This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate failsafe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

This software or hardware and documentation may provide access to or information on content, products and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Preface

This document will help you to install Oracle Banking Collections and Oracle Banking Recovery as an integrated module of Oracle Banking Platform. This document assumes that Oracle Banking Platform Presentation and Host environment are pre-installed.

This preface contains the following topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Organization of the Guide](#)
- [Related Documents](#)
- [Conventions](#)

Audience

This document is intended for the following audience:

- IT Deployment Team
- Consulting Staff
- Administrators

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/us/corporate/accessibility/index.html>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/us/corporate/accessibility/support/index.html#info> or visit <http://www.oracle.com/us/corporate/accessibility/support/index.html#trs> if you are hearing impaired.

Organization of the Guide

The information in this document is organized into the following chapters and appendices:

[Chapter 1 Introduction](#)

This chapter describes the Collections integration.

[Chapter 2 Installing the Host Media Pack](#)

This chapter describes the steps involved in installing the host media pack.

[Chapter 3 Installing the Presentation Media Pack](#)

This chapter describes the steps involved in installing the presentation media pack.

[Chapter 4 External Interface Configuration](#)

This chapter describes the steps involved in Oracle Identity Manager (OIM) Adapter configuration.

Chapter 5 Installing Third-Party Software

This chapter describes the required third-party software.

Chapter 6 User Creation in Oracle Internet Directory

This chapter describes the user creation in OID.

Chapter 7 Threadpool Configuration

This chapter provides information about threadpool configuration.

Related Documents

For more information, see the following documentation:

- For information on the configurations that are to be performed on day zero, see the Oracle Banking Platform Collections and Recovery Day Zero Setup Guide.
- For a brief description about user provisioning in Collections, see the Oracle Banking Platform Collections and Recovery User Provisioning Guide.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1 Introduction

This guide helps you to install Oracle Banking Collections and Oracle Banking Recovery for a seamless integration with Oracle Banking Platform.

2 Installing the Host Media Pack

You must follow the steps mentioned below to install the Host Media Pack:

1. Install the Host Media Pack 2.9.0.0.0
2. Update the environment.
3. Configure the WebLogic domain.

2.1 Prerequisites

Before you install the OB Collections and OB Recovery 2.9.0.0.0 Host Media Pack, you must have the following installed on the machine:

- OBP 2.9.0.0.0 Host Media Pack.
- OBP 2.9.0.0.0 Presentation Media Pack.
- Windows Secure Copy (WINS CP) to copy deliverables from Windows to Linux machine.
- Oracle Java Development Kit (JDK) 1.8 Update 172 (For more information on how to install Oracle JDK, see [Chapter 5 Installing Third-Party Software](#).)
- Manager, a PC X server that runs on the Windows platforms and helps launching X applications UI on a Windows desktop.
- OB Collections and OB Recovery database must be installed. For more information on installing or configuring database, see the Oracle Banking Platform Collections and Recovery DBA Guide.
- Download the hibernate-release-4.1.0.Final.zip file from:

<http://sourceforge.net/projects/hibernate/files/hibernate4/>

It is very important that you download the exact version, as the product has only been certified with this exact release.

2.2 Installing the OB Collections and OB Recovery Host Media Pack

The OB Collections and OB Recovery 2.9.0.0.0 installation package is used for installing both the OBP Host and Presentation Media Packs. You can download the installation package from the following location:

<https://edelivery.oracle.com/>

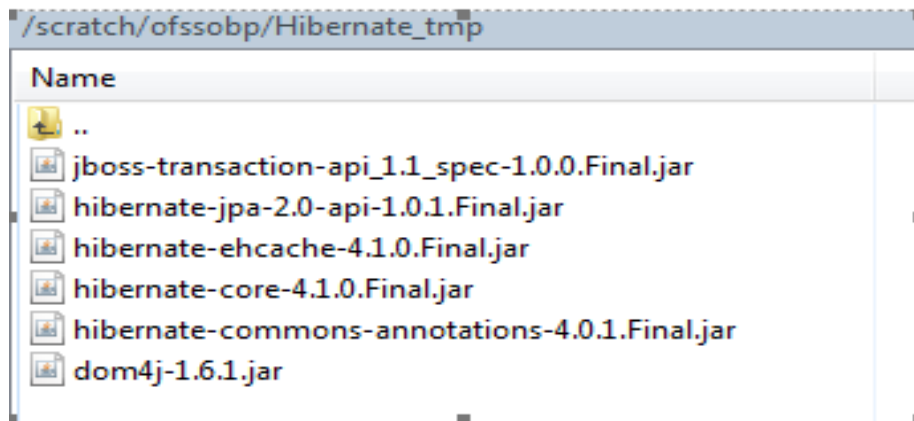

To install the OBP Host Media Pack:

1. Log in to the Host Server.
2. Create a temporary directory (for example, `TEMPDIR`) on the Host Server using the following command:

```
mkdir TEMPDIR
```

3. Copy the OB Collections and OB Recovery 2.9.0.0.0 installation package, Collection_V[Build_Number].zip, which you have downloaded from the edelivery to Host Server by using WINSOCP to created TEMPDIR folder.
4. Create a Hibernate_tmp directory and follow the below steps.
 - a. Extract downloaded hibernate-release-4.1.0.Final.zip package in temp directory.
 - b. Copy below jars from extracted hibernate-release-4.1.0/lib/required folder to created hibernate_tmp path
 - hibernate-commons-annotations-4.0.1.Final.jar
 - hibernate-core-4.1.0.Final.jar
 - hibernate-jpa-2.0-api-1.0.1.Final.jar
 - jboss-transaction-api_1.1_spec-1.0.0.Final.jar
 - dom4j-1.6.1.jar
 - c. Copy hibernate-ehcache-4.1.0.Final.jar from extracted hibernate-release-4.1.0/lib/optional/ehcache folder to created hibernate_tmp path

Figure 2–1 Hibernate tmp folder

5. Uncompress the Collection_V[Build_Number].zip file using the following command:

```
cd <PATH>/TEMPDIR
unzip Collection_V[Build_Number].zip
```

Where, <PATH> is the path where the TEMPDIR folder is located.

The contents of the zip file are extracted in the TEMPDIR folder. The following files / folders are extracted:

- config.properties
- ouaf.properties
- data
- Install.sh

- Install_Silent.sh
- collectioninstaller.jar
- collectionupgradeinstaller.jar

Figure 2–2 Collection_V[Build_Number].zip uncompressed

6. Collection installer operates in two modes, go with either mode.
 - a. Silent mode:
 - i. Update config.properties in the TEMPDIR directory
 - ii. Set IS_STANDALONE = N
 - iii. Update below sections in config.properties as shown in [Figure 2–3](#):
 - INSTALLER DETAILS
 - IS_DEV_ENV=false
 - IS_UI_ENABLED=N
 - INITIAL DETAILS
 - HOST_CONFIG=Y
 - UI_CONFIG=N
 - BATCH_CONFIG=Y
 - CUSTOM_SUPPORT=N
 - THREADPOOL_CONFIG=N
 - DOMAINNAME=HOST+BATCH
 - HOST CONFIGURATION
 - HOST DB CONFIGURATION
 - BATCH CONFIGURATION
 - THREADPOOL CONFIGURATION

In config.properties: **Initial Details** section contains the following fields

Table 2–1 Installer: Initial Details in config.properties

Field	Description
Operating System (OPERATING_SYSTEM)	Used to indicate the operating system on which you want to install the OB Collections and OB Recovery Host Media Pack. The options are: <ul style="list-style-type: none"> ■ Linux ■ Windows <p>You can only integrate OB Collections and OB Recovery with OBP on the Linux environment.</p>
Installation Directory (INSTALL_DIR)	Used to specify the directory where you want to install the OB Collections and OB Recovery Host Media Pack. It should be same as the installation directory where OBP Host Media pack is installed. By default, /scratch/app/product/fmw/obpinstall/obp is specified in this field. You can change the path and directory name, if required.
Generate Host Configuration (HOST_CONFIG)	Used to deploy the OB Collections and OB Recovery Host Media Pack components, if HOST_CONFIG is set to Y.
Generate UI Configuration (UI_CONFIG)	Used to deploy the OB Collections and OB Recovery Presentation Media Pack components, if UI_CONFIG is set to Y.
Generate Batch Configuration (BATCH_CONFIG)	Used to deploy the batch components used for configuring the batch server, if BATCH_CONFIG option is set Y. If you want to deploy the batch components, you must always set the HOST_CONFIG and BATCH_CONFIG value to Y.
Generate Thread Pool Configuration (THREADPOOL_CONFIG)	Used to deploy the threadpool components used for configuring the threadpool, if this option is checked. If you want to deploy the threadpool components, you must always set the HOST_CONFIG , BATCH_CONFIG and THREADPOOL_CONFIG value to Y.
Customization Support Required (CUSTOM_SUPPORT)	Used to enable the customization support, if CUSTOM_SUPPORT is set to Y.
Domain name (DOMAINNAME)	Used to specify domain name. The options are: <ul style="list-style-type: none"> ■ UI ■ HOST ■ HOST+BATCH <p>if BATCH_CONFIG option is set to Y then choose HOST+BATCH.</p>

In config.properties: **Host Configuration** section contains the following fields

Table 2–2 Installer: Host Configuration in config.properties

Field	Description
Host IP address (DB_IP_ADDRESS)	Used to specify the host IP address. For example, 10.180.6.11.
Host port (DB_PORT)	Used to specify the Host server WebLogic managed server port. For example, 8001.
Host Logs Directory (HOST_LOG_DIR)	Used to indicate the directory where the logs must be created on the host server. By default, /scratch/app/product/fmw/obpinstall/obp/fclogs/logs is specified in this field. You can change the path and directory name, if required.
Java Home Path (JAVA_HOME)	Used to indicate the directory where Oracle JDK is installed. By default, /scratch/app/product/jdk1.8.0_172 is specified in this field. You can change the path and directory name, if required.
Hibernate Path (HIBERNATE_JAR_DIR)	Used to indicate the directory where Hibernate jars downloaded and copied jars from /lib/required/ from extracted hibernate-release-4.1.0.Final.zip package by default, /scratch/app/product/hibernate is specified in this field. You can change the path and directory name, if required. Installer will copy the jars from this directory to Third party directory.
Host weblogic user name (HOST_WEBLOGIC_PASSWORD)	Used to specify the host weblogic username.
Host weblogic password (HOST_WEBLOGIC_PASSWORD)	Used to specify the host weblogic password.
Host Admin server port (HOST_ADMINSERVERPORT)	Used to specify the Host server WebLogic admin server port. For example, 7001.

In config.properties: **Host DB Configuration** section contains the following fields:

Table 2–3 Installer: DB Configuration in config.properties

Field	Description
Database IP address (DB_IP_ADDRESS)	Used to specify the database IP address. For example, 10.180.7.77.
Database port (DB_PORT)	Used to specify the database port. For example, 1521.
Database System ID (DB_SID)	Used to specify the database SID. For example, ORA125.
Database user name (DB_USERNAME)	Used to specify the database user name.
Database user password (DB_PASSWORD)	Used to specify the database password.
Host Datasource name (HOST_DATASOURCE)	Used to specify the host NonXA data source name. For example, jdbc/FCBDataSource_NonXA.

In config.properties: **Batch Configuration** section contains the following fields:

Table 2–4 Installer: Batch Configuration in config.properties

Field	Description
Thread pool name (THREADPOOL_NAME)	Used to specify the name of the thread pool. For example, MT.
Number of threads (NUMBER_OF_THREADS)	Used to specify the number of the threads that the thread pool can support. For example, 10.
Batch user ID (BATCH_USER)	Used to specify the batch user ID. For example, SYSUSER.
Batch log directory (BATCH_LOG_DIR)	Used to specify the batch log directory. For example, /scratch/app/product/fmw/obpinstall/obp/fclogs/logs.

In config.properties: **Threadpool Configuration** section contains the following fields:

Table 2–5 Installer: Threadpool Configuration in config.properties

Field	Description
Weblogic Server Home (WEBLOGIC_SERVER_HOME)	Used to specify the weblogic server home path. For example, /scratch/app/product/fmw/wlserver.
RMI Port (RMI_PORT)	Used to specify the rmi port. For example, 2120.
Host Domain Path (HOST_DOMAIN_PATH)	Used to specify the Host Domain Path. For example, /scratch/app/product/fmw/user_projects/domains/host_domain.
Cluster Name (CLUSTER_NAME)	Used to specify the Threadpool cluster name. For example, Cluster1
Cluster IP Address (CLUSTER_MULTICAST_LISTENER_IP_ADDRESS)	Used to specify Threadpool cluster IP Address. For Example, 232.0.01
Cluster Port (CLUSTER_MULTICAST_LISTENER_PORT)	Used to specify Threadpool Cluster Port. For Example, 6660
Target JMS Module (TARGETTYPE)	Used to specify target JMS Module: <ul style="list-style-type: none"> ■ Server ■ Cluster
Target JMS Module name (TARGETJMSSERVER)	If TARGETTYPE set to 1 i.e Server then provide the name of the managed server. Eg(obphost_server1). If TARGETTYPE set to 2 i.e Cluster then provide the name of the cluster. Eg(obphost_cluster1).

```

- iv. Save config.properties file.
- v. Ensure that Admin server is in RUNNING state and Managed server is down.
- vi. Check if Admin server is running. Access Weblogic Admin Console. If Weblogic Admin Console returns below screen Admin server is up.

Figure 2–4 Weblogic Admin Console

- vii. If Admin Server is down, start Admin Server. To start Admin server, use the following command:

```
${middleware__home}/user_projects/domains/{domain_name}/bin/ startWeblogic.sh
```

- viii. To check if managed server is running, navigate to servers tab.

Figure 2–5 Summary of servers

- ix. If managed server state is running, navigate to control tab and select managed server check box, click on shutdown button and select Force shutdown now.

Figure 2–6 Force shutdown

- x. Click Yes on next screen.

Figure 2–7 Verify Server State

- xi. If only Admin server is running, run installer using below command.

```
sh Install_Silent.sh
```

Installation Completed..! is prompted at the end.

- b. GUI mode:

- i. Start the XManager application on the windows machine from where you have connected to the Host Server remotely and then click XPassive.
- ii. Export the XManager UI on the Host Server (Linux environment) using the following command:

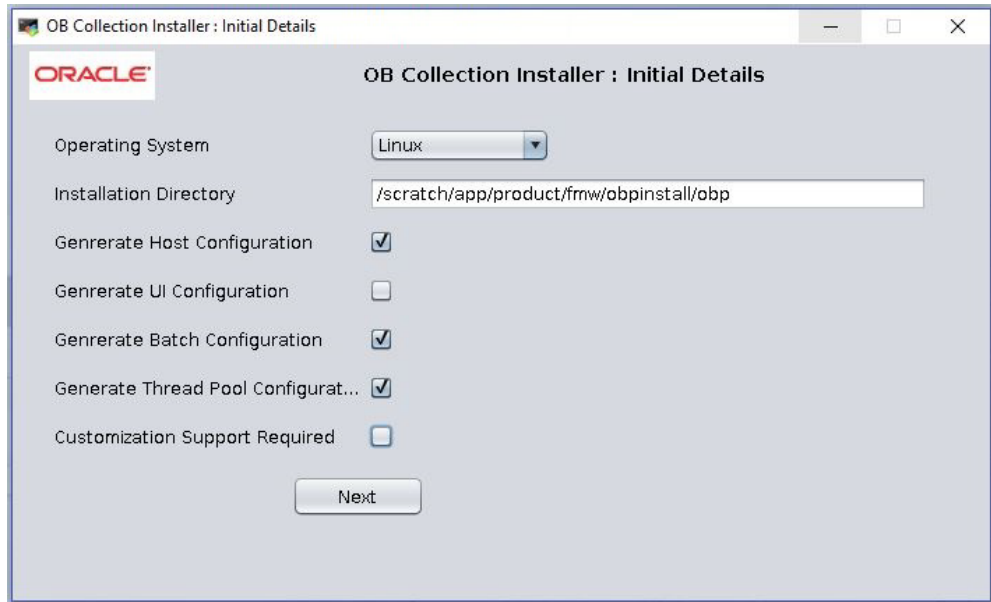

```
DISPLAY=<IP>:0.0;  
export DISPLAY
```

Where, <IP> is the IP address of the windows machine.

- iii. Update config.properties in the TEMPDIR directory.
- iv. Set IS_UI_ENABLED=Y.
- v. Set IS_STANDALONE = Y
- vi. Run installer using the following command:

```
java -jar collectioninstaller.jar
```

The **Installer: Initial Details** wizard page appears.

Figure 2–8 Installer: Initial Details

The **Installer: Initial Details** wizard page contains the following fields:

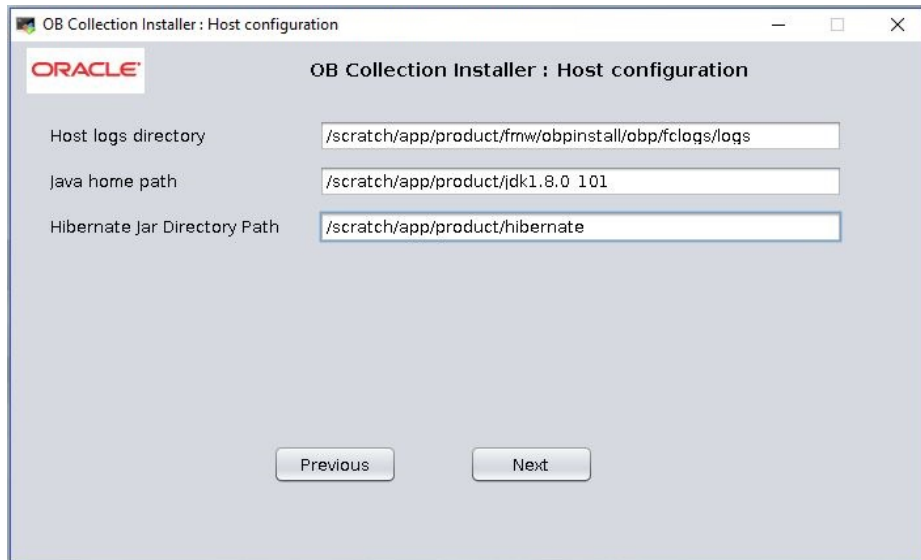

Table 2–6 Installer: Initial Details

Field	Description
Operating System	Used to indicate the operating system on which you want to install the OB Collections and OB Recovery Host Media Pack. The options are: <ul style="list-style-type: none"> ■ Linux ■ Windows You can only integrate OB Collections and OB Recovery with OBP on the Linux environment.
Installation Directory	Used to specify the directory where you want to install the OB Collections and OB Recovery Host Media Pack. It should be same as the installation directory where OBP Host Media pack is installed. By default, /scratch/app/product/fmw/obpinstall/obp is specified in this field. You can change the path and directory name, if required.

Table 2–10 Installer: Threadpool Configuration in config.properties

Field	Description
Weblogic Server Home	Used to specify the weblogic server home path. For example, /scratch/app/product/fmw/wlserver.
RMI Port	Used to specify the rmi port. For example, 2120.
Host Domain Path	Used to specify the Host Domain Path. For example, /scratch/app/product/fmw/user_projects/domains/host_domain.
Cluster Name	Used to specify the Threadpool cluster name. For example, Cluster1
Cluster IP Address	Used to specify Threadpool cluster IP Address. For Example, 232.0.01
Cluster Port	Used to specify Threadpool Cluster Port. For Example, 6660

- xv. Click **Next**. The **Installer: Confirm installation details** screen appears.

Figure 2–13 Installer: Confirm Installations Details**Figure 2–14 Installer: Confirm Installations Details**

xvi. Click **Generate**. The **Installer: Installing** screen appears.

xvii. Click **Done**.

7. Delete below jar if present.

/scratch/app/product/fmw/wlserver/modules/cglib.cglib-nodep.jar

OR

/scratch/app/product/fmw/oracle_common/modules/thirdparty/cglib-nodep-3.2.5.jar

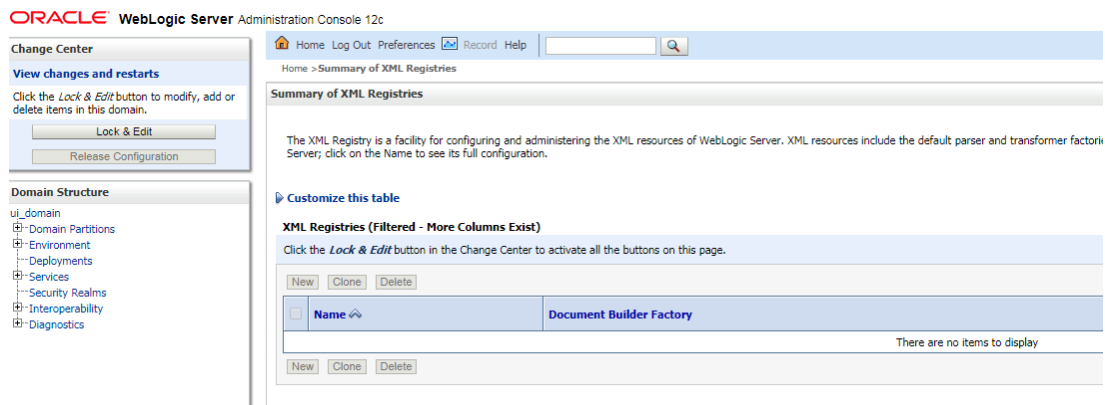

8. Log in to Weblogic console and navigate to Data Sources-> OBP_HOST_DS_NONXA -> Connection Pool.
9. Change Driver Class Name = oracle.jdbc.OracleDriver if it is different.

Figure 2–15 Data Source Connection Pool

10. Log in to Weblogic console and navigate to XML Registries.
11. Add new XML Registry Properties. If New button is disabled click on Lock & Edit button.

Figure 2–16 Add XML Registry

12. Change the following properties while adding XML Registry Properties and save changes.
 - Document Builder Factory = com.sun.org.apache.xerces.internal.jaxp.DocumentBuilderFactoryImpl

- SAX Parser Factory = com.sun.org.apache.xerces.internal.jaxp.SAXParserFactoryImpl
- Transformer Factory = com.sun.org.apache.xalan.internal.xsltc.trax.TransformerFactoryImpl

Save

Use this page to configure an XML registry, in particular to specify the implementation classes that WebLogic Server uses, by default, for the factories used to obtain

Name: XML Registry-0

Document Builder Factory: com.sun.org.apache.xerces.internal.jaxp.DocumentBuilderFactoryImpl

SAX Parser Factory: com.sun.org.apache.xerces.internal.jaxp.SAXParserFactoryImpl

Transformer Factory: com.sun.org.apache.xalan.internal.xsltc.trax.TransformerFactoryImpl

XPath Factory: weblogic.xml.jaxp.WebLogicXPathFactory

Schema Factory: weblogic.xml.jaxp.WebLogicSchemaFactory

XML Input Factory: weblogic.xml.jaxp.WebLogicXMLInputFactory

XML Output Factory: weblogic.xml.jaxp.WebLogicXMLOutputFactory

XML Event Factory: weblogic.xml.jaxp.WebLogicXMLEventFactory

When To Cache: cache-on-reference

Save

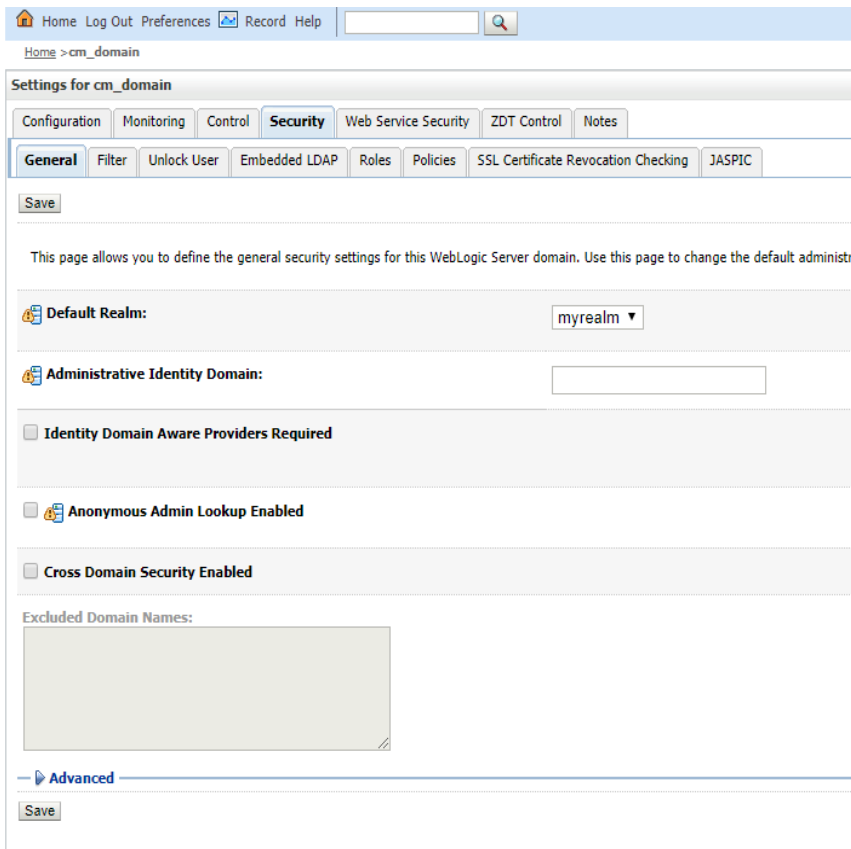

13. Click Next if available and Deploy XML Registry to managed server.

Figure 2–18 Deploy XML Registry

14. Log in to Weblogic console and navigate to Domain -> host_domain (if multiple domains available) -> Security tab.
15. Verify **Cross Domain Security Enabled** check box is unchecked.

Figure 2–19 Host Domain Security

2.3 Configuring Weblogic Domain For Host

The following steps explain how to configure weblogic domain for host. These steps are already integrated in Silent mode of installer so continue from step 11. For GUI mode follow all steps.

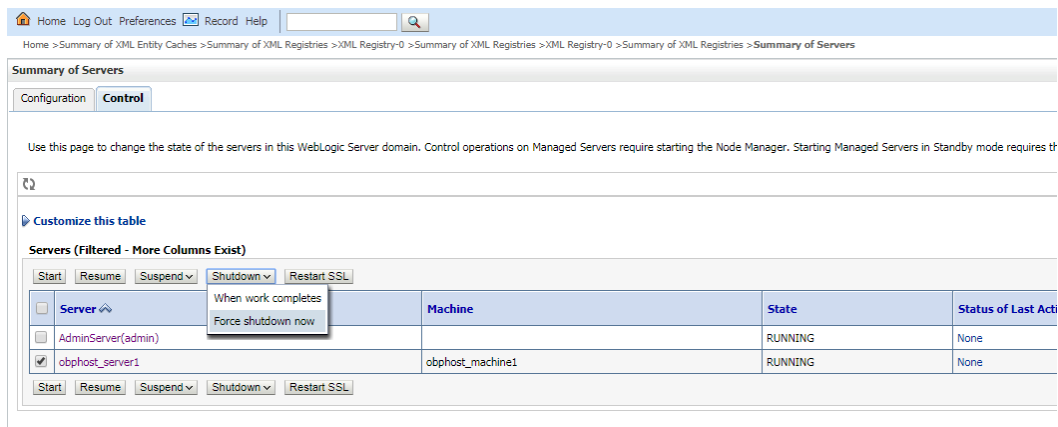

1. To perform domain configuration, you must run Admin server. Ensure that managed server is not running.
2. To check if managed server is running, login to Weblogic console and navigate to servers tab.

Figure 2–20 Summary of servers

3. If managed server state is running, navigate to control tab and select managed server check box, click on shutdown button and select Force shutdown now.

Figure 2–21 Force shutdown

4. Click Yes on next screen.

Figure 2–22 Verify Server State

5. Check if Admin server is running. Access Weblogic Admin Console. If Weblogic Admin Console returns below screen Admin server is up.

Figure 2–23 Weblogic Admin Console

6. If Admin Server is down, start Admin Server. To start Admin server, use the following command:

```
${middleware__home}/user_projects/domains/{domain_name}/bin/startWeblogic.sh
```

7. Browse the folder where you have extracted the Installation package.
8. Run the following command:

```
cd <PATH>/TEMPDIR
```

9. Execute the Install.sh file as below:

```
./Install.sh
```

The install file prompts for the following input:

Table 2–11 Configuring Weblogic Domain for Host

Field	Description
Select the Domain Name (Host / UI)	Indicates whether to configure Host or UI domain. To set up host domain, enter host.
Enter the Host IP/DNS (Domain Name Server)	Indicates the host IP address or DNS name.
Enter Admin Server Port	Indicates the port number of admin server.
Enter Weblogic home (WL_HOME) directory (<code>\${middleware_home}/wlserver</code>)	Indicates the home path of Weblogic. For example, <code>/scratch/app/product/fmw/wlserver</code>
Enter Deployment/Installation directory name	Used to specify the directory where you want to install the OB Collections and OB Recovery Host Media Pack. By default, <code>/scratch/app/product/fmw/obpinstall/obp</code> is specified in this field. You can change the path and directory name, if required.
Enter Domain Directory Path where Domain is created (<code>\${middleware_home}/user_projects/domain</code>)	Indicates the generic domain_home path.
Enter Domain Name Directory (for example, host_domain)	Provide the domain name configured on weblogic and the directory present in domain_home.
Enter Weblogic console username	Indicates the username of weblogic console.
Enter Weblogic console password	Indicates the password of weblogic console.
Select the option (1 or 2) where you want to target JMS Module: 1. Server 2. Cluster	Select the option 1 or 2 as per requirement or configuration in OBP.
Enter the Name of Server where you want to target JMS module (for example, obphost_server1) -	If option 1 is selected then provide the name of the managed server.
Enter the Name of the Cluster where you want to target JMS module (For example, obphost_cluster1) -	If option 2 is selected then provide the name of the cluster.

10. Verify whether the information passed is correct and enter 'Y' to continue the configuration or 'N' to avoid domain configuration as shown in the following screenshot:

Figure 2–24 Domain Configuration: Confirm

```

ofssobp@ofss3131407:/scratch/install
[ofssobp@ofss3131407 install]$ ./Install.sh

Please provide the exact information as asked below

Please select the Domain Name (Host / UI/ Host+Batch )- Host+Batch

Enter the Host server IP / DNS - 10.180.84.194

Enter Admin server port - 7001

Please enter Weblogic home (WL_HOME) directory (${middleware_home}/wlserver)- /scratch/app/product/fmw/wlserver

Enter Deployment/Installation directory name - /scratch/app/product/fmw/obpinstall/obp

Enter Domain Directory Path where Domain is created (${middleware_home}/user_projects/domain)- /scratch/app/product/fmw/user_projects/domains

Enter Domain Name Directory (e.g. base_domain)- host_domain

Enter Weblogic console username - weblogic

Enter Weblogic console password -

Please select the option (1 or 2) where you want to target JMS Module -
1. Server
2. Cluster
--> 2

Enter the Name of the Cluster where you want to target JMS module (e.g. obphost_cluster1) - obphost_cluster1

Hope the information provided is valid and we can proceed with domain configuration for Collection

Please enter Y/N, so that we can continue with configuration... - █

```

Once you have completed the execution steps listed above, perform the following steps:

1. Connect to the database and execute below two statements to enable collection bootstrap.

You must set the collection bootstrap to true for the Collections module to function properly.

```

update flx_fw_config_all_b set prop_value='true' where
prop_id='collection.bootstrap' and category_id='root';
update flx_fw_config_all_b set prop_value='true' where
prop_id='collection.webservice.bootstrap' and category_
id='root';

```

2. Need to update setDomainEnv.sh file to append EXTRA_JAVA_PROPERTIES and append PRE_CLASSPATH as following, if not present:

EXTRA_JAVA_PROPERTIES before installation:

```

EXTRA_JAVA_PROPERTIES=" -
Djavax.xml.parsers.DocumentBuilderFactory=com.sun.org.apache.
xerces.internal.jaxp.DocumentBuilderFactoryImpl -
Djavax.xml.transform.TransformerFactory=com.sun.org.apache.xa
lan.internal.xsltc.trax.TransformerFactoryImpl -
Dweblogic.configuration.schemaValidationEnabled=false -
DidentityExpansionLimit=1000 -Duser.home=${OBP_ORACLE_
HOME}/config -Dfc.io.dir=${OBP_ORACLE_HOME} ${ORACLE_MEM_ARGS}
${EXTRA_JAVA_PROPERTIES}"

```

After Installation:

```

EXTRA_JAVA_PROPERTIES=" -
Djavax.xml.parsers.DocumentBuilderFactory=com.sun.org.apache.
xerces.internal.jaxp.DocumentBuilderFactoryImpl -
Djavax.xml.transform.TransformerFactory=com.sun.org.apache.xa
lan.internal.xsltc.trax.TransformerFactoryImpl -

```

```
Djavax.xml.parsers.SAXParserFactory=com.sun.org.apache.xerces
.internal.jaxp.SAXParserFactoryImpl -
Dweblogic.configuration.schemaValidationEnabled=false -
Dweblogic.configuration.schemaValidationEnabled=false -
DentityExpansionLimit=1000 -Duser.home=${OBP_ORACLE_
HOME}/config -Dfc.io.dir=${OBP_ORACLE_HOME} ${ORACLE_MEM_ARGS}
${EXTRA_JAVA_PROPERTIES}"
```

Before Installation:

```
PRE_CLASSPATH="${OBP_ORACLE_HOME}/config:${OBP_ORACLE_
HOME}/config/security/oaam:${PRE_CLASSPATH}"
export PRE_CLASSPATH
```

After Installation:

```
PRE_CLASSPATH="${OBP_ORACLE_HOME}/config:${OBP_ORACLE_
HOME}/config/security/oaam:${OBP_ORACLE_
HOME}/obp.thirdparty.app.domain/APP-INF/lib/xmlparserv2-
12.1.0.2.0.jar:${PRE_CLASSPATH}"
export PRE_CLASSPATH
```

3. Restart the admin server. To restart the Admin server, first stop the Admin server and then start it again.

- a. To stop the Admin server, use the following command:

```
${middleware_home}/user_projects/domain/{domain_
name}/bin/stopWeblogic.sh
```

- b. Delete tmp, cache directories present inside the server directory.

For example,

```
${middleware_home}/user_projects/domain/{domain_
name}/servers/{server_name}/cache
${middleware_home}/user_projects/domain/{domain_
name}/servers/{server_name}/tmp
```

- c. Delete the stage folder also if it is present under the following location:

```
${middleware_home}/user_projects/domain/{domain_
name}/servers/{server_name}/stage
```

Where {server_name} indicates all the servers that are available in the domain, such as AdminServer, Managed server (obphost_server1).

- d. Then start Admin server by using the following command:

```
${middleware_home}/user_projects/domain/{domain_
name}/bin/startWeblogic.sh
```

4. Start the managed servers.

Ignore the below error while starting host managed server.

ERROR (support.license.ModuleInfoCache) Module feature configuration not found; no modules will be disabled. To resolve this error add a feature configuration of type F1MD and associated options for disabled modules.

3 Installing the Presentation Media Pack

You must follow the steps mentioned below to install the Presentation Media Pack:

1. Install the Presentation Media Pack.
2. Configure the web logic domain.
3. Deploy the Collections module.

3.1 Prerequisites

You must install the following software prior to installing the Presentation Media Pack:

- OBP 2.9.0.0.0 Host Media Pack.
- OBP 2.9.0.0.0 Presentation Media Pack.
- OB Collections and OB Recovery 2.9.0.0.0 Host Media Pack.

Note

Oracle JDK 1.8 Update 172 is required to run the OB Collections and OB Recovery V2.8 installer. For more information on JDK installation, see [Chapter 5 Installing Third-Party Software](#).

3.2 Installing the Presentation Media Pack

To install the Presentation Media Pack, you must download the installation package from the following link:

<https://edelivery.oracle.com/>

Note

Ensure that the node manager is not running on any of the target installation machines. Also, ensure that there are no processes running on the listener ports for any of the OBP domain servers that are to be installed.

To install the Presentation Media Pack, perform the following steps:

1. Download the appropriate OB Collections and OB Recovery Media Pack. The media pack is available in this format: Collection_V[Build_Number].zip
2. Log in to the presentation server.
3. Create a temporary directory on the presentation server. For example, <TEMPDIR>.
4. Copy the OB Collections and OB Recovery Media Pack Collection_V[Build_Number].zip downloaded from edelivery to presentation Linux server using WINSXP.
5. Copy the OB Collections and OB Recovery Media Pack Collection_V[Build_Number].zip into the <TEMPDIR>.

6. Uncompress the OB Collections and OB Recovery Media Pack Collection_V[Build_Number].zip by running the following commands:

```
cd <TEMPDIR>
unzip Collection_V[Build_Number].zip
```

The contents of the zip file are extracted in the TEMPDIR folder. The following files/folders are extracted:

- config.properties
- ouaf.properties
- data
- Install.sh
- Install_Silent.sh
- collectioninstaller.jar
- collectionupgradeinstaller.jar

Figure 3–1 Collection_V[Build_Number].zip uncompressed

7. Collection installer operates in two modes. Go with either mode.
 - a. Silent Mode:
 - i. Update config.properties in the TEMPDIR directory.
 - ii. Set IS_STANDALONE = N
 - iii. Update below sections in config.properties as shown in [Figure 2–3](#):
 - INSTALLER DETAILS
 - IS_DEV_ENV=false
 - IS_UI_ENABLED=N
 - INITIAL DETAILS
 - HOST_CONFIG=N
 - UI_CONFIG=Y

- BATCH_CONFIG=N
 - CUSTOM_SUPPORT=N
 - THREADPOOL_CONFIG=N
- HOST CONFIGURATION
 - UI CONFIGURATION
 - DB CONFIGURATION

In config.properties: Initial Details section contains the following fields

Table 3–1 Installer: Initial Details in config.properties

Field	Description
Operating System (OPERATING_SYSTEM)	Used to indicate the operating system on which you want to install the OB Collections and OB Recovery Host Media Pack. The options are: <ul style="list-style-type: none"> • Linux • Windows <p>You can only integrate OB Collections and OB Recovery with OBP on the Linux environment.</p>
Installation Directory (INSTALL_DIR)	Used to specify the directory where you want to install the OB Collections and OB Recovery Host Media Pack. It should be same as the installation directory where OBP Host Media pack is installed. <p>By default, <code>/scratch/app/product/fmw/obpinstall/obp</code> is specified in this field. You can change the path and directory name, if required.</p>
Generate Host Configuration (HOST_CONFIG)	Used to deploy the OB Collections and OB Recovery Host Media Pack components, if this option is true.
Generate UI Configuration (UI_CONFIG)	Used to deploy the OB Collections and OB Recovery Presentation Media Pack components, if this option is true.
Generate Batch Configuration (BATCH_CONFIG)	Used to deploy the batch components used for configuring the batch server, if this option is true. <p>If you want to deploy the batch components, you must always set the HOST_CONFIG and BATCH_CONFIG value to true.</p>
Generate Thread	Used to deploy the threadpool components used for

Field	Description
Pool Configuration (THREADPOOL_CONFIG)	configuring the threadpool, if this option is checked. If you want to deploy the threadpool components, you must always set the HOST_CONFIG , BATCH_CONFIG and THREADPOOL_CONFIG value to true.
Customization Support Required (CUSTOM_SUPPORT)	Used to enable the customization support, if this option is true.
Domain name (DOMAINNAME)	Used to specify domain name, possible options are: <ul style="list-style-type: none"> • UI • HOST • HOST + BATCH Select UI for presentation mediapack.

In config.properties: Host Configuration section contains the following fields:

Table 3–2 Installer: Host Configuration in config.properties

Field	Description
Host IP address (DB_IP_ADDRESS)	Used to specify the host IP address. For example, 10.180.6.11.
Host port (DB_PORT)	Used to specify the Host server WebLogic managed server port. For example, 8001.
Host Logs Directory (HOST_LOG_DIR)	Used to indicate the directory where the logs must be created on the host server. By default, /scratch/app/product/fmw/obpinstall/obp/fclogs/logs is specified in this field. You can change the path and directory name, if required.
Java Home Path (JAVA_HOME)	Used to indicate the directory where Oracle JDK is installed. By default, /scratch/app/product/jdk1.8.0_172 is specified in this field. You can change the path and directory name, if required.
Hibernate Path (HIBERNATE_JAR_DIR)	Used to indicate the directory where Hibernate jars downloaded and copied jars from /lib/required/ from extracted hibernate-release-4.1.0.Final.zip package by default, /scratch/app/product/hibernate is

Field	Description
	specified in this field. You can change the path and directory name, if required. Installer will copy the jars from this directory to Third party directory.
Host weblogic user name (HOST_WEBLOGIC_PASSWORD)	Used to specify the host weblogic username.
Host weblogic password (HOST_WEBLOGIC_PASSWORD)	Used to specify the host weblogic password.
Host Datasource name (HOST_DATASOURCE)	Used to specify the host NonXA data source name. For example, jdbc/FCBDataSource_NonXA.
Host Admin server port (HOST_ADMINSERVERPORT)	Used to specify the Host server WebLogic admin server port. For example, 7001.

The following fields appear in the Installer: UI Configuration screen:

Table 3–3 Installer: UI Configuration in config.properties

Field	Description
UI log directory (UI_LOG_DIR)	Used to specify the log directory for the presentation server. For example, /oracle/deployable/sails/fclogs/logs.
UI IP Address (UI_IP_ADDRESS)	Used to specify the host IP address. For example, 10.180.6.12.
UI Port (UI_PORT)	Used to specify the UI server WebLogic managed server port. For example, 8001.
UI Weblogic user name	Used to specify the UI WebLogic server admin user name.

Field	Description
(UI_WEBLOGIC_USERNAME)	
UI Weblogic password (UI_WEBLOGIC_PASSWORD)	Used to specify the UI WebLogic server admin password.
Host Datasource name (UI_DATASOURCE)	Used to specify the host NonXA data source name. For example, jdbc/FCBDataSource_NonXA.
UI Admin server port (HOST_ADMINSERVERPORT)	Used to specify the UI server WebLogic admin server port. For example, 7001.

In config.properties: DB Configuration section contains the following fields:

Table 3–4 Installer: DB Configuration in config.properties

Field	Description
Database IP address (DB_IP_ADDRESS)	Used to specify the database IP address. For example, 10.180.7.77.
Database port (DB_PORT)	Used to specify the database port. For example, 1521
Database System ID (DB_SID)	Used to specify the database SID. For example,ORA125.
Database user name (DB_USERNAME)	Used to specify the database user name.
Database user password (DB_PASSWORD)	Used to specify the database password.

- iv. Save config.properties file.
- v. Check if Admin server is running and Managed is down. Access Weblogic Admin

Console. If Weblogic Admin Console returns below screen Admin server is up.

Figure 3–3 Weblogic Admin Console

- vi. If Weblogic Admin Server is down, start Admin server, use the following command:

```
{middleware__home}/user_projects/domain/{domain_
home}/bin/startWeblogic.sh
```

- vii. If only Admin Server is up , run installer using below commands:

```
sh Install_Silent.sh
```

Installation Completed..! is prompted at the end.

- b. GUI Mode:

- i. Run XManager application on Windows machine.
- ii. To export the XManager UI on the Linux environment, run the following command:

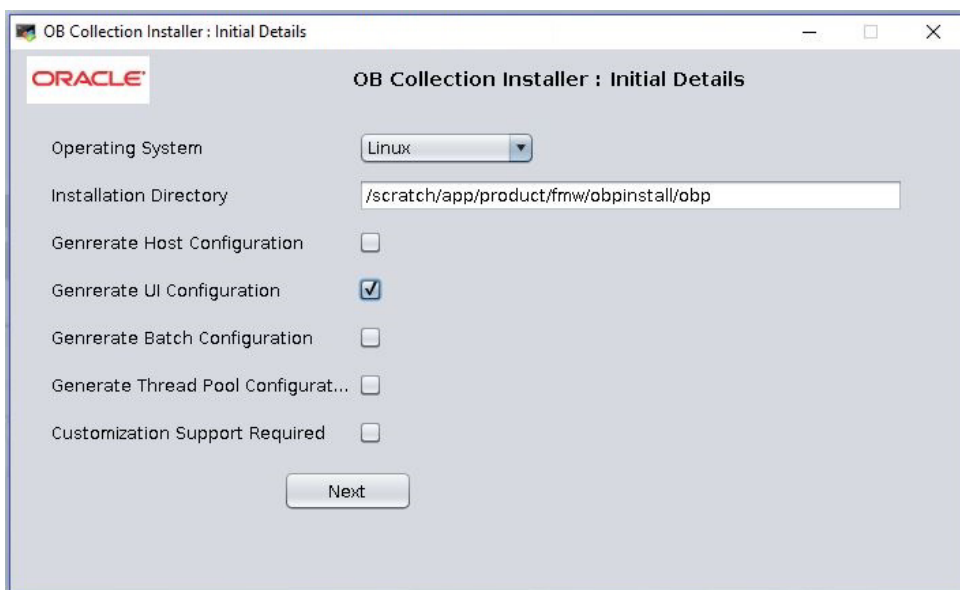

```
DISPLAY=<IP>:0.0;
export DISPLAY
```

Where, IP is the IP address of your machine.

- iii. Update config.properties in the TEMPDIR directory
- iv. Set IS_UI_ENABLED=Y
- v. Set IS_STANDALONE=Y
- vi. Run the following command to start the OB Collections and OB Recovery installer. The Installer: Initial Details screen appears.

```
java -jar collectioninstaller.jar
```

- vii. In the Installer: Initial Details screen, select the Installation directory and UI Configurations.

Figure 3–4 Installer: Initial Details

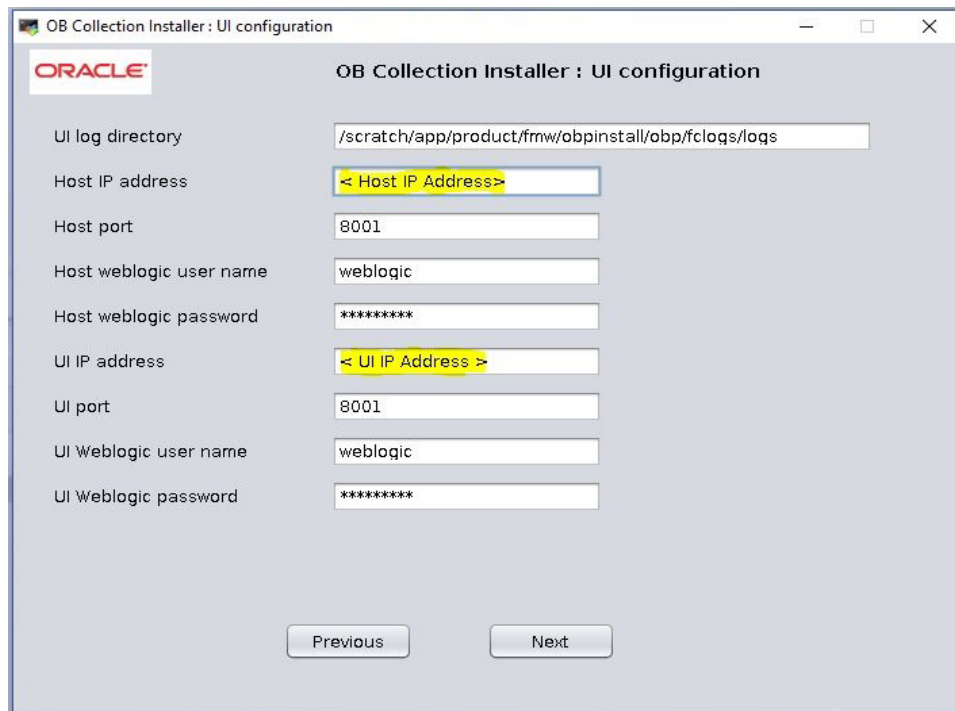

The following fields appear in the Installer: Initial Details screen:

Table 3–5 Installer: Initial Details

Field	Description
Operating System	Used to specify the operating system platform on which the installation is to be done. For example, Linux.
Installation Directory	Used to specify the directory where OB Collections and OB Recovery 2.8 should be installed. Note that this is the same directory where the OBP presentation or host media packs are installed. For example, <code>/oracle/deployables/sails/fclogs/logslogs/scratch/app/product/fmw/obpinstall/obp</code> .
Generate Host Configuration	Deploys the host media pack components.
Generate UI Configuration	Deploys the presentation media pack components.
Generate Batch Configuration	Deploys the host media pack components. Note that host configuration must also be selected when batch components are to be enabled on the host that is used for configuring the batch server.
Generate Thread Pool Configuration	Deploys the Host media pack components. Note that host configuration must also be selected when Thread Pool components are to be enabled on the host that is used for configuring the Thread Pool Node.
Customization Support Required	Enables the customization support.

- viii. Click Next. The **Installer: UI configuration** screen appears.

11. In the Installer: Installing screen, confirm the following:
 - Under the InstallDir, collectionenv directory is created.
 - Collectionenv folder contains the properties folder and properties folder contains the web directory.

3.3 Configuring Weblogic Domain for Presentation Server

The following steps explain how to configure weblogic domain for presentation server. These steps are already integrated in Silent mode of installer so continue from step 8. For GUI mode follow all steps.

1. To perform domain configuration, Admin server must be running. Check if Admin server is running. Access Weblogic Admin Console. If Weblogic Admin Console returns below screen Admin server is up.

Figure 3–9 Weblogic Admin Console

2. If Weblogic Admin Server is down, start Admin server, use the following command:

```
${middleware__home}/user_projects/domain/${domain_
home}/bin/startWeblogic.sh
```

3. Browse the folder where you have extracted the Installation package.

4. Run the following command:

```
cd <PATH>/TEMPDIR
```

5. Execute the Install.sh file as mentioned below:

```
./Install.sh
```

6. The install file prompts for input. Enter the following details when prompted:

Table 3–7 Configuring Weblogic Domain for Presentation

Field	Description
Please select the Domain Name (Host / UI)	Enter UI to setup host domain.
Enter the Host IP/DNS	Enter UI IP address or DNS name.
Enter Admin server port	Enter Admin server port number.
Please enter Weblogic home (WL_HOME) directory (\${middleware__home}/wlserver)	Its Weblogic home path. For example, /scratch/app/product/fmw/wlserver
Enter Deployment/Installation directory name	Used to specify the directory where you want to install the OB Collections and OB Recovery Host Media Pack. By default, /scratch/app/product/fmw/obpinstall/obp is specified in this field. You can change the path and directory name, if required.
Enter Domain Directory Path where Domain is created (\${middleware__home}/user_projects/domain)	Its generic domain_home path.
Enter Domain Name Directory (for	Provide the domain name configured on weblogic and the

Field	Description
example, base_domain)	directory present in domain_home.
Enter Weblogic console username	Username of weblogic console.
Enter Weblogic console password	Password of weblogic console.
Enter Database URL	Provide database connection URL.
Enter Database user name	Provide database user name.
Enter Database password	Provide password for the user.
Select the option (1 or 2) where you want to target Datasource and CollectionWeb application: 1. Server 2. Cluster	Select the option 1 or 2 as per requirement or configuration in OBP.
Enter the Name of Server where you want to target data source and collectionweb application (for example, obpui_server1)	If option 1 is selected then provide the name of the managed server.
Enter the Name of Cluster where you want to target data source and collectionweb application (for example, obpui_cluster01)	If option 2 is selected then provide the name of the cluster.

7. Verify whether the information passed is correct and enter 'Y' to continue the configuration or 'N' to avoid domain configuration.

Figure 3–10 Domain Configuration: Confirm

Enter Deployment/Installation directory name - /scratch/app/product/fmw/obpinstall/obp
Enter Domain Directory Path where Domain is created (${middleware_home}/user_projects/domain)- /scratch/app/product/fmw/user_projects/domains
Enter Domain Name Directory (e.g. base_domain)- ui_domain
Enter Weblogic console username - weblogic
Enter Weblogic console password -
Enter Database url (DB_IP:PORT/SID eg: 10.10.10.10:1521/HR) - 10.180.84.34:1523/P843422B
Enter Database username - OBPEXA271
Enter Database password -

Please select the option (1 or 2) where you want to target CollectionWeb application -
    1. Server
    2. Cluster
--> 2
Enter the Name of Cluster where you want to target data source and collectionweb application (e.g. obpui_cluster1) - obpui_cluster1
Hope the information provided is valid and we can proceed with domain configuration for Collection

Please enter Y/N, so that we can continue with configuration... - Y

```

Figure 3–11 Domain Configuration: Proceeding with the Process

```

[cfasobp@mun00bqr Collections]$ ./install.sh

Please provide the exact information as asked below

Please select the Domain Name (Host / UI/ Host+Batch )- UI
Enter the UI server IP / DNS - 10.180.34.173
Enter Admin server port - 7001

Please enter Weblogic home (WL_HOME) directory (${middleware_home}/wlserver_
3)- /scratch/app/product/fmw/wlserver
Enter Deployment/Installation directory name - /scratch/app/product/fmw/obpinstall/obp
Enter Domain Directory Path where Domain is created (${middleware_home}/user_projects/domain)- /scratch/app/product/fmw/user_projects/domains/
Enter Domain Name Directory (e.g. base_domain)- ui_domain
Enter Weblogic console username - weblogic
Enter Weblogic console password -

Please select the option (1 or 2) where you want to target CollectionWeb application -
    1. Server
    2. Cluster
--> 1
Enter the Name of Server where you want to target data source and collectionweb application (e.g. obpui_server1) - obpui_server1
Hope the information provided is valid and we can proceed with domain configuration for Collection

Please enter Y/N, so that we can continue with configuration... - y

Start Deploying Collection as Enterprises application on weblogic

Collection web deployment is successful, please re-start the servers now.

Will be adding entry into setDomainEnv.sh

[cfasobp@mun00bqr Collections]$

```

8. Need to update setDomainEnv.sh file to append EXTRA_JAVA_PROPERTIES, if not present.
EXTRA_JAVA_PROPERTIES before installation:

```
EXTRA_JAVA_PROPERTIES=" -
Djavax.xml.parsers.DocumentBuilderFactory=com.sun.org.apache.
xerces.internal.jaxp.DocumentBuilderFactoryImpl -
Djavax.xml.transform.TransformerFactory=com.sun.org.apache.xa
lan.internal.xsltc.trax.TransformerFactoryImpl -
Dweblogic.configuration.schemaValidationEnabled=false -
DentityExpansionLimit=1000 -Duser.home=${OBP_ORACLE_
HOME}/config -Dfc.io.dir=${OBP_ORACLE_HOME} ${ORACLE_MEM_ARGS}
${EXTRA_JAVA_PROPERTIES}"
```

After Installation:

```
EXTRA_JAVA_PROPERTIES=" -
Djavax.xml.parsers.DocumentBuilderFactory=com.sun.org.apache.
xerces.internal.jaxp.DocumentBuilderFactoryImpl -
Djavax.xml.transform.TransformerFactory=com.sun.org.apache.xa
lan.internal.xsltc.trax.TransformerFactoryImpl -
Djavax.xml.parsers.SAXParserFactory=com.sun.org.apache.xerces
.internal.jaxp.SAXParserFactoryImpl -
Dweblogic.configuration.schemaValidationEnabled=false -
Dweblogic.configuration.schemaValidationEnabled=false -
DentityExpansionLimit=1000 -Duser.home=${OBP_ORACLE_
HOME}/config -Dfc.io.dir=${OBP_ORACLE_HOME} ${ORACLE_MEM_ARGS}
${EXTRA_JAVA_PROPERTIES}"
```

9. Restart Admin server. Before restarting, stop Admin server.

- a. To stop the Admin server, use the following command:

```
${middleware_home}/user_projects/domain/{domain_
name}/bin/stopWeblogic.sh
```

- b. Delete tmp, cache directories present inside the server directory.

For example,

```
${middleware_home}/user_projects/domain/{domain_
name}/servers/{server_name}/cache
${middleware_home}/user_projects/domain/{domain_
name}/servers/{server_name}/tmp
```

Where {server_name} indicates all the servers that are available in the domain, such as AdminServer, Managed server (obphost_server1).

- c. Then start Admin server by using the following command:

```
${middleware_home}/user_projects/domain/{domain_
name}/bin/startWeblogic.sh
```

10. Once the Admin server is up, then start the managed servers.

3.4 Verifying the Presentation Server Deployment

Before you start verifying the presentation server deployment, configure SYSUSER on OID server as per the steps mentioned in [Chapter 6 User Creation in Oracle Internet Directory](#).

To verify successful deployment, log on to the following URL:

3.4 Verifying the Presentation Server Deployment

http://IPADDRESS:PORT/CollectionAdmin/cis.jsp

Following are the components of the URL:

Table 3–8 Verifying the Presentation Server Deployment

Components	Description
IPAddress	Indicates the IP address of the presentation WebLogic server.
Port	Indicates the Presentation WebLogic managed server port number.

For example,

http://10.180.10.11:8001/CollectionAdmin/cis.jsp

4 External Interface Configuration

This chapter explains the OB Collections and OB Recovery external interface configuration details.

4.1 Oracle Identity Manager (OIM)

You can download the OIM Adapter configuration files from the following location:

<http://edelivery.oracle.com>

To extract the OIM Adapter configuration files, perform the following steps:

1. Download the appropriate OB Collections and OB Recovery Media Pack. The media pack is available in the following format: `Collection_V[Build_Number].zip`
2. Copy the `Collection_V[Build_Number].zip` into the `<TEMPDIR>`.
3. Uncompress `Collection_V[Build_Number].zip` by running the following commands:

```
cd <TEMPDIR>
unzip Collection_V[Build_Number].zip
```

The contents of the zip file are extracted in the `TEMPDIR` folder. The following files and folders are extracted:

- `config.properties`
 - `ouaf.properties`
 - `data`
 - `Install.sh`
 - `collectioninstaller.jar`
 - `collectionupgradeinstaller.jar`
4. You can locate the OIM adapter configuration files under the following location: `data/extxface/OIM/` folder. Following files are available:
 - `collections_oim_export.xml`
 - `com.ofss.fc.extxface.oim.jar`
 - `com.ofss.fc.extxface.wsdclient.jar`

Note

For detailed configuration of the OIM Adapter, see the Oracle Banking Platform Collections and Recovery User Provisioning Guide.

5 Installing Third-Party Software

You must install the Oracle JDK before you install the OB Collections and OB Recovery media packs, if not already installed on the servers.

5.1 Installing Oracle Java Development Kit (JDK)

You must install the JDK for 64-bit Linux operating system before you install presentation or host media pack.

To download, install and use JDK, follow the steps mentioned below:

1. Download the JDK file to any directory for which you have write permission. The file appears in the following format:

```
jdk-8u
<version>-linux-x64.bin
<version> jdk-8u101-linux-x64.bin
```

Note

Only the root user has the privilege to displace the system version of the Java platform that is supplied by Linux.

2. To set the execute permission, run the following command:

```
% chmod +x 8u <version> -linux-x64.bin
```

3. Change the directory location to the location where you want to install the files.
4. To execute the self-extract binary file, run the following command and then press Enter:

```
% ./jdk-8u <version> -linux-x64.bin
```

5. You must agree to the terms of the binary code license. This installs the JDK files in the following directory under the current directory: `jdk.8.0_<version>`

6 User Creation in Oracle Internet Directory

This chapter provides information about user creation in Oracle Internet Directory.

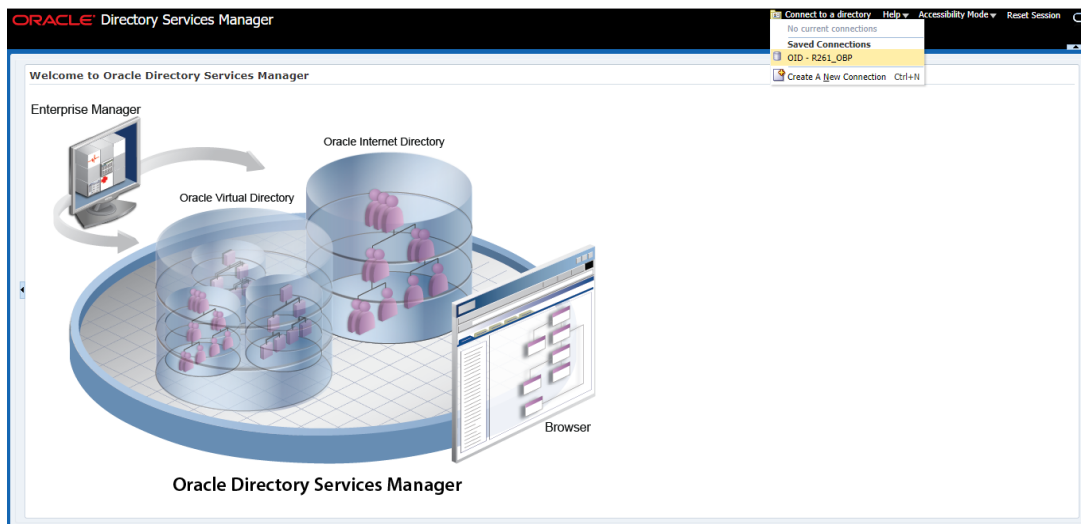

6.1 User Creation in OID

SYSUSER has to be created in Oracle Internet Directory (OID). It is used as default login into the CollectionAdmin. Follow the below steps to create a user:

1. Access the appropriate ODSM and select the required OID.

ODSM URL: <OID_IP>:7005/odsm.

Figure 6–1 Opening ODSM

2. Log in to the OID.

Figure 6–2 Log in to OID

3. Click the **Data Browser** tab, in the Data tree panel navigate to Root -> dc=com -> dc=oracle -> dc=in -> cn=Users as shown in below screen. Right click on any user already present and select **Create** option.

Figure 6–3 Navigating to Data Browser Tab

Figure 6–4 Creating New Entry

4. Create new entry in **Users** tab and add the following Object classes:

- top
- person
- fcPerson
- organisationalPerson
- inetOrgPerson
- orclUser
- orclUserV2

Figure 6–5 Adding Object Classes: Top

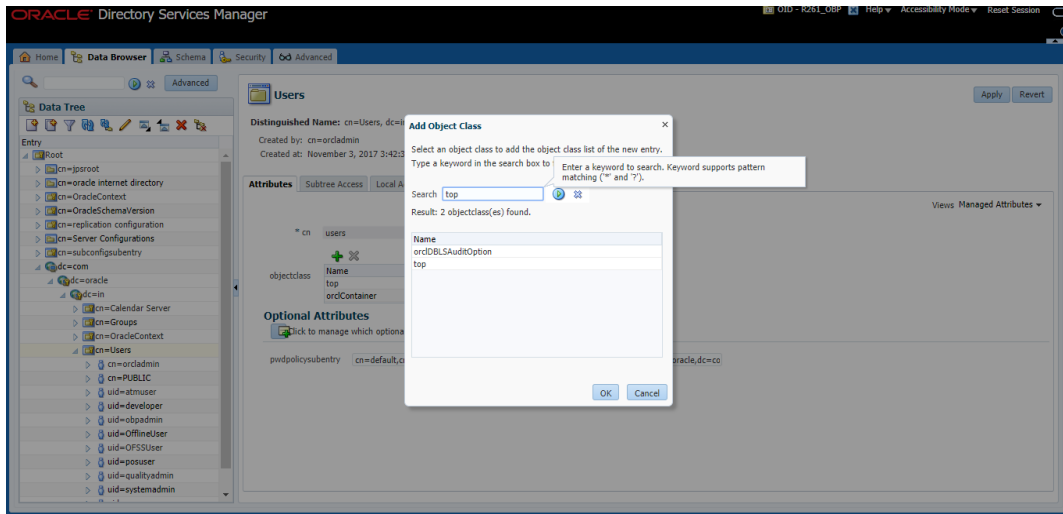

Figure 6–6 Adding Object Classes: Person

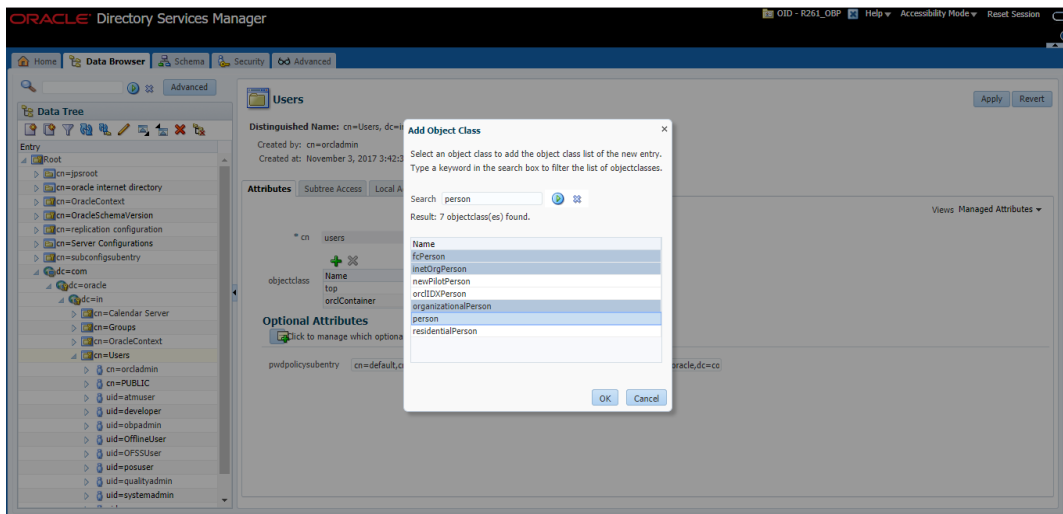

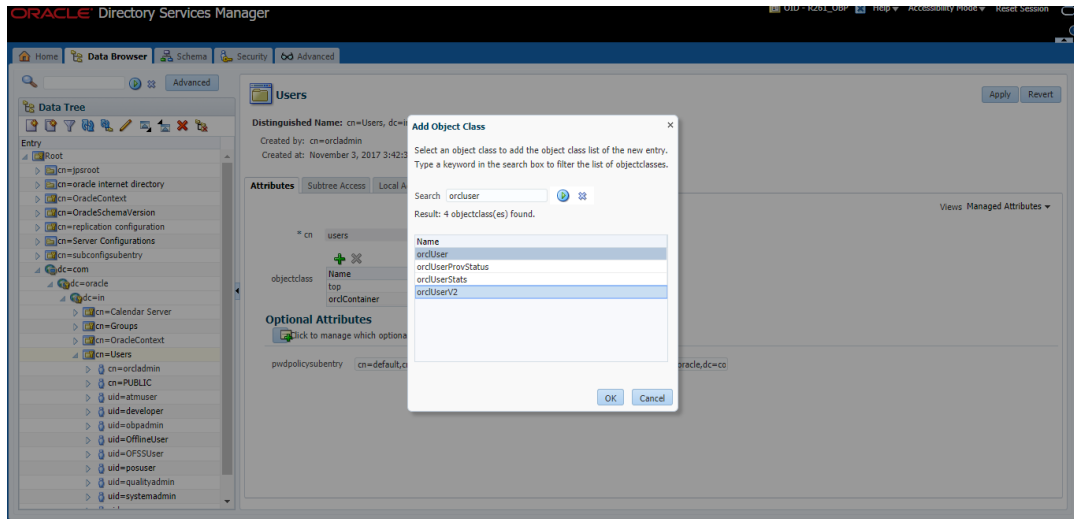

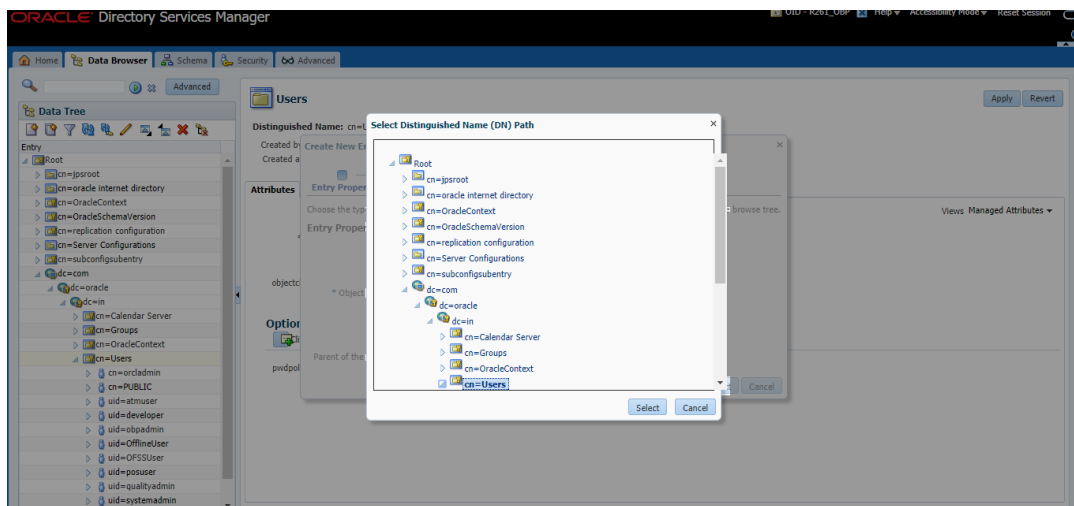

Figure 6–7 Adding Object Classes: Oracle User

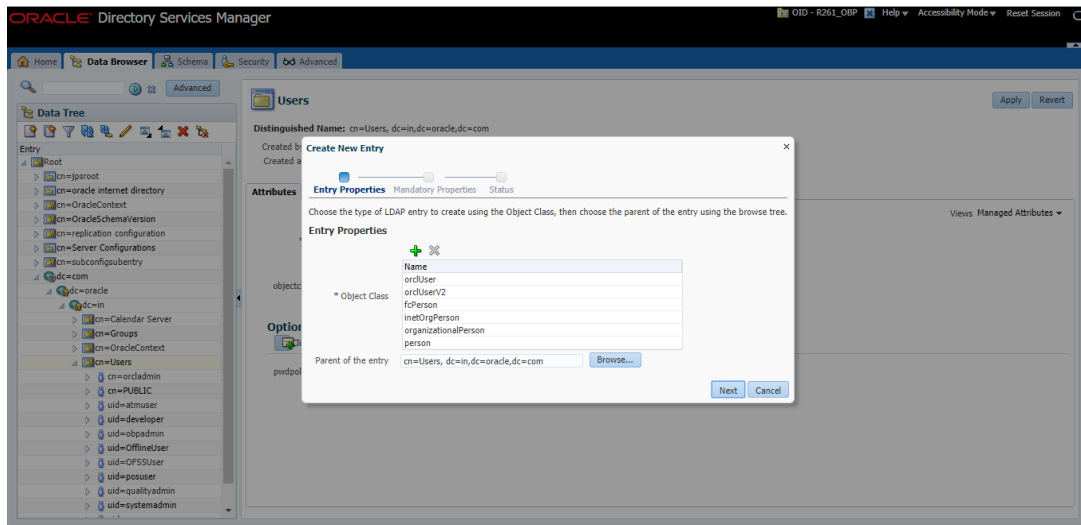

5. Select the Parent of the entry (**Distinguished Name DN**) by clicking the **Browse** button. Select the path as Root -> dc=com -> dc-oracle -> dc=in -> cn=Users

Figure 6–8 Selecting Distinguished Name

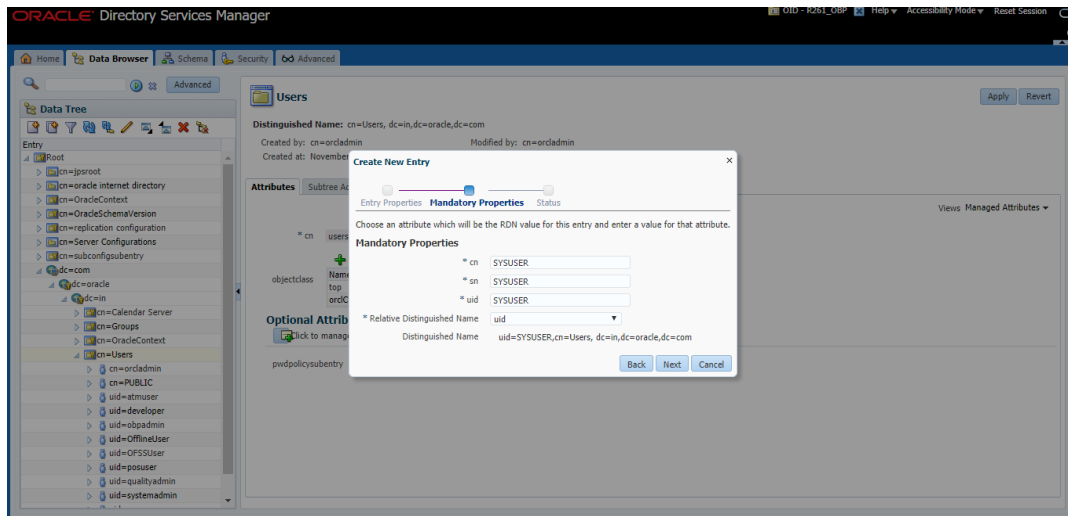

6. Click the **Next** button.

Figure 6–9 Selecting Entry Properties

7. Select the **Relative Distinguished Name** as **uid**. Then enter the values of **cn**, **sn** and **uid** as **SYSUSER**.

Figure 6–10 Selecting Mandatory Properties

8. Click **Next**. The new user is created in OID and a message appears as shown in Figure 6–11.

Figure 6–11 Status Message

9. Select that user 'uid=SYSUSER' from the Data tree list.

Figure 6–12 Selecting the User

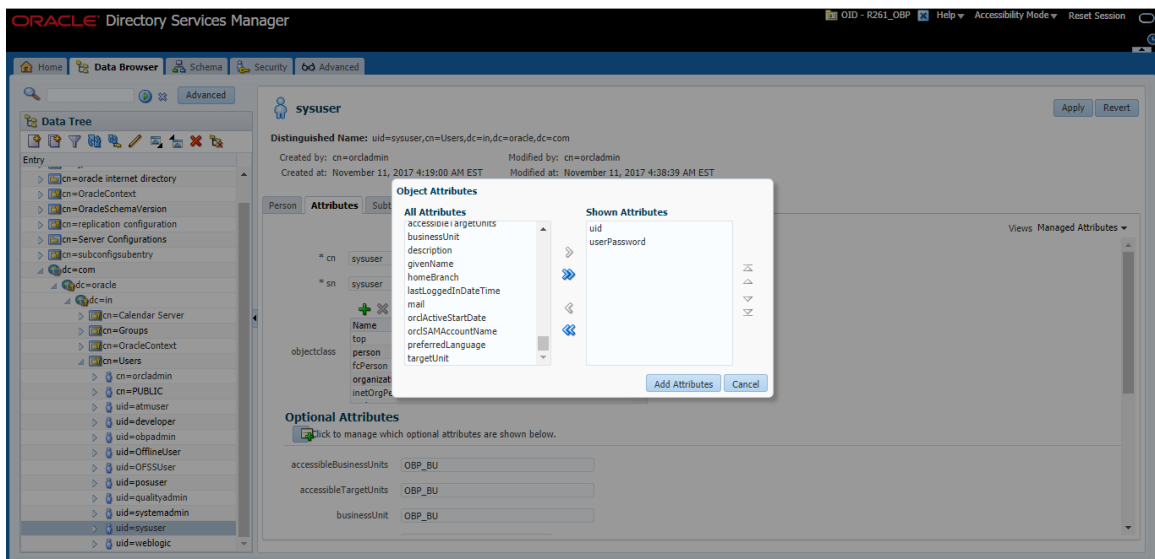

10. Click the **Attributes** tab, and then click the **Add** symbol under **Optional Attributes** section.

Figure 6–13 Attributes Tab

- Click on Add button under Optional Attributes and add the 'userPassword' attribute from the All Attribute list and click the Add Attribute button.

Figure 6–14 Adding User Password

- Enter the value in the **userPassword** field and click the **Apply** button in right hand corner.

Figure 6–15 Setting User Password

The confirmation message appears as "Changes have been applied successfully." as shown in Figure 6–16.

Figure 6–16 Confirm Message

13. Once user is created, add it into **Administrator group**. Navigate in Data tree as Root -> dc=com -> dc=oracle -> dc=in -> cn=Groups.

Figure 6–17 Adding to Administrator Group

- Click the **Attributes** tab and click the **Add** button in 'uniqueMember' table. Add the below entry into it.
uid=SYSUSER,cn=users,dc=in,dc=oracle,dc=com

Figure 6–18 Attributes Tab

- Click the **Apply** button. The confirmation message appears as "Changes have been applied successfully."

Figure 6–19 Confirmation message

16. Run the following query to ensure that Collection Dashboard is shown as the default page after logging in.

```
update flx_fw_config_all_b set prop_value='Role' where prop_id='collection.roles' and CATEGORY_ID='BROPConfig';
```

where **Role** = configured user role in step 14.

7 Threadpool Configuration

This chapter provides information about threadpool configuration.

7.1 Manage Requisite Files in lib

To manage the requisite files in lib:

1. Go to Putty and change directories to ../obpinstall/obp/collectionenv/standalone/lib/ext.
2. If wfullclient.jar, dms.jar and ojdk.jar are present in this directory, then go to step 8.
3. If this directory is empty, change directories to the server/lib directory.

```
../app/product/fmw/wlserver/server/lib
```

4. Use the following command to create wfullclient.jar in the server/lib directory:

```
java -jar wljarbuilder.jar
```

Figure 7–1 Command to Create wfullclient.jar

```
Integrating jar -->(1)/(37265)//scratch/app/product/fmw/modules/com.bea.core.htt
p.pubsub.mbean_1.7.0.0.jar
Integrating jar <--(1)/(37269)/(4)//scratch/app/product/fmw/modules/com.bea.core
.http.pubsub.mbean_1.7.0.0.jar
Integrating jar -->(1)/(37269)//scratch/app/product/fmw/modules/com.bea.core.dia
gnostics.accessor_1.5.0.0.jar
Integrating jar <--(1)/(37365)/(96)//scratch/app/product/fmw/modules/com.bea.cor
e.diagnostics.accessor_1.5.0.0.jar
Created new jar file: /scratch/app/product/fmw/wlserver_10.3/server/lib/wfullcl
ient.jar
[ofssobp@mum00are lib]$
```

5. Copy the generated wfullclient.jar to path:
../obpinstall/obp/collectionenv/standalone/lib/ext/
6. Copy **dms.jar** to path ../obpinstall/obp/collectionenv/standalone/lib/ext from
../app/product/fmw/oracle_common/modules/oracle.dms/
7. Copy **ojdl.jar** to path ../obpinstall/obp/collectionenv/standalone/lib/ext from
.. app/product/fmw/oracle_common/modules/oracle.odl/
8. Add below properties to **setDomainEnv.sh** if not present.
WLS_JDBC_REMOTE_ENABLED="-Dweblogic.jdbc.remoteEnabled=true"
export WLS_JDBC_REMOTE_ENABLED
9. In ThreadpoolEnv.sh file at ../obpinstall/obp/collectionenv/standalone/lib, verify that the following properties are according to the environment:
export JAVA_HOME=/scratch/app/product/jdk1.8.0_172/jre

```
export SPLEBASE=.../product/fmw/obpininstall/obp/collectionenv
export OBPBASE=.../product/fmw/obpininstall/obp
export com_ofss_standalone_executor_filterId=XXXXXX
#specify com_ofss_standalone_executor_filterId property if there is any filter defined.
#Check from FLX_RL_FILTER_TEXTS TABLE in DB for filter defined.
```

10. Verify threadpoolworker.properties.

- To modify threadpoolworker.properties:

a. Go to the path:

```
../obpininstall/obp/collectionenv/standalone/config/threadpoolworker.properties
```

b. Verify the rmi_port and Server Name--

```
com.splwg.grid.distThreadPool.threads.ThreadPool_Name=<Maximum Thread count>
spl.runtime.management.rmi.port=<rmi_port>
spl.runtime.management.connector.url.default=service:jmx:rmi:///jndi/rmi://< server-
name>:<rmi_port>/spl/fw/jmxConnector
```

Where:

rmi_port= RMI port used for JMX. To manage each instance of the pool an unique port number should be used.

server-name = host server IP

For Example:

```
com.splwg.grid.distThreadPool.threads.STANDALONE_TP=40
```

```
spl.runtime.management.rmi.port=9999
```

```
spl.runtime.management.connector.url.default=service:jmx:rmi:///jndi/rmi://XX.XX.XX.
XX:
```

```
9999/spl/fw/jmxConnector
```

```
XX.XX.XX.XX= host IP
```

Figure 7–2 Standalone lib

Name	Ext	Size	Changed	Rights	Owner
..			3/18/2016 6:52:21 PM	rw-r-xr-x	ofssobp
wfullclient.jar		53,718 KiB	1/29/2016 2:16:42 PM	rw-r-xr-x	ofssobp
dms.jar		1,603 KiB	1/25/2016 3:17:51 PM	rw-r-xr-x	ofssobp
ojdl.jar		192 KiB	12/30/2015 12:16:49 PM	rw-r-xr-x	ofssobp

7.2 Recommendations for Threadpool Memory Configuration

Consider setting the Threadpool JVM memory arguments as mentioned below. This needs to be modified in `threadpoolworker.sh`

```
MEM_ARGS="-Xms4096m-Xmx8192m -XX:MaxPermSize=1024m -XX:+UseParallelGC -
XX:ParallelGCThreads=16"
```

7.3 Start Threadpoolworker

To start the threadpool worker:

1. Open the putty and go to `.../obpininstall/obp/collectionenv/standalone/bin`
2. Run the command:

```
../threadpoolworker.sh
```

- Logs related to threadpool are generated as **threadpoolworker.2017XXX.XXX.log** and **ThreadPool.log** along with collection.log and specific Batch related logs will be generated at:

```
../fmw/obpininstall/obp/fclogs/logs
```

- Logs of OBP related to ThreadPool will be generated at:

```
.../fmw/obpininstall/obp/fclogs/logs/standalone/obp/logs
```

(Use root collection log path in place of `.../fmw/obpininstall/obp/fclogs`)

7.4 Verification

To verify OBP context is successfully up:

1. Check **threadpoolworker.2017XXX.XXX.log** and search for **Done with OBP initialisation.**

Figure 7–3 ThreadPool Worker Log

```

```

To verify whether the Threadpoolworker has started successfully:

1. Check for connection to:

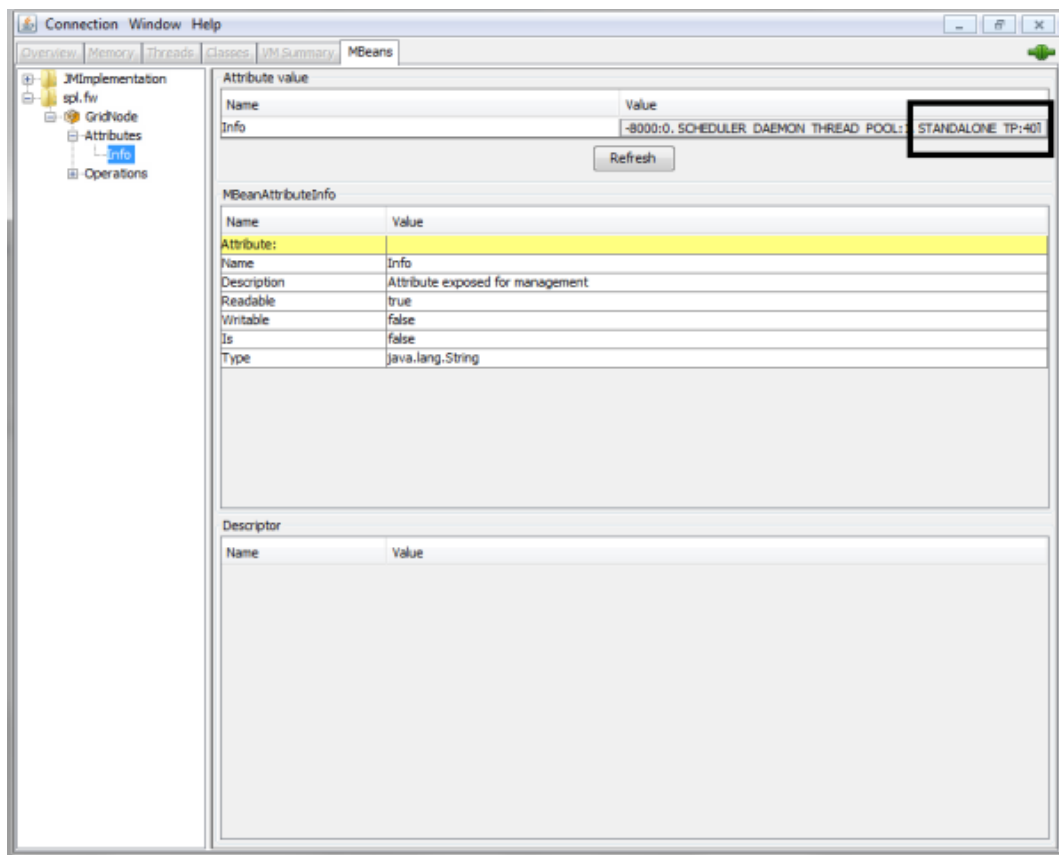

service:jmx:rmi:///jndi/rmi://<server-name>:<rmi_port>/spl/fw/jmxConnector

By using any VM tool (For example, jconsole).

Note

Ensure this poolname is same as what is mentioned in threadpoolworker.properties (as com.splwg.grid.distThreadPool.threads.STANDALONE_TP=40) and also in jconsole.

Figure 7–5 Verify Threadpool Worker: Check Connection

2. Search for the following text with latest time stamp in **ThreadPool.log**:

In Distributed Mode:

INFO (grid.node.DistributedGridNode) Distributed node 7621b973d7669cd8:3cdc534f:15affeb62a5:-7ff6 joined grid

In Clustered Mode:

INFO (support.cluster.ClusteredNode) Clustered node with member id=3 has been initialized on cluster: CLUSTER1

3. Verify that the following properties are present in <INSTALLATION_DIR>/collectionenv/standalone/bin/spl.properties.

If HOST OS is Linux

```
export SERVER_ROLE_BATCH=true
```

```
export OBPBASE=<INSTALLATION DIR PATH>
```

If Host OS is Windows

```
set SERVER_ROLE_BATCH=true
```

```
set OBPBASE=<INSTALLATION DIR PATH>
```

7.5 Submit the Batch

Run the CSMB and CASETRAN batch with Thread pool name specified in **threadpoolworker.properties** (as `com.splwg.grid.distThreadPool.threads.STANDALONE_TP=40`)

by using `-p`

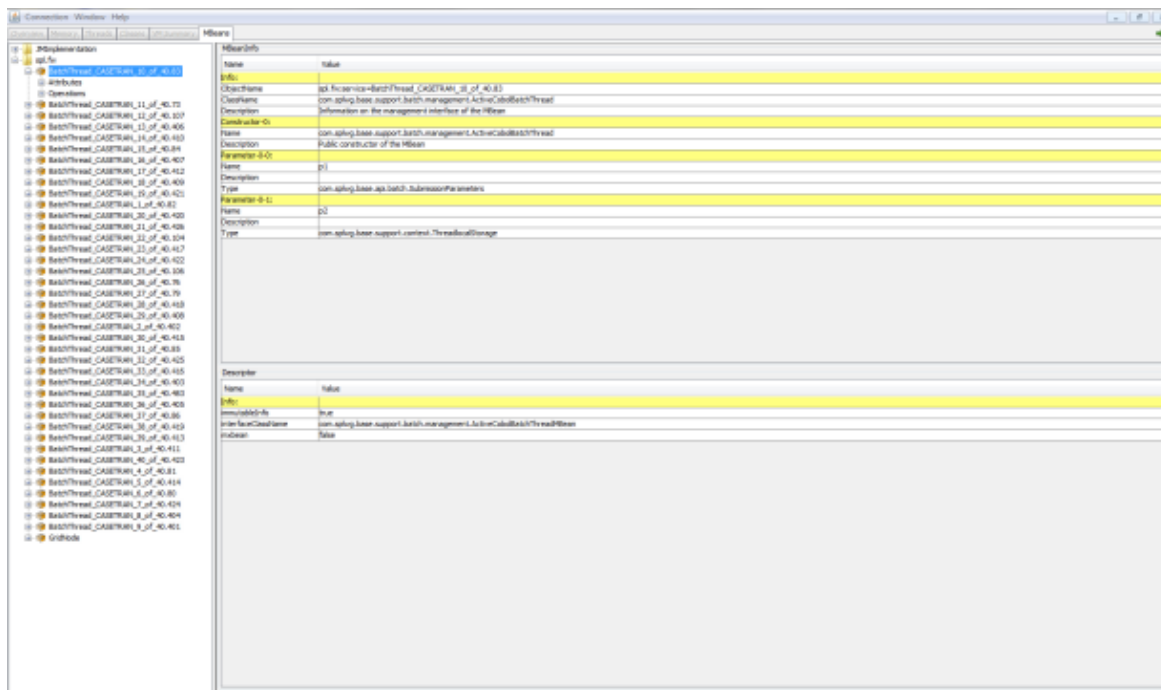

For example:

```
./submitjob.sh -b CASETRAN -t 0 -c 8 -p STANDALONE_TP
```

Where:

- c - No. of threads
- t - Thread Number
- p - ThreadPool Name

Figure 7–6 Submit the Batch

7.6 Stop Threadpoolworker

jmxbatchclient.sh: This script will wrap the JMXCommandLineClient java class so that it can be executed just like any operating scripts. The only option required is the JMX URL to connect. By default, it will only display information. For example, supplying only the required JMX connection information would result in as follows:

```
Options: -j
service:jmx:rmi:///jndi/rmi://myserver:9999/spl/fw/jmxConnector
Connecting to

```

```
threadPools=[DEFAULT:5, SCHEDULER_DAEMON_THREAD_POOL:1, LOCAL_
THREAD_POOL:b9835d11f15fd71b:1df6824f:120011dc94e:-8000:0]
BatchThread_ZZQABAT2_1_of_1.36
```

This shows that the thread pools defined, separated by commas, and that there is currently an active batch thread.

7.7 Command-Line Options

The following options can be specified when executing script `jmxbatchclient`.usage:

```
com.splwg.base.api.batch.JMXCommandLineClient
-h Show this usage information.
-j <JMX URL> The JMX URL to connect to.
-d display details
-k Kill threadpool worker.
-s Display summary
```

Show usage (-h)

Display the available options and their descriptions.

Show usage (-j)

Required. Specify the JMX URL to connect to. This should match the `spl.runtime.management.connector.url.default` property specified in the `threadpoolworker.properties`.

```
jmxbatchclient.sh -j service:jmx:rmi:///jndi/rmi://myserver:9999/spl/fw/jmxConnector
```

Display details (-d)

Display the details of the currently active threads.

```
Options: -j
service:jmx:rmi:///jndi/rmi://myserver:9999/spl/fw/jmxConnector -d

ProgramName = com.splwg.cm.domain.qa.batch.QaBatch2
RunType = New Run

```

Kill threadpoolworker (-k)

Specifying this option will result in the cancellation of all currently running threads and the stoppage of the threadpoolworker process.

After successful stoppage of threadpoolworker message will be displayed on command line as:

```
"Successfully stopped threadpoolworker..."
```

```
"Distributed Grid stopped successfully"
```

Display summary (-s)

Display the summary of the currently active threads is a listing format.

```

7.8 List of Batches to be Run on Standalone Threadpool or Weblogic

The following table refers to the list of batches to be run on standalone threadpool:

Table 7-1 List of Batches to be Run on Standalone Threadpool

#	Batch	Batch Code
1	Update Entity	C1-UPENT
2	Delinquency Identification	C1-DELID
3	Move Delinquent Accounts to RMB Feeder Tables	C1-MVDEL
4	Validate Incoming Data from Host	C1-VALFD
5	Create Entity	C1-CRENT
6	Increment DPD	C1-INCDP
7	Derived Fields	C1-DRFLD
8	Suspend Activity Monitor	C1-SUSMN

#	Batch	Batch Code
9	Bulk Contact Creation	C1-BLKCC
10	Contact Processing	C1-CNTPR
11	Strategy Monitor	C1-CSMB
12	Case Life Cycle Tracking	CASETTRAN
13	Queue Allocation Monitor	C1-ALOCM
14	Display Priority Monitor	C1-PRMON
15	User Allocation Monitor	C1-USALC
16	Treatment Activity Monitor	C1-TRMON
17	Dialer and IVR (O/B Robot) Extracts	C1-DIEXT
18	Batch to unlock cases	C1-CSCL
19	ToDo Creation for Locked cases	C1-CSTD
20	PTP Tracking	C1-PTPM
21	Collection Statistics	C1-COLST

The following table refers to the list of batches to be run on weblogic:

Table 7-2 List of Batches to be Run on Weblogic

#	Batch	Batch Code
1	Payment Handling	C1-FDPAY
2	Event Manager	C1-EVENT
3	Dialer Results Upload	C1-DLRRS
4	Vendor/ Agency Upload Batch	C1-VNDUP
5	Cure Monitor	C1-FINCO
6	Write-off Monitor/ Account abandon monitor	WRITEOFF
