1. Preface

1.1 Intended Audience

This document is intended for the following audience:

- Customers
- Partners

1.2 **Documentation Accessibility**

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=accandid=docacc.

1.3 Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit

http://www.oracle.com/pls/topic/lookup?ctx=accandid=info or visit

http://www.oracle.com/pls/topic/lookup?ctx=accandid=trs if you are hearing impaired.

1.4 Structure

This manual is organized into the following categories:

Preface gives information on the intended audience. It also describes the overall structure of the User Manual.

The subsequent chapters describes following details:

• Configuration / Installation.

1.5 Related Information Sources

For more information on Oracle Banking Digital Experience Release 19.2.0.0.0, refer to the following documents:

Oracle Banking Digital Experience Licensing Guide

2. User Interface Workbench

User Interface Workbench is a development tool to design the User Interface of an Application using APIs to fetch data, enabling communication of one screen with another and generating screens to be displayed to the end user. This tool aims at minimizing developers' efforts and time by generating the working screens automatically with minimal user input.

The tool also enables the developers to make the changes in the existing screens created by them or provided out of box, which are designed using the UI Workbench tool.

Components:

The screens created consist of the following components:

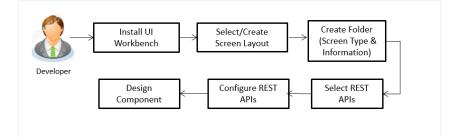

- Template: It decides visual representation of data on the front-end
- Model: It is responsible for fetching data from REST APIs
- Bindings: It consists of logic for processing the data fetched from the APIs
- Resource Bundle: It comprises of strings which are to be displayed on the screen
- Hooks: It comprises of user provided logic.
- Metadata: It consists of summarized information, which can generate all the above mentioned artefacts.

Pre-requisites:

- Basic knowledge of Swagger. (To know more about swagger refer https://swagger.io/)
- Basic knowledge of JavaScript, Knockout Js
- Basic knowledge of Oracle JET
- Basic knowledge of Sass

Workflow:

The process to create the screen ready to be used by the user / customer is as follows:

- 1. Install UI Workbench: The tool can be easily installed simply by running the setup file.
- 2. Select/Create Screen Layout: User can select one of the predefined screen layouts according to his requirement

- 3. **Create Folder**(**Screen Information**): User has to provide basic screen details like the name of the screen and the type of the screen e.g. (transaction, inquiry, and widget)
- 4. Select REST APIs: User can select multiple REST APIs which will be needed for fetching required information to display on the screen.
- 5. **Screen Designing**: User can design how the screen content will be displayed by using the form elements (e.g. Input Box, Text Area) available in the tool. User can drag and drop these elements and design the screen as per requirement

Home

3. UI Workbench Manual Build

In the project directory, place folders **obdx-ui-workbench-core** and **obdx-ui-workbench-gui** side by side.

Follow the steps mentioned below to setup your environment for build.

- 1. Open terminal inside **obdx-ui-workbench-core** and perform **npm install** to setup the workspace and then execute **npm run build** to build the core.
- 2. Open terminal inside **obdx-ui-workbench-gui** and perform **npm install** and then **npm link ../obdx-ui-workbench-core.** This will locally install the core package to GUI project.
- 3. Run **npm run build** to create executables for macOS, Windows and Linux. Please note that executables for Windows can only be created on Windows setup and code signing for macOS applications can only be done on macOS operating system. To create executables for Windows and macOS on Linux machine, use Wine and Mono on Linux. For more details you can refer to <u>https://www.electron.build/</u>

Alternatively, you can use **docker** to simplify the operations as follows and create Windows & macOS builds on Linux by running the following command in **obdx-ui-workbench-gui** folder root:

docker	run	rm	-ti
env	ELECTRON CACHE="/ro	ot/.cache/electron"	\
env	ELECTRON_BUILDER_CACHE="/ro	ot/.cache/electron-builder"	\setminus
-v	\${PWD}:/r	project	\setminus
-v	~/.cache/electron:/ro	oot/.cache/electron	\setminus
-v	~/.cache/electron-builder:/rd	oot/.cache/electron-builder	\
electron	nuserland/builder:wine-mono /bi	n/bash -c "npm run build"	

4. The artifacts will be available inside **uiworkbench**/ directory.

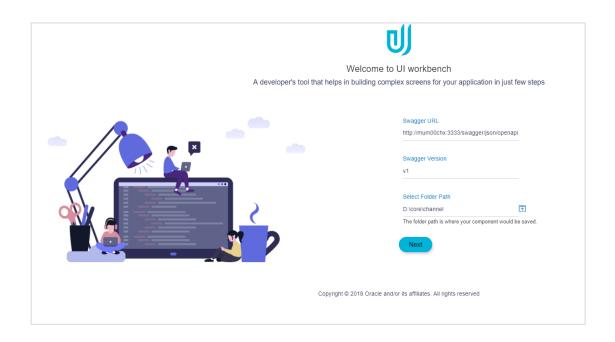

3. UI workbench installation

As a first step, user should download the UI Workbench setup from the Oracle Software Delivery Cloud portal. Once the setup is downloaded, double click to install the tool.

After installation, user would be directed to the following Landing Page. User is expected to provide the URL where the swagger document of the RESTful APIs are hosted.

To know more about swagger refer <u>https://swagger.io/</u> Swagger version (By default it is v1) Directory path : <OBDX codebase location>/core/channel

Provide these details at the time of installation. The path can be changed anytime later by clicking on settings. Please note: Every time the path is changed, data is lost.

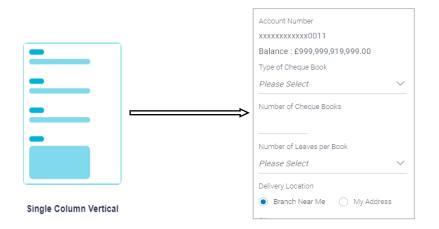

4. Layout Selection

Next step is to select the screen layout. The tool offers five pre-defined templates, which will decide the layout of the screen that the user wants to create. The user can select any of these layout from the list provided or can create a custom layout in case the desired layout is not found in the mentioned list. To know the steps to create the custom layout Please refer **Grid** section.

Layout Selection	Folder Cr		3 REST API Selection	(4)	6 Design Component
			Select layout		
	Single Column Horizontal	Double Column Horizontal	Single Column Vertical	Double Column Vertical	
	Three Column Vertical				

E.g. incase if user select the following layout, the label and value fields will be vertically aligned and in a single column.

In case the user wants to change the layout once, he has moved on to the next step, he can navigate to this step by clicking back button at the bottom of the screen. Layout can be changed at any given point of time during the process of screen creation.

5. Folder Creation

As a part of next step, following screen is displayed to the user to create the new folder. User is expected to furnish following information.

• Module Name:

Module is a category of the screen the user are creating, for e.g. a fund-transfer screen would be of category Payments. So in this case, the module name would be payments. Module consists of various components, which contains the artefacts of the screen the user wants to generate.

• Component Name:

Component name would be the type of screen e.g. Funds transfer, Cheque Book Request, Letter of Credit Initiation, Bill Payment, New Deposit etc.

• Component Type:

Component type is the type screen layout the user wants to be displayed. User can select from the options as Individual page Transaction Page or a Widget. (Explained in the detail below)

U							ĝ
New Component *	+

		Module Name		Component N	lame		
		Type module name		Type compone	ent name		
		Component Type Select component type Know More	~				
				Back Next			

Following are the different component types and the examples where these are used.

• Individual Page :

Individual page is a stand-alone page that consists of the detailed information for the Selected transaction/component e.g. Account Details (Component) in a standalone page shows the various Balances, transactions and other information of the selected accounts.

• Flows:

Flows consists of pre-defined multiple pages in accordance to OBDX UI framework. For e.g. A transaction where the customer or user enters information asked on the screen, reviews the same and submit it for further processing. It consists of multiple screens.

Go To Dashboard More Paym	ent Options Add as Payee?	
so to basiloond more rayin	residential constraints and a segment	

In case of such scenario, one must select component type as FLOW.

Types of FLOW supported are

1. CREATE:

This is an n-step flow, which is similar to a transaction. The only difference is the initiation page can be any number of pages as per the requirement and not only one. For e.g. first page can comprise of primary details of a customer e.g. name, surname and second page can consist of additional information like address. Review and confirmation page will each consist of a single page only.

Once the flow type is selected as CREATE, additional details are required to be filled such as

- Flow name : The name will be the identifier of the entire flow
- Number of Stages : The number of pages before the review screen appears in the flow
- Stages navigation display: The type of navigation control to navigate between the pages
- Confirmation Template: Type of layout for confirmation screen
- Show summary : if summary is to be shown about the progress of the form filled and continue where the user had left the last time, the switch can be toggled to YES
- Widget -

Widget is a small section on the screen especially on the Dashboard that displays commonly used functions or important information in a summarized form. The component generated of this type will be shown on the dashboard.

6. **REST API Selection**

In this step, the user has to select the REST APIs to enable the functioning of the elements on the screen. The dropdown will contain all the REST APIs mentioned in the swagger document hosted on the URL which user had specified in the landing page.

U)							ĝ
New Component	x +						
	Layout Selection	Folder Creation	3	REST API Configuration	5 Design Component	6 Design Review Component	
			Select REST API f	or the component			
		REST API services			Manage Swagger URLs		
		No items to display.					
			Back	Next			

In case, the user needs REST APIs whose documentation is hosted on other URLs apart from the ones the user had mentioned earlier, the user can add them by selecting manage Swagger URLs link.

On clicking the link, a panel will open on the left side. By default, it will contain the URL and the version, the user had specified during installation. User can change this URL or can add multiple URLs by clicking on 'Add URL' text link, depending upon the requirements.

U)							ŝ

		/about get v1		0	
		/accessPoints/{accessPointId} get v1		0	
			Back Next		

On clicking on the edit button, a panel will open on right, which has three configuration options.

Parameters are the options that the user can pass with the endpoint (such as specifying the response format or the amount returned) to influence the response.

• Required Parameters:

They are also known as path parameters. These parameters are part of the REST URL written within curly braces. E.g. /accessPoints/ {accessPointld}.Here accessPointld is the required parameter.

• Optional Parameters:

They are also known as query parameters. These parameters are part of the REST URL written at the end of the URL followed by? Symbol. E.g. /accessPoints? NoOfpoints=3. Here NoOfPoints is an optional parameter.

The value of these parameters can be set by two ways.

- 1. Current component sets the value.
- Value is passed to the current component from the previous component. In case the parameter values are being passed from the previous component, the variable name has to be mentioned in this pane The current parameter value is set in later steps, refer <u>Value</u> attribute.
- Configurations:

The GET REST API can be used for two purposes.

- 1. To fetch details
- 2. To download a file

If user wants to use GET REST API as a download service, user can enable the switch named as 'Use as download Service' in configurations section

= ⋓					\$

Select REST API		
✓ Review		
✓ Final REST		
	Back Next	

The final REST dropdown value should consist of the REST that will be fired once the user has confirmed the details and which will make the concerned transaction.

7. **REST API Configuration**

In this step, the user can configure how the selected REST APIs will be called when the screen is loaded. There are two sections in this step.

• Chain selected REST APIs

There are 3 ways how REST APIs can be called:

Independent

If all the selected REST APIs are to be called irrespective of any dependency on other APIs, then the user has to select the NO option.

Sequential

If a REST API calling is dependent on the response of other REST APIs then such case is known as sequential manner. For e.g. A REST API fetching details of cities in a country is dependent on the response of API fetching the list of countries. If REST APIs are to be called in such a manner, select the option 'Yes'.

On selecting the 'Yes' option, a panel appears on the left having list of selected REST APIs

Parallel

If REST APIs are to be called together and the combined response of these APIs are needed then they are to be called parallelly. If REST APIs are to be called in such a manner, select the option 'Yes'.

On selecting the 'Yes' option, a panel appears on the left having list of selected REST APIs

U							ŝ
New Component	x +						
	Layout Selection	Folder Creation	REST API Selection	REST API Configuration	Design Component	Design Review Component	
			REST API C	Configuration			
		Chain selected REST API What is chaining? Execute REST API on component load	Yes No d Yes No				
			Back	Next			

How to chain Rests, refer Chain RESTS.

In case of FLOW, user can configure RESTs for each step.

	REST API Configuration	
Chain selected REST API		
What is chaining?		
∨ Stage 1		
∨ Stage 2		
✓ Review		
	Back	

8. Chain REST APIs

User is expected to chain the REST APIs, if the REST APIs are to be called parallel or sequentially. To chain the APIs, the user must select 'Yes' option in the previous screen. Once the user selects 'Yes', a panel appears on the left having list of selected REST APIs.

To start chaining, user needs to drag the APIs and drop it in the chaining section shown in the middle section of the screen.

User Interface Workbench View				1.	- 0 ×
= ⋓					ŝ
, New Tab 🗙					
GET					
/enumerations/country get v1	Folder Creation	REST API Selection	REST API Configuration	Design Component	
/enumerations/country/{countryCode}/sta get v1					1
		REST API Configuratio	n		
	Chain selected REST API What is chaining?	Yes No			
	Chaining		Selected RES	ST API	
	/enumerations/country/{coun get v1	tryCode}/sta			l
		No data to display			

Once the user has dropped the REST APIs in the middle section, a right panel gets opened where user has to provide information about the REST type and if the RESTs are parallel independent or dependent.

Some common terms used in chaining are:

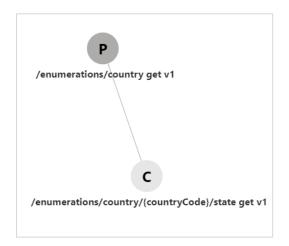

REST Type:

- **Parent** If this option is selected then, every service call flow needs a parent rest, which will be called first.
- Child If this option is selected then, service to be called after parent call finishes.

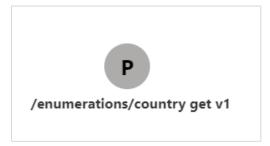

Is this REST Parallel Independent or Parallel Dependent?

- **Parallel Independent** On selecting this option, service calls can be fired independently.
- **Parallel Dependent** On selecting this option, service calls logic, which depend on response of an immediate parallel service call, those immediate service calls needs to be parallel dependent

The chaining structure is similar to tree structure. The top most node would be parent and the other nodes would be child nodes.

If user selects REST type as Parent then the node with letter P will be generated.

If user selects REST type as Child then the node with letter C will be generated.

Consider an example if two REST APIs are to be called in a sequential manner.

The first API to be called will be declared as Parent and since no other API is to be called along with this API, it will be parallel independent.

= IJ		ŵ
New Tab × ×		REST API Details
GET		Select rest type
/about get v1	Folder Creation REST API Selection REST API Configuration	Parent Child
/accessPoints/(accessPointid) get v1		Is this rest parallel independent or parallel dependent?
/enumerations/country get v1	REST API Configuration	Parallel Independent
/enumerations/country/{countryCode}/state get v1	Chain selected REST API Yes No	Parallel Dependent
	What is chaining?	
	Chaining Selected REST API	Save
	No data to display	

The second API which is to be called after the response of the first API is received, will be declared as a child and parallel independent

≡ IJ					Ô
Selected REST API				REST API Details	×
GET			0	Select rest type	
/about get v1	Folder Creation	REST API Selection	REST API Configuration	O Parent	
accessPoints/[accessPointid] get v1 /enumerations/country get v1 /enumerations/country/(countryCode)/state get v1		REST API Configuration		Child Is this rest parallel independent or para Parallel Independent Parallel Dependent	allel dependent?
	Chain selected REST API What is chaining? Chaining	Yes No	Selected REST API	Savo	
		No data to slopity			

To establish the linkage between the parent and its child nodes and distinguish them from each other, the connection has to be made. To make a connection, drag the child REST from the chaining section, and drop it on the Parent REST and then drag the child node down, the connection will be made.

≡ IJ	¢
Selected REST API X	
GET	O6
/about get v1	Folder Creation REST API Selection REST API Configuration Design Component
/accessPoints/{accessPointid} get v1

	Chaining Selected REST API
	Cidaning
	/about get v1 C /accessPoints/(accessPointid) get v1 /enumerations/countryCode//state get v1
	Confirm
	Execute REST API on component load Ves No

The connection is only to be established if the services are to be called in sequential manner.

In case, all the services are to be called together and the wait till response of each service has been received, connection will be not established as they all act as parent nodes. In such case, all REST APIs will be configured as parent node and will be parallel dependent since they will have to wait for the response of the selected APIs.

Select rest type
Parent
Child
Is this rest parallel independent or parallel dependent?
O Parallel Independent
Parallel Dependent
Save

If out of the selected RESTs, some of them are sequential or parallel Dependent and rest of them are parallel Independent, the chaining is still to be performed. To declare a REST to be independent of other rests, select the rest type as Parent and Parallel independent and do not make any connections with those RESTs. Incase all the REST APIs are independent of each other then there is no need of chaining.

If user wants to call the REST APIs as soon as the screen loads, the option 'Yes' needs to be selected.

= IJ					{

Once the yes option is selected, the REST Chains will be shown to user. In case of independent RESTs their name will appear.

/about get v1 /accessPoints/{accessPointId} get v1

If there is a sequential rest then it will be displayed as

If there is a parallel dependent chain then it will be displayed with their names together

User can select which REST chains he wants to call when the screen loads. Once he has selected the chains, user needs to click on generate init function to generate the code to fire the services on the screen load.

Generate Init Function

Once the function is generated user can click on Edit Init Function link to edit the code to perform desired actions.

Controls Framework Visualizations	PageSection		2 1 1	

The following information is captured on this screen.

• Component Header

The text entered in this field will be displayed as the Page Title. E.g. Cheque Book Request, Loan Repayment etc.

• Validation Tracker ID

The ID provided by the user should be the ID of the element within which the form elements reside. The tool by default generates this ID. So this is an optional field. However, there may arise a situation where the user needs to use such an ID. In such case, user can provide custom ID in this field.

• Component CSS Style

User has the provision to provide custom style sheet (CSS) for the screen he wants to generate and change the look and feel of the component as per his requirement.

To create custom style sheet, user has to toggle the button to Yes. A CSS Editor button will appear on the right of the toggle button.

• More

On clicking more, context menu is opened that has following options:

Custom Resource Bundle

To add custom entry to the resource bundle file (which contains all the text that will be displayed on the screen), user can select this option. After selecting this option, editor window will pop up where user can add the custom entry.

Layout Selection	- Creation	REST API Selection	REST API Configuration	S Design Component
		Design Component		
Component	t header	Enter component header		
Validation 1	racker ID	Validation Tracker ID		
Component	t css style	Yes No		
Form Drag H			Available Components Edit Init Func	Custom ResourceBundle
				Component JSON

To add new entry, add key and the resource value inside the braces of 'const nls', as shown in the picture below:

User Interface Workbench File View					-	a x
						(ĝ)
New Tab ×						
Lay	Out Selection	Folder Creation	REST API Selection	REST API Configuration	3 Design Component	
	Component header Validation Tracker ID Component cas shyle From Drag Here	Save Cancel	Create component	N Int Fuscion More		

This resource bundle value can be used in two way in the component

- 1. Inside init function: Here resource bundle value can be accessed with code *self.nls.custom_key*.
- Inside html: In normal scenario, tool creates resource bundle for every string attached to html element. But in special case, this can be simply done by writing \$component.nls.custom_key.
 - Component JSON

Selecting this option will open editor window. On creation of component, this JSON file is created inside the component.

User can fix the errors and can click on Create Component again. If there are no further errors, component will be generated and success window will be displayed.

Generated Artefacts

After Creating components following files are generated inside channel path selected by the user;

- a. Inside channel_path/component/module_name/component_name:
 - 1. Hooks.js It contains all the custom code written by user in the Init function or Hook function.
 - 2. Loader.js This is the entry file to load the component.
 - 3. Model.js This file is responsible for communicating with server and transferring data between component and server.
 - 4. Component_name.js- This file is the view model for the component.
 - 5. Component_name.html It contains the html code for the designed layout.
 - 6. Component_name.json Code written in component JSON window is added in this file
 - 7. Component_name.scss If Component SCSS style was turned on, a SCSS file is created which contains the code written in SCSS Editor.
 - 8. Component_name.css If Component CSS style was turned on, the same file is created which contains code written in CSS Editor.

e.g. Below screenshot refers to a virtual-account-record-list component which is generated using the tool.

Note: Generated artefacts must not be overwritten manually.

Name	Date modified	Туре
👔 hooks.js	25/04/2019 22:48	JavaScript File
🚿 loader.js	25/04/2019 22:48	JavaScript File

👔 virtual-account-record-list.js	25/04/2019 22:48	JavaScript File
📝 virtual-account-record-list.json	25/04/2019 22:48	JSON File

- b. Inside channel_path/resources/nls:
 - 1. component_name.js It contains the language specific values entered by user.
- c. Inside channel_path/metadata/module_name/component_name:
 - 1. component_name.json- This is the manifest file for the component.

2. hooks.js- It contains all the custom code written by user in Init function or Hook function.

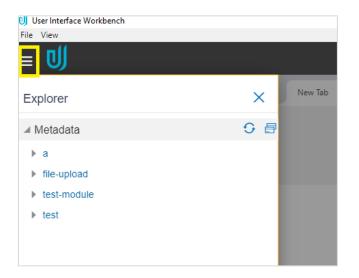

E.g. metadata files for Virtual-Account-Record-List component

core	> channel > metadata > file-upload >	virtual-account-record-list	
^	Name	Date modified	Туре
	👔 hooks.js	30/04/2019 18:16	JavaSci
	📝 virtual-account-record-list.json	30/04/2019 18:16	JSON F

Editing Component

All the components generated using the tool can be edited by opening the component in the tool.

To edit a component, click on File Explorer icon, available at top left corner of the tool in the grey panel.

All the created components are present under Metadata accordion. To start editing a component, expand the module_name->component-> click on the component name

U User Interface Workbench						- ø ×
File View						^
= IJ						0

		Form Drag Here					
				Back Create component			
				Chedro component			

The user can now edit the screen as per requirement and save the changes by clicking on Create Component Button.

Design Review Component

If the type of component is FLOW, this step is automatically added. It is similar to design component stage.

In this Stage, a default design is created using the fields which have been designed on the design stages.

User Interface Workbench File View Edit About Debug			- 0
= 🔰			¢
Available Components X			
 ✓ Forms AnchorTag & Avatar 	yout Selection REST API Selection REST API Configur	ation Design Stage 1 Design Stage 2 Design Review C	
CheckBox Combobox DatePicker	eview Layout Two Column Vertice	11 <u>v</u>	
FilePicker	Review	Available Components Edit Init Function N	lore
InputNumber InputPassword	a	2 🗈 🛍	
InputBox ListView Menu	First Name		
MenuButton Progress	a	2 🗎 🖬	
 RadioButton Select 			
 Switch Table 	Address		
Aa Text TextArea	⊘ Confirm		
O Train ♣ TreeView	← Back		
Controls Framework	⊗ Cancel		
 Visualizations Business 			
	в	ack Next	

Thus a review page can be generated without user intervention.

In case the design does not meet the requirements, user can make changes in the design as needed. Once the user manipulates the screen, the tool stops automatic design generation. For e.g. If user adds a field in one of the design pages, then he will have to add that field on the review design step also.

Confirmation Screen:

Confirmation screen is used to show confirmation of the operation, only in case of flows. User can design his own confirmation screen. Confirmation template option will be available when Component Type is Flow & Flow Type is Create.

There will be 2 options available for Confirmation Template:

1. Standard

It is a standard template of confirmation screen, which means user cannot modify or add any component in this screen. Screen will look like image below.

	N

2. Animated Page

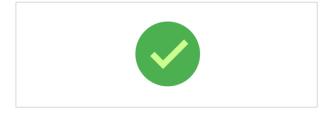

In this case user can design his own confirmation screen.

One extra step will get added in train after review screen, this will be the design step for confirmation screen.

Toolkit will generate a page with an animated imaged centrally placed by default.

User can delete or change this image. He can also add any text of his choice e.g. Thank You or Transaction Confirmed or can add other components e.g. Buttons, Icons etc.

Confirm folder will get generated in NLS, metadata & in created component folder also.

10. Available Components

There are four types of components available in this panel.

- A) Forms
- B) Controls
- C) Framework Components
- D) Visualization

A) Forms

This section contains the components which are required in designing a form.

For example, a Login form accepts user name and password and validates a user. In the example below, developer can use Input Text and Input Password element for user name and password respectively.

User	name
Pase	sword 🕐
	Login
	Forgot Username Forgot Password

Following is the list of available components under this section.

- 1. Anchor Tag
- 2. Avatar
- 3. Check Box
- 4. Combo Box
- 5. Date Picker
- 6. File Picker
- 7. Image
- 8. Input Number
- 9. Input Password
- 10. Input Text
- 11. List View
- 12. Menu
- 13. Radio Buttons
- 14. Select

- 15. Switch
- 16. Table
- 17. Text
- 18. Text Area
- 19. Train
- 20. Tree View

B) Controls

This section contains the components, which are used to control the activity on the form.

For example, user has a form to transfer money from one account to another account in which he will have the following two actions:

- Transfer button to confirm the transaction
- Cancel button to cancel the transaction

In the below example, buttons are displayed:

Account Number	
xxxxxxxxxx0166 - John S	\checkmark
Balance : £347,997.22	
Transfer From	
xxxxxxxxxx0170	\sim
Balance : €345,975.51	
Amount	
GBP \smallsetminus	£1,000.00
Transfer When	View Limits
Now Later	
Note	
payment for credit card	
57 Characters Left	
	_
	el
	_

Following is the list of available components under this section.

- 1. Button
- 2. Button Set
- 3. Container
- 4. Component Loader

C) Framework Components

This section contains the components, which are predefined & supported by OBDX. It has in-built functionality.

In the below example, an account input component which lists all the accounts of the user and shows its details like balance and address of the account selected by the user .

Transfer From	
xxxxxxxxxxx0031	\sim
Balance : £201,065.00	

Following is the list of available components under this section.

- 1. Account Input
- 2. Amount Input
- 3. Bank Look Up
- 4. Help Panel
- 5. Navigation Bar
- 6. Page Section
- 7. Row Control

D) Visualization

This section contains the components, which are useful to design a widget that display s information graphically.

In the below example, a chart that shows the net worth of different accounts (CASA) of the user

Following is the list of available components under this section.

- 1. Chart
- 2. TimeLine

Details of components

A) Forms:

1) Anchor Tag :

Usage: This component is used to add a link. This link can be an image / icon or text. Example:

	Username
	Password 🔞
~	Login
(S)	Forgot Username Forgot Password

Supported attributes:

- a) Basic:
 - <u>Label</u>
 - Format Label

b) Advanced:

- Select anchor type
- Add formatter
- REST API chain
- Hook functions
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
 - Grid

2) Avatar

Usage: This component is used to display initials for name or product and images in a circle. Example:

Supported attributes:

- a) Basic:
 - Label
- b) Advanced:
 - Select Size
 - Enter Image Path
 - Enter Initials
 - Add Loop
 - Add Custom Attributes:
 - Conditional Field
- c) Layout:
 - Grid

3) Check Box:

Usage: This component is used to add checkbox to allow a user select one or more options from the available choices.

Example:

Payment Methods Credit Card 🗹 Debit Card 🔽 Current and Savings Account	Payment Methods	Credit Card	✓ Debit Card	Current and Savings Account
------------------------------------------------------------------------	-----------------	-------------	--------------	-----------------------------

- a) Basic:
 - Label
 - Hide Label

- Value
- Options
- b) Advanced:
 - Value Change Handler
 - Validations
 - Required Field
 - Add Loop
 - Add Custom Attributes
 - Conditional Field
- c) Layout:
 - Grid

4) Combo Box:

Usage: This component is used to add a drop down to allow user to make multiple selection from the predefined options or type his own option.

Example:

Combobox Ma	iny
Chrome ×	Internet Explorer $ imes$
Firefox	
Opera	
Safari	

Supported attributes:

a) Basic:

I) Label:

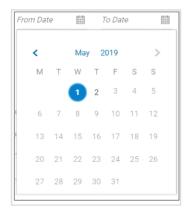

- Hide Label
- Value
- Select Type
- Options

- b) Advanced
 - Value Change Handler
 - Validations
 - Required Field
 - Add Loop
 - Add Custom Attributes
 - Conditional Field
- c) Layout:
 - Grid

5) Date Picker:

Usage: This component is used to add an input box to accept date as an input from user.

Example:

- a) Basic:
- Label
- Hide Label
- Value
- b) Advanced:
- Value Change Handler
- Validations

- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
- Grid

6) File Picker:

Usage: This component is used to add an action as a button to accept the documents (files) as an input from user.

Example:

Supported attributes:

a) Basic:

• Label

d) Advanced:

- Selection Mode
- Enter Allowed File Extensions
- REST API chain
- Hook functions
- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field
- e) Layout:
 - Grid

7) Image:

Usage: This component is used to add an image. Example:

Supported attributes:

- a) Basic:
 - Image source
- b) Advanced:
 - Add Loop
 - II)Add Custom Attributes
 - III)Conditional Field
- c) Layout:
 - Grid

8) Input Number:

Usage: This component is used to add an input box to accept numbers as an input from the user . Example:

Enter years		
22	~	^

- a) Basic:
- Label

- Hide Label
- Value
- b) Advanced:
- Enter Minimum Length
- Enter Maximum Length
- Enter Step
- Value Change Handler
- Validations
- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
- Grid

9) Input Password:

Usage: This component is used to add an input box to accept the password as an input from the user. Example:

- a) Basic:
- Label
- Hide Label
- Value
- b) Advanced:
- Value Change Handler

- Validations
- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
- Grid

10) Input Text:

Usage: This component is used to add an input box to accept text as an input from the user Example:

City		
Pune		

- Basic
- Label
- Hide Label
- Value
- a) Advanced:
- Value Change Handler
- Validations
- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field
- b) Layout:
- Grid

11) List View:

Usage: This component is used to add a view which groups several items and display s them in a vertical scrollable list

Example:

00	OBDXDEV COUNTERPARTY 237,UK ,UK	ld-001003 Contact Number 9999900017	Party Role-Counterparty,Anchor	Active
AE	Adaani Electricity Andheri Station,IN	Id -NC00000399 Contact Number 7045212345	Party Role-Counterparty	Initiated
RE	Reliance Energy Andheri Station,AD	Id -NC00000406 Contact Number 8879710570	Party Role-Counterparty	Initiated

Supported attributes:

a) Basic:

- Label
- Source variable
- Id attribute
- b) Advanced:
 - Renderer ID
 - Pagination
 - Indexer
 - Add Loop
 - Add Custom Attributes
 - Conditional Field
- c) Layout:
 - Grid

12) Menu:

Usage: This component is used to add an element, which displays popup menu with multiple options relevant to the particular row for easier navigation.

Example:

06 Sep 2018	xxxxxxxxx0064	Own Account	£100.00	Self	AT30UPA18249AZIG	Failed
06 Sep 2018	000000000000000000000000000000000000000	Own Account	£333.00	Self	AT3OUPA18249AYD0	Failed View Details
06 Sep 2018	000000000000000000000000000000000000000	OA Own Account	£1,888.00	Self	AT3OUPA18249AXYO	Failed Re-Initiate

Supported attributes:

- a) Basic:
 - Label
 - ID
 - Options

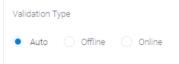

b) Advanced:

- Enter Menu Launcher
- REST API chain
- Hook functions
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
 - Grid

13) Radio Buttons:

Usage: This component is used to add buttons to let a user select an option from the available choices.

Example:

Supported attributes:

- a) Basic:
- Label
- Hide Label
- Value:
- Options
- b) Advanced:
- Value Change Handler
- Validations
- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field

c) Layout:

• Grid:

14) Select:

Usage: This component is used to add a drop down, to allow user to make a choice from the predefined options.

Example:

Country	
Select	\sim
1	Q
Andorra	-
United Arab Emirates	
Afghanistan	
Antigua And Barbuda	
Anguilla	
Albania	

Supported attributes:

- a) Basic:
- Label
- Hide Label
- Value
- Select type
- Options

b) Advanced:

- Value Change Handler
- Validations
- Required Field
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
- Grid

15) Switch:

Usage: This component is used to add a toggle button for binary status such as on/off. Example:

- a) Basic:
 - Label
 - Hide Label
 - Value
- b) Advanced:
 - Value change handler

- Required field
- Add Loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
 - Grid

16) Table:

Usage: This component is used to add a view which groups several items and display s them in row- column fashion.

Example:

Touch Point	Currency	Updated On	Roles
APINTERNET	GBP	13 Jul 2018	corporateuser
APINTERNET	GBP	19 Jul 2018	corporateuser
001	GBP	25 Oct 2018	corporateuser
APINTERNET	GBP	13 Jul 2018	corporateuser

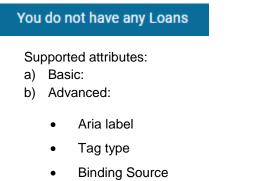

Supported attributes:

a) Basic:

- Label
- Source variable
- Id attribute
- Columns
- b) Advanced:
 - Row renderer
 - Pagination
 - Add Loop
 - Add Custom Attributes
 - Conditional Field
- c) Layout:
 - Grid

17) Text:

Usage: This component is used to add a simple text. Example:

- Add formatter
- Add loop
- Add Custom Attributes
- Conditional Field
- c) Layout:
 - Grid

18) Text Area:

Usage: This component is used to add an input box to accept the multi-line text as an input from user.

Example:

Enter Description	
This is a text-area.	
This accepts multi-line input.	

- a) Basic:
 - Label

- Hide Label
- Value
- b) Advanced:
 - Enter rows
 - Value Change Handler
 - Validations
 - Required Field
 - Add Loop
 - Add Custom Attributes
 - Conditional Field
- c) Layout:
 - Grid

19) Train:

Usage: This component is used to add an element for navigation that allows a user to go between different "steps" i.e. different components. Each step can display information about the state of the step such as "visited", "unvisited", "disabled".

Example:

1	2	3
Request Parameters	Build Your Form	Preview

Supported attributes:

- a) Basic:
 - Label
 - Value

b) Advanced:

- Selected step
- Value change handler
- Add Loop
- Add Custom Attributes:
- Conditional Field
- c) Layout:

I) Grid

20) Tree View:

Usage: This component is used to add an element to display the hierarchical relationship between the items of the tree.

Example:

hews
🔺 🚞 Blogs
b Today
Yesterday
Archive
🔺 🚞 Links
🕨 🛅 Oracle
IBM
Microsoft

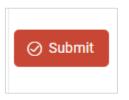

- a) Basic:
 - Label
 - Source variable
- b) Advanced:
 - Renderer ID
 - Add Loop
 - Add Custom Attributes
 - Conditional Field
- c) Layout:
 - Grid

B) Controls:

1) Button:

Usage: This component is used to add a call to action to the page which can be configured to perform various actions on its click.

Example:

Supported Attributes:

a) Basic:

label

b) Advanced:

- Icons
- Select Class Type
- Select Type
- Rest API Chain
- Hook Function
- Add Loop
- Add Custom Attributes
- Conditional Field

c) Layout:

• Grid

2) Button Set:

Usage: Basically button set is a group of button which can be used as radio button or checkbox button. In case of single selection it act as radio button and in case of multiple selection it act as checkbox set button

Example:

a) Radio button set

b) Checkbox button set

Supported Attributes:

a) Basic:

- ID: It accepts the same value as Label
- Value
- Select Type:
 - 1) Buttons Set One: Choose this to use it as radio button set
 - 2) Button Set Many: Choose this to use it a checkbox button set
- Options

b) Advanced:

- Value Change Handler
- Add Loop
- Add Custom Attributes
- Conditional Field

c) Layout:

• Grid

3) Container:

Usage: This component is used to provide a wrapper or group for form elements to apply a common behavior to them. e.g. display / hide of buttons. An element is always placed inside the container start element and container end element.

- 1. On Dropping the container element at the desired position on form area, a panel will open on the right side
- 2. User can select the type, fill the required fields and click confirm.

Note: Container can also be used inside container.

Supported Attributes:

a) Basic:

• Select Type Of Container

b) Advanced:

- Add Loop
- Add Custom Attributes
- Conditional Field

c) Layout:

• Grid

4) Component Loader:

Usage: Component Loader is used to load already created component or partial in current component. Supported Attributes:

a) Advanced:

- Select Type:
 - a) Component
 - 1) Select Type
 - i) Framework Elements: To use Framework Components.

Refer to framework components section for more detail.

ii) Transaction: To load transaction type of component. Refer to Transaction component section.

III) Single: To load normal component.

b) Partial:

- Add Loop:
- Add Custom Attributes:
- Conditional Field:

b) Layout:

• Grid:

C) Framework Component:

These components are predefined component that can be plugged with the user's created component to give specific functionality. Different framework component:

1) Account Input:

Usage: Component which provides account selection that is fetched from current logged in user or custom URL

Example:

Transfer From	
xxxxxxxxx0046	\sim
xxxxxxxxxx0046	
xxxxxxxxxx0035	
xxxxxxxxxx0024	nits
xxxxxxxxxxx0013	
NOW ULATER	

Supported Attributes:

a) Basic:

- Label
- Value

b) Advanced:

- Enter Type: These values will passed to 'type' key in params for account input.
 - 1. balance
 - 2. address
 - 3. nodeValue
 - 4. loans
 - Add Loop:
 - Add Custom Attributes:
 - Conditional Field:

c) Layout:

Grid

2) Amount Input:

Usage: This component is used to accept amount in an input box. The component gives currency selection and entered amount is formatted with respect to selected currency.

Example:

Amount			
GBP	\sim	£345.00	

Supported Attributes:

a) Basic:

- Label
- Value

b) Advanced:

- Enter Currency Variable: To store selected currency value.
- Required
- Currency List Required: Whether to display currency list. In case currency list is required, user has to provide URL to fetch currency list or provide a function called Currency Parser which returns the currency list.
- Currency URL: URL for Fetching currency.
- Currency Parser: Custom function which returns currency list that can be declared in init function
- Enter Root ID: Root id which will be passed in params of amount input.
- Enter Root Class: Root class which will be passed in params of amount input.
- Add Loop
- Add Custom Attributes
- Conditional Field

c) Layout:

Grid

3) Bank Look up:

Usage: This component is used to provide bank look up on the basis of IFSC Code, state, city or branch name.

Example

Search IFSC Code			\otimes
IFSC Code	Bank Name		
A			
State	City		
Q Search			
Bank Name Branch	Address	IFSC Code	
AARBDE5W	13, VARDANANTS STR.	AARBDE5W108	
AAAKUK02	SALAM STREET	AAAKUK02XXX	
APACGB61001		APACGB61001	
BARCLSY MUMBAI		BARCMM01XXX	

Supported Attributes:

a) Basic:

Label

b) Advanced:

- Clearing Code Type
- Account Type
- Region
- Network Code
- Add Loop
- Conditional Field

c) Layout:

• Grid

4) Help Panel:

Usage: This component is used to display related information about the current component . Example:

Image Source Path	
I his function enables you to onboard and manage users, their personal information and their login credentials for channel panking access. Description You can also define the various Touch Points from which the user can access the application and limit package applicable for the same.	
User Status change (lock/unlock) and whether the channel access has to be given to the user can be simply be managed and updated from the search results.	

Supported Attributes:

a) Basic:

• Partial Name: Name of the partial which will be created inside ChannelPath/partials/help/

b) Advanced:

- Enter Heading
- Image Source: Path of image inside channelPath/images/

- Enter Description
- Enter Button Name
- Rest API Chain: Rest to be fired on button click
- Hook Function: Write action to be performed on button click
- Add Loop
- Conditional Field

c) Layout:

• Grid

5) Navigation Bar:

Usage: This component is used to provide tab based page Navigation, where each tab item / name will display specific view.

Example:

Account Details	View Statement	Cheque Boo	ok Request	Cheque Status I	inquiry	Stop/Unblock Ch	neque	Debit Cards	Requ	est Statement	Swe >
ustomer Name Iloria Rodrigues	Account Numbe xxxxxxxxxxx		Net Balance £1,254,534.00		Product Nan	e	⊕ Add	Nickname			
Basics					Balance	Details					
Customer ID ***801					Available B £1,254,53						
Holding Pattern Single					Average Ba £1,254,53						
Branch	ERSAL BANK, Callister A	venue 115, Lono	ion, GREAT BRITA	IN	Unclear Fu £0.00	nds					
Status Active					Advance A £0.00	ainst Unclear Funds	Limit				
Nomination Not Registered					Average QL £1,200,00	arterly Balance D.00					
Sweep-in Provider Yes					Average Me £1,100,00	onthly Balance 0.00					
					Lien Amou £2,000.00						
					Sweep-in A £190,000.						

Supported Attributes:

a) Basic:

- Label:
- Tabs: Can be provided externally or custom just like select box option. In case user is not familiar with how to provide option, refer Option section in Available attributes.

b) Advanced:

- UI Options:
 - a) Icon Available
 - b) Default option
 - c) Menu Float
 - d) Full Width

E) Edge

- Navigation Bar Description
- Add Loop
- VI) Conditional Field

c) Layout:

Grid

6) Page Section:

Usage: This component is used to provide basic layout structure and styling for every page / screen.

Note: All the form elements must be present inside this container.

Example: In the example below, Page Section is added and header is optional. The other form elements can also be added via Partial.

Basics	Page Section Header
Customer ID ***698	
Holding Pattern Joint	
Joint Account Holde Maria M	r
Mode of Operation Branch AT3 FLEXCUBE UI	NIVERSAL BANK, Needal Street, London, GREAT BRITAIN
Status Active	
Nomination Not Registered	
Sweep-in Provider No	

Supported Attributes:

a) Basic:

- Label
- Format label
- Hide Page Heading: Switch to active mode to hide the page section heading.

b) Advanced:

- Add Loop
- Conditional Field

c) Layout:

Grid

7) Row Control:

This component is used to display label and its corresponding value in structure supported by OBDX framework

Example:

Holding Pattern <mark>label</mark> Joint _{Value} Supported Attributes:

a) Basic:

- Label
- Format label
- Value

b) Advanced:

- Add Formatter
- Add Loop
- Conditional Field

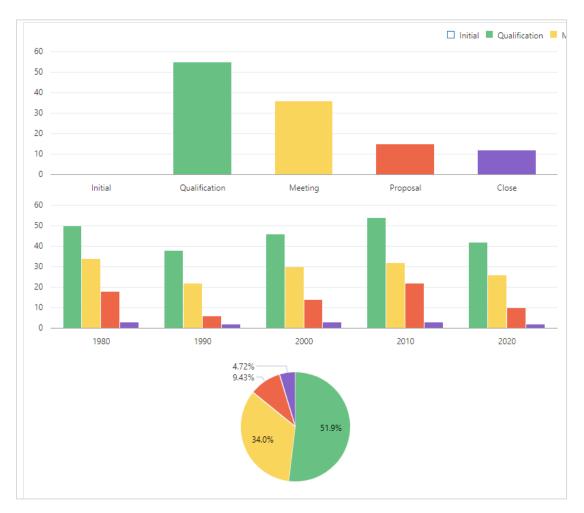

c) Layout:

• Grid

D) Visualizations

- 1) Chart: There are three types of chart that can be drawn with the help of tool:
 - a) Pie Chart,
 - b) Bar Chart,
 - c) Line Chart. For more information about each chart type, visit jet.us.oracle.com.

Example:

Supported Attributes:

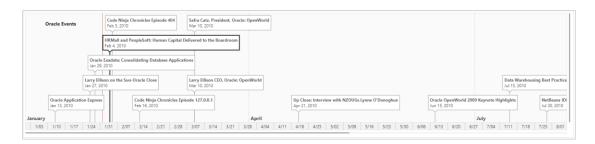

a) Advanced:

- Series
- Groups
- Add loop
- Add Custom Attributes
- Conditional Field

b) Layout:

- Grid
- 2) Timeline:

Usage: This component is used to display the timeline component. To provide values to timeline component use Add Custom Attribute (refer section **Add Custom attribute in Available Attributes**). Example:

Supported Attributes:

a) Basic:

Label

b) Advanced:

- Add Loop
- Add Custom Attributes
- Conditional Field

c) Layout:

Grid

11. Available Attributes

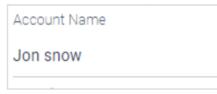

11.1 Label:

Description: This attribute is a mandatory element and is used to display the label of the element on the screen.

Component to accept the input: Input Text

Label		
Enter Label		

Example: User has an input field to provide account name as shown in the image.

Usage: Enter the label as "Account Name" in the input text field as shown in the image.

Label		
Account Name		

11.1.1 Hide Label:

Description: This attribute is used to hide the label of the element on the screen.

Component to accept the input: Switch

Hide Label		
\bigcirc		

Example: In the below example, User can **apply** this component to use checkboxes that selects rows in a table without displaying the label.

Counterparty Name & ID	Program Name and ID	Invoice No	Invoice Amount	Due Date	Status	Comments
OBDXDEV COUNTERPARTY	BPT	BULKFUV0126	£100,000.00	21 May 2019	Ranad	Type Comments
OBDXDEV COUNTERPARTY	BPT	BULKFUV0127	£100,000.00	21 May 2019	Raned	Type Comments
OBDXDEV COUNTERPARTY	BPT	BULKFUV0124	£100,000.00	21 May 2019	Resed	Type Comments
OBDXDEV COUNTERPARTY	BPT	BULKFUV0130	£100,000.00	21 May 2019	Raised	Type Comments

Usage: Enable the switch on as shown in the image. It will disable the label of the element.

Hide Label	

11.1.2 Format Label:

Description: This attribute is used when user wants to change the label or text dynamically. **Components to accept the input**: Switch and Input text

If user enabled the switch, it will display two input texts.

- 1. Add variables to label
- 2. Enter variable's mapping

Format Label	
Add Variables To Label	
Enter Variables Mapping	
key1 : Value1,key2 : Value2	

Example: In the example below, user name of logged in user and other login details are display ed. User name and Login details will be dynamic. ("Welcome <user name>" and "Last Login <login Details>") and will change based on the current user and time.

Welcome, Matt Dam	\sim	
Last login 06 Nov 02:26 PM		

Usage: Enter the label of an element which is static (e.g. "Welcome") in Label attribute,

Then enable the "Format Label" switch. It will display two input texts.

Label		
Welcome		
Format Label		

11.1.3 Add variables to label:

When user enables the switch, the label user entered in Label attribute will be pre-filled in this input field as shown in the image.

Label	
Welcome	
Format Label	
Add Variables To Label	
Welcome	
Enter Variables Mapping	
key1 : Value1,key2 : Value2	

Now user needs a key to hold the value, which will change dynamically. In the example below, key name is user name. User will have to add this key name (user name) after the label (Welcome) in this field.

To add a key, write the key name surrounded by curly braces.

Label			
Welco	me		
Forma	t Label		
)		
Add Va	ariables To I	Label	
Welco	me {userna	me}	
Enter	/ariables M	apping	
key1:	Value1,key	2 : Value2	

11.1.4 Enter variables mapping:

User will have to map this key to a variable, which will hold the dynamic value. In the example below, the value is stored in a variable called as user _name.

To map the key to the variable, write the key name, colon (:) and variable name.

Label	
Welcome	
Format Label	
Add Variables To Label	
Welcome {username}	
Enter Variables Mapping	
username : user_name	

User can have multiple keys and values as shown in the image.

Label
Welcome
Format Label
Add Variables To Label
Welcome {username} {accountType}
Enter Variables Mapping
username : user_name, accountType : accou

11.2 **Value:**

Description: This attribute is used to store the value of an element. This value can be displayed on the screen or used for further processing, such as sending to server.

Components to accept the input: Select Box

\sim

This select box has five options

- a. Observable variable
- b. Rest properties
- c. Inside table
- d. Inside List/tree view
- e. Inside loop

Value	
Select Bind Type	\sim
Observable Variable	
Rests Properties	
Inside Table	
Inside List/Tree View	
Inside Loop	

Example: In the example below, User has a form to request a statement account for a given time period. In the form, account number component and two date pickers, **From date** and **To date** are available. User will send the values of **From date** and **To date** field to the server to fetch the details.

Account Number	
xxxxxxxxxx0166	
Balance : £347,997.22	
From Date	
To Date	

Usage:

User can store the values of these fields using five different ways. By selecting the type based on requirement.

a. Observable variable

In some scenarios, the data fetched from the REST API cannot be directly shown on the screen. Similarly the data submitted by the user cannot be directly saved on the server. It needs processing. To process this data, sometimes the user needs to store it in another variable. Therefore, if user wants to store the value of an element into a variable, which is defined by you, this option should be selected.

In the example below, user has a variable From Date, storing the value of From Date field.

Select the option as "Observable variable". After selection, it will display an input field named as variable name.

Enter this variable name (fromDate) into "variable name" field as displayed in the image below.

Value	
Observable Variable	\sim
Variable Name	
fromDate	

b. Rest properties:

Rest API can be used for multiple requirements.

- 1. GET: To fetch data from the server.
- 2. POST: To save data on the server.
- 3. PUT: To modify data on the server

1. DELETE: To delete data from the server.

When user selects the option "Rest properties", it will display a select box named as "Select REST API".

Select REST API: This select box display s all the REST APIs that user has selected in Step 3 i.e. REST API Selection as shown in the below image.

Value	
Rests Properties	\sim
Select REST API	
Select REST API	\sim
Select REST API	
/accounts/demandDeposit/{acco	ountl
d} get v1	

When user selects a REST API from this select box, it will display another select box named as "Select Options".

Select Options: This select box has two options as shown in the below image.

Value
Rests Properties \checkmark
Select REST API
/accounts/demandDeposit/{accountI
Select Options
Select Option 🗸
Select Option
Required Or Optional Parameters
Payload Properties

• Required and Optional Parameters :

To understand what is "Required or Optional Parameters" refer to Required and optional parameters section.

When user will select" Required or Optional Parameters" option, it will display two different select boxes.

Value
Rests Properties V
Select REST API
/accessPoint/{accessPointId} get v1
Select Options
Required Or Optional Parameters ~
Required Parameters
Select Required Params
Optional Parameters
Select Optional Params

- a. Required Parameters: This select box will display all the required parameters of the selected REST API.
- b. Optional Parameters: This select box will display all the optional parameters of the selected REST API.

Example: User has a REST API "/accessPoint/{accessPointId} get v1". In this REST API, accessPointId is a required parameter and user wants this parameter to be filled as in Input and wants to map this property to input text.

Usage:

- a. Select "REST Properties".
- b. Select REST API i.e. / accessPoint/{accessPointId} get v1
- c. Select Required or Optional Parameters
- d. Map the accessPointId to the input text.

Value
Rests Properties V
Select REST API
/accessPoint/{accessPointId} get v1
Select Options
Required Or Optional Parameters \checkmark
Required Parameters
accessPointId ~
Optional Parameters
Select Optional Params V

• Payload Properties:

When user select "Payload Properties", it will display a select box named as "Properties".

Properties: This select box will display all the payload properties of the selected REST API.

As discussed above, REST API can be used for multiple request types like GET, POST OR PUT.

In the case of GET request, server sends the data to the user . In this case, this response data is considered as payload. All the payload properties listed in this select box will store the server response of that selected REST API. User can map this property to the elements, which display s the data. For example, Row control, Text.

In the of POST or PUT request, user sends the data to the server. In this case, this request data is considered as payload. All the payload properties listed in this select box will store the data entered by the user for that selected REST API. User can map these payload properties to the elements, which accepts the input, and send it to the server.

Value
Rests Properties 🗸
Select REST API
/accounts/demandDeposit/{accountl
Salact Options
Select Options
Payload Properties V
Properties
Fiopenies
Select payload Property V
<u>ا</u> ۵
Select payload Property
.demandDepositAccountDTO.id.dis
playValue
.demandDepositAccountDTO.id.val
ue

In the above example, there are two components.

1. Row Control to display the account number

In this case, account number is fetched from the server.

- a. Select "REST Properties".
- b. Select REST API i.e. /accounts/demandDeposits/{accoundId} get v1
- c. Select Payload Property
- d. This is the GET request Payload Property will store the response came from the server, hence select the required property from payload i.e. demandDepositeAccountDTO.id.display value and map it to the row control.

Value
Rests Properties \lor
Select REST API
/accounts/demandDeposit/{accountl
Select Options
Payload Properties V
Properties
.demandDepositAccountDTO.id.disp

2. Two date pickers to store the dates.

In this case, dates need to be sent to the server.

- a. Select "REST Properties".
- b. Select REST API i.e. /accounts/demandDeposits/{accoundId} post v1
- c. Select Payload Property
- d. This is the POST request Payload Property will store the input and this payload will be sent to the sever, select the required property from payload i.e. demandDepositeAccountDTO.id.display value and map it to the date pickers.

Rests Properties ~ Select REST API ////////////////////////////////////	Value	
/accessPointGroup post v1 ∨ Select Options Payload Properties ∨ Properties	Rests Properties	\sim

Payload Properties ~	/accessPointGroup post v1	\sim
Properties	Select Options	
	Payload Properties	\sim
.accessPointGroupDTO.creationDate	Properties	
	.accessPointGroupDTO.creationDa	ate

• Inside table:

If element is inside the table, then select this option.

Example: In the below image, user has Invoice list table as display. All the components, which are used, are inside the table such as checkbox, input box etc. select this option.

Invoice Lis	Invoice List						
	Counterparty Name & ID	Program Name and ID	Invoice No	Invoice Amount	Due Date	Status	Comments
()	OBDXDEV COUNTERPARTY	BPT	BULKFUV0126	£100,000.00	21 May 2019	Raised	Type Comments
	OBDXDEV COUNTERPARTY	ВРТ	BULKFUV0127	£100,000.00	21 May 2019	Raised	Type Comments
	OBDXDEV COUNTERPARTY	BPT	BULKFUV0124	£100,000.00	21 May 2019	Raised	Type Comments
	OBDXDEV COUNTERPARTY	ВРТ	BULKFUV0130	£100,000.00	21 May 2019	Raised	Type Comments

When user will select "Inside table" option, it will display an input box to add a variable name as shown in the below image. This variable is nothing but one of the keys available in the data source object given to the table. This variable can be used to display the data or to store the data.

Inside Table	\sim
Variable Name	
Enter Variable Name	

Example: The datasource object looks like this:

datasource[0] {

counterPartyName: "OBDX_COUNTER_PARTY", invoiceNo: "BULKFUV0126"(this is string) comment: user _comment(this is variable)

}

Note: Datasource is an array of objects. The object shown above is just one object for the first row of the table. Data source will have an object for every row. That is why it is written as datasource[0] i.e. first object in an array.

Let us consider two cases here:

1. Invoice No:

This field is displaying the data. Now user wants to display the invoice BULKFUV0126. As user can see in data source object written above, the key, which stores invoice number(BULKFUV0126), is "invoiceNo". User will enter this key as a variable name for this field.

Value	
Inside Table	\sim
Variable Name	
invoiceNo	

2. Comments:

This field is accepting the user comments, i.e. it is storing the data entered by the user. User will need a variable to store the data, which is user _comment variable. As user can see in data source object written above, the key, which has a reference to the variable(user _comment) is "comment". User will enter this key as a variable name for this field.

Value	
Inside Table	\sim
Variable Name	
vanable name	

• Inside List/tree view :

If element is inside the list or tree view, then select this option. This is similar to the table. User will have the data source having all the objects. User will write the key name into the variable name for their respective field.

Value	
Inside List/Tree View	\sim
Variable Name	
comment	

• Inside loop:

Refer "Add loop" attribute to understand what is loop.

If the element is inside the loop, user will select this option.

referring to the same example of add loop attribute.

In this example, there are three fields: name, city and mobile number. They are inside the loop. for these elements user will select "Inside loop" as value.

The objective is as follows:

user _data = [{name: "James Smith", city: "New York", mobileNo: 3454654},

{name: "Christopher Robin", city: "Manhattan", mobileNo:4758945},

{name: "William Turner", city: "London", mobileNo:7857694}];

For example, user is adding the first text element, which displays the name. User will select an option as "Inside loop".

User will enter the key, which is storing the name (James Smith, Christopher Robin and William Turner) of every object. That key is "name". Enter this "name" key in variable name field as shown in the image below.

Value	
Inside Loop	\sim
Variable Name	
name	

Similar for city and mobile number.

Value	Value
Inside Loop V	Inside Loop \sim
Variable Name	Variable Name
city	mobileNO

11.3 **Options:**

Description: This attribute is used for all the components, which enables the user to select one or more options. For example, select box, radio buttons, checkboxes etc.

Component used to accept the input: Collapsible element, Button set and Input texts.

When user clicks on Options, it will expand. There are two ways to add the options.

- a. External
- b. Custom

▲ Options	
Туре	
Custom	External
Variable Nar	ne
Enter Variab	le Name
Value Key	
Enter Value	Key
Label Key	
Enter Label	Key

Example: User has a select box, which shows multiple options like Current month, Previous month as shown in the below image.

View Options	
Current Month	\sim
Current Month	
Previous Month	
Previous Quarter	
Date Range	

Usage: User can add these options using the following two ways

a. External

In this type, if user has options to be displayed on the screen which are getting fetched from a REST API, then select the type as external.

▲ Options	
Туре	
Custom	External
Variable Nar	ne
Enter Variab	le Name
Value Key	
Enter Value	Key
Label Key	
Enter Label	Kev

Under this type, there are three input fields.

1. Variable name: This field stores the data fetched from REST API. It is mandatory to have the data in this variable in **value=>labe**l format. In case the data is not in this format, then convert it to the required format and enter that variable name in this field.

Example: The variable name is time_range.

This variable has the following data which is fetched from REST API.

time_range = [{ label : "Current Month", value :"CM"}, { label : "Previous Month", value :"PM"}, { label : "Previous Quarter", value :"PQ"}, { label : "Date Range", value :"DR"}]

2. Value key: As mentioned in point (1), value from variable name represents the actual data that will be used for further processing and is to be entered in this field.

Here time_range is an array having multiple objects.

In this object {label:"Current Month", value:"CM"}, value "CM" is going to be processed.

Hence, in this case value key will be, "value".

3. Label Key: As mentioned in point (1) above, label from variable name represents the description that needs to be displayed against an option of an input field such as select box, radio button set etc. This label is to be entered in this field.

In this object {label:"Current Month", value:"CM"}, label "Current Month "is going to be displayed on screen,

in this case label key will be, "label".

Note: User can name this value key and label key as per their choice i.e. {label:"Current Month", value:"CM"} can be written as {name:"Current Month", id:"CM"}. In this case, value key will be "id", and label key will be "name".

label		

a. Custom

In this type, if user wants to add the options manually, i.e. for data not fetched from any REST API, then select the type custom.

▲ Options			
Туре			
Custom	External		
Enter Value			\otimes
Enter Label			
		Add Op	tions

Under this type, there are two input fields.

1. Enter Value: This field represents the actual data that will be used for further processing. If user enters the value in double quotes, it will be processed as string. For special cases such as Boolean, where the value is true/ false do not enter the value in double quotes.

In the below image, "CM", "PM","PQ" are the values.

2. Enter Label: This field represents the description that needs to be displayed against an option of an input field such as select box, radio button set, etc.

as shown in the image below, Current Month, Previous Month and Previous Quarter are the labels.

User can add more options using the "Add Options" link highlighted in green below. User can delete the option using the icon highlighted in red below

Enter Value		\otimes
"CM"		
Enter Label		
Current Month		
Enter Value		8
Enter Label		
Previous Month		
Enter Value		\otimes
Enter Label		
Previous Quarter		
	Add Op	otions

11.4 Value change handler:

Description: This attribute is used to handle the events, when the value of an element is changed. Components to accept the input: Switch, select box, and code editor

When user enables the switch, it will display an input box and a button as shown in the below image.

Value Change Handler
REST API Chain
Select REST API Chain
Hook function
Open Editor

- 1. REST API Chain: To understand REST chaining, please refer **REST API Chaining** section. This select box lists all the REST API chaining that user has created in step four i.e. REST API Configuration. From this select box, user can select REST API chain that he wants to fire when the value of an element is changed.
- 2. Hook function: There is a button named as "Open Editor". When user clicks on this button, it will open a code editor as shown in the below image. In this editor, user can write the code to be executed when the value of an element is changed.

To understand more about editor, refer Open Editor of hook function section.

function(newValue){		
let self=this; •		
<pre>1 //write code here;</pre>		-
}		
Save Cancel		

Example:

- 1. User has two select box options
 - a. Buyer Name: This select box lists all available buyer names.
 - b. Name of Program: When user selects a buyer name, this select box will lists available programs specific to the selected buyer.

Buyer Name	Name of Program
NonCustomerSecond \checkmark	SupplierProgram1 🗸
CounterPartyBuyer	SupplierProgram1
OBDXDEV COUNTERPARTY	NRJCORPPROG
NonCustomerSecond	Purchase Order Date

In above example, user will need to fire a REST API to fetch the available programs of the selected buyer. It means the user needs to perform an operation when the value of buyer field changes. In such scenarios, this attribute is used.

Usage: Enable the "value change handler" switch.

Select the REST API that user needs to fire when the value of **buyer** field changes as shown in the below image.

Value Change Handler
REST API Chain
/payments/transfers/peerToPeer/user get v1
Hook function
Open Editor

Now if user clicks on the "Open Editor" button, it will open the code editor.

A default code is already present in the window generated by the tool. When user selects a REST API, the tool generates the required code to execute that REST API. However, in some cases, there is a need to do some additional operation on the data fetched from the server. Therefore, for this purpose, there is a support for code editor. In such scenarios, use the response variable(highlighted in red circle in the above image) for further processing.

Whenever the value of buyer name field changes, it will execute the block of code written inside the editor.

1) User has a form and wants to give an option to use this form as a template. If the user says yes, then an input text field is displayed to accept the template name as shown in the image.

Usage: In this example, user will need a variable to handle this case, say "isTemplate". Initially this variable will have a value set as false (Boolean). it will hide "Template Name" input field. But when the user will select "Yes" option, its value will change to true (Boolean) and it will display the input field "Template Name".

Enable the "value change handler" switch.

As user does not need to fire any REST API, no REST API is to be selected.

Value Change Handler
REST API Chain
Select REST API Chain
Hook function
Open Editor

Click on the "Open Editor" button, and write code inside the editor as shown in the below image.

newValue represents the new value of the field. If user selects "Yes", **newValue** will be "Yes" and variable will be true. If user selects "No", **newValue** will be "No" and variable will be false. Whenever the value of radio button changes, it will execute this block of code.

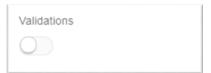

Note: As there is no REST API selected, there will be no auto-generated code.

function(newValue){	
let self=this;	
	-
}	
Save Cancel	

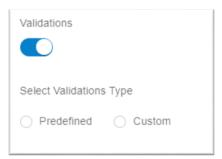

11.5 Validations:

Description: This attribute is used to add UI level validations for an element.

Components to accept the input: Switch, Radio buttons, Select box

When user will enable this switch, it will display two radio buttons as shown in the below image.

1. Predefined: There are some validations, which are common such as mobile number must have 10 digits. Such validations are already defined by OBDX framework.

When user selects this option, it will display a select box named as "Select Validations" as shown in the below image. This select box lists all the predefined validations, which are available. For example, mobile number, address, email etc.

Validations	
Select Validations Type Predefined Custom	
Select Validation	
Select Validation	\sim
	0
EMAIL	
MOBILE_NO	
IFSC_CODE	
ADDRESS	
POSTAL_CODE	
OTP	

2. Custom: There are some validations which are element specific, for example, some element must have a specific length or special characters etc. Select this option to customize validations.

When user selects this option, it displays a select box named as "Select Validations" as shown in the below image. This select box lists all the custom validation options such as "alphabets with space", "alphabets with some special characters" etc.

Validations				
Select Validations Type				
Predefined Custom				
Select Validation				
Select Validation				
ALPHABETS				
ALPHABETS_WITH_SPACE				
ALPHABETS_WITH_SOME_SPEC				
IAL				
LOWER_ALPHABETS				

Below the select box, there is an input box named as "Enter error message" and a switch for "Length validation" as shown in the below image.

Enter error message: Enter the error message that should display on the screen when the validation fails.

Length validation: Enabled this switch, if there is a length validation. When user will enable this switch, it will display two input boxes for minimum length and maximum length.

Example: User has two fields, which needs some validations.

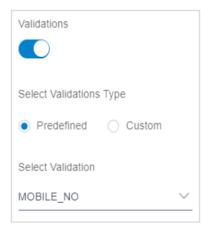

1. Input field to accept the phone number:

Validation for phone number is "Enter 10 or fewer characters, not more." As shown in the below image.

Phone Number	91	\sim	344095604578678
			Enter 10 or fewer characters, not more.

Usage: This validation is available in predefined validation.

After selecting the validation, select the option, "mobile_no" as shown in the below image.

2. Input field to set the password:

Validation for password is "Password must have minimum 8 and maximum 12 characters. It can have special characters".

Example of Error Message can be 'Please enter a valid password.

Usage: This validation is specific to password field, and hence is not available in predefined validation. The user needs to customize the validation. Therefore, user will enable the validation switch and select custom validation.

From the select box, user needs to select the option, "APHABETS_WITH_ME_SPECIAL".

Enter the error message example 'password is not valid' into the input box.

Enable the switch and enter the minimum length and maximum length in respective input fields as shown in the below image.

Validations
Select Validations Type
O Predefined Custom
Select Validation
ALPHABETS_WITH_SOME_SPECI V
Enter Error Message
Please enter a valid password
Length Validation
Minimun Length
8
Maximum Length
12

11.6 **Required field:**

Description: This attribute is used to make the field mandatory, i.e. user cannot leave the field empty.

Components to accept the input: Switch

In the below Example, User has a date picker and wants to make it mandatory i.e. user must select the date otherwise an error is will be displayed.

Usage: Enable the switch as shown in the below image. This will make the date picker field mandatory.

Required Field		

11.7 Add Loop:

Description: This attribute is used to display the same element multiple times with different values.

Components to accept the input: Switch and input text.

Add Loop			
\bigcirc			

When user enables the switch, it displays an input text named as "Looping variable name" as shown in the below image.

Add Loop	
Looping Variable Name	

In the below example, User has a template, which displays the name, city and mobile number of the three user s.

Name:	Name:	Name:
James Smith	Christopher Robin	William Turner
City:	City:	City:
New York	Manhattan	London
Mobile number:	Mobile number:	Mobile number:
3454654	4758945	7857694

There are two ways in which this can be achieved:

- 1. Writing the template 3 times for three users, which is quite cumbersome and will produce unnecessary redundancy in code.
- 2. Writing the template once, and using it 3 times for three user s which can be achieved using **add loop** attribute

Usage: Assume user has a normal container (For container refer **Container element**) and all the fields(name, city and mobile number) are wrapped inside this container.

The user details are stored in the variable "user _data":

user _data = [{name: "James Smith", city: "New York", mobileNo: 3454654},

{name: "Christopher Robin", city: "Manhattan", mobileNo:4758945},

{name: "William Turner", city: "London", mobileNo:7857694}];

Note: user _data is an array of objects. Each object represents one user. In this array, there are three objects length of this variable is three. Hence, the container will repeat three times.

To enable the switch of add loop attribute, and user will enter user _data variable name in the "Looping variable name" input field as shown in the below image.

To know how to add the elements, which are inside the looping variable, (name, city, mobile number) refer to Inside loop attribute section.

Note: In this example, looping variable has been added to the container. But user can add the looping variable to any element using the same process (For example, input text, anchor tag etc.) In that case, input text and anchor tag will be repeated as many times as the length defined by the looping variable.

11.8 Add Custom Attributes:

Description: This attribute is used to add custom attribute, i.e. attribute not supported by the tool.

Components to accept the input: Switch, Input box

Add Custom Attributes	
0	

When user enables the switch, it will display two input boxes and two switches as shown in the image. User can add more attributes using the link "Add attribute" highlighted in green and can delete the attribute using the icon highlighted in red.

Add Custom Attributes					
Enter Attribute	8				
Enter Value					
Use Colon					
Use Curly Braces					
\bigcirc					
Add Attribute					

- a. Input boxes :
 - 1. Enter attribute: This field represents the attribute name.
 - 2. Enter value: This field represents the attribute value. It supports both strings and variables. For strings use double quotes("").
- b. Switch:

Attributes support two types of bindings : one way binding and two way binding. To understand one way binding and two way binding refer: https://knockoutjs.com/documentation/value-binding.html

- 1. Use colon: This option is only valid if the user is using one way binding to add attributes to the JET components, for example, oj-input-text, oj-select-one etc. Use this field as some of the JET attributes need colon before attribute name. If this switch is enabled, attribute name will start with colon. Refer JET site to know whether the attribute needs colon or not. http://jet.us.oracle.com/6.1.0/jetCookbook.html
- 2. Use curly braces: If this switch is enabled, attribute value will be surrounded by curly braces.

For one way binding, use square brackets. For two way binding, use curly brackets.

Example: User can use this attribute in two cases.

 User has a list and wants to refresh it whenever the data changes. To refresh the list, its ID attribute is required. Tool generates ID for every element but it is random and will change every time the component is edited. Therefore, this ID cannot be used to refresh the list. Hence, user can add new id attribute. It will replace the id generated by the tool. In the below example, "listview" is taken as an attribute.

Usage: Enable the switch.

Enter the attribute name in "Enter Attribute" field. Attribute name is "id".

Enter the attribute value in "Enter Value" field. Attribute value is "listview". As it is a simple string, use double quotes as shown in the image below.

This id attribute needs colon. enable the switch.

This attribute needs one way binding, it needs square brackets. Hence, do not enable the switch as shown in the image below.

Add Custom Attributes			
Enter Attribute	\otimes		
id			
Enter Value			
"listview"			
Use Colon			
Use Curly Braces			
\bigcirc			
Add	Add Attribute		

2. A single element can support many attributes and it is not feasible to add each attribute. Therefore, there will be some attributes, which will not be available inside the tool user can add such attributes using this custom attribute.

Note: When user add attributes to the Non-JET components, some attributes goes inside **attr** attribute. Refer <u>https://knockoutjs.com/documentation/attr-binding.html</u>

In that case, Attribute Name will be attr and Attribute value will be actual attribute user want to add.

Assume user want to add id attribute to an Image, i.e. html tag. In this case, id attribute goes inside attr attribute. Therefore, Attribute Name will be attr and Attribute value will be id: fb_image as shown in the image below.

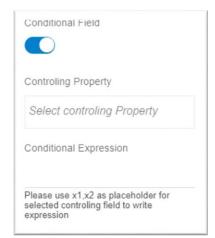

Add Custom Attributes		
Enter Attribute	\otimes	
attr		
Enter Value		
id:fb_image		
Use Colon		
Use Curly Braces		
\bigcirc		
Add Attribute		

11.9 Conditional Field:

Description: This attribute is used to display an element only if given condition gets satisfied. **Components to accept the input:** switch, select box, and input text.

When user enable the switch, it will display a select box and an input text as shown in the image below.

- 1. Controlling property: This select box lists name of the all the elements which user have added. If user want to display element based on the value of a different element, then user can use all these elements available in the select box to write a condition.
- 2. Conditional Expression: This field accepts the condition that needs to be satisfied.

Example: User have a form to transfer money from account to another account. That form has select box to select a payee, account input to select an account from which user want to transfer the money, input field which accepts the amount and radio buttons which accepts the date i.e. when to transfer the money as shown in the image.

Payee	
Please Select	▼
Transfer From	
xxxxxxxxxx0067	•
Balance : £995,824.11	
Amount	
· ·	
View Limits	
Now Later	
Transfer Cancel	

This radio button (Transfer when) has two options.

- a. Now : If user wants to transfer the money today only, he will select this option.
- b. Later: If user wants to transfer the money on a different date, he will select this option.

Now when user selects "Later" option, there should be a date picker to accept the date as shown in the image below.

Payee		
Please Select		•
Transfer From		
xxxxxxxxxx0067		•
Balance : £995,824.11		
Amount		
*		
Transfer When	View Limits	
Now Later		
Transfer Date		
Transfer Cancel		

In this case user have to display the date picker "Transfer date", if user selects "Later" option. This is condition.

Usage:

Assuming user has already added the radio buttons, and amount field.

Now when user will add "Transfer date" date picker, user will enable the conditional field switch. It will display a select box (Controlling property) and input text (Conditional Expression).

3. Controlling property: This select box will list name of all the elements. Therefore, it will display name of radio buttons ("Transfer when") and amount ("Amount") field as shown in the image below.

Conditional Field
Controling Property
Select controling Property
Transfer When
Amount
Please use x1,x2 as placeholder for selected controling field to write expression

If date picker based on the value of radio button is to be displayed, user will select the "Transfer When".

4. Conditional Expression: User will have to add the condition. There is a help text written just below this input field.

"Please use x1, x2 as placeholder for selected controlling field to write expression".

It implies when the condition is written, the name of an element that user have selected from Controlling Property, instead refer them as x1,x2 and on is not mentioned.

Therefore, in this example, user will write "Transfer When" as x1.

condition will be x1 === "Later".

Write this condition in the input field as shown in the image below.

Conditional Field
Controling Property
Transfer When ×
Conditional Expression
x1 === "Later"
Please use x1,x2 as placeholder for selected controling field to write expression

Note: Sometimes, condition is a combination of multiple elements. In that case, user can select multiple elements from Controlling property. For example, user wants to display the date picker, only if user selects later and amount entered is greater than 100INR. Then user can select both "Transfer when" and "Amount". And condition will be x1==="Later" & x2 > 100 as shown in the image below.

Conditional Field				
Controling Property				
Transfer When ×				
Amount ×				
Conditional Expression				
x1 === "Later" && x2 > 1000				
Please use x1,x2 as placeholder for selected controling field to write expression				

5. Condition cannot always be depend on element's value that user have added. For example, user has only one condition, display the date picker in case of large screen only. This condition is not based on any element that user have added. In such cases user can directly write condition in Conditional expression field. As there is no controlling property, there will be no x1, x2 placeholder.

Condition will be "\$baseModel.large()" (\$baseModel.large() returns true if it is large screen) as shown in the image below.

Conditional Field	
Controling Property	
Select controling Property	
Conditional Expression	
\$baseModel.large()	
Please use x1,x2 as placeholder for selected controling field to write expression	

6. With controlling properties, user can add me different condition al. For example, user has a condition, which is a combination of all the three conditions, which are discussed above.

condition will be x1==="Later" && x2 > 100 && \$baseModel.large() as shown in the image below.

Conditional Field
Controling Property
Transfer When ×
Amount ×
Conditional Expression
x1==="Later" && x2 > 100 && \$baseN
Please use x1,x2 as placeholder for selected controling field to write expression

11.10Grid:

The grid section is used to design grid structure supported by Oracle JET. Refer <u>http://jet.us.oracle.com/jetCookbook.html?component=grid&demo=gridresponsive</u> to learn how to use grid structure.

small classes	medium classes	large classes	xlarge classes					
S-4				S-4	S-4			
M-3			M-6			M-3		
L-2	1	L-8					L-2	
XL-1	XL-10							XL-1

Usage: By default tools support Oracle JET oj-form-layout (refer <u>http://jet.us.oracle.com/jetCookbook.html?component=ojFormLayout&demo=formverticalofl</u>).

The default layout will be the one which user selected on Layout Selection page (refer <u>Layout</u> <u>Selection</u> Page). But there are limitations of oj-form-layout. Not every element is supported by oj-form-layout and not every structure can be created by oj-form-layout, hence grid layout can be used to resolve this problem. Use of grid is pretty simple.

Creating grid Layout: Select grid option to enable grid layout.

a. Flex:

This property provide new flex to the selected element. And the current element will be wrapped as flex-item in this Flex. But in case user does not select this option and previous element has Flex true than this element will be added as flex item in the previous element. It is okay if this all seems little complex, we will clear this in upcoming examples.

b. Flex Item Label Class:

In case of form element like input box, select box, etc. this property is used to decide the width and position of label. In case form element does not have label or user does not want to display the label, keep the switch off.

c. Flex item label Class:

This field is used to get configuration for width and position of current element.

Examples:

Case:

a) Grid: true, flex : true; Flex item label class: true,

Label Class: 'oj-lg-3 oj-md-4 oj-sm-12', Flex Item Class: 'oj-lg-4 oj-md-5 oj-sm-12'

b) Grid: true, flex: false, previous element flex: true, Flex item label class: true Label Class: 'oj-lg-2 oj-md-4 oj-sm-12', Flex Item Class: 'oj-lg-3 oj-md-5 oj-sm-12' * A row 1 text Previous Element

```
B row 1 text
```

c) Grid: true, flex: true, Flex item label class: false

Flex Item Class: 'oj-Ig-3 oj-md-5 oj-sm-12'

-	-	
	text	

Open Editor of hook function: Whatever is written inside this code editor goes inside the function.

Function has three parts:

function_name(function_parameters) {

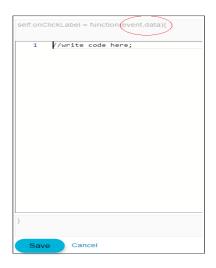

Function_body

}

- 1. function_name: Function name will be generated by the tool
- 2. function_parameters:
 - a. In case of JET components, which support value attribute for example, oj-input-text, oj-selectone etc. function parameter will be newValue as shown in the image below. newValue stores a new value of the field. To know more about JET components refer <u>http://jet.us.oracle.com/6.1.0/jetCookbook.html.</u>

function(newValu	
let self=this,	·/
	code here;
1 ////10	code here,
}	
Save Ca	ncel

b. In case of JET components, which do not support value attribute, for example, oj-button, ojmenu, oj-file-picker etc. function parameter will be event and data as shown in the image below.

c. In case of Non JET components i.e. pure html components, for example, anchor tag function parameters will be data and event as shown in the image below.

self.onClickLabel = function(data,event))
1 //write code here;
}
Save Cancel

 function_body: User can write own code inside this body. If user select any REST API from REST API Chain select box, it will have some auto-generated code. Otherwise, it will be an empty body. There are two buttons.

- 1. Save Button: It will save all the code user has written.
- 2. Cancel Button: It will close the code editor without saving anything user has written after opening the code editor.

11.11Select anchor type:

Description: This attribute is used to determine the type of anchor tag.

Components to accept the input: Select box

This select box has three options as shown in the image below.

- 1. Text
- 2. Icon
- 3. Image

Select anchor type	
Select anchor type	\sim
Text	
Icon	
Image	
17601 ATTE POIN	

1. Text: This option is used for simple text. When user select "Text" option, it shows "Value" select box as shown in the image below.

Select anchor type	
Text	\sim
Please use value option if anch fetched from ResourceBundle	or text is not
Value	
Select Bind Type	\sim

2. Icon: This option is used for icons. When user select "Icon" option, it shows an input box named as "Icon class Name" as shown in the image below. This input text accepts an icon class.

3. Image: This option is used for image. When user select "Image" option, it shows an input box named as "Enter Image Path" as shown in the image below. This input text accepts image path where it is located.

Select anchor type	
Image	\sim
Enter Image Path	
Type Image Path	

Example: Now anchor tag can be used with simple text, icon or image.

1. Text: User have a simple text "Forgot User name" that user want to use as a link, as shown in the image below highlighted in red oval.

8	Username	
Ð	Password	
	ogin got Username)Forgot Password	

Usage: In this type, select this option as shown in the image below.

Select anchor type	
Text	\sim
Please use value option if a fetched from ResourceBun	
Value	
Select Bind Type	\sim

As user can see in above image, there is small information text, "Please use value option if anchor text is not fetched from ResourceBundle".

It means, if text is not a simple string, i.e. it is fetched from the server or stored in variable then user can use value option available just below the text.

To understand value attribute refer value attribute section.

In this example, "Forgot User name" it is a simple string, do not select anything from "Value" select box.

2. Icon: User have an icon (>) that user want to use as a link, as shown in the image below highlighted in red oval.

Current & Savings £1,378,138	.11
Term Deposits £55,645	i.44 >
Recurring Deposits £0	.00 >

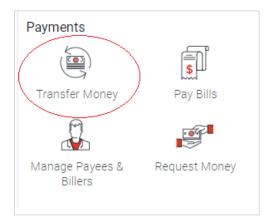

Usage: In this type, select this option as shown in the image below.

It will display an input box to enter the class name for an icon.

For this icon, class name is "icons icon-arrow-right", enter it in the input box as shown in the image below.

Select anchor type	
Icon	\sim
Icon Class Name	
icons icon-arrow-right	

3. Image: User have an image that user want to use as a link, as shown in the image below highlighted in red oval.

Usage: In this type, select this option as shown in the image below.

It will display an input box to enter the path for an image.

For this image, path is "dashboard/quick-access/ transfer-money", enter it in the input box as shown in the image below.

Note: Use single quotes if path is of type string.

Select anchor type	
Image	\sim
Enter Image Path	
'dashboard/quick-access/ trans	sfer-money.svg

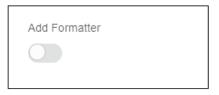

If "dashboard/quick-access" is string but "transfer-money" is stored in image variable. Then path will be 'dashboard/quick-access' + image

Image	\sim
Enter Image Path	
dashboard/quick-access' + image	

11.12Add formatter:

Description: This attribute is used to add formatter to format a date, currency or number.

Components to accept the input: Switch, Select box and Input box

When user enables this switch, it will display a select box named as "Select Formatter type".

Add Formatter	
Select Formatter Type	
Select Formatter Type	\sim
Format Date	
Format Currency	
Format Number	

This select box has three options:

a) Format Date: To format a date

Add Formatter	
Select Formatter Type	
Format Date	\sim

b) Format Currency: To format currency as per the standard format for a particular currency.

Add Formatter	
Select Formatter Type	
Format Currency	\sim
Enter Currency Variable	
Enter Currency Variable	

User Interface Workbench

When user selects this option, it will display an input box named as "Enter Currency Variable". Add variable name which has currency value.

c) Format Number: To format a number into percent value.

When user selects this option, it will display three input boxes as shown in the image below

Add Formatter	
Select Formatter Type	
Format Number	\sim
Style	
Style	
Min Fraction Digit	
Min Fraction Digit	
Max Fraction Digit	
Max Fraction Digit	

- a) Style: This field is used to specify the style which should be used for formatting the number, like percent or decimal
- b) Min Fraction Digit: This field is used to specify the minimum digits permissible after the decimal.
- c) Max Fraction Digit: This field is used to specify the maximum digits permissible after the decimal.

Example:

1) Format Date: User has a date like "2017-10-03T19:43:45.695Z". And user wants to format it using dateTimeStampFormat, which will be "04 Oct 2017 01:13:45 AM".

Usage: Enable the switch, and select type "Format Date"

Add Formatter	
Select Formatter Type	
Format Date	\sim

2) Format Currency: User has an amount "2,502.25" and user want to format it using currency "GBP", which will be "£2,502.25".

Usage: Enable the switch.

Here what user write in "Enter Currency Variable" input box depends on what user select in value attribute. Refer **value attribute** section

If user selects "Observable variable / Inside Table/ Inside List/TreeView", then user will write variable name in which this currency has been stored.

Assume variable name is "tempCurrency". Its value is "GBP".

Add Formatter	
Select Formatter Type	
Format Currency	\sim
Enter Currency Variable	
tempCurrency	

If user select "Rest Properties", then user will write "currency" word as shown in the image below.

Add Formatter	
Select Formatter Type	
Format Currency	\sim
Enter Currency Variable	
currency	

 3) Format Number: User has a number "63.2512" and want to format it with percentage. Minimum fraction digit is 1, and maximum is 2. It will be 63.25%.
 Usage: Enable the switch, select "Format Number" type. Enter style as percent (do not use single quotes), and fractions digits as shown in the image below.

Add Formatter	
Select Formatter Type	
Format Number	\sim
Style	
percent	
Min Fraction Digit	
1	
Max Fraction Digit	
2	

11.13 Select Size:

Description: This attribute is used to specify the size of the avatar.

Components to accept the input: Select box

Select Size	
Select Size	\checkmark
XS	
SM	
MD	
LG	
XL	

This select box has seven options:

- 1. XXS : Double extra small
- 2. XS: Extra small
- 3. SM: Small
- 4. MD: Medium
- 5. LG: Large
- 6. XL: Extra large
- 7. XXL: Double extra large

Example: User has an avatar, and user wants to specify the size as extra small. To know more about avatar size refer <u>http://jet.us.oracle.com/6.1.0/jetCookbook.html?component=avatar&demo=basic</u>

Usage: Select XS option as shown in the image below.

11.14 Enter Image Path:

Description: This attribute is used to specify the path for the image of the avatar. Image will be rendered as a background image.

Components to accept the input: Input Text

Enter Image Path	
Enter Image Path	

Example: User wants to add an image in avatar located at "composites/avatar-image.jpg".

Usage: Enter path "composites/avatar-image.jpg" in an input box as shown in the image below.

Note: Use single quotes if path is of type string

Enter Image Path

'composites/avatar-image.jpg'

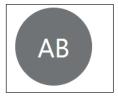

11.15 Enter Initials:

Description: This attribute is used to specify the initials of the avatar. It will only be displayed if the source (src) attribute i.e. path of an image is null or not specified.

Components to accept the input: Input Text

Enter Initials	
Enter Initials	

Example: User wants the initials as "AB" in avatar.

Usage: Enter the initials "AB" in an input box as shown in the image below.

Note: Use single quotes if initials are of type string.

Enter Initials
'AB'

11.16 Select Type:

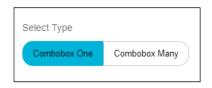

Description: This attribute is used to specify whether to allow single or multiple option selection. By default, it will be single selection.

Components to accept the input: Buttonset

For Select:

Select Type	
Select One	Select Many

For ComboBox:

There are two types of button available.

- 1. Select/ComboBox One : For single select
- 2. Select/ComboBox Many : For multi select

By default, "Select/ComboBox One" will be selected.

Example:

1. For Select Component:

User wants multi select drop down as shown in the image below.

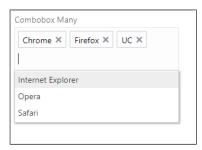

Chrome ×	Safari 🗙
Internet Explo	rer
Firefox	
Opera	

Usage: Select type "Select Many" as shown in the image below.

Select Type	
Select One	Select Many

2. For ComboBox Component:

User wants multi select combobox as shown in the image below.

Usage: Select type "ComboBox Many" as shown in the image below.

Select Type
Combobox One Combobox Many

11.17 Selection Mode:

Description: This attribute is used to specify whether to allow single or multiple file selection.

Components to accept the input: Select box

Selection Mode V Single Multiple	Selection Mode	
-	Selection Mode	\sim
Multiple	Single	
	Multiple	

This selection box has two options:

- 1. Single
- 2. Multiple

Example: User wants to allow multiple file selection as shown in the image below highlighted in red oval.

Custom file p	icker
1 Upload	
Selected files:	'voicemail.wav", "header.txt"]

Usage: Select type "Multiple" as shown in the image below.

Selection Mode	
Multiple	\sim

11.18Enter Allowed File Extensions:

Description: This attribute is used to specify the file extensions that can be uploaded. If not specified, accept all file types.

Component to accept the input: Input text

Enter Allowed File Extensions Enter Allowed File Extensions Example : ['.jpg','.png']

In the image above, there is information text written under the input text. Example['.jpg', '.png']

All extensions must be in an array, separated by a comma (,), surrounded by single quotes(' ') and start with full stop (.).

Example: User wants to accept only the following file extension.

"jpg", "png", "gif"

Usage: array will be ['.jpg','.png','.gif']

Enter this array in an input box as shown in the image below.

```
Enter Allowed File Extensions
['.jpg','.png','.gif'] |
Example : ['.jpg','.png']
```

11.19Image source:

Description: This attribute is used to specify the path or source of an image.

Components to accept the input: Input Text

Image Source	
Enter Image Source	

Example: User wants to add an image, available at "composites/avatar-image.jpg" location. **Usage**: Enter this path "composites/avatar-image.jpg" in the input text as shown in the image below.

Note: Use single quotes if path is of type string.

Image Source '¢omposites/avatar-image.jpg'

If path is stored in a variable, write that variable name as shown in the image below. Example variable name is "image".

Image Source	
image	

11.20Enter Minimum Length:

Description: This attribute is used to specify the minimum allowed value. This number is used in the range validator; if the value is less than the minimum value then the range validator flags an error to the user. The down arrow is disabled when the minimum value is reached.

Component to accept the input: Input Text

Enter Minimun Length	
Enter Minimun Length	

Example: User wants to set the minimum value as 5 as shown in the image below.

Enter	number		
4		~	^
0	The number is too low. The number must be gre than or equal to 5.	ater	

Usage: Enter 5 in the input text as shown in the image below.

Note: Do not write number in quotes.

Enter Minimun Length	
5	

11.21 Enter Maximum Length:

Description: This attribute is used to specify the maximum allowed value. This number is used in the range validator; if the value is greater than the maximum value then the range validator flags an error to the user. The up arrow is disabled when the maximum value is reached.

Component to accept the input: Input Text

Enter Maximum Length	
Enter Maximum Length	

Example: User wants to set the maximum value as 15 as shown in the image below.

Enter	number		
16		~	^
0	The number is too high. The number must be less equal to 15.	thar	ı or

Usage: Enter 15 in the input text as shown in the image below.

Note: Do not	write	number	in	quotes.
--------------	-------	--------	----	---------

Enter Maximum Length
15

11.22Enter Step:

Description: This attribute is used to specify the size of the step to take when spinning via buttons. Step must be a number greater than 0, otherwise an exception is thrown. It defaults to 1. To understand more about step attribute refer http://jet.us.oracle.com/6.1.0/jsdocs/oj.ojInputNumber.html#step

Component to accept the input: Input Text

Enter Step

Example: User wants to set the step value as 2.

5	^

Value of input number is 5. If user clicks the up arrow, value will increment by 2 and it will be 7 as shown in the image below.

Enter number		
7	~	^

Now value of input number is 7. If user clicks the down arrow, value will decrement by 2 and it will be 5 as shown in the image below.

Enter number		
5	~	^

Usage: Enter 2 in the input text as shown in the image below.

Note: Do not write number in quotes.

Enter Step		
2		

11.23 **Source variable:**

Description: This attribute is used to specify the data source for the list/table/tree. A Data source is a variable, which stores the data that needs to be displayed on the screen in the form of a list/table/tree.

Input Text

Source Variable
Enter Source Variable

Example: User has stored data in a variable named as "deptArray".

Note: In case of Tree element, this variable must be in JN format.

Usage: Enter this variable in an input box as shown in the image below.

Source Variable	
deptArray	

11.24 Id attribute:

Description: This attribute is used to specify the column name that contains the unique key from the data source of the list/table. A Unique key i.e. a column is used to identify an item of list/table uniquely.

Component to accept the input: Input Text

Id Attribute		
Id Attribute		

Example: User has a data source deptArray, which has the following data.

Var deptArray= [

{DepartmentId: 10, DepartmentName: 'Administration', LocationId: 200},

{DepartmentId: 20, DepartmentName: 'Marketing', LocationId: 200},

{DepartmentId: 30, DepartmentName: 'Purchasing', LocationId: 200}];

Usage: In this example, the column, which is a unique key, is "DepartmentId". Because value of every "DepartmentId" is unique.

Enter this column name in an input box as shown in the image below.

Id Attribute	
DepartmentId	

11.25 Renderer ID:

Description: This attribute is used to specify the id of a renderer that user have created for list/tree. To understand what is renderer and how to create it refer (link to renderer)

Components to accept the input: Input text

Renderer ID
Enter Template ID

Example: User has created a renderer with the id as "item_template".

Usage: Enter "item_template" in an input box as shown in the image below.

Renderer ID	
item_template	

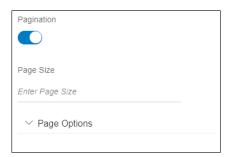

11.26 Pagination:

Description: This attribute is used to apply pagination to list/table.

Components to accept the input: Switch

Pagination	
\bigcirc	

When user enables the switch, it will display an input text and accordion as shown in the image below.

1) Page Size: This is used to specify the page size i.e. how many records should be visible to the user on the first page.

For example, user has given page size as 3, only first three records will be visible to the user as shown in the image below.

Department Id	Department Name
10015	ADFPM 1001 neverending
556	BB
10	Administration
Page 1 of 2 (1-3 of 5 items) K <	1 2 > >

2) Page Options: When user expands this accordion, it shows multiple page options as shown in the image below.

Pagination	
Page Size Enter Page Size	
∧ Page Options	_
Layout	
Select Layout 	~
Enter Max PageLinks	
Orientation Select Orientation	~
	×

3) Layout: This option is used to specify how the paging navigation controls should be displayed.

Page Options	
Layout	
Select Layout	\sim
Select Layout	
All	
Auto	
Input	
Nav	

It has following six options:

a) All: Display all controls

b) Auto: The Paging Control decides which controls to display.

c) Input: Display the page input control

Page	1	of 5

d) Navigation: Display the navigation arrows

e) Pages: Display the page links

f) RangeText: Display the page range text control

1) Maximum PageLinks: This option is used to give the maximum number of page links to display.

An ellipsis '...' will be displayed for pages, which exceed the maximum number as shown in the image below. maxPageLinks must be greater than 4.

2) Orientation: This option is used to give the orientation of the page links.

Orientation	
Select Orientation	\sim
Select Orientation	
Horizontal	
Vertical	

It has following options:

a) Horizontal: This option is used to align the page links horizontally.

Department Id	Department Name
10015	ADFPM 1001 neverending
556	BB
10	Administration
Page 1 of 1 (1-3 of 3 items) K < 1	K <

b) Vertical: This option is used to align the page links vertically.

Example: User wants a pagination with following options.

Page size: 4 Layout : 'All'

Max Page Links: "5"

Orientation: "Horizontal"

Department Id	Department Name	Location Id
10015	ADFPM 1001 neverending	200
556	BB	200
10	Administration	200
20	Marketing	200
Page 1 of 12 (1-4 of 45 items) K	< 1 2 3 4 5 12 > X	

Usage: Enter all the options as shown in the image below.

Pagination

11.27 Indexer:

Description: The JET Indexer is usually associated with a scrollable JET ListView. It provides a list of sections that corresponds to group headers in ListView. When a section is selected, the corresponding group header will be scroll to the top of the ListView.

Components to accept the input: Switch

When user enables this switch, it will display an input box as shown in the image below.

Indexer		
Indexer Key		

Indexer key: This field accepts the key of the data on which grouping is based on.

Example: User wants a list with indexer and user want to group all list items based on the surname as shown in the image below.

A	-	A B
Mozhe Atkinson	ł	C D
Simon Austin		E F G
В		H
Hermann Baer		J K
Shelli Baida		L M N
Annett Barnes		O P
Amy Bartlet		Q R S
Laura Bissot		T U
Bart Buckler		V W
Andrew Bugsy		X Y Z
С	-	#

Usage: Assume user have following data source of the list. datasource= [{id: "1", first_name: "", last_name: "Dunphy"}, {id: "100", first_name: "Mozhe", last_name: "Atkinn"}, {id: "101", first_name: "Simon", last_name: "Austin"}, {id: "200", first_name: "Hermann", last_name: "Baer"}, {id: "201", first_name: "Shelli", last_name: "Baida"},

{id: "2300", first_name: "Eleni", last_name: "Zlotkey"}]

Here surname is stored in last_name key.

Enable the switch and enter the indexer key as "last_name" as shown in the image below.

11.28 **ID:**

Description: This attribute is used to specify the id attribute for menu. This id attribute is used to launch the menu.

Components to accept the input: Input text

ID	
Enter ID	

Example: User wants to give the id as "actionMenu".

Usage: Enter "actionMenu" in an input box as shown in the image below.

Note: Use single quotes if it is a simple string.

ID		
'actionMenu'		
		_

If it is a combination of a string and a variable, for example string is "actionMenu" and variable is "\$data.index" then ID will be " 'actionMenu' + \$data.index " as shown in the image below

ID	
'actionMenu' + \$data.index	

11.29 Enter menu launcher:

Description: This attribute is used to specify the DOM Element, which may or may not be a JET element that launches the menu. For example anchor tag (<a>) or oj-button.

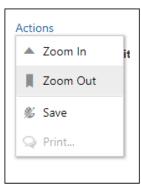

Components to accept the input: Select box

Enter Menu Launcher	
Actions	\sim
Actions	
Open Menu	

This select box lists the name of all clickable elements that user has added in page. For example, anchor tag and button.

First option "Actions" is a name of the anchor tag and second option "Open Menu" is a name of the button.

Example: User wants to open menu on the click of an anchor tag "Actions" as shown in the image below.

Usage: Select the "Actions" anchor tag option as shown in the image below.

Enter Menu Launcher	
Actions	\sim

11.30 Columns:

Description: This attribute is used to add the columns of a table.

Component to accept the input: Accordion, Buttonset and Input text

When user expands the "Columns" accordion, it shows a buttonset, with custom and external options as shown in the image below.

Columns	5	
Туре		
Custom	External	
Variable Na	me	
Enter Variat	ole Name	

These are two ways to add columns of the table.

1) Custom: When user clicks this option, it shows three input text as shown in the image below.

▲ Columns		
Туре		
Custom	External	
Enter Field		8
Enter Header	Text	
Enter Class		
	Add C	olumns

- 2) Enter Field: This field is used to specify the data field the column refers to i.e. the data of the column.
- 3) Enter HeaderText: This field is used to specify the text to display in the header of the column i.e. name of the column
- 4) Enter Class: This field is used to specify the CSS class to apply to the column cells.

User can add more columns using "Add Columns" link highlighted in green oval in the above image.

User can delete the columns using an icon highlighted in red oval in the above image.

5) External: By default, this option will be selected. When user click this option, it shows an input text as shown in the image below.

▲ Columns	5
Туре	
Custom	External
Variable Na	me
Enter Variable Name	

6) Variable name: This accepts the variable name in which columns information is stored.

Example:

1) Custom: User has a table, which display s Department name and manager ID as shown in the image below.

Department Name	Manager Id
ADFPM 1001 neverending	300
BB	300
Administration	300
Marketing	300

Data source of the table is as following.

var deptArray = [

{DepartmentName: 'ADFPM 1001 neverending', ManagerId: 300},

{DepartmentName: 'BB', ManagerId: 300},

{DepartmentName: 'Administration', ManagerId: 300},

{DepartmentName: 'Marketing', , ManagerId: 300];

- a) For the first column i.e. "Department Name"
 - Name of the column is Department Name, headerText is "Department Name".
 - Data of the column is stored in the field DepartmentName (refer the deptArray), field is "DepartmentName".
 - No class is needed.

Usage: Enter all these information as shown in the image below.

Columns	5	
Туре		
Custom	External	
Enter Field		\otimes
Department	Name	
Enter Heade	erText	
Department	Name	
Enter Class		
	Add Co	olumns

- b) For the second column i.e. "Manager ID".
 - Name of the column is Manager ID, headerText is "Manager ID".
 - Data of the column is stored in the field Managerld (refer the deptArray), field is "Managerld".
 - Class is "oj-sm-12"

Usage: To add this column, click "Add columns". It will add one more column and add all the details as shown in the image below.

Enter Field	\otimes
DepartmentName	
Enter HeaderText	
Department Name	
Enter Class	
Enter Field	\otimes
Managerld	
Enter HeaderText	
Manager Id	
Enter Class	
oj-sm-12	

2) External: If user wants to display the same table used in above example. User wants to make first column resizable, which can be done by adding resizable: enabled configuration to the column. But in custom type there is no option to add this configuration because it accepts only headerText, field and class. In such cases, where column has more configuration, use "External" type.

Create one variable "columnsArray". Add two objects for two columns. In those objects, user can add any configuration needed for the column.

columnsArray = [{"headerText": "Department Name",

"field": "DepartmentName",

"resizable": "enabled"},

{"headerText": "Manager Id",

"field": "Managerld",

"class": "oj-sm-2"}]

As user can see for the first column, "Department Name", resizable: enabled configuration is added.

User Interface Workbench

Usage: Enter this variable name in an input box as shown in the image below.

Columns	5	
Туре		
Custom	External	
Variable Name		
columnsArray		

11.31 Row renderer:

Description: This attribute is used to specify the id of a renderer for table. This is only valid if user have added any row renderer for the table.

If user has a simple data to display i.e. every column of the table, display some text. In that case, user do not need any row renderer. Refer the image below.

Date	Description	Reference No	Amount	Balance
06 Sep 2018	AT30028200778 NEW DEPOSIT	AT3DEBK1824915AE	£121.00 Dr	£6,160.45
06 Sep 2018	AT30028200745 NEW DEPOSIT	AT3DEBK1824915AA	£221.00 Dr	£6,281.45
06 Sep 2018	Payments and Collections Transaction code	AT30UPA18249B0QN	£550.00 Dr	£6,502.45
06 Sep 2018	Payments and Collections Transaction code	AT3OUPA18249B0QL	£550.00 Dr	£7,052.45

However, in the table, input fields such as input text, checkboxes or anchor tag have to be added. In that case, user needs a row renderer. For example in the following image, there is checkbox highlighted in red oval and input text highlighted in green oval inside the table. To understand what is renderer and how to create it refer **renderer** section.

Invoice Li	st						
	Counterparty Name & ID	Program Name and ID	Invoice No	Invoice Amount	Due Date	Status	Comments
	OBDXDEV COUNTERPARTY	BPT	BULKFUV0126	£100,000.00	21 May 2019	Raised	Type Comments
	OBDXDEV COUNTERPARTY	BPT	BULKFUV0127	£100,000.00	21 May 2019	Raised	Type Comments
	OBDXDEV COUNTERPARTY	BPT	BULKFUV0124	£100,000.00	21 May 2019	Raised	Type Comments
	OBDXDEV COUNTERPARTY	BPT	BULKFUV0130	£100,000.00	21 May 2019	Raised	Type Comments

Components to accept the input: Switch, Input box

Row rer	nderer		
\bigcirc			

When user enables the switch, it shows an input box named as "Row template".

Row renderer	
Row Template	
Enter Row Template Id	

Example: User has created a renderer with the id as "item_template".

Usage: Enter "item_template" in an input box as shown in the image below.

Row renderer	
Row Template	
item_template	

11.32Aria label

Description: This attribute is used to specify the aria label of the tag.

Components to accept the input: Input text

Aria Label
Enter Aria Label

Example: User wants aria label as "Accounts".

Usage: Enter "Accounts" in an input box as shown in the image below.

Aria Label
Accounts

11.33Tag type:

Description: This attribute is used to specify the type of tag.

Components to accept the input: Select box

Тад Туре	
Select Tag Type	\sim
Select Tag Type	
Div	
Span	
Label	
НЗ	

This select box has five options:

- 1. Div : It is a block-level element. A block-level element always starts on a new line and takes up the full width available.
- 2. Span: It is an inline element. An inline element does not start on a new line and only takes up as much width as necessary.
- 3. Label: It is a label tag of HTML. This element is used to associate a text label with a form input field
- 4. H3: It is h3 tag of HTML. It represents a level 3 heading in an HTML.

As per requirement, select the type.

Example: User wants do display "Please do not refresh or hit back" text. And user wants other text "Waiting" on the next line as shown in the image below.

Please do not refresh or hit back	
Waiting	

Usage: Now in this example, our first text should occupy the whole line and second text should start on the next line. As Div is a block element, it satisfies the requirement. When user adds "Waiting" text and selects Div type as shown in the image below. "Waiting" text will start on a new line.

Тад Туре	
Div	\sim

11.34 Binding source:

Description: This attribute is used to specify the use of the tag. For example, it can be used to display text, or some value or an icon etc.

Components to accept the input: Select box

Binding Source	
Select binding Type	\sim
Select binding Type	
NLS	
Bindings	
Icon	
After Renderer	

This select box has five options:

1) NLS: This option is used to display simple text. When user selects this option it will display an input box named as "Label" as shown in the image below.

Binding Source	
NLS	\sim
Label	
Enter Label	

2) Bindings: This option is used to display value of some variable. When user selects this option it will display a select box named as "Value" as shown in the image below. To know more about value refer **Value attribute** section.

Binding Source	
Bindings	\sim
Value	
Select Bind Type	\sim

3) Icon: This option is used to display an icon. When user selects this option, it will display an input box named as "Icon class name" as shown in the image below.

Binding Source	
Icon	\sim
Icon Class Name	
Type Icon Class	

4) After Renderer: This option is used to call a function after the DOM (Document Object Model) has rendered the specific HTML code. When user selects this option, it will display an input box named as "Enter Function Name" as shown in the image below. To know more about this refer <u>https://knockoutjs.com/documentation/template-binding.html</u>

\sim

Example:

1) User wants to display simple text "Welcome" as shown in the image below.

Usage: As this is a simple text coming from Resource Bundle, select Type "NLS". Enter "Welcome" text in the "Label" input box as shown in the image below.

Binding Source	
NLS	\sim
Label	
Welcome	

2) User wants to display "Welcome" which is stored in a variable.

Wel	lcome,

Usage: Assume variable name is "tempVariable". As this is stored in a variable and not coming from Resource Bundle, select type "Binding Source".

How to add a variable using Value attribute refer Value attribute section.

Binding Source	
Bindings	\sim
Value	
Observable Variable	\sim
Variable Name	
tempVariable	

3) User wants to display the user icon and password icon, highlighted in red oval in the image below.

Sername	
assword	
Login	

Usage: User icon class is "icons icon-user".

Select type "Icon"

Enter the user icon class "icons icon-user" in the "Icon class name" input box as shown in the image below.

\sim

4) User wants to execute some function once the specific elements are rendered on the screen.

Usage: Assume function name is "display Success".

Select type "After renderer"

Enter function name "display Success" in the "Enter Function Name" input box as shown in the image below.

Binding Source	
After Renderer	\sim
Enter Funtion Name	
displaySuccess	

11.35 Enter rows

Description: This attribute is used to specify the number of visible text lines in the text area. It can be used to give specific height to the text area.

Components to accept the input: Input text

Enter Rows		
Enter Rows		

Example: User want to add text area with 3 rows as shown in the image below.

0.1	
first row	
second row	
third row	_

In the image above, only first three rows are visible to the user because the number of rows are 3. There is a scroll for other rows as shown in the image below.

the and a second state	*
third row	
fourth row	
fifth row	

Usage: Enter 3 in the input text as shown in the image below.

Enter Rows	
3	

11.36 Selected step:

Description: This attribute is used to specify the ID of the current selected step. Default is the first step in the steps array.

Components to accept the input: Input text

Selected Step

Example: User wants to set step 2 as a selected step as shown in the image below.

Usage: Assume step array has following data:

Step_array = [{label:'Step One', id:'stp1'},

{label:'Step Two', id:'stp2'},

{label:'Step Three', id:'stp3'},

{label:'Step Four', id:'stp4'},

{label:'Step Five', id:'stp5'}];

Therefore, ID of second step is "stp2". Enter this id in the input text as shown in the image below.

Selected	Step

stp2

11.37REST API Chain and Hook Function

• REST API Chain: To understand what is chaining refer **REST API Configuration** section. This select box lists all the REST API chaining that user have created in step four i.e. REST API Configuration. From this select box, user can select REST API chain that user wants to fire when an element is clicked.

REST API Chain
Select REST API Chain
/accessPointGroup post v1
/accounts/cards/credit/{creditCardId}
/repayment delete v1
/accessPoint/{accessPointId} get v1

• Hook function: There is a button named as "Open Editor". When user clicks this button, it will open a code editor as shown in the below image. In this editor, user can write the code user wants to execute when the value of an element is changed.

To understand more about editor refer **Open Editor of hook function** section

1 //write	code here;			

Example:

1. User want to give an option to use a form as a template. It has an input text to accept the template name as shown in the image below. And it has an anchor tag that checks for the availability of the name entered by the user highlighted in a green oval as shown in the image below.

Save As Template	
Yes No	
Template Name	
	Check Availability

In this example, user needs to fire a rest to check the availability of the name.

Usage:

Select the REST API, user needs to fire when user clicks the Check Availability option as shown in the image below.

REST API Chain					
/accessPoint/{accessPointId} get v1 ×					
Hook function					
Open Editor					

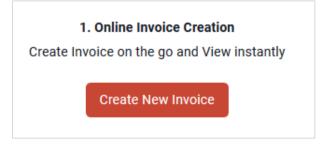

If user click the "Open Editor" button, it will open the code editor.

	ccessPointaccessPointIdgetCall(self.accessPointaccessPointIdgetaccessPointId()).	Contractory
	hen(function(response)	
	<pre>// result for get : "/accessPoint/{accessPointId}"</pre>	
	self.accessPointaccessPointIdgetVar(response);	
})	
3		

There is some code already written inside the editor, the tool has generated this code. When user selects any REST API, the tool generates the required code to execute that REST API. However, in some cases, there is need to do some additional operation on the data, fetched from the server. Therefore, for this purpose, there is a support for code editor, to let user write its own code. In such scenarios, use the response (highlighted in red circle in the image above) for further processing.

Whenever user clicks this option, it will execute the block of code written inside the editor.

2. User want to create an invoice. On clicking Create New Invoice button, navigate should be to the form of creating an invoice.

Usage: In this example user do not need to fire any REST API, user will not select any REST API. Click the "Open Editor" button, and write code inside the editor as shown in the image below.

1 µ 2	<pre>varams.baseModel.registerComponent("create-invoice", "invoice");</pre>	
	arams.dashboard.loadComponent("create-invoice");	

Function has two parameters event and data. User can use these parameters in code if required.

Note: As there is no REST API selected, there will be no auto-generated code.

11.38 Select Type of Container

vailable Components \times				6	Container)

	Accordion					

- 1. Normal Container: This is the most basic type of container which is used to group an element to:
 - apply a common style
 - repeat a form section on page
 - hide and display form section
 - apply grid size to a form section

Example:

In the below example, normal container option has been selected. Two elements will be added with a gap in between them. User can drop any form element inside it.

NormalContainer	28	=
		=

In the below image an input box and date picker are added inside a normal container.

NormalContainer		2 🕯 🛍	=
name		2 🗎 🛍	=
Date of birth		2 🗎 🛍	_
			=

2. Partial: Partials are small unit of the page which can be reused.

			 Normal Container
			 Partial
	Design Component		Modal Window
			Renderer
mponent header	Enter component header		O Button Container
			 Accordion
lidation Tracker ID	Validation Tracker ID		Collapsible
			Select Type
mponent css style	Yes No		Create Create And Load
		Available Components Edit Init Function More	Label
Form			testPartial
Header			
			✓ Advanced
			✓ Layout
Partial			
			Confirm
name			
		=	

Example:

When user chooses a container type as partial and create a component, an extra file will be created in partials folder along with other artefacts (refer creating component) at location. ChannelPath/partials/you_module/label.html.

Generated partials:

> (> core > channel > partials					
	^	Name	Date modified			
		testPartial.html	07/05/2019 12:07			
		😲 test.html	07/05/2019 11:49			
		🔊 dashboard-notification.html	09/02/2019 19:23			
		🔊 footer.html	09/02/2019 19:23			

To use it, refer component loader or select type 'create and load' to use is at same location where container is dropped.

Select Type:

- Create: to create the partial.
- Create And Load: to create and load the partial.

3. Modal Window:

Usage: This container type is used to display the layout in overlay window or dialog box.

My Limits			\otimes		
^{Channel} (j)				
Internet			Ŧ		
Available L	imits				
Ø	Amount	£5.00 to £10,000.00			
644	Count	150			
O Note - Above limits are derived based on your per transaction initiation limits, total available cumulative limit for the current channel, payee cooling period and payee limits set up by you if any for initiating current transaction. You may have limits available for initiating this transaction from other channel, to know more details access - View Limits					

4. Renderer

Usage: Renderer are used to design row of Table or ListView.

For reference go to http://jet.us.oracle.com/.

• Container ID: This Id will be mapped to Row Template in case of Table or Renderer Id in case of ListView (refer Table and ListView Section).

5. Button Container:

Usage: This container is used to display one or more button as the call to action button. Only buttons can be placed inside this container

Example:

Correspondence Charges		
SHARED	•	
Payment Details		
Add Payment Details		
Note		
90 Characters Left		
80 Characters Left		_

6. Accordion:

Usage: A vertically stacked element which allows the user to toggle between sections of content is an accordion. Accordion container is used to create a group of collapsible items. A collapsible container is dropped inside it. To know about accordion and its use follow the link:

http://jet.us.oracle.com/jetCookbook.html?component=accordion&demo=basicAccordion.

Example:

🕨 📱 Header 1		
Header 3		
Colors Blue Green Red		
Header 4		

7. Collapsible:

Usage: Collapsible container can contain any element inside it, which the user uses to toggle between sections of content. To know more about collapsible visit http://jet.us.oracle.com/jetCookbook.html?component=collapsible&demo=basicCollapsible.

Note: UX Extensibility Toolkit and UI Workbench are used interchangeably.
