTION_ERROR</code>—crash during execution of the statement. <p>The default value is <code>PROBLEM_TYPE_PERFORMANCE</code>.</p>
<code>auto_apply_patch</code>	<p>A value that decides if the recommended SQL patch needs to be accepted. Possible values are:</p> <ul style="list-style-type: none"> <code>YES</code>—accepts the recommended SQL patch. <code>NO</code>—does not accept recommended SQL patch automatically. <p>User need to manually accept the SQL patch.</p> <p>The default value is <code>YES</code>.</p>

167.4.27 UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the `PACK_STGTAB_SQLPATCH` Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the `ACCEPT_SQL_PATCH` Function & Procedure).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
    patch_name          IN  VARCHAR2 := '%',
    patch_category      IN  VARCHAR2 := '%',
    replace             IN  BOOLEAN,
    staging_table_name  IN  VARCHAR2,
    staging_schema_owner IN  VARCHAR2 := NULL);
```

Parameters

Table 167-36 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
<code>patch_name</code>	Name of patch to unpack (% wildcards acceptable, case-sensitive)
<code>patch_category</code>	Category from which to unpack patches (% wildcards acceptable, case-insensitive)

Table 167-36 (Cont.) UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
replace	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- **Requires:** ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

Related Topics

- [PACK_STGTAB_SQLPATCH Procedure](#)
This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.
- [ACCEPT_SQL_PATCH Function & Procedure](#)
This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

DBMS_SQLPA

The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_SQLPA Subprograms](#)

168.1 DBMS_SQLPA Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE_ANALYSIS_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.
2. The [EXECUTE_ANALYSIS_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT_ANALYSIS_TASK Function](#) displays the results of an analysis task.

168.2 DBMS_SQLPA Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

168.3 Summary of DBMS_SQLPA Subprograms

This table lists the DBMS_SQLPA subprograms and briefly describes them.

Table 168-1 DBMS_SQLPA Package Subprograms

Subprogram	Description
CANCEL_ANALYSIS_TASK Procedure	Cancels the currently executing task analysis of one or more SQL statements
CREATE_ANALYSIS_TASK Functions	Creates an advisor task to process and analyze one or more SQL statements
DROP_ANALYSIS_TASK Procedure	Drops a SQL analysis task

Table 168-1 (Cont.) DBMS_SQLPA Package Subprograms

Subprogram	Description
EXECUTE_ANALYSIS_TASK Function & Procedure	Executes a previously created analysis task
INTERRUPT_ANALYSIS_TASK Procedure	Interrupts the currently executing analysis task
REPORT_ANALYSIS_TASK Function	Displays the results of an analysis task
RESET_ANALYSIS_TASK Procedure	Resets the currently executing analysis task to its initial state
RESUME_ANALYSIS_TASK Procedure	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
SET_ANALYSIS_TASK_PARAMETER Procedures	Sets the SQL analysis task parameter value
SET_ANALYSIS_DEFAULT_PARAMETER Procedures	Sets the SQL analysis task parameter default value

168.3.1 CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
  task_name          IN VARCHAR2);
```

Parameters

Table 168-2 CANCEL_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task to cancel

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

168.3.2 CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.

- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  parsing_schema    IN VARCHAR2 := NULL,
  task_name         IN VARCHAR2 := NULL,
  description       IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER := NULL,
  task_name        IN VARCHAR2 := NULL,
  con_name         IN VARCHAR2 DEFAULT,
  description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  dbid             IN NUMBER DEFAULT,
  begin_snap       IN NUMBER,
  end_snap         IN NUMBER,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER := NULL,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL)
  con_name         IN VARCHAR2 DEFAULT,
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  con_name         IN VARCHAR2 DEFAULT,
  order_by        IN VARCHAR2 := NULL,
  top_sql         IN VARCHAR2 := NULL,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL)
  sqlset_owner     IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 168-3 *CREATE_ANALYSIS_TASK* Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	A set of bind values
parsing_schema	Name of the schema where the statement can be compiled
task_name	Optional analysis task name
dbid	The DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used
con_name	Container for the SPA task. The semantics depend on the function format: For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis. The following statements are true of all function formats: <ul style="list-style-type: none"> • In a non-CDB, this parameter is ignored. • In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, error occurs. • In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, error occurs.
description	Description of the SQL analysis task to a maximum of 256 characters
sql_id	Identifier of a SQL statement
plan_hash_value	Hash value of the SQL execution plan
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```

variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id      => 'aylm3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap   => 2,
    sql_id     => 'aylm3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
    sqlset_name  => 'my_workload', -
    order_by     => 'BUFFER_GETS', -
    description  => 'process workload ordered by buffer gets');

```

168.3.3 DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

```

DBMS_SQLPA.DROP_ANALYSIS_TASK(
    task_name      IN VARCHAR2);

```

Parameters

Table 168-4 DROP_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	The name of the analysis task to drop

168.3.4 EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name      IN VARCHAR2,
    execution_type IN VARCHAR2           := 'test execute',
    execution_name IN VARCHAR2           := NULL,
    execution_params IN dbms_advisor.argList := NULL,
    execution_desc  IN VARCHAR2           := NULL)
RETURN VARCHAR2;

```

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL);
```

Parameters

Table 168-5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. Possible values are: <ul style="list-style-type: none"> [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(  
    sqlset_name      => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name        => :tname,  
    execution_type   => 'test execute',  
    execution_name   => 'before_change');
```

3. Make change

...

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name        => :tname, -  
    execution_type   => 'test execute',  
    execution_name   => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(  
    :tname, 'comparison_metric', 'buffer_gets');  
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name        => :tname, -  
    execution_type   => 'compare performance', -  
    execution_name   => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name        => :tname, -  
    execution_type   => 'compare performance',  
    execution_params => dbms_advisor.arglist(  
        'execution_name1',  
        'before_change',  
        'execution_name2',  
        'after_change',  
        'comparison_metric',  
        'buffer_gets'));
```

168.3.5 INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
    task_name          IN VARCHAR2);
```

Parameters

Table 168-6 INTERRUPT_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to interrupt

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

168.3.6 REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    type               IN VARCHAR2 := 'TEXT',
    level             IN VARCHAR2 := 'TYPICAL',
    section           IN VARCHAR2 := 'SUMMARY',
    object_id         IN NUMBER := NULL,
    top_sql           IN NUMBER := 100,
    execution_name    IN VARCHAR2 := NULL,
    task_owner        IN VARCHAR2 := NULL,
    order_by          IN VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 168-7 REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).

Table 168-7 (Cont.) REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
level	Level of detail in the report: <ul style="list-style-type: none"> • ALL - details of all SQL • BASIC - currently the same as typical • CHANGED - only SQL with changed performance • CHANGED_PLANS - only SQL with plan changes • ERRORS - SQL with errors only • IMPROVED - only improved SQL • REGRESSED - only regressed SQL • TIMEOUT - only SQL which timed-out during execution • TYPICAL (default) - show information about every statement analyzed, including changing and errors • UNCHANGED - only SQL with unchanged performance • UNCHANGED_PLANS - only SQL with unchanged plans • UNSUPPORTED - only SQL not supported by SPAs
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> • SUMMARY (default) - workload summary only • ALL - summary and details on SQL
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
order_by	How to sort SQL statements in the report (summary and body). Possible values: <ul style="list-style-type: none"> • CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric • NULL (default) - order SQL statement by impact on workload • SQL_IMPACT - order SQL statement by change impact on SQL • WORKLOAD_IMPACT - same as NULL • METRIC_DELTA - same as CHANGE_DIFF

Return Values

A CLOB containing the desired report.

Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

168.3.7 RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
  task_name          IN VARCHAR2);
```

Parameters

Table 168-8 RESET_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

168.3.8 RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or `FAILED` (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters

Table 168-9 RESUME_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter basic_filter) that was specified when calling the CREATE_ANALYSIS_TASK Functions .

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

168.3.9 SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name          IN VARCHAR2,
    parameter          IN VARCHAR2,
    value              IN VARCHAR2,
    test_execute_dop   IN NUMBER DEFAULT 0,
    compare_resultset IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name          IN VARCHAR2,
    parameter          IN VARCHAR2,
    value              IN NUMBER,
    test_execute_dop   IN NUMBER DEFAULT 0,
    compare_resultset IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 168-10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
parameter	<p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none">• APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).• BASIC_FILTER: basic filter for SQL tuning set• CELL_SIMULATION_ENABLED: for more details, see the helper script <code>tcellsim.sql</code> in the <code>ADMIN</code> directory.• COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)• DATABASE_LINK: can be set to the global name of a <code>PUBLIC</code> database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.• DAYS_TO_EXPIRE: number of days until the task is deleted• DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure.

Table 168-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter (contd.)	<ul style="list-style-type: none"> • DISABLE_MULTI_EXEC: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to TRUE to disable this capability. In this case, each SQL in the SQL tuning set is executed only once. • EXECUTE_TRIGGERS: Set this parameter to TRUE to execute all statement-level triggers in the FULLDML mode. If the parameter is set to FALSE, then the triggers will not be executed even in FULLDML mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by SPA. The default value of this parameter is FALSE. • EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions will be deleted (without deleting the task) • EXECUTE_FULLDML: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds) • METRIC_DELTA_THRESHOLD: threshold of the difference between the SQL performance metric before and after the change. The default value is zero. • NUM_ROWS_TO_FETCH: specifies the number of rows to be fetched for an SQL query. You can use one of the following values: <ul style="list-style-type: none"> – ALL_ROWS: Fetches all the rows for an SQL query – AVERAGE: Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS – AUTO: Number of result rows is determined using the value of <code>optimizer_mode</code> parameter of the optimizer environment captured in the STS. If the value of <code>optimizer_mode</code> is ALL_ROWS, then all result rows will be fetched. If its value is FIRST_ROWS_n, then <code>n</code> result rows will be fetched by the SPA. – A valid number: Fetches the exact number of rows specified by in the SQL query <p>The default value is ALL_ROWS.</p> • PLAN_FILTER: plan filter for SQL tuning set (see <code>SELECT_SQLSET</code> for possible values) • PLAN_LINES_COMPARISON: <ul style="list-style-type: none"> - ALWAYS --line by line comparison of plans in all scenarios.- AUTO -Line by Line comparison of plans only if <code>phv2</code> is not available and <code>phv1</code> is different- NONE (default) - line by line comparison of plans only if <code>phv</code> is unknown

Table 168-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
	<ul style="list-style-type: none"> RANK_MEASURE1: first ranking measure for SQL tuning set RANK_MEASURE2: second possible ranking measure for SQL tuning set RANK_MEASURE3: third possible ranking measure for SQL tuning set REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values: <ul style="list-style-type: none"> CURRENT_SYSDATE: SYSDATE calls return the current date. SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS The default value is CURRENT_SYSDATE. RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. SQL_LIMIT: maximum number of SQL statements to process SQL_PERCENTAGE: percentage filter of SQL tuning set statements SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA. SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME. TIME_LIMIT: global time out (seconds) WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression. CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container.
parameter (contd.)	
value	New value of the specified parameter
test_execute_dop	Specifies the requested level of concurrency with which a SPA task should be executed. Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload.

Table 168-10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
compare_resultset	<p>Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement.</p> <ul style="list-style-type: none"> • If set to TRUE the result set comparison will be performed • If set to FALSE result set comparison will not be performed.

Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the `test_execute_dop` parameter. This parameter applies only to `test-execute` or `explain plan type` of trials that process a SQL Tuning set.

Examples

To request two concurrent processes to execute the SPA task:

```
dbms_sqlpa.set_analysis_task_parameter(:tname,'TEST_EXECUTE_DOP',2)
```

To enable result-set validation

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','TRUE')
```

To disable result-set validation:

```
exec
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','FALSE')
```

168.3.10 SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter IN VARCHAR2,
    value     IN VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter IN VARCHAR2,
    value     IN NUMBER);
```

Parameters

Table 168-11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter	<p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> • APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>) • DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. • EXECUTE_FULLDML: <code>TRUE</code> to execute DML statement fully, including acquiring row locks and modifying rows; <code>FALSE</code> (default) to execute only the query part of the DML without modifying data. When <code>TRUE</code>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) • EXECUTION_NAME1: name of the first task execution to analyze • EXECUTION_NAME2: name of the second task execution to analyze • LOCAL_TIME_LIMIT: per-statement time out (seconds)

Table 168-11 (Cont.) SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter (contd.)	<ul style="list-style-type: none"> • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. • SQL_LIMIT: maximum number of SQL statements to process • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • TIME_LIMIT: global time out (seconds) • WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
value	New value of the specified parameter

DBMS_SQLQ

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

This chapter contains the following topics:

- [DBMS_SQLQ Overview](#)
- [Summary of DBMS_SQLQ Subprograms](#)

169.1 DBMS_SQLQ Overview

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

You can use the `DBMS_SQLQ` package subprograms to:

- create quarantine configurations for execution plans of SQL statements and specify quarantine thresholds for their resource consumption
- query quarantine thresholds specified in quarantine configurations
- delete quarantine configurations
- transfer quarantine configurations from one database to another

169.2 Summary of DBMS_SQLQ Subprograms

This table lists the `DBMS_SQLQ` subprograms and briefly describes them.

Table 169-1 DBMS_SQLQ Package Subprograms

Procedure	Description
ALTER_QUARANTINE Procedure	Specifies a quarantine threshold in a quarantine configuration for execution plans of a SQL statement
CREATE_QUARANTINE_BY_SQL_ID Function	Creates a quarantine configuration for execution plans of a SQL statement using SQL ID
CREATE_QUARANTINE_BY_SQL_TEXT Function	Creates a quarantine configuration for execution plans of a SQL statement using SQL text
CREATE_STGTAB_QUARANTINE Procedure	Creates a staging table to store quarantine configurations
DROP_QUARANTINE Procedure	Deletes a quarantine configuration

Table 169-1 (Cont.) DBMS_SQLQ Package Subprograms

Procedure	Description
GET_PARAM_VALUE_QUARANTINE Function	Returns the value for a quarantine threshold specified in a quarantine configuration
PACK_STGTAB_QUARANTINE Function	Adds one or more quarantine configurations to a staging table
UNPACK_STGTAB_QUARANTINE Function	Creates quarantine configurations in a database from a staging table

169.2.1 ALTER_QUARANTINE Procedure

This procedure specifies a quarantine threshold for a resource in a quarantine configuration for execution plans of a SQL statement.

Syntax

```
DBMS_SQLQ.ALTER_QUARANTINE (
    quarantine_name  IN VARCHAR2,
    parameter_name  IN VARCHAR2,
    parameter_value  IN VARCHAR2);
```

Parameters

Table 169-2 ALTER_QUARANTINE Procedure Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration.
parameter_name	Name of the resource for which quarantine threshold needs to be specified. You can specify any one of the following values: <ul style="list-style-type: none"> CPU_TIME: CPU time ELAPSED_TIME: Elapsed time IO_MEGABYTES: I/O in megabytes IO_REQUESTS: Number of physical I/O requests IO_LOGICAL: Number of logical I/O requests ENABLED: Flag to enable or disable the quarantine configuration. Specify YES to enable it and NO to disable it. The default value is YES. AUTOPURGE: Flag to enable or disable automatic purging of the quarantine configuration. If it is set to YES, the quarantine configuration is automatically purged after 53 weeks, if not used. If it is set to NO, the quarantine configuration is never purged. The default value is YES.

Table 169-2 (Cont.) ALTER_QUARANTINE Procedure Parameters

Parameter	Description
parameter_value	Quarantine threshold for the resource specified in parameter_name.

Examples

In the following example, the quarantine threshold specified for CPU time is 5 seconds and elapsed time is 10 seconds for the quarantine configuration

SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'CPU_TIME',
    PARAMETER_VALUE => '5');

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'ELAPSED_TIME',
    PARAMETER_VALUE => '10');

END;
/
```

When the SQL statement is executed using the execution plan specified in the quarantine configuration, and if the Resource Manager threshold for CPU time is 5 seconds or less, or elapsed time is 10 seconds or less, then the SQL statement is not allowed to run.

169.2.2 CREATE_QUARANTINE_BY_SQL_ID Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL ID.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters**Table 169-3 CREATE_QUARANTINE_BY_SQL_ID Function Parameters**

Parameter	Description
sql_id	SQL ID of the SQL statement.

Table 169-3 (Cont.) CREATE_QUARANTINE_BY_SQL_ID Function Parameters

Parameter	Description
plan_hash_value	Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement.

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration for the SQL statement having the SQL ID of 8vu7s907prbgr. The quarantine configuration applies to all the execution plans of the SQL statement.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr');
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL ID of 8vu7s907prbgr.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID =>
'8vu7s907prbgr', PLAN_HASH_VALUE => '3488063716');
END;
/
```

169.2.3 CREATE_QUARANTINE_BY_SQL_TEXT Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL text.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT (
    sql_text          IN CLOB,
    plan_hash_value  IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 169-4 CREATE_QUARANTINE_BY_SQL_TEXT Function Parameters

Parameter	Description
sql_text	SQL statement.
plan_hash_value	Hash value of the execution plan of the SQL statement. Default value is NULL. When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement.

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration that applies to all the execution plans of the SQL statement 'select count(*) from emp'.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'));
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL text of 'select count(*) from emp'.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'), PLAN_HASH_VALUE => '3488063716');
END;
/
```

169.2.4 CREATE_STGTAB_QUARANTINE Procedure

This procedure creates a staging table to store the quarantine configurations, so that the staging table can be exported from the current database and imported into another database, thus enabling the quarantine configurations to be used across databases.

Syntax

```
DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (
    staging_table_name    IN VARCHAR2,
    staging_table_owner  IN VARCHAR2 DEFAULT NULL,
    tablespace_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 169-5 CREATE_STGTAB_QUARANTINE Procedure Parameters

Parameter	Description
staging_table_name	Name of the staging table.
staging_table_owner	Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.
tablespace_name	Name of the tablespace in which the staging table needs to be created. Default value is NULL, which means the staging table is created in the default tablespace of the database.

Examples

The following example creates the staging table `TBL_STG_QUARANTINE` in the default tablespace of the database and sets its table owner to the database user executing this procedure.

```
BEGIN
  DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

169.2.5 DROP_QUARANTINE Procedure

This procedure deletes a quarantine configuration.

Syntax

```
DBMS_SQLQ.DROP_QUARANTINE (quarantine_name IN VARCHAR2);
```

Parameters

Table 169-6 DROP_QUARANTINE Procedure Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration to delete.

Examples

The following example deletes the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
BEGIN
  DBMS_SQLQ.DROP_QUARANTINE ('SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4');
END;
/
```

169.2.6 GET_PARAM_VALUE_QUARANTINE Function

This function returns the quarantine threshold for a resource specified in a quarantine configuration.

Syntax

```
DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
    quarantine_name    IN VARCHAR2,
    parameter_name    IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 169-7 GET_PARAM_VALUE_QUARANTINE Function Parameters

Parameter	Description
quarantine_name	Name of the quarantine configuration.
parameter_name	Resource for which the quarantine threshold needs to be retrieved.

Return Value

Returns the quarantine threshold for a resource specified in a quarantine configuration.

Examples

The following example returns the quarantine threshold for CPU time specified in the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
DECLARE
    quarantine_config_setting_value VARCHAR2(30);
BEGIN
    quarantine_config_setting_value := DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
        QUARANTINE_NAME =>
        'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
        PARAMETER_NAME => 'CPU_TIME');
END;
```

169.2.7 PACK_STGTAB_QUARANTINE Function

This function adds one or more quarantine configurations into a staging table.

Syntax

```
DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
    staging_table_name    IN VARCHAR2,
    staging_table_owner  IN VARCHAR2 DEFAULT NULL,
    name                  IN VARCHAR2 DEFAULT '%',
    sql_text              IN VARCHAR2 DEFAULT '%');
```

```

        enabled          IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;

```

Parameters

Table 169-8 PACK_STGTAB_QUARANTINE Function Parameters

Parameter	Description
staging_table_name	Name of the staging table in which the quarantine configurations need to be added.
staging_table_owner	Name of the schema owner of the staging table. Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner.
name	Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.
sql_text	SQL statement text. Its value is case-sensitive and it accepts wildcard characters.
enabled	Flag indicating whether the quarantine configuration should be enabled or disabled. If it is set to <code>YES</code> , then the quarantine configuration is enabled, else it is disabled. Default value is <code>NULL</code> , which means the quarantine configuration is disabled by default.

Return Value

Number of quarantine configurations added to the staging table.

Examples

The following example adds all the quarantine configurations having the names starting with `SQL_QUARANTINE_` into the staging table `TBL_STG_QUARANTINE`.

```

DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE',
        NAME => 'SQL_QUARANTINE_%');
END;
/

```

169.2.8 UNPACK_STGTAB_QUARANTINE Function

This function creates quarantine configurations in a database from a staging table.

Syntax

```

DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
    staging_table_name  IN VARCHAR2,
    staging_table_owner IN VARCHAR2 DEFAULT NULL,
    name               IN VARCHAR2 DEFAULT '%',

```

```

    sql_text          IN VARCHAR2 DEFAULT '%',
    enabled           IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 169-9 UNPACK_STGTAB_QUARANTINE Function Parameters

Parameter	Description
staging_table_name	Name of the staging table from which the quarantine configurations need to be created in the database.
staging_table_owner	Name of the schema owner of the staging table. Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner.
name	Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.
sql_text	SQL statement text. Its value is case-sensitive and it accepts wildcard characters.
enabled	Flag indicating whether the quarantine configuration should be enabled or disabled. If its value is <code>YES</code> , then the quarantine configuration is enabled, else it is disabled. Default value is <code>NULL</code> , which means the quarantine configuration is disabled by default.

Return Value

Number of quarantine configurations created in the database from the staging table.

Examples

The following example creates the quarantine configurations in the database from all the quarantine configurations stored in the staging table `TBL_STG_QUARANTINE`.

```

DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
```

DBMS_SQLSET

The `DBMS_SQLSET` package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in `DBMS_SQLTUNE`. The difference is that `DBMS_SQLSET` does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- [DBMS_SQLSET Overview](#)
- [DBMS_SQLSET Security Model](#)
- [DBMS_SQLSET Data Structures](#)
- [Summary of DBMS_SQLSET Subprograms](#)

170.1 DBMS_SQLSET Overview

Use this package to manage SQL tuning sets.

Note:

All `DBMS_SQLSET` subprograms have equivalents in the `DBMS_SQLTUNE` package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT_SQLPA_TASK Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of subprograms listed in [Summary of DBMS_SQLSET Subprograms](#) facilitates this functionality. As examples:

- The [CREATE_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.
- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE_CURSOR_CACHE Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

170.2 DBMS_SQLSET Security Model

This package is available to `PUBLIC` and performs its own security checking.

SQL tuning set subprograms require either the `ADMINISTER SQL TUNING SET` or the `ADMINISTER ANY SQL TUNING SET` privilege. Users having the `ADMINISTER SQL TUNING SET` privilege can only create and modify a SQL tuning set that they own. The `ADMINISTER ANY SQL TUNING SET` privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use [CREATE_SQLSET Procedure and Function](#) to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the `ADMINISTER SQL TUNING SET` privilege to manipulate the SQL tuning set.

170.3 DBMS_SQLSET Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- [SQLSET_ROW Object Type](#)

170.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (  
    sql_id                VARCHAR(13),
```

```

force_matching_signature NUMBER,
sql_text                  CLOB,
object_list               sql_objects,
bind_data                 RAW(2000),
parsing_schema_name      VARCHAR2(30),
module                   VARCHAR2(48),
action                   VARCHAR2(32),
elapsed_time              NUMBER,
cpu_time                  NUMBER,
buffer_gets               NUMBER,
disk_reads                NUMBER,
direct_writes             NUMBER,
rows_processed            NUMBER,
fetches                   NUMBER,
executions                NUMBER,
end_of_fetch_count        NUMBER,
optimizer_cost            NUMBER,
optimizer_env             RAW(2000),
priority                  NUMBER,
command_type              NUMBER,
first_load_time           VARCHAR2(19),
stat_period               NUMBER,
active_stat_period        NUMBER,
other                     CLOB,
plan_hash_value           NUMBER,
sql_plan                  sql_plan_table_type,
bind_list                 sql_binds,
con_dbid                  NUMBER,
last_exec_start_time      VARCHAR2(19))

```

Attributes

Table 170-1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID.
forcing_matching_signature	Signature with literals, case, and whitespace removed.
sql_text	Full text for the SQL statement.
object_list	Currently not implemented.
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed.
module	Last application module for the SQL.
action	Last application action for the SQL.
elapsed_time	Sum total elapsed time for this SQL statement.
cpu_time	Sum total CPU time for this SQL statement.
buffer_gets	Sum total number of buffer gets.

Table 170-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
disk_reads	Sum total number of disk reads.
direct_writes	Sum total number of direct path writes.
rows_processed	Sum total number of rows processed by this SQL.
fetches	Sum total number of fetches.
executions	Total executions of this SQL statement.
end_of_fetch_count	Number of times the SQL statement was fully executed with all of its rows fetched.
optimizer_cost	Optimizer cost for this SQL.
optimizer_env	Optimizer environment for this SQL statement.
priority	User-defined priority (1,2,3).
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of the parent cursor.
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected.
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active.
other	Other column for user-defined attributes.
plan_hash_value	Plan hash value of the plan.
sql_plan	Execution plan for the SQL statement.
bind_list	List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive.
con_dbid	DBID of the PDB or CDB root.
last_exec_start_time	Most recent execution start time of this SQL statement.

170.4 Summary of DBMS_SQLSET Subprograms

This table lists the DBMS_SQLSET subprograms and briefly describes them.

Table 170-2 DBMS_SQLSET Package Subprograms

Subprogram	Description
ADD_REFERENCE Function	This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.
CAPTURE_CURSOR_CACHE Procedure	This procedure captures a workload from the shared SQL area into a SQL tuning set.
CREATE_SQLSET Procedure and Function	This procedure or function creates a SQL tuning set object in the database.

Table 170-2 (Cont.) DBMS_SQLSET Package Subprograms

Subprogram	Description
CREATE_STGTAB Procedure	This procedure creates a staging table through which SQL tuning sets are imported and exported.
DELETE_SQLSET Procedure	This procedure deletes a set of SQL statements from a SQL tuning set.
DROP_SQLSET Procedure	This procedure drops a SQL tuning set if it is not active.
LOAD_SQLSET Procedure	This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.
PACK_STGTAB Procedure	This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.
REMAP_STGTAB Procedure	This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.
REMOVE_REFERENCE Procedure	This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.
SELECT_CURSOR_CACHE Function	This function collects SQL statements from the workload repository.
SELECT_SQL_TRACE Function	This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> .
SELECT_SQLPA_TASK Function	This function collects SQL statements from a SQL Performance Analyzer comparison task.
SELECT_SQLSET Function	This is a table function that reads the contents of a SQL tuning set.
SELECT_WORKLOAD_REPOSITORY Function	This function collects SQL statements from the workload repository.
UNPACK_STGTAB Procedure	This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.
UPDATE_SQLSET Procedures	This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

170.4.1 ADD_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

Syntax

```
DBMS_SQLSET.ADD_REFERENCE (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 :=NULL)  
RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 170-3 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>description</code>	Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.

Return Values

The identifier of the added reference.

Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```
VARIABLE b_rid NUMBER;  
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload',  
description => 'my sts ref');
```

170.4.2 CAPTURE_CURSOR_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

Syntax

```
DBMS_SQLSET.CAPTURE_CURSOR_CACHE (
  sqlset_name      IN VARCHAR2,
  time_limit       IN POSITIVE := 1800,
  repeat_interval  IN POSITIVE := 300,
  capture_option   IN VARCHAR2 := 'MERGE',
  capture_mode     IN NUMBER    := MODE_REPLACE_OLD_STATS,
  basic_filter     IN VARCHAR2 := NULL,
  sqlset_owner     IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 170-4 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the SQL tuning set name
<code>time_limit</code>	Defines the total amount of time, in seconds, to execute.
<code>repeat_interval</code>	Defines the amount of time, in seconds, to pause between sampling.
<code>capture_option</code>	Specifies whether to insert new statements, update existing statements, or both. Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> .
<code>capture_mode</code>	Specifies the capture mode (<code>UPDATE</code> and <code>MERGE</code> capture options). Possible values: <ul style="list-style-type: none"> <code>MODE_REPLACE_OLD_STATS</code> — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set <code>MODE_ACCUMULATE_STATS</code> — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
<code>basic_filter</code>	Defines a filter to apply to the shared SQL area for each sample. If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set or <code>NULL</code> for current schema owner

Table 170-4 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
<code>recursive_sql</code>	Defines a filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>).

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    =>
'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    => 'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5, -
                                     capture_mode    =>
DBMS_SQLSET.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
                                     sqlset_name    => 'my_workload', -
                                     time_limit     => 30, -
                                     repeat_interval => 5, -
                                     capture_option  => 'INSERT');
```

170.4.3 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLSET.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL  
    sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLSET.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2 := NULL,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

Parameters

Table 170-5 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
description	Provides an optional description of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.

Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.

Examples

```
EXEC DBMS_SQLSET.CREATE_SQLSET(-  
    sqlset_name => 'my_workload', -  
    description => 'complete application workload');
```

170.4.4 CREATE_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

Syntax

```
DBMS_SQLSET.CREATE_STGTAB (
    table_name          IN VARCHAR2,
    schema_name         IN VARCHAR2 := NULL,
    tablespace_name     IN VARCHAR2 := NULL,
    db_version          IN NUMBER   := NULL);
```

Parameters

Table 170-6 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

Parameter	Description
table_name	Specifies the of the table to create. The name is case sensitive.
schema_name	Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.
tablespace_name	Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> • NULL (default) — Specifies the current database version. • STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. • STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. • STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. • STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. • STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

```
EXEC DBMS_SQLSET.CREATE_STGTAB(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 12c Release 1 (12.1.0.2) format:

```
BEGIN
    DBMS_SQLSET.CREATE_STGTAB (
        table_name => 'STGTAB_SQLSET_121'
    ,    db_version => DBMS_SQLSET.STS_STGTAB_12_1_VERSION );
END;
```

170.4.5 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLSET.DELETE_SQLSET (
  sqlset_name   IN  VARCHAR2,
  basic_filter  IN  VARCHAR2 := NULL,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 170-7 DELETE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time < 1000000');
```

170.4.6 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

Syntax

```
DBMS_SQLSET.DROP_SQLSET (
  sqlset_name   IN  VARCHAR2,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 170-8 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.

Table 170-8 (Cont.) DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');
```

170.4.7 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

Syntax

```
DBMS_SQLSET.LOAD_SQLSET (
  sqlset_name      IN VARCHAR2,
  populate_cursor  IN sqlset_cursor,
  load_option      IN VARCHAR2 := 'INSERT',
  update_option    IN VARCHAR2 := 'REPLACE',
  update_condition IN VARCHAR2 := NULL,
  update_attributes IN VARCHAR2 := NULL,
  ignore_null      IN BOOLEAN  := TRUE,
  commit_rows      IN POSITIVE := NULL,
  sqlset_owner     IN VARCHAR2 := NULL);
```

Parameters

Table 170-9 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of SQL tuning set to be loaded.
populate_cursor	Specifies the cursor reference to the SQL tuning set to be loaded.
load_option	Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> INSERT (default) — Adds only new statements. UPDATE — Updates existing the SQL statements and ignores any new statements. MERGE — Inserts new statements and updates the information of the existing ones.

Table 170-9 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_option	<p>Specifies how existing SQL statements are updated.</p> <p>This parameter is considered only if <code>load_option</code> is specified with <code>UPDATE</code> or <code>MERGE</code> as an option. The possible values are:</p> <ul style="list-style-type: none"> • <code>REPLACE</code> (default) — Updates the statement using the new statistics, bind list, object list, and so on. • <code>ACCUMULATE</code> — Combines attributes when possible (for example, statistics such as <code>elapsed_time</code>), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: <code>elapsed_time</code>, <code>buffer_gets</code>, <code>direct_writes</code>, <code>disk_reads</code>, <code>row_processed</code>, <code>fetches</code>, <code>executions</code>, <code>end_of_fetch_count</code>, <code>stat_period</code> and <code>active_stat_period</code>.
update_condition	<p>Specifies when to perform the update.</p> <p>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</p> <ul style="list-style-type: none"> • <code>OLD</code> — Refers to statement attributes from the SQL tuning set (destination). • <code>NEW</code> — Refers to statement attributes from the input statements (source).
update_attributes	<p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • <code>NULL</code> (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to <code>ALL</code> without execution contexts such as module and action. • <code>BASIC</code> — Specifies statistics and binds only. • <code>TYPICAL</code> — Specifies <code>BASIC</code> with SQL plans (without row source statistics) and without an object reference list. • <code>ALL</code> — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: <ul style="list-style-type: none"> – <code>EXECUTION_CONTEXT</code> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> with added row source statistics)
ignore_null	<p>Specifies whether to update attributes when the new value is <code>NULL</code>.</p> <p>If <code>TRUE</code>, then the procedure does not update an attribute when the new value is <code>NULL</code>. That is, do not override with <code>NULL</code> values unless intentional.</p>

Table 170-9 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
<code>commit_rows</code>	Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If <code>NULL</code> is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the <code>DBA_SQLSET</code> views. The <code>STATEMENT_COUNT</code> value increases as new SQL statements are loaded.
<code>sqlset_owner</code>	Defines the owner of the SQL tuning set, or the current schema owner (or <code>NULL</code> for the current owner).

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to `SYS` schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> 'SYS' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
```

```
END;
/
```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <>'
                                                'SYS',
                                                NULL, NULL, NULL, NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur,
                          load_option     => 'MERGE',
                          update_option   => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
```

```

SELECT VALUE(P)
FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;

DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                        populate_cursor => cur,
                        load_option     => 'UPDATE');

END;
/

```

170.4.8 PACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.

Syntax

```

DBMS_SQLSET.PACK_STGTAB (
  sqlset_name      IN VARCHAR2,
  sqlset_owner     IN VARCHAR2 := NULL,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version       IN NUMBER   := NULL);

```

Parameters

The parameters are identical for the DBMS_SQLTUNE.PACK_STGTAB_SQLSET and DBMS_SQLSET.PACK_STGTAB procedures.

Table 170-10 PACK_STGTAB_SQLSET and PACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted.
sqlset_owner	Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted.
staging_table_name	Specifies the name of the table to use. The value is case sensitive.
staging_schema_owner	Specifies the schema where the table resides, or NULL for the current schema. The value is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values: <ul style="list-style-type: none"> NULL (default) — Specifies the current database version. STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.

Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a `COMMIT` after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   sqlset_owner   => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'my_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 2 (11.2):

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
```

```
, db_version          => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

170.4.9 REMAP_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

Syntax

```
DBMS_SQLSET.REMAP_STGTAB (
  old_sqlset_name      IN VARCHAR2,
  old_sqlset_owner     IN VARCHAR2 := NULL,
  new_sqlset_name      IN VARCHAR2 := NULL,
  new_sqlset_owner     IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  old_con_dbid         IN NUMBER   := NULL,
  new_con_dbid         IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 170-11 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.
old_sqlset_owner	Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	Specifies the new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	Specifies the new owner for the tuning set, or NULL to keep the same owner name.
staging_table_name	Specifies the name of the table on which to perform the remap operation. The value is case sensitive.
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.
old_con_dbid	Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.
new_con_dbid	Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name =>
'my_workload'
  ,   old_sqlset_owner => 'SH'
  ,   new_sqlset_name =>
'imp_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name => 'imp_workload'
  ,   old_sqlset_owner => 'SH'
  ,   new_sqlset_owner => 'SYS'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

170.4.10 REMOVE_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

Syntax

```
DBMS_SQLSET.REMOVE_REFERENCE (
  sqlset_name   IN VARCHAR2,
  reference_id  IN NUMBER,
  sqlset_owner  IN VARCHAR2 := NULL,
  force_remove  IN NUMBER   := 0);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE and DBMS_SQLSET.REMOVE_REFERENCE procedures.

Table 170-12 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
reference_id	Specifies the identifier of the reference to remove.
sqlset_owner	Specifies the owner of the SQL tuning set (or NULL for the current schema owner).

Table 170-12 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>force_remove</code>	Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name => 'my_workload', -
                                reference_id => :rid);
```

Use the `DBA_SQLSET_REFERENCES` view to find all references to a given SQL tuning set.

170.4.11 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (
  basic_filter      IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN  NUMBER := NULL,
  attribute_list   IN  VARCHAR2 := 'TYPICAL',
  recursive_sql    IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 170-13 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>basic_filter</code>	Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.

Table 170-13 (Cont.) SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>object_filter</code>	Currently not supported.
<code>ranking_measure(n)</code>	Defines an <code>ORDER BY</code> clause on the selected SQL.
<code>result_percentage</code>	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. The value applies only if one ranking measure is supplied.
<code>result_limit</code>	Defines the top limit SQL from the filtered source ranked by the ranking measure.
<code>attribute_list</code>	Specifies the list of SQL statement attributes to return in the result. Possible values are: <ul style="list-style-type: none"> • <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default). • <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • <code>ALL</code> — Specifies all attributes. • Comma-separated list of attribute names. This values returns only a subset of SQL attributes: <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>BIND_LIST</code> – <code>OBJECT_LIST</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics
<code>recursive_sql</code>	Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Example 170-1 Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```
SELECT SQL_ID, SQL_TEXT
FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

Example 170-2 All Information About a Statement

The following query obtains all information about the SQL statement with the SQL ID 4rm4183czbs7j:

```
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j''));
```

Example 170-3 Multiple Plans for a SQL Statement

A data source may store multiple plans for each SQL statement. The output of the `SELECT_CURSOR_CACHE` function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID `ay1m3ssvtrh24`:

```
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id =
''ay1m3ssvtrh24''))
ORDER BY sql_id, plan_hash_value;
```

Example 170-4 Processing All Statements in the Shared SQL Area

This example processes all statements in the shared SQL area:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

  -- Process each statement in cursor (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

Example 170-5 Process Statements Not Parsed by SYS

This example processes all statements not parsed in the `SYS` schema:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <>
''SYS'')) p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
```

```
end;  
/
```

Example 170-6 All Statements from an Application Module and Action

This example processes all statements from a specified application module and action:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(p)  
    FROM TABLE(  
      DBMS_SQLSET.SELECT_CURSOR_CACHE(  
        'module = 'MY_APPLICATION' and action = 'MY_ACTION'')) p;  
  
  -- Process each statement (or pass cursor to load_sqlset)  
  
  CLOSE cur;  
END;/
```

Example 170-7 All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(P)  
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;  
  
  -- Process each statement (or pass cursor to load_sqlset)  
  
  CLOSE cur;  
END;  
/
```

Example 170-8 Statements Parsed in the APPS Schema

This example processes all SQL statements that were parsed in the APPS schema and had more than 100 buffer gets:

```
DECLARE  
  cur sys_refcursor;  
BEGIN  
  OPEN cur FOR  
    SELECT VALUE(p)  
    FROM TABLE(  
      DBMS_SQLSET.SELECT_CURSOR_CACHE(  
        'buffer_gets > 100 and parsing_schema_name = 'APPS''))p;  
  
  -- Process each statement (or pass cursor to load_sqlset)
```

```
    CLOSE cur;
END;
/
```

Example 170-9 Plans and SQL Statements

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The `SQL_PLAN` attribute of `sqlset_row` is `NULL`.

```
-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and
-- binds
-- for performance reasons - in this case the SQL_PLAN attribute of
-- sqlset_row
-- is NULL)
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => 'elapsed_time > 5000000',
            object_filter     => NULL,
            ranking_measure1  => NULL,
            ranking_measure2  => NULL,
            ranking_measure3  => NULL,
            result_percentage => 1,
            result_limit      => NULL,
            attribute_list    => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
            recursive_sql     => HAS_RECURSIVE_SQL)) p;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;/
```

Example 170-10 Top 100 Statements Ordered by Elapsed Time

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => NULL,
            object_filter     => NULL,
            ranking_measure_1 => 'ELAPSED_TIME',
            ranking_measure_2 => NULL,
            ranking_measure_3 => NULL,
            result_percentage => 1,
```

```

        result_limit      => 100,
        attribute_list    => 'TYPICAL',
        recursive_sql     => HAS_RECURSIVE_SQL))) p;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

Example 170-11 Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure_1 => 'BUFFER_GETS',
      ranking_measure_2 => NULL,
      ranking_measure_3 => NULL,
      result_percentage => .9,
      result_limit      => NULL,
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL))) p;

-- Process each statement (or pass cursor to load_sqlset).

CLOSE cur;
END;
/

```

170.4.12 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

Syntax

```

DBMS_SQLSET.SELECT_SQL_TRACE (
  directory          IN VARCHAR2,
  file_name          IN VARCHAR2 := NULL,
  mapping_table_name IN VARCHAR2 := NULL,
  mapping_table_owner IN VARCHAR2 := NULL,
  select_mode        IN POSITIVE := SINGLE_EXECUTION,
  options            IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start      IN VARCHAR2 := NULL,

```

```

pattern_end          IN VARCHAR2 := NULL,
result_limit        IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 170-14 SELECT_SQL_TRACE Function Parameters

Parameter	Description
directory	Defines the directory object containing the trace files. This field is mandatory.
file_name	Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.
mapping_table_name	Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.
mapping_table_owner	Specifies the mapping table owner. If it is NULL, then the function uses the current user.
select_mode	Specifies the mode for selecting SQL from the trace. Possible values are: <ul style="list-style-type: none"> SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. ALL_EXECUTIONS — Returns all executions.
options	Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. ALL_COMMAND_TYPE — Returns the SQL statements with all command types.
pattern_start	Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.
pattern_end	Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.
result_limit	Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.

Return Values

This function returns a SQLSET_ROW object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with SELECT privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
     FROM TABLE(
       DBMS_SQLSET.SELECT_SQL_TRACE(
         directory=>'SQL_TRACE_DIR',
         file_name=>'%trc',
         mapping_table_name=>'mapping')) p;
  DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/
```

 **See Also:**

Oracle Database SQL Language Reference to learn more about the `PATH_PREFIX` clause

170.4.13 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

Oracle Database Testing Guide for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLSET.SELECT_SQLPA_TASK(  
    task_name          IN VARCHAR2,  
    task_owner         IN VARCHAR2 := NULL,  
    execution_name     IN VARCHAR2 := NULL,  
    level_filter       IN VARCHAR2 := 'REGRESSED',  
    basic_filter       IN VARCHAR2 := NULL,  
    object_filter      IN VARCHAR2 := NULL,  
    attribute_list     IN VARCHAR2 := 'TYPICAL')  
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 170-15 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
<code>task_name</code>	Specifies the name of the SQL Performance Analyzer task.
<code>task_owner</code>	Specifies the owner of the SQL Performance Analyzer task. If NULL, then assume the current user.
<code>execution_name</code>	Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code>) from which the provided filters will be applied. If NULL, then assume the most recent <code>COMPARE PERFORMANCE</code> execution.

Table 170-15 (Cont.) SELECT_SQLPA_TASK Function Parameters

Parameter	Description
level_filter	<p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> IMPROVED includes only improved SQL. REGRESSED includes only regressed SQL (default). CHANGED includes only SQL with changed performance. UNCHANGED includes only SQL with unchanged performance. CHANGED_PLANS includes only SQL with plan changes. UNCHANGED_PLANS includes only SQL with unchanged plans. ERRORS includes only SQL with errors only. MISSING_SQL includes only missing SQL statements (across STS). NEW_SQL includes only new SQL statements (across STS).
basic_filter	Specifies the SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.
attribute_list	<p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. ALL — Returns all attributes. Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

170.4.14 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

Syntax

```
DBMS_SQLSET.SELECT_SQLSET (
  sqlset_name      IN   VARCHAR2,
  basic_filter     IN   VARCHAR2 := NULL,
  object_filter    IN   VARCHAR2 := NULL,
  ranking_measure1 IN   VARCHAR2 := NULL,
  ranking_measure2 IN   VARCHAR2 := NULL,
  ranking_measure3 IN   VARCHAR2 := NULL,
```

```

result_percentage IN NUMBER := 1,
result_limit     IN NUMBER := NULL)
attribute_list   IN VARCHAR2 := 'TYPICAL',
plan_filter      IN VARCHAR2 := NULL,
sqlset_owner     IN VARCHAR2 := NULL,
recursive_sql    IN VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 170-16 SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to query.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW.
object_filter	Currently not supported.
ranking_measure(n)	Specifies an ORDER BY clause on the selected SQL.
result_percentage	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.
result_limit	The top limit SQL from the filtered source, ranked by the ranking measure.
attribute_list	Defines the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • ALL — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics)

Table 170-16 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
<code>plan_filter</code>	<p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> • <code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp. • <code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp. • <code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>MAX_ELAPSED_TIME</code> — Returns the plan with the maximum elapsed time. • <code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets. • <code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads. • <code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes. • <code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.
<code>recursive_sql</code>	Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)
```

```

    CLOSE cur;
END;
/

```

170.4.15 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := 'TYPICAL',
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

```

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  baseline_name   IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit    IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := 'TYPICAL',
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 170-17 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
<code>begin_snap</code>	Defines the beginning AWR snapshot (non-inclusive).
<code>end_snap</code>	Defines the ending AWR snapshot (inclusive).

Table 170-17 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
baseline_name	Specifies the name of the AWR baseline period.
basic_filter	Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
object_filter	Currently not supported.
ranking_measure(n)	Defines an <code>ORDER BY</code> clause on the selected SQL.
result_percentage	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.
result_limit	Specifies the top limit SQL from the source according to the supplied ranking measure.
attribute_list	Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default. • <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. • <code>ALL</code> — Returns all attributes • Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).
recursive_sql	Specifies the filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>).
dbid	Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
```

```

OPEN cur FOR
  SELECT VALUE (P)
  FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/

```

170.4.16 UNPACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

Syntax

```

DBMS_SQLSET.UNPACK_STGTAB (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner         IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);

```

Parameters

The parameters are identical for DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET and DBMS_SQLSET.UNPACK_STGTAB.

Table 170-18 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.
sqlset_owner	Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.
replace	Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.
staging_table_name	Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).

Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace         => FALSE, -
                               staging_table_name => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system. In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call
unpack
-- Replace set to TRUE.
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace         => TRUE, -
                               staging_table_name => 'STGTAB_SQLSET');
```

170.4.17 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

Syntax

```
DBMS_SQLSET.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

```
DBMS_SQLSET.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

Parameters

Table 170-19 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sql_id	Specifies the identifier of the SQL statement to be updated.
plan_hash value	Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.

Table 170-19 (Cont.) UPDATE_SQLSET Procedure Parameters

Parameter	Description
<code>attribute_name</code>	Specifies the name of the attribute to be modified. You can update the text field for <code>MODULE</code> , <code>ACTION</code> , <code>PARSING_SCHEMA_NAME</code> , and <code>OTHER</code> . The only numerical field that you can update is <code>PRIORITY</code> . If a statement has multiple plans, then the procedure changes the attribute value for all plans.
<code>attribute_value</code>	Specifies the new value of the attribute.

DBMS_SQLTUNE

The `DBMS_SQLTUNE` package is the interface for tuning SQL on demand. The related package `DBMS_AUTO_SQLTUNE` package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- [DBMS_SQLTUNE Overview](#)
- [DBMS_SQLTUNE Security Model](#)
- [DBMS_SQLTUNE Data Structures](#)
- [DBMS_SQLTUNE Subprogram Groups](#)
- [Summary of DBMS_SQLTUNE Subprograms](#)

See Also:

["DBMS_AUTO_SQLTUNE Overview"](#)

171.1 DBMS_SQLTUNE Overview

The `DBMS_SQLTUNE` package provides a number of interrelated areas of functionality.

This section contains the following topics:

- [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS_SQLTUNE SQL Profile Subprograms](#)
- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#)

SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. [CREATE_TUNING_TASK Functions](#) creates a tuning task for tuning one or more SQL statements.
2. The [EXECUTE_TUNING_TASK Function and Procedure](#) executes a previously created tuning task.

3. The [REPORT_TUNING_TASK Function](#) displays the results of a tuning task.
4. You use the [SCRIPT_TUNING_TASK Function](#) to create a SQL*Plus script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [DBMS_SQLTUNE SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT_SQL_PROFILE Procedure and Function](#) to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL profile with the [ALTER_SQL_PROFILE Procedure](#).
- You can drop a SQL profile with the [DROP_SQL_PROFILE Procedure](#).

SQL Tuning Sets

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT_SQLPA_TASK Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- The [CREATE_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.

- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE_CURSOR_CACHE_SQLSET Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

 **Note:**

When manipulating SQL tuning sets, you can use [DBMS_SQLSET](#) as an alternative to `DBMS_SQLTUNE`.

Import and Export of SQL Tuning Sets and SQL Profiles

Use `DBMS_SQLTUNE` subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the [CREATE_STGTAB_SQLPROF Procedure](#) or the [CREATE_STGTAB_SQLSET Procedure](#).
2. To populate the staging table with information from the source system, call the [PACK_STGTAB_SQLPROF Procedure](#) or [PACK_STGTAB_SQLSET Procedure](#).
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the [UNPACK_STGTAB_SQLPROF Procedure](#) or the [UNPACK_STGTAB_SQLSET Procedure](#).

 **See Also:**

Oracle Database SQL Tuning Guide for more information about programmatic flow

Automatic Tuning Task Functions

The automated system task `SYS_AUTO_SQL_TUNING_TASK` is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK` API.

 **See Also:**

[DBMS_AUTO_SQLTUNE](#) for the list of subprograms that you can use to manage the automated SQL tuning task.

Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views expose these statistics. In addition, `DBMS_SQLTUNE` provides the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions to report monitoring information.

Note:

`DBMS_SQL_MONITOR` also contains the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions.

Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables `DBMS_SQLTUNE` to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the `database_link_to` parameter.

171.2 DBMS_SQLTUNE Security Model

This package is available to `PUBLIC` and performs its own security checking.

Note the following:

- Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (`*_TUNING_TASK`) require the `ADVISOR` privilege.
- SQL tuning set subprograms (`*_SQLSET`) require either of the following privileges:
 - `ADMINISTER SQL TUNING SET`
You can only create and modify a SQL tuning set that you own.
 - `ADMINISTER ANY SQL TUNING SET`
You can operate on all SQL tuning sets, even those owned by other users.
- In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
 - `CREATE ANY SQL PROFILE`
 - `ALTER ANY SQL PROFILE`
 - `DROP ANY SQL PROFILE`

The preceding privileges have been deprecated in favor of `ADMINISTER SQL MANAGEMENT OBJECT`.

171.3 DBMS_SQLTUNE Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

Object Types

- [SQLSET_ROW Object Type](#)

171.3.1 SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text              CLOB,
  object_list          sql_objects,
  bind_data            RAW(2000),
  parsing_schema_name  VARCHAR2(30),
  module               VARCHAR2(48),
  action               VARCHAR2(32),
  elapsed_time         NUMBER,
  cpu_time             NUMBER,
  buffer_gets          NUMBER,
  disk_reads           NUMBER,
  direct_writes        NUMBER,
  rows_processed       NUMBER,
  fetches              NUMBER,
  executions           NUMBER,
  end_of_fetch_count   NUMBER,
  optimizer_cost       NUMBER,
  optimizer_env        RAW(2000),
  priority             NUMBER,
  command_type         NUMBER,
  first_load_time      VARCHAR2(19),
  stat_period          NUMBER,
  active_stat_period   NUMBER,
  other                CLOB,
  plan_hash_value      NUMBER,
```

```

sql_plan          sql_plan_table_type,
bind_list         sql_binds,
con_dbid         NUMBER,
last_exec_start_time  VARCHAR2(19))

```

Attributes

Table 171-1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID.
forcing_matching_signature	Signature with literals, case, and whitespace removed.
sql_text	Full text for the SQL statement.
object_list	Currently not implemented.
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed.
module	Last application module for the SQL.
action	Last application action for the SQL.
elapsed_time	Sum total elapsed time for this SQL statement.
cpu_time	Sum total CPU time for this SQL statement.
buffer_gets	Sum total number of buffer gets.
disk_reads	Sum total number of disk reads.
direct_writes	Sum total number of direct path writes.
rows_processed	Sum total number of rows processed by this SQL.
fetches	Sum total number of fetches.
executions	Total executions of this SQL statement.
end_of_fetch_count	Number of times the SQL statement was fully executed with all of its rows fetched.
optimizer_cost	Optimizer cost for this SQL.
optimizer_env	Optimizer environment for this SQL statement.
priority	User-defined priority (1,2,3).
command_type	Statement type, such as <code>INSERT</code> or <code>SELECT</code> .
first_load_time	Load time of the parent cursor.
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected.
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active.
other	Other column for user-defined attributes.
plan_hash_value	Plan hash value of the plan.
sql_plan	Execution plan for the SQL statement.

Table 171-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
<code>bind_list</code>	List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for <code>bind_data</code> : they are mutually exclusive.
<code>con_dbid</code>	DBID of the PDB or CDB root.
<code>last_exec_start_time</code>	Most recent execution start time of this SQL statement.

171.4 DBMS_SQLTUNE Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function.

- [DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS_SQLTUNE SQL Profile Subprograms](#)
- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#)
- [DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms](#)
- [DBMS_SQLTUNE SQL Performance Reporting Subprograms](#)

171.4.1 DBMS_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 171-2 SQL Tuning Task Subprograms

Subprogram	Description
" CANCEL_TUNING_TASK Procedure "	Cancels the currently executing tuning task
" CREATE_SQL_PLAN_BASELINE Procedure "	Creates a SQL plan baseline for an existing plan
" CREATE_TUNING_TASK Functions "	Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor
" DROP_TUNING_TASK Procedure "	Drops a SQL tuning task
" EXECUTE_TUNING_TASK Function and Procedure "	Executes a previously created tuning task
" IMPLEMENT_TUNING_TASK Procedure "	Implements a set of SQL profile recommendations made by SQL Tuning Advisor
" INTERRUPT_TUNING_TASK Procedure "	Interrupts the currently executing tuning task
" REPORT_AUTO_TUNING_TASK Function "	Displays a report from the automatic tuning task, reporting on a range of executions
" REPORT_TUNING_TASK Function "	Displays the results of a tuning task
" RESET_TUNING_TASK Procedure "	Resets the currently executing tuning task to its initial state
" RESUME_TUNING_TASK Procedure "	Resumes a previously interrupted task that was created to process a SQL tuning set

Table 171-2 (Cont.) SQL Tuning Task Subprograms

Subprogram	Description
" SCHEDULE_TUNING_TASK Function "	Creates a tuning task and schedules its execution as a scheduler job
" SCRIPT_TUNING_TASK Function "	Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations
" SET_TUNING_TASK_PARAMETER Procedures "	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER

"[Summary of DBMS_SQLTUNE Subprograms](#)" contains a complete listing of all subprograms in the package.

171.4.2 DBMS_SQLTUNE SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

Table 171-3 SQL Profile Subprograms

Subprogram	Description
ACCEPT_ALL_SQL_PROFILES Procedure	Accepts all SQL profiles recommended by a specific execution of a tuning task
ACCEPT_SQL_PROFILE Procedure and Function	Creates a SQL profile for the specified tuning task
ALTER_SQL_PROFILE Procedure	Alters specific attributes of an existing SQL profile object
CREATE_STGTAB_SQLPROF Procedure	Creates the staging table used for copying SQL profiles from one system to another
DROP_SQL_PROFILE Procedure	Drops the named SQL profile from the database
PACK_STGTAB_SQLPROF Procedure	Moves profile data out of the SYS schema into the staging table
REMAP_STGTAB_SQLPROF Procedure	Changes the profile data values kept in the staging table prior to performing an unpack operation
SQLTEXT_TO_SIGNATURE Function	Returns a SQL text's signature
UNPACK_STGTAB_SQLPROF Procedure	Uses the profile data stored in the staging table to create profiles on this system

"[Summary of DBMS_SQLTUNE Subprograms](#)" contains a complete listing of all subprograms in the package.

171.4.3 DBMS_SQLTUNE SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 171-4 SQL Tuning Set Subprograms

Subprogram	Description
ADD_SQLSET_REFER ENCE Function	Adds a new reference to an existing SQL tuning set to indicate its use by a client
CAPTURE_CURSOR_ CACHE_SQLSET Procedure	Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set
CREATE_SQLSET Procedure and Function	Creates a SQL tuning set object in the database
CREATE_STGTAB_SQ LSET Procedure	Creates a staging table through which SQL Tuning Sets are imported and exported
DELETE_SQLSET Procedure	Deletes a set of SQL statements from a SQL tuning set
DROP_SQLSET Procedure	Drops a SQL tuning set if it is not active
LOAD_SQLSET Procedure	Populates the SQL tuning set with a set of selected SQL
PACK_STGTAB_SQ LSET Procedure	Copies tuning sets out of the SYS schema into the staging table
REMAP_STGTAB_SQ LSET Procedure	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system
REMOVE_SQLSET_RE FERENCE Procedure	Deactivates a SQL tuning set to indicate it is no longer used by the client
SELECT_CURSOR_CA CHE Function	Collects SQL statements from the shared SQL area
SELECT_SQL_TRACE Function	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>
SELECT_SQLPA_TASK Function	Collects SQL statements from a SQL performance analyzer comparison task
SELECT_SQLSET Function	Collects SQL statements from an existing SQL tuning set
SELECT_WORKLOAD_ REPOSITORY Function	Collects SQL statements from the workload repository
UNPACK_STGTAB_SQ LSET Procedure	Copies one or more SQL tuning sets from the staging table
UPDATE_SQLSET Procedures	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The [Summary of DBMS_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

171.4.4 DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 171-5 Real-Time SQL Monitoring Subprograms

Subprogram	Description
REPORT_SQL_MONITOR Function	Reports on Real-Time SQL Monitoring
REPORT_SQL_MONITOR_LIST Function	Builds a report for all or a subset of statements monitored by Oracle Database
REPORT_SQL_MONITOR_LIST_XML Function	Builds an XML report for all or a subset of statements monitored by Oracle Database

171.4.5 DBMS_SQLTUNE SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the shared SQL area and automatic workload repository (AWR).

Table 171-6 SQL Performance Reporting Subprograms

Subprogram	Description
REPORT_SQL_DETAIL Function	This function reports on a specific SQL ID.
REPORT_SQL_MONITOR Function	This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.
REPORT_SQL_MONITOR_LIST Function	This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics.
REPORT_TUNING_TASK Function	This function displays the results of a tuning task.
REPORT_TUNING_TASK_XML Function	This function displays an XML report of a tuning task.

171.5 Summary of DBMS_SQLTUNE Subprograms

This table lists the DBMS_SQLTUNE subprograms and briefly describes them.

Table 171-7 DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
ACCEPT_ALL_SQL_PROFILES Procedure	Accepts all SQL profiles recommended by a particular execution of a particular tuning task	DBMS_SQLTUNE SQL Profile Subprograms
ACCEPT_SQL_PROFILE Procedure and Function	Creates a SQL profile for the specified tuning task	DBMS_SQLTUNE SQL Profile Subprograms
ADD_SQLSET_REFERENCE Function	Adds a new reference to an existing SQL tuning set to indicate its use by a client	DBMS_SQLTUNE SQL Tuning Set Subprograms
ALTER_SQL_PROFILE Procedure	Alters specific attributes of an existing SQL profile object	DBMS_SQLTUNE SQL Profile Subprograms

Table 171-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
CANCEL_TUNING_TASK Procedure	Cancels the currently executing tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
CAPTURE_CURSOR_CACHE_SQLSET Procedure	Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_SQL_PLAN_BASELINE Procedure	Creates a SQL plan baseline for an existing plan	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
CREATE_SQLSET Procedure and Function	Creates a SQL tuning set object in the database	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_STGTAB_SQLPROF Procedure	Creates the staging table used for copying SQL profiles from one system to another	DBMS_SQLTUNE SQL Profile Subprograms
CREATE_STGTAB_SQLSET Procedure	Creates a staging table through which SQL tuning sets are imported and exported	DBMS_SQLTUNE SQL Tuning Set Subprograms
CREATE_TUNING_TASK Functions	Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
DELETE_SQLSET Procedure	Deletes a set of SQL statements from a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
DROP_SQL_PROFILE Procedure	Drops the named SQL profile from the database	DBMS_SQLTUNE SQL Profile Subprograms
DROP_SQLSET Procedure	Drops a SQL tuning set if it is not active	DBMS_SQLTUNE SQL Tuning Set Subprograms
DROP_TUNING_TASK Procedure	Drops a SQL tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
EXECUTE_TUNING_TASK Function and Procedure	Executes a previously created tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
IMPLEMENT_TUNING_TASK Procedure	implements a set of SQL profile recommendations made by SQL Tuning Advisor	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
INTERRUPT_TUNING_TASK Procedure	Interrupts the currently executing tuning task	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
LOAD_SQLSET Procedure	Populates the SQL tuning set with a set of selected SQL	DBMS_SQLTUNE SQL Tuning Set Subprograms
PACK_STGTAB_SQLPROF Procedure	Moves profile data out of the SYS schema into the staging table	DBMS_SQLTUNE SQL Profile Subprograms
PACK_STGTAB_SQLSET Procedure	Moves tuning sets out of the SYS schema into the staging table	DBMS_SQLTUNE SQL Tuning Set Subprograms

Table 171-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
REMAP_STGTAB_SQLPROF Procedure	Changes the profile data values kept in the staging table prior to performing an unpack operation	DBMS_SQLTUNE SQL Profile Subprograms
REMAP_STGTAB_SQLSET Procedure	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system	DBMS_SQLTUNE SQL Tuning Set Subprograms
REMOVE_SQLSET_REFERENCE Procedure	Deactivates a SQL tuning set to indicate it is no longer used by the client	DBMS_SQLTUNE SQL Tuning Set Subprograms
REPORT_AUTO_TUNING_TASK Function	Displays a report from the automatic tuning task, reporting on a range of subtasks	DBMS_SQLTUNE SQL Tuning Set Subprograms
REPORT_SQL_DETAIL Function	Reports on a specific SQL ID	DBMS_SQLTUNE SQL Performance Reporting Subprograms
REPORT_SQL_MONITOR Function	Builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_SQL_MONITOR_LIST Function	Builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_SQL_MONITOR_LIST_XML Function	Equivalent to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code>	DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
REPORT_TUNING_TASK Function	Displays the results of a tuning task	DBMS_SQLTUNE SQL Performance Reporting Subprograms
REPORT_TUNING_TASK_XML Function	Displays an XML report of a tuning task	DBMS_SQLTUNE SQL Performance Reporting Subprograms
RESET_TUNING_TASK Procedure	Resets the currently executing tuning task to its initial state	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
RESUME_TUNING_TASK Procedure	Resumes a previously interrupted task that was created to process a SQL tuning set	DBMS_SQLTUNE SQL Tuning Advisor Subprograms

Table 171-7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
SCHEDULE_TUNING_TASK Function	Creates a SQL tuning task and schedule its execution as a scheduler job	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SCRIPT_TUNING_TASK Function	Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SELECT_CURSOR_CACHE Function	Collects SQL statements from the shared SQL area	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQL_TRACE Function	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQLPA_TASK Function	Collects SQL statements from a SQL Performance Analyzer comparison task	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_SQLSET Function	Collects SQL statements from an existing SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms
SELECT_WORKLOAD_REPOSITORY Function	Collects SQL statements from the workload repository	DBMS_SQLTUNE SQL Tuning Set Subprograms
SET_TUNING_TASK_PARAMETER Procedures	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER	DBMS_SQLTUNE SQL Tuning Advisor Subprograms
SQLTEXT_TO_SIGNATURE Function	Returns a SQL text's signature	DBMS_SQLTUNE SQL Profile Subprograms
UNPACK_STGTAB_SQLPROFILE Procedure	Uses the profile data stored in the staging table to create profiles on this system	DBMS_SQLTUNE SQL Profile Subprograms
UNPACK_STGTAB_SQLSET Procedure	Moves one or more SQL tuning sets from the staging table	DBMS_SQLTUNE SQL Tuning Set Subprograms
UPDATE_SQLSET Procedures	Updates selected fields for a SQL statement in a SQL tuning set	DBMS_SQLTUNE SQL Tuning Set Subprograms

171.5.1 ACCEPT_ALL_SQL_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
  task_name          IN VARCHAR2,
  category           IN VARCHAR2 := NULL,
  replace            IN BOOLEAN  := FALSE,
  force_match        IN BOOLEAN  := FALSE,
  profile_type       IN VARCHAR2 := REGULAR_PROFILE,
  autotune_period    IN NUMBER   := NULL,
  execution_name     IN VARCHAR2 := NULL,
  task_owner         IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  database_link_to   IN VARCHAR2 := NULL);
```

Parameters

Table 171-8 ACCEPT_ALL_SQL_PROFILES Procedure Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
category	This is the category name which must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.
replace	If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
force_match	If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter.
profile_type	Options: <ul style="list-style-type: none"> <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. <code>PX_PROFILE</code> - regular profile with a change to parallel execution

Table 171-8 (Cont.) ACCEPT_ALL_SQL_PROFILES Procedure Parameters

Parameter	Description
<code>autotune_period</code>	<p>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</p> <ul style="list-style-type: none"> • null or negative value (default) - all or full. The result includes all task executions. • 0 - result of the current or most recent task execution. • 1 - result for the most recent 24-hour period. • 7 - result for the most recent 7-day period. <p>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</p>
<code>execution_name</code>	Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.
<code>task_owner</code>	Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
<code>description</code>	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.
<code>database_link_to</code>	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Security Model

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required. The `CREATE ANY SQL PROFILE` privilege is deprecated.

171.5.2 ACCEPT_SQL_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL

Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

    category      IN  VARCHAR2 := NULL;
    task_owner    IN  VARCHAR2 := NULL,
    replace       IN  BOOLEAN   := FALSE,
    force_match   IN  BOOLEAN   := FALSE,
    profile_type  IN  VARCHAR2 := REGULAR_PROFILE,
    database_link_to IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 171-9 ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.
description	A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.

Table 171-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
category	The category name. This name must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
force_match	If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter.
profile_type	Options: <ul style="list-style-type: none">• <code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.• <code>PX_PROFILE</code> - regular profile with a change to parallel execution

Table 171-9 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

The name of the SQL profile.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :stmt_task, -
    category  => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
                                       force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to 5. You must pass an object ID to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
    sqlset_name => 'my_workload', -
    rank1      => 'ELAPSED_TIME', -
    time_limit  => 3600,          -
    description => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :sts_task, -
    object_id => 5);
```

171.5.3 ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 171-10 ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>description</code>	Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` procedure to delete references to a SQL tuning set.

```
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
```

```
sqlset_name => 'my_workload', -
description => 'my sts reference');
```

You can use the `DBA_SQLSET_REFERENCES` view to find all references on a given SQL tuning set.

171.5.4 ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- `STATUS` can be set to `ENABLED` or `DISABLED`.
- `NAME` can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- `DESCRIPTION` can be set to any string of size no more than 500 characters.
- `CATEGORY` can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
    name           IN  VARCHAR2,
    attribute_name IN  VARCHAR2,
    value          IN  VARCHAR2);
```

Parameters

Table 171-11 ALTER_SQL_PROFILE Procedure Parameters

Parameter	Description
<code>name</code>	The (mandatory) name of the existing SQL profile to alter
<code>attribute_name</code>	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
<code>value</code>	The (mandatory) new value of the attribute using valid attribute values

Usage Notes

Requires the `ALTER ANY SQL PROFILE` privilege.

Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
```

```

                                attribute_name => 'STATUS', -
                                value           => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                attribute_name => 'STATUS', -
                                value           => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this
profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                attribute_name => 'CATEGORY', -
                                value           => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                attribute_name => 'CATEGORY', -
                                value           => 'DEFAULT');

```

171.5.5 CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 171-12 CANCEL_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Specifies the name of the task to cancel

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

171.5.6 CAPTURE_CURSOR_CACHE_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
  sqlset_name          IN VARCHAR2,
  time_limit           IN POSITIVE := 1800,
  repeat_interval     IN POSITIVE := 300,
  capture_option      IN VARCHAR2 := 'MERGE',
  capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,
  basic_filter        IN VARCHAR2 := NULL,
  sqlset_owner        IN VARCHAR2 := NULL,
  recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 171-13 CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the SQL tuning set name
<code>time_limit</code>	Defines the total amount of time, in seconds, to execute.
<code>repeat_interval</code>	Defines the amount of time, in seconds, to pause between sampling.
<code>capture_option</code>	Specifies whether to insert new statements, update existing statements, or both. Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> .

Table 171-13 (Cont.) CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

Parameter	Description
capture_mode	Specifies the capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
basic_filter	Defines a filter to apply to the shared SQL area for each sample. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
sqlset_owner	Specifies the owner of the SQL tuning set or NULL for current schema owner
recursive_sql	Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                         sqlset_name    =>
'my_workload', -
                                         time_limit     => 30, -
                                         repeat_interval => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                         sqlset_name    => 'my_workload', -
                                         time_limit     => 30, -
                                         repeat_interval => 5, -
                                         capture_mode    =>
dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                     sqlset_name      => 'my_workload', -
                                     time_limit       => 30, -
                                     repeat_interval  => 5, -
                                     capture_option   => 'INSERT');
```

171.5.7 CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
  task_name          IN VARCHAR2,
  object_id          IN NUMBER   := NULL,
  plan_hash_value    IN NUMBER,
  owner_name         IN VARCHAR2 := NULL,
  database_link_to   IN VARCHAR2 := NULL);
```

Parameters

Table 171-14 CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Name of the task for which to get a script
object_id	Object ID to which the SQL corresponds
plan_hash_value	Plan to create plan baseline
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.

Table 171-14 (Cont.) CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

171.5.8 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL
  sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 171-15 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
description	Provides an optional description of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

171.5.9 CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
  table_name          IN VARCHAR2,
  schema_name         IN VARCHAR2 := NULL,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 171-16 CREATE_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
table_name	The name of the table to create (case-insensitive unless double quoted).
schema_name	The schema to create the table in, or NULL for the current schema (case-insensitive unless double quoted).
tablespace_name	The tablespace to store the staging table within, or NULL for the default tablespace of the current user (case-insensitive unless double quoted).

Usage Notes

- Call this procedure once before issuing a call to the [PACK_STGTAB_SQLPROF Procedure](#).
- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```

171.5.10 CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
    table_name          IN VARCHAR2,
    schema_name        IN VARCHAR2 := NULL,
    tablespace_name    IN VARCHAR2 := NULL,
    db_version         IN NUMBER   := NULL);
```

Parameters

Table 171-17 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

Parameter	Description
table_name	Specifies the name of the table to create. The name is case sensitive.
schema_name	Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.
tablespace_name	Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.
db_version	Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values: <ul style="list-style-type: none"> NULL (default) — Specifies the current database version. STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version. STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version. STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version. STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version. STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.

Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.

Usage Notes

- Call this procedure once before packing the SQL set.

- To have different tuning sets in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.
- The staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 2 (11.2) format

```
BEGIN
  DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET'
  ,   db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION );
END;
```

171.5.11 CREATE_TUNING_TASK Functions

This function creates a SQL Tuning Advisor task.

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_text          IN CLOB,
  bind_list        IN sql_binds := NULL,
  user_name        IN VARCHAR2  := NULL,
```

```

scope          IN VARCHAR2 := SCOPE_COMPREHENSIVE,
time_limit     IN NUMBER    := TIME_LIMIT_DEFAULT,
task_name      IN VARCHAR2 := NULL,
description    IN VARCHAR2 := NULL,
con_name       IN VARCHAR2 := NULL,
database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

SQL ID format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER    := NULL,
  scope          IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit     IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name      IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL,
  con_name       IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

AWR format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK (
  begin_snap     IN NUMBER,
  end_snap       IN NUMBER,
  sql_id         IN VARCHAR2,
  plan_hash_value IN NUMBER    := NULL,
  scope          IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit     IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name      IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL,
  con_name       IN VARCHAR2 := NULL,
  dbid          IN NUMBER    := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

SQL tuning set format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sqlset_name     IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  rank1           IN VARCHAR2 := NULL,
  rank2           IN VARCHAR2 := NULL,
  rank3           IN VARCHAR2 := NULL,
  result_percentage IN NUMBER  := NULL,
  result_limit    IN NUMBER    := NULL,
  scope          IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit     IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name      IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL,
  plan_filter     IN VARCHAR2 := 'MAX_ELAPSED_TIME',

```

```

sqlset_owner      IN VARCHAR2 := NULL,
database_link_to  IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

SQL Performance Analyzer format:

```

DBMS_SQLTUNE.CREATE_TUNING_TASK (
  spa_task_name      IN VARCHAR2,
  spa_task_owner     IN VARCHAR2 := NULL,
  spa_compare_exec   IN VARCHAR2 := NULL,
  basic_filter       IN VARCHAR2 := NULL,
  time_limit         IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name          IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

Parameters

Table 171-18 *CREATE_TUNING_TASK Function Parameters*

Parameter	Description
sql_text	Specifies the text of a SQL statement.
begin_snap	Specifies the begin snapshot identifier.
end_snap	Specifies the end snapshot identifier.
sql_id	Specifies the identifier of a SQL statement.
bind_list	Defines an ordered list of bind values in ANYDATA type. NOTE: This parameter is not supported on a standby database.
plan_hash_value	Specifies the hash value of the SQL execution plan.
sqlset_name	Specifies the SQL tuning set name.
basic_filter	Specifies the predicate used to filter the SQL from the SQL tuning set.
object_filter	Specifies the object filter.
rank(i)	Specifies an ORDER BY clause on the selected SQL statement.
result_percentage	Specifies the percentage on the sum of a ranking measure.
result_limit	Specifies the top L(imit) SQL from the filtered or ranked SQL.
user_name	Specifies the user name for whom the statement is to be tuned.
scope	Specifies the tuning scope: <ul style="list-style-type: none"> LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated. COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling.
time_limit	Specifies the maximum duration in seconds for the tuning session.
task_name	Specifies an optional tuning task name.
description	Provides a description of the SQL tuning session, up to a maximum of 256 characters.

Table 171-18 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
plan_filter	<p>Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are:</p> <ul style="list-style-type: none"> • LAST_GENERATED: most recent timestamp • FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED • LAST_LOADED: most recent first_load_time statistics information • FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED • MAX_ELAPSED_TIME: maximum elapsed time • MAX_BUFFER_GETS: maximum buffer gets • MAX_DISK_READS: maximum disk reads • MAX_DIRECT_WRITES: maximum direct writes • MAX_OPTIMIZER_COST: maximum optimizer cost
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for the current schema owner.
spa_task_name	Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned.
spa_task_owner	Specifies the owner of specified SQL Performance Analyzer task or NULL for current user.
spa_compare_exec	Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If NULL, then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE.
dbid	Specifies the DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.

Table 171-18 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
<code>con_name</code>	<p>Specifies the container for the tuning task. The semantics depend on the function format:</p> <ul style="list-style-type: none"> For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container. For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container. For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container. <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> In a non-CDB, this parameter is ignored. In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs. In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs.
<code>database_link_to</code>	<p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed

with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Example 171-1 Examples

The following examples assume the following variable definitions:

```
VARIABLE stmt_task      VARCHAR2(64);
VARIABLE sts_task       VARCHAR2(64);
VARIABLE spa_tune_task  VARCHAR2(64);
```

Example 171-2 Create Tuning Task with SQL Text Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE
s.time_id = t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

Example 171-3 Create Tuning Task with SQL ID Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'ay1m3ssvtrh24');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'ay1m3ssvtrh24', -
    scope => 'LIMITED');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id =>
'ay1m3ssvtrh24', -
    time_limit => 600);
```

Example 171-4 Create Tuning Task with AWR Snapshot Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
    end_snap => 2, sql_id => 'ay1m3ssvtrh24');
```

Example 171-5 Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and also sets a time limit of one hour. The default ranking measure is elapsed time.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sqlset_name => 'my_workload', -
    rank1       => 'BUFFER_GETS', -
    time_limit  => 3600, -
    description => 'tune my workload ordered by buffer gets');
```

Example 171-6 Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from the compare performance execution of the SQL Performance Analyzer task named `task_123`.

```
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    spa_task_name      => 'task_123',
    spa_task_owner     => 'SCOTT',
    spa_compare_exec   => 'exec1');
```

Example 171-7 Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The `tune_stby_wkld` task uses the `lnk_to_primary` database link to write data to the primary database, which is open read/write.

```
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ coll FROM table1 t WHERE coll=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query,-
    task_name => :tname, database_link_to => 'lnk_to_primary');
```

171.5.12 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
    sqlset_name   IN   VARCHAR2,
    basic_filter  IN   VARCHAR2 := NULL,
    sqlset_owner  IN   VARCHAR2 := NULL);
```

Parameters

Table 171-19 DELETE_SQLSET Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>basic_filter</code>	Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for current schema owner.

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');
```

```
-- Delete all statements in a sql tuning set which ran for less than a
second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time <
1000000');
```

171.5.13 DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
    name          IN  VARCHAR2,
    ignore        IN  BOOLEAN := FALSE);
```

Parameters

Table 171-20 DROP_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of SQL profile to be dropped. The name is case sensitive.
ignore	Ignores errors due to object not existing

Usage Notes

Requires the `DROP ANY SQL PROFILE` privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

171.5.14 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (  
    sqlset_name    IN  VARCHAR2,  
    sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 171-21 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sqlset_owner	Specifies the owner of the SQL tuning set, or NULL for current schema owner.

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

171.5.15 DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK (
  task_name          IN VARCHAR2);
```

Parameters

Table 171-22 DROP_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Specifies name of the tuning task to drop.

171.5.16 EXECUTE_TUNING_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
  task_name          IN VARCHAR2,
  execution_name     IN VARCHAR2                := NULL,
  execution_params   IN dbms_advisor.argList    := NULL,
  execution_desc     IN VARCHAR2                := NULL,
  database_link_to   IN VARCHAR2                := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
  task_name          IN VARCHAR2,
  execution_name     IN VARCHAR2                := NULL,
  execution_params   IN dbms_advisor.argList    := NULL,
  execution_desc     IN VARCHAR2                := NULL,
  database_link_to   IN VARCHAR2                := NULL);
```

Parameters

Table 171-23 EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to execute.

Table 171-23 (Cont.) EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
<code>execution_name</code>	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
<code>execution_params</code>	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures).
<code>execution_desc</code>	A 256-length string describing the execution.
<code>database_link_to</code>	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

171.5.17 IMPLEMENT_TUNING_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing `IMPLEMENT_TUNING_TASK` is equivalent to executing the [SCRIPT_TUNING_TASK Function](#) and then running the script.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name          IN  VARCHAR2,
    rec_type           IN  VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name         IN  VARCHAR2 := NULL,
    execution_name     IN  VARCHAR2 := NULL,
    database_link_to   IN  VARCHAR2 := NULL);
```

Parameters

Table 171-24 IMPLEMENT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task for which to implement recommendations.
rec_type	Filter the types of recommendations to implement. Only 'PROFILES' is supported.
owner_name	Owner of the relevant tuning task or NULL for the current user.
execution_name	Name of the task execution to use. If NULL, then the procedure implements recommendations from the last task execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri: <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

171.5.18 INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

Table 171-25 INTERRUPT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to interrupt

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

171.5.19 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (  
    sqlset_name        IN VARCHAR2,  
    populate_cursor    IN sqlset_cursor,  
    load_option        IN VARCHAR2 := 'INSERT',  
    update_option      IN VARCHAR2 := 'REPLACE',  
    update_condition   IN VARCHAR2 := NULL,
```

```

update_attributes IN VARCHAR2 := NULL,
ignore_null      IN BOOLEAN  := TRUE,
commit_rows     IN POSITIVE  := NULL,
sqlset_owner    IN VARCHAR2 := NULL);

```

Parameters

Table 171-26 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of SQL tuning set to be loaded.
populate_cursor	Specifies the cursor reference to the SQL tuning set to be loaded.
load_option	Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> INSERT (default) — Adds only new statements. UPDATE — Updates existing the SQL statements and ignores any new statements. MERGE — Inserts new statements and updates the information of the existing ones.
update_option	Specifies how existing SQL statements are updated. This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are: <ul style="list-style-type: none"> REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on. ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.
update_condition	Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: <ul style="list-style-type: none"> OLD — Refers to statement attributes from the SQL tuning set (destination). NEW — Refers to statement attributes from the input statements (source).

Table 171-26 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
<code>update_attributes</code>	<p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> • <code>NULL</code> (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to <code>ALL</code> without execution contexts such as module and action. • <code>BASIC</code> — Specifies statistics and binds only. • <code>TYPICAL</code> — Specifies <code>BASIC</code> with SQL plans (without row source statistics) and without an object reference list. • <code>ALL</code> — Specifies all attributes, including the execution context attributes such as module and action. • List of comma separated attribute names to update: <ul style="list-style-type: none"> – <code>EXECUTION_CONTEXT</code> – <code>EXECUTION_STATISTICS</code> – <code>SQL_BINDS</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> with added row source statistics)
<code>ignore_null</code>	<p>Specifies whether to update attributes when the new value is <code>NULL</code>.</p> <p>If <code>TRUE</code>, then the procedure does not update an attribute when the new value is <code>NULL</code>. That is, do not override with <code>NULL</code> values unless intentional.</p>
<code>commit_rows</code>	<p>Specifies whether to commit statements after DML.</p> <p>If a value is provided, then the load commits after each specified number of statements is inserted. If <code>NULL</code> is provided, then the load commits only once, at the end of the operation.</p> <p>Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the <code>DBA_SQLSET</code> views. The <code>STATEMENT_COUNT</code> value increases as new SQL statements are loaded.</p>
<code>sqlset_owner</code>	<p>Defines the owner of the SQL tuning set, or the current schema owner (or <code>NULL</code> for the current owner).</p>

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
          'parsing_schema_name
<> ''SYS'',
          NULL, NULL, NULL, NULL,
          1,
          NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
    populate_cursor => cur,
    Using DBMS_SQLTUNE
    load_option => 'MERGE',
```

```

                                update_option => 'ACCUMULATE');
END;

```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/

```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
                           populate_cursor => cur,
                           load_option     => 'UPDATE');
END;
/

```

171.5.20 PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the `sys.` schema into the staging table.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
  profile_name      IN VARCHAR2 := '%',
  profile_category  IN VARCHAR2 := 'DEFAULT',

```

```
staging_table_name    IN VARCHAR2,
staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 171-27 PACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Security Model

This procedure requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table.

Usage Notes

This function issues a `COMMIT` after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put only those profiles in the `DEFAULT` category into the staging table. This corresponds to all profiles used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name =>
'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
staging_table_name =>
'PROFILE_STGTAB');
```

171.5.21 PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET procedure.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2,
  sqlset_owner         IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version           IN NUMBER   := NULL);
```

Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  , sqlset_owner    => '%'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'my_workload'
  , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 1 (11.2):

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
  ,   db_version      => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

171.5.22 REMAP_STGTAB_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 171-28 REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
<code>old_profile_name</code>	The name of the profile to target for a remap operation (case-sensitive)

Table 171-28 (Cont.) REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
<code>new_profile_name</code>	The new name of the profile, or <code>NULL</code> to remain the same (case-sensitive)
<code>new_profile_category</code>	The new category for the profile, or <code>NULL</code> to remain the same (case-sensitive)
<code>staging_table_name</code>	The name of the table on which to perform the remap operation (case-sensitive). Required.
<code>staging_schema_owner</code>	The schema where the table resides, or <code>NULL</code> for current schema (case-sensitive)

Security Model

This procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_name => 'IMP' || :pname
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_category => 'TEST'
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

171.5.23 REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
    old_sqlset_name      IN VARCHAR2,
    old_sqlset_owner    IN VARCHAR2 := NULL,
    new_sqlset_name     IN VARCHAR2 := NULL,
    new_sqlset_owner    IN VARCHAR2 := NULL,
    staging_table_name  IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL,
    old_con_dbid        IN NUMBER   := NULL,
    new_con_dbid        IN NUMBER   := NULL);
);
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 171-29 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.
old_sqlset_owner	Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	Specifies the new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	Specifies the new owner for the tuning set, or NULL to keep the same owner name.
staging_table_name	Specifies the name of the table on which to perform the remap operation. The value is case sensitive.
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.
old_con_dbid	Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.
new_con_dbid	Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
```

```

    DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
        old_sqlset_name =>
'my_workload'
    ,   old_sqlset_owner => 'SH'
    ,   new_sqlset_name =>
'imp_workload'
    ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
    old_sqlset_name => 'imp_workload'
    ,   old_sqlset_owner => 'SH'
    ,   new_sqlset_owner => 'SYS'
    ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

171.5.24 REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
    sqlset_name   IN  VARCHAR2,
    reference_id  IN  NUMBER,
    sqlset_owner  IN  VARCHAR2 := NULL,
    force_remove  IN  NUMBER   := 0);
```

Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

Table 171-30 REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>sqlset_name</code>	Specifies the name of the SQL tuning set.
<code>reference_id</code>	Specifies the identifier of the reference to remove.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner).

Table 171-30 (Cont.) REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

Parameter	Description
<code>force_remove</code>	Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
    sqlset_name => 'my_workload', -
    reference_id => :rid,
    sqlset_owner => NULL,
    force_remove => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

171.5.25 REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the [REPORT_TUNING_TASK Function](#) reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

See Also:

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- [REPORT_AUTO_TUNING_TASK Function](#)

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec    IN VARCHAR2 := NULL,
    end_exec      IN VARCHAR2 := NULL,
    type          IN VARCHAR2 := TYPE_TEXT,
    level         IN VARCHAR2 := LEVEL_TYPICAL,
    section       IN VARCHAR2 := SECTION_ALL,
```

```

    object_id      IN NUMBER      := NULL,
    result_limit  IN NUMBER      := NULL)
RETURN CLOB;

```

Parameters

Table 171-31 REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
begin_exec	Specifies the name of the execution from which to begin the report. NULL retrieves a report on the most recent run.
end_exec	Specifies the name of the execution at which to end the report. NULL retrieves a report on the most recent run.
type	Specifies the type of the report to produce. Possible values are TYPE_TEXT which produces a text report
level	Specifies the level of detail in the report: <ul style="list-style-type: none"> LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Limits the report to a single section (ALL for all sections): <ul style="list-style-type: none"> SECTION_SUMMARY - summary information SECTION_FINDINGS - tuning findings SECTION_PLAN - explain plans SECTION_INFORMATION - general information SECTION_ERROR - statements with errors SECTION_ALL - all statements
object_id	Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify NULL for all statements. Only valid for reports that target a single execution.
result_limit	Specifies the maximum number of SQL statements to show in the report.

Return Values

A CLOB containing the desired report.

171.5.26 REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the v\$sql views and AWR.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
  sql_id                IN  VARCHAR2    DEFAULT NULL,
  sql_plan_hash_value  IN  NUMBER       DEFAULT NULL,
  start_time           IN  DATE          DEFAULT NULL,
  duration             IN  NUMBER       DEFAULT NULL,
  inst_id             IN  NUMBER       DEFAULT NULL,
  dbid                IN  NUMBER       DEFAULT NULL,
  event_detail        IN  VARCHAR2     DEFAULT 'YES',
  bucket_max_count    IN  NUMBER       DEFAULT 128,
  bucket_interval     IN  NUMBER       DEFAULT NULL,
  top_n               IN  NUMBER       DEFAULT 10,
  report_level        IN  VARCHAR2     DEFAULT 'TYPICAL',
  type                IN  VARCHAR2     DEFAULT 'ACTIVE',
  data_source         IN  VARCHAR2     DEFAULT 'AUTO',
  end_time            IN  DATE          DEFAULT NULL,
  duration_stats      IN  NUMBER       DEFAULT NULL,
  con_name            IN  VARCHAR2     DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 171-32 REPORT_SQL_DETAIL Function Parameters

Parameter	Description
sql_id	SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.
sql_plan_hash_value	Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.
start_time	If specified, shows SQL activity (from GV\$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.
duration	Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.
inst_id	Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.
dbid	DBID from which to get SQL details. If NULL, uses current DBID.
event_detail	When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
top_n	Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.

Table 171-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
report_level	<p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> 'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default 'SPM' - Show existing plan baselines for a SQL statement; OFF by default 'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default. 'STATS' - Show SQL execution statistics per plan from GV\$SQLAREA_PLAN_HASH; ON by default 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default 'XPLAN' - Show execution plans; ON by default 'BINDS' - show captured bind data; ON by default <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> -SQL_TEXT - No SQL text in report +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) +SQL_FULLTEXT - Show full SQL text (default value) <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> NONE - minimum possible BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR ALL - everything <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>
type	<p>Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).</p>
data_source	<p>Determines the data source of SQL data based on one of the following values:</p> <ul style="list-style-type: none"> MEMORY: The data source is GV\$ view DISK: The data source is DBA_HIST_* view AUTO: Automatically determines the data source based on the time frame (default)

Table 171-32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
end_time	If specified, shows SQL activity from start_time to end_time. If NULL (default), shows SQL activity for systimestamp.
duration_stats	Duration of additional SQL execution statistics from AWR (in hours), for the report. If NULL (default), then the duration of 24 hours is considered.
con_name	Name of the multitenant container database (CDB).

Security Model

The invoker needs the EXECUTE privilege on the [DBMS_XPLAN](#) package.

Return Values

A CLOB containing the desired report.

Usage Notes

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the SELECT or READ privilege on the following views:
 - V\$SESSION
 - DBA_ADVISOR_FINDINGS
 - V\$DATABASE
 - GV\$ASH_INFO
 - GV\$ACTIVE_SESSION_HISTORY
 - GV\$SQLAREA_PLAN_HASH
 - GV\$SQL
 - DBA_HIST_SNAPSHOT
 - DBA_HIST_WR_CONTROL
 - DBA_HIST_ACTIVE_SESS_HISTORY
 - DBA_HIST_SQLSTAT
 - DBA_HIST_SQL_BIND_METADATA
 - DBA_HIST_SQLTEXT
 - DBA_SQL_PLAN_BASELINES
 - DBA_SQL_PROFILES
 - DBA_ADVISOR_TASKS
 - DBA_SERVICES

- DBA_USERS
- DBA_OBJECTS
- DBA_PROCEDURES

171.5.27 REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

See Also:

[Real-Time SQL Monitoring](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  dbop_name             IN VARCHAR2  DEFAULT NULL,
  dbop_exec_id          IN NUMBER    DEFAULT NULL,
  session_id            IN NUMBER    DEFAULT NULL,
  session_serial        IN NUMBER    DEFAULT NULL,
  sql_exec_start        IN DATE      DEFAULT NULL,
  sql_exec_id           IN NUMBER    DEFAULT NULL,
  inst_id               IN NUMBER    DEFAULT NULL,
  start_time_filter     IN DATE      DEFAULT NULL,
  end_time_filter       IN DATE      DEFAULT NULL,
  instance_id_filter    IN NUMBER    DEFAULT NULL,
  parallel_filter       IN VARCHAR2  DEFAULT NULL,
  plan_line_filter      IN NUMBER    DEFAULT NULL,
  event_detail          IN VARCHAR2  DEFAULT 'YES',
  bucket_max_count     IN NUMBER    DEFAULT 128,
  bucket_interval       IN NUMBER    DEFAULT NULL,
  base_path             IN VARCHAR2  DEFAULT NULL,
  last_refresh_time     IN DATE      DEFAULT NULL,
  report_level          IN VARCHAR2  DEFAULT 'TYPICAL',
  type                 IN VARCHAR2  DEFAULT 'TEXT',
  sql_plan_hash_value   IN NUMBER    DEFAULT NULL,
  con_name              IN VARCHAR2  DEFAULT NULL,
  report_id            IN NUMBER    DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 171-33 REPORT_SQL_MONITOR Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.

Table 171-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
dbop_name	DBOP_NAME for which monitoring information of the composite database operation is displayed.
dbop_exec_id	Execution ID for the composite database operation for which monitoring information is displayed.
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
sql_exec_id	This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
start_time_filter	If not NULL, the report considers only the activity (from GV\$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.
end_time_filter	If not NULL, the report shows only the activity (from GV\$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
instance_id_filter	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.

Table 171-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
<code>parallel_filter</code>	<p>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:</p> <ul style="list-style-type: none"> • NULL to target all processes • <code>[qc][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]</code>: 'qc' stands for query coordinator and <code>servers()</code> stipulate which PX servers to consider. <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> • <code>qc</code>: targets only the query coordinator • <code>servers(1)</code>: targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. • <code>servers(,2)</code>: targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) • <code>servers(1,1)</code>: consider only group 1, set 1 • <code>servers(1,2,4)</code>: consider only group 1, set 2, server number 4. This reports for a single parallel server process • <code>qc servers(1,2,4)</code>: same as above by also including the query coordinator
<code>event_detail</code>	<p>When value is 'YES' (the default), reported activity from <code>GV\$ACTIVE_SESSION_HISTORY</code> is aggregated by (<code>wait_class</code>, <code>event_name</code>). Use 'NO' to only aggregate by <code>wait_class</code>.</p>
<code>bucket_max_count</code>	<p>If specified, this should be the maximum number of histogram buckets created in the report</p>
<code>bucket_interval</code>	<p>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, <code>bucket_max_count</code> is ignored.</p>
<code>base_path</code>	<p>URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)</p>
<code>last_refresh_time</code>	<p>If not NULL (default is NULL), the time when the report was last retrieved (see <code>SYSDATE</code> attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:</p> <ul style="list-style-type: none"> • SQL text is not returned when this option is specified • activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if <code>last_refresh_time</code> is after the start of that bucket

Table 171-33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
report_level	<p>Level of detail for the report: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> 'XPLAN' - Show explain plan; ON by default 'PLAN' - Show plan monitoring statistics; ON by default 'SESSIONS' - Show session details. Applies only to parallel queries; ON by default 'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default 'PARALLEL' - An umbrella parameter for specifying sessions+instance details 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default 'BINDS' - Show bind information when available; ON by default 'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default 'OTHER' - Other info; ON by default <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> SQL_TEXT - No SQL text in report +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) +SQL_FULLTEXT - Show full SQL text (default value)
report_level (contd.)	<p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> NONE - minimum possible +BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS TYPICAL - everything but PLAN_HISTOGRAM ALL - everything <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).
sql_plan_hash_value	Target only those SQL executions with the specified plan_hash_value. Default is NULL.
con_name	Name of the multitenant container database (CDB).
report_id	ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS.

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
 - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
 - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id =>` for the current session or `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
 - The most recent execution of a specific statement identified by its `sql_id`.
 - A specific execution of a SQL statement identified by its execution key (`sql_id, sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
 - `GV$SQL_MONITOR`
 - `GV$SQL_PLAN_MONITOR`
 - `GV$SQL_PLAN`
 - `GV$ACTIVE_SESSION_HISTORY`
 - `GV$SESSION_LONGOPS`
 - `GV$SQL`
- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram. By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because $600/8 = 74$, which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.
- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.

 **See Also:**

Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

171.5.28 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the [REPORT_SQL_MONITOR Function](#) to get detailed monitoring information for a single SQL statement.

 **See Also:**

[Real-Time SQL Monitoring](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  session_id            IN NUMBER     DEFAULT NULL,
  session_serial        IN NUMBER     DEFAULT NULL,
  inst_id               IN NUMBER     DEFAULT NULL,
  active_since_date     IN DATE       DEFAULT NULL,
  active_since_sec      IN NUMBER     DEFAULT NULL,
  active_before_date   IN DATE       DEFAULT NULL,
  last_refresh_time     IN DATE       DEFAULT NULL,
  dbop_name             IN VARCHAR2   DEFAULT NULL,
  monitor_type          IN NUMBER     DEFAULT MONITOR_TYPE_ALL,
  max_sqltext_length   IN NUMBER     DEFAULT NULL,
  top_n_count           IN NUMBER     DEFAULT NULL,
  top_n_rankby         IN VARCHAR2   DEFAULT 'LAST_ACTIVE_TIME',
  report_level          IN VARCHAR2   DEFAULT 'TYPICAL',
  auto_refresh          IN NUMBER     DEFAULT NULL,
  base_path             IN VARCHAR2   DEFAULT NULL,
  type                 IN VARCHAR2   DEFAULT 'TEXT',
  con_name              IN VARCHAR2   DEFAULT NULL,
  top_n_detail_count    IN NUMBER     DEFAULT NULL)
RETURN CLOB;

```

Parameters

Table 171-34 REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
<code>sql_id</code>	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
<code>session_id</code>	If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.
<code>session_serial</code>	In addition to the <code>session_id</code> parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when <code>session_id</code> is NULL.
<code>inst_id</code>	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
<code>active_since_date</code>	If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.
<code>active_since_sec</code>	Same as <code>active_since_date</code> but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.
<code>active_before_date</code>	If not NULL (default), returns only monitored statements that have been active before the specified date and time.
<code>last_refresh_time</code>	If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified <code>last_refresh_time</code> . For other queries, the report returns the execution key (<code>sql_id</code> , <code>sql_exec_start</code> , <code>sql_exec_id</code>). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics.
<code>dbop_name</code>	DB operation name. Specify NULL to display all the monitored DB operations.
<code>monitor_type</code>	Type of the SQL Monitor operation. Specify one of the following values: <ul style="list-style-type: none"> • MONITOR_TYPE_SQL - Returns only SQL statements • MONITOR_TYPE_DBOP - Returns only database operations • MONITOR_TYPE_ALL - Returns SQL statements as well as database operations
<code>max_sqltext_length</code>	Maximum length of the SQL text. Default is NULL (no limit).
<code>top_n_count</code>	Limits the number of top-N SQL statements that need to be included in the report.

Table 171-34 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
top_n_rankby	Specifies the attribute to rank the SQL statements. Specify this value when top_n_count value is not NULL. The ranking of an SQL statement is done based on one of the following values: <ul style="list-style-type: none"> LAST_ACTIVE_TIME - Last active date and time (top N most recent) DURATION - Total duration of execution DB_TIME - DB time used CPU_TIME - CPU time used IO_REQUESTS - Number of I/O requests IO_BYTES - Number of I/O bytes
report_level	Level of detail for the report. The level is one of the following: <ul style="list-style-type: none"> BASIC - SQL text up to 200 characters TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters ALL - currently the same as TYPICAL
auto_refresh	Currently non-operational, reserved for future use.
base_path	URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself).
type	Report format: TEXT (default), HTML, or XML.
con_name	Name of the multitenant container database (CDB)
top_n_detail_count	Limits the number of top-N SQL statements for which the SQL monitor details need to be included in the report.

Return Values

A report for the list of SQL statements that have been monitored. The report type is text, XML, or HTML.

Usage Notes

You must have the privilege to access the following fixed views: GV\$SQL_MONITOR and GV\$SQL.

See Also:

Oracle Database SQL Tuning Guide for more information about SQL real-time monitoring.

171.5.29 REPORT_TUNING_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK (
  task_name          IN   VARCHAR2,
  type               IN   VARCHAR2   := 'TEXT',
  level              IN   VARCHAR2   := 'TYPICAL',
  section            IN   VARCHAR2   := ALL,
  object_id          IN   NUMBER     := NULL,
  result_limit       IN   NUMBER     := NULL,
  owner_name         IN   VARCHAR2   := NULL,
  execution_name     IN   VARCHAR2   := NULL,
  database_link_to  IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 171-35 REPORT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task.
type	Type of the report to produce. Possible values are <code>TEXT</code> which produces a text report.
level	Level of detail in the report: <ul style="list-style-type: none"> <code>BASIC</code>: simple version of the report. Just show info about the actions taken by the advisor. <code>TYPICAL</code>: show information about every statement analyzed, including requests not implemented. <code>ALL</code>: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include. You can limit the report to any of the following single sections (<code>ALL</code> for all sections): <ul style="list-style-type: none"> <code>SUMMARY</code> - Summary information <code>FINDINGS</code> - Tuning findings <code>PLAN</code> - Explain plans <code>INFORMATION</code> - General information <code>ERROR</code> - Statements with errors <code>ALL</code> - All statements

Table 171-35 (Cont.) REPORT_TUNING_TASK Function Parameters

Parameter	Description
object_id	Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report.
owner_name	Owner of the relevant tuning task. The default is the current schema owner.
execution_name	Name of the task execution to use. If NULL, then the function generates the report for the last task execution.
database_link_to	Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri: <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

A CLOB containing the desired report.

Examples

```
-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM   DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL',
'SUMMARY')
FROM   DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT',
'TYPICAL','FINDINGS', 5)
FROM   DUAL;
```

171.5.30 REPORT_TUNING_TASK_XML Function

This function displays an XML report of a tuning task.

See Also:

[DBMS_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK_LIST_XML(
  task_name      IN   VARCHAR2      := NULL,
  level          IN   VARCHAR2      := LEVEL_TYPICAL,
  section       IN   VARCHAR2      := SECTION_ALL,
  object_id     IN   NUMBER         := NULL,
  result_limit  IN   NUMBER         := 160,
  owner_name    IN   VARCHAR2      := NULL,
  execution_name IN VARCHAR2      := NULL,
  autotune_period IN NUMBER       := NULL,
  report_tag    IN   VARCHAR2      := NULL)
RETURN XMLTYPE;
```

Parameters

Table 171-36 REPORT_TUNING_TASK_XML Function Parameters

Parameter	Description
task_name	Name of the tuning task.
level	Level of detail in the report: <ul style="list-style-type: none"> BASIC: simple version of the report. Just show info about the actions taken by the advisor. TYPICAL: show information about every statement analyzed, including requests not implemented. ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections): <ul style="list-style-type: none"> SUMMARY - Summary information ALL - All statements
object_id	Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.

Table 171-36 (Cont.) REPORT_TUNING_TASK_XML Function Parameters

Parameter	Description
result_limit	The number of statements in a SQL tuning set or snapshot range for which the report is generated. The default is 160 (20 statements * 8 categories). The categories are as follows: <ul style="list-style-type: none"> • Profile • Index • Restructure SQL • Alternate plan • Statistics • Errors • Information • No findings
owner_name	Owner of the relevant tuning task. The default is the current schema owner.
execution_name	Name of the task execution to use. If NULL, then the function generates the report for the most recent task execution.
autotune_period	The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: <ul style="list-style-type: none"> • Null or negative value (default) — All or full. The result includes all task executions. • 0 — Result of the current or most recent task execution. • 1 — Result for the most recent 24-hour period. • 7 — Result for the most recent 7-day period. The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.
report_tag	The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework.

Return Values

A CLOB containing the desired report.

171.5.31 RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
  task_name          IN VARCHAR2);
```

Parameters

Table 171-37 RESET_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

171.5.32 RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters

Table 171-38 RESUME_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to resume.
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the parameter <code>basic_filteri</code> when calling CREATE_TUNING_TASK Functions .

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or
check
-- out its results and then decide. For this example we will just
resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

171.5.33 SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER           := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
  scope          IN VARCHAR2         :=
SCOPE_COMPREHENSIVE,
  time_limit     IN NUMBER           := TIME_LIMIT_DEFAULT,
  task_name      IN VARCHAR2         := NULL,
  description    IN VARCHAR2         := NULL,
  con_name       IN VARCHAR2         := NULL)
RETURN VARCHAR2;
```

AWR Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  begin_snap     IN NUMBER,
  end_snap       IN NUMBER,
```

```

sql_id          IN VARCHAR2,
plan_hash_value IN NUMBER           := NULL,
start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
scope          IN VARCHAR2         := SCOPE_COMPREHENSIVE,
time_limit     IN NUMBER           := TIME_LIMIT_DEFAULT,
task_name      IN VARCHAR2         := NULL,
description    IN VARCHAR2         := NULL,
con_name       IN VARCHAR2         := NULL,
dbid           IN NUMBER           := NULL)
RETURN VARCHAR2;

```

Parameters

Table 171-39 SCHEDULE_TUNING_TASK Function Parameters

Parameter	Description
begin_snap	The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included.
end_snap	The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.
sql_id	The SQL ID of the statement to be tuned.
plan_hash_value	The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.
start_date	The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.
scope	The scope of the tuning job: limited, or comprehensive.
time_limit	The maximum duration in seconds for the SQL tuning session.
task_name	Optional SQL tuning task name.
description	Description of the SQL tuning session. The description can contain a maximum of 256 characters.
con_name	The container from which SQL Tuning Advisor accesses the SQL statement information.
dbid	DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.

Security Model

The caller must possess the `CREATE JOB` privilege for the job.

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows:
`sqltune_job_taskid_orahash(systemtimestamp)`.

171.5.34 SCRIPT_TUNING_TASK Function

This function creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK (
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMBER    := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL,
  database_link_to   IN VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 171-40 SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task for which to apply a script.
rec_type	Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL:' 'PROFILES' 'STATISTICS' 'INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES, STATISTICS'.
object_id	Optionally filters by a single object ID.
result_limit	Optionally shows commands for only top <i>n</i> SQL (ordered by object_id and ignored if an object_id is also specified).
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the script is generated for the last task execution.

Table 171-40 (Cont.) SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- After the script is returned, check it before executing it.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;

-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about only one SQL statement when we
have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

171.5.35 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter      IN   VARCHAR2 := NULL,
  object_filter    IN   VARCHAR2 := NULL,
  ranking_measure1 IN   VARCHAR2 := NULL,
  ranking_measure2 IN   VARCHAR2 := NULL,
  ranking_measure3 IN   VARCHAR2 := NULL,
  result_percentage IN   NUMBER   := 1,
  result_limit     IN   NUMBER   := NULL,
  attribute_list   IN   VARCHAR2 := NULL,
  recursive_sql    IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 171-41 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
basic_filter	Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
object_filter	Currently not supported.
ranking_measure(n))	Defines an ORDER BY clause on the selected SQL.
result_percentage	Specifies a filter that picks the top n% according to the supplied ranking measure. The value applies only if one ranking measure is supplied.
result_limit	Defines the top limit SQL from the filtered source ranked by the ranking measure.

Table 171-41 (Cont.) SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
<code>attribute_list</code>	<p>Specifies the list of SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> • <code>TYPICAL</code> — Specifies <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list (default). • <code>BASIC</code> — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. • <code>ALL</code> — Specifies all attributes. • Comma-separated list of attribute names. <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> – <code>EXECUTION_STATISTICS</code> – <code>BIND_LIST</code> – <code>OBJECT_LIST</code> – <code>SQL_PLAN</code> – <code>SQL_PLAN_STATISTICS</code> — Similar to <code>SQL_PLAN</code> plus row source statistics
<code>recursive_sql</code>	<p>Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>, which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).</p>

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j''));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This
is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24''))
```

```

ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor,
along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
      FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;

    SELECT VALUE(P)
```

```

        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                    NULL,
                                                    'ELAPSED_TIME', NULL,
NULL,
                                                    1,
                                                    100)) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of
the
-- buffer gets in the shared SQL area. This means that the buffer
gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                    NULL,
                                                    'BUFFER_GETS', NULL,
NULL,
                                                    .9)) P;

-- Process each statement (or pass cursor to load_sqlset).

CLOSE cur;
END;
/

```

171.5.36 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SELECT_SQL_TRACE (
    directory          IN VARCHAR2,
    file_name         IN VARCHAR2 := NULL,

```

```

mapping_table_name      IN VARCHAR2 := NULL,
mapping_table_owner     IN VARCHAR2 := NULL, ,
select_mode             IN POSITIVE := SINGLE_EXECUTION,
options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
pattern_start          IN VARCHAR2 := NULL,
pattern_end            IN VARCHAR2 := NULL,
result_limit           IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

Parameters

Table 171-42 SELECT_SQL_TRACE Function Parameters

Parameter	Description
directory	Defines the directory object containing the trace files. This field is mandatory.
file_name	Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.
mapping_table_name	Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.
mapping_table_owner	Specifies the mapping table owner. If it is NULL, then the function uses the current user.
select_mode	Specifies the mode for selecting SQL from the trace. Possible values are: <ul style="list-style-type: none"> SINGLE_EXECUTION — Returns one execution of a SQL. This is the default. ALL_EXECUTIONS — Returns all executions.
options	Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default. ALL_COMMAND_TYPE — Returns the SQL statements with all command types.
pattern_start	Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.
pattern_end	Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.
result_limit	Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.

Return Values

This function returns a `SQLSET_ROW` object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
      FROM TABLE(
         DBMS_SQLTUNE.SELECT_SQL_TRACE(
            directory=>'SQL_TRACE_DIR',
            file_name=>'%trc',
            mapping_table_name=>'mapping')) p;
   DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
```

```
END;
/
```

171.5.37 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

 **See Also:**

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK (
  task_name          IN VARCHAR2,
  task_owner        IN VARCHAR2 := NULL,
  execution_name     IN VARCHAR2 := NULL,
  level_filter       IN VARCHAR2 := 'REGRESSED',
  basic_filter       IN VARCHAR2 := NULL,
  object_filter      IN VARCHAR2 := NULL,
  attribute_list     IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 171-43 SELECT_SQLPA_TASK Function Parameters

Parameter	Description
<code>task_name</code>	Specifies the name of the SQL Performance Analyzer task.
<code>task_owner</code>	Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user.
<code>execution_name</code>	Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code>) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution.

Table 171-43 (Cont.) SELECT_SQLPA_TASK Function Parameters

Parameter	Description
level_filter	<p>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</p> <ul style="list-style-type: none"> IMPROVED includes only improved SQL. REGRESSED includes only regressed SQL (default). CHANGED includes only SQL with changed performance. UNCHANGED includes only SQL with unchanged performance. CHANGED_PLANS includes only SQL with plan changes. UNCHANGED_PLANS includes only SQL with unchanged plans. ERRORS includes only SQL with errors only. MISSING_SQL includes only missing SQL statements (across STS). NEW_SQL includes only new SQL statements (across STS).
basic_filter	Specifies the SQL predicate to filter the SQL in addition to the level filters.
object_filter	Currently not supported.
attribute_list	<p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default. BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result. ALL — Returns all attributes. Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

171.5.38 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name      IN  VARCHAR2,
  basic_filter     IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN  NUMBER := NULL)
attribute_list    IN  VARCHAR2 := NULL,
plan_filter       IN  VARCHAR2 := NULL,
sqlset_owner      IN  VARCHAR2 := NULL,
recursive_sql     IN  VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 171-44 SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set to query.
basic_filter	Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> .
object_filter	Currently not supported.
ranking_measure(n)	Specifies an <code>ORDER BY</code> clause on the selected SQL.
result_percentage	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.
result_limit	The top limit SQL from the filtered source, ranked by the ranking measure.
attribute_list	Defines the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result. • TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default. • ALL — Returns all attributes. • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> – EXECUTION_STATISTICS – SQL_BINDS – SQL_PLAN_STATISTICS (similar to <code>SQL_PLAN</code> plus row source statistics)

Table 171-44 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
<code>plan_filter</code>	<p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> • <code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp. • <code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp. • <code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information. • <code>MAX_ELAPSED TIME</code> — Returns the plan with the maximum elapsed time. • <code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets. • <code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads. • <code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes. • <code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value.
<code>sqlset_owner</code>	Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.
<code>recursive_sql</code>	Specifies that the filter must include recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it (<code>NO_RECURSIVE_SQL</code>).

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

171.5.39 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  baseline_name   IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL,
  recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid            IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 171-45 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
<code>begin_snap</code>	Defines the beginning AWR snapshot (non-inclusive).
<code>end_snap</code>	Defines the ending AWR snapshot (inclusive).
<code>baseline_name</code>	Specifies the name of the AWR baseline period.

Table 171-45 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
<code>basic_filter</code>	Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> . If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .
<code>object_filter</code>	Currently not supported.
<code>ranking_measure(n)</code>	Defines an <code>ORDER BY</code> clause on the selected SQL.
<code>result_percentage</code>	Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.
<code>result_limit</code>	Specifies the top limit SQL from the source according to the supplied ranking measure.
<code>attribute_list</code>	Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default. <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result. <code>ALL</code> — Returns all attributes Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).
<code>recursive_sql</code>	Specifies the filter that includes recursive SQL in the SQL tuning set (<code>HAS_RECURSIVE_SQL</code>) or excludes it (<code>NO_RECURSIVE_SQL</code>).
<code>dbid</code>	Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.

Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
```

```

        FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;
/

```

171.5.40 SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  VARCHAR2,
    database_link_to  IN  VARCHAR2);

```

```

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  NUMBER,
    database_link_to  IN  VARCHAR2);
);

```

Parameters

Table 171-46 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 171-46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	<p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> • APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). • BASIC_FILTER: basic filter for SQL tuning set • DAYS_TO_EXPIRE: number of days until the task is deleted • DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function and Procedure • EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) • LOCAL_TIME_LIMIT: per-statement time out (seconds) • MODE: tuning scope (comprehensive, limited) • OBJECT_FILTER: object filter for SQL tuning set • PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) • RANK_MEASURE1: first ranking measure for SQL tuning set • RANK_MEASURE2: second possible ranking measure for SQL tuning set • RANK_MEASURE3: third possible ranking measure for SQL tuning set • RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER • SQL_LIMIT: maximum number of SQL statements to tune • SQL_PERCENTAGE: percentage filter of SQL tuning set statements • TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute • TIME_LIMIT: global time out (seconds) • USERNAME: username under which the statement is parsed
value	New value of the specified parameter

Table 171-46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
database_link_to	<p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>

Usage Notes

When setting automatic tuning task parameters, use the [SET_AUTO_TUNING_TASK_PARAMETER Procedures](#) in the [DBMS_AUTO_SQLTUNE](#) package.

171.5.41 SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in dba_sql_profiles.

**See Also:**

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text      IN CLOB,
  force_match  IN BOOLEAN := FALSE)
RETURN NUMBER;
```

Parameters

Table 171-47 SQLTEXT_TO_SIGNATURE Function Parameters

Parameter	Description
sql_text	SQL text whose signature is required. Required.
force_match	If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

171.5.42 UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
  profile_name          IN VARCHAR2 := '%',
  profile_category     IN VARCHAR2 := 'DEFAULT',
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 171-48 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
profile_category	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
replace	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists
staging_table_name	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.

Table 171-48 (Cont.) UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
staging_schem a_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace           => FALSE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;

-- If there is a failure during the unpack operation, you can find the
-- profile
-- that caused the error and perform a remap_stgtab_sqlprof operation
-- targeting it.
-- You can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created are replaced.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace           => TRUE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

171.5.43 UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

**See Also:**

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name      IN VARCHAR2 := '%',
  sqlset_owner     IN VARCHAR2 := NULL,
  replace          IN BOOLEAN,
```

```
staging_table_name IN VARCHAR2,  
staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET and DBMS_SQLSET.UNPACK_STGTAB.

Table 171-49 UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.
sqlset_owner	Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.
replace	Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.
staging_table_name	Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).
staging_schema_owner	Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).

Examples

```
-- unpack all STS in the staging table  
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -  
                                       sqlset_owner     => '%', -  
                                       replace           => FALSE, -  
                                       staging_table_name =>  
'STGTAB_SQLSET');  
  
-- errors can arise during STS unpack when a STS in the staging table  
-- has the  
-- same name/owner as STS on the system. In this case, users should  
-- call  
-- remap_stgtab_sqlset to patch the staging table and with which to  
-- call unpack  
-- Replace set to TRUE.  
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -  
                                       sqlset_owner     => '%', -  
                                       replace           => TRUE, -  
                                       staging_table_name =>  
'STGTAB_SQLSET');
```

171.5.44 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

See Also:

[DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL);
```

Parameters

Table 171-50 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	Specifies the name of the SQL tuning set.
sql_id	Specifies the identifier of the SQL statement to be updated.
plan_hash value	Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.
attribute_name	Specifies the name of the attribute to be modified. You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY. If a statement has multiple plans, then the procedure changes the attribute value for all plans.
attribute_value	Specifies the new value of the attribute.

DBMS_STAT_FUNCS

The `DBMS_STAT_FUNCS` package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS_STAT_FUNCS Subprograms](#)

172.1 Summary of DBMS_STAT_FUNCS Subprograms

This table lists and briefly describes the `DBMS_STAT_FUNCS` subprograms.

Table 172-1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure	Tests how well a sample of values fits a Weibull distribution

172.1.1 EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  mu          IN   NUMBER,
  sig        OUT  NUMBER);
```

Parameters

Table 172-2 EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
<code>ownername</code>	The schema where the table resides.

Table 172-2 (Cont.) EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

172.1.2 NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
  ownername IN VARCHAR2,
  tablename IN VARCHAR2,
  columnname IN VARCHAR2,
  test_type IN VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
  mean IN NUMBER,
  stdev IN NUMBER,
  sig OUT NUMBER);
```

Parameters

Table 172-3 NORMAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

172.1.3 POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 172-4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

172.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  sigma_value IN   NUMBER DEFAULT 3,
  s           OUT  SummaryType);
```

Parameters

Table 172-5 SUMMARY Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.

Table 172-5 (Cont.) SUMMARY Procedure Parameters

Parameter	Description
tablename	The table where the column resides.
columnname	The column of the table to be summarized.
sigma_value	The number of sigmas for the set of extreme values, defaults to 3.
s	The Record containing summary information about given column.

Definition of SummaryType

```

TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
    count          NUMBER,
    min            NUMBER,
    max            NUMBER,
    range          NUMBER,
    mean           NUMBER,
    cmode          num_table,
    variance       NUMBER,
    stddev         NUMBER,
    quantile_5     NUMBER,
    quantile_25    NUMBER,
    median         NUMBER,
    quantile_75    NUMBER,
    quantile_95    NUMBER,
    plus_x_sigma   NUMBER,
    minus_x_sigma  NUMBER,
    extreme_values num_table,
    top_5_values   n_arr,
    bottom_5_values n_arr);

```

172.1.5 UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```

DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
    ownername IN VARCHAR2,
    tablename IN VARCHAR2,
    columnname IN VARCHAR2,
    var_type IN VARCHAR2 DEFAULT 'CONTINUOUS',
    test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    paramA IN NUMBER,
    paramB IN NUMBER,
    sig OUT NUMBER);

```

Parameters

Table 172-6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

172.1.6 WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  alpha       IN   NUMBER,
  mu          IN   NUMBER,
  beta        IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 172-7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.

Table 172-7 (Cont.) WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

DBMS_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the `DBMS_STATS` package. However, `DBMS_STATS` cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

- [DBMS_STATS Overview](#)
- [DBMS_STATS Deprecated Subprograms](#)
- [DBMS_STATS Types](#)
- [DBMS_STATS Constants](#)
- [DBMS_STATS Operational Notes](#)
- [DBMS_STATS Data Structures](#)
- [Summary of DBMS_STATS Subprograms](#)

See Also:

- *Oracle Database SQL Tuning Guide*
- *Oracle Database Administrator's Guide*

173.1 DBMS_STATS Overview

To improve performance, the database enables you to collect optimizer statistics.

Note:

By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the `DELETE_COLUMN_STATS` procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only optimizer statistics stored in the data dictionary have an effect on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel.

Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations. The advisor task runs automatically in the maintenance window. However, you can also run the job on demand.

 **See Also:**

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics

173.2 DBMS_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11g Release 2 (11.2), the following subprograms are obsolete:

- [GET_PARAM Function](#)
Instead, use [GET_PREFS Function](#)
- [SET_PARAM Procedure](#)
Instead, use [SET_GLOBAL_PREFS Procedure](#)
- [RESET_PARAM_DEFAULTS Procedure](#)
Instead use [RESET_GLOBAL_PREF_DEFAULTS Procedure](#)

The following subprogram is deprecated with Oracle Database 12c and later:

- [GENERATE_STATS](#)

This procedure is replaced by the [GATHER_INDEX_STAT](#) procedure.

 **See Also:**

"[GATHER_INDEX_STATS Procedure](#)"

173.3 DBMS_STATS Types

Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```
TYPE numarray IS VARRAY(2050) OF NUMBER;  
TYPE datearray IS VARRAY(2050) OF DATE;  
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);  
TYPE rawarray IS VARRAY(2050) OF RAW(2000);  
TYPE fltarray IS VARRAY(2050) OF BINARY_FLOAT;  
TYPE dblarray IS VARRAY(2050) OF BINARY_DOUBLE;
```

Stale Tables

Types for listing stale tables include the following:

```

TYPE ObjectElem IS RECORD (
  ownname    VARCHAR2(30),    -- owner
  objtype    VARCHAR2(6),    -- 'TABLE' or 'INDEX'
  objname    VARCHAR2(30),    -- table/index
  partname   VARCHAR2(30),    -- partition
  subpartname VARCHAR2(30));  -- subpartition
TYPE ObjectTab IS TABLE OF ObjectElem;

```

Statistics Difference Reports

Use the following type to displays a statistics difference report:

```

TYPE DiffRepElem IS RECORD (
  report      CLOB,          -- stats difference report
  maxdiffpct NUMBER);      -- max stats difference (percentage)
TYPE DiffRepTab IS TABLE OF DiffRepElem;

```

Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```

TYPE ObjectElem IS RECORD (
  ownname      dbms_quoted_id, -- owner
  objtype      VARCHAR2(6), -- 'TABLE' or 'INDEX'
  objname      dbms_quoted_id, -- table/index
  partname     dbms_quoted_id, -- partition
  subpartname  dbms_quoted_id -- subpartition
);
TYPE ObjectTab IS TABLE OF ObjectElem;

```

Note:

Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed

The following type represents an operation:

```

TYPE StatsAdvOpr IS RECORD (
  name  VARCHAR2(64), -- name of the operation
  param VARCHAR2(4000)
); -- XML containing parameters and their values
TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;

```

The following type represents a filter list:

```

TYPE StatsAdvFilter IS RECORD (
  rulename VARCHAR2(64), -- rule name
  objlist  ObjectTab,    -- object filter list
  oprlist  StatsAdvOprTab, -- operation filter list

```

```
include BOOLEAN);          -- include/exclude elements in the list
TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;
```

173.4 DBMS_STATS Constants

The `DBMS_STATS` package defines several constants to use specifying parameter values.

Table 173-1 DBMS_STATS Constants

Name	Type	Description
<code>ADD_GLOBAL_PREFS</code>	NUMBER	Copies global preferences
<code>AUTO_CASCADE</code>	BOOLEAN	Lets Oracle decide whether to collect statistics for indexes or not
<code>AUTO_DEGREE</code>	NUMBER	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
<code>AUTO_INVALIDATE</code>	BOOLEAN	Lets Oracle decide when to invalidate dependent cursors
<code>AUTO_SAMPLE_SIZE</code>	NUMBER	Indicates that auto-sample size algorithms should be used
<code>PURGE_ALL</code>	TIMESTAMP WITH TIME ZONE	A flag that can be passed to the PURGE_STATS Procedure and unconditionally deletes all the history statistics. The deletion uses <code>TRUNCATE</code> statements on the various dictionary statistics tables holding the history of statistics.
<code>RECLAIM_SYNOPSIS</code>	TIMESTAMP WITH TIME ZONE	A constant used for reclaiming synopsis table space.

173.5 DBMS_STATS Operational Notes

Observe these operational notes when using the `DBMS_STATS` package.

The `DBMS_STATS` subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)

- [Extended Statistics](#)
- [Optimizer Statistics Advisor](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET_DATABASE_PREFS Procedure](#), [SET_GLOBAL_PREFS Procedure](#), [SET_SCHEMA_PREFS Procedure](#) and [SET_TABLE_PREFS Procedure](#).

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a `force` parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

- [GATHER_DATABASE_STATS Procedures](#)
- [GATHER_DICTIONARY_STATS Procedure](#)
- [GATHER_FIXED_OBJECTS_STATS Procedure](#)
- [GATHER_INDEX_STATS Procedure](#)
- [GATHER_SCHEMA_STATS Procedures](#)
- [GATHER_SYSTEM_STATS Procedure](#)
- [GATHER_TABLE_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE_STATS Procedure](#)

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

[PREPARE_COLUMN_VALUES](#) Procedures
[PREPARE_COLUMN_VALUES_NVARCHAR](#) Procedure
[PREPARE_COLUMN_VALUES_ROWID](#) Procedure

[SEED_COL_USAGE](#) Procedure
[SET_INDEX_STATS](#) Procedures
[SET_SYSTEM_STATS](#) Procedure
[SET_TABLE_STATS](#) Procedure

[GET_COLUMN_STATS](#) Procedures
[GET_INDEX_STATS](#) Procedures
[GET_SYSTEM_STATS](#) Procedure
[GET_TABLE_STATS](#) Procedure

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE_COLUMN_STATS](#) Procedure
[DELETE_DATABASE_STATS](#) Procedure
[DELETE_DICTIONARY_STATS](#) Procedure
[DELETE_FIXED_OBJECTS_STATS](#) Procedure
[DELETE_INDEX_STATS](#) Procedure
[DELETE_SCHEMA_STATS](#) Procedure
[DELETE_SYSTEM_STATS](#) Procedure
[DELETE_TABLE_STATS](#) Procedure

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are 'OBJECT_STATS' (table statistics, column statistics and index statistics) and 'SYNOPSIS' (auxiliary statistics created when statistics are incrementally maintained). The default is 'OBJECT_STATS, SYNOPSIS'.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE_STAT_TABLE Procedure](#)

[DROP_STAT_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table ([EXPORT_*](#))
- from a user statistics table to the dictionary ([IMPORT_*](#))

[EXPORT_COLUMN_STATS Procedure](#)

[EXPORT_DATABASE_STATS Procedure](#)

[EXPORT_DICTIONARY_STATS Procedure](#)

[EXPORT_FIXED_OBJECTS_STATS Procedure](#)

[EXPORT_INDEX_STATS Procedure](#)

[EXPORT_SCHEMA_STATS Procedure](#)

[EXPORT_SYSTEM_STATS Procedure](#)

[EXPORT_TABLE_STATS Procedure](#)

[IMPORT_COLUMN_STATS Procedure](#)

[IMPORT_DATABASE_STATS Procedure](#)

[IMPORT_DICTIONARY_STATS Procedure](#)

[IMPORT_FIXED_OBJECTS_STATS Procedure](#)

[IMPORT_INDEX_STATS Procedure](#)

[IMPORT_SCHEMA_STATS Procedure](#)

[IMPORT_SYSTEM_STATS Procedure](#)

[IMPORT_TABLE_STATS Procedure](#)

 **Note:**

Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK_PARTITION_STATS Procedure](#)

[LOCK_SCHEMA_STATS Procedure](#)

[LOCK_TABLE_STATS Procedure](#)

[UNLOCK_PARTITION_STATS Procedure](#)

[UNLOCK_SCHEMA_STATS Procedure](#)

[UNLOCK_TABLE_STATS Procedure](#)

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET_GLOBAL_PREF_DEFAULTS Procedure](#)
[RESTORE_DATABASE_STATS Procedure](#)
[RESTORE_DICTIONARY_STATS Procedure](#)
[RESTORE_FIXED_OBJECTS_STATS Procedure](#)
[RESTORE_SCHEMA_STATS Procedure](#)
[RESTORE_SYSTEM_STATS Procedure](#)
[RESTORE_TABLE_STATS Procedure](#)

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER_STATS_HISTORY_RETENTION Procedure](#).

The other `DBMS_STATS` procedures related to restoring statistics are:

- [PURGE_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET_STATS_HISTORY_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET_STATS_HISTORY_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

`RESTORE_*` operations are not supported for user defined statistics.

User-Defined Statistics

The `DBMS_STATS` package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET_INDEX_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET_*` and `GET_*` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

`EXPORT_*`, `IMPORT_*` and `RESTORE_*` operations are not supported for user defined statistics.

Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the `PUBLISH` option to `FALSE` using the `SET*PREFS` procedures. The default value for `PUBLISH` is `TRUE`. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to `TRUE`. The

default value of this parameter is `FALSE` and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT_PENDING_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the [PUBLISH_PENDING_STATS Procedure](#) if the performance is acceptable, or delete the pending statistics using [DELETE_PENDING_STATS Procedure](#) if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE_PENDING_STATS Procedure](#)
- [EXPORT_PENDING_STATS Procedure](#)
- [PUBLISH_PENDING_STATS Procedure](#)

Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on column group (c1, c2), the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

- [DROP_EXTENDED_STATS Procedure](#)
- [SHOW_EXTENDED_STATS_NAME Function](#)
- [REPORT_COL_USAGE Function](#)
- [SEED_COL_USAGE Procedure](#)
- [RESET_COL_USAGE Procedure](#)

Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in `DBA_ADVISOR_RECOMMENDATIONS`.

The advisor organizes rules into the following classes:

- **System**
This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value `SYSTEM` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Operation**
This class checks whether statistics collection uses the defaults, test statistics are created using the `SET_*_STATS` procedures, and so on. Rules in this class have the value `OPERATION` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Object**
This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value `OBJECT` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

All Optimizer Statistics Advisor subprograms require the `ADVISOR` privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the `ANALYZE ANY DICTIONARY` privilege creates a task `t1`, and if a DBA then executes this task, then the task execution checks for `SYS` objects. Another example is a task that is executed by `user1`, interrupted, and then resumed by `user2`. In this case, the checks of the resumed execution are based on the privilege of `user2` rather than `user1`.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- [CANCEL_ADVISOR_TASK Procedure](#)
- [CONFIGURE_ADVISOR_FILTER Function](#)
- [CONFIGURE_ADVISOR_OBJ_FILTER Function](#)
- [CONFIGURE_ADVISOR_OPR_FILTER Functions](#)
- [CONFIGURE_ADVISOR_RULE_FILTER Function](#)
- [CREATE_ADVISOR_TASK Function](#)

- [DROP_ADVISOR_TASK](#) Procedure
- [EXECUTE_ADVISOR_TASK](#) Function
- [GET_ADVISOR_OPR_FILTER](#) Procedure
- [GET_ADVISOR_RECS](#) Function
- [IMPLEMENT_ADVISOR_TASK](#) Function
- [INTERRUPT_ADVISOR_TASK](#) Procedure
- [REPORT_ADVISOR_TASK](#) Function
- [RESET_ADVISOR_TASK](#) Procedure
- [RESUME_ADVISOR_TASK](#) Procedure
- [SCRIPT_ADVISOR_TASK](#) Function
- [SET_ADVISOR_TASK_PARAMETER](#) Procedure

173.6 DBMS_STATS Data Structures

The `DBMS_STATS` package defines a `RECORD` type.

RECORD Types

- [STAT_REC](#) Record Type

173.6.1 DBMS_STATS STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD (  
    epc    NUMBER,  
    minval RAW(2000),  
    maxval RAW(2000),  
    bkvals NUMARRAY,  
    novals NUMARRAY,  
    chvals CHARARRAY,  
    eavals RAWARRAY,  
    rpcnts NUMARRAY,  
    eavs   NUMBER);
```

Fields of the Record type COMPARISON_TYPE (STAT_REC Attributes)**Table 173-2 STAT_REC Attributes**

Field	Description
epc	Number of buckets in histogram
minval	Minimum value
maxval	Maximum value
bkvals	Array of bucket numbers
novals	Array of normalized end point values
chvals	Array of dumped end point values
eavals	Array of end point actual values
rpcnts	Array of end point value frequencies
eavs	A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures , this field will be automatically filled.

173.7 Summary of DBMS_STATS Subprograms

This table lists the DBMS_STATS subprograms and briefly describes them.

Table 173-3 DBMS_STATS Package Subprograms

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure	Changes the statistics history retention value
CANCEL_ADVISOR_TASK Procedure	Cancels an Optimizer Statistics Advisor execution
CONFIGURE_ADVISOR_FILTER Function	Configures the filter list for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_OBJ_FILTER Function	Configures an object filter for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_OPR_FILTER Functions	Configures an operation filter for an Optimizer Statistics Advisor task
CONFIGURE_ADVISOR_RULE_FILTER Function	Configures a rule filter for an Optimizer Statistics Advisor task
CREATE_ADVISOR_TASK Function	Creates an advisor task for the Optimizer Statistics Advisor
CONVERT_RAW_VALUE Procedures	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure	Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value

Table 173-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
COPY_TABLE_STATS Procedure	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure	Creates a table with name <code>stattab</code> in <code>ownname</code> 's schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure	Deletes the statistics preferences of all the tables
DELETE_DATABASE_STATS Procedure	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure	Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and database component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure	Deletes index-related statistics
DELETE_PENDING_STATS Procedure	Deletes the private statistics that have been collected but have not been published
DELETE_PROCESSING_RATE Procedure	Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources
DELETE_SCHEMA_PREFS Procedure	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure	Deletes system statistics
DELETE_TABLE_PREFS Procedure	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure	Deletes table-related statistics
DIFF_TABLE_STATS_IN_HISTORY Function	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps
DIFF_TABLE_STATS_IN_PENDING Function	Compares pending statistics and statistics as of a timestamp or statistics from dictionary
DIFF_TABLE_STATS_IN_STATTAB Function	Compares statistics for a table from two different sources
DROP_ADVISOR_TASK Procedure	Drops the specified Optimizer Statistics Advisor task
DROP_EXTENDED_STATS Procedure	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure	Drops a user statistics table created by <code>CREATE_STAT_TABLE</code>
EXECUTE_ADVISOR_TASK Function	Executes a previously created Optimizer Statistics Advisor task

Table 173-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
EXPORT_COLUMN_STAT S Procedure	Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_DATABASE_PR EFS Procedure	Exports the statistics preferences of all the tables
EXPORT_DATABASE_ST ATS Procedure	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code>
EXPORT_DICTIONARY_S TATS Procedure	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_FIXED_OBJECT S_STATS Procedure	Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_INDEX_STATS Procedure	Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_PENDING_STAT S Procedure	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREF S Procedure	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STAT S Procedure	Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_SYSTEM_STAT S Procedure	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONI TORING_INFO Procedure	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_ST ATS Procedures	Gathers statistics for all objects in the database
GATHER_DICTIONARY_S TATS Procedure	Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components
GATHER_FIXED_OBJECT S_STATS Procedure	Gathers statistics of fixed objects
GATHER_INDEX_STATS Procedure	Gathers index statistics
GATHER_PROCESSING_ RATE Procedure	Starts the job of gathering the processing rates which end after <code>interval</code> defined in minutes
GATHER_SCHEMA_STAT S Procedures	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STAT S Procedure	Gathers system statistics
GATHER_TABLE_STATS Procedure	Gathers table and column (and index) statistics

Table 173-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
GENERATE_STATS Procedure	Generates object statistics from previously collected statistics of related objects
GET_ADVISOR_OPR_FILTER Procedure	Creates an operation filter for an Optimizer Statistics Advisor operation
GET_ADVISOR_RECS Function	Generates a recommendation report for the specified item
GET_COLUMN_STATS Procedures	Gets all column-related information
GET_INDEX_STATS Procedures	Gets all index-related information
GET_PARAM Function	Gets the default value of parameters of DBMS_STATS procedures (see DBMS_STATS Deprecated Subprograms)
GET_PREFS Function	Gets the default value of the specified preference
GET_STATS_HISTORY_AVAILABILITY Function	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_RETENTION Function	Returns the current statistics history retention value
GET_SYSTEM_STATS Procedure	Gets system statistics from <code>stattab</code> , or from the dictionary if <code>stattab</code> is NULL
GET_TABLE_STATS Procedure	Gets all table-related information
IMPLEMENT_ADVISOR_TASK Function	Implements the recommendations made by Optimizer Statistics Advisor
IMPORT_COLUMN_STATS Procedure	Retrieves statistics for a particular column from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure	Imports the statistics preferences of all the tables
IMPORT_DATABASE_STATS Procedure	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_STATS Procedure	Retrieves statistics for fixed tables from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
IMPORT_INDEX_STATS Procedure	Retrieves statistics for a particular index from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
IMPORT_SCHEMA_PREFS Procedure	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure	Retrieves statistics for all objects in the schema identified by <code>ownname</code> from the user statistics table and stores them in the dictionary
IMPORT_SYSTEM_STATS Procedure	Retrieves system statistics from the user statistics table and stores them in the dictionary
IMPORT_TABLE_PREFS Procedure	Sets the statistics preferences of the specified table in the specified schema

Table 173-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
IMPORT_TABLE_STATS Procedure	Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
INTERRUPT_ADVISOR_TASK Procedure	Interrupts a currently executing Optimizer Statistics Advisor task.
LOCK_PARTITION_STATS Procedure	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure	Locks the statistics on the table
MERGE_COL_USAGE Procedure	Merges column usage information from a source database, by means of a <code>dblink</code> , into the local database
PREPARE_COLUMN_VALUES Procedures	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_NVARCHAR Procedure	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SEED_COL_USAGE Procedure
PUBLISH_PENDING_STATS Procedure	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure	Purges old versions of statistics saved in the dictionary
REMAP_STAT_TABLE Procedure	Remaps the names of objects in the user statistics table
REPORT_ADVISOR_TASK Function	Reports the results of an Optimizer Advisor Task.
REPORT_COL_USAGE Function	Reports the recorded column (group) usage information
REPORT_GATHER_AUTO_STATS Function	Runs the auto statistics gathering job in reporting mode
REPORT_GATHER_DATABASE_STATS Functions	Runs the GATHER_DATABASE_STATS Procedures in reporting mode.
REPORT_GATHER_DICTIONARY_STATS Functions	Runs the GATHER_DICTIONARY_STATS Procedure in reporting mode
REPORT_GATHER_FIXED_OBJECTS_STATS Function	Runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode
REPORT_GATHER_SCHEMA_STATS Functions	Runs the GATHER_SCHEMA_STATS Procedures in reporting mode
REPORT_GATHER_TABLE_STATS Function	Runs the GATHER_TABLE_STATS Procedure in reporting mode

Table 173-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
REPORT_STATS_OPERATIONS Function	Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided
RESET_ADVISOR_TASK Procedure	Resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing
RESET_COL_USAGE Procedure	Resets the recorded column (group) usage information
RESET_GLOBAL_PREFS Procedure	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure	Resets global preferences to default values (see DBMS_STATS Deprecated Subprograms)
RESTORE_DICTIONARY_STATS Procedure	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_STATS Procedure	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure	Restores statistics of a table as of a specified timestamp (<i>as_of_timestamp</i>), as well as statistics of associated indexes and columns
RESUME_ADVISOR_TASK Procedure	Resumes an interrupted task. It only resumes the execution that was most recently interrupted
SCRIPT_ADVISOR_TASK Function	Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor
SEED_COL_USAGE Procedure	Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements
SET_ADVISOR_TASK_PARAMETER Procedure	Updates the value of an Optimizer Statistics Advisor task parameter
SET_COLUMN_STATS Procedures	Sets column-related information
SET_DATABASE_PREFS Procedure	Sets the statistics preferences of all the tables
SET_GLOBAL_PREFS Procedure	Sets the global statistics preferences
SET_INDEX_STATS Procedures	Sets index-related information
SET_PARAM Procedure	Sets default values for parameters of DBMS_STATS procedures (see DBMS_STATS Deprecated Subprograms)
SET_PROCESSING_RATE Procedure	Sets the value of rate of processing for a given operation
SET_SCHEMA_PREFS Procedure	Sets the statistics preferences of all the tables owned by the specified owner name

Table 173-3 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
SET_SYSTEM_STATS Procedure	Sets system statistics
SET_TABLE_PREFS Procedure	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure	Sets table-related information
SHOW_EXTENDED_STAT_S_NAME Function	Returns the name of the virtual column that is created for the user-specified extension
TRANSFER_STATS Procedure	Transfers statistics for specified table(s) from a remote database specified by <code>dblink</code> to the local database
UNLOCK_PARTITION_STATS Procedure	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure	Unlocks the statistics on all the tables in schema
UNLOCK_TABLE_STATS Procedure	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure	Upgrades user statistics on an older table

173.7.1 ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and [PURGE_STATS Procedure](#).

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention      IN      NUMBER);
```

Parameters

Table 173-4 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
<code>retention</code>	<p>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</p> <ul style="list-style-type: none"> -1: Statistics history is never purged by automatic purge 0: Old statistics are never saved. The automatic purge will delete all statistics history NULL: Change statistics history retention to default value

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges

173.7.2 CANCEL_ADVISOR_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

Parameters

Table 173-5 CANCEL_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

Example 173-1 Canceling an Optimizer Statistics Advisor

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

173.7.3 CONFIGURE_ADVISOR_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
  task_name          IN   VARCHAR2,
  stats_adv_opr_type IN   VARCHAR2,
  configuration_type IN   VARCHAR2,
  filter             IN   StatsAdvFilterTab := NULL)
RETURN CLOB;
```

Parameters

Table 173-6 CONFIGURE_ADVISOR_FILTER Function Parameters

Parameter	Description
<code>task_name</code>	The name of the Optimizer Statistics Advisor task.
<code>stats_adv_opr_type</code>	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. The function permits you to specify a combination of operation types by using the plus (+) operator, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of advisor operations.

Table 173-6 (Cont.) CONFIGURE_ADVISOR_FILTER Function Parameters

Parameter	Description
<code>configuration_type</code>	The type of configuration. Possible values are as follows: <ul style="list-style-type: none"> • SET: Sets the specified filter list values. The submitted filter overrides existing filter values. • CLEAR: Clears the existing values for the specified filter. • SHOW: Shows the current values of the specified filter.
<code>filter</code>	The list of filter items for the script.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns a CLOB that contains the configuration of the provided filter in XML format.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

To provide fine-grained control and a unified interface across all procedures, `DBMS_STATS` provides the `StatsAdvFilter` type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type `StatsAdvFilter` to `CONFIGURE_ADVISOR_FILTER` along with a Boolean variable that specifies either of the following:

- **Inclusion list**
Only include these objects in the check.
- **Exclusion list**
Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- **Rule filter**
This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.

- Operation filter

This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the `DBA_OPTSTAT_OPERATIONS` view. To obtain the filter for an operation, use `DBMS_STATS.GET_ADVISOR_OPR_FILTER`.

- Object filter

This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

Example 173-2 Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```

DECLARE
  v_task_name    VARCHAR2(128)           := 'my_task';
  v_ret          VARCHAR2(128);
  filter         DBMS_STATS.StatsAdvFilter := null;
  filterTab     DBMS_STATS.StatsAdvFilterTab := null;
  v_counter      NUMBER                 := 0;
  v_filterReport CLOB;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize the filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- First filter: set filters to be FALSE by default
  filter.include := FALSE;

  -- Add this filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  -- Second filter: turn on filter for one rule
  filter.include := TRUE;
  filter.rulename := 'TurnOnSQLPlanDirective';

  -- Add the SQL plan directive filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
                    task_name           => v_task_name,

```

```

        stats_adv_opr_type => NULL,
        configuration_type => 'SET',
        filter              => filterTab);
    -- Drop the task
    DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

Example 173-3 Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

```

DECLARE
    v_task_name    VARCHAR2(128)           := 'my_task';
    v_ret          VARCHAR2(128);
    filter        DBMS_STATS.StatsAdvFilter := null;
    filterTab     DBMS_STATS.StatsAdvFilterTab := null;
    opr           DBMS_STATS.StatsAdvOpr;
    oprTab       DBMS_STATS.StatsAdvOprTab;
    v_oprCnt      NUMBER                   := 0;
    TYPE numTab IS TABLE OF NUMBER;
    opr_tab      numTab;
    v_filterReport CLOB;

BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Initialize operations filter
    oprTab := DBMS_STATS.StatsAdvOprTab();

    SELECT ID
           BULK COLLECT INTO opr_tab
    FROM   WRI$_OPTSTAT_OPR
    WHERE  OPERATION = 'set_table_stats'
    AND    TARGET = 'HR.EMPLOYEES';

    -- Populate the operations table
    FOR i IN 1..opr_tab.count LOOP

        -- Use the procedure GET_ADVISOR_OPR_FILTER to construct
        -- an operation filter
        DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);

        v_oprCnt := v_oprCnt + 1;
        oprTab.extend;
        oprTab(v_oprCnt) := opr;

    END LOOP;

    filter.include := FALSE;
```

```
filter.oprlist := oprTab;

-- Add to filter table
filterTab.extend;
filterTab(1) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name           => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter              => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
```

Example 173-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the `sh` schema. Also, you want to skip the `sh.products` table. You create an object filter as follows:

```
DECLARE
    v_task_name      VARCHAR2(128)           := 'my_task';
    v_ret            VARCHAR2(128);
    filter           DBMS_STATS.StatsAdvFilter := null;
    filterTab        DBMS_STATS.StatsAdvFilterTab := null;
    v_filterReport   CLOB;
    v_counter        NUMBER                   := 0;
    obj              DBMS_STATS.ObjectElem;
    objTab           DBMS_STATS.ObjectTab;
    v_objCnt         NUMBER                   := 0;
BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Set object filter to be off by default
    filter.include := FALSE;

    objTab := DBMS_STATS.ObjectTab();

    obj.ownname := NULL;
    obj.objname := NULL;

    -- Add to the object table

    v_objCnt := v_objCnt + 1;
    objTab.extend;
    objTab(v_objCnt) := obj;

    filter.objlist := objTab;
```

```
-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 1, turn on the check only for schema SH

filter.include := TRUE;

objTab := DBMS_STATS.ObjectTab();
v_objCnt := 0;

obj.ownname := 'SH';
obj.objname := NULL;

-- add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 2, exclude the check for object sh.products

filter.include := FALSE;

objTab := dbms_stats.ObjectTab();
v_objCnt := 0;

-- Specify another object filter for sh.products
obj.ownname := 'SH';
obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
```

```

stats_adv_opr_type => NULL,
configuration_type => 'SET',
filter              => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

173.7.4 CONFIGURE_ADVISOR_OBJ_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  ownname            IN VARCHAR2,
  tablename          IN VARCHAR2,
  action             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 173-7 CONFIGURE_ADVISOR_OBJ_FILTER Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
stats_adv_opr_type	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".
rule_name	The name of the rule to configure. If null, the function applies the filter to all operation-level rules.
ownname	The owner name of the operation target. If null, the function applies the filter to all owner names.
tablename	The table name of the operation target.
action	The configuration action to take for the specified rule. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- **ORA-20000:** Insufficient privileges
- **ORA-20001:** Invalid input values
- **ORA-20012:** Optimizer Statistics Advisor errors

173.7.5 CONFIGURE_ADVISOR_OPR_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_name     IN VARCHAR2,
    action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_name     IN VARCHAR2,
    ownname            IN VARCHAR2,
    tabname            IN VARCHAR2,
    action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_id       IN NUMBER,
    action             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 173-8 CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Table 173-8 (Cont.) CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

Parameter	Description
stats_adv_opr_type	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".
rule_name	The name of the rule to configure. If null, the function applies the filter to all operation-level rules.
operation_name	The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null.
operation_id	The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OPSTAT_OPERATIONS.ID. This value cannot be null.
ownname	The owner name of the operation target. This value cannot be null.
tabname	The table name of the operation target.
action	The configuration action to take for the specified rule. See " CONFIGURE_ADVISOR_RULE_FILTER Function ".

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 173-5 Excluding Operations for Gathering Table Statistics

In this example, your goal is to exclude operations that gather table statistics in the `hr` schema. User account `stats` has been granted the `DBA` role, `ADVISOR` privilege, and `SELECT ON DBA_OPTSTAT_OPERATIONS` privilege. You perform the following steps:

1. Log in to the database as `stats`.
2. Drop any existing task named `opt_adv_task1`.

```
DECLARE
  v_tname VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
```

```

        DBMS_STATS.DROP_ADVISOR_TASK(v_tname);
    END;
/

```

3. Create a procedure named `opr_filter` that configures a task to advise on all operations *except* those that gather statistics for tables in the `hr` schema.

```

CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS
    v_retc CLOB;
BEGIN
    -- For all rules, prevent the advisor from operating
    -- on the operations selected in the following query
    FOR rec IN
        (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION =
'gather_table_stats' AND TARGET LIKE 'HR.%')
    LOOP
        v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(
            task_name          => p_tname
            , stats_adv_opr_type => NULL
            , rule_name         => NULL
            , operation_id      => rec.id
            , action            => 'DISABLE');
    END LOOP;
END;
/
SHOW ERRORS

```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```

DECLARE
    v_tname VARCHAR2(32767);
    v_ret   VARCHAR2(32767);
BEGIN
    v_tname := 'opt_adv_task1';
    v_ret   := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
    opr_filter(v_tname);
END;
/

```

5. Execute the task `opt_adv_task1`.

```

DECLARE
    v_tname VARCHAR2(32767);
    v_ret   VARCHAR2(32767);
begin
    v_tname := 'opt_adv_task1';
    v_ret   := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

6. Print the report.

```

SPOOL /tmp/rep.txt
SET LONG 1000000
COLUMN report FORMAT A200
SET LINESIZE 250
SET PAGESIZE 1000

SELECT DBMS_STATS.REPORT_ADVISOR_TASK(
       task_name      => 'opt_adv_task1'
       , execution_name => NULL
       , type          => 'TEXT'
       , section       => 'ALL'
       ) AS report
FROM   DUAL;
SPOOL OFF

```

173.7.6 CONFIGURE_ADVISOR_RULE_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (
  task_name      IN  VARCHAR2,
  stats_adv_opr_Type IN VARCHAR2,
  rule_name      IN  VARCHAR2,
  action         IN  VARCHAR2)
RETURN CLOB;

```

Parameters

Table 173-9 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
stats_adv_opr_type	The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. You can specify a combination of operation types, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations.
rule_name	The name of the rule to configure. If null, the function applies the filter to all rules.

Table 173-9 (Cont.) SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
action	The configuration action to take for the specified rule. Possible values are: <ul style="list-style-type: none"> • ENABLE: Enables the filter • DISABLE: Disables the filter • DELETE: Deletes the filter • SHOW: Shows the current filter value

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

173.7.7 CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT VARCHAR2);
```

Parameters

Table 173-10 CONVERT_RAW_VALUE Procedure Parameters

Parameter	Description
rawval	Raw representation of a column minimum, maximum, histogram end point actual value
resval	Converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.8 CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
    rawval    RAW,
    resval OUT NVARCHAR2);
```

Parameters

Table 173-11 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.9 CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval    RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 173-12 CONVERT_RAW_VALUE_ROWID Procedure Parameters

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.10 COPY_TABLE_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of blks, or number of rows) based on the given `scale_factor`.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    srcpartname      VARCHAR2,
    dstpartname      VARCHAR2,
    scale_factor     VARCHAR2 DEFAULT 1,
    flags            NUMBER DEFAULT NULL,
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-13 COPY_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the table of source and destination [sub] partitions
tabname	Table name of source and destination [sub] partitions
srcpartname	Source [sub] partition
dstpartname	Destination [sub] partition
scale_factor	Scale factor to scale nblks, nrows etc. in dstpartname

Table 173-13 (Cont.) COPY_TABLE_STATS Procedure Parameters

Parameter	Description
flags	For internal Oracle use (should be left as <code>NULL</code>)
force	When value of this argument is <code>TRUE</code> copy statistics even if the destination [sub]partition is locked

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Invalid [sub]partition name

ORA-20001: Bad input value

Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH`, then the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST`, then the behavior depends on the setting of the destination partition:
 - If the destination partition is a `NOT DEFAULT` partition, then the following statements are true:
 - * The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
 - * The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
 - Alternatively, if the destination partition is a `DEFAULT` partition, then the following statements are true:
 - * The minimum value of the destination partition is set to the minimum value of the source partition.
 - * The maximum value of the destination partition is set to the maximum value of the source partition.
- If the partitioning type is `RANGE`, then the following statements are true:
 - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
 - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is

MAXVALUE, in which case the maximum value of the destination partition is set to the high bound of the previous partition.

- If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is D and its preceding partition is $D-1$ and the key column to be adjusted is C_n , the maximum value for C_n is set to the upper bound of D (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column C_{n-1} are the same in partitions D and $D-1$.

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.
- If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.

173.7.11 CREATE_ADVISOR_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.CREATE_ADVISOR_TASK (
    task_name    IN    VARCHAR2    := NULL)
RETURN VARCHAR2;
```

Parameters

Table 173-14 CREATE_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- This subprogram executes using invoker's rights.

Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20012: Optimizer Statistics Advisor errors

Example 173-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

Note:

Oracle Database SQL Tuning Guide to learn how manage Optimizer Statistics Advisor

173.7.12 CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called **extended statistics**. This function returns the name of this newly created entry for the extension.

This second form of this function creates statistics extensions based on the column group usage recorded by the [SEED_COL_USAGE Procedure](#). This function returns a report of extensions created.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;
```

```
DBMS_STATS.CREATE_EXTENDED_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2)
RETURN CLOB;
```

Parameters

Table 173-15 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has columns <code>c1</code> , <code>c2</code> . An example column group is "(<code>c1</code> , <code>c2</code>)". An example expression is "(<code>c1</code> + <code>c2</code>)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have either the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

The extension has the following restrictions:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables, or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column cannot appear more than once in a column group.
- The extension can contain an expression only if a corresponding virtual column has been created.
- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The `COMPATIBLE` parameter must be 11.0.0.0.0 or greater.

173.7.13 CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
  ownname          VARCHAR2,
  stattab          VARCHAR2,
  tblspace        VARCHAR2 DEFAULT NULL,
  global_temporary BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-16 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>stattab</code>	Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly.
<code>tblspace</code>	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.
<code>global_temporary</code>	Whether or not the table should be created as a global temporary table

Security Model

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

Exceptions

ORA-20000: Table already exists or insufficient privileges

ORA-20001: Tablespace does not exist

173.7.14 DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
```

```

cascade_parts BOOLEAN DEFAULT TRUE,
statown       VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                get_param('NO_INVALIDATE')),
force         BOOLEAN DEFAULT FALSE,
col_stat_type VARCHAR2 DEFAULT 'ALL';

```

Parameters

Table 173-17 DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tablename	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	When value of this argument is TRUE, deletes column statistics even if locked
col_stat_type	Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"> HISTOGRAM - delete column histogram only ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.15 DELETE_DATABASE_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname          IN  VARCHAR2,
    add_sys        IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-18 DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
<code>pname</code>	<p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS
<code>add_sys</code>	Determines whether <code>SYS</code> tables will be included.

Table 173-19 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
GRANULARITY	Determines the granularity of statistics to collect. This value is only relevant for partitioned tables.
INCREMENTAL	Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	Controls which synopses to collect when INCREMENTAL preference is set to TRUE.

Table 173-19 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>

Table 173-19 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.
NO_INVALIDATE	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
OPTIONS	Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure .
PREFERENCE_OVERRIDES_PARAMETER	Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.
STAT_CATEGORY	Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — Specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. The value 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS' specifies table statistics, column statistics, index statistics, and synopsis. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'.

Table 173-19 (Cont.) Statistics Preferences

Preference	Description
TABLE_CACHED_BLOCKS	Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Example 173-7 Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

173.7.16 DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN  DEFAULT FALSE,
  stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 173-20 DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

173.7.17 DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  stattype       VARCHAR2 DEFAULT 'ALL',
  force          BOOLEAN  DEFAULT FALSE,
  stat_category  VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 173-21 DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing from where to delete the statistics. If statab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
statown	Schema containing statab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattype	Statistics type
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

Table 173-21 (Cont.) DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stat_category	<p>Statistics to delete. It accepts multiple values separated by comma:</p> <ul style="list-style-type: none"> • OBJECT_STATS — table statistics, column statistics and index statistics • SYNOPSES — information to support incremental statistics • REALTIME_STATS — Specifies only real-time statistics. • MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSES, REALTIME_STATS, MODELS'</p>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

173.7.18 DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force           BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 173-22 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
statab	The user statistics table identifier describing from where to delete the current statistics. If statab is NULL, the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within statab. This only applies if statab is not NULL.
statown	Schema containing statab (if different from current schema)

Table 173-22 (Cont.) DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Ignores the statistics lock on objects and deletes the statistics if set to TRUE

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

173.7.19 DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN   DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  stattype        VARCHAR2 DEFAULT 'ALL',
  force           BOOLEAN   DEFAULT FALSE);
  stat_category   VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 173-23 DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Table 173-23 (Cont.) DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing stattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattype	Statistics type
force	When value of this argument is TRUE, deletes index statistics even if locked
stat_category	Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics SYNOPSIS — information to support incremental statistics REALTIME_STATS — Specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The default is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.20 DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (  
    ownname      IN  VARCHAR2  DEFAULT USER,  
    tablename    IN  VARCHAR2);
```

Parameters

Table 173-24 DELETE_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name

Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

If the parameter `tablename` is `NULL` delete applies to all tables of the specified schema.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

173.7.21 DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (  
    stat_source  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 173-25 DELETE_PROCESSING_RATE Procedure Parameters

Parameter	Description
stat_source	Source of processing rates: <ul style="list-style-type: none"> 'MANUAL': values set by the user manually using the SET_PROCESSING_RATE Procedure 'CALIBRATION': values collected by the calibration GATHER_PROCESSING_RATE Procedure run explicitly by the user 'FEEDBACK': values obtained by time feedback

Usage Notes

You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure since `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

173.7.22 DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname IN VARCHAR2,
    pname   IN VARCHAR2);
```

Parameters

Table 173-26 DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 173-26 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS

Table 173-27 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG <p>This is the default. If <code>INCREMENTAL</code> is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format.</p> • ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses.</p> • HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses.</p>

Table 173-27 (Cont.) Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the <code>CREATE_EXTENDED_STATS</code> function is executed, or when extended statistics are specified explicitly in the <code>METHOD_OPT</code> clause of <code>DBMS_STATS</code>. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
COORDINATOR_TRIGGER_SHARD	<p>User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards.</p> <p>While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • TRUE—Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale. • FALSE—Ignores the statistics gathering command triggered from the shard coordinator. <p>The default value is <code>FALSE</code>.</p>
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	The value determines the percentage of rows to estimate.
METHOD_OPT	Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed.

Table 173-27 (Cont.) Statistics Preferences

Preference	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
GRANULARITY	The value determines granularity of statistics to collect (only pertinent if the table is partitioned)
PUBLISH	This value determines whether or not newly gathered statistics will be published once the gather job has completed.
INCREMENTAL	This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.

Table 173-27 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. <ul style="list-style-type: none"> For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>

Table 173-27 (Cont.) Statistics Preferences

Preference	Description
ROOT_TRIGGER_PDB	<p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB.</p> <p>During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale. • <code>FALSE</code>—Ignores the statistics gathering command triggered from application root. <p>The default value is <code>FALSE</code>.</p>
STALE_PERCENT	<p>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</p>
GLOBAL_TEMP_TABLE_STATS	<p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the GATHER_TABLE_STATS Procedure.</p>

 **Note:**
CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.

Security Model

To run this procedure, you must be the object owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

173.7.23 DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
  ownname          VARCHAR2,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

Table 173-28 DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
statab	Identifies the table where statistics are stored. If statab is NULL, then the procedure deletes statistics directly from the data dictionary.
statid	Specifies the identifier (optional) associated with these statistics within statab. This parameter is only relevant if statab is not NULL.

Table 173-28 (Cont.) DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
statown	Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code>).
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Indicates whether to force the deletion for locked statistics. When the value is <code>TRUE</code> , this procedure deletes table statistics even if locked.
stat_category	<p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics. • <code>SYNOPSIS</code> — Specifies metadata for incremental statistics. • <code>REALTIME_STATS</code> — Specifies only real-time statistics. • <code>MODELS</code> — supports import, export, and deletion for regression models in real-time stats. <p>You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopses. The default value is <code>'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'</code>.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

173.7.24 DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the `'INTERVAL'` or `'START'` and `'STOP'` options) and resets the default to `noworkload` statistics (collected using `'NOWORKLOAD'` option), if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-29 DELETE_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

173.7.25 DELETE_TABLE_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tablename  IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

Parameters

Table 173-30 DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name

Table 173-30 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GRANULARITY • GLOBAL_TEMP_STATS • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS

Table 173-31 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines the degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate.
GRANULARITY	Determines granularity of statistics to collect. This value is only relevant for partitioned tables.

Table 173-31 (Cont.) Statistics Preferences

Preference	Description
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.
INCREMENTAL	This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.
INCREMENTAL_LEVEL	This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.

Table 173-31 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <code>STALE_PERCENT</code> preference. For example, assume that <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <code>STALE_PERCENT</code> is 10. You specify <code>USE_STALE_PERCENT</code> for <code>INCREMENTAL_STALENESS</code>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that <code>STALE_PERCENT</code> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that <code>STALE_PERCENT</code> is 10. You specify the value 'NULL' for <code>INCREMENTAL_STALENESS</code>. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>

Table 173-31 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	<p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only 'FOR ALL' syntax is allowed.</p>
NO_INVALIDATE	<p>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.</p>
OPTIONS	<p>Determines the options parameter used in the GATHER_TABLE_STATS Procedure.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether newly gathered statistics will be published after the statistics gathering job has completed.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — table statistics, column statistics and index statistics (default) SYNOPSIS — information to support incremental statistics REALTIME_STATS — specifies only real-time statistics. MODELS — supports import, export, and deletion for regression models in real-time stats. <p>The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.</p>

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted `ANALYZE` privilege on the table, or `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

See Also:

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

173.7.26 DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN   DEFAULT TRUE,
  cascade_columns BOOLEAN   DEFAULT TRUE,
  cascade_indexes BOOLEAN   DEFAULT TRUE,
  statown        VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force          BOOLEAN   DEFAULT FALSE,
  stat_category  VARCHAR2  DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-32 DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Specifies the name of the schema.
<code>tablename</code>	Specifies the name of the table to which this column belongs.
<code>partname</code>	Specifies the name of the table partition or subpartition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level.

Table 173-32 (Cont.) DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
stattab	Identifies the user statistics table where statistics will be retrieved. If <code>stattab</code> is <code>NULL</code> , then the procedure retrieves statistics directly from the dictionary.
statid	Specifies the identifier (optional) associated with these statistics within <code>stattab</code> . This parameter is only relevant if <code>stattab</code> is not <code>NULL</code> .
cascade_parts	Specifies whether the procedure should operate on underlying partitions. If the table is partitioned, and if <code>partname</code> is <code>NULL</code> , then specifying <code>TRUE</code> deletes statistics for underlying partitions.
cascade_columns	Indicates whether to invoke the <code>DELETE_COLUMN_STATS</code> procedure. If <code>TRUE</code> , then this procedure calls <code>DELETE_COLUMN_STATS</code> for all underlying columns.
cascade_indexes	Indicates whether to invoke the <code>DELETE_INDEX_STATS</code> procedure. If <code>TRUE</code> , then this procedure calls <code>DELETE_INDEX_STATS</code> for all underlying columns.
statown	Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code>).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Indicates whether to force the deletion for locked statistics. When the value is <code>TRUE</code> , this procedure deletes table statistics even if locked.
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> <code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics. <code>SYNOPSIS</code> — Specifies metadata for incremental statistics. <code>REALTIME_STATS</code> — Specifies only real-time statistics. <p>You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopses. The default value is <code>'OBJECT_STATS, REALTIME_STATS'</code>.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

173.7.27 DIFF_TABLE_STATS_IN_HISTORY Function

This function compares statistics for a table as of two specified timestamps.

Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY (
  ownname      IN  VARCHAR2,
  tabname      IN  VARCHAR2,
  time1        IN  TIMESTAMP WITH TIME ZONE,
  time2        IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  pctthreshold IN  NUMBER                      DEFAULT 10)
RETURN DiffRepTab pipelined;

```

Parameters

Table 173-33 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

Parameter	Description
ownname	Specifies the owner of the table. Specify NULL for current schema.
tabname	Specifies the table for which statistics are to be compared.
time1	Specifies the first timestamp for comparison.
time2	Specifies the second timestamp for comparison.
pctthreshold	Specifies the threshold limit. The function reports differences in statistics only if the change percentage exceeds this limit. The default value is 10.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Usage Notes

If the second timestamp is `NULL`, then the function compares the current statistics in the data dictionary with the statistics as of the first timestamp.

173.7.28 DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING (
  ownname      IN  VARCHAR2,
  tabname      IN  VARCHAR2,
  timestamp    IN  TIMESTAMP WITH TIME ZONE,

```

```

        pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;

```

Parameters

Table 173-34 DIFF_TABLE_STATS_IN_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify <code>NULL</code> for the current schema.
tablename	Table for which statistics are to be compared.
timestamp	Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is <code>NULL</code> , then this function compares the current statistics in the dictionary with the pending statistics (default).
pctthreshold	Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10.

Security Model

To invoke this procedure you must be owner of the table, or you must have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you must have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.29 DIFF_TABLE_STATS_IN_STATTAB Function

This function compares table statistics from two sources.

The function can obtain statistics from the following sources:

- Two user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary

The function also compares the statistics of the dependent objects: indexes, columns, and partitions. It displays statistics of the objects from both sources when the difference between those statistics exceeds a certain threshold (%). You can specify this threshold as an argument to the function. The function uses the statistics corresponding to the first source (`stattab1` or `time1`) as the basis for computing the difference percentage.

Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB (
    ownname          IN  VARCHAR2,
    tablename        IN  VARCHAR2,
    stattab1         IN  VARCHAR2,
    stattab2         IN  VARCHAR2 DEFAULT NULL,
    pctthreshold     IN  NUMBER   DEFAULT 10,
    statid1          IN  VARCHAR2 DEFAULT NULL,
    statid2          IN  VARCHAR2 DEFAULT NULL,
    stattablown     IN  VARCHAR2 DEFAULT NULL,

```

```

    statab2own    IN VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;

```

Parameters

Table 173-35 DIFF_TABLE_STATS_IN_STATAB Function Parameters

Parameter	Description
ownname	Specifies the owner of the table. Specify <code>NULL</code> for current schema.
tablename	Specifies the table for which statistics are to be compared.
statab1	Specifies the user statistics table 1.
statab2	Specifies the user statistics table 2. If <code>NULL</code> , the function compares statistics in <code>statab1</code> with current statistics in the data dictionary. This is the default. To compare two sets within the statistics table, specify the same table as <code>statab1</code> (see <code>statid</code> below).
pctthreshold	Specifies the percent thresholds for comparison. The function reports difference in statistics only if it exceeds this limit. The default value is 10.
statid1	(optional) Identifies statistics set within <code>statab1</code> .
statid2	(optional) Identifies statistics set within <code>statab2</code> .
statab1own	Specifies the schema containing <code>statab1</code> (if other than <code>ownname</code>).
statab2own	Specifies the schema containing <code>statab2</code> (if other than <code>ownname</code>).

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.30 DROP_ADVISOR_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

Syntax

```

DBMS_STATS.DROP_ADVISOR_TASK (
    task_name IN VARCHAR2);

```

Parameters

Table 173-36 DROP_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.

- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 173-8 Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named `my_task`:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

173.7.31 DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension.

This cancels the effects of the [CREATE_EXTENDED_STATS Function](#).

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    extension  VARCHAR2);
```

Parameters

Table 173-37 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Owner name of a table
<code>tabname</code>	Name of the table
<code>extension</code>	Can be either a column group or an expression. Suppose the specified table has two column <code>c1</code> , <code>c2</code> . An example column group can be " <code>(c1, c2)</code> " and an example expression can be " <code>(c1 + c2)</code> ".

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- If no extended statistics set is created for the extension, this function throws an error.

173.7.32 DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
    ownname VARCHAR2,
    statab VARCHAR2);
```

Parameters

Table 173-38 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
statab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.

173.7.33 EXECUTE_ADVISOR_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.EXECUTE_ADVISOR_TASK (
    task_name          IN  VARCHAR2,
    execution_name     IN  VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 173-39 EXECUTE_ADVISOR_TASK Parameters

Parameter	Description
task_name	Name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- Object level

Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Returns

This function returns the name of the new execution.

Usage Notes

The results of the execution depend on user privileges and the type of rules:

- System

To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- **Operation**

If you have the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges, then you can execute this function for all operations. If you have only the `ANALYZE ANY` privilege, then you can execute this function for operations related to any schemas except `SYS`. If you have only the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function for operations related to any schemas, including `SYS`. If you have neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function only for operations in your own schema.

- **Object**

If you have the privilege to collect statistics for an object, then you can execute this function for the object.

Example 173-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

173.7.34 EXPORT_COLUMN_STATS Procedure

This procedure exports statistics for a specified column and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
  ownname  VARCHAR2,
  tablename VARCHAR2,
  colname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-40 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.35 EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab      IN  VARCHAR2,
    statid       IN  VARCHAR2 DEFAULT NULL,
    statown      IN  VARCHAR2 DEFAULT NULL
    add_sys      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-41 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name to where statistics should be exported

Table 173-41 (Cont.) EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
statid	(Optional) Identifier to associate with these statistics within statab
statown	Schema containing statab (if other than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

173.7.36 EXPORT_DATABASE_STATS Procedure

This procedure exports statistics for all objects in the database and stores them in the user statistics tables identified by statown.statab.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
  statab          VARCHAR2,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters**Table 173-42 EXPORT_DATABASE_STATS Procedure Parameters**

Parameter	Description
statab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)

Table 173-42 (Cont.) EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stat_category	<p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS - table statistics, column statistics and index statistics (Default) SYNOPSIS - information to support incremental statistics <p>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopses are deleted.</p>

Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.37 EXPORT_DICTIONARY_STATS Procedure

This procedure exports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) and stores them in the user statistics table identified bystattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-43 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)

Table 173-43 (Cont.) EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stat_category	<p>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS - table statistics, column statistics and index statistics (Default) SYNOPSIS - information to support incremental statistics <p>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopsis are deleted.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.38 EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure exports statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
    stattab VARCHAR2,
    statid  VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-44 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different from current schema)

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.39 EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
    ownname  VARCHAR2,
    indname  VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-45 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are exported.
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

173.7.40 EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
  ownname      IN  VARCHAR2  DEFAULT USER,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2  DEFAULT NULL,
  statown      IN  VARCHAR2  DEFAULT USER);
```

Parameters

Table 173-46 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Owner name
<code>tablename</code>	Table name
<code>stattab</code>	Statistics table name to where to export the statistics
<code>statid</code>	(Optional) Identifier to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if other than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- If the parameter `tablename` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

173.7.41 EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
  ownname      IN  VARCHAR2,
  statab       IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-47 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
statab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within statab
statown	Schema containing statab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

173.7.42 EXPORT_SCHEMA_STATS Procedure

This procedure exports statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by statab.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
  ownname      VARCHAR2,
  statab       VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
```

```
statown          VARCHAR2 DEFAULT NULL,
stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-48 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
stattab	Identifies the user statistics table in which to store the exported statistics.
statid	Specifies the identifier (optional) associated with these statistics within stattab.
statown	Specifies the schema containing stattab (if different than ownname).
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — Specifies table statistics, column statistics, and index statistics. SYNOPSIS — Specifies metadata for incremental statistics. REALTIME_STATS — Specifies only real-time statistics. You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.43 EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-49 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table that describes where the statistics will be stored
statid	Optional identifier associated with the statistics stored from the stattab
statown	Schema containing stattab (if different from current schema)

Security Model

To run this procedure, you must have the `GATHER_SYSTEM_STATISTICS` role.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

Usage Notes

Oracle Database does not support the export or import of statistics across databases of different character sets.

173.7.44 EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
  ownname      IN  VARCHAR2,
  tablename    IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-50 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab

Table 173-50 (Cont.) EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
statown	Schema containing <code>stattab</code> (if other than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

173.7.45 EXPORT_TABLE_STATS Procedure

This procedure exports statistics for a specified table (including associated index statistics) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  cascade          BOOLEAN  DEFAULT TRUE,
  statown          VARCHAR2 DEFAULT NULL,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-51 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tablename	Specifies the name of the table.
partname	Specifies the name of the table partition. If the table is partitioned, and if <code>partname</code> is <code>NULL</code> , then the procedure exports global and partition statistics.

Table 173-51 (Cont.) EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
stattab	Specifies the identifier (optional) associated with these statistics within stattab.
statid	Specifies the identifier (optional) associated with these statistics within stattab.
cascade	Indicates whether to export column and index statistics. If TRUE, then the procedure exports column and index statistics for the specified table. This is the default.
statown	Specifies the schema containing stattab (if different than ownname).
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — Specifies table statistics, column statistics, and index statistics. SYNOPSIS — Specifies metadata for incremental statistics. REALTIME_STATS — Specifies only real-time statistics. You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.46 FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the `*_TAB_MODIFICATIONS`, `*_TAB_STATISTICS` and `*_IND_STATISTICS` views.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Security Model

The `ANALYZE ANY` system privilege is required to run this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call `FLUSH_DATABASE_MONITORING_INFO` to view the latest information in `*_TAB_STATISTICS` and `*_IND_STATISTICS` because these views show statistics cached in the SGA and stored on disk. Because the `GATHER_*_STATS` procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

173.7.47 GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```

DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                               (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  objlist         OUT         ObjectTab,
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (
                               get_param('NO_INVALIDATE')),
  obj_filter_list ObjectTab  DEFAULT NULL);

```

```

DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER      DEFAULT to_estimate_percent_type
                               (get_param('ESTIMATE_PERCENT')),
  block_sample      BOOLEAN    DEFAULT FALSE,
  method_opt       VARCHAR2   DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER     DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN    DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2   DEFAULT NULL,
  statid          VARCHAR2   DEFAULT NULL,
  options         VARCHAR2   DEFAULT 'GATHER',
  statown        VARCHAR2   DEFAULT NULL,
  gather_sys      BOOLEAN    DEFAULT TRUE,
  no_invalidate   BOOLEAN    DEFAULT to_no_invalidate_type (

```

```

                                get_param('NO_INVALIDATE')),
obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 173-52 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	<p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
block_sample	<p>Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code>.</p> <p>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>
method_opt	<p>When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.:</p> <ul style="list-style-type: none"> • <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code> <ul style="list-style-type: none"> - <code>integer</code> : Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code> : Collects histograms only on the columns that already have histograms. - <code>AUTO</code> : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code> : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
degree	<p>Determines the degree of parallelism used for gathering statistics. The default for <code>degree</code> is <code>NULL</code>. <code>NULL</code> means to use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution when the size of the object does not warrant parallel execution.</p>
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics</p>
cascade	<p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the <code>GATHER_INDEX_STATS</code> procedure on each index of the table. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics.</p> <p>The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</p>

Table 173-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> .
options	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> • <code>GATHER</code> — Gathers statistics on all objects in the database. This is the default. • <code>GATHER AUTO</code> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • <code>GATHER STALE</code> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale. • <code>GATHER EMPTY</code> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • <code>LIST AUTO</code> — Returns a list of objects to be processed with <code>GATHER AUTO</code>. • <code>LIST STALE</code> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views. • <code>LIST EMPTY</code> — Returns a list of objects that currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing <code>stattab</code> (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the <code>SYS</code> user.
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>

Table 173-52 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) or (o.a2 like s2) or ... is true.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

173.7.48 GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample    BOOLEAN   DEFAULT FALSE,
  method_opt      VARCHAR2  DEFAULT get_param('METHOD_OPT'),
  degree          NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity     VARCHAR2  DEFAULT GET_PARAM('GRANULARITY'),
  cascade         BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab        VARCHAR2  DEFAULT NULL,
  statid          VARCHAR2  DEFAULT NULL,
  options         VARCHAR2  DEFAULT 'GATHER AUTO',
  objlist         OUT       ObjectTab,
  statown        VARCHAR2  DEFAULT NULL,
```

```

no_invalidate      BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
obj_filter_list   ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2  DEFAULT NULL,
  estimate_percent NUMBER  DEFAULT

to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2  DEFAULT GET_PARAM('METHOD_OPT'),
  degree           NUMBER  DEFAULT to_degree_type(GET_PARAM('DEGREE')),
  granularity       VARCHAR2  DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
  stattab          VARCHAR2  DEFAULT NULL,
  statid           VARCHAR2  DEFAULT NULL,
  options          VARCHAR2  DEFAULT 'GATHER AUTO',
  statown          VARCHAR2  DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT
                                to_no_invalidate_type(get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);

```

Parameters

Table 173-53 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.

Table 173-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
method_opt	<p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>

Table 173-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics</p>
cascade	<p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics</p>
statid	<p>The (optional) identifier to associate with these statistics within stattab</p>

Table 173-53 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
options	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> • GATHER AUTO — Gathers all necessary statistics automatically. This is the default. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed. • GATHER — Gathers statistics on all objects in the relevant schema. • GATHER STALE — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale. • GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. • LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. • LIST STALE — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views. • LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	The list of objects found to be stale or empty.
statown	Schema containing <code>stattab</code> , if different from the current schema.
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
obj_filter_list	<p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1</code> like <code>s1</code>) and (<code>o.a2</code> like <code>s2</code>) and ... is true. See Applying an Object Filter List.</p>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

173.7.49 GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 173-54 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing where to save the current statistics
statid	Identifier to associate with these statistics within statab (optional)
statown	Schema containing statab (if different from current schema)

Table 173-54 (Cont.) GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

173.7.50 GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (GET_PARAM('ESTIMATE_PERCENT')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')),
  force            BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 173-55 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Schema of index to analyze
indname	Name of index
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
degree	Degree of parallelism. The default for <code>degree</code> is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . NULL means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code> , <code>DEGREE=>n</code> , or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.

Table 173-55 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

173.7.51 GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an interval defined in minutes.

Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
    gathering_mode    IN    VARCHAR2    DEFAULT 'START',
    interval          IN    NUMBER      DEFAULT NULL);
```

Parameters

Table 173-56 GATHER_PROCESSING_RATE Procedure Parameters

Parameter	Description
gathering_mode	Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes.
interval	Time interval (number of minutes) for which the processing must be gathered

Usage Notes

- You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.
- `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

173.7.52 GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab         VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER',
    objlist         OUT      ObjectTab,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
    force           BOOLEAN  DEFAULT FALSE,
    obj_filter_list ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
```

```

method_opt      VARCHAR2 DEFAULT get_param('METHOD_OPT'),
degree          NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab        VARCHAR2 DEFAULT NULL,
statid         VARCHAR2 DEFAULT NULL,
options        VARCHAR2 DEFAULT 'GATHER',
statown        VARCHAR2 DEFAULT NULL,
no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                    get_param('NO_INVALIDATE')),
force          BOOLEAN  DEFAULT FALSE,
obj_filter_list ObjectTab DEFAULT NULL);

```

Parameters

Table 173-57 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	<p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> • <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code> <ul style="list-style-type: none"> - <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code>: Collects histograms only on the columns that already have histograms - <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
degree	Degree of parallelism. The default for <code>degree</code> is <code>NULL</code> . The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code> , <code>DEGREE=>n</code> , or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). ' <code>ALL</code> ' - Gathers all (subpartition, partition, and global) statistics ' <code>AUTO</code> ' - Determines the granularity based on the partitioning type. This is the default value. ' <code>DEFAULT</code> ' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the ' <code>GLOBAL AND PARTITION</code> ' for this functionality. Note that the default value is now ' <code>AUTO</code> '. ' <code>GLOBAL</code> ' - Gathers global statistics ' <code>GLOBAL AND PARTITION</code> ' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. ' <code>PARTITION</code> ' - Gathers partition-level statistics ' <code>SUBPARTITION</code> ' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>

Table 173-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
options	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics on all objects in the schema. This is the default. GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, statab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed. GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale. GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics. LIST AUTO — Returns a list of objects to be processed with GATHER AUTO. LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views. LIST EMPTY — Returns a list of objects that currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing statab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that the tables `SH.SALES` and `SH.COSTS`, if stale, will have statistics gathered upon them.

```
DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SH';
    filter_lst(1).objname := 'SALES';
    filter_lst(2).ownname := 'SH';
    filter_lst(2).objname := 'COSTS';
    DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
```

173.7.53 GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
    gathering_mode    VARCHAR2 DEFAULT 'NOWORKLOAD',
    interval          INTEGER   DEFAULT NULL,
    stattab           VARCHAR2  DEFAULT NULL,
    statid            VARCHAR2  DEFAULT NULL,
    statown           VARCHAR2  DEFAULT NULL);
```

Parameters

Table 173-58 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	<p>Specifies the mode in which the database gathers system statistics. Possible values are:</p> <ul style="list-style-type: none"> • NOWORKLOAD The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. To fine tune system statistics for the workload, use START and STOP or the INTERVAL option. If you gather both NOWORKLOAD and workload-specific statistics (statistics collected using INTERVAL or START and STOP), the optimizer uses the workload statistics. Collected components include cpuspeednw, ioseektim, and iotfrspeed. • INTERVAL The database captures system activity during a specified interval in minutes. This parameter works in combination with the interval parameter. The database creates or updates system statistics in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • START STOP The database captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. The database ignores the INTERVAL value. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc. • EXADATA In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed.
interval	Specifies the number of minutes in which to gather system statistics. This parameter applies only when gathering_mode='INTERVAL' .
stattab	Specifies the table in which the database stores the statistics.
statid	Specifies an optional identifier associated with the statistics saved in stattab .
statown	Specifies the schema containing stattab , if different from the current schema.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    statab   => 'mystats',
    statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    statab   => 'mystats',
    statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats','OLTP');'
    sysdate, 'sysdate + 1');
  COMMIT;
END;

BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
    ('mystats','OLAP');'
    sysdate + 0.5, 'sysdate + 1');
  COMMIT;
END;
```

173.7.54 GATHER_TABLE_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  statab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  stattype         VARCHAR2 DEFAULT 'DATA',
  force           BOOLEAN  DEFAULT FALSE,
  context          DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
  options          VARCHAR2 DEFAULT get_param('OPTIONS');
```

Parameters

Table 173-59 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema containing the table.
tabname	Name of the table.
partname	Name of the partition.
estimate_percent	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code> . Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.

Table 173-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	<p>METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name extension name extension</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name: Name of a column - extension: can be either a column group in the format of (column_name, Column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Determines the degree of parallelism used for gathering statistics.</p> <p>The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</p>

Table 173-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
cascade	<p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</p>
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Table 173-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>
stattype	Statistics type. The only value allowed is DATA.
force	Gather statistics of table even if it is locked
context	Not used.
options	<p>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM`
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO on gather_table_stats`.

- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
  'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
  'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

173.7.55 GENERATE_STATS Procedure

This **deprecated procedure** generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the GATHER_INDEX_STAT procedure. See "[GATHER_INDEX_STATS Procedure](#)".

Syntax

```
DBMS_STATS.GENERATE_STATS (
  ownname    VARCHAR2,
  objname    VARCHAR2,
  organized  NUMBER DEFAULT 7,
  force      BOOLEAN default FALSE);
```

Parameters

Table 173-60 GENERATE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of object
objname	Name of object

Table 173-60 (Cont.) GENERATE_STATS Procedure Parameters

Parameter	Description
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

173.7.56 GET_ADVISOR_OPR_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.GET_ADVISOR_OPR_FILTER (
  opr_id          IN          NUMBER,
  opr_filter      IN OUT NOCOPY StatsAdvOpr);
```

Parameters

Table 173-61 GET_ADVISOR_OPR_FILTER Procedure Parameters

Parameter	Description
opr_id	The ID of the statistics operation stored in the DBA_OPTSTAT_OPERATIONS view.
opr_filter	The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

173.7.57 GET_ADVISOR_RECS Function

This function generates a recommendation report for the specified item.

Syntax

```
DBMS_STATS.GET_ADVISOR_RECS (
  ownname      IN   VARCHAR2,
  tablename    IN   VARCHAR2,
  rec          IN   VARCHAR2,
  type         IN   VARCHAR2   := 'TEXT')
RETURN CLOB;
```

Parameters

Table 173-62 GET_ADVISOR_RECS Function Parameters

Parameter	Description
<code>ownname</code>	The owner of the table.
<code>tablename</code>	The name of the table.
<code>rec</code>	<p>The Optimizer Statistics Advisor recommendation.</p> <ul style="list-style-type: none"> • <code>INCREMENTAL</code> When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off. • <code>CONCURRENT</code> The report recommends either setting the <code>CONCURRENT</code> preference, or specifying <code>AUTO_DEGREE</code> for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting <code>CONCURRENT</code> first. The advisor only recommends <code>AUTO_DEGREE</code> when statistics gathering on an individual table take a long time and the <code>CONCURRENT</code> preference is already set.

Table 173-62 (Cont.) GET_ADVISOR_RECS Function Parameters

Parameter	Description
type	Type of the report: TEXT, HTML, or XML.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must have the privileges to gather statistics for the objects for which recommendations are generated.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

173.7.58 GET_COLUMN_STATS Procedures

These overloaded procedures get column-related statistics. In the user-defined statistics version, the procedure returns the type of statistics stored.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  distcnt OUT      NUMBER,
  density OUT      NUMBER,
  nullcnt OUT      NUMBER,
  srec OUT         StatRec,
  avgclen OUT      NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  realtime_stats  BOOLEAN iDEFAULT TRUE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  ext_stats        OUT RAW,
  stattyown        OUT VARCHAR2 DEFAULT NULL,
  stattyname       OUT VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-63 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tablename	Specifies the name of the table to which this column belongs.
colname	Specifies the name of the column or extension.
partname	Specifies the name of the table partition from which to get the statistics. If the table is partitioned, and if partname is NULL, then the procedure retrieves statistics at the global table level.
statab	Specifies the statistics table ID describing where to retrieve the statistics. If statab is NULL, then the procedure retrieves statistics directly from the data dictionary.
statid	Specifies an optional identifier associated with these statistics within statab. This parameter is only relevant when statab is not NULL.
ext_stats	Specifies the user-defined statistics.
stattyown	Specifies the schema of the statistics type.
stattyname	Specifies the name of the statistics type.
distcnt	Specifies the number of distinct values.
density	Specifies the column density.
nullcnt	Specifies the number of NULL values.
srec	Specifies the structure holding the internal representation of the column minimum, maximum, and histogram values.
avgclen	Specifies the average length of the column (in bytes).
statown	Specifies the schema containing statab (if different than ownname).
realtime_stats	Specifies whether to include real-time statistics. The default value is TRUE. When realtime_stats is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be the owner of the table, or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Before invoking this procedure, ensure that the table exists.

173.7.59 GET_INDEX_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numlblks        OUT NUMBER,
  numdist         OUT NUMBER,
  avglblk         OUT NUMBER,
  avgdblk         OUT NUMBER,
  clstfct         OUT NUMBER,
  indlevel        OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL);
```

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab         VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numlblks        OUT NUMBER,
  numdist         OUT NUMBER,
  avglblk         OUT NUMBER,
  avgdblk         OUT NUMBER,
  clstfct         OUT NUMBER,
  indlevel        OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL,
  guessq          OUT NUMBER);
```

Use the following form of the procedure for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  ext_stats        OUT RAW,
  stattyown        OUT VARCHAR2 DEFAULT NULL,
  stattyname       OUT VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-64 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved for the global index level.
statab	User statistics table identifier describing from where to retrieve the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>)
ext_stats	User-defined statistics
stattyown	Schema of the statistics type
stattyname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing <code>statab</code> (if different than <code>ownname</code>)
guessq	Guess quality for the index (partition)

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`,

you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
 - When not enough data has been analyzed, such as when an object has been recently created
 - When the system does not have one major workload resulting in averages not corresponding to real values

173.7.60 GET_PARAM Function

This function returns the default value of parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET_PREFS Function](#).

See also [DBMS_STATS Deprecated Subprograms](#).

Syntax

```
DBMS_STATS.GET_PARAM (  
    pname      IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 173-65 GET_PARAM Function Parameters

Parameter	Description
pname	Parameter name

Exceptions

ORA-20001: Invalid input values

173.7.61 GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (  
    pname      IN  VARCHAR2,  
    ownname    IN  VARCHAR2 DEFAULT NULL,  
    tablename  IN  VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 173-66 GET_PREFS Function Parameters

Parameter	Description
pname	<p>Preference name. The possible values are:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATS
ownname	Owner name
tabname	Table name

Table 173-67 Preference Descriptions

Preference Name	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
AUTO_TASK_STATUS	<p>Enables or disables the high-frequency automatic optimizer statistics collection. Values are:</p> <ul style="list-style-type: none"> ON — Enables high-frequency automatic optimizer statistics collection. OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
AUTO_TASK_MAX_RUN_TIME	Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.
AUTO_TASK_INTERVAL	Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
CONCURRENT	Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"> MANUAL — Concurrency is enabled only for manual statistics gathering. AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. ALL — Concurrency is enabled for both manual and automatic statistics gathering. OFF — Concurrency is disabled for both manual and automatic statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: <ul style="list-style-type: none"> SHARED — All sessions see the same set of statistics SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
GRANULARITY	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	<p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p>

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <p>USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.</p> <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> <p>USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> <p>ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</p> <p>NULL—A partition or subpartition is considered stale when it has any DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p>

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
METHOD_OPT	<p>Note that the following two executions are different:</p> <pre data-bbox="859 407 1317 495">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre data-bbox="859 564 1292 653">EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:</p> <ul data-bbox="859 963 1373 1024" style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>The size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p>REPEAT — Collects histograms only on the columns that already have histograms.</p> <p>AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p>SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics for all objects in the table. This is the default. GATHER AUTO — Oracle recommends using GATHER AUTO to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using INCREMENTAL statistics. <p>For partitioned tables using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using INCREMENTAL statistics, GATHER_TABLE_STATS with GATHER AUTO may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>

Table 173-67 (Cont.) Preference Descriptions

Preference Name	Description
STALE_PERCENT	<p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (default) • <code>SYNOPSIS</code> - information to support incremental statistics <p>The value '<code>OBJECT_STATS, SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopsis.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>
WAIT_TIME_TO_UPDATE_STATS	<p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p>

Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: `CREATE JOB`, `MANAGE SCHEDULER`, and `MANAGE ANY QUEUE`.

Exceptions

- `ORA-20000`: Unable to gather statistics concurrently: Resource Manager is not enabled.
- `ORA-20001`: Invalid input values

Usage Notes

Note the following guidelines:

- The `CONCURRENT` preference determines whether statistics are gathered concurrently when the user issues `GATHER_*_STATS` procedures. `DBMS_STATS` can collect statistics for a single object in parallel based on the value of the `DEGREE` parameter. However, parallelism is limited to one object. The `CONCURRENT`

preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.

To gather statistics concurrently, Resource Manager must be enabled, and the setting for the `JOB_QUEUE_PROCESSES` initialization parameter must be at least 4.

- If the `ownname` and `tabname` are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

Oracle Database SQL Tuning Guide to learn how to get optimizer statistics preferences

173.7.62 GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY  
RETURN TIMESTAMP WITH TIMEZONE;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.63 GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION  
RETURN NUMBER;
```

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.64 GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (  
    status    OUT  VARCHAR2,  
    dstart    OUT  DATE,  
    dstop     OUT  DATE,  
    pname     IN   VARCHAR2,
```

```
pvalue OUT NUMBER,
stattab IN VARCHAR2 DEFAULT NULL,
statid IN VARCHAR2 DEFAULT NULL,
statown IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-68 GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
status	Output is one of the following: <ul style="list-style-type: none"> COMPLETED: AUTOGATHERING: MANUALGATHERING: BADSTATS:
dstart	Date when statistics gathering started. If status = MANUALGATHERING, the start date is returned.
dstop	Date when statistics gathering stopped. <ul style="list-style-type: none"> If status = COMPLETE, the finish date is returned. If status = AUTOGATHERING, the future finish date is returned. If status = BADSTATS, the must-finished-by date is returned.
pname	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> iotfrspeed - I/O transfer speed in bytes for each millisecond ioseektim - seek time + latency time + operating system overhead time, in milliseconds sreadtim - average time to read single block (random read), in milliseconds mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option). mbrc - average multiblock read count for sequential read, in blocks maxthr - maximum I/O system throughput, in bytes/second slavethr - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is NULL, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

173.7.65 GET_TABLE_STATS Procedure

This overloaded procedure gets all table-related statistics.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tablename         VARCHAR2,
  partname          VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows          OUT NUMBER,
  numblks          OUT NUMBER,
  avgrlen          OUT NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  realtime_stats   BOOLEAN DEFAULT TRUE);
```

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tablename         VARCHAR2,
  partname          VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows          OUT NUMBER,
  numblks          OUT NUMBER,
  avgrlen          OUT NUMBER,
  statown          VARCHAR2 DEFAULT NULL,
  im_imcu_count   OUT NUMBER,
  im_block_count  OUT NUMBER,
  scanrate         OUT NUMBER,
  realtime_stats   BOOLEAN DEFAULT TRUE);
```

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tablename         VARCHAR2,
  partname          VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
```

```

numrows      OUT NUMBER,
numblks      OUT NUMBER,
avgrlen      OUT NUMBER,
cachedblk    OUT NUMBER,
cachehit     OUT NUMBER,
realtime_stats  BOOLEAN DEFAULT TRUE);

```

Parameters

Table 173-69 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tablename	Specifies the name of the table to which this column belongs.
partname	Specifies the name of the table partition from which to get the statistics. If the table is partitioned and if <code>partname</code> is NULL, then the statistics are retrieved from the global table level.
stattab	Specifies the user statistics table ID. This ID describes where to retrieve the statistics. If <code>stattab</code> is NULL, then the procedure gathers statistics directly from the data dictionary.
statid	Specifies the optional ID associates with these statistics within <code>stattab</code> . This ID is only relevant when <code>stattab</code> is not NULL.
numrows	Specifies the number of rows in the table or partition.
numblks	Specifies the number of blocks in the table or partition.
avgrlen	Specifies the average row length for the table or partition.
statown	Specifies the schema containing <code>stattab</code> (if different from <code>ownname</code>).
im_imcu_count	Specifies the number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	Specifies the number of In-Memory blocks in the table or partition. An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks.
scanrate	Specifies the rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.
realtime_stats	Specifies whether to include real-time statistics. The default value is TRUE. When <code>realtime_stats</code> is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures.
cachedblk	For internal use only.
cachehit	For internal use only.

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects

owned by SYS, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_*_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently created
 - When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

173.7.66 IMPLEMENT_ADVISOR_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (
  task_name          IN  VARCHAR2,
  execution_name     IN  VARCHAR2   := NULL,
  level              IN  VARCHAR2   := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 173-70 IMPLEMENT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
level	The level of the implementation. Possible values are <ul style="list-style-type: none"> ALL: Ignores the filters and implements all recommendations. TYPICAL: Implements the recommendations according to the filters in place.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- `SYSTEM` level
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.

- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level
Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 173-10 Implementing Optimizer Statistics Advisor Recommendations

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```
DECLARE
  v_tname      VARCHAR2(128) := 'my_task';
  v_ename      VARCHAR2(128) := NULL;
  v_report     CLOB := null;
  v_script     CLOB := null;
  v_imp_result CLOB;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

  -- view the task report
  v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
  DBMS_OUTPUT.PUT_LINE(v_report);

  -- implement all recommendations
  v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;
```

173.7.67 IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-71 IMPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>tabname</code>	Name of the table to which this column belongs
<code>colname</code>	Name of the column or extension
<code>partname</code>	Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier to associate with these statistics within <code>stattab</code> (optional)
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>no_invalidate</code>	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
<code>force</code>	If set to <code>TRUE</code> , imports statistics even if statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

173.7.68 IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    statab      IN  VARCHAR2,
    statid      IN  VARCHAR2 DEFAULT NULL,
    statown     IN  VARCHAR2 DEFAULT NULL,
    add_sys     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-72 IMPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
<code>statab</code>	Statistics table name where to import the statistics
<code>statid</code>	Optional identifier to associate with these statistics within <code>statab</code>
<code>statown</code>	Schema containing <code>statab</code> (if different than <code>ownname</code>)
<code>add_sys</code>	Value <code>TRUE</code> will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

173.7.69 IMPORT_DATABASE_STATS Procedure

This procedure imports statistics for all objects in the database from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-73 IMPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	Specifies the statistics table that contains the statistics to be imported.
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. The default can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics FALSE - The statistics will be imported only if they are not locked
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS - table statistics, column statistics and index statistics (Default) SYNOPSIS - information to support incremental statistics

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.70 IMPORT_DICTIONARY_STATS Procedure

This procedure imports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
    statab          VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force           BOOLEAN DEFAULT FALSE,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-74 IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
statab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-74 (Cont.) IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
force	Overrides statistics lock at the object (table) level: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics. FALSE - The statistics will be imported only if there is no lock.
stat_category	Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> OBJECT_STATS - table statistics, column statistics and index statistics (Default) SYNOPSIS - information to support incremental statistics

Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.71 IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure imports statistics for fixed tables from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
  statab      VARCHAR2,
  statid      VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force       BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-75 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Overrides statistics lock: <ul style="list-style-type: none"> TRUE - Ignores the statistics lock and imports the statistics FALSE - The statistics will be imported only if there is no lock

Security Model

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.72 IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
```

```

statown          VARCHAR2 DEFAULT NULL,
no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force           BOOLEAN DEFAULT FALSE);

```

Parameters

Table 173-76 IMPORT_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.
statab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within statab
statown	Schema containing statab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Imports statistics even if index statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

173.7.73 IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (  
    ownname    IN  VARCHAR2,  
    stattab    IN  VARCHAR2,  
    statid     IN  VARCHAR2 DEFAULT NULL,  
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-77 IMPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

173.7.74 IMPORT_SCHEMA_STATS Procedure

This procedure imports statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the data dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (  
    ownname    VARCHAR2,  
    stattab    VARCHAR2,  
    statid     VARCHAR2 DEFAULT NULL,  
    statown    VARCHAR2 DEFAULT NULL,
```

```
no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force           BOOLEAN DEFAULT FALSE,
stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 173-78 IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
stattab	Identifies the user table that stores the statistics to be imported.
statid	Specifies the ID associated with these statistics within stattab.
statown	Specifies the schema containing stattab (if different than ownname).
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	<p>Specifies whether to override statistics locked at the object level. The possible values are as follows:</p> <ul style="list-style-type: none"> TRUE — Ignores the statistics lock and imports the statistics. FALSE — Imports the statistics only if there is no lock. This is the default.
stat_category	<p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> OBJECT_STATS — Specifies table statistics, column statistics, and index statistics. SYNOPSIS — Specifies metadata for incremental statistics. REALTIME_STATS — Specifies only real-time statistics. <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.</p>

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.75 IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-79 IMPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table where the statistics will be retrieved
<code>statid</code>	Optional identifier associated with the statistics retrieved from the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.

173.7.76 IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
  ownname      IN VARCHAR2,
```

```

tabname    IN  VARCHAR2,
stattab    IN  VARCHAR2,
statid     IN  VARCHAR2 DEFAULT NULL,
statown    IN  VARCHAR2 DEFAULT NULL);

```

Parameters

Table 173-80 IMPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

173.7.77 IMPORT_TABLE_STATS Procedure

This procedure import statistics for a specified table from the user statistics table identified by `stattab` and stores them in the data dictionary.

Syntax

```

DBMS_STATS.IMPORT_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  cascade          BOOLEAN  DEFAULT TRUE,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);

```

Parameters

Table 173-81 IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Specifies the name of the schema.
tabname	Specifies the name of the table.
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported.
stattab	Identifies the user statistics table that describes where to retrieve the statistics.
statid	Specifies the ID associated with these statistics within stattab.
cascade	Indicates whether to import column and index statistics for this table. The default is TRUE.
statown	Specifies the schema containing stattab (if different than ownname).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
force	Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> TRUE — Ignores the statistics lock and imports the statistics. FALSE — Imports the statistics only if there is no lock. This is the default.
stat_category	Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> OBJECT_STATS — Specifies table statistics, column statistics, and index statistics. SYNOPSIS — Specifies metadata for incremental statistics. REALTIME_STATS — Specifies only real-time statistics. You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.

Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

173.7.78 INTERRUPT_ADVISOR_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the ["RESUME_ADVISOR_TASK Procedure"](#).

Syntax

```
DBMS_STATS.INTERRUPT_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 173-82 INTERRUPT_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 173-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
    v_tname VARCHAR2(128) := 'my_task';
    v_ename VARCHAR2(128) := NULL;
```

```

BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```

XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');

```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```

ORA-13638: The user interrupted the current operation.

```

173.7.79 LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```

DBMS_STATS.LOCK_PARTITION_STATS (
  ownname   VARCHAR2,
  tablename VARCHAR2,
  partname  VARCHAR2);

```

Parameters

Table 173-83 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tablename	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.80 LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 173-84 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

173.7.81 LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2);
```

Parameters

Table 173-85 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET *`, `DELETE *`, `IMPORT *`, `GATHER *` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT *_STATS` procedures.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

173.7.82 MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
    dblink    IN    VARCHAR2);
```

Parameters

Table 173-86 MERGE_COL_USAGE Procedure Parameters

Parameter	Description
<code>dblink</code>	Name of <code>dblink</code>

Usage Notes

User must be `SYS` to execute this procedure. addition the user specified during the creation of the `dblink` is expected to have privileges to select from tables in the `SYS` schema.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter `dblink` cannot be `NULL`

ORA-20002: Unable to create a `TEMP` table

173.7.83 PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using `SET_COLUMN_STATS`.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    charvals  CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    datevals  DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    dblvals  DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
```

```

srec      IN OUT StatRec,
fltvals   FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
srec      IN OUT StatRec,
numvals   NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
srec      IN OUT StatRec,
rawvals   RAWARRAY);

```

Parameters

Table 173-87 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.epc	<p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>
srec.bkvals	<p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>
srec.rpcnts	<p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> • Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in [Table 173-88](#).

Table 173-88 Datatype-Specific Input Parameters

Type	Description
charvals	The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
datevals	Array of values when the column type is date-based
dblvals	Array of values when the column type is double-based
fltvals	Array of values when the column type is float-based
numvals	Array of values when the column type is numeric-based
rawvals	Array of values when the column type is RAW. Up to the first 64 bytes of each value should be provided.
nvmin, nvmax	Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
rwmin, rwmax	Minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 173-89 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.84 PREPARE_COLUMN_VALUES_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (
    srec      IN OUT StatRec,
    nvmin     NVARCHAR2,
    nvmax     NVARCHAR2);
```

Parameters

Table 173-90 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Parameters

Parameter	Description
srec.epc	<p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>
srec.bkvals	<p>If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>
srec.rpcnts	<p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above. Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in [Table 173-88](#).

Table 173-91 PREPARE_COLUMN_VALUES_NVARCHAR Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 173-92 PREPARE_COLUMN_VALUES_NVARCHAR Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS
srec.eavals	Array suitable for use in a call to SET_COLUMN_STATS
srec.rpcnts	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

Related Topics

- [SET_COLUMN_STATS Procedures](#)
This procedure sets column-related information.

173.7.85 PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
  srec IN OUT StatRec,
  rwmn ROWID,
  rwmx ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 173-93 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec	<p>Values (IN):</p> <ul style="list-style-type: none"> • epc • bkvals • rpcnts <p>Values (OUT):</p> <ul style="list-style-type: none"> • minval • maxval • bkvals • novals • eavals • rpcnts
rwmin	Minimum value when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.
rwmax	Maximum value when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.

Table 173-94 StatRec Record Type Fields

Field	Description
epc (IN)	<p>Number of values specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (<code>nvarchar</code> and <code>rowid</code>).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to <code>SET_COLUMN_STATS</code>.</p>
bkvals (IN)	<p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in <code>charvals</code>, <code>datevals</code>, <code>dblvals</code>, <code>fltvals</code>, <code>numvals</code>, or <code>rawvals</code>. Otherwise, it is merely an output parameter, and it must be set to <code>NULL</code> when this procedure is called.</p>

Table 173-94 (Cont.) StatRec Record Type Fields

Field	Description
rpents (IN)	<p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpents(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> • Whenever srec.rpents is populated, srec.bkvals must be populated as described above. • Whenever bkvals and/or rpents are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.
minval (OUT)	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.
maxval (OUT)	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.
bkvals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
novals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS.
eavals (OUT)	Array suitable for use in a call to SET_COLUMN_STATS
rpents (OUT)	Array suitable for use in a call to SET_COLUMN_STATS

Usage Notes

No special privilege or role is needed to invoke this procedure.

173.7.86 PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate    BOOLEAN DEFAULT
        TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),
    force            IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-95 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name

Table 173-95 (Cont.) PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
tablename	Table name
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	If TRUE, will override the lock

Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tablename` is NULL then `publish` applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

173.7.87 PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp    TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 173-96 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

173.7.88 REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
  ownname      IN   VARCHAR2,
  statab       IN   VARCHAR2,
  src_own      IN   VARCHAR2,
  src_tab      IN   VARCHAR2,
  tgt_own      IN   VARCHAR2,
  tgt_tab      IN   VARCHAR2);
```

Parameters

Table 173-97 REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Owner of the statistics table. NULL means the current schema.
statab	User statistics table identifier
src_own	Owner of the table to be renamed. This argument cannot be NULL.
src_tab	Name of the table to be renamed. If NULL, all tables are owned by src_own.

Table 173-97 (Cont.) REMAP_STAT_TABLE Procedure Parameters

Parameter	Description
tgt_own	New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL.
tgt_tab	New name of the table. This argument is valid only if src_tab is not NULL.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers', 'shsave', 'customers_sav');
```

173.7.89 REPORT_ADVISOR_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.REPORT_ADVISOR_TASK(
  task_name      IN   VARCHAR2,
  execution_name IN   VARCHAR2  := NULL,
  type           IN   VARCHAR2  := 'TEXT',
  section       IN   VARCHAR2  := 'ALL',
  level         IN   VARCHAR2  := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 173-98 REPORT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Table 173-98 (Cont.) REPORT_ADVISOR_TASK Function Parameters

Parameter	Description
execution_name	A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task.
type	The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML.
section	A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'.
level	The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.
- **Operation level**
The results depend on the following privileges:
 - Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
 - Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
 - Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
 - Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: User input errors
- ORA-20012: Optimizer Statistics Advisor errors

Returns

This function returns a CLOB that contains the report.

Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

Example 173-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fctype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_fctype VARCHAR2(400) := p_fctype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps    NUMBER(10) := 10000;
  v_pn    NUMBER(10) := 1;
  v_ret   VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_fctype,
      section  => 'ALL',
      level    => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
    WHILE (v_pn < v_len)
    LOOP
      DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
      v_pn := v_pn + v_ps;
    END LOOP;
  END IF;
END;
```

```

        END LOOP;
    ELSE
        -- generate a script
        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR( v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','HTML','REPORT');
SPOOL OFF

```

Example 173-13 Generating a Textual Report for AUTO_STATS_ADVISOR_TASK

The following example invokes the `myrep` procedure created in the preceding example for `AUTO_STATS_ADVISOR_TASK`:

```
EXEC myrep('AUTO_STATS_ADVISOR_TASK','TEXT','REPORT');
```

The following sample output shows part of the report:

```

GENERAL INFORMATION
-----
Task Name       : AUTO_STATS_ADVISOR_TASK
Execution Name  : EXEC_97
Created        : 07-08-16 10:18:10
Last Modified   : 07-11-16 03:02:30
-----

SUMMARY
-----

For execution EXEC_97 of task AUTO_STATS_ADVISOR_TASK, the Statistics
Advisor
has 10 finding(s). The findings are related to the following rules:
COMPLETEAUTOJOB, MAINTAINSTATSHISTORY, USEDEFAULTPREFERENCE,
AVOIDSETPROCEDURES, USEDEFAULTPARAMS, USEGATHERSCHEMASTATS,
AVOIDSTALESTATS,
UNLOCKNONVOLATILETABLE, USEINCREMENTAL, AVOIDANALYZETABLE. Please
refer to the
finding section for detailed information.
-----

```

```

-----
FINDINGS
-----
--
Rule Name:          MaintainStatsHistory
Rule Description:   Maintain Statistics History

Finding:  Statistics history tables are too big.

Recommendation:  Check the other findings of this rule, as well as
the
                findings for the rules
AvoidFrequentStatsCollection,
                UseDefaultPreference, UseDefaultParams for possible
causes
                and
recommendations.
Rationale:  The size of the statistics history table could be big because
of
                violations of other rules.

-----

Rule Name:          UseDefaultPreference
Rule Description:   Use Default Preference for Stats Collection
Finding:  Global preference SYS_FLAGS is set to a non-default value '1'.

Recommendation:  Set the value of preference SYS_FLAGS to '0'.
Example:
-- Setting preference cascade to default value:
dbms_stats.set_global_prefs('CASCADE', NULL);

Rationale:  Preference SYS_FLAGS is for Oracle internal use only, setting
it
                to nondefault value '1' could cause unforeseen consequences.
.
.
.

```

173.7.90 REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax

```

DBMS_STATS.REPORT_COL_USAGE (
    ownname   IN   VARCHAR2,
    tabname   IN   VARCHAR2)
RETURN CLOB;

```

Parameters

Table 173-99 REPORT_COL_USAGE Function Parameters

Parameter	Description
ownname	Owner name. If NULL it reports column usage information for tables in all schemas in the database.
tablename	Table name. If NULL it reports column usage information for all tables of ownname.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

173.7.91 REPORT_GATHER_AUTO_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (  
    detail_level    VARCHAR2  DEFAULT 'TYPICAL',  
    format         VARCHAR2  DEFAULT 'TEXT')  
RETURN CLOB;
```

Parameters

Table 173-100 REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 173-100 (Cont.) REPORT_GATHER_AUTO_STATS Function Parameters

Parameter	Description
format	Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)

Usage Notes

Only user SYS can run the REPORT_GATHER_AUTO_STATS function.

173.7.92 REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER_DATABASE_STATS. The input set of parameters is the same as in GATHER_DATABASE_STATS, with two extra parameters.

Syntax

```

DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
  estimate_percent      IN      NUMBER      DEFAULT
  to_estimate_percent_type (
    GET_PARAM('ESTIMATE_PERCENT')),
  block_sample          IN      BOOLEAN     DEFAULT FALSE,
  method_opt            IN      VARCHAR2    DEFAULT
  GET_PARAM('METHOD_OPT'),
  degree                IN      NUMBER     DEFAULT TO_DEGREE_TYPE(
    GET_PARAM('DEGREE')),
  granularity           IN      VARCHAR2    DEFAULT
  GET_PARAM('GRANULARITY'),
  cascade               IN      BOOLEAN     DEFAULT to_cascade_type (
    GET_PARAM('CASCADE')),
  statab               IN      VARCHAR2    DEFAULT NULL,
  statid                IN      VARCHAR2    DEFAULT NULL,
  options               IN      VARCHAR2    DEFAULT 'GATHER',
  statown               IN      VARCHAR2    DEFAULT NULL,
  gather_sys            IN      BOOLEAN     DEFAULT TRUE,
  no_invalidate         IN      BOOLEAN     DEFAULT TO_NO_INVALIDATE_TYPE
  (
    GET_PARAM('NO_INVALIDATE')),
  gather_temp           IN      BOOLEAN     DEFAULT FALSE,
  gather_fixed          IN      BOOLEAN     DEFAULT FALSE,
  stattype              IN      VARCHAR2    DEFAULT DATA,
  obj_filter_list       IN      ObjectTab   DEFAULT NULL,
  detail_level          IN      VARCHAR2    DEFAULT 'TYPICAL',
  format                IN      VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 173-101 REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
estimate_percent	<p>The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute.</p> <p>Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
block_sample	<p>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>
method_opt	<p>Method options. This parameter accepts the following values: <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code>.</p> <p><code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code></p> <ul style="list-style-type: none"> - <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048]. - <code>REPEAT</code>: Collects histograms only on the columns that already have histograms. - <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p>

Table 173-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
granularity	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
cascade	<p>Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics.</p> <p>The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.</p>
statid	<p>Identifier (optional) to associate with these statistics within <code>stattab</code>.</p>

Table 173-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
options	<p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>stattab</code>, <code>statid</code>, <code>objlist</code> and <code>statown</code>; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO</p> <p>LIST STALE: Returns a list of stale objects as determined by looking at the <code>*_tab_modifications</code> views</p> <p>LIST EMPTY: Returns a list of objects which currently have no statistics</p>
statown	Schema containing <code>stattab</code> , if different from current schema.
gather_sys	Gathers statistics on the objects owned by the <code>SYS</code> user.
no_invalidate	<p>Does not invalidate the dependent cursors if set to <code>TRUE</code>. The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code>. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
gather_temp	<p>Gathers statistics on global temporary tables when <code>TRUE</code>. The default is <code>FALSE</code>.</p> <p>The temporary table must be created with the <code>ON COMMIT PRESERVE ROWS</code> clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.</p>
gather_fixed	<p>Gather statistics on fixed tables when <code>TRUE</code>. The default is <code>FALSE</code>.</p> <p>Only user <code>SYS</code> can collect statistics for fixed tables. The <code>ownname</code> must be <code>SYS</code> or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments:</p> <ul style="list-style-type: none"> • <code>estimate_percent</code> • <code>block_sample</code> • <code>stattab</code> • <code>statid</code> • <code>statown</code> <p>The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.</p>

Table 173-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
<code>stattype</code>	<p>The type of statistics:</p> <ul style="list-style-type: none"> • DATA — Data statistics only • CACHE — Cache statistics only • ALL — All statistics
<code>obj_filter_list</code>	<p>A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values.</p> <p>When specified, <code>GATHER_DATABASE_STATS</code> gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values <code>s1</code> and <code>s2</code> are specified for attributes <code>a1</code> and <code>a2</code> in one object filter. An object <code>o</code> is said to satisfy this object filter when <code>(o.a1 LIKE s1) AND (o.a2 LIKE s2)</code> is true.</p>

Table 173-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
detail_level	<p>The level of detail for the content of the report. Valid values are as follows:</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 173-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

Parameter	Description
format	The format of the report. Valid values are: <ul style="list-style-type: none"> XML HTML TEXT (Default)

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

173.7.93 REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER_DICTIONARY_STATS. The detail level for the report is defined by the detail_level input parameter. See the descriptions of detail_level and format in [REPORT_GATHER_DICTIONARY_STATS Functions](#). For all other input parameters, see [GATHER_DICTIONARY_STATS Procedure](#).

Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
  comp_id          IN   VARCHAR2  DEFAULT NULL,
  estimate_percent IN   NUMBER     DEFAULT
  TO_ESTIMATE_PERCENT_TYPE

  (GET_PARAM('ESTIMATE_PERCENT')),
  block_sample    IN   BOOLEAN    DEFAULT FALSE,
  method_opt      IN   VARCHAR2   DEFAULT
  GET_PARAM('METHOD_OPT'),
  degree          IN   NUMBER     DEFAULT TO_DEGREE_TYPE
  (GET_PARAM('DEGREE')),
  granularity     IN   VARCHAR2   DEFAULT
  GET_PARAM('GRANULARITY'),
  cascade         IN   BOOLEAN    DEFAULT TO_CASCADE_TYPE
  (GET_PARAM('CASCADE')),
  stattab         IN   VARCHAR2   DEFAULT NULL,
  options         IN   VARCHAR2   DEFAULT 'GATHER AUTO',
  no_invalidate  IN   BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE
```

```

                                (GET_PARAM('NO_INVALIDATE')),
stattype                       IN    VARCHAR2    DEFAULT 'DATA',
obj_filter_list                 IN    ObjectTab    DEFAULT NULL,
detail_level                    IN    VARCHAR2    DEFAULT 'TYPICAL',
format                          IN    VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 173-102 REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
comp_id	Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.
estimate_percent	Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	<p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms. - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
degree	<p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=>NULL</code>, <code>DEGREE=>n</code>, or <code>DEGREE=>DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p>
granularity	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • <code>ALL</code> — Gathers all statistics: subpartition, partition, and global. • <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value. • <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality. • <code>GLOBAL</code> — Gathers global statistics. • <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • <code>PARTITION</code> — Gathers partition-level statistics. • <code>SUBPARTITION</code> — Gathers subpartition-level statistics.
cascade	<p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics.</p>

Table 173-102 (Cont.) REPORT_GATHER_DICTIONARY_STATS Function Parameters

Parameter	Description
options	<p>Further specification of objects for which to gather statistics:</p> <ul style="list-style-type: none"> 'GATHER' - Gathers statistics on all objects in the schema 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are <code>comp_id</code>, <code>stattab</code>, <code>statid</code> and <code>statown</code>; all other parameter settings will be ignored. Also, returns a list of objects processed. 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, returns a list of objects found to be stale. 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO' 'LIST STALE' - Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views 'LIST EMPTY' - Returns list of objects which currently have no statistics
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattype	<p>The type of statistics:</p> <ul style="list-style-type: none"> DATA — Data statistics only CACHE — Cache statistics only ALL — All statistics
obj_filter_list	<p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1 like s1</code>) and (<code>o.a2 like s2</code>) and ... is true.</p>
detail_level	<p>See the description in REPORT_GATHER_DICTIONARY_STATS Functions.</p>
format	<p>See the description in REPORT_GATHER_DICTIONARY_STATS Functions.</p>

Return Values

A CLOB object that contains the report

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

173.7.94 REPORT_GATHER_FIXED_OBJ_STATS Function

This function runs the GATHER_FIXED_OBJECTS_STATS Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when GATHER_FIXED_OBJ_STATS is invoked are reported. The input set of parameters are exactly the same as in GATHER_FIXED_OBJ_STATS with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
  statab          IN  VARCHAR2 DEFAULT NULL,
  statid          IN  VARCHAR2 DEFAULT NULL,
  statown         IN  VARCHAR2 DEFAULT NULL,
  no_invalidate  IN  BOOLEAN  DEFAULT TO_NO_INVALIDATE_TYPE (
                                GET_PARAM('NO_INVALIDATE')),
  detail_level   IN  VARCHAR2  DEFAULT 'TYPICAL',
  format         IN  VARCHAR2  DEFAULT 'TEXT')
RETURN CLOB;
```

Parameters

173.7.95 REPORT_GATHER_SCHEMA_STATS Functions

This function runs the GATHER_SCHEMA_STATS procedure in reporting mode.

The database does not actually gather statistics, but reports all objects that would be affected when invoking GATHER_SCHEMA_STATS. The input set of parameters is exactly the same as in GATHER_SCHEMA_STATS, with two extra parameters.

Syntax

```
DBMS_STATS.REPORT_GATHER_SCHEMA_STATS (
  ownname          IN   VARCHAR2,
  estimate_percent IN   NUMBER          DEFAULT TO_ESTIMATE_PERCENT_TYPE (
                                GET_PARAM ('ESTIMATE_PERCENT')),
  block_sample     IN   BOOLEAN        DEFAULT FALSE,
  method_opt       IN   VARCHAR2      DEFAULT GET_PARAM ('METHOD_OPT'),
  degree           IN   NUMBER          DEFAULT TO_DEGREE_TYPE (
                                GET_PARAM ('DEGREE')),
  granularity      IN   VARCHAR2      DEFAULT GET_PARAM ('GRANULARITY'),
  cascade          IN   BOOLEAN        DEFAULT TO_CASCADE_TYPE (
                                GET_PARAM ('CASCADE')),
  stattab          IN   VARCHAR2      DEFAULT NULL,
  statid           IN   VARCHAR2      DEFAULT NULL,
  options          IN   VARCHAR2      DEFAULT 'GATHER',
  statown         IN   VARCHAR2      DEFAULT NULL,
  no_invalidate    IN   BOOLEAN        DEFAULT TO_NO_INVALIDATE_TYPE (
```

```

                                GET_PARAM ('NO_INVALIDATE')),
force                          IN   BOOLEAN      DEFAULT FALSE,
obj_filter_list                IN   ObjectTab    DEFAULT NULL,
detail_level                   IN   VARCHAR2     DEFAULT 'TYPICAL',
format                         IN   VARCHAR2     DEFAULT 'TEXT')
RETURN CLOB;

```

Parameters

Table 173-104 REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY} <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab

Table 173-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
options	<p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, statab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO.</p> <p>LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views.</p> <p>LIST EMPTY: Returns list of objects which currently have no statistics.</p>
objlist	List of objects found to be stale or empty
statown	Schema containing statab (if different than ownname)
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
force	Gather statistics on objects even if they are locked
obj_filter_list	<p>A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</p>

Table 173-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 173-104 (Cont.) REPORT_GATHER_SCHEMA_STATS Function Parameters

Parameter	Description
format	Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples**Applying an Object Filter List**

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema or any table in the `HR` schema, if stale, will have statistics gathered upon it.

```

DECLARE
  filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'HR';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                options => 'GATHER STALE');
END;
```

173.7.96 REPORT_GATHER_TABLE_STATS Function

This procedure runs the `GATHER_TABLE_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_TABLE_STATS` is invoked are reported.

Syntax

```

DBMS_STATS.REPORT_GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2  DEFAULT get_param('METHOD_OPT'),
```

```

degree          NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
granularity     VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab        VARCHAR2 DEFAULT NULL,
statid         VARCHAR2 DEFAULT NULL,
statown        VARCHAR2 DEFAULT NULL,
no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                    get_param('NO_INVALIDATE')),
stattype       VARCHAR2 DEFAULT 'DATA',
force          BOOLEAN  DEFAULT FALSE)
detail_level   VARCHAR2 DEFAULT 'TYPICAL',  format          VARCHAR2 DEFAULT
'TEXT')
RETURN CLOB;

```

Parameters

Table 173-105 REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 173-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
method_opt	<p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] • FOR COLUMNS [column_clause] [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name extension name extension</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns. - column_name : Name of a column - extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>

Table 173-105 (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if <code>partname</code> is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
cascade	<p>Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. format	<p>Report format:</p> <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)

Return Values

A CLOB object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Related Topics

- [GATHER_TABLE_STATS Procedure](#)
This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

173.7.97 REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (  
  opid          NUMBER,  
  detail_level  VARCHAR2  DEFAULT 'TYPICAL',  
  format        VARCHAR2  DEFAULT 'TEXT'  
  container_id  NUMBER    DEFAULT NULL)  
RETURN CLOB;
```

Parameters

Table 173-106 REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
opid	Operation ID

Table 173-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed-out objects (applies to only auto statistics gathering) <p>With regard to target objects:</p> <ul style="list-style-type: none"> - owner and name of each target object - target object type (such as: table, index) - start time - end time - completion status • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name - session ID - parameter values - error message if the operation failed <p>With regard to target objects:</p> <ul style="list-style-type: none"> - job name - batching details - estimated cost - rank in the target list - columns for which histograms were collected - list of collected extended statistics (if any) - reason for including the object in the target list (applies to only automatic statistics gathering operation tasks) - additional error details if the task has failed. <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).</p>

Table 173-106 (Cont.) REPORT_SINGLE_STATS_OPERATION Function Parameters

Parameter	Description
format	Report format: <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)
container_id	ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

173.7.98 REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```
DBMS_STATS.REPORT_STATS_OPERATIONS (
  detail_level      VARCHAR2 DEFAULT 'TYPICAL',
  format            VARCHAR2 DEFAULT 'TEXT',
  latestN           NUMBER DEFAULT NULL,
  since             TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  until             TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  auto_only         BOOLEAN DEFAULT FALSE,
  container_ids     DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)
RETURN CLOB;
```

Parameters

Table 173-107 REPORT_STATS_OPERATIONS Function Parameters

Parameter	Description
detail_level	<p>Detail level for the content of the report</p> <ul style="list-style-type: none"> • BASIC: The report includes <ul style="list-style-type: none"> - operation ID - operation name - operation target object - start time - end time - completion status (such as: succeeded, failed) • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> - total number of target objects - total number of successfully completed objects - total number of failed objects - total number of timed -out objects (applies to only auto statistics gathering) • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> - job name (if the operation was run in a job) - session ID - parameter values - additional error details if the operation has failed
format	<p>Report format:</p> <ul style="list-style-type: none"> • XML • HTML • TEXT (Default)
latestN	<p>Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is NULL, meaning that all qualifying operations will be reported.</p>
since	<p>The report will include only statistics operations that started after this timestamp.</p>
until	<p>The report will include only statistics operations that before after this timestamp.</p>
auto_only	<p>When TRUE, the report will contain only auto statistics gathering job runs.</p>
container_ids	<p>A multitenant environment contains one or more pluggable databases (PDBs). <code>container_ids</code> represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).</p>

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `hash` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
    conid_tab DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

173.7.99 RESET_ADVISOR_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

Syntax

```
DBMS_STATS.RESET_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 173-108 RESET_ADVISOR_TASK Procedure Parameters

Parameter	Description
<code>task_name</code>	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values

- ORA-20012: Optimizer Statistics Advisor errors

173.7.100 RESET_COL_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

Syntax

```
DBMS_STATS.RESET_COL_USAGE (
  ownname   IN   VARCHAR2,
  tablename IN   VARCHAR2);
```

Parameters

Table 173-109 RESET_COL_USAGE Procedure Parameters

Parameter	Description
ownname	Owner name. If NULL it deletes column usage information for tables in all schemas in the database.
tablename	Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tablename is NULL, the seed column usage is stopped if applicable. See :SEED_COL_USAGE Procedure for more information.

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

173.7.101 RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedure sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the [SET_GLOBAL_PREFS Procedure](#).

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

173.7.102 RESET_PARAM_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the [RESET_GLOBAL_PREF_DEFAULTS Procedure](#).

See also . [DBMS_STATS Deprecated Subprograms](#)

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

173.7.103 RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 173-110 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

173.7.104 RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate       BOOLEAN DEFAULT to_no_invalidate_type
  (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 173-111 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	Timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

173.7.105 RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(  
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,  
  force                BOOLEAN DEFAULT FALSE,  
  no_invalidate       BOOLEAN DEFAULT to_no_invalidate_type  
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 173-112 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .

Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

173.7.106 RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(  
  ownname              VARCHAR2,
```

```

as_of_timestamp    TIMESTAMP WITH TIME ZONE,
force              BOOLEAN DEFAULT FALSE,
no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type

(GET_PARAM('NO_INVALIDATE')));

```

Parameters

Table 173-113 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the tables for which the statistics are to be restored
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.107 RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

Syntax

```

DBMS_STATS.RESTORE_SCHEMA_STATS (
    as_of_timestamp    TIMESTAMP WITH TIME ZONE);

```

Parameters

Table 173-114 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

173.7.108 RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  restore_cluster_index  BOOLEAN DEFAULT FALSE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 173-115 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tablename	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.

Table 173-115 (Cont.) RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
no_invalidate	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.109 RESUME_ADVISOR_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

Table 173-116 RESUME_ADVISOR_TASK Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.

- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 173-14 Resuming an Interrupted Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

173.7.110 SCRIPT_ADVISOR_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (
  task_name      IN   VARCHAR2,
  execution_name IN   VARCHAR2  := NULL,
  dir_name       IN   VARCHAR2  := NULL,
  level          IN   VARCHAR2  := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 173-117 SCRIPT_ADVISOR_TASK Function Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
execution_name	A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.
dir_name	Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory.
level	The level of the script to generate. Possible values are <ul style="list-style-type: none"> ALL: Ignores the filter and generates a script for all findings TYPICAL: Generates a script according to the filters in place

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- SYSTEM level**
Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.

- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.
- Object level
Users can perform this task for any object for which they have statistics collection privileges.

Return Values

This function returns a CLOB that contains the script.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 173-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named `myrep`, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fotype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_fotype VARCHAR2(400) := p_fotype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10)    := 10000;
  v_pn     NUMBER(10)    := 1;
  v_ret    VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_fotype,
      section   => 'ALL',
      level     => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
```

```

        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    ELSE
        -- generate a script
        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','-','SCRIPT');
SPOOL OFF

```

Oracle Database SQL Tuning Guide

173.7.111 SEED_COL_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

Syntax

```

DBMS_STATS.SEED_COL_USAGE (
    sqlset_name    IN    VARCHAR2,
    owner_name     IN    VARCHAR2,
    time_limit     IN    POSITIVE DEFAULT NULL);

```

Parameters

Table 173-118 SEED_COL_USAGE Procedure Parameters

Parameter	Description
sqlset_name	Name of the SQL tuning set that contains the statements to be monitored. If this parameter and owner_name are both null, then the procedure monitors all statements in the database for the specified time limit.
owner_name	Owner of the SQL tuning set that contains the statements to be monitored. If this parameter and sqlset_name are both null, then the procedure monitors all statements in the database for the specified time limit.
time_limit	Time limit (in seconds).

Security Model

To invoke this procedure you must have the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the [CREATE_EXTENDED_STATS Function](#) procedure. If `sqlset_name` and `owner_name` are NULL, then the procedure records the column (group) usage information for the statements executed in the system in next `time_limit` seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in `SYS.COL_USAGE$`. The procedure stores information in `SYS.COL_GROUP_USAGE$`.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
  DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

173.7.112 SET_ADVISOR_TASK_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
  task_name      IN   VARCHAR2,
  parameter      IN   VARCHAR2,
  value          IN   VARCHAR2);
```

Parameters

Table 173-119 SET_ADVISOR_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The name of the Optimizer Statistics Advisor task.
parameter	The name of the parameter to set. The function returns an error if the specified parameter does not exist.
value	The new value of the parameter.

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

See Also:

Oracle Database SQL Tuning Guide to learn how to manage Optimizer Statistics Advisor

173.7.113 SET_COLUMN_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
    ownname      VARCHAR2,
    tabname      VARCHAR2,
    colname      VARCHAR2,
    partname     VARCHAR2 DEFAULT NULL,
    statab       VARCHAR2 DEFAULT NULL,
    statid       VARCHAR2 DEFAULT NULL,
    distcnt      NUMBER DEFAULT NULL,
    density      NUMBER DEFAULT NULL,
```

```

nullcnt      NUMBER DEFAULT NULL,
srec         StatRec DEFAULT NULL,
avgclen     NUMBER DEFAULT NULL,
flags       NUMBER DEFAULT NULL,
statown     VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
force       BOOLEAN DEFAULT FALSE);

```

Use the following for user-defined statistics:

```

DBMS_STATS.SET_COLUMN_STATS (
  ownname     VARCHAR2,
  tablename   VARCHAR2,
  colname     VARCHAR2,
  partname    VARCHAR2 DEFAULT NULL,
  statab      VARCHAR2 DEFAULT NULL,
  statid      VARCHAR2 DEFAULT NULL,
  ext_stats   RAW,
  statypown   VARCHAR2 DEFAULT NULL,
  statypname  VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                get_param('NO_INVALIDATE')),
  force       BOOLEAN DEFAULT FALSE);

```

Parameters

Table 173-120 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tablename	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
statab	User statistics table identifier describing where to store the statistics. If statab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
ext_stats	User-defined statistics
statypown	Schema of the statistics type
statypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)

Table 173-120 (Cont.) SET_COLUMN_STATS Procedure Parameters

Parameter	Description
flags	For internal Oracle use (should be left as NULL)
statown	Schema containingstattab (if different than ownname)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.114 SET_DATABASE_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
  pname          IN   VARCHAR2,
  pvalue         IN   VARCHAR2,
  add_sys        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 173-121 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The existing value for following preferences can be set and default preference values will be used:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_STALENESS • INCREMENTAL_LEVEL • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default values</p>
add_sys	<p>Value TRUE will include the Oracle-owned tables</p>

Table 173-122 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> The accuracy of the new algorithm is similar to the original algorithm. The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	<p>Determines whether to collect index statistics as part of gathering table statistics.</p>
DEGREE	<p>Determines the degree of parallelism used for gathering statistics.</p>

Table 173-122 (Cont.) Statistics Preferences

Preference	Description
ESTIMATE_PERCENT	Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: <ul style="list-style-type: none"> • <code>SHARED</code> — All sessions see the same set of statistics • <code>SESSION</code> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.
GRANULARITY	Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid: <ul style="list-style-type: none"> • <code>ALL</code> — Gathers all statistics: subpartition, partition, and global. • <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value. • <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality. • <code>GLOBAL</code> — Gathers global statistics. • <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • <code>PARTITION</code> — Gathers partition-level statistics. • <code>SUBPARTITION</code> — Gathers subpartition-level statistics.

Table 173-122 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL	<p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p>
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 173-122 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>

Table 173-122 (Cont.) Statistics Preferences

Preference	Description
METHOD_OPT	<p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed:</p> <ul style="list-style-type: none"> <code>FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause]</code> <p>The <code>size_clause</code> is defined as <code>size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</code></p> <p><code>integer</code> — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p><code>REPEAT</code> — Collects histograms only on the columns that already have histograms.</p> <p><code>AUTO</code> — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p><code>SKEWONLY</code> — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> <code>TRUE</code>: Dependent cursors are not invalidated. <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>

Table 173-122 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	<p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> GATHER — Gathers statistics on all objects in the database. This is the default. GATHER AUTO — Gathers all necessary statistics automatically. This is the default. <p>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> TRUE — Ignores input parameter values, and uses the value of the corresponding preference. FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> OBJECT_STATS - table statistics, column statistics and index statistics (default) SYNOPSIS - information to support incremental statistics <p>The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopsis.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using DBMS_STATS. Index statistics gathered during CREATE INDEX or REBUILD INDEX operations will use the default value 1.</p>

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');  
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');  
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

173.7.115 SET_GLOBAL_PREFS Procedure

This procedure sets statistics preferences at the global level.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (  
    pname      IN   VARCHAR2,  
    pvalue     IN   VARCHAR2);
```

Parameters

Table 173-123 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> • APPROXIMATE_NDV_ALGORITHM • AUTO_STAT_EXTENSIONS • AUTO_TASK_STATUS • AUTO_TASK_MAX_RUN_TIME • AUTO_TASK_INTERVAL • AUTOSTATS_TARGET • CASCADE • CONCURRENT • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • STAT_CATEGORY • TABLE_CACHED_BLOCKS • WAIT_TIME_TO_UPDATE_STATS
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default values</p>

Table 173-124 Global Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li data-bbox="854 558 1373 877">• REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. <li data-bbox="854 890 1373 1010">• ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. <li data-bbox="854 1022 1373 1377">• HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li data-bbox="899 1234 1373 1289">– The accuracy of the new algorithm is similar to the original algorithm. <li data-bbox="899 1297 1373 1377">– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li data-bbox="854 1493 1373 1612">• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. <li data-bbox="854 1625 1373 1816">• OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
AUTO_TASK_STATUS	<p>Enables or disables the high-frequency automatic optimizer statistics collection. Values are:</p> <ul style="list-style-type: none"> • ON — Enables high-frequency automatic optimizer statistics collection. • OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.
AUTO_TASK_MAX_RUN_TIME	<p>Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.</p>
AUTO_TASK_INTERVAL	<p>Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).</p>
AUTOSTATS_TARGET	<p>Controls the objects considered for statistics collection. It takes the following values:</p> <ul style="list-style-type: none"> • 'ALL' - Statistics collected for all objects in system • 'ORACLE' - Statistics collected for all Oracle owned objects • 'AUTO' - Oracle decides on which objects to collect statistics <p>This preference is applicable only for automatic statistics collection.</p>
CASCADE	<p>Determines whether to collect index statistics as part of gathering table statistics.</p>

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
CONCURRENT	<p>Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are:</p> <ul style="list-style-type: none"> • MANUAL — Concurrency is enabled only for manual statistics gathering. • AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering. • ALL — Concurrency is enabled for both manual and automatic statistics gathering. • OFF — Concurrency is disabled for both manual and automatic statistics. <p>Note the following guidelines: The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER_*_STATS procedures. DBMS_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers. To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB_QUEUE_PROCESSES initialization parameter must be at least 4.</p>
DEGREE	<p>Determines the degree of parallelism used for gathering statistics.</p>
ESTIMATE_PERCENT	<p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p>
GLOBAL_TEMP_TABLE_STATS	<p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> • SHARED — All sessions see the same set of statistics • SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
GRANULARITY	<p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> • ALL — Gathers all statistics: subpartition, partition, and global. • AUTO — Determines the granularity based on the partitioning type. This is the default value. • DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality. • GLOBAL — Gathers global statistics. • GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. • PARTITION — Gathers partition-level statistics. • SUBPARTITION — Gathers subpartition-level statistics.
INCREMENTAL	<p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> • The INCREMENTAL value for the partitioned table is set to TRUE. • The PUBLISH value for the partitioned table is set to TRUE. • The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p>

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> • PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses. • TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <p>USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.</p> <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> <p>USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> <p>ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</p> <p>NULL—A partition or subpartition is considered stale when it has any DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p>

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
	<p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>
METHOD_OPT	<p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT : Collects histograms only on the columns that already have histograms - AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension : can be either a column group in the format of (column_name, columne_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using <code>GATHER AUTO</code> to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using <code>INCREMENTAL</code> statistics. <p>For partitioned tables using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>

Table 173-124 (Cont.) Global Statistics Preferences

Preference	Description
PUBLISH	<p>Determines whether the database publishes newly gathered statistics after the gathering job completes.</p> <p>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>
STAT_CATEGORY	<p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> • <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default) • <code>SYNOPSIS</code> — information to support incremental statistics • <code>REALTIME_STATS</code> — specifies only real-time statistics. <p>The value '<code>OBJECT_STATS, SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopses.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>
WAIT_TIME_TO_UPDATE_STATS	<p>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</p>

Security Model

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Example 173-16 Overriding Statistics Preferences at the Global Level

You use the `SET_GLOBAL_PREFS` procedure to set the `ESTIMATE_PERCENT` preference to 5 for every table in the database that does not have a table preference set. Because `sh.costs` does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');
```

PL/SQL procedure successfully completed.

You use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to true for the `sh.sales` table only.

```
SQL> EXEC  
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER','TRUE');
```

PL/SQL procedure successfully completed.

A script attempts to set `ESTIMATE_PERCENT` to 10 when gathering statistics for `sh.sales`. However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, and because a global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs',  
ESTIMATE_PERCENT=>10);
```

PL/SQL procedure successfully completed.

Example 173-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');  
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');  
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

 **See Also:**

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

173.7.116 SET_INDEX_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

Syntax

```

DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  statab       VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  numrows      NUMBER    DEFAULT NULL,
  numblks     NUMBER    DEFAULT NULL,
  numdist      NUMBER    DEFAULT NULL,
  avgblk       NUMBER    DEFAULT NULL,
  avgdblk     NUMBER    DEFAULT NULL,
  clstfct      NUMBER    DEFAULT NULL,
  indlevel     NUMBER    DEFAULT NULL,
  flags        NUMBER    DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  guessq       NUMBER    DEFAULT NULL,
  cachedblk   NUMBER    DEFAULT NULL,
  cachehit     NUMBER    DEFAULT NULL,
  force        BOOLEAN  DEFAULT FALSE);

```

Use the following syntax for user-defined domain index statistics:

```

DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  statab       VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  ext_stats    RAW,
  stattyown    VARCHAR2  DEFAULT NULL,
  stattyname   VARCHAR2  DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type(

```

```

                                get_param('NO_INVALIDATE')),
force          BOOLEAN    DEFAULT FALSE);

```

Parameters

Table 173-125 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
ext_stats	User-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from <code>numlblks</code> and <code>numdist</code> .
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from <code>clstfct</code> and <code>numdist</code> .
clstfct	See <code>clustering_factor</code> column of the <code>all_indexes</code> view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as <code>NULL</code>)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> • <code>TRUE</code>: Dependent cursors are not invalidated. • <code>FALSE</code>: Dependent cursors are marked for immediate invalidation. • <code>AUTO</code>: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
guessq	Guess quality. See the <code>pct_direct_access</code> column of the <code>all_indexes</code> view for a description.

Table 173-125 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
cachedblk	Internal use only. Do not set.
cachehit	Internal use only. Do not set.
force	Sets the values even if statistics of the index are locked

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

173.7.117 SET_PARAM Procedure

This deprecated procedure sets default values for parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET_GLOBAL_PREFS Procedure](#).

See also [DBMS_STATS Deprecated Subprograms](#).

You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
  pname      IN   VARCHAR2,
  pval       IN   VARCHAR2);
```

Parameters

Table 173-126 SET_PARAM Procedure Parameters

Parameter	Description
pname	<p>The parameter name The default value for following parameters can be set.</p> <ul style="list-style-type: none"> CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. DEGREE ESTIMATE_PERCENT METHOD_OPT NO_INVALIDATE GRANULARITY AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	<p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> 'ALL' - Statistics are collected for all objects in the system 'ORACLE' - Statistics are collected for all Oracle owned objects 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':
 - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
 - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Examples

```
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```

173.7.118 SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (
    opname      IN   VARCHAR2,
    procrate    IN   NUMBER);
```

Parameters

Table 173-127 SET_PROCESSING_RATE Procedure Parameters

Parameter	Description
opname	Name of the operation.

Table 173-127 (Cont.) SET_PROCESSING_RATE Procedure Parameters

Parameter	Description
procrate	<p>Processing rate. Valid values are as follows:</p> <ul style="list-style-type: none"> • AGGR • ALL • CPU • CPU_ACCESS • CPU_AGGR • CPU_BYTES_PER_SEC • CPU_FILTER • CPU_GBY • CPU_HASH_JOIN • CPU_JOIN • CPU_NL_JOIN • CPU_RANDOM_ACCESS • CPU_SEQUENTIAL_ACCESS • CPU_SM_JOIN • CPU_SORT • HASH • IO • IO_ACCESS • IO_BYTES_PER_SEC • IO_RANDOM_ACCESS • IO_SEQUENTIAL_ACCESS • MEMCMP • MEMCPY

Security Model

You must have the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.

Usage Notes

`AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

173.7.119 SET_SCHEMA_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname IN VARCHAR2,
```

```

pname    IN    VARCHAR2,
pvalue   IN    VARCHAR2);

```

Parameters

Table 173-128 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	<p>Preference name. You can set the default value for the following preferences:</p> <ul style="list-style-type: none"> • AUTO_STAT_EXTENSIONS • CASCADE • DEGREE • ESTIMATE_PERCENT • GLOBAL_TEMP_TABLE_STATS • GRANULARITY • INCREMENTAL • INCREMENTAL_LEVEL • INCREMENTAL_STALENESS • METHOD_OPT • NO_INVALIDATE • OPTIONS • PREFERENCE_OVERRIDES_PARAMETER • PUBLISH • STALE_PERCENT • TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it sets the database default value.

Table 173-129 Statistics Preferences

Preference	Description
AUTO_STAT_EXTENSIONS	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
CASCADE	Determines whether index statistics are collected as part of gathering table statistics.
DEGREE	Determines degree of parallelism used for gathering statistics.
ESTIMATE_PERCENT	Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.
GLOBAL_TEMP_TABLE_STATS	<p>This preference takes the following values:</p> <ul style="list-style-type: none"> • SHARED - All sessions see the same set of statistics • SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 173-129 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	<p>Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are:</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>
INCREMENTAL	<p>Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> • INCREMENTAL value for the partitioned table is set to TRUE • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>

Table 173-129 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	<p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none">• TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run <code>GATHER_TABLE_STATS</code> on this table with <code>INCREMENTAL</code> to <code>TRUE</code> and <code>INCREMENTAL_LEVEL</code> to <code>TABLE</code> before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the <code>SET_GLOBAL/DATABASE/SCHEMA_PREFS</code> procedures.• PARTITION - partition level synopses are gathered. This is the default value. If <code>PARTITION</code> is set on a non partitioned table, no synopses are gathered.

Table 173-129 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> • USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics. • USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics. • ALLOW_MIXED_FORMAT—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting. • NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS</pre>

Table 173-129 (Cont.) Statistics Preferences

Preference	Description
	<pre>('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre>
METHOD_OPT	<p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>

Table 173-129 (Cont.) Statistics Preferences

Preference	Description
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • <code>GATHER</code> — Gathers statistics for all objects in the table. This is the default. • <code>GATHER AUTO</code> — Oracle recommends using <code>GATHER AUTO</code> to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using <code>INCREMENTAL</code> statistics. <p>For partitioned tables using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • <code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference. • <code>FALSE</code> — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>
PUBLISH	<p>Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11g Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.</p>
STALE_PERCENT	<p>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10%. Note that if you set <code>stale_percent</code> to zero the <code>AUTO STATS</code> gathering job will gather statistics for this table every time a row in the table is modified.</p>
TABLE_CACHED_BLOCKS	<p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. The preference applies only when gathering statistics using <code>DBMS_STATS</code>. Index statistics gathered during <code>CREATE INDEX</code> or <code>REBUILD INDEX</code> operations will use the default value 1.</p>

Security Model

To run this procedure, you must be the schema owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

173.7.120 SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
  pname          VARCHAR2,
  pvalue         NUMBER,
  statab        IN   VARCHAR2 DEFAULT NULL,
  statid        IN   VARCHAR2 DEFAULT NULL,
  statown       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 173-130 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> iotfrspeed—I/O transfer speed in bytes for each millisecond ioseektim - Seek time + latency time + operating system overhead time, in milliseconds sreadtim - Average time to read single block (random read), in milliseconds mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option. mbrc - Average multiblock read count for sequential read, in blocks maxthr - Maximum I/O system throughput, in bytes/second slavethr - Average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

173.7.121 SET_TABLE_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tabname    IN  VARCHAR2,  
    pname      IN  VARCHAR2,  
    pvalue     IN  VARCHAR2);
```

Parameters

Table 173-131 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. You can set the default value for following preferences: <ul style="list-style-type: none">• APPROXIMATE_NDV_ALGORITHM• AUTO_STAT_EXTENSIONS• CASCADE• DEGREE• ESTIMATE_PERCENT• GRANULARITY• INCREMENTAL• INCREMENTAL_LEVEL• INCREMENTAL_STALENESS• METHOD_OPT• NO_INVALIDATE• OPTIONS• PREFERENCE_OVERRIDES_PARAMETER• PUBLISH• STALE_PERCENT• TABLE_CACHED_BLOCKS
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Table 173-132 Statistics Preferences

Preference	Description
APPROXIMATE_NDV_ALGORITHM	<p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> • REPEAT OR HYPERLOGLOG This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • ADAPTIVE SAMPLING The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • HYPERLOGLOG The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> – The accuracy of the new algorithm is similar to the original algorithm. – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.
AUTO_STAT_EXTENSIONS	<p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.
CASCADE	<p>Determines whether to collect index statistics as part of gathering table statistics.</p>

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
CONCURRENT	<p>This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:</p> <ul style="list-style-type: none">• 'MANUAL' - Concurrency will be turned on only for manual statistics gathering.• 'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering.• 'ALL': Concurrency will be turned on for both manual and automatic statistics gathering.• 'OFF': Concurrency will be turned off for both manual and automatic statistics
DEGREE	<p>Determines degree of parallelism used for gathering statistics.</p>
ESTIMATE_PERCENT	<p>Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>
GLOBAL_TEMP_TABLE_STATS	<p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</p> <ul style="list-style-type: none">• SHARED - All sessions see the same set of statistics• SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
GRANULARITY	<p>Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>
INCREMENTAL	<p>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> • INCREMENTAL value for the partitioned table is set to TRUE; • PUBLISH value for the partitioned table is set to TRUE; • User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p>

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_LEVEL	<p>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none">• TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run <code>GATHER_TABLE_STATS</code> on this table with <code>INCREMENTAL</code> to TRUE and <code>INCREMENTAL_LEVEL</code> to <code>TABLE</code> before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the <code>SET_GLOBAL/DATABASE/SCHEMA_PREFS</code> procedures.• PARTITION - partition level synopses are gathered. This is the default value. If <code>PARTITION</code> is set on a non partitioned table, no synopses are gathered.

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
INCREMENTAL_STALENESS	<p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <p>USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.</p> <p>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.</p> <p>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</p> <p>USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</p> <p>ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</p> <p>NULL—A partition or subpartition is considered stale when it has any DML changes.</p> <p>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</p>

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
	<p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>
METHOD_OPT	<p>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> • FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer: Number of histogram buckets. Must be in the range [1,2048]. - REPEAT: Collects histograms only on the columns that already have histograms - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns - column_name: name of a column - extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
NO_INVALIDATE	<p>Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values:</p> <ul style="list-style-type: none"> • TRUE: Dependent cursors are not invalidated. • FALSE: Dependent cursors are marked for immediate invalidation. • AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. <p>You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</p>
OPTIONS	<p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Oracle recommends using <code>GATHER AUTO</code> to gather necessary statistics, such as histograms, after a table has been bulk loaded and acquired online statistics. This is applicable only to tables that are not using <code>INCREMENTAL</code> statistics. <p>For partitioned tables using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> will gather statistics for a table if it is marked stale or has no statistics. In addition, statistics will be gathered for partitions and sub-partitions that are marked stale or have no statistics.</p> <p>For tables not using <code>INCREMENTAL</code> statistics, <code>GATHER_TABLE_STATS</code> with <code>GATHER AUTO</code> may gather statistics for partitions and sub-partitions, even if they are not marked stale.</p>
PREFERENCE_OVERRIDES_PARAMETER	<p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> • TRUE — Ignores input parameter values, and uses the value of the corresponding preference. • FALSE — Obeys input parameter values. <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>

Table 173-132 (Cont.) Statistics Preferences

Preference	Description
PUBLISH	Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.
STALE_PERCENT	Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you must connect as owner of the table or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

Example 173-18 Overriding Statistics Preferences

In this example, legacy scripts set `ESTIMATE_PERCENT` explicitly rather than using the recommended `AUTO_SAMPLE_SIZE`. Your goal is to prevent users from using these scripts to set preferences on the `sh.costs` table.

No preference for `ESTIMATE_PERCENT` is set for `sh.costs` or at the global level, so the preference defaults to `AUTO_SAMPLE_SIZE`:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS
"STAT_PREFS" FROM DUAL;
```

```
STAT_PREFS
-----
DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to `TRUE` for the `costs` table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to 100 when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs',
ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of 100.

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

173.7.122 SET_TABLE_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab           VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows         NUMBER   DEFAULT NULL,
  numblks         NUMBER   DEFAULT NULL,
  avgrlen         NUMBER   DEFAULT NULL,
  flags           NUMBER   DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  cachedblk       NUMBER   DEFAULT NULL,
  cachehit        NUMBER   DEFAULT NULL,
  force           BOOLEAN   DEFAULT FALSE,
  im_imcu_count   NUMBER   DEFAULT NULL,
  im_block_count  NUMBER   DEFAULT NULL,
  scanrate        NUMBER   DEFAULT NULL);
```

Parameters

Table 173-133 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table.
partname	Name of the table partition in which to store the statistics. If the table is partitioned and <code>partname</code> is NULL, then the statistics are stored at the global table level.
stattab	Table in which to store the statistics. If <code>stattab</code> is NULL, then the database stores the statistics in the data dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> . This identifier is only relevant if <code>stattab</code> is not NULL.
numrows	Number of rows in the table or partition.
numblks	Number of blocks that the table or partition occupies.
avgrlen	Average row length for the table or partition.
flags	For internal use only. Do not set.
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>).
no_invalidate	Controls the invalidation of dependent cursors when statistics are gathered. The parameter takes the following values: <ul style="list-style-type: none"> TRUE: Dependent cursors are not invalidated. FALSE: Dependent cursors are marked for immediate invalidation. AUTO: This is the default value. Rolling invalidation is used to invalidate all dependent cursors over a period of time. The performance impact on the database is reduced especially in cases where a large number of cursors are invalidated. You can change the default using the SET_DATABASE_PREFS Procedure , SET_GLOBAL_PREFS Procedure , SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
cachedblk	For internal use only. Do not set.
cachehit	For internal use only. Do not set.
force	A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE.
im_imcu_count	The number of In-Memory Compression Units (IMCUs) in the table or partition.
im_block_count	The number of In-Memory blocks in the table or partition.
scanrate	The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.

Security Model

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

ORA-20005: Object statistics are locked

Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

Note:

The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
 - When not enough data has been analyzed, such as when an object has been recently created

- When the database does not have one major workload, resulting in averages that do not correspond to real values

173.7.123 SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
  ownname   VARCHAR2,
  tabname   VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 173-134 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column <i>c1</i> , <i>c2</i> . An example column group can be "(<i>c1</i> , <i>c2</i>)" and an example expression can be "(<i>c1</i> + <i>c2</i>)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

173.7.124 TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
  ownname      IN      VARCHAR2,
  tablename    IN      VARCHAR2,
  dblink       IN      VARCHAR2,  options      IN      NUMBER DEFAULT NULL);
```

Parameters

Table 173-135 TRANSFER_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.
tablename	Name of the table. If NULL, all tables in OWNNAME.
dblink	Database link name
options	By default the procedure does not transfer the global preferences. Specifying ADD_GLOBAL_PREFS copies global preferences.

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

173.7.125 UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
  ownname      VARCHAR2,
  tablename    VARCHAR2,
  partname     VARCHAR2);
```

Parameters

Table 173-136 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tablename	Name of the table
partname	[Sub]Partition name

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

173.7.126 UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 173-137 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

173.7.127 UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tablename  VARCHAR2);
```

Parameters

Table 173-138 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK_SCHEMA_STATS Procedure](#) nor the [UNLOCK_TABLE_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK_TABLE_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK_PARTITION_STATS Procedure](#).

173.7.128 UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
    ownname    VARCHAR2,
    statab     VARCHAR2);
```

Parameters

Table 173-139 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
statab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

DBMS_STORAGE_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS_STORAGE_MAP Subprograms](#)

174.1 DBMS_STORAGE_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

See Also:

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for `V$MAP` views, including `V$MAP_FILE`, `V$MAP_ELEMENT`, `V$MAP_SUBELEMENT`, `V$MAP_FILE_EXTENT`

174.2 DBMS_STORAGE_MAP Operational Notes

Invoking the `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL` functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

See Also:

Oracle Database Administrator's Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.

174.3 Summary of DBMS_STORAGE_MAP Subprograms

This table lists the `DBMS_STORAGE_MAP` subprograms and briefly describes them.

Table 174-1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function	Drops the mapping information for the element defined by <code>elemname</code>
DROP_FILE Function	Drops the file mapping information defined by <code>filename</code>
LOCK_MAP Procedure	Locks the mapping information in the shared memory of the instance
MAP_ALL Function	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function	Builds mapping information for the element identified by <code>elemname</code>
MAP_FILE Function	Builds mapping information for the file identified by <code>filename</code>
MAP_OBJECT Function	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure	Unlocks the mapping information in the shared memory of the instance.

174.3.1 DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 174-2 DROP_ALL Function Parameters

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

174.3.2 DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(  
    elemname          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 174-3 DROP_ELEMENT Function Parameters

Parameter	Description
elemname	The element for which mapping information is dropped.
cascade	If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by elemname, if possible.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

174.3.3 DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(  
    filename          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 174-4 DROP_FILE Function Parameters

Parameter	Description
filename	The file for which file mapping information is dropped.
cascade	If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

174.3.4 LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V\$MAP tables. Without locking the mapping information, V\$MAP_ELEMENT and V\$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

174.3.5 MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
  max_num_fileext IN NUMBER DEFAULT 100,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 174-5 MAP_ALL Function Parameters

Parameter	Description
max_num_fileext	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

174.3.6 MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT (
  elemname          IN VARCHAR2,
  cascade           IN BOOLEAN,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 174-6 MAP_ELEMENT Function Parameters

Parameter	Description
<code>elemname</code>	The element for which mapping information is built.
<code>cascade</code>	If <code>TRUE</code> , all elements within the <code>elemname</code> I/O stack DAG are mapped.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

174.3.7 MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE (
  filename          IN VARCHAR2,
  filetype          IN VARCHAR2,
  cascade           IN BOOLEAN,
  max_num_fileextent IN NUMBER DEFAULT 100,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 174-7 MAP_FILE Function Parameters

Parameter	Description
<code>filename</code>	The file for which mapping information is built.

Table 174-7 (Cont.) MAP_FILE Function Parameters

Parameter	Description
filetype	Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE".
cascade	Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.
max_num_fileextent	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

174.3.8 MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
  objname IN VARCHAR2,
  owner   IN VARCHAR2,
  objtype IN VARCHAR2);
```

Parameters

Table 174-8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

174.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

174.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

174.3.11 UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

DBMS_SYNC_REFRESH

The `DBMS_SYNC_REFRESH` package provides an interface to perform a synchronous refresh of materialized views.

See Also:

Oracle Database Data Warehousing Guide for more information on using `DBMS_SYNC_REFRESH`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_SYNC_REFRESH Subprograms](#)

175.1 DBMS_SYNC_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

See Also:

Oracle Database Data Warehousing Guide for more information about using synchronous refresh

175.2 DBMS_SYNC_REFRESH Security Model

The execute privilege for this package is granted to `PUBLIC`, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the `DBA` privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that is, the user must have the `SELECT` or `READ`, `INSERT`, `UPDATE`, and `DELETE` privileges on that table or materialized view. A couple of exceptions are:

- `PURGE_REFRESH_STATS` and `ALTER_REFRESH_STATS_RETENTION` Functions

These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The `CAN_SYNCREF_TABLE` Function
This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the `SELECT` or `READ` privilege on all materialized views associated with the specified table.

175.3 Summary of DBMS_SYNC_REFRESH Subprograms

This table lists and briefly describes the `DBMS_SYNC_REFRESH` package subprograms.

Table 175-1 DBMS_SYNC_REFRESH Package Subprograms

Subprogram	Description
<code>ABORT_REFRESH Procedure</code>	Aborts a refresh.
<code>ALTER_REFRESH_STATS_RETENTION Procedure</code>	Alters the refresh history retention value, specified in days.
<code>CAN_SYNCREF_TABLE Procedure</code>	Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.
<code>EXECUTE_REFRESH Procedure</code>	Executes synchronous refresh on the synchronous refresh groups.
<code>GET_ALL_GROUP_IDS Function</code>	Returns the group IDs of all the synchronous refresh groups in the database.
<code>GET_GROUP_ID Function</code>	Returns the group ID of a table or materialized view.
<code>GET_GROUP_ID_LIST Function</code>	Returns the group IDs of the tables in a given list of objects (tables or materialized views).
<code>PREPARE_REFRESH Procedure</code>	Prepares the sync refresh groups for refresh.
<code>PREPARE_STAGING_LOG Procedure</code>	Validates and collects statistics on the data in the staging log.
<code>PURGE_REFRESH_STATS Procedure</code>	Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter.
<code>REGISTER_MVIEWS</code>	Registers materialized views for synchronous refresh.
<code>REGISTER_PARTITION_OPERATION Procedure</code>	Registers a partition maintenance operation on a partition of a base table.
<code>UNREGISTER_MVIEWS</code>	Unregisters materialized views from synchronous refresh.
<code>UNREGISTER_PARTITION_OPERATION Procedure</code>	Unregisters a partition maintenance operation on a partition of a base table.

175.3.1 ABORT_REFRESH Procedure

This procedure undoes all the changes made by `PREPARE_REFRESH` or `EXECUTE_REFRESH` for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id      IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters**Table 175-2 ABORT_REFRESH Procedure Parameters**

Parameter	Description
group_id	The group ID of a sync refresh group.
group_id_list	An array of group IDs of the sync refresh groups to be aborted for sync refresh.

Usage Notes

If called after `PREPARE_REFRESH`, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after `EXECUTE_REFRESH` fails, this procedure restores the state of tables to before `EXECUTE_REFRESH` by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE_REFRESH Procedure](#)" for a description of these locks.

`ABORT_REFRESH` will work only if a `PREPARE_REFRESH` or `EXECUTE_REFRESH` statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

175.3.2 ALTER_REFRESH_STATS_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with `PURGE_REFRESH_HISTORY`. It also requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (
    retention    IN NUMBER);
```

Parameters

Table 175-3 ALTER_REFRESH_STATS_RETENTION Procedure Parameters

Parameter	Description
retention	<p>The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000.</p> <p>You can use the following values for special purposes:</p> <ul style="list-style-type: none"> • -1 - Refresh history is never purged by PREPARE_REFRESH. • 0 - Old refresh history is never saved. PREPARE_REFRESH will delete all refresh history. • NULL - Change refresh history retention to default value.

175.3.3 CAN_SYNCREF_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide*.

You can invoke CAN_SYNCREF_TABLE in two ways. The first is to use a table, while the second is to create a VARRAY.

Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of statement_id or output_array need be provided to CAN_SYNCREF_TABLE.

Parameters

Table 175-4 CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
schema_name	The name of the schema of the base table.
table_name	The name of the base table.

Table 175-4 (Cont.) CAN_SYNCREF_TABLE Procedure Parameters

Parameter	Description
statement_id	A string (VARCHAR2 (30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema.
output_array	The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.

Using SYNCREF_TABLE

The output of CAN_SYNCREF_TABLE can be directed to a table named SYNCREF_TABLE. The user is responsible for creating the SYNCREF_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
  statement_id  VARCHAR2(30),
  schema_name  VARCHAR2(30),
  table_name   VARCHAR2(30),
  mv_schema_name VARCHAR2(30),
  mv_name      VARCHAR2(30),
  eligible     VARCHAR2(1),
  seq_num      NUMBER,
  msg_number   NUMBER,
  message      VARCHAR2(4000));
```

Using a VARRAY

You can save the output of CAN_SYNCREF_TABLE in a PL/SQL VARRAY. The elements of this array are of type CanSyncRefMessage, which is predefined in the SYS schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
  schema_name  VARCHAR2(30),
  table_name   VARCHAR2(30),
  mv_schema_name VARCHAR2(30),
  mv_name      VARCHAR2(30),
  eligible     VARCHAR2(1),
  seq_num      NUMBER,
  msg_number   NUMBER,
  message      VARCHAR2(4000));
```

The array type CanSyncRefArrayType, which is a varray of CanSyncRefMessage objects, is predefined in the SYS schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each CanSyncRefMessage record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the SYNCREF_TABLE. However, the SYNCREF_TABLE has a statement_id field which is absent in CanSyncRefMessage because no statement_id is supplied (because it is not required) when CAN_SYNCREF_TABLE is called with a VARRAY parameter.

175.3.4 EXECUTE_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by `DBMS_SYNC_REFRESH.PREPARE_REFRESH`. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

This procedure is overloaded.

Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id    IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id_list  IN DBMS_UTILITY.NUMBER_ARRAY);
```

Parameters

Table 175-5 EXECUTE_REFRESH Procedure Parameters

Parameter	Description
<code>group_id</code>	The group ID of a sync refresh group.
<code>group_id_list</code>	An array of group IDs of the sync refresh groups to be executed for sync refresh.

Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE_REFRESH Procedure](#)" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after `DBMS_SYNC_REFRESH.EXECUTE_REFRESH`.

175.3.5 GET_ALL_GROUP_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
    RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 175-6 GET_ALL_GROUP_IDS Function Parameter

Parameter	Description
get_all_group_ids	Returns the group IDs of all the sync refresh groups in the database.

175.3.6 GET_GROUP_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 175-7 GET_GROUP_ID Function Parameter

Parameter	Description
object_name_list	The name of the materialized view. The name can be schema-qualified.

175.3.7 GET_GROUP_ID_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 175-8 GET_GROUP_ID_LIST Function Parameter

Parameter	Description
object_name_list	A comma-separated list of object names (materialized views). Each name can be schema-qualified.

175.3.8 PREPARE_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (
  group_id IN NUMBER)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

Parameters

Table 175-9 PREPARE_REFRESH Procedure Parameters

Parameter	Description
<code>group_id</code>	The group ID of the sync refresh group to be prepared for sync refresh.

Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the `EXECUTE_REFRESH`.

Before running this procedure, the user must run `PREPARE_STAGING_LOG` on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the `REGISTER_PARTITION_OPERATION`.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an `EXECUTE_REFRESH` statement. Alternatively, you can issue an `ABORT_REFRESH` operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an `ALTER SESSION` statement.

The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

175.3.9 PREPARE_STAGING_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide*.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.
- In the new values row (`DMLTYPE$$` is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to `NULL`.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN;' multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE\$\$ is 'I') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows (DMLTYPE\$\$ is 'D') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows (DMLTYPE\$\$ is 'UO' or 'UN') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    psl_mode         IN NUMBER DEFAULT
    DBMS_SYNC_REFRESH.ENFORCED);
```

Parameters

Table 175-10 PREPARE_STAGING_LOG Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema of the base table.
<code>base_table_name</code>	The name of the base table.
<code>psl_mode</code>	The mode in which staging log preparation should be done. The possible values are: <ul style="list-style-type: none"> • <code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default) • <code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code> • <code>DBMS_SYNC_REFRESH.TRUSTED</code>

175.3.10 PURGE_REFRESH_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (
    before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 175-11 PURGE_REFRESH_STATS Procedure Parameter

Parameter	Description
<code>before_timestamp</code>	Records of sync refreshes saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using <code>ALTER_REFRESH_STATS_RETENTION</code> . The default is 31 days.

175.3.11 REGISTER_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide*. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (
    mv_list IN VARCHAR2);
```

Parameter

Table 175-12 REGISTER_MVIEWS Procedure Parameter

Parameter	Description
<code>mv_list</code>	A comma-delimited list of materialized views to register. These names are optionally schema-qualified.

175.3.12 REGISTER_PARTITION_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (
    partition_op          IN VARCHAR2,
    schema_name          IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    partition_name       IN VARCHAR2,
    outside_partn_table_schema IN VARCHAR2,
    outside_partn_table_name IN VARCHAR2);
```

Parameters

Table 175-13 REGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.
outside_partn_table_schema	The name of the schema of the outside partition table (required for EXCHANGE only).
outside_partn_table_name	The name of the outside partition table (required for EXCHANGE only).

Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

175.3.13 UNREGISTER_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (
    mv_list    IN VARCHAR20;
```

Parameter

Table 175-14 UNREGISTER_MVIEWS Parameter

Parameter	Description
mv_list	A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified.

175.3.14 UNREGISTER_PARTITION_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with REGISTER_PARTITION_OPERATION on a base table. The three kinds of change operations that can be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (
    partition_op    IN VARCHAR2,
    schema_name     IN VARCHAR2,
    base_table_name IN VARCHAR2,
    partition_name  IN VARCHAR2);
```

Parameters

Table 175-15 UNREGISTER_PARTITION_OPERATION Procedure Parameters

Parameter	Description
partition_op	The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).
schema_name	The name of the schema of the base table.
base_table_name	The name of the base table.
partition_name	The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated.

DBMS_TABLE_DATA

The `DBMS_TABLE_DATA` package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table. These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the row content for row data on which the hash or user signature is computed.

This chapter contains the following topics:

- [DBMS_TABLE_DATA Overview](#)
- [DBMS_TABLE_DATA Security Model](#)
- [Summary of DBMS_TABLE_DATA Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*

176.1 DBMS_TABLE_DATA Overview

The `DBMS_TABLE_DATA` package can be used to retrieve the byte value of a single column, or a series of columns, in any table.

These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the `row content` for row data on which the hash or user signature is computed.

The procedures provide platform-neutral binary values for columns.

The procedures give you fine-grained control over the scope of a digital signature or cryptographic hash in terms of the columns you extract and the order in which you assemble the results.

176.2 DBMS_TABLE_DATA Security Model

The `DBMS_TABLE_DATA` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). The current user needs `SELECT` privileges on the table to extract column data.

176.3 Summary of DBMS_TABLE_DATA Subprograms

The DBMS_TABLE_DATA package uses GET_BYTES_FOR_COLUMN, GET_BYTES_FOR_COLUMNS, and GET_BYTES_FOR_ROW subprograms to perform various functions.

Table 176-1 DBMS_TABLE_DATA Package Subprograms

Subprogram	Description
GET_BYTES_FOR_COLUMN Procedure	Returns the <code>column_data</code> in bytes for the particular column with name <code>column_name</code> for <code>row_id</code> row in the particular table identified by <code>schema_name.table_name</code> .
GET_BYTES_FOR_COLUMNS Procedure	Returns a concatenated array of column byte values in <code>column_data</code> in the order of columns specified in the <code>column_names</code> array.
GET_BYTES_FOR_ROW Procedure	Returns a concatenated array of column byte values in <code>column_data</code> in the order of column positions for the particular row identified by <code>row_id</code> .

176.3.1 GET_BYTES_FOR_COLUMN Procedure

This procedure returns the `column_data` in bytes for the particular column with name `column_name` for `row_id` row in the particular table identified by `schema_name.table_name`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMN(
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_name      IN VARCHAR2,
  column_data      IN OUT BLOB);
```

Parameters

Table 176-2 GET_BYTES_FOR_COLUMN Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table.
<code>row_id</code>	The row id.
<code>column_name</code>	The column name.
<code>column_data</code>	The data in the column.

Usage Notes

All arguments are required.

176.3.2 GET_BYTES_FOR_COLUMNS Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of columns specified in the `column_names` array.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMNS (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_names     IN VARCHAR2,
  column_data      IN OUT BLOB);
```

Parameters

Table 176-3 GET_BYTES_FOR_COLUMNS Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table.
<code>row_id</code>	The row id.
<code>column_names</code>	The names of the columns.
<code>column_data</code>	The data in the columns.

Usage Notes

All arguments are required.

176.3.3 GET_BYTES_FOR_ROW Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of column positions for the particular row identified by `row_id`.

Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_ROW (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  row_id           IN ROWID,
  column_data      IN OUT BLOB);
```

Parameters

Table 176-4 GET_BYTES_FOR_ROW Procedure Parameters

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table.
<code>row_id</code>	The row id.
<code>column_data</code>	The data in the row.

Usage Notes

All arguments are required.

DBMS_TDB

The `DBMS_TDB` package reports whether a database can be transported between platforms using the `RMAN CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

See Also:

Oracle Database Backup and Recovery User's Guide regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- [Overview](#)
- [DBMS_TDB Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS_TDB Subprograms](#)

177.1 DBMS_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

177.2 DBMS_TDB Security Model

Use of this package requires the `DBA` privilege.

177.3 DBMS_TDB Constants

The `DBMS_TDB` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, `DBMS_TDB.SKIP_NONE`.

The `DBMS_TDB` package uses the constants shown in [Table 177-1](#).

Table 177-1 DBMS_TDB Constants

Name	Type	Value	Description
<code>SKIP_NONE</code>	NUMBER	0	Check all files when checking whether a database is ready for transport.
<code>SKIP_OFFLINE</code>	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
<code>SKIP_READONLY</code>	NUMBER	3	Skip files in read-only tablespaces when checking whether a database is ready for transport.

177.4 DBMS_TDB Views

The `DBMS_TDB` package uses the `V$DB_TRANSPORTABLE_PLATFORM` view.

This view is described in *Oracle Database Reference*.

- `V$DB_TRANSPORTABLE_PLATFORM`, which specifies which combinations of source and target platforms support database transport

177.5 DBMS_TDB Operational Notes

The following notes apply to `DBMS_TDB`.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

177.6 Summary of DBMS_TDB Subprograms

This table lists the `DBMS_TDB` subprograms and briefly describes them.

Table 177-2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function	Checks whether a database has external tables, directory or BFILES

177.6.1 CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2,
    skip_option           IN  NUMBER)
RETURN BOOLEAN;
```

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2)
RETURN BOOLEAN;
```

```
DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

Parameters

Table 177-3 CHECK_DB Function Parameters

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V\$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 177-1 .

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 177-4](#).

Table 177-4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check <code>V\$DB_TRANSPORTABLE_PLATFORM</code> for recognized platform names.
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the <code>COMPATIBLE</code> initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

177.6.2 CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL  
    RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON  
SQL> DECLARE  
    external BOOLEAN;  
    BEGIN  
        external := DBMS_TDB.CHECK_EXTERNAL;  
    END;  
    /
```

The following external tables exist in the database:

SH.SALES_TRANSACTIONS_EXT

The following directories exist in the database:

SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR

The following BFILEs exist in the database:

PM.PRINT_MEDIA

PL/SQL procedure successfully completed.

DBMS_TF

The DBMS_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

See Also:

- *Oracle Database PL/SQL Language Reference* for an overview of Polymorphic Table Function (PTF) concepts
- *Oracle Database PL/SQL Language Reference* for more information about `CREATE FUNCTION PIPELINED` clause syntax and semantics

This chapter contains the following topics:

- [DBMS_TF Overview](#)
- [DBMS_TF Security Model](#)
- [DBMS_TF Constants](#)
- [DBMS_TF Operational Notes](#)
- [DBMS_TF Execution Flow](#)
- [DBMS_TF Restrictions](#)
- [DBMS_TF Examples](#)
- [DBMS_TF Data Structures](#)
- [Summary of DBMS_TF Subprograms](#)

178.1 DBMS_TF Overview

The DBMS_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS_TF package provides these server and client interfaces utilities.

178.2 DBMS_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS_TF. Its subprograms execute with invoker's rights privileges.

178.3 DBMS_TF Constants

This topic describes useful constants defined in the DBMS_TF package.

The DBMS_TF package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, DBMS_TF.TYPE_DATE.

Table 178-1 DBMS_TF Supported Types

Name	Description
TYPE_BINARY_DOUBLE	Type code for BINARY_DOUBLE
TYPE_BINARY_FLOAT	Type code for BINARY_FLOAT
TYPE_BLOB	Type code for BLOB
TYPE_CHAR	Type code for CHAR
TYPE_CLOB	Type code for CLOB
TYPE_DATE	Type code for DATE
TYPE_INTERVAL_DS	Type code for INTERVAL_DS
TYPE_INTERVAL_YM	Type code for INTERVAL_YM
TYPE_NUMBER	Type code for NUMBER
TYPE_ROWID	Type code for ROWID
TYPE_RAW	Type code for RAW
TYPE_TIMESTAMP	Type code for TIMESTAMP
TYPE_TIMESTAMP_TZ	Type code for TIMESTAMP_TZ
TYPE_VARCHAR2	Type code for VARCHAR2

Additional constants are defined for use with specific subprograms.

See Also:

- [Table 178-3](#) for more information about CSTORE related constants
- [Table 178-4](#) for more information about predefined PTF method names
- [Table 178-6](#) for more information about XSTORE related constants
- [Supported Types Collections](#) for more information about predefined collections of supported types

178.4 DBMS_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

178.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as `NULL` values (when using bind variables for instance). During execution, the actual values are passed in.

DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

FETCH_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

Example 178-1 Noop Polymorphic Table Function Example

This example creates a PTF called `noop`. This PTF returns the input rows as the output rows without any modification or filtering. `Noop` is one of the smallest PTF you can write.

Live SQL:

You can view and run this example on Oracle Live SQL at [Noop Polymorphic Table Function](#)

To implement the `noop` PTF, you first create the implementation package `noop_package`.

```
CREATE PACKAGE noop_package AS
  FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
    RETURN DBMS_TF.DESCRIBE_T;

  PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
  FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
    RETURN DBMS_TF.DESCRIBE_T AS
  BEGIN
    RETURN NULL;
  END;

  PROCEDURE fetch_rows AS
```

```

BEGIN
    RETURN;
END;
END noop_package;

```

The noop PTF is defined to execute the noop_package when it is invoked.

```

CREATE FUNCTION noop (t TABLE)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;

```

The PTF can be invoked in queries. For example:

```

SELECT *
FROM   NOOP(emp)
WHERE  deptno = 10;

```

7782	CLARK	MANAGER	7839	09-JUN-81	2450	10
7839	KING	PRESIDENT		17-NOV-81	5000	10
7934	MILLER	CLERK	7782	23-JAN-82	1300	10

```

WITH e
    AS (SELECT *
        FROM   emp
            NATURAL JOIN dept
            WHERE  dname = 'SALES')
SELECT t.*
FROM   NOOP(e) t;

```

30	7499	ALLEN	SALESMAN	7698	20-FEB-81	1600	300
SALES		CHICAGO					
30	7521	WARD	SALESMAN	7698	22-FEB-81	1250	500

SALES		CHICAGO					

178.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

178.4.2 PTF Server Side Interface

The DBMS_TF package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

Table 178-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface

NAME	DESCRIPTION
COLUMN_METADATA_T	Column metadata record
COLUMN_T	Column descriptor record
TABLE_T	Table descriptor record
COLUMNS_T	Collection containing column names
COLUMNS_NEW_T	Collection for new columns
TAB_<typ>_T	Collection for each supported types, where <typ> is described in " Supported Types Collections "
ROW_SET_T	Data for a rowset record
GET_COL Procedure	Fetches data for a specified (input) column
PUT_COL Procedure	Returns data for a specified (new) column
GET_ROW_SET Procedure	Fetches the input rowset of column values
PUT_ROW_SET Procedure	Returns data for ALL (new) columns
SUPPORTED_TYPE Function	Verifies if a type is supported by DBMS_TF subprograms
GET_XID Function	Returns a unique execution ID to index PTF state in a session

See Also:

- [DBMS_TF Data Structures](#) for the complete list of types
- [Summary of DBMS_TF Subprograms](#) for the complete list of subprograms

178.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the `FETCH_ROWS` procedure.

The PTF indicates the read columns inside `DESCRIBE` by annotating them in the input table descriptor, `TABLE_T`. Only the indicated read columns will be fetched and thus available for processing during `FETCH_ROWS`.

The PTF invocation in a query will typically use the `COLUMNS` operator to indicate which columns the query wants the PTF to read, and this information is passed to the `DESCRIBE` function which then in turn sets the `COLUMN_T.FOR_READ` boolean flag.

Only scalar SQL data types are allowed for the read columns.

The [Echo Polymorphic Table Function Example](#) takes a table and a list of columns and produces new columns with the same values.

178.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to false. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the `DESCRIBE` function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

178.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. **Compilation State** : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. **Execution State**: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

178.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as OPEN, FETCH_ROWS and CLOSE.

CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

Name	Description
CSTORE_GET procedure	Fetches item of specified type. If not found, the OUT value remains unchanged.
CSTORE_EXISTS function	If an item with the given key exists in the CSTORE, this function returns TRUE.

CSTORE Supported Types

The DBMS_TF.DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Table 178-3 DBMS_TF CSTORE Scalar Supported Types

Name	Description
CSTORE_TYPE_VARCHAR2	CSTORE VARCHAR2 type code
CSTORE_TYPE_NUMBER	CSTORE NUMBER type code
CSTORE_TYPE_DATE	CSTORE DATE type code
CSTORE_TYPE_BOOLEAN	CSTORE BOOLEAN type code

Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767) INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE INDEX BY VARCHAR2(32767);
```

DBMS_TF Method Names

The method names are also stored in the DBMS_TF.DESCRIBE_T record. These predefined values for the method names can be customized by the PTF author.

See [Method Name Overrides](#) for more information about changing the default method names

Table 178-4 DBMS_TF Method Names Constants

Name	Type	Value	Description
CLOSE	DBMS_QUOTED_ID	'CLOSE'	Predefined index value for the method named CLOSE

Table 178-4 (Cont.) DBMS_TF Method Names Constants

Name	Type	Value	Description
FETCH_ROWS	DBMS_QUOTED_ID	'FETCH_ROWS'	Predefined index value for the method named FETCH_ROWS
OPEN	DBMS_QUOTED_ID	'OPEN'	Predefined index value for the method named OPEN

178.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

XSTORE Subprograms

The execution state management interface consists of the following subprograms.

Table 178-5 DBMS_TF XSTORE Subprograms

Name	Description
XSTORE_CLEAR procedure	Removes all key-value pairs from the XSTORE execution state
XSTORE_EXISTS function	Returns TRUE if an item with a given key exists in the XSTORE
XSTORE_GET procedure	Gets the associated value for a given key stored in the XSTORE
XSTORE_REMOVE procedure	Removes an item associated with the given key and key_type
XSTORE_SET procedure	Sets the value for the given key for PTF Execution State Management

XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

Table 178-6 DBMS_TF XSTORE Scalar Supported Types

Name	Description
XSTORE_TYPE_VARCHAR2	XSTORE VARCHAR2 type code
XSTORE_TYPE_NUMBER	XSTORE NUMBER type code

Table 178-6 (Cont.) DBMS_TF XSTORE Scalar Supported Types

Name	Description
XSTORE_TYPE_DATE	XSTORE DATE type code
XSTORE_TYPE_BOOLEAN	XSTORE BOOLEAN type code

178.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (`OPEN`, `FETCH_ROWS`, and `CLOSE`) with your PTF specific names.

To override a method name, the application can specify the new method names using `DBMS_TF.METHOD_NAMES` collection (see [DESCRIBE_T Record Type](#)).

See Also:

[Table 178-4](#)

Example 178-2 DBMS_TF Method Name Overrides

This example shows how to change the default method name of the `noop_p` PTF `fetch_rows` method to `noop_fetch`.

Live SQL:

You can view and run this example on Oracle Live SQL at [DBMS_TF Method Name Overrides](#)

Create the PTF implementation package `noop_p`.

```
CREATE PACKAGE noop_p AS
    FUNCTION describe(tab IN OUT DBMS_TF.table_t)
        RETURN DBMS_TF.describe_t;
    PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using `DBMS_TF.Method_Names` collection. The `FETCH_ROWS` method name is changed to `'Noop_Fetch'`. The procedure `noop_fetch` to implement this method is defined in the package.

```
CREATE OR replace PACKAGE BODY noop_p
AS
    FUNCTION describe(tab IN OUT DBMS_TF.table_t)
        RETURN DBMS_TF.describe_t AS
```

```

        methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows =>
'Noop_Fetch');
    BEGIN
        RETURN DBMS_TF.describe_t(method_names => methods);
    END;
    PROCEDURE noop_fetch AS
    BEGIN
        RETURN;
    END;
END noop_p;

```

The noop PTF is defined to execute the noop_p when it is invoked.

```

CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING
noop_p;

```

The PTF is invoked in the FROM clause of a query block.

```

SELECT *
FROM noop(scott.emp)
WHERE deptno =10;

```

178.4.7 Using the COLUMNS Pseudo-Operator

The `COLUMNS` pseudo-operator is an addition to the SQL expression language.

Use the `COLUMNS` pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the `FROM` clause. The `COLUMNS` pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

See Also:

Oracle Database PL/SQL Language Reference for more information about the `COLUMNS` pseudo-operator syntax and semantics

178.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a Row Semantics PTF, and the `PARTITION BY` key columns of a Table Semantics PTF can be used for projection and predicate pushdown.

Example 178-3 Query Transformations

This example illustrates the predicate and projection pushdown for a Row Semantics PTF.

This query calls the echo PTF created in [Echo Polymorphic Table Function Example](#).

```

SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))

```

```
WHERE deptno = 30
      AND echo_sal > 1000;
```

EMPNO	ENAME	SAL	COMM	ECHO_SAL
7499	ALLEN	1600	300	1600
7521	WARD	1250	500	1250
7654	MARTIN	1250	1400	1250
7698	BLAKE	2850		2850
7844	TURNER	1500	0	1500

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

178.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

Row Semantics PTF

Under `Row Semantics` PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table `emp` has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
```

Id	Operation	Name
0	SELECT STATEMENT	
1	PX COORDINATOR	
2	PX SEND QC (RANDOM)	:TQ10000
3	POLYMORPHIC TABLE FUNCTION	ECHO
6	PX BLOCK ITERATOR

```

Table Semantics PTF

Table Semantics PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

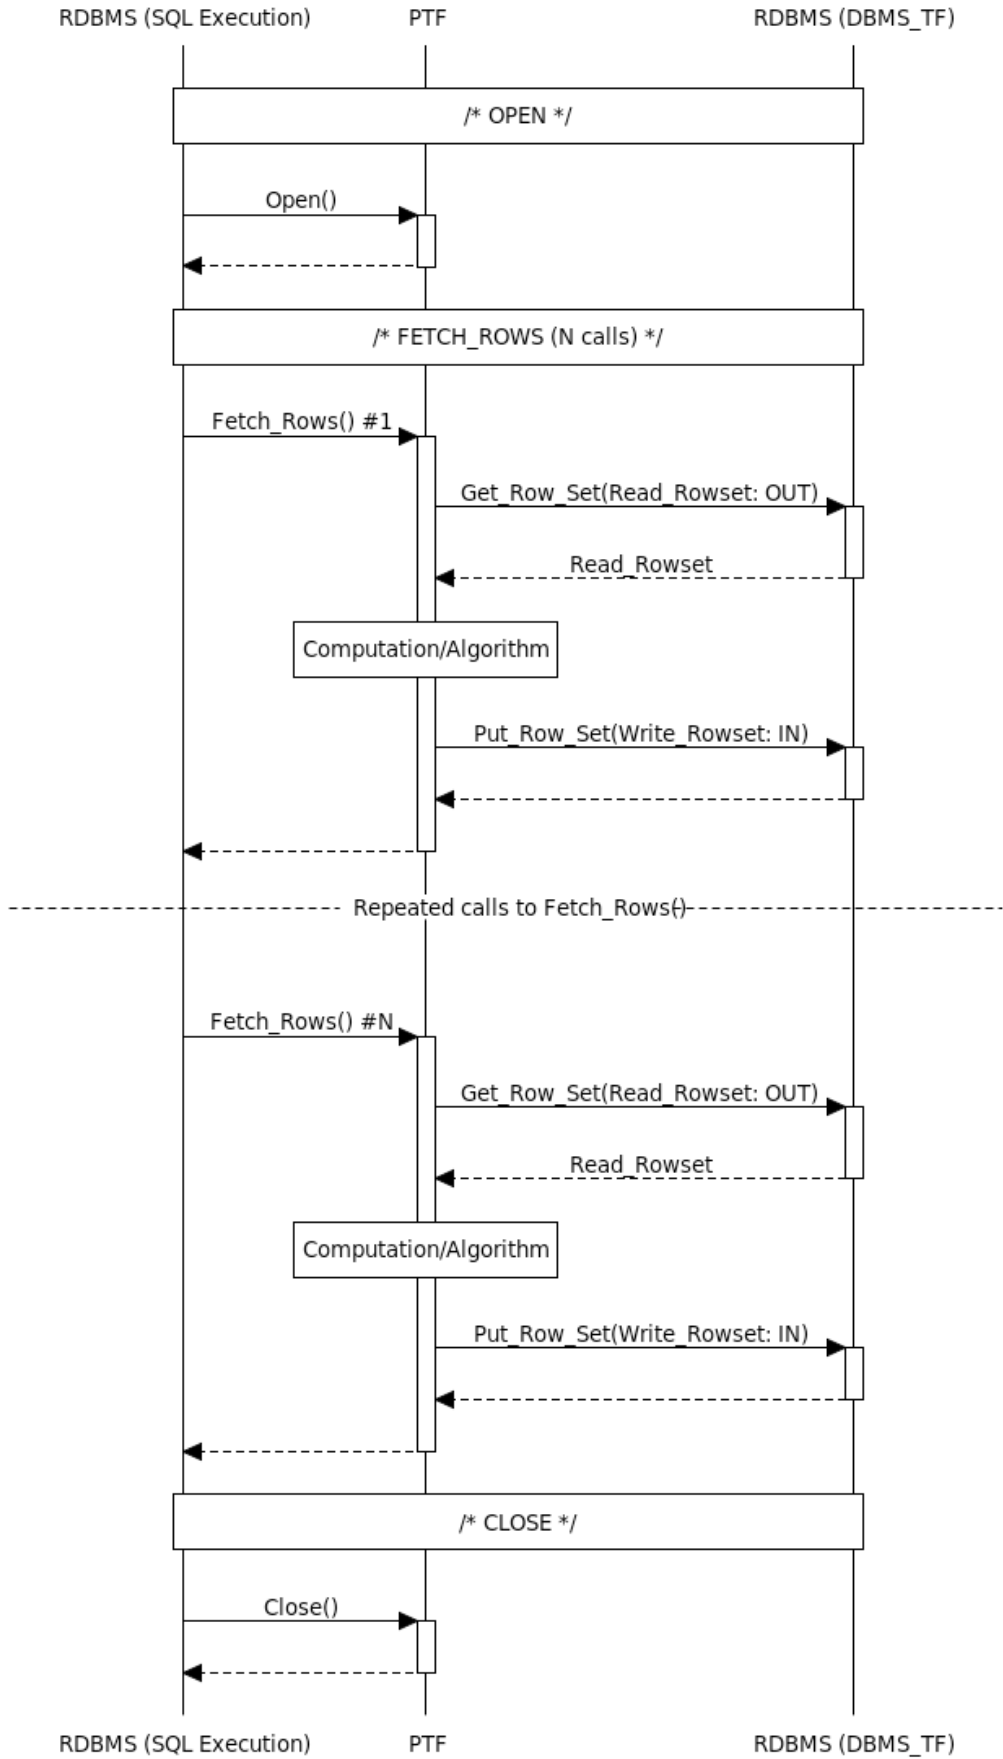

178.5 DBMS_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)

The `FETCH_ROWS` procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to `FETCH_ROWS` is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The `GET_ROW_SET` or `GET_COL` is used to read the input rowset.

The `PUT_ROW_SET` or `PUT_COL` is used to produce an output rowset, that is written back to the database.

`PUT_ROW_SET` is used to set all the new columns in a single call.

The `ROWSET_T` record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use `PUT_COL` to produce a single column. A given column can only be produced once within a call to `FETCH_ROWS`.

For a Row Semantics PTF, the `FETCH_ROWS` procedure will return the new rows using the PTF Server interface before returning back to the database.

178.6 DBMS_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the `DBMS_TF` package.

Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the `PUT_ROW_SET`, `PUT_COL`, `GET_ROW_SET` and `GET_COL` procedures. All SQL types can be used with pass-through columns. The `DESCRIBE` function can determine the supported types using the `DBMS_TF.SUPPORTED_TYPE` function.

PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the `FROM` clause of a query. Nesting PTF is only allowed using `WITH` clause.

Nesting table function with polymorphic table function is only allowed using `CURSOR` expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The `PARTITION BY` and the `ORDER BY` clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods `OPEN`, `FETCH_ROWS`, and `CLOSE` must be invoked in the polymorphic table function execution context only.

You cannot invoke the `DESCRIBE` method directly.

This example shows ten PTF nested invocation.

```
WITH t0
  AS (SELECT /*+ parallel */ *
      FROM   noop(dept)),
```

```
t1
AS (SELECT *
    FROM noop(t0)),
t2
AS (SELECT *
    FROM noop(t1)),
t3
AS (SELECT *
    FROM noop(t2)),
t4
AS (SELECT *
    FROM noop(t3)),
t5
AS (SELECT *
    FROM noop(t4)),
t6
AS (SELECT *
    FROM noop(t5)),
t7
AS (SELECT *
    FROM noop(t6)),
t8
AS (SELECT *
    FROM noop(t7)),
t9
AS (SELECT *
    FROM noop(t8))
SELECT *
FROM noop(t9)
WHERE deptno = 10;
```

10 ACCOUNTING NEW YORK

178.7 DBMS_TF Examples

These examples use DBMS_TF subprograms.

Summary of DBMS_TF Examples

These examples are incomplete and for demonstration purpose only.

- [Example 178-1](#), "Noop Polymorphic Table Function"

178.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table `tab`, and adds to it the columns listed in `cols` but with the column names prefixed with "ECHO_".

Live SQL:

You can view and run this example on Oracle Live SQL at [Echo Polymorphic Table Function](#)

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));
```

DEPTNO	DNAME	LOC	ECHO_DNAME	ECHO_LOC
10	ACCOUNTING	NEW YORK	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS	RESEARCH	DALLAS
30	SALES	CHICAGO	SALES	CHICAGO
40	OPERATIONS	BOSTON	OPERATIONS	BOSTON

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH_ROWS and CLOSE methods are optional.

- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
- PTF Function: The PTF function has a reference to the implementation package.

The echo_package package specification defines the DESCRIBE and FETCH_ROWS methods.

```
CREATE PACKAGE echo_package
AS
  prefix DBMS_ID := 'ECHO_';
  FUNCTION describe(
    tab IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T;
  PROCEDURE fetch_rows;
END echo_package;
```

The echo_package package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
  FUNCTION describe(tab IN OUT DBMS_TF.TABLE_T,
    cols IN DBMS_TF.COLUMNS_T)
  RETURN DBMS_TF.DESCRIBE_T
  AS
    new_cols DBMS_TF.COLUMNS_NEW_T;
    col_id PLS_INTEGER := 1;
  BEGIN
    FOR I IN 1 .. tab.COLUMN.COUNT LOOP
      FOR J IN 1 .. cols.COUNT LOOP
        IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
          IF ( NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) )
          THEN
            RAISE_APPLICATION_ERROR(-20102, 'Unsupported column
type [' ||
            TAB.COLUMN(i).description.TYPE||']');
          END IF;

          TAB.COLUMN(i).for_read := TRUE;
          NEW_COLS(col_id) := TAB.COLUMN(i).description;
          NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
          col_id := col_id + 1;

          EXIT;
        END IF;
      END LOOP;
    END LOOP;

    /* Verify all columns were found */
    IF ( col_id - 1 != cols.COUNT ) THEN
      RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id -
```

```

1||'], ['||cols.COUNT||']');
    END IF;

    RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
END;
PROCEDURE FETCH_ROWS
AS
    ROWSET DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
END echo_package;

```

The PTF echo references the implementation package echo_package.

```

CREATE FUNCTION echo(tab TABLE,
                    cols COLUMNS)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING echo_package;

```

Example 178-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns ECHO_ENAME, ECHO_HIREDATE, and ECHO_SAL.

```

SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;

```

EMPNO	ENAME	JOB	MGR	HIREDATE	SAL	COMM	DEPTNO	ECHO_ENAME	ECHO_HIREDATE	ECHO_SAL
7369	SMITH	CLERK	7902	17-DEC-80	800		20	SMITH	17-DEC-80	800
7566	JONES	MANAGER	7839	02-APR-81	2975		20	JONES	02-APR-81	2975
7788	SCOTT	ANALYST	7566	19-APR-87	3000		20	SCOTT	19-APR-87	3000
7876	ADAMS	CLERK	7788	23-MAY-87	1100		20	ADAMS	23-MAY-87	1100
7902	FORD	ANALYST	7566	03-DEC-81	3000		20	FORD	03-DEC-81	3000

Using subquery w, display ENAME, ECHO_LOC and DNAME columns for all employees in department 30 with a salary greater than 1000.

```

WITH w
AS (SELECT e.*,
          dname,
          loc
    FROM   scott.emp e,
          scott.dept d
    WHERE  e.deptno = d.deptno)
SELECT  ename,
        echo_loc,
        dname
FROM    echo(w, COLUMNS(sal, dname, loc, hiredate))

```

```
WHERE deptno = 30
      AND echo_sal > 1000;
```

ENAME	ECHO_LOC	DNAME
ALLEN	CHICAGO	SALES
WARD	CHICAGO	SALES
MARTIN	CHICAGO	SALES
BLAKE	CHICAGO	SALES
TURNER	CHICAGO	SALES

Using subquery w, display ENAME and DNAME columns for all employees with a salary greater than 1000.

```
WITH w
     AS (SELECT e.*,
              dname,
              loc
          FROM   scott.emp e,
              scott.dept d
          WHERE  e.deptno = d.deptno)
SELECT echo_ename,
       dname
FROM   echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE  ename IN (SELECT echo_ename
                FROM   echo(scott.emp, COLUMNS(sal, deptno, ename,
                hiredate))
                WHERE  deptno = e.echo_deptno
                AND sal > 1000);
```

ECHO_ENAME	DNAME
ALLEN	SALES
MILLER	ACCOUNTING
CLARK	ACCOUNTING
WARD	SALES
ADAMS	RESEARCH
TURNER	SALES
SCOTT	RESEARCH
BLAKE	SALES
JONES	RESEARCH
KING	ACCOUNTING
FORD	RESEARCH
MARTIN	SALES

178.8 DBMS_TF Data Structures

The DBMS_TF package defines these RECORD types, TABLE types and subtype.

RECORD Types

- [COLUMN_DATA_T Record Type](#)
- [COLUMN_METADATA_T Record Type](#)
- [COLUMN_T Record Type](#)

- [DESCRIBE_T Record Type](#)
- [ENV_T Record Type](#)
- [PARALLEL_ENV_T Record Type](#)
- [TABLE_T Record Type](#)

TABLE Types

- [Supported Types Collections \(TAB_<typ>_T\)](#)
- [COLUMNS_NEW_T Table Type](#)
- [COLUMNS_T Table Type](#)
- [COLUMNS_WITH_TYPE_T Table Type](#)
- [TABLE_COLUMNS_T Table Type](#)
- [ROW_SET_T Table Type](#)

Types

- [XID_T Subtype](#)

CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See [Collections For Compilation Storage](#) for more information.

178.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

Syntax

```

TYPE TAB_BOOLEAN_T          IS TABLE OF BOOLEAN          INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_FLOAT_T    IS TABLE OF BINARY_FLOAT    INDEX BY PLS_INTEGER;
TYPE TAB_BINARY_DOUBLE_T   IS TABLE OF BINARY_DOUBLE   INDEX BY PLS_INTEGER;
TYPE TAB_BLOB_T            IS TABLE OF BLOB             INDEX BY PLS_INTEGER;
TYPE TAB_CHAR_T            IS TABLE OF CHAR(32767)      INDEX BY PLS_INTEGER;
TYPE TAB_CLOB_T            IS TABLE OF CLOB             INDEX BY PLS_INTEGER;
TYPE TAB_DATE_T            IS TABLE OF DATE            INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_YM_T     IS TABLE OF YMINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_INTERVAL_DS_T     IS TABLE OF DSINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;
TYPE TAB_NATURALN_T        IS TABLE OF NATURALN        INDEX BY PLS_INTEGER;
TYPE TAB_NUMBER_T          IS TABLE OF NUMBER          INDEX BY PLS_INTEGER;
TYPE TAB_RAW_T             IS TABLE OF RAW(32767)      INDEX BY PLS_INTEGER;
TYPE TAB_ROWID_T           IS TABLE OF ROWID           INDEX BY PLS_INTEGER;

```

```

TYPE TAB_VARCHAR2_T      IS TABLE OF VARCHAR2(32767) INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T     IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T  IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

TYPE TAB_TIMESTAMP_LTZ_T IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY
PLS_INTEGER;

```

**See Also:**

[Table 178-1](#) for more information about the DBMS_TF supported types

178.8.2 COLUMN_DATA_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See [Table 178-1](#) for the list of supported types.

Syntax

```

TYPE COLUMN_DATA_T IS RECORD
( description          COLUMN_METADATA_T,
  tab_varchar2        TAB_VARCHAR2_T,
  tab_number           TAB_NUMBER_T,
  tab_date             TAB_DATE_T,
  tab_binary_float     TAB_BINARY_FLOAT_T,
  tab_binary_double    TAB_BINARY_DOUBLE_T,
  tab_raw              TAB_RAW_T,
  tab_char             TAB_CHAR_T,
  tab_clob             TAB_CLOB_T,
  tab_blob            TAB_BLOB_T,
  tab_timestamp        TAB_TIMESTAMP_T,
  tab_timestamp_tz     TAB_TIMESTAMP_TZ_T,
  tab_interval_ym      TAB_INTERVAL_YM_T,
  tab_interval_ds      TAB_INTERVAL_DS_T,
  tab_timestamp_ltz    TAB_TIMESTAMP_LTZ_T,
  tab_rowid            TAB_ROWID_T);

```

Fields

Table 178-7 COLUMN_DATA_T Fields

Field	Description
description	The tag defines the metadata for the column indicating which variant field is active.
tab_varchar2	Variant field

Table 178-7 (Cont.) COLUMN_DATA_T Fields

Field	Description
tab_number	Variant field
tab_date	Variant field
tab_binary_float	Variant field
tab_binary_double	Variant field
tab_raw	Variant field
tab_char	Variant field
tab_clob	Variant field
tab_blob	Variant field
tab_timestamp	Variant field
tab_timestamp_tz	Variant field
tab_interval_ym	Variant field
tab_interval_ds	Variant field
tab_timestamp_ltz	Variant field
tab_rowid	Variant field

178.8.3 COLUMN_METADATA_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

Syntax

```
TYPE COLUMN_METADATA_T IS RECORD
( type          PLS_INTEGER,
  max_len       PLS_integer DEFAULT -1,
  name          VARCHAR2(32767),
  name_len      PLS_INTEGER,
  precision     PLS_INTEGER,
  scale         PLS_INTEGER,
  charsetid     PLS_INTEGER,
  charsetform   PLS_INTEGER,
  collation     PLS_INTEGER );
```

Fields

Table 178-8 COLUMN_METADATA_T Fields

Field	Description
type	Internal Oracle typecode for the column's type
max_len	Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored.

Table 178-8 (Cont.) COLUMN_METADATA_T Fields

Field	Description
name	Name of the column
name_len	Length of the name
precision	The precision, or the maximum number of significant decimal digits (for numeric data types)
scale	Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)
charsetid	Character set id (internal Oracle code, applies to string types)
charsetform	Character set form (internal Oracle code, applies to string types)
collation	Collation id (internal Oracle code, applies to string types)

178.8.4 COLUMN_T Record Type

The column descriptor record for the type COLUMN_METADATA_T that contains PTF specific attributes.

Syntax

```
TYPE column_t IS RECORD (
    description          COLUMN_METADATA_T,
    pass_through        BOOLEAN,
    for_read             BOOLEAN);
```

Fields

Table 178-9 COLUMN_T Fields

Field	Description
description	Column metadata
pass_through	Is this a pass through column
for_read	Is this column read by the PTF

178.8.5 DESCRIBE_T Record Type

The return type from the DESCRIBE method of PTF.

Syntax

```
TYPE DESCRIBE_T          IS RECORD
( NEW_COLUMNS           COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),
  CSTORE_CHR            CSTORE_CHR_T   DEFAULT CSTORE_CHR_T(),
  CSTORE_NUM            CSTORE_NUM_T   DEFAULT CSTORE_NUM_T(),
  CSTORE_BOL            CSTORE_BOL_T   DEFAULT CSTORE_BOL_T(),
  CSTORE_DAT            CSTORE_DAT_T   DEFAULT CSTORE_DAT_T(),
  METHOD_NAMES          METHODS_T      DEFAULT METHODS_T());
```

Fields

Table 178-10 DESCRIBE_T Fields

Field	Description
NEW_COLUMNS	New columns description that will be produced by the PTF
CSTORE_CHR	CStore array key type : VARCHAR2 (optional)
CSTORE_NUM	CStore array key type : NUMBER (optional)
CSTORE_BOL	CStore array key type : BOOLEAN (optional)
CSTORE_DAT	CStore array key type : DATE (optional)
METHOD_NAMES	Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods

178.8.6 ENV_T Record Type

This record contains metadata about the polymorphic table function execution state.

Syntax

```
TYPE ENV_T IS RECORD (
  get_columns      TABLE_METADATA_T,
  put_columns      TABLE_METADATA_T,
  ref_put_col      REFERENCED_COLS_T,
  parallel_env     PARALLEL_ENV_T,
  query_optim     BOOLEAN,
  row_count        PLS_INTEGER,
  row_replication  BOOLEAN,
  row_insertion    BOOLEAN);
```

Fields

Table 178-11 ENV_T Fields

Field	Description
get_columns	Metadata about the columns read by PTF GET_COL procedure
put_columns	Metadata about columns sent back to database by PUT_COL procedure
ref_put_col	TRUE if the put column was referenced in the query
parallel_env	Parallel execution information (when a query runs in parallel)
query_optim	Is this execution for query optimization? TRUE, if the query was running on behalf of optimizer
row_count	Number of rows in current row set
row_replication	Is Row Replication Enabled?
row_insertion	Is Row Insertion Enabled?

178.8.7 PARALLEL_ENV_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

Syntax

```

TYPE PARALLEL_ENV_T          IS RECORD
( instance_id                PLS_INTEGER,
  session_id                 PLS_INTEGER,
  slave_svr_grp              PLS_INTEGER,
  slave_set_no               PLS_INTEGER,
  no_slocal_slaves           PLS_INTEGER,
  global_slave_no            PLS_INTEGER,
  no_local_slaves            PLS_INTEGER,
  local_slave_no             PLS_INTEGER );

```

Fields**Table 178-12** PARALLEL_ENV_T Fields

Field	Description
instance_id	QC instance ID
session_id	QC session ID
slave_svr_grp	Slave server group
slave_set_no	Slave server set number
no_slocal_slaves	Number of sibling slaves (including self)
global_slave_no	Global slave number (base 0)
no_local_slaves	Number of sibling slaves running on instance
local_slave_no	Local slave number (base 0)

178.8.8 TABLE_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE_T record type.

Syntax

```

TYPE TABLE_T IS RECORD(
  column                TABLE_COLUMNS_T,
  schema_name           DBMS_id,
  package_name          DBMS_id,
  ptf_name               DBMS_id);

```

Fields**Table 178-13** TABLE_T Fields

Field	Description
column	Column information
schema_name	The PTF schema name
package_name	The PTF implementation package name
ptf_name	The PTF name invoked

178.8.9 COLUMNS_NEW_T Table Type

Collection for new columns

Syntax

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

178.8.10 COLUMNS_T Table Type

Collection containing column names

Syntax

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

178.8.11 COLUMNS_WITH_TYPE_T Table Type

Collection containing columns metadata

Syntax

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

178.8.12 TABLE_COLUMNS_T Table Type

A collection of columns(COLUMN_T)

Syntax

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

178.8.13 ROW_SET_T Table Type

Data for a rowset

Syntax

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

178.8.14 XID_T Subtype

The XID_T subtype is defined to store the execution unique ID returned by function GET_XID.

Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

178.9 Summary of DBMS_TF Subprograms

This summary briefly describes the DBMS_TF package subprograms.

Table 178-14 DBMS_TF Subprograms

Subprogram	Description
COLUMN_TYPE_NAME Function	Returns the type name of the specified column type
COL_TO_CHAR Function	Returns the string representation of the specified column
CSTORE_EXISTS Function	Returns TRUE if an item with a given key exists in the PTF Compilation State management Store
CSTORE_GET Procedure	Gets item(s) of specified type from the PTF Compilation State management Store
GET_COL Procedure	Gets read column values
GET_ENV Function	Returns information about the PTF runtime environment
GET_ROW_SET Procedure	Gets read set of column values in the collection
GET_XID Function	Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state
PUT_COL Procedure	Puts column values in the database
PUT_ROW_SET Procedure	Puts the collection read set of column values in the database
ROW_REPLICATION Procedure	Sets the row replication factor
ROW_TO_CHAR Function	Returns the string representation of a row in a rowset
SUPPORTED_TYPE Function	Returns TRUE if a specified type is supported by PTF infrastructure
TRACE Procedure	Prints data structures to help development and problem diagnosis
XSTORE_CLEAR Procedure	Removes all key-value pairs from XStore
XSTORE_EXISTS Procedure	Returns TRUE if the key has an associated value
XSTORE_GET Procedure	Gets a key-value store for PTF Execution State Management
XSTORE_REMOVE Procedure	Removes any value associated with the given key
XSTORE_SET Procedure	Sets the value for the given key store for PTF Execution State Management

178.9.1 COLUMN_TYPE_NAME Function

Returns the type name for the specified column type.

Syntax

```
FUNCTION COLUMN_TYPE_NAME(
    col COLUMN_METADATA_T)
RETURN VARCHAR2;
```

Parameters

Table 178-15 DBMS_TF.COLUMN_TYPE_NAME Function Parameters

Parameter	Description
col	The column metadata. See COLUMN_METADATA_T Record Type

Return Values

Returns the column type converted as text.

Example 178-5 DBMS_TF.COLUMN_TYPE_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
    tab IN OUT DBMS_TF.table_t,
    cols IN DBMS_TF.columns_t)
RETURN DBMS_TF.describe_t
AS
    new_cols DBMS_TF.columns_new_t;
    col_id PLS_INTEGER := 1;
BEGIN
    FOR i IN 1 .. tab.count LOOP
        FOR j IN 1 .. cols.count LOOP
            IF (tab(i).description.name = cols(j)) THEN
                IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2')
THEN
                    raise_application_error(-20102,
                        'Unsupported column type [||tab(i).description.type||]');
                END IF;
                tab(i).for_read := true;
                new_cols(col_id) := tab(i).description;
                new_cols(col_id).name := 'ECHO_' || tab(i).description.name;
                col_id := col_id + 1;
                EXIT;
            END IF;
        END LOOP;
    END LOOP;

    -- Verify all columns were found
    IF (col_id - 1 != cols.count) THEN
        raise_application_error(-20101,
            'Column mismatch [||col_id-1||], [||cols.count||]');
    END IF;

    RETURN DBMS_TF.describe_t(new_columns => new_cols);
END;
```

178.9.2 COL_TO_CHAR Function

Returns the string representation of the specified column.

Syntax

```
FUNCTION COL_TO_CHAR(  
    col    COLUMN_DATA_T,  
    rid    PLS_INTEGER,  
    quote  VARCHAR2 DEFAULT ''')  
RETURN VARCHAR2;
```

Parameters

Table 178-16 DBMS_TF.COL_TO_CHAR Function Parameters

Parameter	Description
col	The column whose value is to be converted
rid	Row number
quote	Quotation mark to use for non-numeric values

Return Values

The string representation of a column data value.

Example 178-6

 DBMS_TF.COL_TO_CHAR Example

```
PROCEDURE Fetch_Rows AS  
    rowset DBMS_TF.rROW_SET_T;  
    str    VARCHAR2(32000);  
BEGIN  
    DBMS_TF.GET_ROW_SET(rowset);  
    str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)  
END;
```

178.9.3 CSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

Syntax

```
FUNCTION CSTORE_EXISTS  
    (key    IN VARCHAR2,  
    key_type IN PLS_INTEGER default NULL)  
return BOOLEAN;
```

Parameters

Table 178-17 CSTORE_EXISTS Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key (optional) Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

Example 178-7 DBMS_TF.CSTORE_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
    DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

178.9.4 CSTORE_GET Procedure

You can use the CSTORE_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the DBMS_TF.DESCRIBE function.

You can get the PTF compilation state during runtime procedures such as OPEN, FETCH_ROWS and CLOSE.

This procedure is overloaded. The DESCRIBE_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 178-3](#) for more information.

Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(
    key    IN    VARCHAR2,
    value  IN OUT VARCHAR2);
```

```
PROCEDURE CSTORE_GET(
```

```

key    IN    VARCHAR2,
value  IN OUT NUMBER);

PROCEDURE CSTORE_GET(
    key    IN    VARCHAR2,
    value  IN OUT DATE);

PROCEDURE CSTORE_GET(
    key    IN    VARCHAR2,
    value  IN OUT BOOLEAN);

```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```

PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);

PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);

```

Parameters

Table 178-18 DBMS_TF.CSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types
key_value	Key value

178.9.5 GET_COL Procedure

Get Read Column Values

Syntax

```

PROCEDURE GET_COL(
    columnId NUMBER,
    collection IN OUT NOCOPY <datatype>);

```

Where *<datatype>* can be any one of the supported types.

See [Table 178-1](#) for the list of supported types.

Parameters

Table 178-19 GET_COL Procedure Parameters

Parameter	Description
columnid	The id for the column

Table 178-19 (Cont.) GET_COL Procedure Parameters

Parameter	Description
collection	The data for the column

Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same ColumnId, GET_COL and PUT_COL may correspond to different column.

Example 178-8 DBMS_TF.GET_COL Example

This example is an excerpt of a fetch_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
  col1 DBMS_TF.TAB_CLOB_T;
  col2 DBMS_TF.TAB_CLOB_T;
  out1 DBMS_TF.TAB_CLOB_T;
  out2 DBMS_TF.TAB_CLOB_T;
BEGIN
  DBMS_TF.GET_COL(1, col1);
  DBMS_TF.GET_COL(2, col2);

  FOR I IN 1 .. col1.COUNT LOOP
    out1(i) := 'ECHO-' || col1(i);
  END LOOP;

  FOR I IN 1 .. col2.COUNT LOOP
    out2(i) := 'ECHO-' || col2(i);
  END LOOP;

  DBMS_TF.PUT_COL(1, out1);
  DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows
```

```
ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.
```

178.9.6 GET_ENV Function

Returns information about the PTF runtime environment

Syntax

```
FUNCTION GET_ENV
    RETURN ENV_T;
```

Return Values

Returns information about the PTF runtime environment.

Example 178-9 DBMS_TF.GET_ENV Example

This line shows how you could initialize a local variable `env` of type `ENV_T` with the PTF execution information in a `FETCH_ROWS` implementation procedure.

```
env          DBMS_TF.ENV_T := DBMS_TF.GET_ENV();
```

178.9.7 GET_ROW_SET Procedure

Get Read Column Values

The `FETCH_ROW` procedure can call the `GET_ROW_SET` procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

Syntax

```
PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T);

PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T,
    row_count  OUT          PLS_INTEGER);

PROCEDURE GET_ROW_SET(
    rowset      OUT NOCOPY ROW_SET_T,
    row_count  OUT          PLS_INTEGER,
    col_count  OUT          PLS_INTEGER);
```

Parameters

Table 178-20 GET_ROW_SET Procedure Parameters

Parameter	Description
<code>rowset</code>	The collection of data and metadata
<code>row_count</code>	The number of rows in the columns
<code>col_count</code>	The number of columns

Example 178-10 DBMS_TF.GET_ROW_SET Example

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
```

```

rowset      DBMS_TF.ROW_SET_T;
accumulator DBMS_TF.TAB_VARCHAR2_T;
row_count  PLS_INTEGER;

FUNCTION get_value(col  PLS_INTEGER,
                  ROW  PLS_INTEGER)
RETURN VARCHAR2
AS
    col_type PLS_INTEGER := rowset(col).description.TYPE;
BEGIN
    CASE col_type
        WHEN DBMS_TF.TYPE_VARCHAR2 THEN
            RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
        ELSE
            RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||col_type);
    END CASE;
END;

BEGIN
    DBMS_TF.GET_ROW_SET(rowset, row_count);

    IF ( rowset.count = 0 ) THEN
        RETURN;
    END IF;

    FOR row_num IN 1 .. row_count LOOP
        accumulator(row_num) := 'empty';
    END LOOP;

    FOR col_num IN 1 .. rowset.count LOOP
        FOR row_num IN 1 .. row_count LOOP
            accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
        END LOOP;
    END LOOP;
    -- Pushout the accumulator
    DBMS_TF.PUT_COL(1, accumulator);
END;

```

178.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

Example 178-11 Stack Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Stack Polymorphic Table Function](#)

Create the PTF implementation package `stack_p`.

The parameters are :

- **tab** - Input table
- **col** - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                     col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t;

    PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body `stack_p`.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                     col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t AS
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = dbms_tf.type_number) THEN
                    tab.column(i).pass_through := false;
                    tab.column(i).for_read     := true;
                END IF;
            END LOOP;
        END LOOP;

        RETURN dbms_tf.describe_t(
            new_columns => dbms_tf.columns_new_t(
                1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                               TYPE =>
dbms_tf.type_varchar2),
                2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                               TYPE =>
dbms_tf.type_number)),
            row_replication => true);
    END;

    PROCEDURE fetch_rows AS
        env      dbms_tf.env_t := dbms_tf.get_env();
        rowset   dbms_tf.row_set_t;
        colcnt   PLS_INTEGER;
        rowcnt   PLS_INTEGER;
```

```

    repfac dbms_tf.tab_naturaln_t;
    namcol dbms_tf.tab_varchar2_t;
    valcol dbms_tf.tab_number_t;
BEGIN
    dbms_tf.get_row_set(rowset, rowcnt, colcnt);

    FOR i IN 1 .. rowcnt LOOP
        repfac(i) := 0;
    END LOOP;

    FOR r IN 1 .. rowcnt LOOP
        FOR c IN 1 .. colcnt LOOP
            IF rowset(c).tab_number(r) IS NOT NULL THEN
                repfac(r) := repfac(r) + 1;
                namcol(nvl(namcol.last+1,1)) :=
                    INITCAP(regex_replace(env.get_columns(c).name, '^"|"$'));
                valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
            END IF;
        END LOOP;
    END LOOP;

    dbms_tf.row_replication(replication_factor => repfac);
    dbms_tf.put_col(1, namcol);
    dbms_tf.put_col(2, valcol);

END;

END stack_p;

```

Create the standalone PTF named `stack`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `stack_p`.

```

CREATE FUNCTION stack(tab TABLE,
                    col columns)
    RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;

```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```

SELECT deptno, ename, column_name, column_value
FROM    stack(scott.emp, COLUMNS(mgr, sal, comm))
WHERE   deptno IN (10, 30)
ORDER BY deptno, ename;

```

DEPTNO	ENAME	COLUMN_NAME	COLUMN_VALUE
10	CLARK	Mgr	7839
10	CLARK	Sal	2450
10	KING	Sal	5000
10	MILLER	Sal	1300
10	MILLER	Mgr	7782
30	ALLEN	Comm	300

30 ALLEN	Mgr	7698
30 ALLEN	Sal	1600
30 BLAKE	Mgr	7839
30 BLAKE	Sal	2850
30 JAMES	Sal	950
30 JAMES	Mgr	7698
30 MARTIN	Comm	1400
30 MARTIN	Mgr	7698
30 MARTIN	Sal	1250
30 TURNER	Comm	0
30 TURNER	Sal	1500
30 TURNER	Mgr	7698
30 WARD	Comm	500
30 WARD	Mgr	7698
30 WARD	Sal	1250

178.9.8 GET_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Syntax

```
FUNCTION GET_XID
    RETURN XID_T;
```

Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

Example 178-12 DBMS_TF.GET_XID Example

This is an excerpt of code showing an invocation of GET_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS
BEGIN
    xst(DBMS_TF.GET_XID()) := 0;
END;
```

178.9.9 PUT_COL Procedure

Put Column Values

Syntax

```
PROCEDURE PUT_COL(
    columnid NUMBER,
    collection IN <datatype>);
```

Where <datatype> can be any one of the supported types.

See [Table 178-1](#) for the list of supported types.

Parameters

Table 178-21 PUT_COL Procedure Parameters

Parameter	Description
columnid	The id for the column
collection	The data for the column

Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same columnid, GET_COL and PUT_COL may correspond to different column.

178.9.9.1 Rand_col Polymorphic Table Function Example

The rand_col PTF appends specified number of random-valued columns to the output.

Example 178-13 Rand_col Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Rand_col Polymorphic Table Function](#)

This rand_col PTF example appends col_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND_<n>"

Create the PTF implementation package rand_col_p.

The parameters are :

- tab : Input table
- col_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]
- high (optional) : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS

    FUNCTION describe(tab          IN OUT DBMS_TF.table_t,
                     col_count    NATURALN DEFAULT 1,
                     low          NUMBER   DEFAULT NULL,
                     high         NUMBER   DEFAULT NULL)
    RETURN DBMS_TF.describe_t;
```

```

PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                    low         NUMBER   DEFAULT NULL,
                    high        NUMBER   DEFAULT NULL);

END rand_col_p;

```

Create the PTF implementation package body `rand_col_p`.

The parameter `col_count` is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of `col_count` to be `NATURALN`, which has an implicit `NOT NULL` constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```

CREATE PACKAGE BODY rand_col_p AS
  col_name_prefix CONSTANT dbms_id := 'RAND_';

  FUNCTION describe(tab          IN OUT DBMS_TF.table_t,
                   col_count    NATURALN DEFAULT 1,
                   low          NUMBER   DEFAULT NULL,
                   high         NUMBER   DEFAULT NULL)
    RETURN DBMS_TF.describe_t
  AS
    cols DBMS_TF.columns_new_t;
  BEGIN
    FOR i IN 1 .. col_count LOOP
      cols(i) := DBMS_TF.column_metadata_t(name=>col_name_prefix||i,
TYPE=>DBMS_TF.type_number);
    END LOOP;

    RETURN DBMS_TF.describe_t(new_columns => cols);
  END;

  PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                      low         NUMBER   DEFAULT NULL,
                      high        NUMBER   DEFAULT NULL)
  AS
    row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;
    col       DBMS_TF.tab_number_t;
  BEGIN
    FOR c IN 1 .. col_count LOOP
      FOR i IN 1 .. row_count LOOP
        col(i) := CASE WHEN (low IS NULL OR high IS NULL)
                      THEN dbms_random.VALUE
                      ELSE dbms_random.VALUE(low,
high)
        END;
      END LOOP;
      DBMS_TF.put_col(c, col);
    END LOOP;
  END;

END rand_col_p;

```

Create the standalone `rand_col` PTF. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `rand_col_p`.

```
CREATE FUNCTION rand_col(tab TABLE,
                        col_count NATURALN DEFAULT 1,
                        low        NUMBER  DEFAULT NULL,
                        high       NUMBER  DEFAULT NULL)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING rand_col_p;
```

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with one produced `RAND_1` column.

```
SELECT *
FROM rand_col(scott.dept);
```

DEPTNO	DNAME	LOC	RAND_1
10	ACCOUNTING	NEW YORK	.738666262
20	RESEARCH	DALLAS	.093256312
30	SALES	CHICAGO	.992944835
40	OPERATIONS	BOSTON	.397948124

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with two produced `RAND_1` and `RAND_2` columns.

```
SELECT *
FROM rand_col(scott.dept, col_count => 2);
```

DEPTNO	DNAME	LOC	RAND_1	RAND_2
10	ACCOUNTING	NEW YORK	.976521361	.209802028

178.9.10 PUT_ROW_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the `ROW_REPLICATION` procedure to set the replication factor.

Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(
    rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
PROCEDURE PUT_ROW_SET(
    rowset          IN  ROW_SET_T,
    replication_factor IN NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(
    rowset          IN  ROW_SET_T,
    replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 178-22 PUT_ROW_SET Procedure Parameters

Parameter	Description
rowset	The collection of data and metadata
replication_factor	The replication factor per row

Example 178-14

DBMS_TF.PUT_ROW_SET Example
This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);
END;
```

178.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

Example 178-15 Split Polymorphic Table Function Example

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

Live SQL:

You can view and run this example on Oracle Live SQL at [Split Polymorphic Table Function](#)

Create the PTF implementation package split_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.table_t,
                     col      DBMS_TF.columns_t,
                     cnt      NATURALN)
        RETURN DBMS_TF.describe_t;

    PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.Table_t,
                     col      DBMS_TF.Columns_t,
                     cnt      NATURALN)
        RETURN DBMS_TF.describe_t
    AS
        new_cols DBMS_TF.columns_new_t;
        col_id   PLS_INTEGER := 1;
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
                    tab.column(i).pass_through := FALSE;
                END IF;
            END LOOP;
        END LOOP;
        new_cols := tab.column;
        col_id := col_id + 1;
    END describe;

    PROCEDURE fetch_rows(cnt NATURALN)
    AS
        row DBMS_TF.table_t;
    BEGIN
        row := tab;
        row := row / cnt;
    END fetch_rows;

END split_p;
```

```

        tab.column(i).for_read      := TRUE;
        new_cols(col_id) := tab.column(i).description;
        col_id := col_id + 1;
    END IF;
END LOOP;
END LOOP;

RETURN DBMS_TF.describe_t(new_columns=>new_cols,
row_replication=>true);
END;
PROCEDURE fetch_rows(cnt NATURALN)
AS
    inp_rs DBMS_TF.row_set_t;
    out_rs DBMS_TF.row_set_t;
    rows   PLS_INTEGER;
BEGIN
    DBMS_TF.get_row_set(inp_rs, rows);

    FOR c IN 1 .. inp_rs.count() LOOP
        FOR r IN 1 .. rows LOOP
            FOR i IN 1 .. cnt LOOP
                out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/
cnt;
            END LOOP;
        END LOOP;
    END LOOP;

    DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
END;

END split_p;

```

Create the standalone PTF named `split`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `split_p`.

```

CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;

```

For all employees in department 30, display the `ENAME`, `SAL`, and `COMM` columns. Invoke the `split` PTF with the `COLUMNS` pseudo-operator to divide the value of `SAL` and `COMM` by 2 for each replicated row returned by the query. Each row is replicated twice.

```

SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;

```

ENAME	SAL	COMM
ALLEN	800	150
ALLEN	800	150
WARD	625	250
WARD	625	250

MARTIN	625	700
MARTIN	625	700
BLAKE	1425	
BLAKE	1425	
TURNER	750	0
TURNER	750	0
JAMES	475	
JAMES	475	

178.9.11 ROW_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A `Row Semantics` polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(
    replication_factor IN TAB_NATURALN_T);
```

Parameters

Table 178-23 ROW_REPLICATION Procedure Parameters

Parameter	Description
<code>replication_factor</code>	The replication factor per row

Example 178-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the `replication_factor` that is given as a parameter.

Live SQL:

You can view and run this example on Oracle Live SQL at [Replicate Polymorphic Table Function](#)

Create the PTF implementation package `replicate_p`.

```
CREATE PACKAGE replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,
        replication_factor NATURAL)
        RETURN DBMS_TF.describe_t;
```

```

PROCEDURE Fetch_Rows(replication_factor NATURALN);

END replicate_p;

```

Create the PTF implementation package body replicate_p. The PTF replicates each input row by the replication_factor that is given as a parameter.

```

CREATE PACKAGE body replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
                     , replication_factor NATURAL)
        RETURN DBMS_TF.describe_t AS
    BEGIN
        RETURN DBMS_TF.describe_t(row_replication => True);
    END;

    PROCEDURE Fetch_Rows(replication_factor NATURALN)
    AS
    BEGIN
        DBMS_TF.ROW_REPLICATION(replication_factor);
    END;
END replicate_p;

```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate_p.

```

CREATE FUNCTION replicate(tab TABLE,
                         replication_factor NATURAL)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;

```

This example sets the replication_factor to 2 which results in doubling the number of rows.

```

SELECT *
FROM replicate(dept, replication_factor => 2);

```

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
20	RESEARCH	DALLAS
30	SALES	CHICAGO
30	SALES	CHICAGO
40	OPERATIONS	BOSTON
40	OPERATIONS	BOSTON

This example sets the `replication_factor` to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);
```

no rows selected

Count the number of employees in each department. Invoke the replicate PTF to report from the `SCOTT.EMP` table to set the `replication_factor` to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;
```

```
DEPTNO  COUNT(*)
-----  -
        30  6000000
        10  3000000
        20  5000000
```

This sets the `replication_factor` to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);
```

```
COUNT(*)
-----
1000000000
```

178.9.12 ROW_TO_CHAR Function

The `ROW_TO_CHAR` function converts a row data value to a string representation.

Syntax

```
FUNCTION ROW_TO_CHAR(
    rowset ROW_SET_T,
    rid    PLS_INTEGER,
    format PLS_INTEGER DEFAULT FORMAT_JSON)
RETURN VARCHAR2;
```

Parameters

Table 178-24 DBMS_TF.ROW_TO_CHAR Function Parameters

Parameter	Description
<code>rowset</code>	The rowset whose value is to be converted
<code>rid</code>	Row number
<code>format</code>	The string format (default is <code>FORMAT_JSON</code>)

Usage Notes

Only the JSON format is supported.

Return Values

The string representation in JSON format.

Example 178-17 DBMS_TF.ROW_TO_CHAR Example

```

PROCEDURE Fetch_Rows as
  rowset DBMS_TF.ROW_SET_T;
  str    VARCHAR2(32000);
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;

```

178.9.13 SUPPORTED_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

Syntax

```

FUNCTION SUPPORTED_TYPE(
  type_id PLS_INTEGER)
RETURN BOOLEAN;

```

Parameters

Table 178-25 DBMS_TF.SUPPORTED_TYPE Function Parameters

Parameter	Description
type_id	The type

Return Values

Returns TRUE if the type_id is a scalar supported by PUT_COL and GET_COL.

See Also:

[Echo Polymorphic Table Function Example](#) for an example of DBMS_TF.SUPPORTED_TYPE use.

178.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

Syntax

```

PROCEDURE TRACE(
  msg          VARCHAR2,
  with_id      BOOLEAN   DEFAULT FALSE,
  separator    VARCHAR2  DEFAULT NULL,
  prefix       VARCHAR2  DEFAULT NULL);

```

```

PROCEDURE TRACE(
    rowset      IN ROW_SET_T);

PROCEDURE TRACE(
    env         IN ENV_T);

PROCEDURE TRACE(
    columns_new IN COLUMNS_NEW_T);

PROCEDURE trace(
    cols        IN COLUMNS_T);

PROCEDURE trace(
    columns_with_type IN COLUMNS_WITH_TYPE_T);

PROCEDURE trace(
    tab         IN TABLE_T);

PROCEDURE trace(
    col         IN COLUMN_METADATA_T);

```

Parameters

Table 178-26 TRACE Procedure Parameters

Parameter	Description
msg	Custom user tracing message
with_id	Include the unique execution ID in the trace?
separator	Specify a string to use to separate values
prefix	Specify a string to prefix the actual values
rowset	Data for a rowset
env	Metadata about the polymorphic table function execution state
columns_new	Collection for new columns
cols	Collection containing column names
columns_with_type	Collection containing columns metadata
tab	Table descriptor
col	Metadata about an existing table column or a new column produced

Example 178-18 DBMS_TF.TRACE Example

This example adds tracing to a fetch_rows procedure.

```

PROCEDURE fetch_rows
AS
    rowset DBMS_TF.ROW_SET_T;
BEGIN
    DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);
    DBMS_TF.TRACE(rowset);
    DBMS_TF.GET_ROW_SET(rowset);
    DBMS_TF.TRACE(rowset);
    DBMS_TF.PUT_ROW_SET(rowset);

```

```
DBMS_TF.TRACE(DBMS_TF.GET_ENV);
END;
```

178.9.15 XSTORE_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

Syntax

```
PROCEDURE XSTORE_CLEAR;
```

178.9.16 XSTORE_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

Syntax

```
FUNCTION XSTORE_EXISTS(
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 178-27 DBMS_TF.XSTORE_EXISTS Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key (optional). Default : NULL

Return Values

Returns TRUE if the key has an associated value. When the key_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

See Also:

[Table 178-6](#) for more information about supported key types.

178.9.17 XSTORE_GET Procedure

You can use the XSTORE_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 178-6](#) for more information about supported key types.

Syntax

```
PROCEDURE XSTORE_GET (
  key   IN VARCHAR2,
  value IN OUT VARCHAR2);
```

```
PROCEDURE XSTORE_GET (
  key   IN VARCHAR2,
  value IN OUT NUMBER);
```

```
PROCEDURE XSTORE_GET (
  key   IN VARCHAR2,
  value IN OUT DATE);
```

```
PROCEDURE XSTORE_GET (
  key   IN VARCHAR2,
  value IN OUT BOOLEAN);
```

Parameters

Table 178-28 DBMS_TF.XSTORE_GET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If the key is not found, the value is unchanged.

178.9.17.1 Row_num Polymorphic Table Function Example

The row_num PTF example appends a sequence column to a table.

Example 178-19 Row_num Polymorphic Table Function Example

Live SQL:

You can view and run this example on Oracle Live SQL at [Row_num Polymorphic Table Function](#)

Create the PTF implementation package row_num_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)

- `inc` - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                   ini NUMBER DEFAULT 1,
                   inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);
END;
```

This PTF accepts any input table and appends the sequence column `ROW_ID` to the table. The sequence values start with the specified value (`ini`) and each time it is incremented by the specified value (`inc`).

```
CREATE PACKAGE BODY row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                   ini NUMBER DEFAULT 1,
                   inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t AS
  BEGIN
    RETURN dbms_tf.describe_t(new_columns =>
                             dbms_tf.columns_new_t(1 =>
                                                     dbms_tf.column_metadata_t(name => 'ROW_ID',
                                                                                   TYPE =>
dbms_tf.type_number)));
  END;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
    row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
    rid      NUMBER              := ini;
    col      dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.xstore_get('rid', rid);
    FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
    dbms_tf.put_col(1, col);
    dbms_tf.xstore_set('rid', rid + inc*row_cnt);
  END;
END;
```

Create a standalone polymorphic table function named `row_num`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is `row_num_p`.

```
CREATE FUNCTION row_num(tab TABLE,
                       ini NUMBER DEFAULT 1,
                       inc NUMBER DEFAULT 1)
  RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);
```

DEPTNO	DNAME	LOC	ROW_ID
10	ACCOUNTING	NEW YORK	1
20	RESEARCH	DALLAS	2
30	SALES	CHICAGO	3
40	OPERATIONS	BOSTON	4

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);
```

DEPTNO	DNAME	LOC	ROW_ID
10	ACCOUNTING	NEW YORK	100
20	RESEARCH	DALLAS	101
30	SALES	CHICAGO	102
40	OPERATIONS	BOSTON	103

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);
```

DEPTNO	DNAME	LOC	ROW_ID
10	ACCOUNTING	NEW YORK	0
20	RESEARCH	DALLAS	-1
30	SALES	CHICAGO	-2
40	OPERATIONS	BOSTON	-3

The `row_num` PTF invocation reporting from the `SCOTT.EMP` table produces a new column `ROW_ID` with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
   FROM row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc
=> 0.25)
 WHERE deptno IN (10, 30);
```

DEPTNO	ENAME	JOB	SAL	ROW_ID
10	CLARK	MANAGER	2450	0
10	KING	PRESIDENT	5000	.25
10	MILLER	CLERK	1300	.5
30	ALLEN	SALESMAN	1600	0
30	BLAKE	MANAGER	2850	.25
30	JAMES	CLERK	950	.5
30	MARTIN	SALESMAN	1250	.75

```

30 TURNER      SALESMAN      1500      1
30 WARD        SALESMAN      1250      1.25

```

178.9.18 XSTORE_REMOVE Procedure

Removes an item associated with the given key and key_type.

Syntax

```

PROCEDURE XSTORE_REMOVE (
    key      IN VARCHAR2,
    key_type IN PLS_INTEGER DEFAULT NULL);

```

Parameters

Table 178-29 DBMS_TF.XSTORE_REMOVE Function Parameters

Parameter	Description
key	A unique character key
key_type	The type of key to remove (optional)

Usage Notes

When a key_type parameter value is passed, it removes the associated item for the key and specified type of key.

178.9.19 XSTORE_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store an item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

Syntax

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN VARCHAR2);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN NUMBER);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN DATE);

```

```

PROCEDURE XSTORE_SET (
    key   IN VARCHAR2,
    value IN BOOLEAN);

```

Parameters

Table 178-30 DBMS_TF.XSTORE_SET Procedure Parameters

Parameter	Description
key	A unique character key
value	Value corresponding to the key for supported types

Usage Notes

If an item for a given key already exists, the value is replaced.

DBMS_TNS

The `DBMS_TNS` package provides the `RESOLVE_TNSNAME` function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- [DBMS_TNS Overview](#)
- [DBMS_TNS Security Model](#)
- [Summary of DBMS_TNS Subprograms](#)

179.1 DBMS_TNS Overview

The `DBMS_TNS` package contains one function, `RESOLVE_TNSNAME`, which returns the resolved connect string from configured sources that have been defined in the `names.directory_path` parameter in the `sqlnet.ora` file.

The `RESOLVE_TNSNAME` function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

See Also:

- *Oracle Database Administrator's Guide* for more information about finding database link information
- *Oracle Database Reference* for information about the `ALL_DB_LINKS` data dictionary view

179.2 DBMS_TNS Security Model

You must be granted the `EXECUTE` privilege on the `DBMS_TNS` package.

179.3 Summary of DBMS_TNS Subprograms

This table lists the `DBMS_TNS` subprograms and briefly describes them.

Table 179-1 DBMS_TNS Parameters

Subprogram	Description
RESOLVE_TNSNAME Function	Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the <code>sqlnet.ora</code> <code>names.directory_path</code> parameter)

179.3.1 RESOLVE_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora` `names.directory_path` parameter.

Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (
    tns_name VARCHAR2)
RETURN VARCHAR2;
```

RESOLVE_TNSNAME Function Parameters

Parameter	Description
<code>tns_name</code>	Database address for establishing the connection

Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;

DB_LINK
-----
-----
DBMS_TNS.RESOLVE_TNSNAME(HOST)
-----
-----
US.EXAMPLE.COM
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=may))
(CONNECT_DATA=(SERVICE_NAME=us.example.com)(CID=(PROGRAM=oracle)
(HOST=juno)(USER=psmith)
))
```

180

DBMS_TRACE

The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)
- [Summary of DBMS_TRACE Subprograms](#)

180.1 DBMS_TRACE Overview

`DBMS_TRACE` provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.
Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (`DBMS_TRACE.SET_PLSQL_TRACE`).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (`DBMS_TRACE.CLEAR_PLSQL_TRACE`).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

180.2 DBMS_TRACE Security Model

This package must be created under `SYS`.

180.3 DBMS_TRACE Constants

`DBMS_TRACE` defines constants to use when specifying parameter values.

These constants are shown in the following table.

Table 180-1 DBMS_TRACE Event Constants

Name	Type	Value	Description
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> • PL/SQL Trace Tool started • Trace flags changed • PL/SQL Virtual Machine started • PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Table 180-2 DBMS_TRACE Version Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	

Oracle recommends using the symbolic form for all these constants.

180.4 DBMS_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

180.5 DBMS_TRACE Operational Notes

Certain operational notes apply to `DBMS_TRACE`.

These are described in the following sections:

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

Note:

You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the `DBMS_TRACE` package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by `SYS`.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMS_PBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

 **Note:**

For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level n changes the record limit to $1024 * n$.

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

180.6 Summary of DBMS_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

Table 180-3 DBMS_TRACE Package Subprograms

Subprogram	Description
<code>CLEAR_PLSQL_TRACE</code> Procedure	Stops trace data dumping in session
<code>GET_PLSQL_TRACE_LEVEL</code> Function	Gets the trace level

Table 180-3 (Cont.) DBMS_TRACE Package Subprograms

Subprogram	Description
PLSQL_TRACE_VERSION Procedure	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure	Starts tracing in the current session

180.6.1 CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

180.6.2 GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS_TRACE constants.

See [Table 180-1](#) for a list of the constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL  
RETURN BINARY_INTEGER;
```

180.6.3 PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
  major OUT BINARY_INTEGER,  
  minor OUT BINARY_INTEGER);
```

Parameters

Table 180-4 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

180.6.4 SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (  
    trace_level INTEGER);
```

Parameters

Table 180-5 *SET_PLSQL_TRACE Procedure Parameters*

Parameter	Description
trace_level	You must supply one or more of the constants as listed in Table 180-1 . By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants. Also see DBMS_TRACE Operational Notes: Collecting Trace Data for more information.

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

See Also:

Oracle Database SQL Language Reference

This chapter contains the following topics:

- [DBMS_TRANSACTION Security Model](#)
- [Summary of DBMS_TRANSACTION Subprograms](#)

181.1 DBMS_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

181.2 Summary of DBMS_TRANSACTION Subprograms

This table lists the DBMS_TRANSACTION subprograms and briefly describes them.

Table 181-1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure	Equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT
ADVISE_NOthing Procedure	Equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING
ADVISE_ROLLBACK Procedure	Equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK
COMMIT Procedure	Equivalent to the SQL statement: COMMIT
COMMIT_COMMENT Procedure	Equivalent to the SQL statement: COMMIT COMMENT <text>
COMMIT_FORCE Procedure	Equivalent to the SQL statement: COMMIT FORCE <text>, <number>"
LOCAL_TRANSACTION_ID Function	Returns the local (to instance) unique identifier for the current transaction

Table 181-1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
PURGE_LOST_DB_ENTRY Procedure	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure	Equivalent to the SQL statement: SET TRANSACTION READ ONLY
READ_WRITE Procedure	equivalent to the SQL statement: SET TRANSACTION READ WRITE
ROLLBACK Procedure	Equivalent to the SQL statement: ROLLBACK
ROLLBACK_FORCE Procedure	Equivalent to the SQL statement: ROLLBACK FORCE <text>
ROLLBACK_SAVEPOINT Procedure	Equivalent to the SQL statement: ROLLBACK TO SAVEPOINT <savepoint_name>
SAVEPOINT Procedure	Equivalent to the SQL statement: SAVEPOINT <savepoint_name>
STEP_ID Function	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction
USE_ROLLBACK_SEGMENT Procedure	Equivalent to the SQL statement: SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>

181.2.1 ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

181.2.2 ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

181.2.3 ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

181.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: COMMIT

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

181.2.5 COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement: COMMIT COMMENT <text>

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (  
    cmnt VARCHAR2);
```

Parameters

Table 181-2 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

181.2.6 COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement: COMMIT FORCE <text>, <number>

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (  
    xid VARCHAR2,  
    scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 181-3 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.

Table 181-3 (Cont.) COMMIT_FORCE Procedure Parameters

Parameter	Description
scn	System change number.

181.2.7 LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
    create_transaction BOOLEAN := FALSE)
RETURN VARCHAR2;
```

Parameters

Table 181-4 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
create_transaction	If true, then start a transaction if one is not currently active.

181.2.8 PURGE_LOST_DB_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
    xid VARCHAR2);
```

Parameters

Table 181-5 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
xid	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

Usage Notes

⚠ WARNING:

PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 181-6 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

 **Note:**

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

 **Note:**

Examine and take any manual action to remove inconsistencies; then use the procedure `PURGE_MIXED`.

181.2.9 PURGE_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
    xid VARCHAR2);
```

Parameters

Table 181-7 PURGE_MIXED Procedure Parameters

Parameter	Description
<code>xid</code>	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

181.2.10 READ_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

181.2.11 READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

181.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

181.2.13 ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
    xid VARCHAR2);
```

Parameters

Table 181-8 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.

181.2.14 ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 181-9 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

181.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 181-10 SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

181.2.16 STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID  
    RETURN NUMBER;
```

181.2.17 USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (  
    rb_name VARCHAR2);
```

Parameters

Table 181-11 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
rb_name	Name of rollback segment to use.

DBMS_TRANSFORM

The `DBMS_TRANSFORM` package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- [Summary of DBMS_TRANSFORM Subprograms](#)

See Also:

Oracle Database Advanced Queuing User's Guide for more on message format transformations.

182.1 Summary of DBMS_TRANSFORM Subprograms

This table lists the `DBMS_TRANSFORM` subprograms and briefly describes them.

Table 182-1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_TRANSFORMATION Procedure	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_TRANSFORMATION Procedure	Drops the given transformation
MODIFY_TRANSFORMATION Procedure	Modifies an existing transformation

182.1.1 CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
  schema          VARCHAR2 (30),
  name            VARCHAR2 (30),
  from_schema     VARCHAR2 (30),
  from_type       VARCHAR2 (30),
  to_schema       VARCHAR2 (30),
  to_type         VARCHAR2 (30),
  transformation   VARCHAR2 (4000));
```

Parameters

Table 182-2 CREATE_TRANSFORM Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using <code>MODIFY_TRANSFORM</code> .

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on `DBMS_TRANSFORM`. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

182.1.2 DROP_TRANSFORM Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORM (
    schema VARCHAR2(30),
```

```
name          VARCHAR2(30);
```

Parameters

Table 182-3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

182.1.3 MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
  schema          VARCHAR2(30),
  name            VARCHAR2(30),
  attribute_number INTEGER,
  transformation   VARCHAR2(4000));
```

Parameters

Table 182-4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

DBMS_TSDP_MANAGE

The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

`DBMS_TSDP_MANAGE` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_TSDP_MANAGE Subprograms](#)

Related Topics

- [DBMS_TSDP_PROTECT](#)
The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

See Also:

Oracle Database Security Guide

183.1 DBMS_TSDP_MANAGE Overview

The `DBMS_TSDP_MANAGE` package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the [DBMS_TSDP_PROTECT](#) package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

183.2 DBMS_TSDP_MANAGE Security Model

All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by `SYS`.

The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the `DBMS_TSDP_PROTECT` package would be governed by a security administrator.

183.3 Summary of DBMS_TSDP_MANAGE Subprograms

This table lists the `DBMS_TSDP_MANAGE` subprograms and briefly describes them.

Table 183-1 DBMS_TSDP_MANAGE Package Subprograms

Subprogram	Description
<code>ADD_SENSITIVE_COLUMN Procedure</code>	Adds a column to the sensitive column list
<code>ADD_SENSITIVE_TYPE Procedure</code>	Creates and adds a sensitive column type to the list of sensitive column types in the database
<code>ALTER_SENSITIVE_COLUMN Procedure</code>	Alters the sensitive type and/or the comment of a column in the sensitive column list.
<code>DROP_SENSITIVE_COLUMN Procedure</code>	Removes columns from the sensitive column list
<code>DROP_SENSITIVE_TYPE Procedure</code>	Drops a sensitive column type from the list sensitive column types in the database
<code>DROP_SENSITIVE_TYPE_SOURCE Procedure</code>	Drops sensitive column types corresponding to a source from the list sensitive column types in the database
<code>IMPORT_DISCOVERY_RESULT Procedure</code>	Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance
<code>IMPORT_SENSITIVE_TYPES Procedure</code>	Imports a list of sensitive column types from a source
<code>REMOVE_DISCOVERY_RESULT Procedure</code>	Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

183.3.1 ADD_SENSITIVE_COLUMN Procedure

This procedure adds a column to the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  column_name      IN VARCHAR2,
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-2 *ADD_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL',
  sensitive_type   => 'SALARY_TYPE',
  user_comment     => 'Salary column');
```

183.3.2 ALTER_SENSITIVE_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  column_name      IN VARCHAR2,
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-3 *ALTER_SENSITIVE_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column
column_name	Sensitive column name
sensitive_type	Identifier of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL',
  sensitive_type   => 'FINANCE_Type',
  user_comment     => 'Finance Type. Earlier categorized as Salary Type');
```

183.3.3 ADD_SENSITIVE_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type   IN VARCHAR2,
  user_comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 183-4 ADD_SENSITIVE_TYPE Procedure Parameters

Parameter	Description
sensitive_type	Name of the sensitive column type
user_comment	User comment regarding the sensitive column

Examples

Add a sensitive column type called SALARY_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (
  sensitive_type   => 'SALARY_TYPE',
  user_comment     => 'Salary data');
```

183.3.4 DROP_SENSITIVE_COLUMN Procedure

This procedure removes columns from the sensitive column list.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%');
```

Parameters

Table 183-5 DROP_SENSITIVE_COLUMN Procedure Parameters

Parameter	Description
schema_name	Schema to which the column belongs
table_name	Table containing the column

Table 183-5 (Cont.) DROP_SENSITIVE_COLUMN Procedure Parameters

Parameter	Description
column_name	Sensitive column name

Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name => 'SCOTT',
  table_name  => 'EMP',
  column_name => 'SAL');
```

183.3.5 DROP_SENSITIVE_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type IN VARCHAR2);
```

Parameters**Table 183-6 DROP_SENSITIVE_TYPE Procedure Parameters**

Parameter	Description
sensitive_type	Name of the sensitive column type to be dropped

Examples

To drop SALARY_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type => 'SALARY_TYPE');
```

183.3.6 DROP_SENSITIVE_TYPE_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
  source IN VARCHAR2);
```

Parameters

Table 183-7 *DROP_SENSITIVE_TYPE_SOURCE Procedure Parameters*

Parameter	Description
source	Name of the source

Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
    source      => 'ADM_DEMO');
```

183.3.7 IMPORT_DISCOVERY_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_result      IN CLOB,
    discovery_source      IN VARCHAR2,
    force                 IN FORCE DEFAULT FALSE);

DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_result      IN XMLTYPE,
    discovery_source      IN VARCHAR2,
    force                 IN FORCE DEFAULT FALSE);
```

Parameters

Table 183-8 *IMPORT_DISCOVERY_RESULT Procedure Parameters*

Parameter	Description
discovery_result	List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).
discovery_source	Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.

Table 183-8 (Cont.) IMPORT_DISCOVERY_RESULT Procedure Parameters

Parameter	Description
force	<p>Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source.</p> <ul style="list-style-type: none"> FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported. TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result

Examples

Import the list of sensitive columns of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (
    discovery_results => xml_adm_result,
    discovery_source => 'ADM_Demo');
```

183.3.8 IMPORT_SENSITIVE_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types IN CLOB,
    source          IN VARCHAR2);
```

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types IN XMLTYPE,
    source          IN VARCHAR2);
```

Parameters

Table 183-9 IMPORT_SENSITIVE_TYPES Procedure Parameters

Parameter	Description
sensitive_types	List of sensitive column types in XML Format (possibly as a CLOB)
source	Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name.

Examples

Import the list of sensitive column types of ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types => xml_adm_result,
    source          => 'ADM_Demo');
```

183.3.9 REMOVE_DISCOVERY_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (  
    discovery_source    IN VARCHAR2);
```

Parameters

Table 183-10 REMOVE_DISCOVERY_RESULT Procedure Parameters

Parameter	Description
discovery_source	Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed.

Examples

Remove the sensitive columns corresponding to ADM instance, ADM_Demo:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (  
    discovery_source    => 'ADM_Demo');
```

DBMS_TSDP_PROTECT

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS_TSDP_PROTECT Subprograms](#)

Related Topics

- [DBMS_TSDP_MANAGE](#)
The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

See Also:

Oracle Database Security Guide

184.1 DBMS_TSDP_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the `DBMS_TSDP_MANAGE` package.

184.2 DBMS_TSDP_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

184.3 DBMS_TSDP_PROTECT Constants

DBMS_TSDP_PROTECT defines the TSDP_PARAM_MAX constant for use when specifying parameter values.

This constant is described in the following table.

Table 184-1 DBMS_TSDP_PROTECT Constants - Compression Types

Constant	Type	Value	Description
TSDP_PARAM_MAX	INTEGER	4000	Maximum length of the parameter value that can be specified in FEATURE_OPTIONS

184.4 DBMS_TSDP_PROTECT Data Structures

The DBMS_TSDP_PROTECT package defines two TABLE types.

Table Types

- [FEATURE_OPTIONS Table Type](#)
- [POLICY_CONDITIONS Table Type](#)

184.4.1 FEATURE_OPTIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP_PARAM_MAX) that is indexed by VARCHAR2 (M_IDEN).

Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY VARCHAR2 (M_IDEN);
```

184.4.2 POLICY_CONDITIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP_PARAM_MAX) that is indexed by PLS_INTEGER.

Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

184.5 Summary of DBMS_TSDP_PROTECT Subprograms

This table lists the DBMS_TSDP_PROTECT subprograms and briefly describes them.

Table 184-2 DBMS_TSDP_PROTECT Package Subprograms

Subprogram	Description
ADD_POLICY Procedure	Creates a TSDP policy
ALTER_POLICY Procedure	Alters a TSDP policy
ASSOCIATE_POLICY Procedure	Associates or disassociates a TSDP policy with a sensitive column type
DISABLE_PROTECTION_COLUMN Procedure	Disables protection for columns
DISABLE_PROTECTION_SOURCE Procedure	Disables protection based on the source of truth for the sensitive columns
DISABLE_PROTECTION_TYPE Procedure	Disables protection for a sensitive column type
DROP_POLICY Procedure	Removes a TSDP policy
ENABLE_PROTECTION_COLUMN Procedure	Enables protection for columns
ENABLE_PROTECTION_SOURCE Procedure	Enables protection based on the source of truth for the sensitive columns
ENABLE_PROTECTION_TYPE Procedure	Enables protection for a sensitive column type

184.5.1 ADD_POLICY Procedure

This procedure creates a TSDP policy.

Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
  policy_name          IN VARCHAR2,
  security_feature     IN PLS_INTEGER,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

Parameters

Table 184-3 ADD_POLICY Procedure Parameters

Parameter	Description
<code>policy_name</code>	Name of the policy being created. The maximum length for this identifier is <code>M_IDEN</code> . This follows the Oracle naming convention.
<code>security_feature</code>	Oracle security feature with which the policy is associated. Allowed values: <ul style="list-style-type: none"> <code>DBMS_TSDP_PROTECT.REDACT</code> <code>DBMS_TSDP_PROTECT.VPD</code> <code>DBMS_TSDP_PROTECT.UNIFIED_AUDIT</code> <code>DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT</code> <code>DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION</code>
<code>policy_enable_options</code>	Initialized with the parameter-value pairs corresponding to the <code>security_feature</code> setting

Table 184-3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
policy_apply_condition	<p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> • DBMS_TSDP_PROPERTY.DATATYPE • DBMS_TSDP_PROPERTY.LENGTH • DBMS_TSDP_PROPERTY.PARENT_SCHEMA • DBMS_TSDP_PROPERTY.PARENT_TABLE

Usage Notes

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

Examples

Create a policy PARTIAL_MASK_POLICY:

```

DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', ''SESSION_USER'')          =' 'APPUSER'';
  redact_feature_options ('function_type')              := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters')        := 'STR, VVVVVVVVV, VVVVVVVVV,
*, 1, 6';
  policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)        := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ADD_POLICY
    ('PARTIAL_MASK_POLICY', DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
policy_conditions);
END;

```

184.5.2 ALTER_POLICY Procedure

This procedure alters an existing TDSP policy

Syntax

```

DBMS_TSDP_PROTECT.ALTER_POLICY (
  policy_name           IN VARCHAR2,
  policy_enable_options IN FEATURE_OPTIONS,
  policy_apply_condition IN POLICY_CONDITION default TSDP$default_condition);

```

Parameters

Table 184-4 ALTER_POLICY Procedure Parameters

Parameter	Description
<code>policy_name</code>	Name of the policy to alter
<code>policy_enable_options</code>	Initialized with the parameter-value pairs corresponding to the security feature
<code>policy_apply_condition</code>	<p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding <code>policy_enable_options</code>. This is an associative array with <code>Property</code> as the key (<code>PLS_INTEGER</code>).</p> <p>Example: <code>example_policy_condition(Property)=property_value</code>. Permissible values for <code>Property</code>:</p> <ul style="list-style-type: none"> • <code>DBMS_TSDP_PROPERTY.DATATYPE</code> • <code>DBMS_TSDP_PROPERTY.LENGTH</code> • <code>DBMS_TSDP_PROPERTY.PARENT_SCHEMA</code> • <code>DBMS_TSDP_PROPERTY.PARENT_TABLE</code>

Usage Notes

- If the `policy_apply_condition` matches an existing condition for the policy, then the corresponding enable options are updated with `policy_enable_options`.
- If the `policy_apply_condition` does not match any existing condition for the policy, the combination of `policy_enable_options` and `policy_apply_condition` is added to the policy.

Examples

Add a new combination of `policy_apply_condition` and `policy_enable_options` to an existing policy `PARTIAL_MASK_POLICY`:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', 'SESSION_USER')='APPUSER'';
  redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters') := 'STR, VVVVVVVVV, VVVVVVVVV, *,
    1, 6';
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY', redact_feature_options,
  policy_conditions);
END;
```

184.5.3 ASSOCIATE_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
  policy_name          IN VARCHAR2,
```

```
sensitive_type    IN VARCHAR2,
associate         IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 184-5 ASSOCIATE_POLICY Procedure Parameters

Parameter	Description
policy_name	Name of the TDSP policy
sensitive_type	Name of the sensitive column type:
associate	Associate or Disassociate. TRUE implies Associate

Usage Notes

Both the policy and the sensitive column type should exist in the database.

Examples

Associate PARTIAL_MASK_POLICY with SSN_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

184.5.4 DISABLE_PROTECTION_COLUMN Procedure

This procedure disables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%',
  policy_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 184-6 DISABLE_PROTECTION_COLUMN Procedure Parameters

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is disabled.

Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

184.5.5 DISABLE_PROTECTION_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (
    discovery_sourcename    IN VARCHAR2);
```

Parameters

Table 184-7 *DISABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Disable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

184.5.6 DISABLE_PROTECTION_TYPE Procedure

This procedure disables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (
    sensitive_type          IN VARCHAR2);
```

Parameters

Table 184-8 *DISABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Disable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

184.5.7 DROP_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable_options combinations.

Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (
    policy_name            IN VARCHAR2,
```

```

policy_apply_condition IN POLICY_CONDITIONS);

DBMS_TSDP_PROTECT.DROP_POLICY (
  policy_name          IN VARCHAR2);

```

Parameters

Table 184-9 *DROP_POLICY Procedure Parameters*

Parameter	Description
policy_name	Name of the policy to drop
policy_apply_condition	To be initialized with the relevant condition

Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable_options combination that is being dropped is the last condition-enable_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

Examples

Dropping the condition-enable_options combination based on a specific condition:

```

DECLARE
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);
END;

```

The default condition-enable_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```

DECLARE
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);
END;

```

Dropping a TSDP policy:

```

BEGIN
  DBMS_TSDP_PROTECT.DROP_POLICY (
    policy_name => 'PARTIAL_MASK_POLICY');
END;

```

184.5.8 ENABLE_PROTECTION_COLUMN Procedure

This procedure enables protection for columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
  schema_name      IN VARCHAR2 DEFAULT '%',
  table_name       IN VARCHAR2 DEFAULT '%',
  column_name      IN VARCHAR2 DEFAULT '%',
  policy_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 184-10 *ENABLE_PROTECTION_COLUMN Procedure Parameters*

Parameter	Description
schema_name	Name of the schema containing the column
table_name	Table containing the column
column_name	Column name
policy_name	Optional policy name. If given, only this policy is enabled.

Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema_name, table_name and column_name. AND semantics is followed.

Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

184.5.9 ENABLE_PROTECTION_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
  discovery_sourcename IN VARCHAR2);
```

Parameters

Table 184-11 *ENABLE_PROTECTION_SOURCE Procedure Parameters*

Parameter	Description
discovery_sourcename	Name of the discovery source. This could be the Application Data Model (ADM) name or the database user.

Examples

Enable protection for all columns corresponding to ADM_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

184.5.10 ENABLE_PROTECTION_TYPE Procedure

This procedure enables protection for a sensitive column type.

Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (
    sensitive_type      IN VARCHAR2);
```

Parameters

Table 184-12 *ENABLE_PROTECTION_TYPE Procedure Parameters*

Parameter	Description
sensitive_type	Name of the sensitive column type

Examples

Enable protection for all columns identified by SSN_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view TRANSPORT_SET_VIOLATIONS.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of DBMS_TTS Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

185.1 DBMS_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

185.2 DBMS_TTS Exceptions

The DBMS_TTS package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

185.3 DBMS_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

185.4 Summary of DBMS_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

Table 185-1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure	Downgrades transportable tablespace-related data
TRANSPORT_SET_CHECK Procedure	Checks if a set of tablespaces (to be transported) is self-contained

185.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

185.4.2 TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
    ts_list          IN CLOB,
    incl_constraints IN BOOLEAN DEFAULT FALSE,
    full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 185-2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
ts_list	List of one or more tablespaces, separated by comma.

Table 185-2 (Cont.) TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
<code>incl_constraints</code>	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The <code>incl_constraints</code> parameter is a default so that <code>TRANSPORT_SET_CHECK</code> will work if it is called with only the <code>ts_list</code> argument.)
<code>full_check</code>	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to FALSE. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);  
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

DBMS_TYPES

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)

186.1 DBMS_TYPES Constants

The `DBMS_TYPES` package defines several constants to use when specifying parameter values.

These constants are listed in following table .

Table 186-1 *DBMS_TYPES Constants*

Constant	Description
<code>NO_DATA</code>	Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed
<code>SUCCESS</code>	The operation succeeded
<code>TYPECODE_BDOUBLE</code>	A <code>NUMBER</code> type
<code>TYPECODE_BFILE</code>	A <code>BFILE</code> type
<code>TYPECODE_BFLOAT</code>	A <code>NUMBER</code> type
<code>TYPECODE_BLOB</code>	A <code>BLOB</code> type
<code>TYPECODE_CFILE</code>	A <code>CFILE</code> type
<code>TYPECODE_CHAR</code>	A <code>CHAR</code> type
<code>TYPECODE_CLOB</code>	A <code>CLOB</code> type
<code>TYPECODE_DATE</code>	A <code>DATE</code> type
<code>TYPECODE_INTERVAL_DS</code>	An <code>INTERVAL_DS</code> type
<code>TYPECODE_INTERVAL_YM</code>	A <code>INTERVAL_YM</code> type
<code>TYPECODE_MLSLABEL</code>	An <code>MLSLABEL</code> type
<code>TYPECODE_NAMEDCOLLECTION</code>	A named collection (<code>VARRAY</code> /nested table) type
<code>TYPECODE_NCHAR</code>	A <code>NCHAR</code> type
<code>TYPECODE_NCLOB</code>	A <code>NCLOB</code> type
<code>TYPECODE_NUMBER</code>	A <code>NUMBER</code> type
<code>TYPECODE_NVARCHAR2</code>	A <code>NVARCHAR2</code> type
<code>TYPECODE_OBJECT</code>	An <code>OBJECT</code> type

Table 186-1 (Cont.) DBMS_TYPES Constants

Constant	Description
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

186.2 DBMS_TYPES Exceptions

DBMS_TYPES throws these exceptions.

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

DBMS_UMF

The `DBMS_UMF` package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

See Also:

Oracle Database Performance Tuning Guide for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- [Summary of DBMS_UMF Subprograms](#)

187.1 Summary of DBMS_UMF Subprograms

This topic lists the `DBMS_UMF` subprograms in alphabetical order and briefly describes them.

Table 187-1 DBMS_UMF Package Subprograms

Subprogram	Description
CONFIGURE_NODE Procedure	Configures a node in the RMF topology
CREATE_LINK Procedure	Creates a database link between two nodes in the RMF topology
CREATE_TOPOLOGY Procedure	Creates the RMF topology
DROP_LINK Procedure	Removes a database link between two nodes in the RMF topology
DROP_TOPOLOGY Procedure	Deletes the RMF topology
ENABLE_SERVICE Procedure	Enables a service on a node in the RMF topology
GET_NODE_ID_LOCAL Function	Returns the node ID of a node in the RMF topology
GET_NODE_NAME_LOCAL Function	Returns the node name of a node in the RMF topology
GET_TARGET_ID Function	Returns the destination ID in the RMF topology
GET_TOPOLOGY_NAME_LOCAL Function	Returns the RMF topology name of the local node
QUERY_LINK_INFO Procedure	Returns the information about a database link in the RMF topology
QUERY_NODE_INFO Procedures	Returns the information about a node in the RMF topology
REGISTER_NODE Function and Procedure	Registers a node in the RMF topology

Table 187-1 (Cont.) DBMS_UMF Package Subprograms

Subprogram	Description
SWITCH_DESTINATION Procedure	Designates a source node as a destination node in the RMF topology
UNCONFIGURE_NODE Procedure	Resets the configuration of a node in the RMF topology
UNREGISTER_NODE Procedure	Removes the registration of a node in the RMF topology

187.1.1 CONFIGURE_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

Syntax

```
DBMS_UMF.CONFIGURE_NODE (
    node_name          IN VARCHAR2 DEFAULT NULL,
    dblink_to_target  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 187-2 CONFIGURE_NODE Procedure Parameters

Parameter	Description
node_name	Name of the node. Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter <code>DB_UNIQUE_NAME</code> is assigned as the name for the node by default.
dblink_to_target	Database link from this node to the destination node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.2 CREATE_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.CREATE_LINK (
    topology_name     IN VARCHAR2,
    node_a_name       IN VARCHAR2,
```

```

node_b_name      IN VARCHAR2,
dblink_a_to_b    IN VARCHAR2,
dblink_b_to_a    IN VARCHAR2);

```

Parameters

Table 187-3 CREATE_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.
dblink_a_to_b	Database link from the first node to the second node.
dblink_b_to_b	Database link from the second node to the first node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.3 CREATE_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

Syntax

```

DBMS_UMF.CREATE_TOPOLOGY(
  topology_name IN VARCHAR2);

```

Parameters

Table 187-4 CREATE_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.4 DROP_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_LINK(  
    topology_name IN VARCHAR2,  
    node_a_name   IN VARCHAR2,  
    node_b_name   IN VARCHAR2);
```

Parameters

Table 187-5 DROP_LINK Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_a_name	Name of the first node.
node_b_name	Name of the second node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.5 DROP_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.DROP_TOPOLOGY(  
    topology_name IN VARCHAR2);
```

Parameters

Table 187-6 DROP_TOPOLOGY Procedure Parameters

Parameter	Description
topology_name	Name of the topology to delete.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.6 ENABLE_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.ENABLE_SERVICE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2,  
    service_type     IN NUMBER);
```

Parameters

Table 187-7 ENABLE_SERVICE Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node on which a specific service needs to be enabled.
service_type	Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service.

Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

187.1.7 GET_NODE_ID_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(  
    topology_name IN VARCHAR2 DEFAULT NULL)  
    RETURN NUMBER;
```

Parameters

Table 187-8 GET_NODE_ID_LOCAL Function Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.

Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this function.

187.1.8 GET_NODE_NAME_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the node in the RMF topology on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.9 GET_TARGET_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.GET_TARGET_ID(  
    topology_name IN VARCHAR2)  
RETURN NUMBER;
```

Parameters

Table 187-9 GET_TARGET_ID Function Parameters

Parameter	Description
<code>topology_name</code>	Name of the RMF topology.

Return Value

Returns the ID of the destination node in the RMF topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.10 GET_TOPOLOGY_NAME_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

Return Value

Returns the name of the active RMF topology of the node on which this function is executed.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.11 QUERY_LINK_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_LINK_INFO(  
    topology_name    IN    VARCHAR2,  
    from_node_id     IN    NUMBER,  
    to_node_id       IN    NUMBER,  
    link_name        OUT   VARCHAR2);
```

Parameters

Table 187-10 QUERY_LINK_INFO Procedure Parameters

Parameter	Description
<code>topology_name</code>	Name of the RMF topology.
<code>from_node_id</code>	Node ID of the first node.
<code>to_node_id</code>	Node ID of the second node.
<code>link_name</code>	Name of the database link from the first node to the second node returned by the procedure.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.12 QUERY_NODE_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

Syntax

```
DBMS_UMF.QUERY_NODE_INFO (
  topology_name      IN   VARCHAR2  DEFAULT NULL,
  node_name          IN   VARCHAR2,
  node_id            OUT  NUMBER);
```

```
DBMS_UMF.QUERY_NODE_INFO (
  node_id            IN   NUMBER,
  topology_name      OUT  VARCHAR2,
  node_name          OUT  VARCHAR2);
```

Parameters

Table 187-11 QUERY_NODE_INFO Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology with which the node is registered.
node_name	Name of the node.
node_id	Identifier of the node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.13 REGISTER_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

Syntax

```
DBMS_UMF.REGISTER_NODE (
  topology_name      IN   VARCHAR2,
  node_name          IN   VARCHAR2,
  dblink_to_node     IN   VARCHAR2  DEFAULT NULL,
  dblink_from_node   IN   VARCHAR2  DEFAULT NULL,
  as_source          IN   VARCHAR2  DEFAULT 'TRUE',
  as_candidate_target IN   VARCHAR2  DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE (
  topology_name      IN   VARCHAR2,
  node_name          IN   VARCHAR2,
  dblink_to_node     IN   VARCHAR2  DEFAULT NULL,
  dblink_from_node   IN   VARCHAR2  DEFAULT NULL,
```

```

as_source          IN VARCHAR2 DEFAULT 'TRUE',
as_candidate_target IN VARCHAR2 DEFAULT 'FALSE');
node_id           OUT VARCHAR2);

DBMS_UMF.REGISTER_NODE(
  topology_name    IN VARCHAR2,
  node_name        IN VARCHAR2,
  dblink_to_node   IN VARCHAR2 DEFAULT NULL,
  dblink_from_node IN VARCHAR2 DEFAULT NULL,
  as_source        IN VARCHAR2 DEFAULT 'TRUE',
  as_candidate_target IN VARCHAR2 DEFAULT 'FALSE')
RETURN NUMBER;
```

Parameters

Table 187-12 REGISTER_NODE Function and Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node to register.
dblink_to_node	Name for the database link from the destination to the node.
dblink_from_node	Name for the database link from the node to the destination.
as_source	Set to TRUE, if the node is a source, else set to FALSE.
as_candidate_target	Set to TRUE, if the node is a candidate destination, else set to FALSE.
node_id	Node ID returned by the procedure.

Return Value

Returns the node ID of the registered node.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.14 SWITCH_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

Syntax

```

DBMS_UMF.SWITCH_DESTINATION(
  topology_name    IN VARCHAR2,
  force_switch     IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 187-13 SWITCH_DESTINATION Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
force_switch	If set to <code>FALSE</code> , the execution of this procedure fails in the following situations: <ul style="list-style-type: none">• Candidate destination is a read-only database, and hence it cannot become the new destination.• Candidate destination does not have database links to one or more sources in the topology.• Candidate destination is unable to get the latest AWR data from the old destination. If set to <code>TRUE</code> , the execution of this procedure fails in the following situation: <ul style="list-style-type: none">• Candidate destination is a read-only database, and hence it cannot become the new destination.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.15 UNCONFIGURE_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

187.1.16 UNREGISTER_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

Syntax

```
DBMS_UMF.UNREGISTER_NODE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2);
```

Parameters

Table 187-14 UNREGISTER_NODE Procedure Parameters

Parameter	Description
topology_name	Name of the RMF topology.
node_name	Name of the node which needs to be removed from the topology.

Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

DBMS_USER_CERTS

The `DBMS_USER_CERTS` package allows you add and delete certificates.

This chapter contains the following topics:

- [DBMS_USER_CERTS Overview](#)
- [DBMS_USER_CERTS Security Model](#)
- [Summary of DBMS_USER_CERTS Subprograms](#)

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*
- For information on hidden columns in blockchain tables, see *Hidden Columns in Blockchain Tables*

188.1 DBMS_USER_CERTS Overview

The `DBMS_USER_CERTS` package allows you add and delete certificates.

The `DBMS_USER_CERTS` package allows you to:

- add certificates
- delete certificates

One use case is to attach a digital signature to a row in a blockchain table and be able to verify the digital signature later. A certificate used to sign one or more rows in blockchain tables and which has since expired should remain in the database until all those rows have been deleted from the blockchain tables.

188.2 DBMS_USER_CERTS Security Model

The `DBMS_USER_CERTS` package is owned by `SYS` and is installed as part of database installation.

- Both `ADD_CERTIFICATE()` and `DROP_CERTIFICATE()` sub-programs can be executed by any database user. The `EXECUTE` privilege on `DBMS_USER_CERTS` package is granted to `PUBLIC` role.

- Using `ADD_CERTIFICATE()`, a database user can add multiple certificates, each one would be identified uniquely using a GUID.
- Only SYSDBA or the user who owns the certificate, can drop it using `DROP_CERTIFICATE()`.

188.3 Summary of DBMS_USER_CERTS Subprograms

The `DBMS_USER_CERTS` package uses `ADD_CERTIFICATE` and `DROP_CERTIFICATE` subprograms to add and delete X.509 certificates which are used for signature verification for blockchain tables by the current user.

Table 188-1 DBMS_USER_CERTS Package Subprograms

Subprogram	Description
ADD_CERTIFICATE Procedure	Adds X.509 certificates which are used for signature verification of blockchain tables.
DROP_CERTIFICATE Procedure	Drops a certificate that is used for signature verification of blockchain tables.

188.3.1 ADD_CERTIFICATE Procedure

This procedure can be used by the current user to add an X.509 certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.ADD_CERTIFICATE (
    x509_cert          IN BLOB,
    cert_id            OUT RAW);
```

Parameters

Table 188-2 ADD_CERTIFICATE Procedure Parameters

Parameter	Description
<code>x509_cert</code>	The X.509 certificate used for signature verification of blockchain tables.
<code>cert_id</code>	The Global Unique Identifier (GUID) for the certificate.

188.3.2 DROP_CERTIFICATE Procedure

This procedure can be used by the current user to drop a certificate that is used for signature verification of blockchain tables.

Syntax

```
DBMS_USER_CERTS.DROP_CERTIFICATE (
    cert_id            IN RAW);
```

Parameters

Table 188-3 DROP_CERTIFICATE Procedure Parameters

Parameter	Description
<code>cert_id</code>	The Global Unique Identifier (GUID) of the certificate.

DBMS_UTILITY

The `DBMS_UTILITY` package provides various utility subprograms.

This chapter contains the following topics:

- [DBMS_UTILITY Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Data Structures](#)
- [Summary of DBMS_UTILITY Subprograms](#)

189.1 DBMS_UTILITY Deprecated Subprograms

These `DBMS_UTILITY` subprograms are deprecated in Oracle Database 12c release 12.2.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [GET_PARAMETER_VALUE Function](#)
Query `v$_parameter` directly to find the value of an `init.ora` parameter.
- [ANALYZE_PART_OBJECT Procedure](#)
Use `DBMS_STATS` to gather statistics.
- [GET_DEPENDENCY Procedure](#)
There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

189.2 DBMS_UTILITY Security Model

`DBMS_UTILITY` runs with the privileges of the calling user for the `NAME_RESOLVE` procedure and the `COMPILE_SCHEMA` procedure. This is necessary so that the SQL works correctly.

The package does not run as `SYS`. The privileges are checked using `DBMS_DDL`.

Related Topics

- [NAME_RESOLVE Procedure](#)
This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- [COMPILE_SCHEMA Procedure](#)
This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

189.3 DBMS_UTILITY Constants

The `DBMS_UTILITY` package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

Table 189-1 DBMS_UTILITY Constants

Name	Type	Value	Description
<code>INV_ERROR_ON_RESTRICTIONS</code>	<code>PLS_INTEGER</code>	1	This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram

189.4 DBMS_UTILITY Exceptions

This table lists the exceptions raised by `DBMS_UTILITY`.

Table 189-2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
<code>INV_NOT_EXIST_OR_NO_PRIV</code>	-24237	Raised by the <code>INVALIDATE</code> subprogram when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated
<code>INV_MALFORMED_SETTINGS</code>	-24238	Raised by the <code>INVALIDATE</code> subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
<code>INV_RESTRICTED_OBJECT</code>	-24239	Raised by the <code>INVALIDATE</code> subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

189.5 DBMS_UTILITY Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

Record Types

- [INSTANCE_RECORD Record Type](#)

Table Types

- [DBLINK_ARRAY TABLE Type](#)
- [INDEX_TABLE_TYPE Table Type](#)
- [INSTANCE_TABLE Table Type](#)
- [LNAME_ARRAY Table Type](#)
- [NAME_ARRAY Table Type](#)
- [NUMBER_ARRAY Table Type](#)
- [UNCL_ARRAY Table Type](#)

189.5.1 DBMS_UTILITY INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE INSTANCE_RECORD IS RECORD (
    inst_number    NUMBER,
    inst_name      VARCHAR2(60));
```

Fields**Table 189-3** INSTANCE_RECORD Record Type Fields

Field	Description
inst_number	Active instance number
inst_name	Instance name

189.5.2 DBMS_UTILITY DBLINK_ARRAY TABLE Type

This type stores a list of database links.

Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

189.5.3 DBMS_UTILITY INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

189.5.4 DBMS_UTILITY INSTANCE_TABLE Table Type

This type describes a table of `INSTANCE_RECORD` Record Type.

Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` is 1; `INSTANCE_TABLE` is Dense.

Related Topics

- [DBMS_UTILITY INSTANCE_RECORD Record Type](#)
This type describes a list of active instance number-name pairs.

189.5.5 DBMS_UTILITY LNAME_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

Syntax

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

189.5.6 DBMS_UTILITY NAME_ARRAY Table Type

This type stores lists of `NAME`.

Syntax

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

189.5.7 DBMS_UTILITY NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

189.5.8 DBMS_UTILITY UNCL_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

Syntax

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

189.6 Summary of DBMS_UTILITY Subprograms

This table lists the `DBMS_UTILITY` subprograms and briefly describes them.

Table 189-4 DBMS_UTILITY Package Subprograms

Subprogram	Description
ACTIVE_INSTANCES Procedure	Returns the active instance
ANALYZE_DATABASE Procedure	Analyzes all the tables, clusters and indexes in a database
ANALYZE_PART_OBJECT Procedure	Analyzes the given tables and indexes This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. Use <code>DBMS_STATS</code> to gather statistics.
ANALYZE_SCHEMA Procedure	Analyzes all the tables, clusters and indexes in a schema
CANONICALIZE Procedure	Canonicalizes a given string
COMMA_TO_TABLE Procedures	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure	Creates an error table to be used in the <code>EXCEPTION</code> clause of the <code>ALTER TYPE</code> statement
CURRENT_INSTANCE Function	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function	Gets the file number part of a data block address
DB_VERSION Procedure	Returns version information for the database
EXEC_DDL_STATEMENT Procedure	Executes the DDL statement in <code>parse_string</code>
EXPAND_SQL_TEXT Procedure	Recursively replaces any view references in the input SQL query with the corresponding view subquery
FORMAT_CALL_STACK Function	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function	Formats the current error stack
GET_CPU_TIME Function	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure	Shows the dependencies on the object passed in. This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram.
GET_ENDIANNESNESS Function	Gets the endianness of the database platform
GET_HASH_VALUE Function	Computes a hash value for the given string
GET_PARAMETER_VALUE Function	Gets the value of specified init.ora parameter. This function is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. You can query <code>v\$_parameter</code> directly.
GET_SQL_HASH Function	Computes a hash value for the given string using MD5 algorithm
GET_TIME Function	Returns the current time in 100th's of a second
GET_TZ_TRANSITIONS Procedure	Returns time zone transitions by <code>regionid</code> from the <code>timezone.dat</code> file

Table 189-4 (Cont.) DBMS_UTILITY Package Subprograms

Subprogram	Description
INVALIDATE Procedure	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_BIT_SET Function	Checks the bit setting for the given bit in the given RAW value
IS_CLUSTER_DATABASE Function	Determines if the database is running in cluster database mode
MAKE_DATA_BLOCK_ADDRESS Function	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure	Resolves the given name
NAME_TOKENIZE Procedure	Calls the parser to parse the given name
OLD_CURRENT_SCHEMA Function	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')
OLD_CURRENT_USER Function	Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')
PORT_STRING Function	Returns a string that uniquely identifies the version of Oracle and the operating system
SQLID_TO_SQLHASH Function	Converts a SQL ID into a hash value
TABLE_TO_COMMA Procedures	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure	Makes invalid database objects valid
WAIT_ON_PENDING_DML Function	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

189.6.1 ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table OUT INSTANCE_TABLE,
    instance_count OUT NUMBER);
```

Parameters

Table 189-5 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
instance_table	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
instance_count	Number of active instances

189.6.2 ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
  method          IN VARCHAR2,
  estimate_rows   IN NUMBER DEFAULT NULL,
  estimate_percent IN NUMBER DEFAULT NULL,
  method_opt      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 189-6 ANALYZE_DATABASE Procedure Parameters

Parameter	Description
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this database

189.6.3 ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>] [<command_opt>] [<sample_clause>]"

Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use [DBMS_STATS](#) to gather statistics.

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
  schema          IN VARCHAR2 DEFAULT NULL,
  object_name     IN VARCHAR2 DEFAULT NULL,
  object_type     IN CHAR      DEFAULT 'T',
  command_type    IN CHAR      DEFAULT 'E',
```

```
command_opt IN VARCHAR2 DEFAULT NULL,
sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 189-7 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name
object_name	Name of object to be analyzed, must be partitioned
object_type	Type of object, must be T (table) or I (index)
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	Sample clause to use when command_type is 'E'

Usage Notes

For each partition of the object, run in parallel using job queues.

189.6.4 ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
  schema          IN VARCHAR2,
  method          IN VARCHAR2,
  estimate_rows   IN NUMBER DEFAULT NULL,
  estimate_percent IN NUMBER DEFAULT NULL,
  method_opt      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 189-8 ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.

Table 189-8 (Cont.) ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

189.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE (
    name          IN   VARCHAR2,
    canon_name    OUT  VARCHAR2,
    canon_len     IN   BINARY_INTEGER);
```

Parameters**Table 189-9 CANONICALIZE Procedure Parameters**

Parameter	Description
name	String to be canonicalized
canon_name	Canonicalized string
canon_len	Length of the string (in bytes) to canonicalize

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such

a case, each canonicalized component will be concatenated together in the input position, separated by ".".

- Any other character after a[b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with ",c.f" ignored.

189.6.6 COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
    list IN VARCHAR2,
    tablen OUT BINARY_INTEGER,
    tab OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
    list IN VARCHAR2,
    tablen OUT BINARY_INTEGER,
    tab OUT lname_array);
```

Parameters

Table 189-10 COMMA_TO_TABLE Procedure Parameters

Parameter	Description
list	Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c]][@ d] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted).
tablen	Number of tables in the PL/SQL table
tab	PL/SQL table which contains list of names

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

- The list must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.

- The values in `tab` are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

189.6.7 COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
    schema          IN VARCHAR2,
    compile_all     IN BOOLEAN DEFAULT TRUE,
    reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 189-11 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
<code>schema</code>	Name of the schema
<code>compile_all</code>	If <code>TRUE</code> , will compile everything within the schema regardless of whether it is <code>VALID</code> If <code>FALSE</code> , will compile only <code>INVALID</code> objects
<code>reuse_settings</code>	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 189-12 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile <code>SYS</code> objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for the [RECOMP_SERIAL Procedure](#) included with the [UTL_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

189.6.8 CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(  
    schema_name    IN    VARCHAR2,  
    table_name     IN    VARCHAR2);
```

Parameters

Table 189-13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
schema_name	Name of the schema
table_name	Name of the table created

Exceptions

An error is returned if the table already exists.

189.6.9 CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE  
    RETURN NUMBER;
```

189.6.10 DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (  
    dba NUMBER)  
    RETURN NUMBER;
```

Parameters

Table 189-14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

189.6.11 DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (  
    dba NUMBER)  
    RETURN NUMBER;
```

Parameters**Table 189-15 DATA_BLOCK_ADDRESS_FILE Function Parameters**

Parameter	Description
dba	Data block address

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

189.6.12 DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (  
    version      OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

Parameters

Table 189-16 DB_VERSION Procedure Parameters

Parameter	Description
<code>version</code>	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
<code>compatibility</code>	The compatibility setting of the database determined by the "compatible" <code>init.ora</code> parameter. If the parameter is not specified in the <code>init.ora</code> file, then NULL is returned.

189.6.13 EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
    parse_string IN VARCHAR2);
```

Parameters

Table 189-17 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
<code>parse_string</code>	DDL statement to be executed

189.6.14 EXPAND_SQL_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (
    input_sql_text    IN          CLOB,
    output_sql_text   OUT NOCOPY CLOB);
```

Parameters

Table 189-18 EXPAND_SQL_TEXT Procedure Parameters

Parameter	Description
<code>input_sql_text</code>	Input SQL query text
<code>output_sql_text</code>	View-expanded query text

Exceptions

Table 189-19 EXPAND_SQL_TEXT Procedure Exceptions

Exception	Description
ORA-00942	Current user does not have select privileges on all the views and tables recursively referenced in the <code>input_sql_text</code>
ORA-24251	<code>input_sql_text</code> is not a <code>SELECT</code> statement
ORA-00900	Input is not valid
ORA-29477	Input LOB size exceeds maximum size of 4GB -1

Usage Notes

The expanded and merged SQL statement text is copied to `output_sql_text` on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic `WHERE` clause. This function would return differently, for example, if the `userid` caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

189.6.15 FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK  
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

189.6.16 FORMAT_ERROR_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the `SQLERRM` function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE  
RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS  
  g_start_pos integer := 1;  
  g_end_pos integer;  
  
  FUNCTION Output_One_Line RETURN BOOLEAN IS  
  BEGIN  
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );  
  
    CASE g_end_pos > 0  
      WHEN true THEN  
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,  
g_end_pos-g_start_pos ) );  
        g_start_pos := g_end_pos+1;  
        RETURN TRUE;  
  
      WHEN FALSE THEN  
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,  
(Length(i_buff)-g_start_pos)+1 ) );  
        RETURN FALSE;  
      END CASE;  
    END Output_One_Line;  
  
  BEGIN  
    WHILE Output_One_Line() LOOP NULL;  
    END LOOP;  
  END Log_Errors;  
/  
  
Set Doc Off  
Set Feedback off  
Set Echo Off  
  
CREATE OR REPLACE PROCEDURE P0 IS  
  e_01476 EXCEPTION; pragma exception_init ( e_01476, -1476 );  
  BEGIN  
    RAISE e_01476;  
  END P0;  
/  
Show Errors  
  
CREATE OR REPLACE PROCEDURE P1 IS  
  BEGIN  
    P0();  
  END P1;  
/  
SHOW ERRORS

  or database administrator.
*/
```

189.6.17 FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

189.6.18 GET_CPU_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

189.6.19 GET_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

Note:

This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
type          IN      VARCHAR2,
schema       IN      VARCHAR2,
name         IN      VARCHAR2);
```

Parameters

Table 189-20 GET_DEPENDENCY Procedure Parameters

Parameter	Description
type	Type of the object, for example if the object is a table give the type as 'TABLE'
schema	Schema name of the object
name	Name of the object

Usage Notes

This procedure uses the [DBMS_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

189.6.20 GET_ENDIANNES Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNES
RETURN NUMBER;
```

Return Values

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

189.6.21 GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
    name      VARCHAR2,
    base      NUMBER,
    hash_size NUMBER)
RETURN NUMBER;
```

Parameters**Table 189-21** GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value at which to start
hash_size	Desired size of the hash table

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the `hash_size` value. Using a power of 2 for the `hash_size` parameter works best.

189.6.22 GET_PARAMETER_VALUE Function

This deprecated function gets the value of specified `init.ora` parameter.

**Note:**

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query `v$_parameter` directly.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
    parnam    IN      VARCHAR2,
```

```

    intval    IN OUT    BINARY_INTEGER,
    strval    IN OUT    VARCHAR2,
    listno    IN        BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;

```

Parameters

Table 189-22 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
parnam	Parameter name
intval	Value of an integer parameter or the value length of a string parameter
strval	Value of a string parameter
listno	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

Usage Notes

- To execute the this function, you must have the SELECT privilege on the V\$PARAMETER dynamic view.

Examples

```

DECLARE
    parnam VARCHAR2(256);
    intval BINARY_INTEGER;
    strval VARCHAR2(256);
    partyp BINARY_INTEGER;
BEGIN
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);

    dbms_output.put('parameter value is: ');
    IF partyp = 1 THEN
        dbms_output.put_line(strval);
    ELSE
        dbms_output.put_line(intval);
    END IF;
    IF partyp = 1 THEN
        dbms_output.put('parameter value length is: ');
        dbms_output.put_line(intval);
    END IF;
    dbms_output.put('parameter type is: ');
    IF partyp = 1 THEN
        dbms_output.put_line('string');
    ELSE
        dbms_output.put_line('integer');
    END IF;
END;

```

189.6.23 GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
Dbms_utility.get_sql_hash (
    name          IN  VARCHAR2,
    hash          OUT RAW,
    pre10ihash   OUT  NUMBER)
RETURN NUMBER;
```

Pragmas

Pragma Restrict_references(Get_sql_hash, Wnds, Rnds, Wnps, Rnps);

Parameters

Table 189-23 GET_SQL_HASH Procedure Parameters

Parameter	Description
name	String to be hashed
hash	Stores all 16 bytes of returned hash value
pre10ihash	Stores the pre 10i database version hash value

Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. Use the `hash` parameter to get all 16 bytes and `pre10i` hash parameter to store the pre 10i hash value of 4 bytes.

189.6.24 GET_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers,

application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

189.6.25 GET_TZ_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
  regionid      IN      NUMBER,
  transitions   OUT    MAXRAW);
```

Parameters

Table 189-24 GET_TZ_TRANSITIONS Procedure Parameters

Parameter	Description
<code>regionid</code>	Number corresponding to the region
<code>transitions</code>	Raw bytes from the <code>timezone.dat</code> file

Exceptions

Table 189-25 GET_TZ_TRANSITIONS Procedure Exceptions

Exception	Description
ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR	For an invalid <code>regionid</code>

189.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
  p_object_id          NUMBER,
  p_plsql_object_settings VARCHAR2 DEFAULT NULL,
  p_option_flags       PLS_INTEGER DEFAULT 0);
```

Parameters

Table 189-26 INVALIDATE Procedure Parameters

Parameter	Description
<code>p_object_id</code>	ID number of object to be invalidated. This is the same as the value of the <code>OBJECT_ID</code> column from <code>ALL_OBJECTS</code> . If the <code>object_id</code> argument is <code>NULL</code> or invalid then the exception <code>inv_not_exist_or_no_priv</code> is raised. The caller of this procedure must have create privileges on the object being invalidated else the <code>inv_not_exist_or_no_priv</code> exception is raised.
<code>p_plsql_object_settings</code>	Optional parameter that ignored if the object specified by <code>p_object_id</code> is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to <code>REUSE SETTINGS</code> . If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else <code>inv_malformed_settings</code> exception will be raised. The setting values are changed only for the object specified by <code>p_object_id</code> and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and <code>REUSE SETTINGS</code> is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and <code>REUSE SETTINGS</code> was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
<code>p_option_flags</code>	Optional parameter defaults to zero (no flags). Option flags supported by <code>invalidate</code> . <ul style="list-style-type: none"> <code>inv_error_on_restrictions</code> (see Constants): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by <code>p_object_id</code> cannot be a table. By default, <code>invalidate</code> quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception <code>inv_restricted_object</code> is raised.

Exceptions

Table 189-27 INVALIDATE Exceptions

Exception	Description
<code>INV_NOT_EXIST_OR_NO_PRIV</code>	Raised when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated
<code>INV_MALFORMED_SETTINGS</code>	Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
<code>INV_RESTRICTED_OBJECT</code>	Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

Usage Notes

The object type (`object_type` column from `ALL_OBJECTS`) of the object specified by `p_object_id` must be a `PROCEDURE`, `FUNCTION`, `PACKAGE`, `PACKAGE BODY`, `TRIGGER`, `TYPE`, `TYPE BODY`, `LIBRARY`, `VIEW`, `OPERATOR`, `SYNONYM`, or `JAVA CLASS`. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of `STANDARD`, `DBMS_STANDARD`, or specification or body of `DBMS_UTILITY` and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the `HR` schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_tpb` in the `OE` schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

189.6.27 IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW value.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
    r      IN RAW,  n      IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 189-28 IS_BIT_SET Function Parameters

Parameter	Description
r	RAW source
n	Bit in r to check

Return Values

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

189.6.28 IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode; FALSE otherwise.

189.6.29 MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
    file NUMBER,
    block NUMBER)
RETURN NUMBER;
```

Parameters

Table 189-29 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
file	File that contains the block
block	Offset of the block within the file in terms of block increments

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

189.6.30 NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
    name          IN VARCHAR2,
    context       IN NUMBER,
    schema        OUT VARCHAR2,
    part1         OUT VARCHAR2,
    part2         OUT VARCHAR2,
    dblink        OUT VARCHAR2,
    part1_type    OUT NUMBER,
    object_number OUT NUMBER);
```

Parameters

Table 189-30 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	<p>Name of the object.</p> <p>This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p>

Table 189-30 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
context	Must be an integer between 0 and 9. <ul style="list-style-type: none"> • 0 - table • 1 - PL/SQL (for 2 part names) • 2 - sequences • 3 - trigger • 4 - Java Source • 5 - Java resource • 6 - Java class • 7 - type • 8 - Java shared data • 9 - index
schema	Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.
part1	First part of the name. The type of this name is specified part1_type (synonym or package).
part2	If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.
dblink	If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.
part1_type	Type of part1 is: <ul style="list-style-type: none"> • 5 - synonym • 7 - procedure (top level) • 8 - function (top level) • 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

189.6.31 NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as a [. b [. c]][@ dblink].

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
    name      IN  VARCHAR2,
    a         OUT VARCHAR2,
    b         OUT VARCHAR2,
```

```

c      OUT VARCHAR2,
dblink OUT VARCHAR2,
nextpos OUT BINARY_INTEGER);

```

Parameters

Table 189-31 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Input name, consisting of SQL identifiers (for example, scott.foo@dblink)
a	Output for the first token of the name
b	Output for the second token of the name (if applicable)
c	Output for the third token of the name (if applicable)
dblink	Output for the dblink of the name
nextpos	Next position after parsing the input name

189.6.32 OLD_CURRENT_SCHEMA Function

This function returns the session value from `sys_context ('userenv', 'current_schema')`.

Syntax

```

DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;

```

189.6.33 OLD_CURRENT_USER Function

This function returns the session value from `sys_context ('userenv', 'current_user')`.

Syntax

```

DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;

```

189.6.34 PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```

DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;

```

Pragmas

```

pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);

```

189.6.35 SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
    sql_id    IN    VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 189-32 SQLID_TO_SQLHASH Function Parameters

Parameter	Description
sql_id	SQL ID of a SQL statement. Must be VARCHAR2 (13).

189.6.36 TABLE_TO_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
    tab    IN    UNCL_ARRAY,
    tablen OUT BINARY_INTEGER,
    list   OUT VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (
    tab    IN    lname_array,
    tablen OUT BINARY_INTEGER,
    list   OUT VARCHAR2);
```

Parameters

Table 189-33 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
tab	PL/SQL table which contains list of table names
tablen	Number of tables in the PL/SQL table
list	Comma separated list of tables

Return Values

A comma-delimited list and the number of elements found in the table.

189.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE (
    object_id      NUMBER);

DBMS_UTILITY.VALIDATE (
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,  edition_name  := SYS_CONTEXT ('USERENV',
    'CURRENT_EDITION'));
```

Parameters

Table 189-34 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj\$. Equivalent numeric values are as follows: <ul style="list-style-type: none"> • 1 — TABLE/PROCEDURE/TYPE • 2 — BODY • 3 — TRIGGER • 4 — INDEX • 5 — CLUSTER • 8 — LOB • 9 — DIRECTORY • 10 — QUEUE • 11 — REPLICATION OBJECT GROUP • 12 — REPLICATION PROPAGATOR • 13 — JAVA SOURCE • 14 — JAVA RESOURCE • 58 — (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its

`object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

189.6.38 WAIT_ON_PENDING_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified `scn` have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables      IN      VARCHAR2,
    timeout     IN      BINARY_INTEGER,
    scn         IN OUT  NUMBER)
RETURN BOOLEAN;
```

Parameters

Table 189-35 WAIT_ON_PENDING_DML Function Parameters

Parameter	Description
<code>tables</code>	Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedure , and each item valid to the NAME_RESOLVE Procedure . Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
<code>timeout</code>	Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.
<code>scn</code>	SCN prior to which transactions must have begun to be considered relevant to this request. If the value is NULL or not recognized as a meaningful <code>scn</code> on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output.

Return Values

TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back

DBMS_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS_WARNING Subprograms](#)

190.1 DBMS_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

190.2 Summary of DBMS_WARNING Subprograms

This table lists the `DBMS_WARNING` subprograms and briefly describes them.

Table 190-1 *DBMS_WARNING Package Subprograms*

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure	Modifies the current <code>session</code> or <code>system</code> warning settings of the <code>warning_category</code> previously supplied
ADD_WARNING_SETTING_NUM Procedure	Modifies the current <code>session</code> or <code>system</code> warning settings of the or <code>warning_number</code> previously supplied
GET_CATEGORY Function	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure	Replaces previous settings with the new value

190.2.1 ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category    IN    VARCHAR2,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

Parameters

Table 190-2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
<code>warning_category</code>	Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.
<code>warning_value</code>	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
<code>scope</code>	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

190.2.2 ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE / DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
    warning_number      IN    NUMBER,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

Parameters

Table 190-3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
<code>warning_number</code>	The warning number. Allowed values are all valid warning numbers.

Table 190-3 (Cont.) ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
warning_value	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
scope	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

Example 190-1 Enabling the Deprecation Warnings

This example shows how to enable the DEPRECATE pragma warnings using the DBMS_WARNING package for the session.

```

BEGIN
  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                         'ENABLE',
                                         'SESSION');

END;
```

190.2.3 GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```

DBMS_WARNING.GET_CATEGORY (
  warning_number IN pls_integer)
RETURN VARCHAR2;
```

Parameters**Table 190-4 GET_CATEGORY Function Parameters**

Parameter	Description
warning_number	The warning message number.

190.2.4 GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category IN VARCHAR2)  
RETURN warning_value;
```

Parameters

Table 190-5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

190.2.5 GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number IN NUMBER)  
RETURN warning_value;
```

Parameters

Table 190-6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

190.2.6 GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN VARCHAR2;
```

Usage Notes

Use this function when you do not have `SELECT` or `READ` privilege on `v$parameter` or `v$parameter2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

190.2.7 SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION or ALTER SYSTEM command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value  IN  VARCHAR2,  
    scope          IN  VARCHAR2);
```

Parameters

Table 190-7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
warning_value	The new string that will constitute the new value.
scope	This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.

191

DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

DBMS_WORKLOAD_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the `DBMS_WORKLOAD_REPLAY` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_WORKLOAD_CAPTURE Subprograms](#)

See Also:

Oracle Database Testing Guide for more information about database replay

192.1 DBMS_WORKLOAD_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

192.2 DBMS_WORKLOAD_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
```

```
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrcc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

192.3 Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the DBMS_WORKLOAD_CAPTURE package subprograms in alphabetical order.

Table 192-1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedure	Adds a specified filter
DECRYPT_CAPTURE Procedure	This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.
DELETE_CAPTURE_INFO Procedure	Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID
DELETE_FILTER Procedure	Deletes a specified filter
ENCRYPT_CAPTURE Procedure	This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256.
EXPORT_AWR Procedure	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
GET_CAPTURE_INFO Function	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID
IMPORT_AWR Function	Imports the AWR snapshots associated with a given capture ID
REPORT Function	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates workload capture on all instances

192.3.1 ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN   VARCHAR2 NOT NULL,
    fattribute     IN   VARCHAR2 NOT NULL,
    fvalue         IN   VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN   VARCHAR2 NOT NULL,
    fattribute     IN   VARCHAR2 NOT NULL,
    fvalue         IN   NUMBER NOT NULL);
```

Parameters

Table 192-2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> INSTANCE_NUMBER - type NUMBER USER - type STRING MODULE - type STRING ACTION - type STRING PROGRAM - type STRING SERVICE - type STRING PDB_NAME - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).

Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that affects the next workload capture, and whether the filters are considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.

- You can capture the workload for a particular PDB by specifying a filter of PDB type.

Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME', 'CDB1_PDB1');
```

- To use [DBMS_APPLICATION_INFO](#) to identify workload that is issued to the database:

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);
-- run some SQL here
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');
-- run logging SQL
```

- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION', 'ORDER_ENTRY_LOG');
```

- To filter out the full order entry transaction, define a filter:

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');
```

192.3.2 DECRYPT_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (
  src_dir          IN  VARCHAR2,
  dst_dir          IN  VARCHAR2);
```

Parameters

Table 192-3 DECRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be decrypted. This parameter is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory This parameter is case sensitive.

Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

192.3.3 DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
(capture_id IN NUMBER);
```

Parameters

Table 192-4 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to <code>DBA_WORKLOAD_CAPTURES.ID</code> . (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

192.3.4 DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
filter_name IN VARCHAR2(40) NOT NULL);
```

Parameters

Table 192-5 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	Filter to be deleted

Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

192.3.5 ENCRYPT_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in `START_CAPTURE` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRYPT_CAPTURE
  src_dir      IN VARCHAR2,
  dst_dir      IN VARCHAR2,
  encryption   IN VARCHAR2 DEFAULT 'AES256');
```

Parameters

Table 192-6 ENCRYPT_CAPTURE Procedure Parameters

Parameter	Description
src_dir	A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.
dst_dir	A directory object pointing to an OS path that has write permissions. The encrypted capture files will be written to this directory. The parameter value is case sensitive.
encryption	Specifies if sensitive data in workload capture is encrypted or not. The possible values are: AES128, AES192, and AES256. The default value is AES256.

Usage Notes

For encrypted capture, the `ENCRYPT_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

192.3.6 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
    capture_id    IN NUMBER);
```

Parameters

Table 192-7 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the [GET_CAPTURE_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

192.3.7 FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
    timeout    IN    NUMBER    DEFAULT 30
    reason     IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 192-8 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> .

Usage Notes

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.

- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send its acknowledgement to `FINISH_CAPTURE`.

To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

192.3.8 GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir      IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 192-9 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the [GET_CAPTURE_INFO Function](#) simply returns that row's `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row's `ID` is returned.

192.3.9 IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the `EXPORT_AWR` procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
  capture_id      IN  NUMBER,
  staging_schema  IN  VARCHAR2,
  force_cleanup   IN  BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 192-10 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).
force_cleanup	<p>Values:</p> <ul style="list-style-type: none"> TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL: <pre>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_\$%';</pre> <p>Use this option only if you are sure that there are no important data in any such tables in the staging_schema.</p> FALSE - (default) no tables dropped from the staging_schema prior to the import operation

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

Related Topics

- [EXPORT_AWR Procedure](#)
This procedure exports the AWR snapshots associated with a given capture ID.

192.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
  capture_id      IN   NUMBER,
  format         IN   VARCHAR2)
RETURN CLOB;
```

Parameters

Table 192-11 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB.

Table 192-12 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2 (4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2 (4)	'TEXT'	Used as input to the format argument to generate the text version of the report

192.3.11 START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
  name          IN  VARCHAR2,
  dir           IN  VARCHAR2,
  duration      IN  NUMBER   DEFAULT NULL,
  default_action IN  VARCHAR2 DEFAULT 'INCLUDE',
  auto_unrestrict IN BOOLEAN DEFAULT TRUE,
  capture_sts   IN  BOOLEAN  DEFAULT FALSE,
  sts_cap_interval IN NUMBER  DEFAULT 300,
  plsqli_mode   IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
  encryption    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 192-13 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. <ul style="list-style-type: none"> If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.
auto_unrestrict	Can be either TRUE or FALSE. <ul style="list-style-type: none"> If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) If FALSE, no database instance is automatically unrestricted.
capture_sts	If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.
sts_cap_interval	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Table 192-13 (Cont.) START_CAPTURE Procedure Parameters

Parameter	Description
plsql_mode	<p>Specifies the PL/SQL capture mode:</p> <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are captured • EXTENDED — both top-level PL/SQL calls and SQL called from PL/SQL are captured
encryption	<p>Specify if sensitive data in workload capture is encrypted or not. The possible values are:</p> <ul style="list-style-type: none"> • NULL — capture files are not encrypted • AES128 — capture files are encrypted using AES128 • AES192 — capture files are encrypted using AES192 • AES256 — capture files is encrypted using AES256 <p>The default value is NULL.</p>

Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the [FINISH_CAPTURE Procedure](#) is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the [DBMS_SCHEDULER](#) package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.
- For encrypted capture, the `START_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).
- You must configure a software keystore in `auto-login` mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

DBMS_WORKLOAD_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides a interface to replay a workload capture.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS_WORKLOAD_REPLAY Subprograms](#)

See Also:

Oracle Database Testing Guide for more information about database replay

193.1 DBMS_WORKLOAD_REPLAY Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package.

Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.

Related Topics

- [DBMS_WORKLOAD_CAPTURE](#)
The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

193.2 DBMS_WORKLOAD_REPLAY Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_REPLAY`.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;  
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;  
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

193.3 Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

Table 193-1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
ADD_CAPTURE Function	Adds the given capture to the current schedule
ADD_FILTER Procedure	Adds a filter to replay only a subset of the captured workload
ADD_SCHEDULE_ORDERING Function	Adds a schedule order between two captures
ASSIGN_GROUP_TO_INSTANCE Procedure	Modifies the view <code>DBA_WORKLOAD_GROUP_ASSIGNMENTS</code>
BEGIN_REPLAY_SCHEDULE Procedure	Initiates the creation of a reusable replay schedule
CALIBRATE Function	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure	Cancels the workload replay in progress
COMPARE_PERIOD_REPORT Procedure	Generates a report comparing a replay to its capture or to another replay of the same capture
COMPARE_SQLSET_REPORT Function	Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture
CREATE_FILTER_SET Procedure	Uses the replay filters added to create a set of filters to use against the replay in <code>replay_dir</code>
DELETE_FILTER Procedure	Deletes the named filter
DELETE_REPLAY_INFO Procedure	Deletes the rows in <code>DBA_WORKLOAD_REPLAYS</code> that corresponds to the given workload replay ID
END_REPLAY_SCHEDULE Procedure	Wraps up the creation of the current schedule

Table 193-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
EXPORT_AWR Procedure	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GENERATE_CAPTURE_SUBSET Procedure	Creates a new capture from an existing workload capture
GET_DIVERGING_STATEMENT Function	Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
GET_REPLAY_DIRECTORY Function	Returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure .
GET_REPLAY_INFO Function	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
GET_REPLAY_TIMEOUT Procedure	Retrieves the replay timeout setting
IMPORT_AWR Function	Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID
INITIALIZE_CONSOLIDATED_REPLAY Procedure	Puts the database state in <code>INIT</code> for a multiple-capture replay
INITIALIZE_REPLAY Procedure	Initializes replay, and loads specific data produced during processing into the database
IS_REPLAY_PAUSED Function	Reports whether the replay is currently paused
LOAD_LONG_SQLTEXT Procedure	Loads the captured SQL statements that are longer than 1000 characters to the <code>DBA_WORKLOAD_LONG_SQLTEXT</code> view
PAUSE_REPLAY Procedure	Pauses the in-progress workload replay
POPULATE_DIVERGENCE Procedure	Precomputes the divergence information for the given call, stream, or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls
PREPARE_CONSOLIDATED_REPLAY Procedure	Puts the database in a special "Prepare" mode for a multiple-capture replay
PREPARE_REPLAY Procedure	Puts the database in a special "Prepare" mode
PROCESS_CAPTURE Procedure	Processes the workload capture found in <code>capture_dir</code> in place
REMAP_CONNECTION Procedure	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay
REMOVE_CAPTURE Procedure	Removes the given capture from the current schedule
REMOVE_SCHEDULE_ORDERING Procedure	Removes an existing schedule order from the current replay schedule
REPORT Function	Generates a report on the given workload replay
RESUME_REPLAY Procedure	Resumes a paused workload replay
REUSE_REPLAY_FILTER_SET Procedure	Reuses filters in the specified filter set as if each were added using the ADD_SCHEDULE_ORDERING Function

Table 193-1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
SET_ADVANCED_PARAMETER Procedure	Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure
SET_REPLAY_DIRECTORY Procedure	Sets a directory that contains multiple workload captures as the current replay directory
SET_REPLAY_TIMEOUT Procedure	Sets the replay timeout setting
SET_SQL_MAPPING Procedure	Specifies SQL statements to be skipped or replaced during a database replay operation
SET_USER_MAPPING Procedure	Sets a new schema or user name to be used during replay instead of the captured user
START_CONSOLIDATED_REPLAY Procedure	Starts the replay of a multiple-capture capture
START_REPLAY Procedure	Starts the workload replay
USE_FILTER_SET Procedure	Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay

193.3.1 ADD_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER DEFAULT 0,
    stop_replay           IN    BOOLEAN FALSE,
    take_begin_snapshot  IN    BOOLEAN TRUE,
    take_end_snapshot     IN    BOOLEAN TRUE,
    query_only            IN    BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name      IN    VARCHAR2,
    start_delay_seconds   IN    NUMBER DEFAULT 0,
    stop_replay           IN    BOOLEAN FALSE,
    take_begin_snapshot  IN    BOOLEAN TRUE,
    take_end_snapshot     IN    BOOLEAN TRUE,
    query_only            IN    VARCHAR2 DEFAULT 'N')
RETURN NUMBER;
```

Parameters

Table 193-2 ADD_CAPTURE Function Parameters

Parameter	Description
capture_dir_name	Name of the OS directory containing the capture under the replay top-level directory
start_delay_seconds	Delay time in seconds before the replay of this capture starts
stop_replay	Stop the replay after it finishes
take_begin_snapshot	Take an AWR snapshot when the replay of this capture starts
take_end_snapshot	Take an AWR snapshot when the replay of this capture finishes
query_only	Replay only the read-only queries of this workload capture

Usage Notes

The [SET_REPLAY_DIRECTORY Procedure](#) must have already been called.

193.3.2 ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the [CREATE_FILTER_SET Procedure](#). This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to `CREATE_FILTER_SET` when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue         IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute     IN VARCHAR2,
    fvalue         IN NUMBER);
```

Parameters

Table 193-3 ADD_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.

Table 193-3 (Cont.) ADD_FILTER Procedure Parameters

Parameter	Description
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type <code>STRING</code> : <ul style="list-style-type: none"> • <code>USER</code> • <code>MODULE</code> • <code>ACTION</code> • <code>PROGRAM</code> • <code>SERVICE</code> • <code>CONNECTION_STRING</code>
fvalue	(Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type <code>STRING</code> . Currently all the listed values of <code>fattribute</code> are of type <code>STRING</code> . <code>INSTANCE_NUMBER</code> is a <code>NUMBER</code> attribute. It is currently only supported for capture.

193.3.3 ADD_SCHEDULE_ORDERING Function

This function adds a schedule order between two captures.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
    schedule_capture_id    IN VARCHAR2,
    waitfor_capture_id     IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 193-4 ADD_SCHEDULE_ORDERING Function Parameters

Parameter	Description
<code>schedule_capture_id</code>	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by <code>waitfor_capture_id</code> runs to completion.
<code>waitfor_capture_id</code>	Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by <code>schedule_capture_id</code> will not start until the replay of this capture runs to completion.

Return Values

Returns a non-zero error code if the constraint cannot be added

Usage Notes

The two captures must have already been added to the replay schedule.

193.3.4 ASSIGN_GROUP_TO_INSTANCE Procedure

This procedure modifies the view `DBA_WORKLOAD_GROUP_ASSIGNMENTS`.

Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
    group_id          IN INTEGER,
    instance_number  IN INTEGER);
```

Parameters

Table 193-5 ASSIGN_GROUP_TO_INSTANCE Procedure Parameters

Parameter	Description
<code>group_id</code>	The identifier of the specified group of capture files
<code>instance_number</code>	The number used for instance registration. It is equivalent to the <code>INSTANCE_NUMBER</code> column in <code>V\$INSTANCE</code> .

See Also:

- `DBA_WORKLOAD_GROUP_ASSIGNMENTS` in *Oracle Database Reference*
- `V$INSTANCE` in *Oracle Database Reference*

193.3.5 BEGIN_REPLAY_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE (
    replay_dir_obj  IN  VARCHAR2,
    schedule_name  IN  VARCHAR2);
```

Parameters

Table 193-6 BEGIN_REPLAY_SCHEDULE Procedure Parameters

Parameter	Description
replay_dir_obj	Directory object that points to the replay directory that contains all the capture directories involved in the schedule
schedule_name	Name of the schedule to be replayed

Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
 - The workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - The user must have copied the capture directory appropriately.
 - The database is not in replay mode.
 - The [SET_REPLAY_DIRECTORY Procedure](#) has already been called.

193.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
    capture_dir          IN VARCHAR2,
    process_per_cpu     IN BINARY_INTEGER DEFAULT 4,
    threads_per_process IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

Table 193-7 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of processes allowed for each CPU (default is 4)
threads_per_process	Maximum number of threads allowed for each process (default is 50)

Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

193.3.7 CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 193-8 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE.

Usage Notes

Prerequisite: A call to the [INITIALIZE_REPLAY Procedure](#), or [PREPARE_REPLAY Procedure](#), or [START_REPLAY Procedure](#) was already issued.

193.3.8 COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
    replay_id1    IN    NUMBER,
    replay_id2    IN    NUMBER,
    format        IN    VARCHAR2,
    result        OUT   CLOB );
```

Parameters

Table 193-9 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

193.3.9 COMPARE_SQLSET_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
    replay_id1    IN NUMBER,
    replay_id2    IN NUMBER,
    format        IN VARCHAR2,
    r_level       IN VARCHAR2 DEFAULT 'ALL',
    r_sections    IN VARCHAR2 DEFAULT 'ALL',
    result        OUT CLOB )
RETURN VARCHAR2;
```

Parameters

Table 193-10 COMPARE_SQLSET_REPORT Function Parameters

Parameter	Description
replay_id1	First ID of the workload replay after a change
replay_id2	Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT.
r_level	See level parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
r_sections	See section parameter in the REPORT_ANALYSIS_TASK Function in the DBMS_SQLPA package
result	Output of the report (CLOB)

193.3.10 CREATE_FILTER_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the [ADD_FILTER Procedure](#). After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE_FILTER_SET Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
    replay_dir      IN  VARCHAR2,
    filter_set      IN  VARCHAR2,
    default_action  IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 193-11 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
<code>replay_dir</code>	Object directory of the replay to be filtered
<code>filter_set</code>	Name of the filter set to create (to use in USE_FILTER_SET Procedure)
<code>default_action</code>	<p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_SCHEDULE_ORDERING Function are treated as <code>INCLUSION</code> filters, and will determine the workload that is replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified are assumed to be <code>EXCLUSION</code> filters</p>

Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

193.3.11 DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
    fname  IN  VARCHAR2);
```

Parameters

Table 193-12 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	(Mandatory) Name of the filter that must be deleted

Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

193.3.12 DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in `DBA_WORKLOAD_REPLAYS` that correspond to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
    replay_id    IN NUMBER);
```

Parameters

Table 193-13 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	(Mandatory) ID of the workload replay that must be deleted. Corresponds to <code>DBA_WORKLOAD_REPLAYS.ID</code>

193.3.13 END_REPLAY_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

Usage Notes

The [BEGIN_REPLAY_SCHEDULE Procedure](#) must have already been called.

193.3.14 EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
    replay_id    IN NUMBER);
```

Parameters

Table 193-14 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots are to be exported

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the [GET_REPLAY_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

193.3.15 GENERATE_CAPTURE_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (
    input_capture_dir    IN VARCHAR2,
    output_capture_dir   IN VARCHAR2,
    new_capture_name     IN VARCHAR2,
    begin_time           IN NUMBER,
    begin_include_incomplete IN BOOLEAN DEFAULT TRUE,
    end_time             IN NUMBER,
    end_include_incomplete IN BOOLEAN DEFAULT FALSE,
    parallel_level       IN NUMBER DEFAULT NULL);
```

Parameters

Table 193-15 GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
input_capture_dir	(Mandatory) Name of the directory object that points to an existing workload capture
output_capture_dir	(Mandatory) Name of the directory object that points to the new capture

Table 193-15 (Cont.) GENERATE_CAPTURE_SUBSET Procedure Parameters

Parameter	Description
<code>new_capture_name</code>	(Mandatory) Name of new capture
<code>begin_time</code>	Start of the time range - time offset in seconds from the start of a workload capture
<code>begin_include_incomplete</code>	Column to include incomplete calls caused by <code>begin_time</code>
<code>end_time</code>	End of the time range - time offset in seconds from the start of a workload capture. If <code>end_time</code> is zero or <code>end_time</code> is less or equal than <code>begin_time</code> , the time range is invalid. The new capture will use the whole duration of the input capture.
<code>end_include_incomplete</code>	Column to include incomplete calls caused by <code>end_time</code>
<code>parallel_level</code>	Number of Oracle processes used to process the input captures in a parallel fashion. The <code>NULL</code> default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.

193.3.16 GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
    replay_id    IN NUMBER,
    stream_id    IN NUMBER,
    call_counter IN NUMBER)
RETURN CLOB;
```

Parameters

Table 193-16 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
<code>replay_id</code>	ID of the replay in which that call diverged
<code>stream_id</code>	Stream ID of the diverging call
<code>call_counter</code>	Call counter of the diverging call

Usage Notes

- Returns a `CLOB` formatted as XML that contains:
 - SQL ID
 - SQL Text
 - Bind information: position, name and value
- This function will silently invoke the [POPULATE_DIVERGENCE Procedure](#) to read the information from the capture files. Therefore, if divergence has not been

populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

193.3.17 GET_REPLAY_DIRECTORY Function

This function returns the current replay directory set by the SET_REPLAY_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```

Related Topics

- [SET_REPLAY_DIRECTORY Procedure](#)
This procedure sets a directory that contains multiple workload captures as the current replay directory.

193.3.18 GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    replay_dir    IN VARCHAR2,
    load_details  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

Parameters

Table 193-17 GET_REPLAY_INFO Function Parameters

Parameter	Description
replay_dir	(Mandatory) Name of the workload replay directory object (case sensitive).
load_details	Load the divergence and tracked commits data. The default value is FALSE.

Return Values

The procedure returns the CAPTURE_ID, which can be associated with both DBA_WORKLOAD_CAPTURES.ID and DBA_WORKLOAD_REPLAYS.CAPTURE_ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.

- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

193.3.19 GET_REPLAY_TIMEOUT Procedure

This procedure gets the replay timeout setting.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
    enabled      OUT  BOOLEAN,
    min_delay    OUT  NUMBER,
    max_delay    OUT  NUMBER,
    delay_factor OUT  NUMBER);
```

Parameters

Table 193-18 GET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
enabled	TRUE if the timeout action is enabled, FALSE otherwise.
min_delay	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay.
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor.

Usage Notes

This procedure can be called anytime during replay.

193.3.20 IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id      IN  NUMBER,
    staging_schema IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 193-19 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	(Mandatory) ID of the replay whose AWR snapshots must be imported
staging_schema	(Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input.

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT_AWR Procedure](#).
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Drop any such tables in the staging_schema before invoking IMPORT_AWR.

193.3.21 INITIALIZE_CONSOLIDATED_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay_dir which has already been defined by the [SET_REPLAY_DIRECTORY Procedure](#), pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule_name from the directory, and loads required connection data into the replay system.

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
    replay_name      IN    VARCHAR2,
    schedule_name    IN    VARCHAR2,
    plsqli_mode      IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

Parameters

Table 193-20 INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
schedule_name	Name of the schedule to be replayed. It must have been created through the BEGIN_REPLAY_SCHEDULE Procedure for the replay directory replay_dir.

Table 193-20 (Cont.) INITIALIZE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
plsql_mode	Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Usage Notes

Prerequisites:

- Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The [SET_REPLAY_DIRECTORY Procedure](#) has been called.

193.3.22 INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
    replay_name      IN  VARCHAR2,
    replay_dir       IN  VARCHAR2,
    plsqli_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
    rac_inst_list    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 193-21 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	(Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data
plsqli_mode	Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> • TOP_LEVEL — only top-level PL/SQL calls are replayed • EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.

Table 193-21 (Cont.) INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
<code>rac_inst_list</code>	Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example: <code>rac_inst_list='1,3,5'</code>

Usage Notes

- Prerequisites:
 - Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the `PAUSE_REPLAY` Procedure.

For instance, during capture the user may record the connection string each session used to connect to the server. The `INITIALIZE_REPLAY` Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the `PROCESS_CAPTURE` Procedure, the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the `REMAP_CONNECTION` Procedure.

- For encrypted capture, the `INITIALIZE_REPLAY` Procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

Related Topics

- [PAUSE_REPLAY Procedure](#)
This procedure pauses the in-progress workload replay.
- [INITIALIZE_REPLAY Procedure](#)
This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the `PAUSE_REPLAY` Procedure).
- [PROCESS_CAPTURE Procedure](#)
This procedure processes the workload capture found in `capture_dir` in place.
- [REMAP_CONNECTION Procedure](#)
This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

193.3.23 IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED  
    RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the [PAUSE_REPLAY Procedure](#) has been called successfully and the [RESUME_REPLAY Procedure](#) has not been called yet.

Usage Notes

A call to the [START_REPLAY Procedure](#) must have already been issued as a prerequisite.

193.3.24 LOAD_LONG_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (  
    capture_id    IN NUMBER);
```

Parameters

Table 193-22 LOAD_LONG_SQLTEXT Procedure Parameters

Parameter	Description
capture_id	Internal key for the workload capture

Note:

This procedure is available starting with Oracle Database Release 18c.

See Also:

`DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

193.3.25 PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME_REPLAY Procedure](#) is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the [START_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

193.3.26 POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the [GET_DIVERGING_STATEMENT](#) Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
    replay_id    IN    NUMBER,
    stream_id    IN    NUMBER DEFAULT NULL,
    call_counter IN    NUMBER DEFAULT NULL);
```

Parameters

Table 193-23 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream.

Related Topics

- [GET_DIVERGING_STATEMENT Function](#)
This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

193.3.27 PREPARE_CONSOLIDATED_REPLAY Procedure

Similar to the `PREPARE_REPLAY` Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN BOOLEAN,
    connect_time_scale      IN NUMBER    DEFAULT 100,
    think_time_scale        IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE,
    capture_sts             IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval        IN NUMBER    DEFAULT 300);
```

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization          IN VARCHAR2  DEFAULT 'SCN',
    connect_time_scale      IN NUMBER    DEFAULT 100,
    think_time_scale        IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE,
    capture_sts             IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval        IN NUMBER    DEFAULT 300);
```

Parameters

Table 193-24 PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
<code>synchronization</code>	<p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> <code>'TIME'</code> — The synchronization will be based on the time the action took place during capture (clock-based time). <code>'SCN'</code> — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. <code>'OBJECT_ID'</code> — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses <code>BOOLEAN</code> for this parameter:</p> <ul style="list-style-type: none"> <code>TRUE</code> means <code>'SCN'</code> <code>FALSE</code> means <code>'TIME'</code>

Table 193-24 (Cont.) PREPARE_CONSOLIDATED_REPLAY Procedure Parameters

Parameter	Description
<code>connect_time_scale</code>	Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See " Example 193-1 ".
<code>think_time_scale</code>	Scales the time elapsed between two successive user calls " Example 193-1 " from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See " Example 193-2 ".
<code>think_time_auto_correct</code>	Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See " Example 193-3 ".
<code>capture_sts</code>	If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.
<code>sts_cap_interval</code>	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.

Usage Notes

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

Related Topics

- [PREPARE_REPLAY Procedure](#)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

193.3.28 PREPARE_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
  synchronization          IN BOOLEAN,
  connect_time_scale       IN NUMBER    DEFAULT 100,
  think_time_scale         IN NUMBER    DEFAULT 100,
  think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
  scale_up_multiplier      IN NUMBER    DEFAULT 1,
```

```

capture_sts           IN BOOLEAN  DEFAULT FALSE,
sts_cap_interval      IN NUMBER   DEFAULT 300,
rac_mode              IN NUMBER   DEFAULT GLOBAL_SYNC,
query_only            IN BOOLEAN  DEFAULT FALSE);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
synchronization      IN VARCHAR2  DEFAULT 'SCN',
connect_time_scale    IN NUMBER   DEFAULT 100,
think_time_scale      IN NUMBER   DEFAULT 100,
think_time_auto_correct IN BOOLEAN  DEFAULT TRUE,
scale_up_multiplier   IN NUMBER   DEFAULT 1,
capture_sts           IN BOOLEAN  DEFAULT FALSE,
sts_cap_interval      IN NUMBER   DEFAULT 300),
rac_mode              IN NUMBER   DEFAULT GLOBAL_SYNC,
query_only            IN BOOLEAN  DEFAULT FALSE);

```

Parameters

Table 193-25 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	<p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> 'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> TRUE means 'SCN' FALSE means 'TIME'
connect_time_scale	<p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 193-1".</p>
think_time_scale	<p>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "Example 193-2".</p>

Table 193-25 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
<code>think_time_auto_correct</code>	Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. <code>DEFAULT</code> is <code>TRUE</code> which is to reduce think time if replay goes slower than capture. See "Example 193-3".
<code>scale_up_multiplier</code>	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code> . However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.
<code>capture_sts</code>	If this parameter is <code>TRUE</code> , then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the EXPORT_AWR Procedure along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges (<code>ADMINISTER SQL TUNING SET</code>). The default value is <code>FALSE</code> .
<code>sts_cap_interval</code>	Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.
<code>rac_mode</code>	Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: <ul style="list-style-type: none"> <code>GLOBAL_SYNC</code> — Synchronization across all Oracle RAC instances. This is the default value. <code>PER_INSTANCE_CLIENT</code> — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance. <code>PER_INSTANCE_SYNC</code> — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance
<code>query_only</code>	Replays only the read-only queries of the workload capture. The default value is <code>FALSE</code> .

Usage Notes

- Prerequisites:
 - The database has been initialized for replay using the [INITIALIZE_REPLAY Procedure](#).
 - Any capture time connection strings that require remapping have been already done using the [REMAP_CONNECTION Procedure](#).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to `scale_up_multiplier`:
 - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.

- The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
- Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
- No replay data or error divergence records are generated for the scale-up sessions.
- All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Example 193-1 Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the `connect_time_scale` is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the `connect_time_scale` is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

Example 193-2 Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
       previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
       call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
```

```

call
12:35 : Third user call completes in 9m (takes a minute longer)

```

Example 193-3 Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```

12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m

```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```

12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
call took) after the completion of prev call
12:52 : Third user call completes in 8m

```

193.3.29 PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place.

Syntax

```

DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
  capture_dir      IN  VARCHAR2,
  parallel_level   IN  NUMBER DEFAULT NULL,
  synchronization IN  VARCHAR2 DEFAULT 'SCN',
  plsqli_mode      IN  VARCHAR2 DEFAULT 'TOP_LEVEL');

```

Parameters

Table 193-26 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
capture_dir	(Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.
parallel_level	Number of Oracle processes used to process the capture in parallel. The NULL default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.

Table 193-26 (Cont.) PROCESS_CAPTURE Procedure Parameters

Parameter	Description
synchronization	<p>Determines the synchronization mode that the user will be able to use for replay:</p> <ul style="list-style-type: none"> 'TIME' — When 'TIME' is selected, the replay can use 'TIME' synchronization mode only. When 'TIME' synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time). 'SCN' — When 'SCN' is selected, the replay can use the 'TIME' or 'SCN' synchronization mode. This is the default. When 'SCN' synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode. 'OBJECT_ID' — When 'OBJECT_ID' is selected, replay can use the 'TIME', 'SCN', or 'OBJECT_ID' synchronization mode. When 'OBJECT_ID' synchronization mode is used for replay, every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables. This synchronization mode is deprecated.
plsql_mode	<p>Specifies the processing mode for PL/SQL:</p> <ul style="list-style-type: none"> 'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay. 'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the [INITIALIZE_REPLAY Procedure](#) in order to replay the captured workload present in capture_dir.

- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

- For encrypted capture, the `PROCESS_CAPTURE` procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

193.3.30 REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    connection_id      IN NUMBER,
    replay_connection  IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    capture_number    IN VARCHAR2,
    connection_id     IN NUMBER,
    replay_connection  IN VARCHAR2);
```

Parameters

Table 193-27 REMAP_CONNECTION Procedure Parameters

Parameter	Description
<code>capture_number</code>	Pointing to a capture of the current replay schedule
<code>connection_id</code>	ID of the connection to be remapped. Corresponds to <code>DBA_WORKLOAD_CONNECTION_MAP.CONN_ID</code> .
<code>replay_connection</code>	New connection string to be used during replay

Usage Notes

- Prior to calling `REMAP_CONNECTION` all replay connection strings are set to `NULL` by default. If a `replay_connection` is `NULL`, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable `TNS_ADMIN` is defined and the user does not call the [REMAP_CONNECTION Procedure](#), then the `wrc` executable will connect to the server specified in the `tnsnames.ora` file pointed to by `TNS_ADMIN`.
- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as

net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.

- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

193.3.31 REMOVE_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number    IN    NUMBER);
```

Parameters

Table 193-28 REMOVE_CAPTURE Procedure Parameters

Parameter	Description
<code>schedule_capture_number</code>	Unique ID that identifies this capture within this schedule

193.3.32 REMOVE_SCHEDULE_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD_SCHEDULE_ORDERING Function](#) (`schedule_capture_id, waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waitfor_capture_id` finishes.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (
    schedule_capture_id    IN    NUMBER,
    waitfor_capture_id    IN    NUMBER);
```

Parameters

Table 193-29 REMOVE_SCHEDULE_ORDERING Procedure Parameters

Parameter	Description
<code>schedule_capture_id</code>	Points to a capture that has been added to the current replay schedule (see procedure description).
<code>waitfor_capture_id</code>	Points to a capture that has been added to the current replay schedule.

Usage Notes

Prerequisites:

- The [BEGIN_REPLAY_SCHEDULE Procedure](#) must have been called.
- The replay schedule order should have already been added using the [ADD_SCHEDULE_ORDERING Function](#).

193.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
    replay_id          IN NUMBER,
    format             IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 193-30 REPORT Function Parameters

Parameter	Description
replay_id	(Mandatory) Specifies the ID of the workload replay whose report is requested.
format	(Mandatory) Specifies the report format. Valid values: <ul style="list-style-type: none"> • HTML - Generates the HTML version of the report • XML - Generates the XML version of the report • TEXT - Generates the text version of the report

Return Values

The report body in the desired format returned as a CLOB

193.3.34 RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the [PAUSE_REPLAY Procedure](#) must have already been issued.

193.3.35 REUSE_REPLAY_FILTER_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the [ADD_SCHEDULE_ORDERING Function](#).

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the [CREATE_FILTER_SET Procedure](#) to create a new filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET (
    replay_dir IN VARCHAR2,
    filter_set IN VARCHAR2);
```

Parameters

Table 193-31 REUSE_REPLAY_FILTER_SET Procedure Parameters

Parameter	Description
replay_dir	Capture ID of the existing filter set with which it is associated
filter_set	Name of the filter set to be reused

Related Topics

- [ADD_SCHEDULE_ORDERING Function](#)
This function adds a schedule order between two captures.

193.3.36 SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER (
    pname IN VARCHAR2,
    pvalue IN BOOLEAN);
```

Parameters

Table 193-32 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

'DO_NO_WAIT_COMMITS': (default: FALSE)

This parameter controls whether the `COMMIT` issued by replay sessions is `NOWAIT`. The default value for this parameter is `FALSE`. In this case all the `COMMITs` are issued with the mode they were captured (`wait`, `no-wait`, `batch`, `no-batch`). If the parameter is set to `TRUE`, then all `COMMITs` are issued in `no-wait` mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent `COMMITs`. Setting the parameter to `TRUE` will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

Related Topics

- [PREPARE_REPLAY Procedure](#)
This procedure puts the database state in `PREPARE FOR REPLAY` mode.

193.3.37 SET_REPLAY_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
    replay_dir IN VARCHAR2);
```

Parameters

Table 193-33 SET_REPLAY_DIRECTORY Procedure Parameters

Parameter	Description
<code>replay_dir</code>	Name of the OS directory containing the captures for a workload consolidation

193.3.38 SET_REPLAY_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled OUT BOOLEAN DEFAULT TRUE,
    min_delay OUT NUMBER DEFAULT 10,
    max_delay OUT NUMBER DEFAULT 120,
    delay_factor OUT NUMBER DEFAULT 8);
```

Parameters

Table 193-34 SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
<code>enabled</code>	<code>TRUE</code> to enable the timeout action, and <code>FALSE</code> to disable.
<code>min_delay</code>	Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code> . Default = 10.

Table 193-34 (Cont.) SET_REPLAY_TIMEOUT Procedure Parameters

Parameter	Description
max_delay	Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.
delay_factor	Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8.

Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.
- Once a replay timeout action is enabled, a user call will exit with ORA-15569 if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
 - The timeout action has no effect if it is not enabled.
 - If the call delay in minutes is less than a lower bound specified by parameter min_delay, then the timeout action is non-operational.
 - If the delay in minutes is more than an upper bound specified by parameter max_delay, the timeout action will abort the user call and throw ORA-15569.
 - For delay that is between the lower bound and upper bound, the user call will abort with ORA-15569 only when the current replay elapsed time is more than the product of capture elapsed time and parameter delay_factor.

193.3.39 SET_SQL_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

Syntax

```
PROCEDURE SET_SQL_MAPPING (
  schedule_cap_id    IN NUMBER,
  sql_id             IN VARCHAR2,
  operation          IN VARCHAR2,
  replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

```
PROCEDURE SET_SQL_MAPPING (
  sql_id             IN VARCHAR2,
  operation          IN VARCHAR2,
  replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 193-35 SET_SQL_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of a capture in the schedule
sql_id	SQL identifier of the SQL statement at the time of capture
operation	Directs that one of the following actions be performed for the specified statement during database replay: <ul style="list-style-type: none"> 'SKIP' — Skip the SQL statement identified by sql_id 'REPLACE' — Replace this SQL statement identified by sql_id with the SQL statement in the replacement_sql_text parameter

Usage Notes

- replacement_sql_text: When 'SKIP' is specified for the operation parameter, this parameter is NULL. When 'REPLACE' is specified for the operation parameter, this parameter's value is the SQL statement to be used.
- schedule_cap_id is used for consolidated replay.

193.3.40 SET_USER_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    schedule_cap_id    IN NUMBER,
    capture_user       IN VARCHAR2,
    replay_user        IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    capture_user       IN VARCHAR2,
    replay_user        IN VARCHAR2);
```

Parameters

Table 193-36 SET_USER_MAPPING Procedure Parameters

Parameter	Description
schedule_cap_id	ID of the a capture in the schedule
capture_user	User name during the time of the workload capture
replay_user	User name to which captured user is remapped during replay.

Usage Notes

- A `schedule_cap_id` of `NULL` is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:

```
SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
```

- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute

```
DELETE * FROM DBA_WORKLOAD_USER_MAP
```

193.3.41 START_CONSOLIDATED_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

Usage Notes

Prerequisites:

- The call to the [PREPARE_REPLAY Procedure](#) was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.

193.3.42 START_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
 - The call to the [PREPARE_REPLAY Procedure](#) was already issued.

- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

```
$ wrc mode=calibrate replaydir=.
```

193.3.43 USE_FILTER_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  capture_number IN VARCHAR2,
  filter_set     IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
  filter_set     IN VARCHAR2);
```

Parameters

Table 193-37 USE_FILTER_SET Procedure Parameters

Parameter	Description
<code>capture_number</code>	Pointing to a capture of the current replay schedule
<code>filter_set</code>	Name of the filter set

Usage Notes

The filter set must have been created by calling the [CREATE_FILTER_SET Procedure](#).

DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS_WORKLOAD_REPOSITORY Subprograms](#)

See Also:

Oracle Database Performance Tuning Guide for more information about the Automatic Workload Repository

194.1 DBMS_WORKLOAD_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

194.2 DBMS_WORKLOAD_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

OBJECT Types

- [AWR_BASELINE_METRIC_TYPE](#) Object Type

TABLE Types

- [AWR_BASELINE_METRIC_TYPE_TABLE](#) Table Type
- [AWRRPT_INSTANCE_LIST_TYPE](#) Table Type

194.2.1 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (
  baseline_name      VARCHAR2(64),
  dbid               NUMBER NOT NULL,
  instance_number    NUMBER NOT NULL,
  beg_time           DATE NOT NULL,
  end_time           DATE NOT NULL,
  metric_id          NUMBER NOT NULL,
  metric_name        VARCHAR2(64) NOT NULL,
  metric_unit        VARCHAR2(64) NOT NULL,
  num_interval       NUMBER NOT NULL,
  interval_size      NUMBER NOT NULL,
  average            NUMBER NOT NULL,
  minimum            NUMBER NOT NULL,
  maximum            NUMBER NOT NULL);
```

Fields

Table 194-1 AWR_BASELINE_METRIC_TYPE Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

194.2.2 DBMS_WORKLOAD_REPOSITORY AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRIC Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Related Topics

- [SELECT_BASELINE_METRIC Function](#)
This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

194.2.3 DBMS_WORKLOAD_REPOSITORY AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

194.3 Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

This table lists the DBMS_WORKLOAD_REPOSITORY subprograms and briefly describes them.

Table 194-2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure	Adds a colored SQL ID
ASH_GLOBAL_REPORT_HTML Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function	Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format.
ASH_REPORT_ANALYTICS Function	Displays the ASH Analytics active report
ASH_REPORT_HTML Function	Displays the ASH report in HTML
ASH_REPORT_TEXT Function	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function	Displays the AWR Diff-Diff report in text
AWR_GLOBAL_DIFF_REPORT_HTML Functions	Displays the Global AWR Compare Periods Report in HTML

Table 194-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
AWR_GLOBAL_DIFF_REPORT_TEXT Functions	Displays the Global AWR Compare Periods Report in text
AWR_EXP Procedure	Extracts AWR data from the AWR schema into a dump file.
AWR_GLOBAL_REPORT_HTML Functions	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions	Displays the Global AWR report in text
AWR_IMP Procedure	Loads the AWR data from a dump file into the SYS schema.
AWR_REPORT_HTML Function	Displays the AWR report in HTML
AWR_REPORT_TEXT Function	Displays the AWR report in text
AWR_SET_REPORT_THRESHOLD S Procedure	Configures specified report thresholds, including the number of rows in the report
AWR_SQL_REPORT_HTML Function	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function	Displays the AWR SQL Report in text format
CONTROL_RESTRICTED_SNAPSHOT Procedure	Controls the AWR snapshot creation for a database in the <i>restricted session</i> mode.
CREATE_BASELINE Functions & Procedures	Creates a single baseline
CREATE_BASELINE_TEMPLATE Procedures	Creates a baseline template
CREATE_REMOTE_SNAPSHOT Function and Procedure	Creates a manual <i>remote</i> snapshot immediately using the Remote Management Framework (RMF)
CREATE_SNAPSHOT Function and Procedure	Creates a manual <i>local</i> snapshot immediately
DROP_BASELINE Procedure	Drops a previously-defined baseline
DROP_BASELINE_TEMPLATE Procedure	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure	Drops a range of snapshots
LOCAL_AWR_DBID Function	Returns the database identifier for the local AWR database
MODIFY_BASELINE_WINDOW_SIZE Procedure	Modifies the window size for the Default Moving Window Baseline
MODIFY_SNAPSHOT_SETTINGS Procedures	Modifies the snapshot settings
PURGE_SQL_DETAILS Procedure	Purges SQL details, specifically rows from <code>WRH\$_SQLTEXT</code> and <code>WRH\$_SQL_PLAN</code> that do not have corresponding rows (DBID, SQL_ID) in <code>WRH\$_SQLSTAT</code> .
REGISTER_REMOTE_DATABASE Procedures	Registers a remote database in the AWR using the Remote Management Framework (RMF)
REMOVE_COLORED_SQL Procedure	Removes a colored SQL ID
RENAME_BASELINE Procedure	Renames a baseline

Table 194-2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
SELECT_BASELINE_DETAILS Function	Shows the values of the metrics corresponding to a baseline for a range of snapshots
SELECT_BASELINE_METRIC Function	Shows the values of the metrics corresponding to a baseline for all the snapshots
UNREGISTER_REMOTE_DATABASE Procedures	Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF)
UPDATE_DATAFILE_INFO Procedure	Updates the data file and tablespace information stored in the AWR with the current information in the database
UPDATE_OBJECT_INFO Procedure	Updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database

194.3.1 ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a *TOP SQL*). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the [REMOVE_COLORED_SQL Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL (
    sql_id          IN VARCHAR2,
    dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 194-3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional DBID, defaults to Local DBID

194.3.2 ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML (
    l_dbid          IN NUMBER,
    l_inst_num      IN VARCHAR2 ((1023)),
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER      DEFAULT 0,
```

```

l_slot_width    IN NUMBER    DEFAULT 0,
l_sid           IN NUMBER    DEFAULT NULL,
l_sql_id       IN VARCHAR2   DEFAULT NULL,
l_wait_class    IN VARCHAR2   DEFAULT NULL,
l_service_hash  IN NUMBER    DEFAULT NULL,
l_module       IN VARCHAR2   DEFAULT NULL,
l_action       IN VARCHAR2   DEFAULT NULL,
l_client_id    IN VARCHAR2   DEFAULT NULL,
l_plsql_entry   IN VARCHAR2   DEFAULT NULL,
l_data_src     IN NUMBER    DEFAULT 0,
l_container    IN VARCHAR2   DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 194-4 *ASH_GLOBAL_REPORT_HTML Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instances (such as '1, 2, 3'), or NULL to report on all instances in the database
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Ignored since the report works off of data on disk only
<code>l_container</code>	Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 194-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

194.3.3 ASH_GLOBAL_REPORT_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
    l_dbid          IN VARCHAR2(1023),
    l_inst_num     IN NUMBER,
```

```

l_btime      IN DATE,
l_etime      IN DATE,
l_options    IN NUMBER    DEFAULT 0,
l_slot_width IN NUMBER    DEFAULT 0,
l_sid        IN NUMBER    DEFAULT NULL,
l_sql_id     IN VARCHAR2  DEFAULT NULL,
l_wait_class IN VARCHAR2  DEFAULT NULL,
l_service_hash IN NUMBER   DEFAULT NULL,
l_module     IN VARCHAR2  DEFAULT NULL,
l_action     IN VARCHAR2  DEFAULT NULL,
l_client_id  IN VARCHAR2  DEFAULT NULL,
l_plsql_entry IN VARCHAR2  DEFAULT NULL,
l_data_src   IN NUMBER    DEFAULT 0,
l_container  IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 194-6 *ASH_GLOBAL_REPORT_TEXT* Parameters

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Ignored since the report works off of data on disk only

Table 194-6 (Cont.) ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
<code>l_container</code>	<p>Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code>. Behavior is as follows:</p> <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2 (320)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Table 194-7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes

Table 194-7 (Cont.) ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_plsql_entry</code>	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

194.3.4 ASH_REPORT_ANALYTICS Function

This function returns the ASH Analytics active report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS(
  dbid          IN NUMBER DEFAULT NULL,
  inst_id       IN NUMBER DEFAULT NULL,
  begin_time    IN DATE,
  end_time      IN DATE,
  report_level  IN VARCHAR2 DEFAULT NULL,
  filter_list   IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 194-8 ASH_REPORT_ANALYTICS Parameters

Parameter	Description
<code>dbid</code>	Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.
<code>inst_id</code>	Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL.
<code>begin_time</code>	The start time of the interval for which the ASH report is required.
<code>end_time</code>	The end time of the interval for which the ASH report is required.
<code>report_level</code>	Describes the list of components to build.
<code>filter_list</code>	Describes the list of filters to apply. Its default value is NULL (no filters to apply).

Return Values

Returns the ASH Analytics active report.

194.3.5 ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num     IN NUMBER,
  l_btime        IN DATE,
  l_etime        IN DATE,
  l_options      IN NUMBER   DEFAULT 0,
  l_slot_width   IN NUMBER   DEFAULT 0,
  l_sid          IN NUMBER   DEFAULT NULL,
  l_sql_id       IN VARCHAR2 DEFAULT NULL,
  l_wait_class   IN VARCHAR2 DEFAULT NULL,
  l_service_hash IN NUMBER   DEFAULT NULL,
  l_module       IN VARCHAR2 DEFAULT NULL,
  l_action       IN VARCHAR2 DEFAULT NULL,
  l_client_id    IN VARCHAR2 DEFAULT NULL,
  l_plsql_entry  IN VARCHAR2 DEFAULT NULL,
  l_data_src     IN NUMBER   DEFAULT 0,
  l_container    IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 194-9 *ASH_REPORT_HTML Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)

Table 194-9 (Cont.) ASH_REPORT_HTML Parameters

Parameter	Description
<code>l_data_src</code>	<p>Can be used to specify a data source (see Usage Notes)</p> <ul style="list-style-type: none"> • 1 => memory (V\$ACTIVE_SESSION_HISTORY) • 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
<code>l_container</code>	<p>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V\$CONTAINERS. Behavior is as follows:</p> <ul style="list-style-type: none"> • If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to

generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 194-10 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V\$SESSION.SID)	No
l_sql_id	SQL ID (for example, V\$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V\$SESSION.MODULE)	Yes
l_action	Action name (for example, V\$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER)	Yes

194.3.6 ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT (
  l_dbid          IN NUMBER,
  l_inst_num     IN NUMBER,
  l_btime        IN DATE,
  l_etime        IN DATE,
  l_options      IN NUMBER      DEFAULT 0,
  l_slot_width   IN NUMBER      DEFAULT 0,
  l_sid          IN NUMBER      DEFAULT NULL,
  l_sql_id       IN VARCHAR2    DEFAULT NULL,
  l_wait_class   IN VARCHAR2    DEFAULT NULL,
  l_service_hash IN NUMBER      DEFAULT NULL,
  l_module       IN VARCHAR2    DEFAULT NULL,
  l_action       IN VARCHAR2    DEFAULT NULL,
  l_client_id    IN VARCHAR2    DEFAULT NULL,
  l_plsql_entry  IN VARCHAR2    DEFAULT NULL,
  l_data_src     IN NUMBER      DEFAULT 0,
  l_container    IN VARCHAR2    DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 194-11 ASH_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier

Table 194-11 (Cont.) ASH_REPORT_TEXT Parameters

Parameter	Description
<code>l_inst_num</code>	Instance number
<code>l_btime</code>	The 'begin time'
<code>l_etime</code>	The 'end time'
<code>l_options</code>	Report level (currently not used)
<code>l_slot_width</code>	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between <code>l_btime</code> and <code>l_etime</code> is appropriately split into not more than 10 slots.
<code>l_sid</code>	Session ID (see Usage Notes)
<code>l_sql_id</code>	SQL ID (see Usage Notes)
<code>l_wait_class</code>	Wait class name (see Usage Notes)
<code>l_service_hash</code>	Service name hash (see Usage Notes)
<code>l_module</code>	Module name (see Usage Notes)
<code>l_action</code>	Action name (see Usage Notes)
<code>l_client_id</code>	Client ID for end-to-end backtracing (see Usage Notes)
<code>l_plsql_entry</code>	PL/SQL entry point (see Usage Notes)
<code>l_data_src</code>	Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> • 1 => memory (<code>V\$ACTIVE_SESSION_HISTORY</code>) • 2 => disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>) • 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.
<code>l_container</code>	Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> • If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB. • If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB. <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p>

Return Values

The output will be one column of `VARCHAR2 (80)`.

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or

disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_time` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Table 194-12 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code>)	Yes
<code>l_data_src</code>	Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

194.3.7 AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
    dbid1      IN NUMBER,
    inst_num1  IN NUMBER,
    bid1       IN NUMBER,
    eid1       IN NUMBER,
    dbid2      IN NUMBER,
    inst_num2  IN NUMBER,
    bid2       IN NUMBER,
    eid2       IN NUMBER)
RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 194-13 *AWR_DIFF_REPORT_HTML Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrddrpt.sql` script which prompts users for the required information.

194.3.8 AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
    dbid1      IN NUMBER,
    inst_num1  IN NUMBER,
    bid1       IN NUMBER,
    eid1       IN NUMBER,
    dbid2      IN NUMBER,
```

```

inst_num2 IN NUMBER,
bid2      IN NUMBER,
eid2      IN NUMBER)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 194-14 *AWR_DIFF_REPORT_TEXT Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrdrpt.sql` script which prompts users for the required information.

194.3.9 AWR_EXP Procedure

This procedure extracts AWR data from the AWR schema and dump the information into a file. You can specify the snapshot range for the data that you want to extract.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_EXP (
  dmpfile      IN   VARCHAR2  DEFAULT 'awrdat',
  dmpdir       IN   VARCHAR2  DEFAULT 'DATA_PUMP_DIR',
  dbid         IN   NUMBER     DEFAULT NULL,
  bid          IN   NUMBER     DEFAULT 1,
  eid         IN   NUMBER     DEFAULT 1000000);
```

Parameters

Table 194-15 *AWR_EXP Procedure Parameters*

Parameter	Description
dmpfile	The prefix for the name of the extract dump file and log file. The name of the dump file where all the data from the AWR table will be written is <code>dmpfile.dmp</code> . The <code>dmpfile.log</code> log file shows the status of the export job. The default value for the prefix is <code>awrdat</code> .

Table 194-15 (Cont.) AWR_EXP Procedure Parameters

Parameter	Description
dmpdir	Name of the Directory Object for the file system directory where the extract dump file will be written. The list of Directory Objects can be queried using the DBA_DIRECTORIES view, and a new directory object can be created using the following command: create directory dmpdir as '/directory/path'. The default value is DATA_PUMP_DIR.
dbid	The database ID for the snapshots that you want to export. The default value is NULL, for the local database ID.
bid	The begin snapshot ID for snapshots to be exported. The default value is 1.
eid	The end Snapshot Id for snapshots to be exported. The default value is 10000000.

194.3.10 AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 194-16 *AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters*

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (1500).

194.3.11 AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN    NUMBER,
    inst_num1  IN    AWRRPT_INSTANCE_LIST_TYPE,
    bid1       IN    NUMBER,
    eid1       IN    NUMBER,
    dbid2      IN    NUMBER,
    inst_num2  IN    AWRRPT_INSTANCE_LIST_TYPE,
    bid2       IN    NUMBER,
    eid2       IN    NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN    NUMBER,
    inst_num1  IN    VARCHAR2,
    bid1       IN    NUMBER,
    eid1       IN    NUMBER,
    dbid2      IN    NUMBER,
    inst_num2  IN    VARCHAR2,
    bid2       IN    NUMBER,
    eid2       IN    NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 194-17 AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st beginning snapshot ID
eid1	1st ending snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd beginning snapshot ID
eid2	2nd ending snapshot ID

Return Values

The output will be one column of VARCHAR2 (320).

194.3.12 AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    AWRRPT_INSTANCE_LIST_TYPE,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    VARCHAR2,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 194-18 *AWR_GLOBAL_REPORT_HTML Function Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_options</code>	Report level (currently not used)

Return Values

The output will be one column of `VARCHAR2(1500)`.

194.3.13 AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid          IN    NUMBER,
    l_inst_num      IN    AWRRPT_INSTANCE_LIST_TYPE,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
    l_dbid          IN    NUMBER,
    l_inst_num      IN    VARCHAR2,
    l_bid           IN    NUMBER,
    l_eid           IN    NUMBER,
    l_options       IN    NUMBER DEFAULT 0)
RETURN awdrpt_text_type_table PIPELINED;
```

Parameters

Table 194-19 *AWR_GLOBAL_REPORT_TEXT Function Parameters*

Parameter	Description
<code>l_dbid</code>	Database identifier

Table 194-19 (Cont.) AWR_GLOBAL_REPORT_TEXT Function Parameters

Parameter	Description
<code>l_inst_num</code>	List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_options</code>	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2 (320)`.

194.3.14 AWR_IMP Procedure

This procedure loads the AWR data from a dump file into the `SYS` schema.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_IMP (
    dmpfile      IN   VARCHAR2   DEFAULT 'awrdat',
    dmpdir       IN   VARCHAR2   DEFAULT 'DATA_PUMP_DIR',
    new_dbid     IN   NUMBER     DEFAULT NULL);
```

Parameters

Table 194-20 AWR_IMP Procedure Parameters

Parameter	Description
<code>dmpfile</code>	The prefix for the name of the dump file and log file. This file will be the source of the imported AWR data. The default value is <code>awrdat</code> .
<code>dmpdir</code>	The name of the Directory Object for the file system directory where the load dump file is located. The default value is <code>DATA_PUMP_DIR</code> .
<code>new_dbid</code>	The database ID to be used instead of existing database ID.

194.3.15 AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML (
    l_dbid      IN   NUMBER,
    l_inst_num  IN   NUMBER,
    l_bid       IN   NUMBER,
    l_eid       IN   NUMBER,
```

```

l_options IN NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 194-21 *AWR_REPORT_HTML Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2 (1500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

194.3.16 AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```

DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;

```

Parameters

Table 194-22 *AWR_REPORT_TEXT Parameters*

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID

Table 194-22 (Cont.) AWR_REPORT_TEXT Parameters

Parameter	Description
<code>l_options</code>	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> <code>l_options - 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2 (80)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

194.3.17 AWR_SET_REPORT_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (
  top_n_events      IN  NUMBER DEFAULT NULL,
  top_n_files       IN  NUMBER DEFAULT NULL,
  top_n_segments    IN  NUMBER DEFAULT NULL,
  top_n_services    IN  NUMBER DEFAULT NULL,
  top_n_sql          IN  NUMBER DEFAULT NULL,
  top_n_sql_max     IN  NUMBER DEFAULT NULL,
  top_sql_pct       IN  NUMBER DEFAULT NULL,
  shmem_threshold   IN  NUMBER DEFAULT NULL,
  versions_threshold IN  NUMBER DEFAULT NULL,
  top_n_disks       IN  NUMBER DEFAULT NULL,
  outlier_pct       IN  NUMBER DEFAULT NULL,
  outlier_cpu_pct   IN  NUMBER DEFAULT NULL);
```

Parameters

Table 194-23 AWR_SET_REPORT_THRESHOLDS Procedure Parameters

Parameter	Description
<code>top_n_events</code>	Number of most significant wait events to be included
<code>top_n_files</code>	Number of most active files to be included
<code>top_n_segments</code>	Number of most active segments to be included
<code>top_n_services</code>	Number of most active services to be included
<code>top_n_sql</code>	Number of most significant SQL statements to be included
<code>top_n_sql_max</code>	Number of SQL statements to be included if their activity is greater than that specified by <code>top_sql_pct</code>

Table 194-23 (Cont.) AWR_SET_REPORT_THRESHOLDS Procedure Parameters

Parameter	Description
top_sql_pct	Significance threshold for SQL statements between top_n_sql and top_n_sql_max
shmem_threshold	Shared memory low threshold
versions_threshold	Plan version count low threshold
top_n_disks	Number of cell disks with most I/O
outlier_pct	Percentage of maximum capacity before displaying outliers for Exadata sections
outlier_cpu_pct	Threshold for mean percentage CPU to display outliers

User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR_SET_REPORT_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

194.3.18 AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML (
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_sqlid    IN    VARCHAR2,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters**Table 194-24 AWR_SQL_REPORT_HTML Parameters**

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	Beginning snapshot ID
l_eid	Ending snapshot ID
l_sqlid	SQL ID of statement to be analyzed

Table 194-24 (Cont.) AWR_SQL_REPORT_HTML Parameters

Parameter	Description
<code>l_options</code>	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2 (500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

194.3.19 AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT (
  l_dbid      IN      NUMBER,
  l_inst_num  IN      NUMBER,
  l_bid       IN      NUMBER,
  l_eid       IN      NUMBER,
  l_sqlid     IN      VARCHAR2,
  l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 194-25 AWR_SQL_REPORT_TEXT Parameters

Parameter	Description
<code>l_dbid</code>	Database identifier
<code>l_inst_num</code>	Instance number
<code>l_bid</code>	Beginning snapshot ID
<code>l_eid</code>	Ending snapshot ID
<code>l_sqlid</code>	SQL ID of statement to be analyzed
<code>l_options</code>	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of `VARCHAR2 (120)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

194.3.20 CONTROL_RESTRICTED_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

Note:

To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT (
    allow IN BOOLEAN);
```

Parameters

Table 194-26 CONTROL_RESTRICTED_SNAPSHOT Parameters

Parameter	Description
allow	This parameter can have one of the following values: <ul style="list-style-type: none"> TRUE: AWR snapshots can be created for the database in the <i>restricted session</i> mode. FALSE: AWR snapshots cannot be created for the database in the <i>restricted session</i> mode.

194.3.21 CREATE_BASELINE Functions and Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_snap_id    IN    NUMBER,
    end_snap_id      IN    NUMBER,
    baseline_name    IN    VARCHAR2,
    dbid             IN    NUMBER DEFAULT NULL,
    expiration       IN    NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_snap_id    IN    NUMBER,
    end_snap_id      IN    NUMBER,
    baseline_name    IN    VARCHAR2,
    dbid             IN    NUMBER DEFAULT NULL,
    expiration       IN    NUMBER DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (
    start_time       IN    DATE,
```

```

end_time          IN DATE,
baseline_name    IN VARCHAR2,
dbid             IN NUMBER DEFAULT NULL,
expiration       IN NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  dbid           IN NUMBER DEFAULT NULL,
  expiration     IN NUMBER DEFAULT NULL);
RETURN NUMBER;

```

Parameters

Table 194-27 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline.
end_snap_id	End snapshot sequence number for the baseline.
start_time	Start time for the baseline.
end_time	End time for the baseline.
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```

EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                    end_snap_id   => 107,
                                                    baseline_name =>
'oltp_peakload_bl');

```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

194.3.22 CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
    start_time          IN DATE,
    end_time            IN DATE,
    baseline_name       IN VARCHAR2,
    template_name       IN VARCHAR2,
    expiration          IN NUMBER,
    dbid                IN NUMBER  DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
    day_of_week         IN VARCHAR2,
    hour_in_day         IN NUMBER,
    duration            IN NUMBER,
    start_time          IN DATE,
    end_time            IN DATE,
    baseline_name_prefix IN VARCHAR2,
    template_name       IN VARCHAR2,
    expiration          IN NUMBER,
    dbid                IN NUMBER  DEFAULT NULL);
```

Parameters

Table 194-28 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

194.3.23 CREATE_REMOTE_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_id      IN NUMBER,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_id      IN NUMBER,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_name    IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT');

DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_name    IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL,
    flush_level  IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

Parameters

Table 194-29 CREATE_REMOTE_SNAPSHOT Parameters

Parameter	Description
node_id	RMF node identifier of the database for which the snapshot needs to be created.
node_name	RMF node name of the database for which the snapshot needs to be created.
topology_name	RMF topology name of the database for which the snapshot needs to be created.
flush_level	The flush level can be one of the following: <ul style="list-style-type: none"> BESTFIT: Uses the default value depending on the type of snapshot being taken. LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

194.3.24 CREATE_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER   DEFAULT NULL,
    source_name IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 194-30 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	<p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> BESTFIT: Uses the default value depending on the type of snapshot being taken. LITE: Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container. TYPICAL: Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database. ALL: Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.
dbid	Database ID of the database for which the snapshot needs to be created.
source_name	Name of the database for which the snapshot needs to be created.

Examples

This example creates a snapshot of the local database with the flush level of ALL:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the DBA_HIST_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

194.3.25 DROP_BASELINE Procedure

This procedure drops a previously-defined baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
  baseline_name IN VARCHAR2,
  cascade      IN BOOLEAN DEFAULT FALSE,
  dbid         IN NUMBER  DEFAULT NULL);
```

Parameters

Table 194-31 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database ID for which the baseline needs to be dropped (defaults to local DBID).

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
  baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

194.3.26 DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE (
  template_name IN VARCHAR2,
  dbid          IN NUMBER  DEFAULT NULL);
```

Parameters

Table 194-32 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
template_name	Name of the template to remove
dbid	Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL.

194.3.27 DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE (
    low_snap_id    IN NUMBER,
    high_snap_id   IN NUMBER,
    dbid           IN NUMBER   DEFAULT NULL);
```

Parameters

Table 194-33 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (defaults to local DBID).

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

194.3.28 LOCAL_AWR_DBID Function

This function returns the database identifier for the local AWR database.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID ()
RETURN NUMBER;
```

194.3.29 MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE (
    window_size    IN    NUMBER,
    dbid           IN    NUMBER    DEFAULT NULL);
```

Parameters

Table 194-34 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (defaults to local DBID).

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY_SNAPSHOT_SETTINGS Procedures](#) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

194.3.30 MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention      IN    NUMBER    DEFAULT NULL,
    interval       IN    NUMBER    DEFAULT NULL,
    topnsql        IN    NUMBER    DEFAULT NULL,
    dbid           IN    NUMBER    DEFAULT NULL,
    tablespace_name IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 194-35 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	<p>New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years).</p> <p>If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If NULL is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</p>
interval	<p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year).</p> <p>If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If NULL is specified, the current value is preserved.</p>
topnsql	<ul style="list-style-type: none"> • If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. • If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	<p>Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.</p>
tablespace_name	<p>Specify a user-defined tablespace for storing AWR data (snapshot data). If this parameter is not used, then AWR data is stored in the SYSAUX tablespace by default.</p>

Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
  interval => 60,
  retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

194.3.31 PURGE_SQL_DETAILS Procedure

This procedure purges SQL details, specifically rows from `WRH$_SQLTEXT`, `WRH$_SQL_PLAN`, and `WRH$_SQL_BIND_METADATA` that do not have corresponding rows (`DBID`, `SQL_ID`) in `WRH$_SQLSTAT`.

The subprogram calls for the `DBID` for which to run the purge. If the `DBID` is not specified, the database `DBID` is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS (
    numrows IN NUMBER DEFAULT NULL,
    dbid    IN NUMBER DEFAULT NULL);
```

Parameters

Table 194-36 PURGE_SQL_DETAILS Procedure Parameters

Parameter	Description
<code>numrows</code>	Number of rows
<code>dbid</code>	Database ID (default to local <code>DBID</code>)

194.3.32 REGISTER_REMOTE_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE (
    node_id IN NUMBER);
```

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE (
    node_name      IN VARCHAR2,
    topology_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 194-37 REGISTER_REMOTE_DATABASE Parameters

Parameter	Description
<code>node_id</code>	RMF node identifier of the database that needs to be registered in the AWR.
<code>node_name</code>	RMF node name of the database that needs to be registered in the AWR.

Table 194-37 (Cont.) REGISTER_REMOTE_DATABASE Parameters

Parameter	Description
topology_name	RMF topology name of the database that needs to be registered in the AWR.

Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

194.3.33 REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(
    sql_id          IN VARCHAR2,
    dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 194-38 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

194.3.34 RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
    old_baseline_name  IN VARCHAR2,
    new_baseline_name  IN VARCHAR2,
    dbid               IN NUMBER  DEFAULT NULL);
```

Parameters

Table 194-39 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name.
new_baseline_name	New baseline name.

Table 194-39 (Cont.) RENAME_BASELINE Procedure Parameters

Parameter	Description
dbid	Database ID for which the baseline needs to be renamed (defaults to local DBID).

194.3.35 SELECT_BASELINE_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS (
    l_baseline_id    IN NUMBER,
    l_begin_snap     IN NUMBER DEFAULT NULL,
    l_end_snap       IN NUMBER DEFAULT NULL,
    l_dbid           IN NUMBER DEFAULT NULL)
RETURN awrbl_details_type_table PIPELINED;
```

Parameters

Table 194-40 SELECT_BASELINE_DETAILS Function Parameters

Parameter	Description
l_baseline_id	ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.
l_begin_snap	Start snapshot sequence number for the baseline.
l_end_snap	End snapshot sequence number for the baseline.
l_dbid	Database identifier for the baseline. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.

194.3.36 SELECT_BASELINE_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC (
    l_baseline_name  IN VARCHAR2,
    l_dbid           IN NUMBER DEFAULT NULL,
    l_instance_num   IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;
```

Parameters

Table 194-41 SELECT_BASELINE_METRIC Function Parameters

Parameter	Description
<code>l_baseline_name</code>	Name of the baseline for which the metrics need to be viewed.
<code>l_dbid</code>	Database identifier for the baseline. If set to <code>NULL</code> , the database identifier for the local database is used. Default is <code>NULL</code> .
<code>l_instance_num</code>	The instance number for which the metrics need to be viewed. If set to <code>NULL</code> , metrics for the local database instance are shown. Default is <code>NULL</code> .

194.3.37 UNREGISTER_REMOTE_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_id          IN NUMBER,
    remote_check     IN BOOLEAN  DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_name        IN VARCHAR2,
    topology_name    IN VARCHAR2 DEFAULT NULL,
    remote_check     IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 194-42 UNREGISTER_REMOTE_DATABASE Parameters

Parameter	Description
<code>node_id</code>	Identifier of the remote database whose data needs to be removed from the AWR.
<code>node_name</code>	Name of the remote database whose data needs to be removed from the AWR.
<code>topology_name</code>	RMF topology name of the remote database.
<code>remote_check</code>	If set to <code>TRUE</code> , the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available. If set to <code>FALSE</code> , the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage).

Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

194.3.38 UPDATE_DATAFILE_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

194.3.39 UPDATE_OBJECT_INFO Procedure

This procedure updates rows of WRH\$_SEG_STAT_OBJ table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
    maxrows IN NUMBER DEFAULT 0);
```

Parameters

Table 194-43 UPDATE_OBJECT_INFO Procedure Parameters

Parameter	Description
maxrows	Maximum number of rows to be updated. Default= 0, meaning there is no limit.

DBMS_XA

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS_XA Subprograms](#)

See Also:

Oracle Database Advanced Application Developer's Guide for more information about "Developing Applications with Oracle XA"

195.1 DBMS_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

195.2 DBMS_XA Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

195.3 DBMS_XA Constants

The DBMS_XA package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in [Table 195-1](#) for use in the flag field of the [XA_START Function](#) and the [XA_END Function](#).

Table 195-1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in [Table 195-2](#) for Possible Return Values

Table 195-2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason

Table 195-2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVALID	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

195.4 DBMS_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so

that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

195.5 DBMS_XA Data Structures

The `DBMS_XA` package uses this `OBJECT` type and associated `TABLE` type.

OBJECT Types

- [DBMS_XA_XID Object Type](#)

TABLE Types

- [DBMS_XA_XID_ARRAY Table Type](#)

195.5.1 DBMS_XA DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

Note:

For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT (
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
    gtrid       IN  NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
    gtrid       IN  RAW,
    bqual       IN  RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
    formatid    IN  NUMBER,
```

```

        gtrid      IN    RAW,
        bqual     IN    RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
RETURN SELF AS RESULT)

```

Attributes

Table 195-3 DBMS_XA_XID Object Type

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

195.5.2 DBMS_XA DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

195.6 Summary of DBMS_XA Subprograms

This table lists the DBMS_XA subprograms and briefly describes them.

Table 195-4 DBMS_XA Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)
XA_COMMIT Function	Commits the global transaction specified by <code>xid</code>
XA_END Function	Disassociates the current session from the transaction branch specified by <code>xid</code>
XA_FORGET Function	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function	Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible
XA_RECOVER Function	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function	Sets the transaction timeout in seconds for the current session
XA_START Function	Associates the current session with the transaction branch specified by <code>xid</code>

195.6.1 DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

195.6.2 XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
    xid          IN DBMS_XA_XID,
    onePhase    IN BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 195-5 XA_COMMIT Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type
<code>onePhase</code>	If <code>TRUE</code> , apply single phase commit

Return Values

See [Table 195-2](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

195.6.3 XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (  
    xid    IN  DBMS_XA_XID,  
    flag  IN  PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 195-6 XA_END Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type
<code>flag</code>	See Table 195-1 .

Return Values

See [Table 195-2](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.
