Document Control

The following table provides details for the creation of the document and the updates done in the document.

Table 1: The Details of Revision to the Document

Version Number	Revision Date	Change Log
1.4	August 2022	Inline process is not supported from versions 8.0.8.5.0 onwards. All references to Inline process are removed.
1.3	November 2021	Updated the User Role Mapping and Access Rights Section for (Doc 33506217).
1.2	August 2021	<ul style="list-style-type: none">• Added the Use Case: Event-Based Framework Execution in Real-time Transaction Monitoring section (Doc 33180215).• Minor updates for multiple sections (32944643).
1.1	July 2021	Added the Seed Data in the Event and Event Subtype Tables and Appendix C: Set Up Event Framework Metadata sections for Doc 33092059.
1.0	January 2021	Created the user guide for the features added and enhancements done for the Process Modelling Framework in the OFSAA Release v8.1.1.0.0.

20.2.7	<i>Replay Messages</i>	161
20.2.8	<i>Save Consumer Properties</i>	161
20.2.9	<i>Save Producer Properties</i>	162
20.2.10	<i>Start Consumers</i>	163
20.2.11	<i>Stop Consumers</i>	163

1 Introduction

Process Modelling Framework (PMF) is a design and execution framework that enables Process Pipeline developers to implement various Pipelines modeled by business analysts. Process Pipeline developers use the framework to orchestrate the Business Pipelines and Run Pipelines within OFSAA, and also to design the artifacts that participate in the Pipelines, to complete their implementation.

The Process Modeling Framework consists of Process Modeling components for modeling Pipelines and Process Monitor components for monitoring instantiated Pipelines of OFSAA applications.

See [Process Flow](#) for more information on how these tools fit into the Pipeline design and implementation.

Process Modeller aids in representing the various artifacts required for modeling and provides implementation details of the OFSAA process artifacts.

- OFSAA Process Pipeline or Run Pipeline
- Reusable process components like Sub Pipeline
- Process data (Data Fields)
- Implementation of various types of Human Tasks / Service Tasks
- Business Rules (Application Rules)
- Various External services implementations and other artifacts needed for complex implementations
- Configuring Notifications

Topics:

- [Key Features of Process Modelling Framework](#)
- [Process Pipeline Flow](#)
- [Prerequisites](#)
- [Access Process Modelling Framework](#)

1.1 Categorization of Pipelines

The Categorization of Pipelines creates a clear segregation of the nature of tasks being orchestrated.

For details, see the [Oracle Financial Services Analytical Applications Infrastructure Extension Pack Online Documentation](#).

Applying the Extension Pack categorizes and updates the pipeline types appropriately depending on the nature of tasks that are being orchestrated. Further explanation on the nature of tasks and categorization is as follows:

1. Workflow Pipeline
2. Run Pipeline
3. Sub-Run Pipeline

4. Business Process Pipeline

You can define and orchestrate Business Process Pipelines only if the Oracle Financial Services Analytical Applications Infrastructure Extension Pack (OFSA AIE) is enabled in the OFS AAI setup. The Business Process Pipeline allows orchestration of various tasks and pipelines across Workflow, Run, and Sub-run Process Pipelines of any pipeline type whether it is a Business, Run, or Workflow Pipeline(s).

The various widgets in the PMF Canvas display depending on the type of pipeline selected, which are described as follows:

1. **Run Pipeline:** If any orchestrated pipeline consists of OFSAA tasks and service calls that run within the OFSAA context, it is categorized as Run Pipeline and it allows to stitch or orchestrate other processes of the type "subrunprocess". The Sub-run Process is further explained, or the Run can be mapped within a Run, which allows you to configure an array of tasks and orchestrate them based on the decisions attached.
2. **Workflow:** This represents a state-machine pipeline that allows you to orchestrate manual and automated system tasks, which helps you to stitch a state-change machine by performing manual or system tasks. If there is a Sub-pipeline, then you can stitch a Workflow pipeline. This process also allows you to have service tasks that make REST calls to systems outside of OFSAA.
3. **Subrunprocess:** This is a process similar to the Run process where a Sub-run Process Pipeline allows you to orchestrate the tasks in OFSAA as well as the services and API that run within the OFSAA context. You can also map other processes of the type "subrunprocess" within a Sub-run Process.
4. **Business Process:** This process allows you to access a full range of orchestration where the Business Process Pipeline can interleave a Run Pipeline to a Workflow Pipeline or can orchestrate a Sub-Run process or Workflow process. It enables the widget to have a full range of tasks in OFSAA as well as workflow tasks. This process also allows you to have service tasks that make REST calls to systems outside of OFSAA.

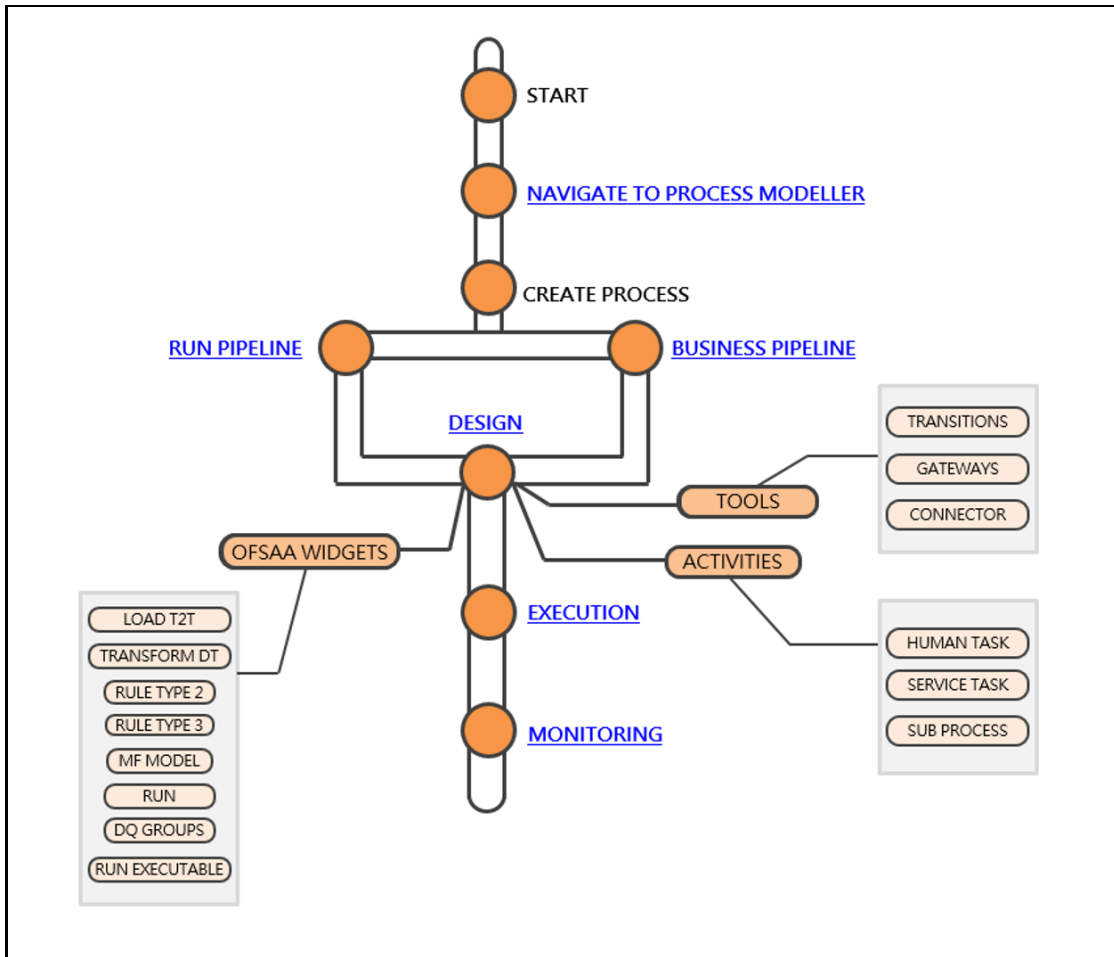

1.2 Key Features of Process Modelling Framework

- Support for visual modeling of the pipelines.
- Support for registration of Process /Activity/ Transition Logic implementation, separated from the modeling itself.
- Built-in orchestration engine (included within OFSAAI's runtime) for task execution (interactive model as opposed to the batch model supported through Rule Run Framework).
- Published interface for the abstraction of task implementation.
- Representation of the pipeline-routing rule logic in Java/ PL-SQL / Web-service.
- Stitching of OFSAA Components within the Process Pipeline
- Orchestration and execution of RRF Run.
- Reminder, Escalation, and Expiry of tasks.
- Registration of Custom Widgets.

- Process Monitoring Admin Tool to view the execution Process Instances.

1.3 Process Pipeline Flow

Figure1: Process Pipeline Flow

TIP

After you click the links in the Process Pipeline Flow, press ALT+ Left Arrow to come back to this page.

1.4 Prerequisites

The following is the prerequisite to access and perform functions in the PMF user interface:

- [User Role Mapping and Access Rights](#)

1.4.1 User Role Mapping and Access Rights

User access to the PMF UI and the ability to perform functions in it is dependent on the mapping of the user profile to the roles in the OFS AAI application and the access rights assigned.

The following user role mapping is mandatory for PMF:

Table 1: User Role Mapping for PMF

Role Code	Role Name	Functionality
WFACC	Workflow Access	Assign this role to the user to access the Process Modeller menu from the Navigation Tree. NOTE: The mapping of this role does not allow view, edit, and add actions.
WFKAFKA	Kafka Producer Consumer	Assign this role to the users who are required to perform the Event-based Orchestration of Process Flow. NOTE: The mapping of this Role displays the following icons in the PMF Canvas: <ul style="list-style-type: none"> • Event Producer • Event Consumer The messages sent by Banks to Topics to trigger the PMF Workflow is consumed by the Event Consumer. The messages from the PMF Workflow to the Banks (Topics) is sent by the Event Producer.
WFMACC	Workflow Monitor Access	Assign this role to the user to access the Process Monitor window. NOTE: The mapping of this role does not allow view, edit, and add actions.
WFREAD	Workflow Read	Assign this role to the user to view the PMF workflow.
WFWRITE	Workflow Write	Assign this role to the user to perform view, edit, and add actions in PMF.
WFACCNEXE	Workflow Execute On Read	Assign this Role to Users who have to Execute, Re-run, or Abort a Process. PREREQUISITE: Ensure that the Users are assigned the Workflow Access (WFACC) Role before you assign this Role.

NOTE

For administrators, ensure that they are mapped to all the roles described in the preceding table to allow them to perform all types of operations in PMF.

1.5 Access Process Modelling Framework

The following are the steps to access Process Modelling Framework:

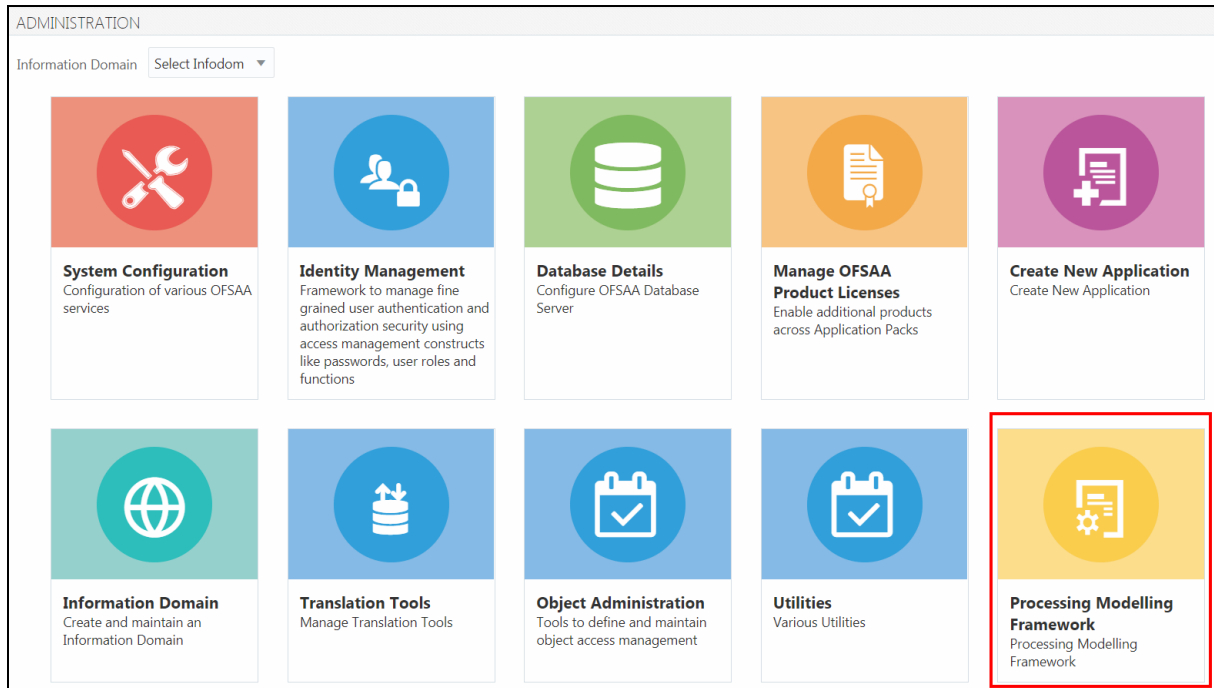

1. From the OFSAA Landing screen, click  **Administration**.

Figure 2: Administration Home Window

2. Select the **Information Domain** from the drop-down list.
3. Click the **Process Modelling Framework** tile to display the sub-menu.

Figure 3: Process Modelling Framework Tile

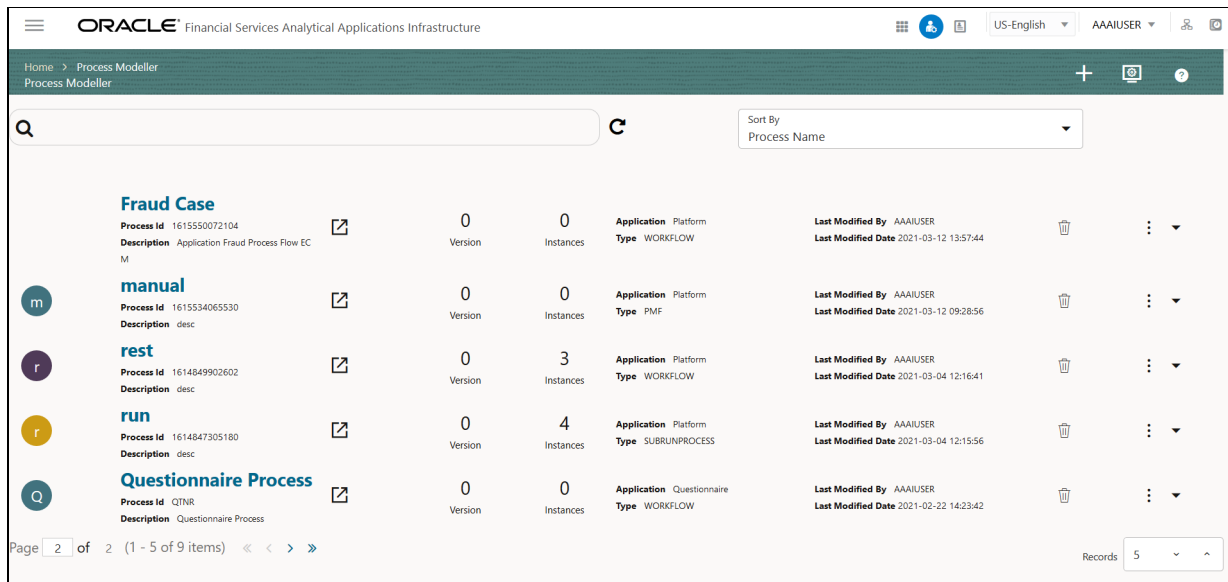

4. Click **Process Modeller** to launch the Process Modeller.
5. Click **Process Monitor** to monitor currently running processes.
6. Click **Delegation** to launch the Delegation framework.

2 Process Modeller

The **Process Modeller** window displays the existing Pipelines with the details such as Process ID, Process Name, Process Description, Version, Instance, Application, and Last Modified details.

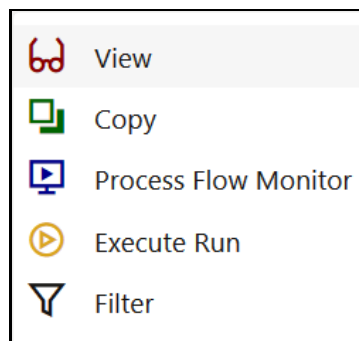

Figure 4: Process Modeller window

You can do the following tasks from this window:

- Click to create a new Pipeline.
- Click the Process Name link to launch and edit the Pipeline.
- Click to **delete** a Pipeline.
- Click to view the following sub-menu:

Figure 5: Process Modeller sub-menu

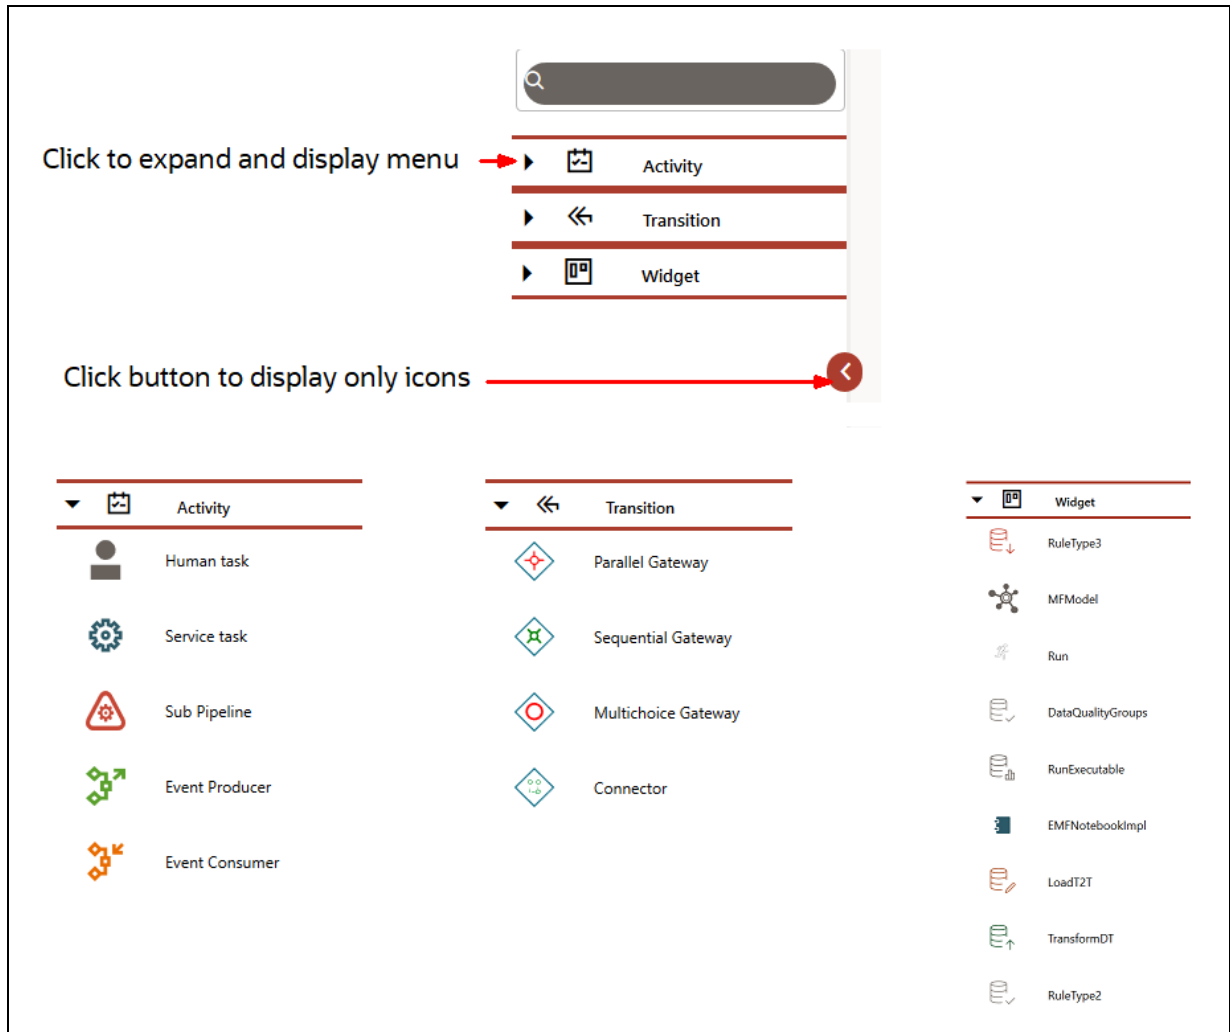

- Click **View** to **see** the process flow.
- Click **Copy** to **copy and create** a new Pipeline with the same process flow.
- Click **Process Flow Monitor** to **monitor** the Pipeline.

- Click **Execute Run** to [execute](#) a Run Pipeline.
- Click **Filter** to [apply a filter condition](#) to a Run Pipeline.
- Using the **Search** grid, you can search for a specific Pipeline by providing a keyword from Process ID, Process Name, or Process Description and clicking . Click the Reset search icon  to reset the Search fields.
- You can sort the Pipelines based on Process ID, Process Name, or Application. Click the **Sort by** drop-down and select the attribute by which you want to sort.
- You can use the **Filter Pipeline** field to filter pipelines based on pipeline type.
For example, if you want to view only Run Pipelines, remove **Process** from the **Filter Pipeline** field.
- Click  to go to the [Process Monitor](#) window.

3 Components for Designing Your Process Flow

The Process Flow tab has a toolbar and a drawing canvas. Drawing canvas is used to design the Process flow with the Tools, Activities, and Widgets available in the toolbar.

Figure 6: Components for Designing your Process Flow

Topics:

- [Transition](#)
- [Human Task](#)
- [Service Task](#)
- [Sub Pipeline](#)
- [Event Producer](#)
- [Event Consumer](#)

- [Widgets](#)

3.1 Transition

A Transition is used to control the flow between various components in the Process flow. Transition connects two activities and the flow is configured based on conditional expression or decision rule.

3.1.1 Gateways

Split refers to a condition where an incoming transition is split into multiple transitions. In Merge, multiple incoming transitions are merged into a single transition. The Splitting and Merging of Activities are modeled through gateways. A gateway can be Sequential, Parallel, or Multi Choice.

- **Parallel Gateway:** A Parallel gateway is used when you want to have multiple transitions/flows that should be executed in parallel.
- **Sequential Gateway:** A Sequential gateway is used when you want to have multiple transitions/flows that should be run in sequence.
- **Multi Choice Gateway:** A Multi Choice gateway is used when you want to execute multiple transitions/flows based on the decision rule.

ATTENTION If you use a Parallel or Multi Choice gateway in your pipeline, ensure that after all the activities added to these gateways, it is merged or closed again with a Parallel or Multi Choice gateway, respectively. If there is no more activity to be performed after the Parallel or Multi Choice gateway, it is mandatory to add empty service task activity. Otherwise, the status is not updated correctly, and the next activity execution does not happen.

3.1.2 Connector

A Connector helps to connect two activities with a different path (other than the default), in case if the default path is overlapping with some existing flow.

3.2 Human Task

A Human Task requires human intervention to move to the next activity.

For more information on stitching human tasks in your Process flow, see the [Human Tasks](#) section.

3.3 Service Task

Service task typically invokes an application component (for example, activity to invoke a business rule to calculate a certain threshold).

For more information on stitching service tasks in your Process flow, see the [Service Tasks](#) section.

3.4 Sub Pipeline

Sub Pipeline provides the reusability of Pipelines. Using the Sub Pipeline component, you can call another Pipeline from your parent Pipeline.

For more information on how to use Sub Pipeline, see [Calling another Pipeline from Your Parent Pipeline](#) section.

3.5 Event Producer

Event Producer creates messages as per the JSON definition and invokes the Producer API by passing the message and the Topic ID.

For more information on how to use Event Producer, see the [Producer Activity](#) section.

3.6 Event Consumer

Event Consumer makes asynchronous requests to execute activities in a process flow based on the conditions of event occurrences.

For more information on how to use Event Consumer, see the [Producer Activity](#) section.

3.7 Widgets

Widgets are used to execute OFSAA components such as T2T definitions, PLC definitions (DT), Rules (Classification Rule and Computation Rule), Models in EMF, RRF Runs, Run Executable, Data Quality Groups, and RRF Processes through Process Modeller.

For more information, see [Configuring OFSAA Tasks in Your Process Flow](#) section.

You can register a new component by entering details in the AAI_WF_COMPONENT_ REGISTRATION table.

For more information, see the [Configuring Custom Components](#) section.

4 Artifacts of Process Modelling

Before you start designing your Pipeline, you must be introduced to some artifacts of the Process Modelling Framework.

- [Application Package](#)
- [Application Registration](#)
- [Data Fields](#)
- [Application Rules](#)
- [Application Object Model \(AOM\)](#)

4.1 Application Package

Application Package is a concept used to group Pipelines, Application Rules, and Data Fields that are required for an Application. When you create a Pipeline, you should select the Application Package in which the Pipeline needs to be available. Similarly, when you define a Data Field or an Application Rule, you can set it to be available across Pipelines created in that Application Package.

You can add a new package by adding a new entry in the AAI_WF_APP_PACKAGE_B table.

Figure 7: AAI_WF_APP_PACKAGE_B table

V_APP_PACKAGE_ID	V_APP_PACKAGE_DESC	V_LANGIN	V_DEFINITION_PAGE_URL	V_IS_EMAIL_REQUIRED
0	Global			N
10	Business Restructure		Restructure/manage_grid.jsp?userId={ASSIGNEEUSERS}&locat	Y
100	Platform			Y
11	Questionnaire		solution/abc_qtnr/QtnrRedirectFrmPMFInbox.jsp?appCode={app	Y

V_APP_PACKAGE_ID – Enter a unique application package ID.

V_APP_PACKAGE_DESC – Enter a description for the application package.

V_DEFINITION_PAGE_URL – Enter the URL of the definition page of the Application.

V_IS_EMAIL_REQUIRED – Set this as Y for configuring email at the Application Level.

4.2 Application Registration

This section is applicable only for Business Pipeline.

Application registration is required to define the Entity and the Attributes that need to be updated for a Business Pipeline. These entries need to be seeded in the AAI_WF_APP_REGISTRATION and AAI_WF_APP_DEFINITION_MAP tables.

4.2.1 Object Type Entry

The AAI_WF_APP_REGISTRATION table stores information like the Object Type, Fact Table, Primary Key Column Name, Object Name, and Object Type Name, and so on for an Application Package.

Figure 8: AAI_WF_APP_REGISTRATION table

V_APP_PACKAGE_ID	V_OBJECT_TYPE	V_FCT_TABLENAME	V_PRIMARY_KEY_COL_NAME	V_OBJECT_NAME_COL	V_OBJECT_TYPE_NAME

4.2.2 Object Type Process Mapping

The AAI_WF_APP_DEFINITION_MAP table stores Process IDs against the required Object Type. Note that multiple object types can be mapped to a single Process.

Figure 9: AAI_WF_APP_DEFINITION_MAP table

V_PROCESS_ID	N_VERSION	V_OBJECT_TYPE	V_DEFAULT_FLAG	V_ENABLE_FLAG	V_KBD_1	V_KBD_2	V_KBD_3	V_KBD_4	V_KBD_5	D_EFFECTIVE_FROM_DATE
1	EDM	0 AML_DD	Y	Y						8/22/2017
4	EDM	0 AML_PAT	Y	Y						8/22/2017
2	EDM	0 AML_SURV	Y	Y						8/22/2017
3	EDM	0 AML_TER	Y	Y						8/22/2017

29	CUSTOMER_VERIFICATION_GATEWAY_FCCM	0 CUSTOMER_VERIFICATION_GATEWAY_FCCM	Y	Y						4/18/2016

4.3 Data Fields

Data Field, which is also known as Process Variable, helps Process Pipelines to access and store information from external sources. Often the process flow is based on the value of this information. In other cases, this information is the result of running the tasks in the Pipeline.

This section has the following subsections:

- [Adding a Data Field](#)
- [System Data Fields](#)
- [AOM Data Field](#)

4.3.1 Add a Data Field

1. From the **Process Modeller** window, click the  submenu icon corresponding to the Pipeline for which you want to add a Data Field. The **Process Flow** tab is displayed.
2. Select  **Data Fields** from the header to display the **Data Fields** window.

Figure 10: Data Fields Window

Data Fields			
Search <input type="text"/>  			
<u>WF_ENTITYID</u>	Description Entity ID Type STRING	Is Mandatory No Value	
<u>WF_INFODOM_CODE</u>	Description INFODOM_CODE Type STRING	Is Mandatory No Value	
<u>WF_INSTANCE</u>	Description INSTANCE Type STRING	Is Mandatory No Value	
<u>WF_LOCALE</u>	Description LOCALE Type STRING	Is Mandatory No Value	
<u>WF_OBJECT_ID</u>	Description OBJECT_ID Type STRING	Is Mandatory No Value	
<u>WF_OBJECT_NAME</u>	Description OBJECT_NAME Type STRING	Is Mandatory No Value	
<u>WF_OBJECT_TYPE</u>	Description OBJECT_TYPE Type STRING	Is Mandatory No Value	
<u>WF_OUTCOME_ID</u>	Description OUTCOME_ID Type STRING	Is Mandatory No Value	
<u>WF_PROCESS_ID</u>	Description PROCESS_ID Type STRING	Is Mandatory No Value	
<u>WF_SEGMENT_CODE</u>	Description SEGMENT_CODE Type STRING	Is Mandatory No Value	
<u>WF_STATUS</u>	Description STATUS Type STRING	Is Mandatory No Value	
<u>WF_TASK_RESPONSE</u>	Description TASK_RESPONSE Type STRING	Is Mandatory No Value	
<u>WF_TASK_STATUS</u>	Description TASK_STATUS Type STRING	Is Mandatory No Value	

- Click **Add**  to display the **Addition of Data Field** window.

Figure 11: Addition of Data Field Window

The screenshot shows a window titled 'Data Fields' with a sub-header 'Addition of Data Field'. It contains the following fields:

- Datafield Code: Sum_Balncs
- Data Field Description: Sum of Balances
- Data Field Type: String
- Initial Value: 100
- Is Mandatory: Yes
- Scope: Process

4. Enter the details as given in the table:

Table 2: Data Field Details Description

Field Name	Description
Data Field Code	Enter the Variable Name/Code, which needs to be used by the application to read or write into this variable. This field is non-translatable.
Data Field Description	Enter a brief description of the Data field.
Data Field Type	Enter the Data Field type. The supported types are String, Integer, Int, Float, AOM (Application Object Model), and Boolean. For more information on where we use the AOM Data Field type, see the AOM Data Field section.
Initial Value	Enter the default value for the Data.
Is Mandatory	This field applies to the Data Field Type of AOM. By default, for AOM Data Field, this is selected as Yes . Select No if you do not want this parameter to be displayed as Execution Parameter for the Run Pipeline.
Scope	Select the scope of the Data Field from the drop-down list. The options are: <ul style="list-style-type: none"> Process- Select Process if you want to use the Data Field only in the current process. Package- Select Package if you want to use the Data Field across all the processes in the package.

5. Click the **Accept**  icon to save it.

4.3.2 System Data Fields

Some data are tracked internally by the System using a predefined set of Data Fields such as Status of Process. You can access these activity instance attributes in the same way you access regular data objects, but you cannot assign them new values.

4.3.3 AOM Data Field

The AOM Data Fields are automatically created from the entries in the AAI_AOM_APP_COMP_ATTR_MAPPING table. These Data Fields, which are marked as mandatory, are displayed in the **Select Run Parameters** window while [executing Run Pipeline](#). For configuring AOM Data Fields, see [Configuring Application Object Model \(AOM\)](#) section.

4.4 Application Rules

The Application or API Rule is the interface between the process engine and the application, including any parameters to be passed.

To access Application Rules, do as follows:

1. From the **Process Modeller** window, click the  submenu icon corresponding to the Pipeline for which you want to add an application rule. The **Process Flow** tab is displayed.
2. Select  **Application Rules** icon from the header to display the **Application Rules** window.
3. Click **Add**  to display the Add Application Rules window. You can delete a rule by clicking the  button.

Based on their usage the Application Rules are categorized as follows:

- **Execution Rule:** These are Business Logic executed as Tasks by an Activity.
- **Decision Rule:** This rule returns the Boolean value “True/False”, used in decision making during split/branching of transition.
- **Selection Rule:** This rule fetches some value, useful to get value dynamically from a table or other source.

For example, `select v_created_by from fct_expenses where id=101`

Following are the available Application Rules:

- [SQL Application Rule](#)
- [Stored Procedure Application Rule](#)
- [Function Application Rule](#)
- [Java Application Rule](#)
- [Java External API Application Rule](#)
- [Outcome Rules Application Rule](#)
- [Expression Application Rule](#)

- [Rest Service Application Rule](#)
- [Attribute Expression Application Rule](#)
- [Advanced Attribute Expression Application Rule](#)
- [JSON Path Expression Application Rule](#)
- [JSON Read From DB Application Rule](#)
- [JSON Write To DB Application Rule](#)

4.4.1 SQL Application Rule

This Application Rule is used to execute any SQL queries in the Process Flow.

Figure 12: Add SQL Application Rule Details Window

The screenshot displays the 'Add Application Rule' window with the following configuration details:

- Application Rule Type:** SQL
- Name:** Proess Name Data
- Rule Type:** Execution Rule
- Execution Type:** SQL
- Implementation Detail:** SELECT PROCESSNAME FROM ofsaatm.Report_links WHERE REPORT_TYPE='MODEL_F
- Return Parameter:** PROCESS_ID
- Scope:** PACKAGE

A green checkmark icon is visible in the bottom right corner of the window.

Table 3: SQL Application Rule Details Description

Field Name	Description
Application Rule Type	Select SQL as the Application Rule Type from the drop-down list.
Name	Enter a unique name for the SQL Application Rule.
Rule Type	Select the Rule Type from the drop-down list. The SQL Application Rule can be used as a Decision Rule, Execution Rule, or Selection Rule based on your requirement.
Execution Type	Displays the Application Execution Type as SQL.
Implementation Detail	<ul style="list-style-type: none"> • Decision Rule- For Decision Rule the SQL Statement should return 'PASS' for success condition. For example, select 'PASS' from dual where {EXPENSES} <= {THRESHOLD} Note: {EXPENSES}, {THRESHOLD} are user defined Data Fields. • Execution Rule- For Execution Rule the SQL Statement can be any DML statement. For example, update fct_expenses set expenses={EXPENSES} where id = {WF_ENTITYID} • Selection Rule- For Selection Rule the SQL Statement should be a Select statement that returns a list of values. For example, select v_created_by from fct_expenses id = {WF_ENTITYID}
Return Parameter	<p>Select the Data Field that receives the return parameter of the SQL Rule, from the drop-down list.</p> <ul style="list-style-type: none"> • For Execution Rule type, the business logic is implemented in the method and the parameter value returned from the SQL Rule is saved in the mapped Data Field. • In the case of Selection Rule type, the Java method should be a String value. • In the case of the Decision Rule type, the Java method should return Boolean values "True/False".
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.

4.4.2 Stored Procedure Application Rule

This Application Rule is used to call a Stored Procedure in your Process Flow.

Figure 13: Stored Procedure Application Rule Details Window

The screenshot shows a web-based form for configuring a Stored Procedure Application Rule. The form is titled 'Application Rule' and 'WF RUN EXE RULE'. It includes the following fields:

- Name:** WF RUN EXE RULE
- Rule Type:** Execution Rule (dropdown menu)
- Execution Type:** Stored Procedure (dropdown menu)
- Procedure Name:** dqcheck
- Input Parameters:** WF_RUNSK (with a close button 'X')
- Parameter Mode:** ["OUT"]
- Scope:** PACKAGE (dropdown menu)

A green checkmark icon is located in the bottom right corner of the form area.

Table 4: Stored Procedure Application Rule Details Description

Field Name	Description
Name	Enter a unique name for the Stored Procedure Application Rule.
Rule Type	Select the Rule Type from the drop-down list. The Stored Procedure Application Rule can be used as a Decision Rule, Execution Rule, or Selection Rule based on your requirement.
Execution Type	Displays the Application Execution Type as Stored Procedure.
Procedure Name	Enter the Stored Procedure Name.
Input Parameters	Select the list of Data Fields that are passed as input parameters, from the drop-down list.

Field Name	Description
Parameter Mode	<p>Enter the Parameter Mode in JSON format. For example, suppose you have given 3 parameters as input parameters, enter parameter mode as ["IN","IN","OUT"].During Execution of Stored Procedure,</p> <ul style="list-style-type: none"> In the case of the Decision Rule type, the first return parameter should return the value 'PASS' for success evaluation. In the case of Selection Rule type, the first return parameter value is taken as Selection data. In the case of the Execution Rule, the procedure return OUT parameter value overwrites the current value of the respective mapped Data Field.
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.

4.4.3 Function Application Rule

This Application Rule is used to call Database functions in your Process Flow.

Figure 14: Function Application Rule Details Window

Table 5: Function Application Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.
Rule Type	Select the rule type from the drop-down list. The available rule types are Decision Rule, Execution Rule, and Selection Rule.
Execution Type	Displays the Application Execution Type as Function.
Function Name	Enter the Function Name.
Input Parameters	Select the list of Data Fields which will be passed as input parameters, from the drop-down list.
Parameter Mode	<p>Enter the Parameter Mode in JSON format. For example, suppose you have given 3 parameters as input parameters, enter parameter mode as ["IN","IN","OUT"].</p> <p>During Execution of Function,</p> <ul style="list-style-type: none"> • In the case of the Decision Rule type, the first return parameter should return the value 'PASS' for success evaluation. • In the case of Selection Rule type, the first return parameter value is taken as Selection data. • In the case of the Execution Rule, the procedure return OUT parameter value overwrites the current value of the respective mapped Data Field.
Return Parameter	<p>Select the Data Field that receives the return parameter of the Java function, from the drop-down list.</p> <ul style="list-style-type: none"> • For Execution Rule type, the business logic is implemented in the method and the parameter value returned from the Java method is saved in the mapped Data Field. • In the case of Selection Rule type, the Java method should be a String value. • In the case of the Decision Rule type, the Java method should return Boolean values "True/False".
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.

4.4.4 Java Application Rule

This Application Rule is used to call Java functions in your Process flow.

Figure 15: Java Application Rule Details Window
Table 6: Java Application Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.
Rule Type	This Rule Execution type supports only the Execution Rule type.
Execution Type	Displays the Application Execution Type as JAVA.
Implementation Detail	<p>Enter the complete java class name which implements the Interface : com.ofss.aai.service.wf.external.base.Activity.</p> <p>The implementation class has to override the method with the Business Logic. executeTask(List<Data Field> Data Fields)</p> <p>The Data Fields are passed by reference, so changes can be made in Data Fields value directly by the implementation class, which will be recognized by the Workflow Engine.</p>

Field Name	Description
Return Parameter	<p>Select the Data Field that receives the return parameter of the Java function, from the drop-down list.</p> <ul style="list-style-type: none"> • For Execution Rule type, the business logic is implemented in the method and the parameter value returned from the Java method is saved in the mapped Data Field. • In the case of Selection Rule type, the Java method should be a String value. • In the case of the Decision Rule type, the Java method should return Boolean values “True/False”.
Scope	<p>Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.</p>

NOTE

The class and its dependent file (or jar) need to be available in the web container classpath.
 For example, <TOMCAT_HOME>/webapps/<context>/WEB-INF/lib/<forecast.jar>

4.4.5 Java External API Application Rule

This Application Rule is used to call Java External API in your process flow. You need to specify the Class Name and the method of the API.

Figure 16: Java External API Application Rule Details Window

The screenshot shows a web-based form for configuring an application rule. The form is titled 'Application Rule' and has a sub-header 'Fore Cast FCCM'. The fields are as follows:

- Name:** Fore Cast FCCM
- Rule Type:** Execution Rule (dropdown)
- Execution Type:** Java External API (dropdown)
- Class Name:** com.Forecast
- Method:** forecastFCCM
- Input Parameters:** INFODOM_CODE (with a close button 'x')
- Return Parameter:** STATUS (dropdown)
- Scope:** PROCESS (dropdown)

A green checkmark icon is located in the bottom right corner of the form area.

Table 7: Java External API Application Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.
Rule Type	Select the Rule Type from the drop-down list. The Java External API Application Rule can be used as a Decision Rule, Execution Rule, or Selection Rule based on your requirement.
Execution Type	Displays the Application Execution Type as JAVA External API.
Class Name	Enter the complete java class name that implements the Business Logic.
Method	Enter the method that you want to execute.
Input Parameters	You can pass Input Parameters for the method using Data Fields. Select the required Data Fields from the drop-down list.

Field Name	Description
Return Parameters	Select the Data Field that stores the Return Parameter of the method, from the drop-down list.
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.

NOTE

1. The class and its dependent file (or jar) need to be available in the web container classpath.
For example,
<TOMCAT_HOME>/webapps/<context>/WEB-INF/lib/<forecast.jar>
2. For details on the supported APIs for use as Java External APIs, see [Appendix B](#).

4.4.6 Outcome Rules Application Rule

Figure 16: Outcome Rule Details Window

The screenshot shows a web-based form titled "Application Rule" for configuring an "Outcome Approve" rule. The form includes the following fields:

- Name:** Outcome Approve
- Rule Type:** Decision Rule
- Execution Type:** Outcome Rules
- Outcomes:** (Empty dropdown)
- Scope:** PACKAGE

A green checkmark icon is located in the bottom right corner of the form area.

Table 8: Outcome Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.
Rule Type	Displays the rule type as Decision Rule. This Rule Execution type supports only the Decision Rule type.
Execution Type	Displays the Application Execution Type as Outcome.
Outcomes	Select the outcome for which you want to add the rule.
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.

4.4.7 Expression Application Rule

This is the same as the SQL execution type. You need to specify only the where clause in the Expression field. It can be any SQL expressions including 'AND' / 'OR'.

Figure 17: Expression Rule Details Window

The screenshot shows the 'Application Rule' configuration window. The title bar is red and contains the text 'Application Rule'. Below the title bar, there is a breadcrumb trail 'QTNR Batch Init Expr'. The main content area contains several form fields:

- Name:** QTNR Batch Init Expr
- Rule Type:** Decision Rule (dropdown menu)
- Execution Type:** Expressions (dropdown menu)
- Expression Type:** SQL (dropdown menu)
- Expression:** '{QTNR_RUN_EOD}'='RE'
- Return Parameter:** STATUS (dropdown menu)
- Scope:** PROCESS (dropdown menu)

A green checkmark icon is visible in the bottom right corner of the window, indicating that the rule has been successfully saved.

Table 9: Expression Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.
Rule Type	Select the Rule Type from the drop-down list. The Expression Application Rule can be used as a Decision Rule, Execution Rule, or Selection Rule based on your requirement.
Execution Type	Displays the Application Execution Type as Expression.
Expression Type	Select Expression Type as SQL to use SQL expressions or JSON to use JSON expressions.
Expression	Enter the expression in SQL format or JSON format.
Return Parameter	Select the Data Field that receives the return parameter of the Expression, from the drop-down list. <ul style="list-style-type: none"> • For Execution Rule type, the business logic is implemented in the method and the parameter value returned from the Application Rule is saved in the mapped Data Field. • In the case of Selection Rule type, the Application Rule should be a String value. • In the case of the Decision Rule type, the Application Rule should return Boolean values “True/False”.
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.

4.4.8 Rest Service Application Rule

This Application Rule is used to call any Rest services (internal or external) in your Process flow.

Table 10: Rest services Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.

Field Name	Description
Rule Type	Select the Rule Type from the drop-down list. This Application Rule can be used as a Decision Rule, Execution Rule, or Selection Rule based on your requirement.
Execution Type	Displays the Application Execution Type as Rest service.
Method Type	Select the method type from the drop-down list. The options are GET and POST .
URL	Enter the REST URL that needs to be called. For example, <IP Address/hostname of the Web Server >:<servlet port>/<context name>/restPMF/PMFService/startWorkflowProcess (A rest URL to start the workflow).
Authorization Type	Select the authorization type from the drop-down list. The options are: <ul style="list-style-type: none"> • No Auth- Select this option for the rest services that do not need an authorization header. • Basic Auth- Select this option if you want to authenticate the invocation of the Rest service.
Authorization	This field is displayed only if you have selected Basic Auth as Authorization Type . <ul style="list-style-type: none"> • In the case of OFSAA local user, enter the User ID only. • In the case of an external user, enter the base 64 encoded string. For more information, see Authentication of Rest Service. • In case this field is left blank, logged-in user credentials will be taken as authorization header. <p>Note: If Authorization is given in the Header explicitly, then it will take preference over the value given in the Authorization field.</p>
Query Param	Enter the Query Parameters that need to be passed to the Rest API. For example, http://example.com/foo?bar
Headers	Enter any headers that need to be passed to the Rest API. For example, "content-type": "application/json" To pass the header values dynamically, use the following format: {Content-Type:~~TYPE~~,Authorization:~~CREDENTIAL~~} Where TYPE and CREDENTIAL are data fields.
Data	Enter if any actual data that needs to be passed to the Rest API. Data can be of type RAW, JSON, Form Data, and so on. For example, "{\n \"objectid\": \"912\", \n \"objecttype\": \"1000\", \n \"infodom\": \"OFSCAPADQINFO\", \n \"segment\": \"OFSCAPADQINFO\", \n \"userid\": \"ORMUSER\", \n \"locale\": \"en_US\", \n \"securityMap\" : {}, \n \"applicationParams\" : {\n \"testparam\": \"value1\", \n \"testparam2\": \"value2\" \n } \n \n }

Field Name	Description
Return Parameter	<p>Select the Data Field which will receive the return parameter of the Expression, from the drop-down list.</p> <ul style="list-style-type: none"> For Execution Rule type, the business logic is implemented in the method and the parameter value returned from the Application Rule is saved in the mapped Data Field. In the case of Selection Rule type, the Application Rule should be a String value. In the case of the Decision Rule type, the Application Rule should return Boolean values "True/False".
Scope	Select the Scope as Process to use the Application Rule only in the current process or Package to use the Application Rule across all the processes in the package.
Is Proxy required	Select Yes if a proxy is required for the Rest Service. That is if the Rest API is outside OFSAA. For information on how to enable proxy, see Enabling Proxy for the REST Service Application Rule section.

4.4.8.1 Enabling Proxy for the REST Service Application Rule

This section explains how to configure the Proxy details if it is required for the Rest Service Application Rule.

Add the following entries in the AAI_WF_GLOBAL_SETTINGS table:

Table 11: AAI_WF_GLOBAL_SETTINGS Entries Table

V_PARAM_NAME	V_PARAM_VALUE	Description
PROXY_SERVER_IP	For example, www.proxy.myserver.com	Provide the IP address of the Proxy server.
PROXY_SERVER_PORT	For example, 80	Provide the port number of the Proxy server.

4.4.8.2 Authentication of Rest Service

Basic auth is supported for authentication of the rest service. You have to encode your username and password using the Online encoder (<https://www.base64encode.org/>) and add the encoded value in the **Authorization** field in the **Rule Details** window. The format of the user name and password to be entered in the online encoder should be username:password. For example, if we give DAVID_MLRO:oracle1, it is converted to "REFWSURfTUxSTzpvcmFjbGUx".

You can also add this as a parameter V_PARAM_1 in the AAI_WF_APPLICATION_API_B table. This needs to be entered as given in the following figure.

Figure 19: AAI_WF_APPLICATION_API_B table

```

SELECT * FROM aai_wf_application_api_t1 where v_app_api_name like 'CaseCreationServiceFwupcase';

SELECT * FROM aai_wf_application_api_b where v_app_api_id= '1549543937135';
--REFWSURfTuxSTzpvcmFjbGUx --{"username":"DAVID_MLRO","password":"oracle1"}

```

V_INPUT_PARAMS_MODE	V_SRC_LOCALE	V_HEADER_PARAMS	V_PARAM_1	V_PARAM_2	V_PARAM_3
1	en_US		REFWSURfTuxSTzpvcmFjbGUx

Table 12: Attribute Builder Description

Field Name	Description
Name	Enter a unique name for the Application Rule.

Field Name	Description
Rule Type	Displays the rule type as Decision Rule. This Rule Execution type supports only the Decision Rule type.
Execution Type	Displays the Application Execution Type as Attribute Expression.
Attribute	<p>Select the attribute for which you want to define the application rule, from the drop-down list. The list displays the attributes configured for the selected application and component. For more information, see Configuring Application Object Model (AOM) section.</p> <p>Click Add  to add values to the selected attributes. A row is added in the Attribute Values window. Click the Value column to select the values for the attribute from the drop-down. You can select one or more values.</p> <p>You can delete a row by clicking the  button.</p> <p>You can select multiple attributes and click Add to assign values to those attributes.</p>

4.4.10 Advanced Attribute Expression Application Rule

This is an advanced version of the Attribute Expression Application Rule with additional logical conditions and assignment operators. The expression can be dynamically built and returns a True or False value after evaluation. This is used as a Decision Rule in transitions.

You can define this application rule with multiple conditions and nested groups.

Figure 21: Advanced Attribute Expression Window

The screenshot shows the 'Advanced Attribute Expression' window for an application rule named 'Adv FCCMRule'. The window has a red header bar with the text 'Application Rule'. Below the header, the rule name 'Adv FCCMRule' is displayed. A text input field contains the name 'Adv FCCMRule'. Underneath, the 'Advanced Attribute Expression' section shows a blue box with the built expression: `((('WF_OUT_MSG' in (") OR ('WF_SVC_PROP_VALUE_2' <> (") OR ('WF_SVC_PROP_VALUE_3' = (") OR (('LOCALE' = (") AND ()))`. Below this, there is a visual builder interface with a dropdown menu set to 'OR', and three rows of conditions. Each row has a 'Condition' label and a trash icon. The first row shows 'WF_OUT_MSG' with an 'in' operator. The second row shows 'WF_SVC_PROP_VALUE_2' with a '<>' operator. The third row shows 'WF_SVC_PROP_VALUE_3' with an '=' operator. A green checkmark icon is visible in the bottom right corner of the window.

Table 13: Advanced Attribute Expression Description

Field Name	Description
Rule Name	Enter a unique name for the Application Rule.
AND/ OR	Select the logical operator to be used for the conditions in a group.
Add Condition	<p>When you click Add Condition, a new row gets added. To define a condition, select the attribute, the operator, and the value from the drop-down lists. Multiple values can be selected for each attribute.</p> <ul style="list-style-type: none"> • Attribute- The drop-down list displays the attributes configured for the selected application and component. For more information, see Configuring Application Object Model (AOM) section. • Operator- Available options are in,=,<>,<,<=,>,>=. • Value- Displays the values configured for the selected attributes. Select the required value. <p>Click Remove Condition to delete an already added condition.</p>

Field Name	Description
Add Group	Click Add Group if you want to have nested conditions. For each group, select the required logical operator as AND or OR. Click Remove Group to delete a group of conditions.

4.4.11 JSON Path Expression Application Rule

This Application rule is used to extract data from the JSON Path Expression, which gets returned from a Rest API or Web Service call, and you can store it into a Data Field for further processing.

Figure 22: JSON Path Expression Rule Details Window

The screenshot shows a configuration window for an 'Application Rule' named 'Get User ID'. The fields are as follows:

- Name:** Get User ID
- Rule Type:** Execution Rule
- Execution Type:** JSON Path Expression
- JSON Input:** User ID
- JSON Path Expression:** \$..UserUniqueID
- Output Datafield:** TASK_RESPONSE
- Scope:** PROCESS
- Convert to Type:** JSON ARRAY

Table 14: JSON Path Expression Rule Details Description

Name	Enter a unique name for the Application Rule.

Field Name	Description
Rule Type	Select the rule type from the drop-down list. The available rule types are Decision Rule and Execution Rule. For Decision Rule, the output of JSON Path Expression is compared with RHS expression, and the rule returns as either true or false accordingly. For execution rule, JSON Path Expression is evaluated and the output is returned to the DataField selected as Output DataField.
Execution Type	Displays the Application Execution Type as JSON Path Expression.
JSON Input	Select the Data Field in which the output of Web Service is stored from the drop-down list. You should select a DataField which has JSON as its value.
JSON Path Expression	Enter the JSON path expression. For more information, see the JsonPath Expressions section.
Operator	This field is displayed only if Rule Type is selected as Decision Rule. Select the required operator for comparison from the drop-down list. The options are =,<,>,>= and <=.
RHS Expression	This field is displayed only if Rule Type is selected as Decision Rule. Enter the expression to which you want to compare the JSON path expression.
Output DataField	This field is displayed only if Rule Type is selected as Execution Rule. Select the DataField to which you want to return the value of JSON Path Expression, from the drop-down list.
Scope	Select the scope of the Application Rule from the drop-down list. The options are: <ul style="list-style-type: none"> • Process- Select Process if you want to use the Application Rule only in the current process. • Package- Select Package if you want to use the Application Rule across all the processes in the application package.
Convert To Type	Select JSON ARRAY to store the output in Array format or select String to store as a string, from the drop-down list.

4.4.12 JSON Read From DB Application Rule

This Application Rule is used to read data from the database in JSON format.

Figure 23: JSON Read from DB Rule Details Window

The screenshot shows a configuration window titled 'Application Rule' with a sub-header 'Read DB Data'. The fields are as follows:

- Name:** Read DB Data
- Rule Type:** Execution Rule
- Execution Type:** JSON Read From DB
- Table name:** DIM_ACCOUNT
- Column List:** N_ACCT_SKEY Account_ID,v_account_desc Account_Narrative
- Where Condition:** V_PROD_CODE='FCCM'
- Return JSON Type:** JSON Array
- Output Datafield:** EventCode
- Scope:** PROCESS

A green checkmark is visible in the bottom right corner of the window.

Table 15: JSON Read from DB Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.
Rule Type	Only the Execution Rule type is supported.
Execution Type	Displays the Execution Type as JSON Read From DB.
Table Name	Enter the table name from which you want to read the data.
Column List	Enter the column names of the selected table.
Where Condition	Enter the filter condition (where clause) of the SQL query.
Return JSON Type	Select the JSON type of the returned value as JSON Object or JSON Array based on your requirement. <ul style="list-style-type: none"> JSON Object- Select this option if the returned value is a single row. JSON Array- Select this option if the returned data has multiple rows.

Field Name	Description
Output DataField	Select the DataField to which you want to return the value of the SQL query, from the drop-down list.
Scope	Select the scope of the Application Rule from the drop-down list. The options are: <ul style="list-style-type: none"> • Process- Select Process if you want to use the Application Rule only in the current process. • Package- Select Package if you want to use the Application Rule across all the processes in the application package.

4.4.13 JSON Write To DB Application Rule

This Application Rule is used to write the data in JSON format into the database.

Figure 24: JSON Write to DB Rule Details Window

Table 16: JSON Write to DB Rule Details Description

Field Name	Description
Name	Enter a unique name for the Application Rule.

Field Name	Description
Rule Type	Only the Execution Rule type is supported.
Execution Type	Displays the Execution Type as JSON Write To DB.
Table Name	Enter the table name to which you want to write the data in JSON format.
Source JSON	Enter the data in the JSON format that you want to write to the database.
Output DataField	This field is not applicable.
Scope	Select the scope of the Application Rule from the drop-down list. The options are: <ul style="list-style-type: none"> • Process- Select Process if you want to use the Application Rule only in the current process. • Package- Select Package if you want to use the Application Rule across all the processes in the application package.

4.5 Configuring Application Object Model (AOM)

This module helps in creating a set of attributes for a given application abstractly so that frameworks like PMF and other modules can leverage to retrieve application attributes and their values.

Each application is identified using an application package ID. For configuring package IDs, see the [Application Package](#) section.

Against each package id, the set of attributes needs to be seeded in the “AAI_AOM_APP_COMP_ATTR_MAPPING” table.

4.5.1 AAI_AOM_APP_COMP_ATTR_MAPPING Table

In this table, make entries for each attribute as given in the following table:

Table 17: AAI_AOM_APP_COMP_ATTR_MAPPING Table Description

Column Name	Description
APP_COMP_ATTR_MAP_ID	Enter a unique ID for the attribute. You need to enter the Attribute name and description for each attribute ID entered here in the AAI_AOM_APP_COMP_ATTR_TL table. See the AAI_AOM_APP_COMP_ATTR_TL Table section.
V_ATTR_CODE	Name of the attribute.
N_ATTR_TYPE_ID	The ID of the attribute type. The values of the attributes are fetched based on the attribute type. 1001- Static

Column Name	Description
	1002- SQL Query 1003- JavaAPI 1004- Hierarchy 1005- Multi-Select Hierarchy 103- Date field 102- Text box field For more information, see Attribute Types .
V_ATTRIBUTE_VALUE1 V_ATTRIBUTE_VALUE2	Values to be fetched for the attribute. Based on the attribute type, you need to pass the values.
N_APP_ID	Application code for which the current attribute is configured. For example, if you are configuring Run execution parameters for the IFRS application, enter the application ID of IFRS here.
N_COMP_ID	Component code for which the attribute is configured.
V_UDP_CODE	Special property used by applications (user-defined). For example, 'GET_STATUS' –to get the status for the workflow.
V_ATTR_CONTROL_TYPE	Enter the Control type ID to be used for the attribute. For example, 3 is used for drop-down list, 7 for textbox, 11 for date control, 41 is for hierarchy, and 42 for Multi-Select hierarchy

4.5.2 Example for Run Pipeline

The following figure shows an example of entries in the AAI_AOM_APP_COMP_ATTR_MAPPING table for Run Pipeline:

Figure 25: AAI_AOM_APP_COMP_ATTR_MAPPING table

APP_COMP_ATTR_MAP_ID	N_ATTRIB	V_ATTR_CODE	N_ATTR_TYPE_ID	V_ATTRIBUTE_VALUE1	V_ATTRIBU	N_APP_ID	N_COMP_ID	V_UDP_CODE	V_ATTR_CONTROL_TY
134	LE	1004	HLLFP029	...	DFS_LLFP	-1	...	GET_RUN_PARAMS	41
135	CONSOTYPE	1001	1	...	DFS_LLFP	-1	...	GET_RUN_PARAMS	3
136	RCY	1004	HLLFP026	...	DFS_LLFP	-1	...	GET_RUN_PARAMS	41
137	STAGEDETERUN	1001	4	...	DFS_LLFP	-1	...	GET_RUN_PARAMS	7
138	FIC_MIS_DATE	103	DFS_LLFP	-1	...	GET_RUN_PARAMS	11
139	V_RUN_MAIN_DESC	102	DFS_LLFP	-1	...	GET_RUN_PARAMS	7

4.5.3 Attribute Types

The values of attributes are fetched based on the attribute types. Following are the attribute types with their IDs:

- **1001 (Static)** - Store attribute values in the AAI_AOM_STATIC and AAI_AOM_STATIC_TL tables.
- **1002 (Query)** - Enter the SQL query in V_ATTRIBUTE_VALUE1 in the AAI_AOM_APP_COMP_ATTR_MAPPING table, which has to be fired to fetch the attribute values.

- **1003 (JavaAPI)** – Enter the method that is configured for V_ATTRIBUTE_VALUE1 for the required attribute. The configured method in the classpath is invoked to get the attribute values in this case.
- **1004 (Hierarchy)** – Specify the Hierarchy code to be fetched in V_ATTRIBUTE_VALUE1 in the AAI_AOM_APP_COMP_ATTR_MAPPING table.
- **1005 (Multi Select Hierarchy)** – Specify the Multi Select Hierarchy entries in the AAI_AOM_APP_COMP_ATTR_TL table.
- **103 (DATE)** - This is used for configuring FIC_MIS_DATE. The V_ATTR_CONTROL_TYPE value should be 11.
- **102 (Text Box)** - This is used for the Description field. The V_ATTR_CONTROL_TYPE value should be 7.

4.5.4 AAI_AOM_APP_COMP_ATTR_TL Table

In this table, for each APP_COMP_ATTR_MAP_ID table, enter the locale-specific Attribute Name, Description as shown:

Figure 26: APP_COMP_ATTR_MAP_ID table

	APP_COMP_ATTR_MAP_ID	V_ATTR_NAME	V_ATTR_DESC	V_LOCALE_CODE
1	134	Legal Entity	Legal Entity	en_US
2	135	Consolidation Type	Consolidation Type	en_US
3	136	Reporting Currency	Reporting Currency	en_US
4	137	Bucket Conversion	Bucket Conversion	en_US
5	138	Interpolation Method	Interpolation Method	en_US
6	139	PD Interpolation Method	PD Interpolation Method	en_US
7	140	Source Run Id	Source Run Id	en_US
8	141	FIC MIS Date	FIC MIS Date	en_US
9	142	Run Execution Description	Run Execution Description	en_US

4.5.5 Usage of AOM Attributes in Run Pipeline

While executing the Run pipeline, the Select Run Params window displays the AOM fields that are marked as mandatory.

For example, for the attributes stored in APP_COMP_ATTR_MAP_ID table as shown in the previous figure, the Select Run Params window is displayed as shown:

Figure 27: Select Run Params window

The screenshot shows a window titled "Select Run Params" with a close button (X) in the top right corner. The window contains the following fields and controls:

- TASK_STATUS**: A text input field with a question mark icon.
- Bucket Conversion**: A dropdown menu with "Mid of Bucket" selected and a downward arrow.
- PD Interpolation Method**: A dropdown menu with "Non-Linear Geometric" selected and a downward arrow, with a question mark icon below the label.
- Interpolation Method**: A dropdown menu with "Cubic Spline" selected and a downward arrow, with a question mark icon below the label.
- FIC MIS Date**: A date input field with the placeholder "mm/dd/yy" and a calendar icon.
- Consolidation Type**: A dropdown menu with "Solo" selected and a downward arrow, with a question mark icon below the label.
- Source Run Id**: A text input field with a question mark icon.
- Legal Entity**: A text input field with a question mark icon and a refresh icon.
- Reporting Currency**: A text input field with a question mark icon and a refresh icon.
- Run Execution Description**: A text input field with a question mark icon.

An "OK" button is located at the bottom center of the window.

5 Design a Pipeline

Business pipelines are defined in OFSAA to design and execute the sequence of tasks that are either OFSAA tasks or external tasks, to derive a well-defined outcome. This flow is defined by using various OFSAA artifacts from the component toolbar.

Using Process Modeller, we can perform as follows:

1. Orchestrate a Business pipeline.
2. Orchestrate a Run pipeline using PMF modeling.
3. Perform Additional Functionalities

Topics:

- [Orchestrate a Business Pipeline](#)
- [Run Pipeline](#)
- [Additional Functionalities](#)

5.1 Orchestrate a Business Pipeline

A business Pipeline is used to design a Business Process that consists of a sequence of tasks either internal or external tasks through well-defined interfaces. Using the designer, you can design the entire business flows consisting of various types of tasks or another business pipeline.

5.1.1 An Example of a Business Pipeline

Figure 28: Business Pipeline Example

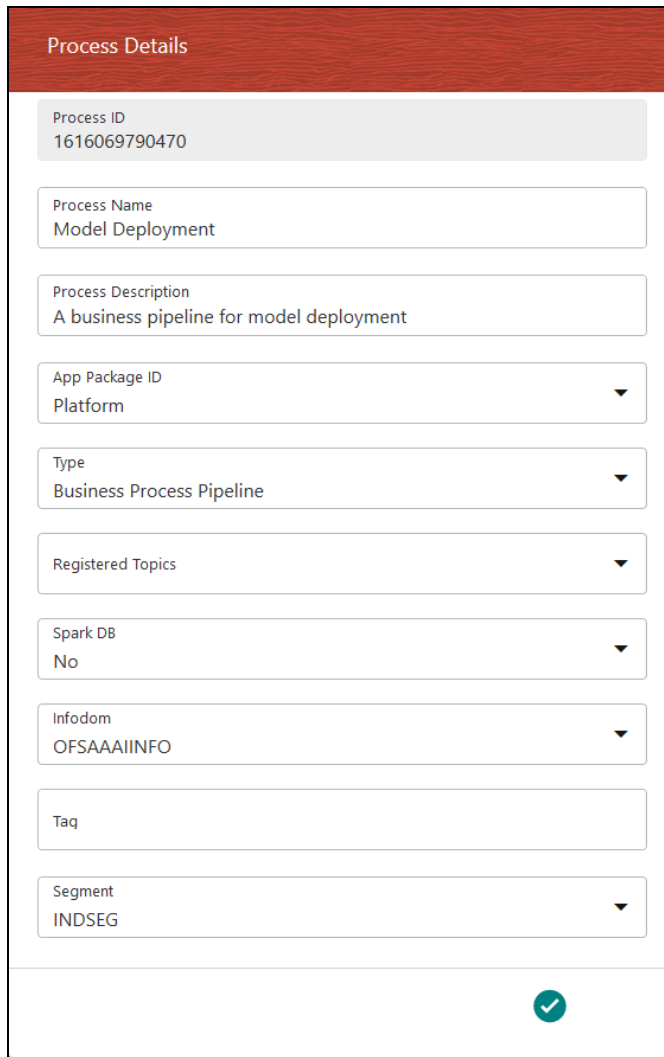

In the example shown, we use various activities such as Human Tasks and Service tasks, which are related to each other through transitions. For executing tasks in parallel, we use Parallel Gateways.

5.1.2 Creating a Business Pipeline

Click  in the **Process Modeller** Summary window.

Figure 29: Process Details window to create a Business Pipeline

The screenshot shows the 'Process Details' window with the following fields and values:

- Process ID: 1616069790470
- Process Name: Model Deployment
- Process Description: A business pipeline for model deployment
- App Package ID: Platform
- Type: Business Process Pipeline
- Registered Topics: (empty)
- Spark DB: No
- Infodom: OFSAAIINFO
- Tag: (empty)
- Segment: INDSEG

1. Enter a unique Process Name and a description. The system creates the unique Process ID.
2. Select the appropriate app package in which you want to create the process. For more information, see [Application Package](#).
3. Select **Business Process Pipeline** from the **Type** drop-down list.
4. Select the information domain in which you want to create the Business Pipeline, from the **Infodom** drop-down list. The list displays all the Infodoms that are mapped to the applications configured in your OFSAA instance.
5. Click the **Accept**  icon to save it. The Process Flow canvas is displayed.

Figure 30: Process Flow Canvas

6. By default,  **START** from the toolbar appears. This Start activity indicates the beginning of the Process.
7. Design your Process with various components available in the **Process Flow** tab. For more information on each component, see the [Components for Designing Your Process Flow](#) section.

5.2 Run Pipeline

A Run Process is used to create a Run definition in Rule Run Framework (RRF) using PMF Process. Visual representation of the Run is enabled through PMF by the construction of a Run Pipeline. Various Widgets that enable the construction of a Run Pipeline are available in the Component toolbar.

5.2.1 An Example of Run Pipeline

Figure 31: Run Pipeline Example

5.2.2 Creating a Run Pipeline

8. Seed AOM Data Fields. For more information, see [Configuring Application Object Model \(AOM\)](#) section.
9. Click  in the **Process Modeller** Summary window.

Figure 32: Process Details Window to Create a Run Pipeline

Process Details

Process ID
1616153586694

Process Name
Run Process for 2 Way

Process Description
A run pipeline for weekly consolidation tasks

App Package ID
Platform

Type
Run Pipeline

Registered Topics

Spark DB
No

Infodom
OFSAAIINFO

Tag

Segment
ORECSEG

10. Enter a Process Name and a description. The Process ID is a system-generated unique value.
11. Select the appropriate app package in which you want to create the process. For more information, see the [Application Package](#) section.
12. Select **Run Pipeline** from the **Type** drop-down list.
13. Select the information domain in which you want to create the Run Process, from the **Infodom** drop-down list. The list displays all the Infodoms that are mapped to the applications configured in your OFSAA instance.
14. Click the **Accept**  icon to save it. The Process Flow canvas is displayed.
15. By default,  **START** from the toolbar appears. This Start activity indicates the beginning of the Process.

5.2.3 Design your Run Pipeline using Widgets

You can construct a Run pipeline using only Widgets.

For details, see [Configuring OFSAA Tasks in Your Process Flow](#).

5.2.4 Design your Run Pipeline using Sub Pipeline

You can construct Run Pipeline using already constructed pipelines. The same pipeline can be used across different Run pipelines.

For more information, see the [Calling another Pipeline from Your Parent Pipeline](#) section.

5.2.5 Design your Run Pipeline using combinations of Widgets and Sub Pipeline

You can construct Run pipeline by combining Widgets, and Sub pipeline.

5.2.6 Applying Filter Condition on Run Pipeline

This section details how to apply filter conditions at the Run Pipeline level. You can apply filter conditions on the Sub Pipeline level also.

For more information, see [Calling another Pipeline from Your Parent Pipeline](#).

To apply a filter on a Run Pipeline

1. From the **Process Modeller Summary** window, click the  submenu icon corresponding to the Run Pipeline for which you want to apply filter condition and click **Filter**. The **Filter Details** window is displayed.

Figure 33: Filter Details Window

The screenshot shows a window titled "Filter" with a red header. It contains two dropdown menus: "Filter Type" (set to "Hierarchy") and "Filter List" (set to "User Group Hierarchy"). A green plus icon is next to the "Filter List" dropdown. Below these is a red button labeled "US" and a section titled "Hierarchy Filter Details" with the text "User Group Hierarchy". To the right of this section are two icons: an orange square with a white checkmark and a red trash can icon. A green checkmark icon is located at the bottom right of the window.

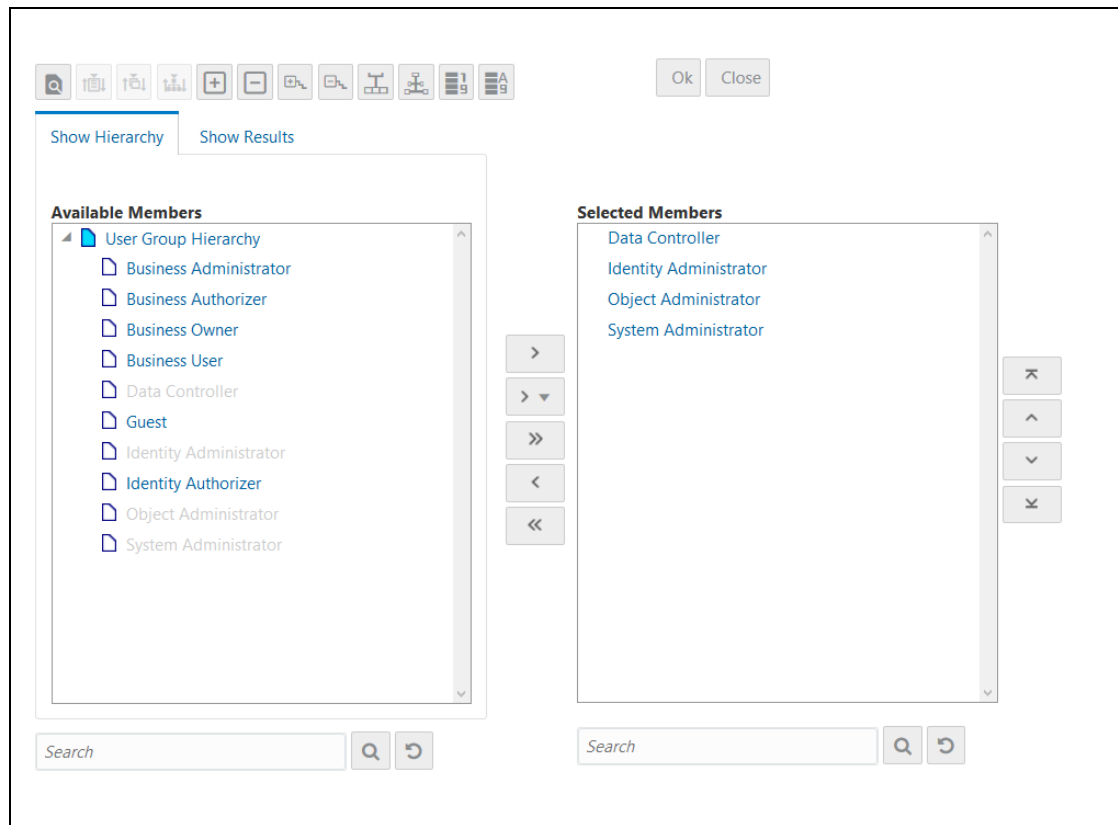

2. Select the **Filter Type** as **Hierarchy** from the drop-down list. Currently, only Hierarchy Filter is supported.
3. Select the Filter from the **Filter List** drop-down list. This list displays all Business Hierarchies defined in the information domain.
4. Click **Add Filter**. The Filter is displayed under the **Hierarchy Filter Details** window.
5. Click  to view the **Hierarchy Browser** window and select the hierarchy members.

Figure 34: Hierarchy Browser Window

6. Select a member/node and click  to select the same. Click  to select the member as Self, Self Children, Parent, Siblings, and Children.

For more information, see [Hierarchical Member Selection Modes](#).

In the **Hierarchy Browser** window you can also:

- Click  to sort members based on the path.
- Click  to sort hierarchy (top to bottom).
- Click  to sort based on level.
- Click  or  to expand or collapse the members under a node.
- Click  or  to expand a branch or collapse the selected branch.
- Click  to focus only on the selected branch. The **Available Values** pane shows the members of the selected branch only. Click  to go back to normal view.
- Click  to display member's numeric codes in the right. The icon changes to .
- Click  to display member's numeric codes on the left. The icon changes to .

- Click  to show only member names. This is the default view. The icon changes to .
 - Click  to display member's alphanumeric codes in the right. The icon changes to .
 - Click  to display member's alphanumeric codes on the left. The icon changes to .
 - Click  to display only member names. This is the default view. The icon changes to .
 - Select a member and click  or  to re-arrange the members in the **Selected Values** pane.
 - Select a member and click  to move it to the top or click  to move it to the bottom.
 - Click  to launch the Search panel. Here you can search based on **Dimension Member Numeric Code**, **Dimension Member Name**, or **Dimension Member Alphanumeric Code**. You can also search in the grid based on member name using the **Search** field.
7. Click **OK** to save.
 8. Click  to remove any selected filters.

5.2.6.1 Hierarchical Member Selection Modes

To aid the selection process, certain standard modes are offered through a drop-down. The available modes are **Self**, **Self Children**, **Parent**, **Siblings**, and **Children**.

Based on the hierarchy member security applied, the nodes/members of the hierarchy are displayed in enabled or disabled mode. The members that are in enabled mode only can be selected. That is, the members that are mapped to your user group only can be selected. For example, if you choose **Self Children**, the immediate children of the selected hierarchy that are mapped to your user group only will be moved to the selected pane.

- The **Self** mode is the default mode displayed. In this mode, only the specific member selected in the available pane is selected on the selected pane.
- Choose the **Self Children** mode when you want a specific member and only its immediate children to be selected onto the selected pane.
- Choose the **Parent** mode when you want to select only the parent member of a selected member onto the selected pane.
- Choose the **Siblings** mode when you want to select all the sibling members of the selected member (those members under the same parent) onto the selected pane.
- Choose the **Children** mode when you want only the immediate children of a specific member to be selected onto the selected pane mode.

You can also click  to select all the members to the **Selected Values** pane. Click  to deselect a selected member from the **Selected Values** pane or click  to deselect all the members.

5.2.7 Executing Run Pipeline

You can execute a Run Pipeline using the following options:

- [From UI](#)
- [Using Command Line Utility](#)
- [Using ICC Batch](#)

5.2.7.1 From UI

To execute Run Pipeline from UI:

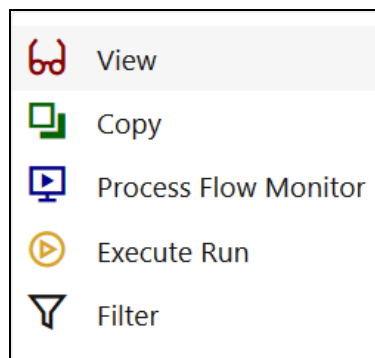

1. From the **Process Modeller Summary** window, click the  submenu icon corresponding to the Run Pipeline you want to execute:

Figure 35: Sub-menu corresponding to the Run Pipeline

2. Click **Execute Run** to execute the Run Pipeline. The **Select Run Params** window is displayed.

Figure 36: Select Run Params window

The screenshot shows a dialog box titled "Select Run Params" with a close button (X) in the top right corner. The dialog contains the following fields and values:

- Bucket Conversion**: Mid of Bucket
- PD Interpolation Method**: Non-Linear Geometric
- Interpolation Method**: Cubic Spline
- FIC MIS Date**: 10/17/18
- Consolidation Type**: Solo
- Source Run Id**: (empty)
- Legal Entity**: Bank of Australia
- Reporting Currency**: Afghanistan Afghani
- Run Execution Description**: (empty)

An "OK" button is located at the bottom center of the dialog.

3. Select values for the Run Parameters and click **OK**.

The execution of the Run Pipeline is triggered using the selected FIC MIS DATE. The RUNSKEY is generated and inserted into the "DIM_RUN" table. For the RUNSKEY generated, the corresponding user-selected parameters are inserted into the "RUN_EXE_PARAMETERS" table.

5.2.7.2 Using Command Line Utility

A command line utility `./wfExecExternal.sh` is available in `$FIC_DB_HOME/bin` folder.

To execute Run Pipeline using the command line utility

1. Navigate to `$FIC_DB_HOME/bin` folder.
2. Execute the script file using the following command:

```
./wfExecExternal.sh processInstanceId processId '$objectId' objectType
infodom userID segment locale 'applicationparams' 'securityparams'
```

- `processInstanceId` - Instance Id of the Process or Run Pipeline
- `processId` - Process ID of the Run Pipeline. This is a mandatory parameter.
- `objectId` - This is an auto-generated unique Object ID. Enter '`$objectId`' as mandatory parameter value.
- `objectType` - Specify the Object Type if it is defined in the `aai_wf_app_definition_map` table.

- `infodom` - Information Domain Name
- `userID` - Specify the user ID
- `segment` - Segment Name
- `locale` - Locale selected. For example, `en_US`
- `'applicationparams'` - Specify values for the Run execution parameters stored in `APP_COMP_ATTR_MAP_ID` within single quotes separated by a comma.
- `'securityparams'` - Specify any security parameters within single quotes separated by comma

For example:

```
./wfExecExternal.sh null '$objectId' CECLShellLatest null OFSIFRSINFO
OFSIFRSINFO AAIUSER en_US
"hierDetailsLE":[{"hierValueCode":"AU","value":"Bank of
Australia","hierNodeCode":"[HLLFP029].[0].[AU]","leafCondition":"CASE
WHEN DIM_ORG_STRUCTURE.f_latest_record_indicator = 'Y' THEN
DIM_ORG_STRUCTURE.v_entity_code_END='AU',"hierNodeDesc":"Bank of
Australia"}], "CONSOTYPE":"S", "hierDetailsRCY":[{"hierValueCode":"DZD", "
value":"Algerian
Dinar","hierNodeCode":"[HLLFP026].[DZD]","leafCondition":"DIM_CURRENCY.
v_iso_currency_cd = 'DZD',"hierNodeDesc":"Algerian
Dinar"}], "FIC_MIS_DATE":"2019-04-19", "V_RUN_MAIN_DESC":"Test"}' null
```

TIP Null needs to be passed if you do not want to pass a value for a parameter.

5.2.7.3 Using ICC Batch

To execute a Run Pipeline from the **Operations** menu as an ICC batch, the

`./pipelineExecutor.sh` script file is made available in the `$FIC_DB_HOME/bin` directory. You must enter the specified parameters in the `./pipelineExecutor.sh` file required for **Run Pipeline** execution and then create an ICC Batch to call this script file through the Run Executable component.

To update the parameters in the `./pipelineExecutor.sh` script file for Run Pipeline execution, follow these steps:

1. Navigate to the `$FIC_DB_HOME/bin` directory.
2. Update the script file by modifying the values that are enclosed within the `##` symbols. The following is an example for the format:

```
pmfscriptexe="./wfExecExternal.sh null '##PROCESS_NAME##' $objectId
null '##INFODOM##' '##SEGMENT##' '##USER##' en_US '{##EXECUTION PARAM
JSON##, \"FIC_MIS_DATE\": \"${datevar}\"}' null"
```

The following list provides descriptions of the script file parameters:

- `Process_Name` - Enter the process name of the Run Pipeline. This is a required parameter.

- `$objectId` - This is an auto-generated unique Object ID that you must not modify. Retain `$objectId` in the script as this mandatory parameter is created by the PMF application during the execution of the Run Pipeline.
- `INFODOM` - Enter the Information Domain name here.
- `SEGMENT`- Enter the Segment name here.
- `USER` - Enter the user ID here.
- `locale` - Modify the locale as required. For example, for English-United States, enter `en_US`.
- `EXECUTION PARAM JSON` - Enter the Run Execution parameters in JSON format.

The following code snippet is an example:

```
{
  "hierDetailsLE": [
    {
      "hierValueCode": "ORG_NAME",
      "value": "ORG_NAME",
      "hierNodeCode": "ORG_NAME",
      "leafCondition": "CASE WHEN DIM_ORG_STRUCTURE.f_latest_record_indicator = 'Y' THEN DIM_ORG_STRUCTURE.v_entity_code END='ORG_NAME'",
      "hierNodeDesc": "ORG_NAME",
      "CONSOTYPE": "SOL O",
      "hierDetailsRCY": [
        {
          "hierValueCode": "INR",
          "value": "Indian Rupee",
          "hierNodeCode": "INR",
          "leafCondition": "DIM_CURRENCY.v_iso_currency_cd = 'INR'",
          "hierNodeDesc": "Indian Rupee"
        }
      ],
      "hierDetailsUDRS": [
        {
          "hierValueCode": "BISNONSECSTD-SETUP1",
          "value": "BIS Non Sec STD - Setup 1",
          "hierNodeCode": "BISNONSECSTD-SETUP1",
          "leafCondition": "USR_DEFINED_RUN_PARAMETERS.V_RUN_PARAMETER_SETUP_CODE = 'BISNONSECSTD-SETUP1'",
          "hierNodeDesc": "BIS Non Sec STD - Setup 1"
        }
      ],
      "FIC_MIS_DATE": "$datevar",
      "V_RUN_MAIN_DESC": "RUN MARCH 09"
    }
  ]
}
```

- `$datevar` - Retain `$datevar` variable in the execution param JSON specified in the preceding list without any modification as this gets replaced by the `FIC_MIS_DATE` selected during batch execution as the date value for the Run execution.
3. Create a new batch in the **Batch Maintenance** window in the **Operations** menu. For more information, see the **Adding Batch Definition** section in the [OFS Analytical Applications Infrastructure User Guide](#).
 4. Create a new task with the **Run Executable** task component. For more information, see the **Adding Task Details** section in the [OFS Analytical Applications Infrastructure User Guide](#).

Figure 37: Call pipelineExecutor.sh in the Executable Field

The screenshot shows a configuration window for a task. At the top right are buttons for 'Save', 'Reset', and 'Close'. Below is a 'Task Definition' section with fields for 'Task ID' (containing 'Task1') and 'Description'. A 'Components' dropdown is set to 'RUN EXECUTABLE'. Below this is a 'Dynamic Parameters List' table:

Property	Value
Datastore Type	EDW
Datastore Name	SAMPLEAPP
Primary IP For Runtime Processes	[Redacted]
Executable	pipelineExecutor.sh
Wait	Y
Batch Parameter	Y
Optional Parameters	

- Call the `pipelineExecutor.sh` script file in the **Executable** field.
 - Select **Y** in the **Batch Parameter** drop-down list for all cases.
 - Select **Y** in the **Wait** drop-down list if you want the Run executable to wait to finish the task execution and then update the task status.
5. Click **Save** to execute the Batch.
 6. Schedule a batch through the **Batch Scheduler** window in the **Operations** menu or schedule and execute the batch through the External Scheduler (ESIC).
For more information, see the **Batch Scheduler** and **External Scheduler Interface Component** sections in the [OFS Analytical Applications Infrastructure User Guide](#).

5.2.8 Abort Run Pipeline

The Abort feature facilitates you to abort a Run Pipeline that is in the process of execution.

To abort a Run Pipeline

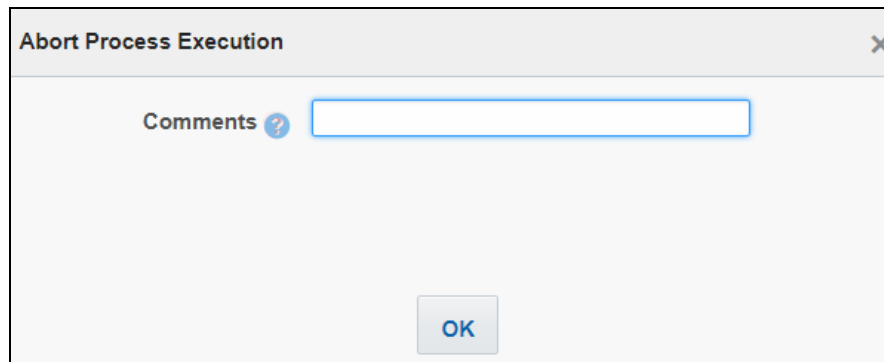

1. From the **Process Monitor** window, click the  submenu icon corresponding to the Run Pipeline you want to abort and click **Abort**.

Figure 38: Abort Process Execution window

2. Enter comments if any, for aborting the Run Pipeline execution.

5.2.9 Resume Run Pipeline

You can resume a Run Pipeline which has not been executed successfully or which has been explicitly interrupted, or canceled, or put on hold during the execution process. By resuming a Run Pipeline, you can continue its execution directly from the point of interruption or failure and complete executing the remaining tasks.

To resume a Run Pipeline

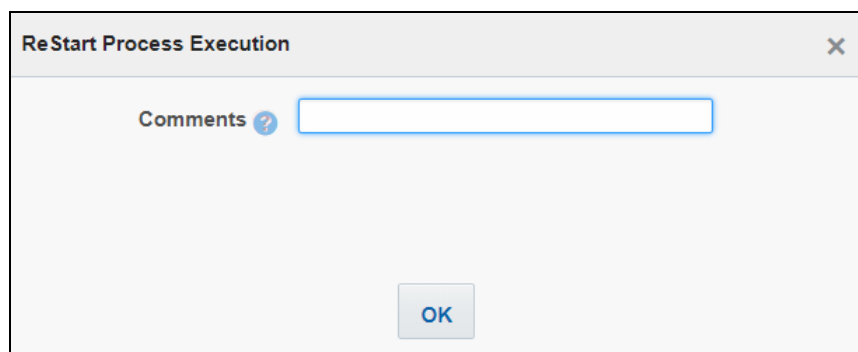

1. From the **Process Monitor** window, click the  submenu icon corresponding to the Run Pipeline you want to resume and click **Resume**.

Figure 39: Re-Start Process Execution window

2. Enter comments if any, for restarting the Run Pipeline execution.

5.2.10 Re-run Run Pipeline

You can re-run a Run Pipeline that was previously executed, irrespective of the previous execution state.

To re-run a Run Pipeline

1. From the **Process Monitor** window, click the  submenu icon corresponding to the Run Pipeline you want to re-run and click **Re-Run**.

Figure 40: Re-Run Process Execution window

2. Enter comments if any, for re-running the Run Pipeline execution.

5.3 Additional Functionalities

This section describes the additional functionalities that can be performed in the **Process Modeler** window.

Topics:

- [Modifying a Pipeline](#)
- [Viewing a Pipeline](#)
- [Copying a Pipeline](#)
- [Deleting a Pipeline](#)

5.3.1 Modifying a Pipeline

This option allows you to modify a Pipeline.

To modify a Pipeline perform the following:

1. From the **Process Modeler** window, search for the Pipeline and click the Pipeline name. The **Process Flow** tab is displayed.
2. Modify the Process Flow, Definition, Application Rules, and Data Fields as required.

NOTE

When you try to delete a component in the Business Pipeline that is used as a Sub Pipeline, a confirmation message is displayed.

After you click **OK** to confirm the deletion, an alert is displayed with the list of the Business Pipelines where the Sub Pipeline is used.

You should click **OK** again to delete the component.

5.3.2 Viewing a Pipeline

This option allows you to view the workflow of an already existing Business Process.

From the **Process Modeler** window, click  to view the sub-menu and select **View**. You can view the Process Flow of the Pipeline.

5.3.3 Copying a Pipeline

This option facilitates you to quickly create a new Business Process based on an existing Process by updating the Process flow or other required details.

To copy a Business Process

1. From the **Process Modeller** window, click the  submenu icon to view the sub-menu and select **Copy**. The **Process Details** window is displayed.
2. Enter a unique **Process ID**, **Process Name**, and **Process Description**. If you select the same App Package ID, then Data Fields and Application Rules are also copied.
3. Select the newly created Process and click the Process Name. Modify the Process flow and other details if required.

5.3.4 Deleting a Pipeline

This option allows you to delete a Business Pipeline or Run Pipeline.

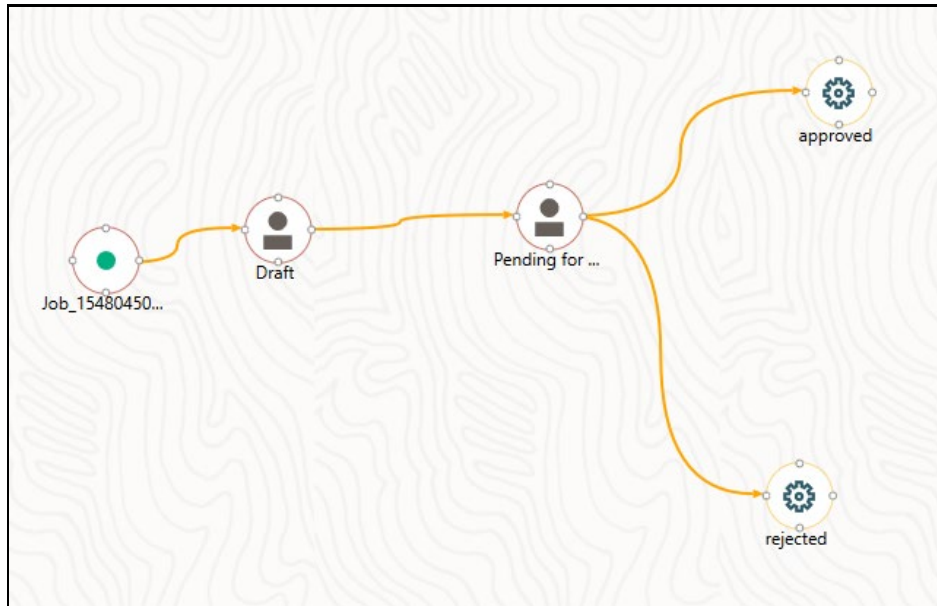

To delete a Pipeline perform the following:

1. From the **Process Modeller** window, click the  icon corresponding to the Pipeline you want to delete.
2. A confirmation message is displayed.
3. Click  **Accept** to confirm the deletion. If this Pipeline is used as a Sub Pipeline in other Business Pipelines, an alert is displayed with the list of Business Pipelines where this is used.
4. Click **Delete Anyway** to delete the Pipeline or click **Cancel** to cancel the delete operation.

6 Human Tasks

Human Task is used if an activity requires a human intervention to go to the next activity.

Figure 42: Human Tasks Flow

Topics:

- [How to Use Human Task](#)
- [Additional Functionalities for Human Tasks](#)

6.1 How to Use Human Task

1. In the **Process Flow** window, select the  Human Task icon from **Activity** in the toolbar and Drag and drop it on the drawing canvas where you want to place it.
2. Double-click the  icon on the canvas to display the **Activity** window is displayed.

6.1.1 Activity Window

Figure 43: Activity Tab

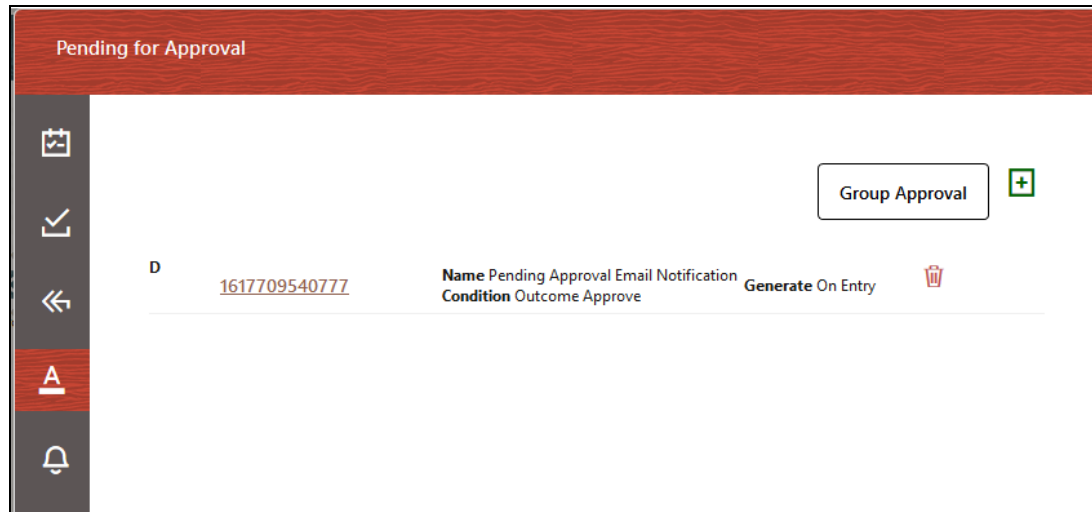

1. Enter Activity Name and Description.
Mouse over the ? icon to view the **Activity ID**.
2. Select the **Status** of the activity from the drop-down list. The list displays the seeded values in the AAI_WF_STATUS_B table.

6.1.2 Action Window to Create Tasks and Notifications

Action or Task is used to inform the assigned user about an action to be completed in the current stage of Workflow. You can add multiple tasks for an activity. A task can be assigned to a user, user group, users with a particular role, or users selected by an application rule. The task is sent to the Application Inbox of the assigned users.

1. Click the  Action icon to define Actions in the Action window.

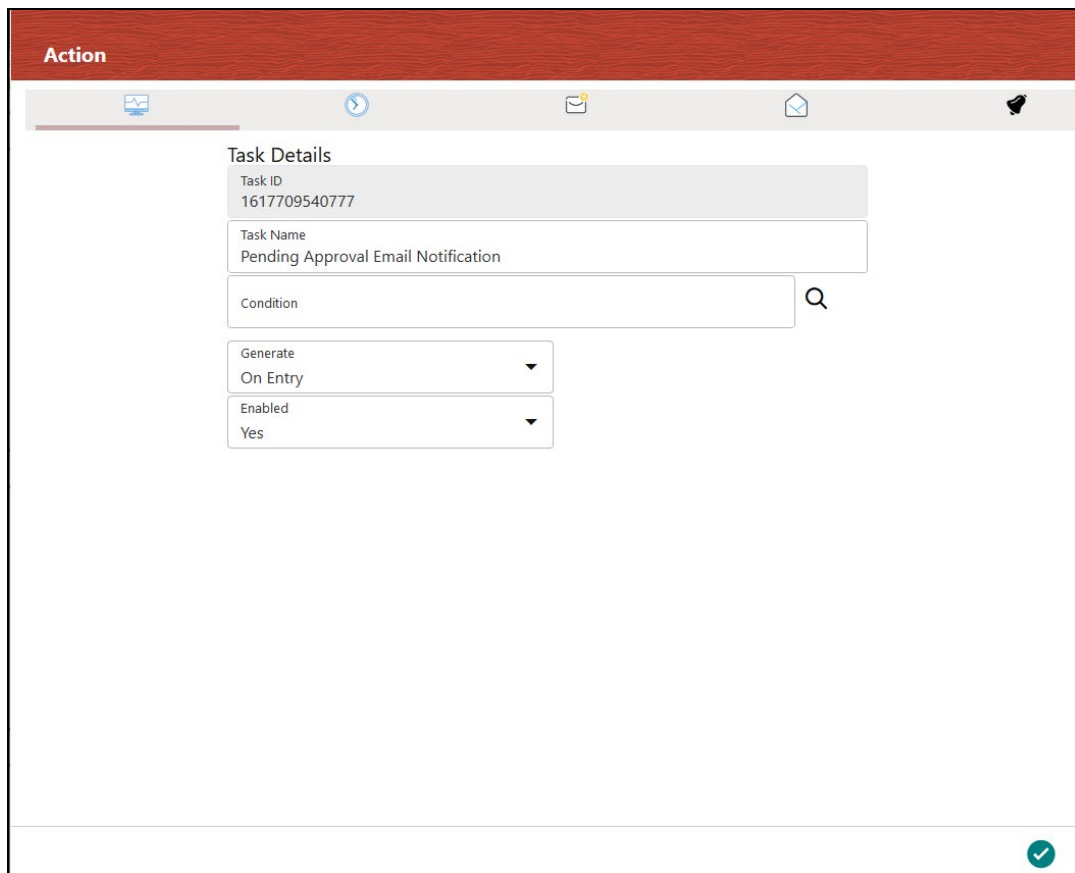

Figure 44: Action Window to Create Tasks and Notifications

2. Click  **Add** from the **Action** window to add a new Task.

6.1.2.1 Defining Task Details

Figure 45: Action Details Window - Defining Task Details

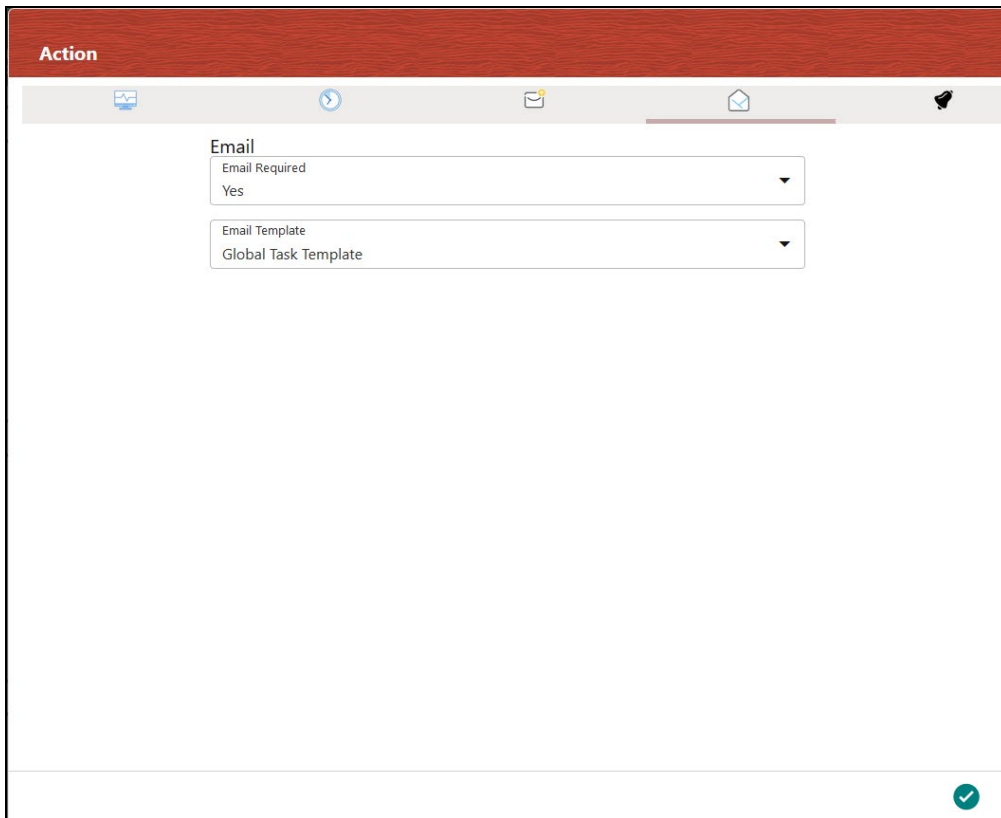

- Task ID is automatically generated.
1. Enter a Task Name.
 2. Select the decision rule so that when the **Condition** is satisfied, the Task is sent to the users associated with this task.
 3. Select the required option for **Generate**:
 - On Entry- Task is sent before executing the activity business logic.
 - On Exit- Task is sent before leaving the activity and moving to the next activity.
 - On Stage- When there is a transition where the target and source are the same activity, and if that transition happens, then OnStage tasks are triggered.
 4. Select **Yes** to enable the Task.

6.1.2.2 Setting Email Notification

Figure 46: Action Details Window - Setting Email Notification

The screenshot shows a window titled "Task Group Details" with a close button (X) in the top right corner. Below the title bar, there are five tabs: "Task Details", "Expiry", "Escalation", "Email", and "Reminder". The "Email" tab is currently selected and highlighted with a blue border. Inside the "Email" tab, there are two configuration options:

- Email Required**: A checkbox with a question mark icon, currently unchecked, followed by the text "Yes".
- Email Template**: A dropdown menu with a question mark icon, currently displaying "Global Notification Template" and a downward arrow.

The screenshot shows a configuration window titled "Action". At the top, there is a red header bar with the word "Action" in white. Below the header is a navigation bar with several icons: a monitor, a play button, an envelope, a house, and a bell. The main content area contains two dropdown menus under the heading "Email". The first dropdown is labeled "Email Required" and has "Yes" selected. The second dropdown is labeled "Email Template" and has "Global Task Template" selected. A green checkmark icon is located in the bottom right corner of the window.

You must configure Email settings before you set email notifications for your tasks.

For more details on how to configure email settings, see [Configuring Email for Human Tasks](#) section.

1. Select **Yes** if it is required to send an email for the task.
2. Select the email template to be used from the drop-down list. Templates are populated from the `AAI_WF_Email_Template` table.

6.2 Additional Functionalities for Human Tasks

6.2.1 Setting Task Expiry

Figure 46: Action Details Window - Setting Task Expiry

Expiry Days	
Days	Hour
3	12

1. Select the required option from the **Expiry** drop-down list:
 - Global Expiry Setting- Select this option to set the task expiry based on a global setting. Global setting can be set from the backend.
 - Never Expire- Select this option if the task should not expire.
 - Expire After- Select this option if you want to set the task expiry after some days and/or hours.
 - Dynamic Value – Select this option if you want the user assigned to the task to set the task expiry date and time dynamically. This value needs to be entered into the code.
2. If **Expiry** is selected as **Expire After**, enter the number of days and/or hours after which the task must expire.

6.2.2 Setting Task Escalation

Figure 47: Action Details Window - Setting Task Escalation

1. Select the **Escalation** criteria as follows:
 - Global Escalation Setting- Select this option to set the task escalation based on a global setting. Global setting can be set from the backend.
 - Never Escalate - Select this option if escalation is not required for the task.
 - Escalate After- Select this option if you want to escalate if the task is not addressed after some days and/or hours.

NOTE

Escalation should be set after the expiry of the task. If you have selected the Never Expire option for Expiry, you cannot set escalation.

2. If **Escalate After** is selected for **Escalation**, enter the number of days and/or hours after which the escalation should be triggered.
3. Enter the maximum number of escalation levels. 1 indicates escalation to the immediate manager, 2 indicates escalation to the manager's manager, and so on.
4. Enter the custom escalation Java Class that you want to call.
5. Select the escalation path from the drop-down list. The options are Default, People Hierarchy, and Custom Rule.

6. Select the type of notification message from the drop-down list. Notification messages are populated from the `AAI_WF_Templates` table.

6.2.3 Setting Task Reminder

Figure 48: Action Details Window - Setting Reminder for Your Task

The screenshot shows a web interface titled "Action" with a red header. Below the header is a navigation bar with icons for home, back, messages, and a bell. The main content area is titled "Reminder" and contains the following fields:

- Recurrence:** A text input field containing the number "3".
- Relative Date:** A dropdown menu currently showing "Task Expiration Date".
- Duration:** A table with two columns: "Days" and "Hour". The "Days" column contains the value "0" and the "Hour" column contains the value "4".
- Notification Message:** A dropdown menu currently showing "Default".

A green checkmark icon is located in the bottom right corner of the form area.

Reminders are sent to the assigned user as an open task in their inbox.

1. Enter the number of times you want to set the reminder from the **Recurrence** field.
2. Select **Task Start Date** if you want to send a reminder after the defined number of days and/or hours, from the start date of the task. Select **Task Expiration Date** if you want to send a reminder before the defined number of days and/or hours from the end date/expiry date of the task.
3. Select the Duration in the number of days and/or hours from the **Relative Date** after/before which you want to set the reminder.
4. Select the **Notification Message** you want to send, from the drop-down list. Notification messages are populated from the `AAI_WF_Templates` table.
5. Click  **Accept** to save.

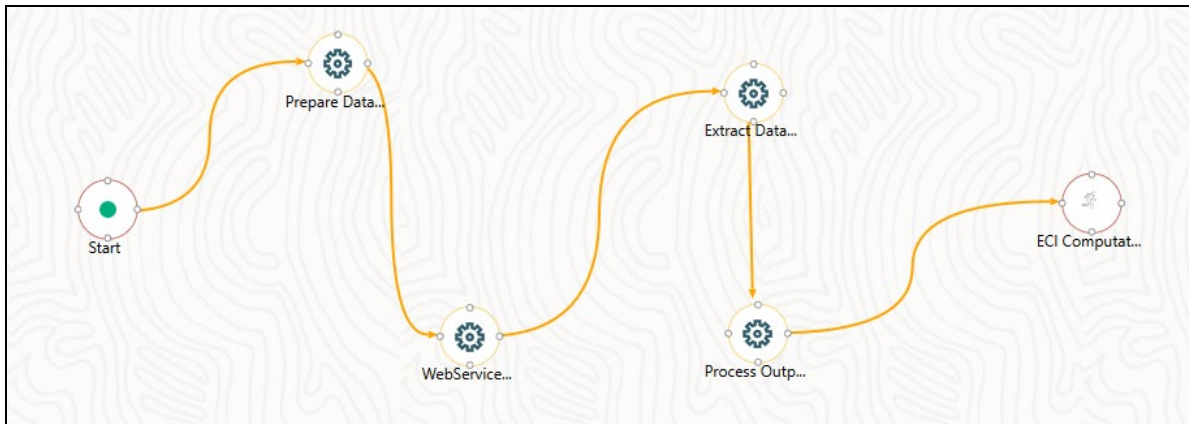

7 Service Tasks

Service Task is an automatic task that gets triggered in the Process flow. It is used to execute the Business Logic that is defined through an Application Rule of Execution Rule type. For more information on configuring the Application Rules, see the [Application Rule](#) section.

Service Tasks are used to invoke External Model Service through Rest API, External Java APIs, Stored Procedures, and Functions.

A more detailed explanation of invoking external model service is available in the [How to invoke External Model through Web Service](#) section.

Figure 49: An Example: Service Tasks Flow

Topics:

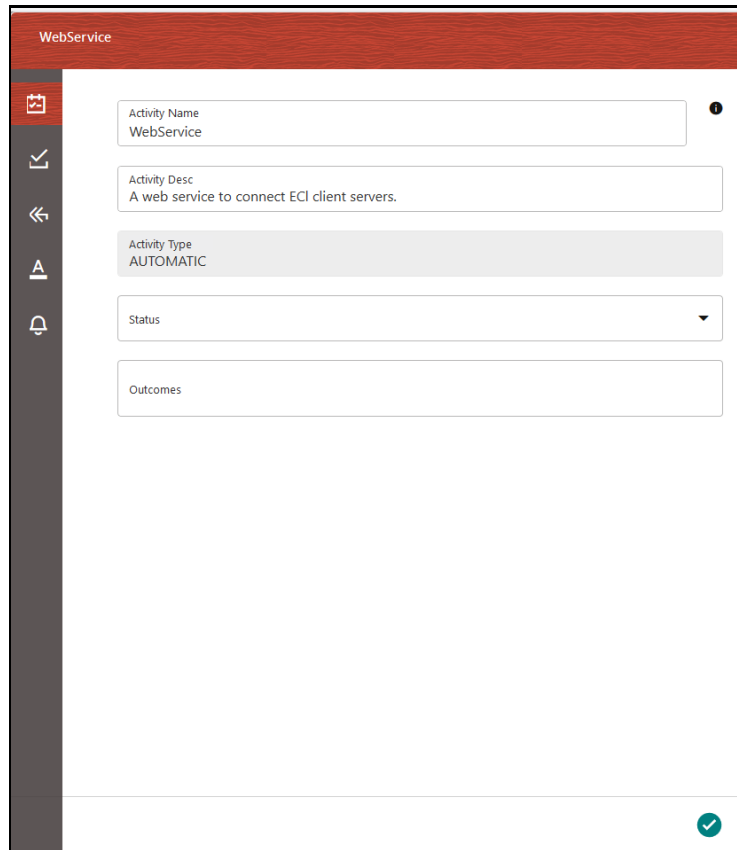

- [How to Use a Service Task](#)

7.1 How to Use a Service Task

1. In the **Process Flow** window, Select the  **Service Task** icon from **Activity** in the toolbar and Drag and drop on the drawing canvas where you want to place it.
2. Double-click the  icon on the canvas to display the **Activity** window.

7.1.1 Activity Tab

Figure 50: Activity Window

The screenshot shows a mobile application window titled 'WebService'. On the left is a dark sidebar with icons for home, back, forward, and search. The main content area has a red header. Below the header are several form fields: 'Activity Name' with the value 'WebService', 'Activity Desc' with the text 'A web service to connect ECI client servers.', 'Activity Type' with the value 'AUTOMATIC', 'Status' with a dropdown arrow, and 'Outcomes'. A green checkmark icon is located in the bottom right corner of the window.

3. **Activity ID** is auto-populated and you can view it by mouse over the **i** icon.
4. Enter Activity Name and Activity Description.
5. Select Status and Outcomes as required.
6. Click  **Accept** to save.

7.1.2 Implementation Tab

1. Click . The **Implementation** window is displayed.

Figure 51: Implementation Window

WebService

Rule

Infodom
OFSAAIINFO

Execution Rule
WF RUN EXE RULE

Parameters

F.OBJECT_NAME	Datafield WF_OBJECT_NAME Type DYNAMIC	Value	
F.OBJECT_ID	Datafield WF_OBJECT_ID Type DYNAMIC	Value	
F.OBJECT_TYPE	Datafield WF_OBJECT_TYPE Type DYNAMIC	Value	

Pre/Post Processing

Pre Rule
WF RUN EXE RULE

Post Rule
WF RUN EXE RULE

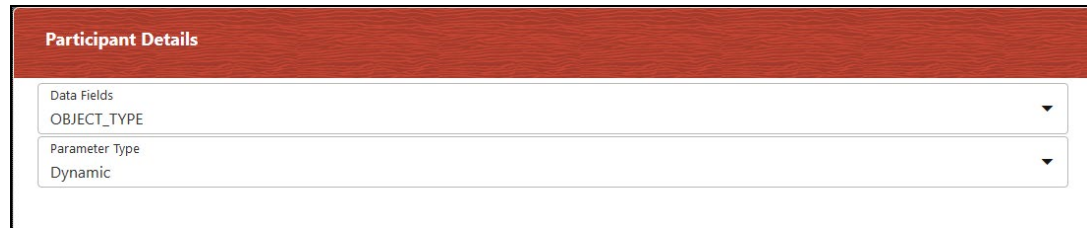

2. Select the information domain where the Execution Rule you want to execute is available, from the **Infodom** drop-down list. The list displays all the Infodoms mapped to the applications configured in your OFSAA instance.
3. Select the **Execution Rule** that needs to be executed for this activity.
For more information on how to define an Application Rule, see the [Application Rules](#) section.
 - Click  The **Participant Details** window is displayed with all Application Rules of Execution Rule types available in your Process.
 - Click the Name link of the Application Rule to view the details.
 - Select the required Rule and click **Ok**.
4. Add Parameters you want to pass to the Execution Rule using Data Fields. You can pass Static values or Dynamic Values. In the case of Dynamic, the value needs to be entered during the execution of the workflow.
 - Click  **Add** under **Parameters**. The **Participant Details** window is displayed.

Figure 52: Participant Details Window

Participant Details	
Data Fields	OBJECT_TYPE
Parameter Type	Dynamic

- Select the **Data Field** to which you want to pass the value. The list displays all Data Fields for the current Process or Package.
- Select the **Parameter Type** as Static to pass a static value to the selected Data Field in the **Value** field or as Dynamic to pass the value during execution of the workflow.

NOTE

The added parameters are displayed under the **Parameters** section in the Implementation Window.

Select the Parameter and click it to edit it.

Click  to delete it.

5. Select an application rule that you want to execute before executing the Execution Rule.
 - Click the  icon corresponding to **Pre Rule** and select the required application rule.
6. Select an application rule that you want to execute after executing the Execution Rule.
 - Click the  icon corresponding to **Post Rule** and select the required application rule.

8 Configuring OFSAA Tasks in Your Process Flow

Widgets are used to orchestrate OFSAA components such as T2T definitions, PLC definitions (DT), Rules (Classification Rule and Computation Rule), Models in EMF, Run, Run Executable, and Data Quality Groups into your Process Flow using the Process Modeller.

Topics:

- [How to Use a Widget](#)
- [Dynamic Parameters for Widgets](#)

8.1 How to Use a Widget

1. In the **Process Flow** window, click the required widget under **Widget** in the toolbar and Drag and drop it onto the canvas. The available Widgets are RuleType3, MFModel, Run, DataQualityGroups, RunExecutable, EMFNotebookImpl, LoadT2T, TransformDT, and RuleType2.
2. Double-click the widget. The **Activity** window is displayed.

Figure 53: OFSAA Widget Activity Window

The screenshot shows the 'ECI Computation' activity configuration window. It features a dark sidebar on the left with navigation icons. The main area contains several input fields and dropdown menus:

- Activity Name:** ECI Computation
- Activity Desc:** Run for ECL Computation
- Activity Type:** Run
- Status:** (Dropdown menu)
- Exclude Task:** No
- Dynamic Parameters for Run:**
 - Datastore Name:** OFSAAIINFO
 - Run Type:** Base Run
 - Execution Rule:** (Dropdown menu)
 - Run Parameters:** (Text input field)

A green checkmark icon is visible in the bottom right corner of the window.

3. Enter the **Activity Name** and **Activity Description**.
4. Based on the OFSAA widget, the **Dynamic Parameters** are displayed.
For more information, see the [Dynamic Parameters for Widgets](#) section.

To view the definition of the OFSAA component you are using, mouse over its icon and click

View. The **Definition** window of the OFSAA component is displayed.

8.2 Dynamic Parameters for Widgets

The Dynamic Parameters in the Activity window are different for each Widget. This section provides information for the following Dynamic Parameters specific to the selected Widget.

- [RuleType3](#)
- [MFModel](#)
- [Run](#)
- [DataQualityGroups](#)
- [RunExecutable](#)
- [EMFNotebookImpl](#)
- [LoadT2T](#)
- [TransformDT](#)
- [RuleType2](#)

8.2.1 RuleType3

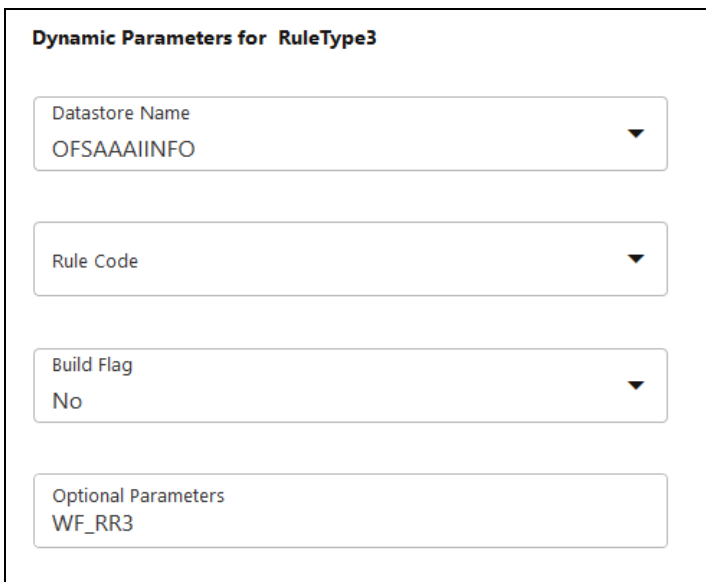

In the **Process Flow** window, click the  **RuleType3** icon in **Widget** from the toolbar and Drag and Drop it onto the canvas. Double-click the widget to display the **Activity** window.

Figure 55: Dynamic Parameters for RuleType3

Dynamic Parameters for RuleType3	
Datastore Name	OFSAAIINFO
Rule Code	
Build Flag	No
Optional Parameters	WF_RR3

Table 20: Dynamic Parameters for RULE_EXECUTION Description

Field Name	Description
Datastore Name	Select the Information Domain in which the RRF Rule you want to execute is present, from the drop-down list.
Rule Code	Display the codes of the RRF Rules defined under the selected Infodom. Select the required Rule from the drop-down list.
Build Flag	Select the required option from the drop-down list as “Yes” or “No”. Build Flag refers to the pre-compiled rules, which are executed with the query stored in the database. While defining a Rule, you can make use of Build Flag to fasten the Rule execution process by making use of existing technical metadata details wherein the rule query is not rebuilt again during Rule execution. Build Flag status set to “No” indicates that the query statement is formed dynamically retrieving the technical metadata details. If the Build Flag status is set to “Yes”, then the relevant metadata details required to form the rule query are stored in the database on “Save” of a Rule definition. When this rule is executed, the database is accessed to form the rule query based on stored metadata details, thus ensuring performance enhancement during Rule execution. For more information, see the Significance of Pre-Built Flag section in the OFS Analytical Applications Infrastructure User Guide .
Optional Parameters	Select the Data Fields you want to pass as parameters for the selected Data Mapping definition. For information on creating Data Fields, see the Data Fields section.

8.2.2 MFModel

In the **Process Flow** window, click the  **MFModel** icon in **Widget** from the toolbar and Drag and drop it onto the canvas. Double-click the widget to display the **Activity** window.

Figure 56: Dynamic Parameters for MODEL

Dynamic Parameters for MFModel

Datastore Name

Model Code

Operation
ALL

Optional Parameters
NA

Table 21: Dynamic Parameters for MODEL Description

Field Name	Description
Datastore Name	Select the Information Domain in which the RRF Rule you want to execute is present, from the drop-down list.
Model Code	Display the codes of the EMF Models defined under the selected Infodom.
Operation	The All definition for the Operation field conveys the process of extracting the data from the flat files and applying the run regression on the data extracted. For Batches that are being built for the first time the data is extracted from the flat files and the run regression is applied on it.
Optional Parameters	Select the Data Fields you want to pass as parameters for the selected Data Mapping definition. For information on creating Data Fields, see the Data Fields section.

8.2.3 Run

In the **Process Flow** window, click the  **Run** icon in **Widget** from the toolbar and Drag and drop it onto the canvas. Double-click the widget to display the **Activity** window.

Figure 57: Dynamic Parameters for RUN

Dynamic Parameters for Run

Datastore Name
 OFSAAIINFO

Run Type
 Base Run

Execution Rule

Run Parameters
 WF_EXEC

Table 22: Dynamic Parameters for RUN Description

Field Name	Description
Datastore Name	Select the required datastore from the drop-down list.
Run Type	Select Base Run or Simulation Run based on the type of the Run you want to execute, from the drop-down list.
Execution Rule	Select the Run you want to execute from the drop-down list.
Run Parameters	Enter the Data Fields you want to pass as parameters for the selected Data Mapping definition. Use comma-separated values if you want to enter more than one Data Field. For information on creating Data Fields, see the Data Fields section.

8.2.4 DataQualityGroups

In the **Process Flow** window, click the  **DataQualityGroups** icon in **Widget** from the toolbar and Drag and drop it onto the canvas. Double-click the widget to display the **Activity** window.

Figure 58: Dynamic Parameters for RUN DQ RULE

Dynamic Parameters for DataQualityGroups

Datastore Name
OFSAAIINFO ▼

DQ Group Name ▼

Rejection Threshold

Additional Parameters

Fail if Threshold Breaches
Yes ▼

Table 23: Dynamic Parameters for RUN DQ RULE Description

Property	Description
DQ Group Name	Refers to the Data Quality Groups consisting of associated Data Quality Rule definition(s). Select the required DQ Group from the drop-down list.
Rejection Threshold	Specify the percentage of the Rejection Threshold (%) limit in numeric value. This refers to the maximum percentage of records that can be rejected in a job. If the percentage of failed records exceeds the Rejection Threshold, the job fails. If the field is left blank, the default value is set to 100%.
Additional Parameters	Specify the Additional Parameters as filtering criteria for execution in the pattern Key#Data type#Value; Key#Data type#Value;...etc. Here the Data type of the value should be "V" for Varchar/Char, or "D" for Date with "MM/DD/YYYY" format, or "N" for numeric data. For example, if you want to filter some specific region codes, you can specify the Additional Parameters value as \$REGION_CODE#V#US;\$CREATION_DATE#D#07/06/1983;\$ACCOUNT_BAL#N#10000.50; Note: In case the Additional Parameters are not specified, the default value is fetched from the corresponding table in the configuration schema for execution.

Property	Description
Fail if Threshold Breaches	Select Yes or No from the drop-down list. If Yes is selected, execution of the task fails if the threshold value is breached. If No is selected, the execution of the task continues. Note: For Custom Check type DQ Rules in Hive Infodoms, the execution of the task does not fail even if the threshold is breached. This is a limitation.
Parameters	Select the Data Fields you want to pass as parameters for the selected Data Mapping definition. For information on creating Data Fields, see the Data Fields section.

8.2.5 RunExecutable

In the **Process Flow** window, click the  **RunExecutable** icon in **Widget** from the toolbar and Drag and drop it onto the canvas. Double-click the widget to display the **Activity** window.

Figure 59: Dynamic Parameters for RUN EXECUTABLE

Dynamic Parameters for RunExecutable

Datastore Name
OFSAAIINFO ▼

Executable

Wait
Yes ▼

Batch Parameter
Yes ▼

Optional Parameter

Table 24: Dynamic Parameters for RUN EXECUTABLE Description

Field Name	Description
Datastore Name	Refers to the name of the Information Domain. By default, the Information Domain to which you are connected is selected.

Field Name	Description
Executable	<p>Refers to the executable path on the DB Server. The Executable parameter contains the executable name as well as the parameters to the executable. These executable parameters have to be specified as they are specified at a command line. In other words, the Executable parameter is the exact command line required to execute the executable file.</p> <p>The path to the executable has been entered in quotes. Quotes have to be used if the EXE name has a space included in it. In other words, the details entered here should look exactly as you would enter it in the command window while calling your executable. The parameter value is case-sensitive. So, ensure that you take care of the spaces, quotes, and case. Additionally, commas are not allowed while defining the parameter value for executable.</p> <p>To pass parameters like \$RUNID, \$PHID, \$EXEID, \$RUNSK to the RUN EXECUTABLE component, specify RRFOPT=Y or rrfopt=y along with other executable details.</p>
Wait	<p>When the file is being executed you have the choice to either wait till the execution is completed or proceed with the next task.</p> <p>Select Y (Yes) or N (No) from the drop-down list.</p> <ul style="list-style-type: none"> • Y- Select this if you want to wait for the execution to be completed • N- Select this if you wish to proceed. <p>If the task is using FIGGEN/RUN EXECUTABLE component and there is no precedence set for this task, then the WAIT should always be set to 'N'.</p>
Batch Parameter	<ul style="list-style-type: none"> • Y- Select Yes if you want to pass the Batch parameters to the shell script file being executed. <ul style="list-style-type: none"> ▪ If Wait is selected as Y and Batch Parameter is selected as Y, following parameters are passed to the executable: NIL <BatchExeRunID> <ComponentId> <Task> <Infodate> <Infodom> <DatstoreType> <IPAddress> ▪ If Wait is selected as N and Batch Parameter is selected as Y, following parameters are passed to the executable: <BatchExeRunID> <ComponentId> <Task> <Infodate> <Infodom> <DatstoreType> <IPAddress> • N- Select No if the Batch parameters should not be passed to the shell script.

Field Name	Description
Optional Parameter	<p>The following runtime parameters can be passed during run execution:</p> <ul style="list-style-type: none"> • \$RUNID • \$PHID • \$EXEID • \$RUNSK • \$MISDATE • \$BATCHRUNID <p>Values for the runtime parameters are implicitly passed while executing the Run definition.</p> <p>Note: The length of PHID is 255 characters and TASKID is 100 characters.</p>

8.2.6 EMFNotebookImpl

In the **Process Flow** window, click the  **EMFNotebookImpl** icon in **Widget** from the toolbar and Drag and drop it onto the canvas. Double-click the widget to display the **Activity** window.

Figure 56: Dynamic Parameters for EMFNootbookImpl

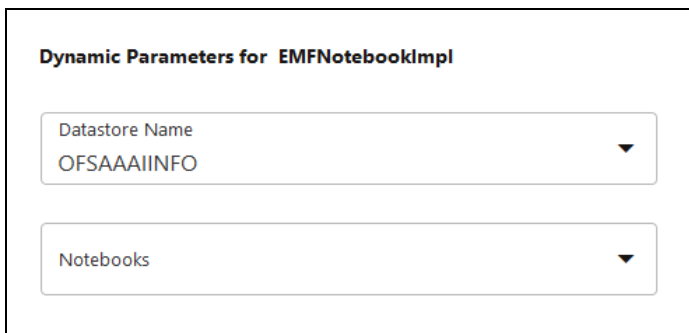

Table 21: Dynamic Parameters for EMFNootbookImpl Description

Field Name	Description
Datastore Name	Select the Information Domain from the drop-down list where the EMFNotebook exists.
Notebooks	Select from the drop-down the EMF Notebook that you want to implement in a task.

8.2.7 LoadT2T

In the **Process Flow** window, click the  **LoadT2T** icon in **Widget** from the toolbar and Drag and drop it onto the canvas. Double-click the widget to display the **Activity** window.

9 Orchestrating External Models/Components in Your Process Flow

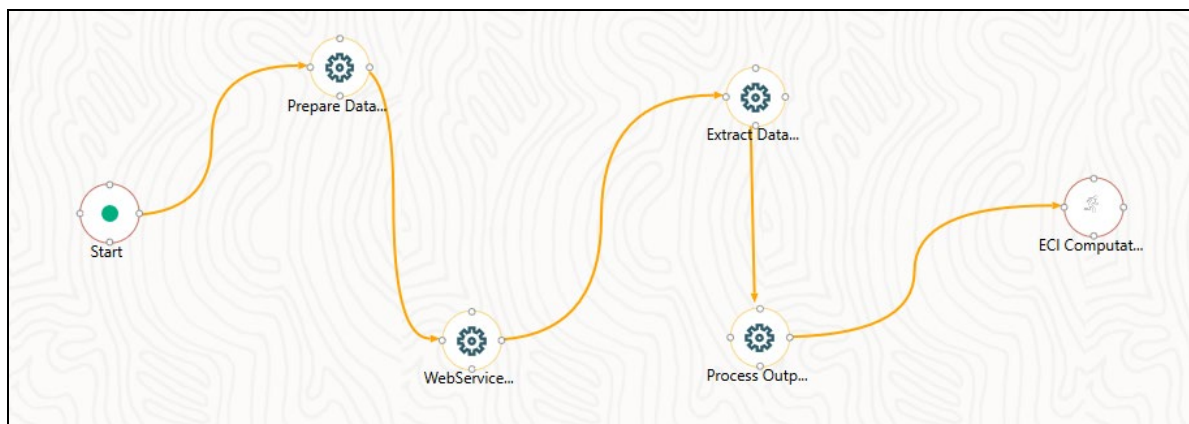

You can use external models or external components in your process flow by using Rest Service Application Rule or External Java API Application Rule.

Topics:

- [How to invoke External Model through Web Service](#)

9.1 How to invoke External Model through Web Service

Figure 60: Invoking External Web Service flow

A typical External Web Service invocation has the following steps:

1. Data Preparation
2. Web Service Invocation
3. Data Extraction

9.1.1 Data Preparation

Before invoking Web Service, we need to prepare data to be passed across to the Web Service. This can be done by configuring the Application Rule.

In the above example, data preparation is done through JSON Read From DB Application Rule as shown below, which reads data from a table, converts it into JSON, and stores output to JSON_DB_DATA Data Field.

Figure 61: Add API Details

9.1.2 Webservice Invocation

Consider you want to use an external model called ForecastModelPost, which is available in `http://<IP Address/hostname of the Web Server>:<servlet port>/<context name>/rest-api/v1/ModelWebService/ForecastModelPost`.

To access Application Rules, do as follows:

1. From the **Process Modeller** window, click the  icon corresponding to the Pipeline for which you want to add an application rule. The **Process Flow** tab is displayed.
 1. Select  **Application Rules** icon from the header to display the **Application Rules** window.
 2. Click **Add**  to display the Add Application Rules window.
- You can delete a rule by clicking the  button.
3. Select **Rest Service** from the **Application Rule Type** drop-down.

✓

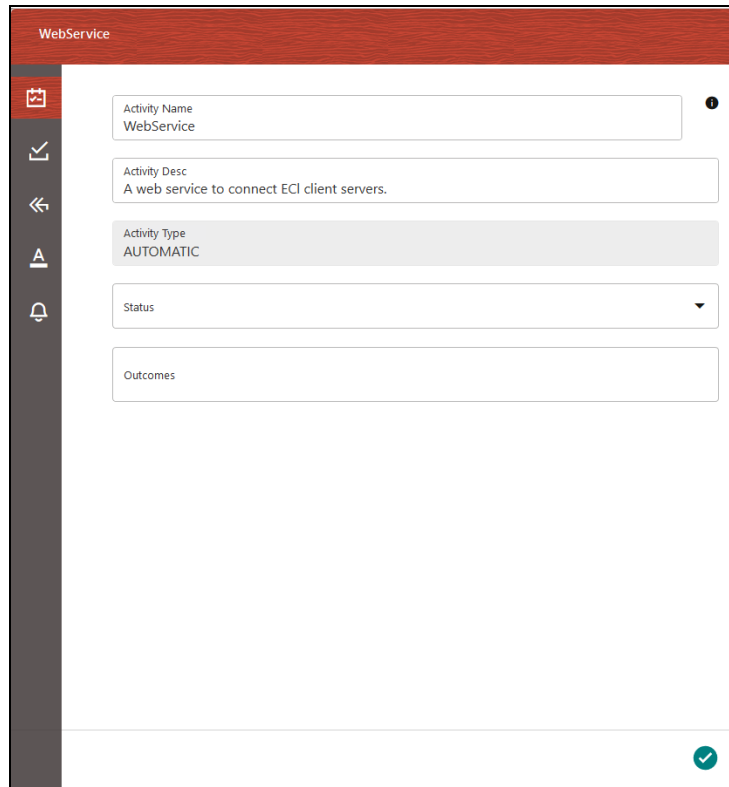

4. Enter the details as shown. For more information on configuring a Rest Service, see the [Rest Service Application Rule](#) section.
5. In this example, the Data sent to the web service is a combination of both static and dynamic value (~~JSON_DB_DATA~~ is a data field holding a JSON string which is prepared as the previous step in the pipeline.)
6. Click **Save**. The ModelWebService Application Rule gets created in your logged-in Information Domain.
7. In the **Process Flow** window, Select the  **Service Task** icon from **Activity** in the toolbar and Drag and drop on the drawing canvas where you want to place it.
8. Double-click the  icon on the canvas to display the **Activity** window.
9. Double-click the Service Task icon.

Figure 63: Webservice Invocation Activity details

The screenshot shows a web interface for configuring a Webservice activity. The title bar is red and labeled 'WebService'. On the left is a dark sidebar with navigation icons: a clipboard, a checkmark, a left arrow, a letter 'A', and a bell. The main content area has a white background and contains several input fields: 'Activity Name' with the value 'WebService', 'Activity Desc' with the value 'A web service to connect ECI client servers.', 'Activity Type' with the value 'AUTOMATIC', a 'Status' dropdown menu, and an 'Outcomes' text area. A green checkmark icon is located in the bottom right corner of the form.

10. Enter the Activity details such as Activity Name and Activity Description.
11. Click . The **Implementation** window is displayed.
12. Select the information domain where the ModelWebService Application Rule is defined, from the **Infodom** drop-down list. The list displays all the Infodoms mapped to the applications configured in your OFSAA instance.
13. Click . The **Participant Details** window is displayed with all Application Rules of Execution Rule types available in your Process.
14. Select Model Webservice.
15. Click  **Accept** to save.

9.1.3 Data Extraction

The response from the Web Service needs to be processed depending on the application requirement. PMF has the capabilities to process the JSON and store it in the output table.

You can use JSON PATH expressions to extract the relevant information from the Web Service response.

For more information on JSON PATH expressions, see [For JSON Path Expression Application Rule](#) section.

Similarly, the response can be stored back to the database using JSON Write To DB Application Rule as shown.

Figure 65: JSON Write To DB Application Rule- Add API Details window

The screenshot shows a web interface for adding an application rule. The window has a dark red header with the text "Application Rule". Below the header, there is a navigation icon and the text "Add Application Rule". The main content area is titled "Add" and contains several form fields:

- Application Rule Type:** A dropdown menu with "JSON Write to DB" selected.
- Name:** A text input field containing "JSON_Write_DB".
- Rule Type:** A dropdown menu with "Execution Rule" selected.
- Execution Type:** A dropdown menu with "JSON Write to DB" selected.
- Table name:** A text input field containing "ModelWeb_Output".
- Source JSON:** A text input field containing "{JSON_DATA}".
- Output Datafield:** A dropdown menu.
- Scope:** A dropdown menu with "PROCESS" selected.

A green checkmark icon is visible in the bottom right corner of the form area.

For more information, see [JSON Write To DB Application Rule](#) section.

10 Configuring Custom Components

For configuring a new custom component as an OFSAA Widget, you need to have entries in the AAI_WF_COMPONENT_REGISTRATION table and AAI_WF_COMPONENT_PARAMETERS table. Additionally, the executeComponent() method needs to be implemented in the Implementation class and the jar should be present in web-inf/lib path.

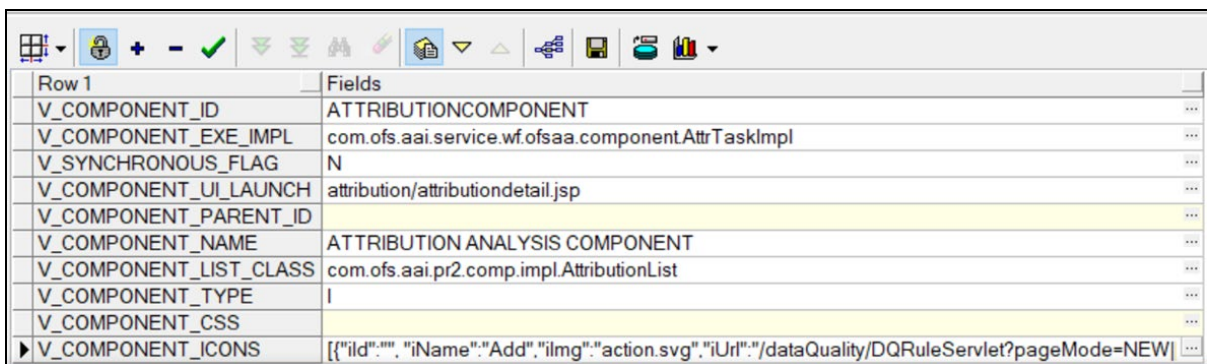

Topics:

- [AAI_WF_COMPONENT_REGISTRATION Table](#)
- [AAI_WF_COMPONENT_PARAMETERS Table](#)

10.1 AAI_WF_COMPONENT_REGISTRATION Table

An entry into the AAI_WF_COMPONENT_REGISTRATION table will create a new custom component in the PMF Widgets.

Figure 66: AAI_WF_COMPONENT_REGISTRATION table

Row 1	Fields
V_COMPONENT_ID	ATTRIBUTIONCOMPONENT
V_COMPONENT_EXE_IMPL	com.ofs.aai.service.wf.ofsaa.component.AttrTaskImpl
V_SYNCHRONOUS_FLAG	N
V_COMPONENT_UI_LAUNCH	attribution/attributiondetail.jsp
V_COMPONENT_PARENT_ID	
V_COMPONENT_NAME	ATTRIBUTION ANALYSIS COMPONENT
V_COMPONENT_LIST_CLASS	com.ofs.aai.pr2.comp.impl.AttributionList
V_COMPONENT_TYPE	I
V_COMPONENT_CSS	
V_COMPONENT_ICONS	{{"id":"","iName":"Add","img":"action.svg","iUrl":"/dataQuality/DQRuleServlet?pageMode=NEW

- V_COMPONENT_ID – Specify a unique ID for the component.
- V_COMPONENT_EXE_IMPL - This is the interface that needs to be implemented by the component owner so that during the execution of this component, this API is invoked.
- V_COMPONENT_UI_LAUNCH - This is the URL of the page that needs to be opened when the component is double-clicked in the canvas.
- V_COMPONENT_NAME – Specify a name for the component, which is displayed for the custom component in the Widgets.
- V_COMPONENT_ICONS - All the icons and menus are configured in this field.

For example:

Figure 67: AAI_WF_COMPONENT_REGISTRATION Example table

```

[{"iId":"","iName":"Add","iImg":"action.svg","iUrl":"/dataQuality/DQRuleServlet?pageMode=NEW|| chr(38) ||actionType=GET_DQ_GROUP_SCREEN|| chr(38) ||infodom={Datastore Name}"), {"iId":"","iName":"Edit","iImg":"edit.svg","iUrl":"/dataQuality/DQRuleServlet?dqGroupId={DQ Group Name}|| chr(38) ||pageMode=EDIT|| chr(38) ||infodom={Datastore Name}|| chr(38) ||actionType=GET_DQ_GROUP_SCREEN"}, {"iId":"","iName":"View","iImg":"previewTree.svg","iUrl":"/dataQuality/DQRuleServlet?dqGroupId={DQ Group Name}|| chr(38) ||pageMode=VIEW|| chr(38) ||infodom={Datastore Name}|| chr(38) ||actionType=GET_DQ_GROUP_SCREEN"}, {"iId":"","iName":"Delete","iImg":"delete.svg","iUrl":""}]
    
```

10.2 AAI_WF_COMPONENT_PARAMETERS Table

The AAI_WF_COMPONENT_PARAMETERS table needs to be populated with the relevant parameters:

Figure 68: AAI_WF_COMPONENT_PARAMETERS table

V_COMPONENT_ID	V_PARAMETER_NAME	I_PARAMETER_ORDER	I_DISPLAY_ORDER	V_PARAMETER_CODE	TYPE_OF_DISPLAY
1	IP Address	1	3	SMSLB.IP_ADDR	2
2	Datastore Type	2	1	ICC.FE.LBL_DATA_STORE_TYPE	2
3	Datastore Name	3	2	ICC.FE.LBL_DATA_STORE	2
4	Load Mode	4	4	ICC.FE.LBL_LOADMODE	2
5	Source Name	5	5	SMSLB.SRC_NAME	2
6	File Name	6	6	GLOBAL.FIL_NAM	2
7	Data File Name	7	7	ETL_PROP_DEF.LABEL_OR_TEXT_DATA_FILE_NAME	1
8	Default Value	8	8	DTDQ.DFLT_VAL	1

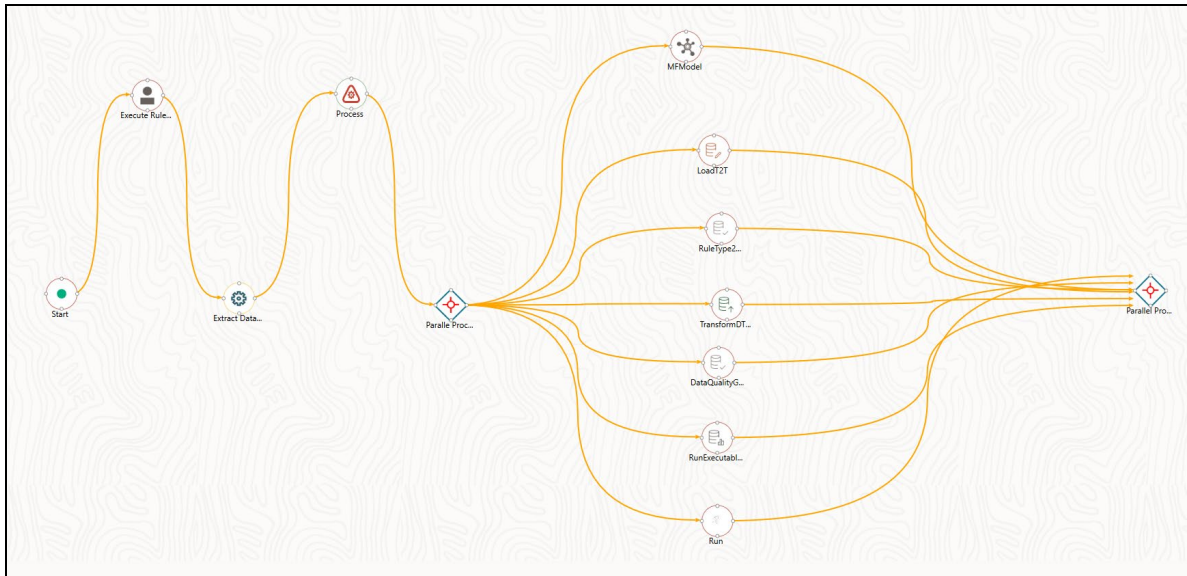

V_DEFAULT_VALUE	V_CLASS_NAME	V_METHOD_NAME
...
...
...
...	com.ofs.aai.service.wf.ofsaa.component.T2TTaskImpl	...
...	com.ofs.aai.service.wf.ofsaa.component.T2TTaskImpl	...
...
...

- V_COMPONENT_ID- Specify the ID for the component. It should be the same as that is given in the AAI_WF_COMPONENT_REGISTRATION table.
- V_PARAMETER_NAME – Specify the Parameter name which will be required by the component]
- I_PARAMETER_ORDER – Specify the Parameter order.
- I_DISPLAY_ORDER -- Specify the order in which the Parameters need to be displayed in the UI.
- V_PARAMETER_CODE – Specify Parameter code.
- TYPE_OF_DISPLAY – Specify the type of display for the parameter. For example: if text input required the value should be 1 or the selection drop-down value should be 2]
- V_DEFAULT_VALUE – Specify if any default value needs to be provided for the parameter.
- V_CLASS_NAME – Specify the class name for listing the drop-down values.
- V_METHOD_NAME - Specify the name of the method for listing values.

11 Executing Parallel Tasks

Parallel Gateway is used to execute multiple tasks in parallel. In the usual flow, tasks are executed sequentially.

Figure 69: Executing Parallel Tasks flow

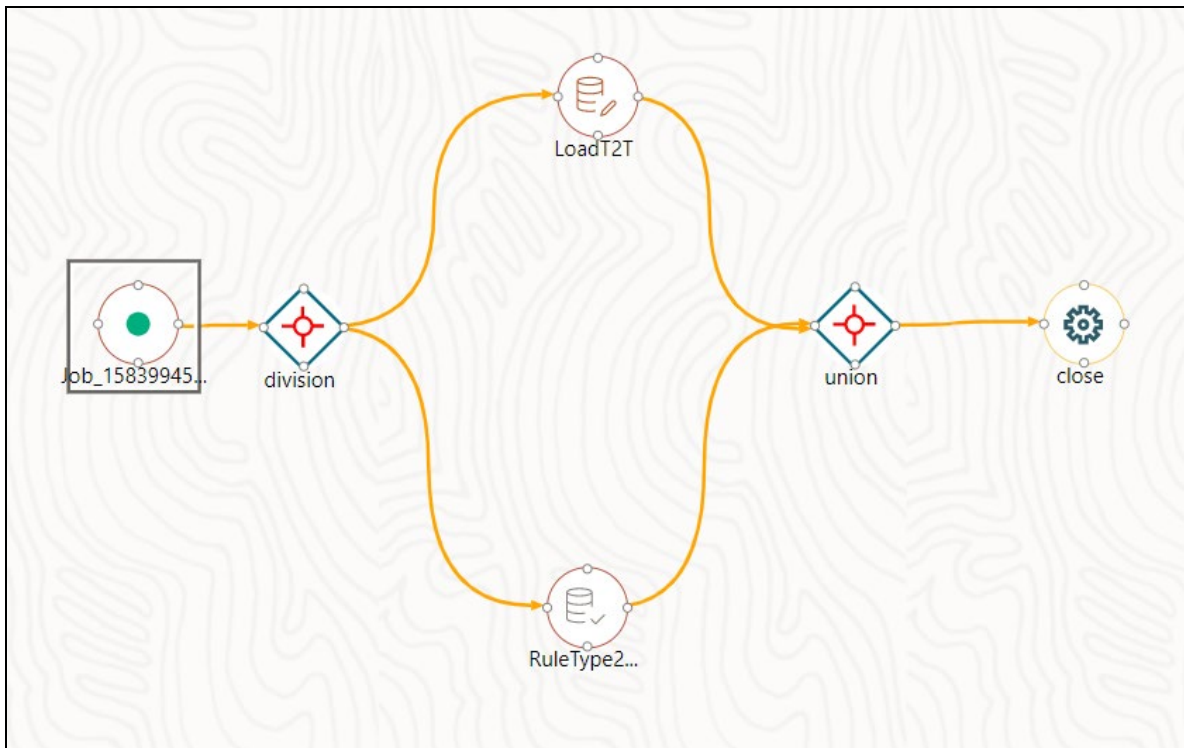

In the shown example, after  is executed, Parallel Gateway  gets invoked. All the OFSAA components, which are placed between Parallel Gateways,  are executed simultaneously. It waits until all components are executed, and then moves to the next activity in the Process Flow.

Topics:

- [How to Use Parallel Gateways](#)

11.1 How to Use Parallel Gateways

Figure 70: RuleType 2 and Load T2T Widget Parallel Execution Flow

This section explains how to design tasks such as RuleType 2 and Load T2T Widget to be executed in parallel.

1. Create a Process Modelling Process.
2. Launch the Process. It displays the **Process Flow** tab.
3. By default, the  **Start** appears on the canvas. Drag and drop to a desired area on the canvas. This Start activity indicates the beginning of the Process.
4. Click  Parallel Gateway from the toolbar and click on the drawing canvas where you want to place it.
5. Drag and drop the Parallel Gateway widget onto the Activity from where the transition starts.
6. Drag and drop the Activity on to the Parallel Gateway widget where the transition progresses.
7. Click  **RuleType2** from the **Widgets** window, and then click the drawing canvas where you want to place it.
8. Drag and drop the Parallel Gateway widget onto the Activity to make the transition connection.
9. Configure the RuleType2 widget. For more information, see [Configuring OFSAA Tasks in Your Process Flow](#) section.
10. Click  **LoadT2T** from the **Widgets** window, and then click the drawing canvas where you want to place it.
11. Drag and drop the **LoadT2T** widget onto the Parallel Gateway widget to make the transition connection.

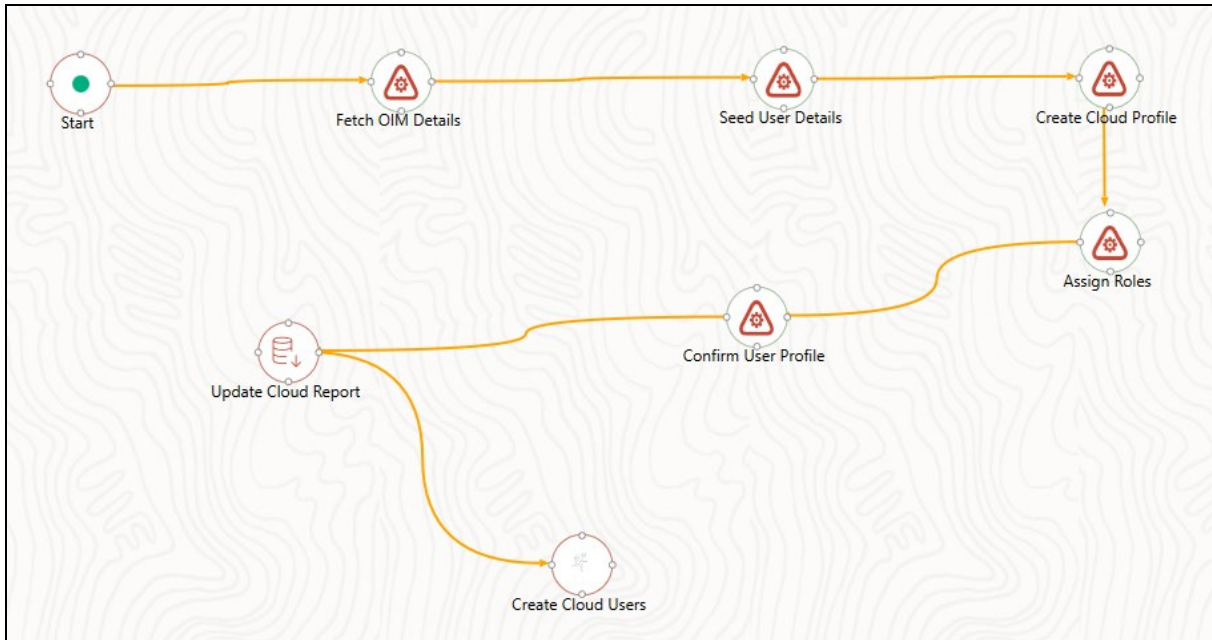

12. Configure the **LoadT2T** widget. For more information, see [Configuring OFSAA Tasks in Your Process Flow](#) section.
13. Drag and drop the Parallel Gateway widgets onto the Run widget to make the transition connection.
14. Click  Parallel Gateway from the toolbar and click on the drawing canvas where you want to place it.
15. Connect the RuleType2 and LoadT2T widgets onto the Parallel Gateway widget to make the transition connections.

You can drag and position the widgets to avoid overlapping widgets or transition lines.

12 Calling another Pipeline from Your Parent Pipeline

Reusability is important while designing your pipeline. Sub Pipeline is the mechanism in the PMF to call another pipeline from your parent pipeline. You can add filters to a Sub Pipeline. Then all Run Pipelines that are using the Sub Pipeline inherit those filters used in the Sub Pipeline.

Figure 71: Calling another Pipeline from Your Parent Pipeline

Topics:

- [How to Configure Sub Pipeline](#)

12.1 How to Configure Sub Pipeline

1. From the **Process Flow** tab, click  **Sub Pipeline** from the **Activity** toolbar and click the drawing canvas where you want to place it.
2. Double-click the  Sub Pipeline icon on the canvas. The **Sub Process Details** window is displayed.

Figure 72: Sub Process Details Window

3. Enter the details as given in the table:

Table 25: Sub Process Details Description

Field Name	Description
App Package ID	Select the Application Package from which you want to call a process, from the drop-down list. The package IDs that are seeded from the backend are displayed in the list.
Process ID	Select the Process that you want to call within your workflow, from the drop-down list. The list displays all processes defined for the selected Application Package.
Object ID	Select the Object ID from the drop-down list. Object ID is the entity ID used to identify if a workflow needs to be started from the beginning of the current stage. Object ID drop-down list is populated from the Data Fields.
Object Type	Select the object type from the drop-down list. Object Type is used to identify a workflow that is passed by the application.
Data field pass	Select Yes to pass the parameters passed to the parent workflow to be passed to the selected sub pipeline.

Field Name	Description
Calling Mode	<ul style="list-style-type: none"> • Synchronous – Select this option if you want the sub pipeline to complete before the flow moves to the next activity. • Asynchronous – Select this option if you do not want to wait for the sub pipeline to complete. Besides, the parent workflow proceeds to the next activity.

4. Mouse-over the Sub Pipeline icon to display the submenu.

Figure 72: Mouse-over Sub Pipeline Icon to display the Submenu

5. Click  to display the Filter details.

For more information on selecting Filters, see [Filter Details](#).

13 Configuring Email for Human Tasks

Following table entries should be made for setting Email notification:

- [AAI_EMAIL_CONFIG Table](#)
- [AAI_WF_APP_PACKAGE_B Table](#)
- [AAI_WF_APP_REGISTRATION Table](#)
- [AAI_WF_ACTIVITY_TASK_B Table](#)
- [AAI_USER_PREFERENCE Table](#)
- [AAI_WF_EMAIL_TEMPLATE Table](#)
- [AAI_WF_BULK_MAIL_TRIGGER Table](#)
- [CSSMS_USR_PROFILE Table](#)
- [AAI_MAIL_AUDIT_TRAIL Table](#)

13.1 AAI_EMAIL_CONFIG Table

This table holds the SMTP server configurations.

- V_PROTOCOL - SMTP
- V_HOST -SMTP/ Mail Server ID

NOTE If the SMTP HostName does not function or displays as invalid, use the IP address of the SMTP server in the AAI_EMAIL_CONFIG table.

- V_PORT - SMTP Server Port
- V_AUTHENTICATION - Either False or True
- V_USER_NAME - Login name to SMTP/ Mail Server ID from which mail is triggered. This is required if V_AUTHENTICATION is set as True.
- V_PASSWORD - Password to login into SMTP/ Mail Server. This is required if V_AUTHENTICATION is set as True.

Figure 73: AAI_EMAIL_CONFIG Table

	V_PROTOCOL	V_HOST	V_PORT	V_AUTHENTICATION	V_USER_NAME	V_PASSWORD	V_SECURITY
▶ 1	smtp	internal-mail-router.oracle.com	25	false			

13.2 AAI_WF_APP_PACKAGE_B Table

The AAI_WF_APP_PACKAGE_B table entry is for configuring email at the Application Level.

- Set the V_EMAIL_REQUIRED parameter value to Y in the AAI_WF_APP_PACKAGE_B table.

- Set V_EMAIL_TYPE as:
 - 0 – To receive no notification mails
 - 1 – To get mails instantly
 - 2 – To get bulk mail (Additionally, you need to set V_BULK_MAIL_TRIGGER value to Y in the AAI_WF_BULK_MAIL_TRIGGER table). A single mail is sent with all the pending notifications from the last trigger, as a PDF attachment. After the bulk mail is sent, the V_BULK_MAIL_TRIGGER value is automatically set to N.
 - 3 – To get mail with attachment

V_BULK_TEMP – This is used to set the template for the bulk emails. You can keep this blank if the bulk email is not set.

Figure 74: AAI_WF_APP_PACKAGE_B Table

V_APP_PACKAGE_ID	V_APP_PACKAGE_DESC	V_IS_EMAIL_REQUIRED	V_EMAIL_TYPE	V_BULK_TEMP	V_LANING_PAGE_URL	V_DEFINITION_PAGE_URL
1 100	Platform	N				
2 10	Business Restructure	Y				Restructure/manage_grid.jsp?userId={ASSIGNEEUSERS}&locale={WF_LOCALI...
3 11	Questionnaire	Y				solution/abc_qtnr/QtnrRedirectFromPMFInbox.jsp?appCode={appld}&appld={app...
4 3	Expense Management	Y	1	5		expense_edit.jsp?id={V_OBJECT_ID}

13.3 AAI_WF_APP_REGISTRATION Table

This table holds email configuration at the module or entity type level.

Set the V_IS_EMAIL_REQUIRED parameter value to Y in the AAI_WF_APP_REGISTRATION table.

Figure 75: AAI_WF_APP_REGISTRATION Table

V_APP_PACKAGE_ID	V_OBJECT_TYPE	V_IS_EMAIL_REQUIRED
1 10	BR	
2 11	QTNR	
3 100	MD_1	
4 3	1000	Y

13.4 AAI_WF_ACTIVITY_TASK_B Table

The AAI_WF_ACTIVITY_TASK_B table holds the email configuration at each activity (Task & notification) level.

Set the V_EMAIL_REQUIRED parameter value to Y against the task.

Additionally, you can set the V_EMAIL_TEMPLATE value based on the AAI_WF_EMAIL_TEMPLATE table.

Figure 76: AAI_WF_ACTIVITY_TASK_B Table

	V_PROCESS_ID	V_ACTIVITY_ID	V_TASK_ID	V_CONDITION_TYPE	V_EMAIL_REQUIRED	V_EMAIL_TEMPLATE
1	New	Job_1539062920201	1539062927787	2	Y	4
2	BR1	Activity_1430138133131	1430304038218			
3	BR1	Activity_1430138133131	1430304084815			
4	QTNR	Job_1468916517232	1496309128751	2	Y	2
5	QTNR	Job_1468916574725	1496295700502		Y	2
6	QTNR	Job_1496226571444	1496296080165	2	Y	2
7	QTNR	Job_1496226679422	1496309653931	2	Y	3
8	MD_1	Job_1472554718819	1472554888526	2	N	1

13.5 AAI_USER_PREFERENCE Table

In this table, you can set the user preference for receiving the notification emails.

Table 26: Email Notification User Preference

V_USER_ID	N_EMAIL_NOTIF_REQ
USER1	1
USER2	2

- 0 – To receive no notification emails
- 1 – To get mails instantly
- 2 – To get bulk mail (Additionally, you need to set V_BULK_MAIL_TRIGGER value to Y in the AAI_WF_BULK_MAIL_TRIGGER table). A single mail is sent with all the pending notifications from the last trigger, as a PDF attachment. After the bulk mail is sent, the V_BULK_MAIL_TRIGGER value is automatically set to N.
- 3 – To get mail with attachment

13.6 AAI_WF_EMAIL_TEMPLATE Table

This table is used to provide the template for the email that needs to be sent.

Figure 77: AAI_WF_EMAIL_TEMPLATE Table

	V_MAIL_FROM	V_MAIL_MESSAGE	V_MAIL_SUBJECT	V_APP_PACKAGE_ID	V_MAIL_TYPE	N_TEMPLATE_ID
1	workflow_test@oracle.com	<html> <body> <p> Hi [USERID]. </p> <p> This is to inform you that a [TASK_TY ...	[TASK_TYPE][ENTITYTYPE][ENTITYID][TITLE] ...	0	Notification	1
2	workflow_test@oracle.com	<html> <body> <p> Hi [USERID]. </p> <p> This is to inform you that a [TASK_TY ...	[TASK_TYPE][ENTITYTYPE][ENTITYID][TITLE] ...	0	Task	4
3	workflow_test@oracle.com	<html> <body> <p> Hi [USERID]. </p> <p> This is to inform you that this a mail dig ...	[ENTITYTYPE][NAME] Mail Digest	0	Bulk Task	5
4	workflow_test@oracle.com	<html> <body> <p> Hi [USERID]. </p> <p> This is to inform you that tasks are del ...	Delegation Notification	0	Delegation	2

13.7 AAI_WF_BULK_MAIL_TRIGGER Table

If you have set the N_EMAIL_NOTIF_REQ parameter to 2 in the AAI_USER_PREFERENCE table, additionally you need to set the V_BULK_MAIL_TRIGGER value to Y in the AAI_WF_BULK_MAIL_TRIGGER table.

13.8 CSSMS_USR_PROFILE Table

This table is used to store the email id of the users, to which the notification emails need to be sent.

Table 27: Email ID and User ID for Email Notification

V_USR_ID	V_EMAIL
USER1	user1@oracle.com
USER2	user2@oracle.com

13.9 AAI_MAIL_AUDIT_TRAIL Table

This is where all email trails are stored. The status changes after the emails are sent. This can be used for debugging purposes.

14 Process Monitor

The Process Monitor is used to monitor the current stage of the Process for different instances. After integration with an Application, the workflow can be invoked. After invoking it goes through all the stages defined. Process Monitor shows all the stages finished, current stage, and stages to come if any. Your user group needs to be mapped to the function role WFMACC (Workflow Monitor Access) to access the Process Monitor window.

Topics:

- [Monitoring a Business Process](#)
- [Viewing Activity Execution Logs](#)
- [Viewing Execution Log for Widgets](#)

Figure 78: Process Monitor Window

This window displays all the Workflows that are invoked from the Application with details such as Entity Name, Entity ID, Process Name, Process Description, Execution Start Time, Last Execution Time, Last Updated By, and Status.

Click to open the Process Monitor in a new window.

Click to display the following submenu for Run Pipeline:

Figure 78: Process Monitor Submenu

- Resume: Select to resume a Run Pipeline.

- Re-run: Select to execute a Run Pipeline again irrespective of the previous execution status.
- Abort: Select to abort an ongoing Run Pipeline.

Using the **Search** grid, you can search for a specific Pipeline by providing a keyword from Process ID, Process Name, or Process Description and clicking . Click  to reset the Search fields.

You can sort the Processes displayed in the **Process Monitor** window based on Entity Id, Entity Name, Process ID, or Process Name. Click  to go to the **Process Modeller** window.

14.1 Monitoring a Business Process

From the **Process Monitor** window, click the Entity ID link corresponding to the process you want to monitor.

Figure 79: Monitoring a Business Process

In the **Process Monitor** window, the status of the activity is represented as follows:

- : This indicates that the execution of the activity is successful.
- : This indicates that the activity is currently running or waiting for the user's input to proceed.
- : This indicates that the execution of activity is failed.
- No icon overlapping the activity indicates that it is yet to be executed.

Double click the  **Sub Pipeline** icon to monitor the tasks inside them.

Click  to refresh the window.

You can also set auto-refresh in the header. Select **Enabled** in **Auto Refresh**, enter a value from 1 to 10 in **Refresh Interval (In Min)** and then click **Apply**.

Figure 79: Configure Auto Refresh

The **Activity Execution** window shows all the execution stages of the process. Click anywhere outside the window to close the **Activity Execution** window.

14.2 Viewing Activity Execution Logs

This feature allows you to view logs of the execution of each activity from the Process Monitor window.

To view Activity execution logs:

1. Double-click an Activity to view the **Activity Execution** window. The Activity Definition details are displayed.

Figure 81: Activity Execution Details Window to View the Activity Execution Logs

2. Click the **Execution Log**  icon to view the activity execution log.

Figure 82: Activity Execution Logs Window

The log shows all the execution stages of the selected Activity if it is already executed. Otherwise, it is blank.

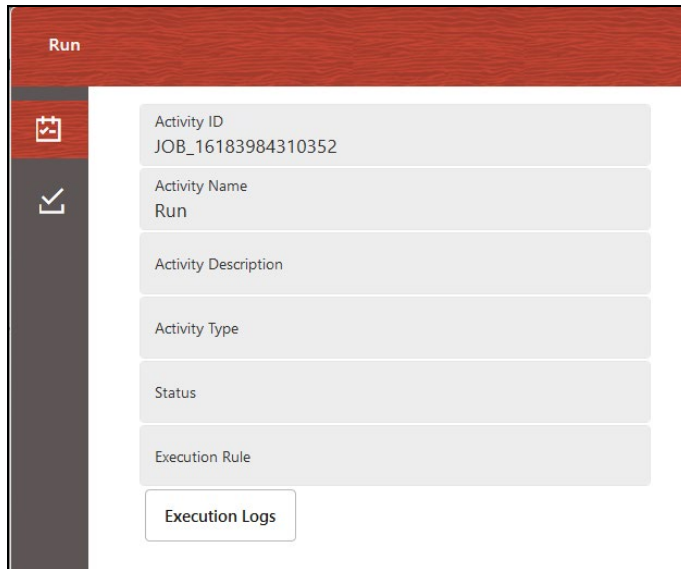

14.3 Viewing Execution Log for Widgets

This option allows you to view the execution logs for Widgets. This option is not available for Service Tasks or Human Tasks.

To view Execution logs, do as follows:

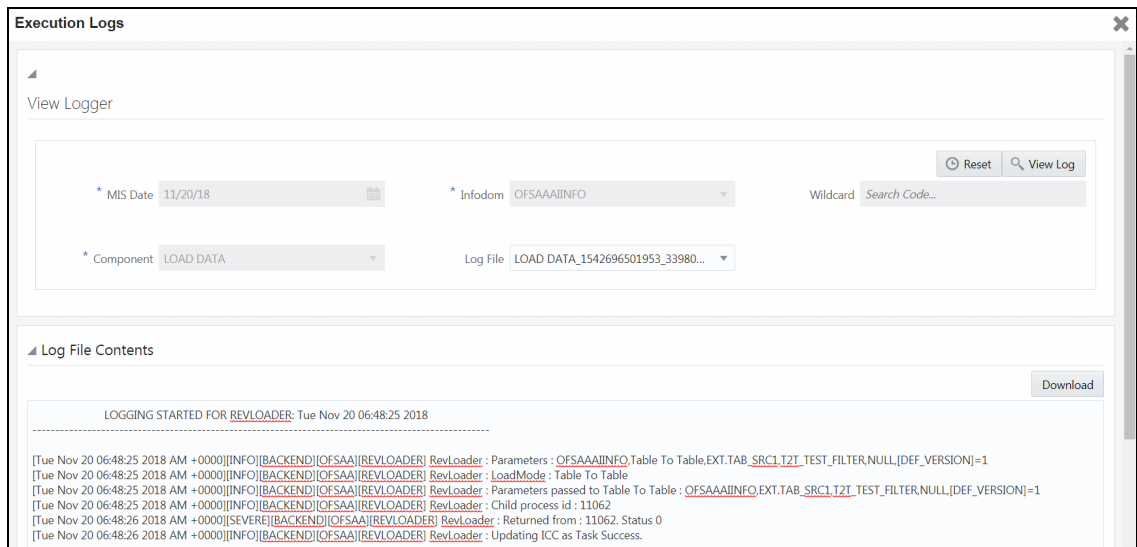

1. Double-click on the activity icon whose logs you want to view. The Activity Execution details are displayed.

Figure 83: Activity Execution Details Window to View the Execution Log for Widgets

2. Click **Execution Logs**.
3. Select the required **Log File** from the drop-down list and click **View Log**. The log information is displayed in the **Log File Contents** window

Figure 84: Log File Contents window

4. Click **Download** to download the execution log details.

15 Invoking PMF Pipeline

You can invoke a PMF pipeline using the following ways:

- [Application UI](#)
- [Within PMF Summary Screen UI](#)
- [Operations Module](#)
- [Command Line Execution](#)

15.1 Application UI

An application can invoke PMF in the following ways:

15.1.1 Java API

```
WorkflowEngineAPI.startWorkflowProcess( String objectId, String
objectType , String infodom, String segment, String userID, String
locale,Map<String, String> applicationParams,Map securityMap)
```

15.1.2 Stored Procedure

```
create or replace procedure startWorkflowProcessAsynch(objectId IN
VARCHAR2,
objectType IN VARCHAR2,
infodom IN VARCHAR2,
segments IN VARCHAR2,
userID IN VARCHAR2,
locale IN VARCHAR2,
appParams IN array_varchar,
secMap IN array_varchar) is
```

15.1.3 Rest Service

URL: <contextPath>/PMFService/startWorkflowProcess

Method: POST

Consumes("application/json")

Produces("text/plain")

Sample Input Params:

```
"{"SummaryPayload":{"objectId":"123","objecttype":"QTNR","infodom":"OFSAAIINFO","segment":"OFSAAIINFO","userid":"AAAIUSER","locale":"en_US","securitymap":{},"applicationparams":{"testparam":"value1","testparam2":"value2"}}}";
```

15.2 Within PMF Summary Screen UI

15.2.1 Using Execute Run

See the [Executing Run Pipeline](#) section on how to invoke a Run pipeline from the PMF screen.

15.3 Operations Module

Execution of a PMF Pipeline can be triggered from the Operations module as a batch.

1. From the **Batch Maintenance** window under the Operations module, create a new Batch.
For more information, see **Adding Batch Definition** section in the [OFS Analytical Applications Infrastructure User Guide](#).
2. Create a new Task with a task component as Workflow Execution.
For more information, see **Adding Task Details** section in the [OFS Analytical Applications Infrastructure User Guide](#).

NOTE To avoid entering the Object ID each time you run a batch, enter the value `$objectId` in the **Object ID** field. This automatically generates the ID in the OFSAA system.

Figure 86: Task Definition Window to Create a New Task

The screenshot shows a 'Task Definition' window with the following elements:

- Task ID:** Task1
- Description:** PMF Task
- Components:** WORKFLOW_EXECUTION
- Dynamic Parameters List:**

Property	Value
Datastore Type	EDW
Datastore Name	OFSIFRSINFO
Primary IP For Runtime Processes	whf00aix
Object ID	\$objectId
Workflow	pmf_cecl_run
Optional Parameters	
- Audit Panel:**
 - Created By:
 - Creation Date
 - Last modified by:
 - Last Modification Date

- a. Select the PMF Pipeline you want to execute from the **Workflow** drop-down list.
 - b. Enter any parameters you want to pass during the execution of the Pipeline in the **Optional Parameters** field.
 - c. Click **Save**.
3. Execute the Batch from the **Batch Execution** window.

For more information, see the **Batch Execution** section in the [OFS Analytical Applications Infrastructure User Guide](#).

15.4 Command Line Execution

A shell script file `wfExec.sh` is available in the `ficdb/bin` folder.

To execute the utility, navigate to `$FIC_DB_HOME/bin` and execute `wfExec.sh` with parameters such as `objectId`, `objectType`, `Infodomain`, `segments`, `userID`, `locale`, `appParams`, and `secMap`.

16 Event-Based Orchestration of Process Flow

The Event Framework integrated into PMF is an event-driven messaging framework that uses Apache Kafka (messaging server) to process information asynchronously and in near real-time. Producers that are either external applications or PMF internal processes, send messages (notify about an event occurrence) to Kafka Topic(s). Consumers, which are internal processes within PMF, read the messages from Kafka Topic(s) and execute other events or activities configured in the PMF Canvas. The framework uses the REST transfer protocol to send messages and the JSON data format to construct the messages.

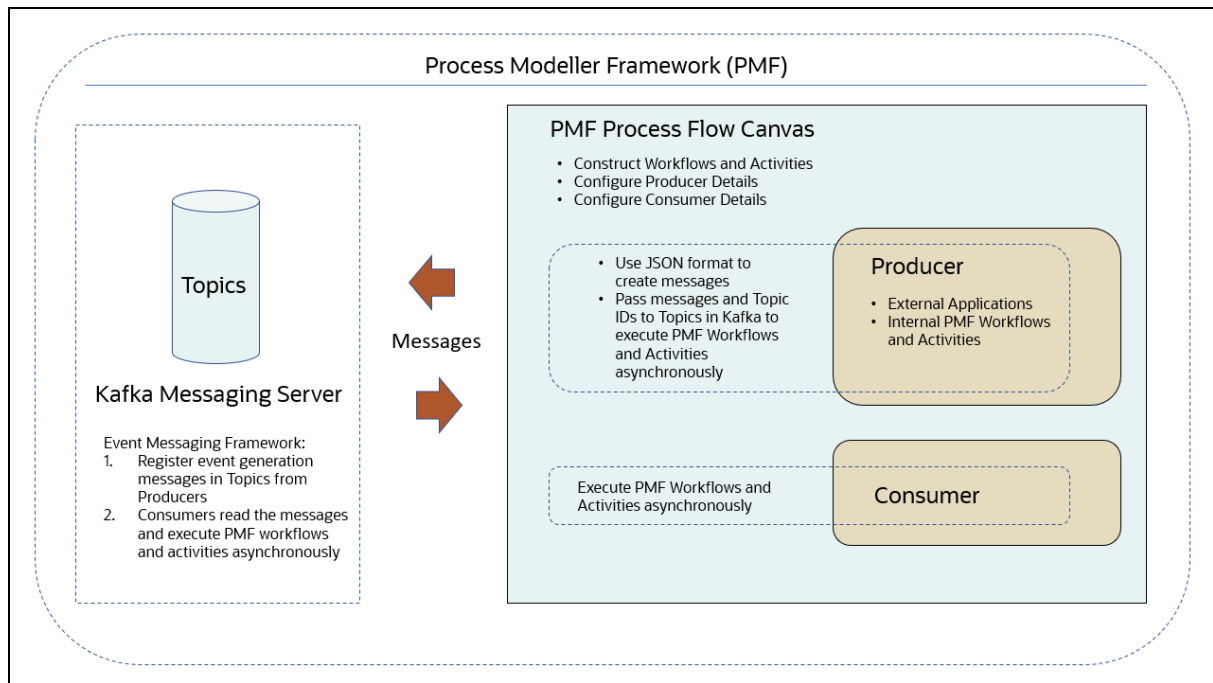

NOTE

The Event-Based Orchestration of Process Flow (based on Apache Kafka) feature requires that you apply the OFSAAIE Pack License in the OFSAA setup.

For more information, see the [OFSAAI Extension Pack Documentation](#).

The notification of the generation of an event to a Topic can execute a workflow or any individual task asynchronously. Previously, the orchestration of workflows in PMF followed a synchronous pattern and executed the activities in the order of sequence configured. In other words, the execution or completion of the activity was required before another activity in the workflow could be executed. However, with the integration of the Event Framework, in addition to the existing sequential workflow, you can now also execute asynchronously not only the workflows constructed in the PMF canvas but also individual activities within the workflows and in any order of the desired configuration.

Figure 1: The Event-Based Process Flow Workflow

Topics:

- [Producer Activity](#)
- [Consumer Activity](#)
- [Seed Data in the Event and Event Subtype Tables](#)
- [Create an Event Process Flow in the Process Modeller](#)
- [Configure an Event Producer](#)
- [Configure an Event Consumer](#)
- [Use Case: Event-Based Framework Execution in Real-time Transaction Monitoring](#)

16.1 Producer Activity

The Event Framework enables the Producers to create messages as per the JSON definition and invokes the Producer API by passing the message and the Topic ID. This message is recorded in the Event Framework Audit Table for reference purposes.

The Producer and Consumer of messages are mapped to the same Topic (a unique identifier for a data stream in Kafka) and the exchange of data takes place (In PMF, execution of Process Flows and Activities).

See the [JSON Definition for Events](#) section for information about JSON definition formats and examples.

16.2 Consumer Activity

The Event Framework enables the Consumer (internal processes in PMF) to make asynchronous requests to execute activities in a process flow based on the conditions of event occurrences. The messaging service can also be used by external applications to post messages to Topics in Kafka to execute events in individual components or execute the whole process asynchronously. In other words, activities do not have to wait for other activities to be completed (as in a synchronous request) and can be messaged to execute events scheduled for the specific activities.

The Producer and the Consumer of the messages routed through the Kafka messaging server are mapped to the same topic (mapped by Producer ID, Topic ID, and Consumer ID) for the following metadata types:

- Event Type
- Event Sub Type
- Event Source

16.3 Seed Data in the Event and Event Subtype Tables

The Event and Event Subtype Tables require the initial population of data (seeding) as a configuration step.

NOTE Before you can use the Event-based Orchestration of Process Flow, seed the data as discussed in this section. The seeding of data is a prerequisite configuration.

To Seed Data in the Event and Event Subtype tables, configure the arguments and Run the following script to add data to the Event Tables in the AAI Config Schema:

```
./SaveEventInfo.sh <EVENT_TYPE> <EVENT_SUB_TYPE> <EVENT_SOURCE>
<EVENT_DESCRIPTION> <LOCALE_CODE>
```

Table 27: Argument Description Table for Event Subtype Tables

Argument	Description
EVENT_TYPE	The type of classification at the Parent level for the various tasks. For example: The type of product such as Insurance, loans, and Deposits.
EVENT_SUB_TYPE	The further classification of the Parent level Event Type. For example: For the Loan Event Type, the subtypes such as long-term loans, short-term loans, and loan transfers.
EVENT_SOURCE	The Source of the OFSAA Application for the Event to be added.
EVENT_DESCRIPTION	The description of the Event that is to be added.
LOCALE_CODE	The locale for the UI.

For example:

```
./SaveEventInfo.sh ECMEVENT AML_DD ECM 'ECM_Type_EVENT' en_US
```

NOTE For more information about additional configurations related to Event Framework Metadata, see [Appendix C: Set Up Event Framework Metadata](#).

16.4 Create an Event Process Flow in the Process Modeller

Use the Activities in the PMF Canvas to create an Event Workflow and execute it so that the process of communication of data between the Producers (external applications or PMF internal processes) and

consumers (PMF internal processes) is established and the events are triggered from the PMF Canvas. Configure to execute each task independently as events in the process flow.

To create an Event Process Flow, follow these steps:

1. Log in to the OFSAA Application.
2. Click **Applications** from the Header to display the applications in the Tiles menu.
3. Select an Application.

For example, Financial Services Enterprise Modeling.

The Navigation Tree displays a menu.

4. Click **Common Tasks**,

NOTE

The navigation path to access the **Process Modelling Framework** window can vary in applications based on the Menu Tree configuration.

5. Select **Process Modelling Framework** to display a submenu.
6. Select **Process Modeller** from the submenu to display the **Process Modeller** window.
7. Click the **+** icon in the window to display the **Process Details** drawer window.

Figure 2: The Process Details Drawer Window

The screenshot shows a 'Process Details' drawer window with a red header. It contains several input fields and dropdown menus:

- Process ID:** 1612169930424 (read-only)
- Process Name:** Event Process Flow Demo
- Process Description:** A demo to show the Event Process Flow
- App Package ID:** Platform (dropdown)
- Type:** Workflow Pipeline (dropdown)
- Registered Topics:** (empty dropdown)
- Spark DB:** No (dropdown)
- Infodomain:** OFSAAIINFO (dropdown)
- Tag:** (empty text field)
- Segment:** CAPRSEG (dropdown)

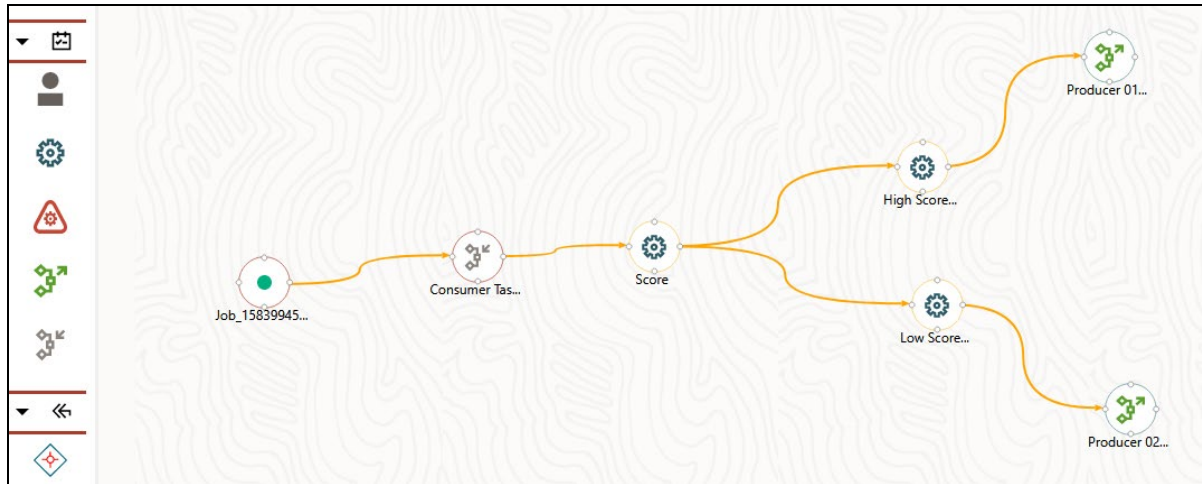

A green checkmark icon is visible at the bottom right of the drawer.

8. In the **Process Details** drawer window, enter the required details as follows:
 - a. Enter a name in the **Process Name** field. The **Process ID** field is created by the application and is read-only.
 - b. Enter a description for the process in the **Process Description** field.
 - c. Select **Platform** from the **App Package ID** drop-down.
 - d. Select **Workflow Pipeline** from the **Type** drop-down.
 - e. Do not select any value from **Registered Topics** as it does not apply to an event process.
 - f. Do not select any value from **Spark DB** as it does not apply to an event process.
 - g. Select the required Infodomain from the **Infodomain** drop-down.
 - h. Enter any appropriate tags in the **Tag** field. This field is optional.
 - i. Select the required application segment from the **Segment** drop-down.
9. After entering the details, click the **Accept**  icon to save it. The Process Flow is created and is displayed in the PMF Canvas. By default, a job of the type **START** is created on the Canvas.
10. Drag and drop the required activities from the **Activity** menu into the Canvas to construct the Process Flow.

11. Drag and drop the **Event Producer**  and **Event Consumer**  activities into the Canvas.
12. Click the  icon to save the process definition.

The following illustration provides a simple example of the Event Process Flow with Producer and Consumer activities displayed on the Canvas. For more information about configuring Consumers and Producers, see the [Configure an Event Consumer](#) and [Configure an Event Producer](#) sections.

Figure 3: A Simple Representation of Event Process Flow on the PMF Canvas

16.5 Configure an Event Producer

After adding an Event Producer activity on the Canvas, configure the activity. You can add details for Activity, Transition, and Notifications.

To configure an Event Producer, follow these steps:

1. Click an Event Process Flow in the **Process Modeller** window to display it in the PMF Canvas.
2. Double-click the **Event Producer**  activity icon, or click the **Edit Activity**  icon that displays when you mouse over the activity, to display the activity configuration details in the **Producer Activity** drawer window.

The window displays three tabs: **Activity** , **Transition** , and **Notifications** . The Activity tab requires mandatory details, whereas the Transition and Notifications tabs are optional.

To configure details in the Activity tab, follow these steps:

Figure 4: The Producer Activity Tab

The screenshot shows the 'Producer Activity Tab' configuration interface. The form is titled 'Producer ECM' and contains the following fields and sections:

- Activity Name:** Producer ECM
- Activity Desc:** EOD Balances for Current
- Activity Type:** Event Producer (read-only)
- Status:** (drop-down menu)
- Exclude Task:** No (drop-down menu)
- Producer Properties:**
 - Message Datafield:** WF_OUT_MSG (drop-down menu)
 - Topics:** ECM_TF_SWIFT (with a close button)
 - Event Type:** ECMEVENT (drop-down menu)
 - Event Sub Type:** AML_DD (drop-down menu)
 - Source:** ECM (drop-down menu)
 - Event Description:** ECM_Type_EVENT (read-only)

A green checkmark icon is visible in the bottom right corner of the form, indicating that the configuration is valid.

- a. Enter a name for the Producer Event in the **Activity Name** field.
- b. Enter a description for the Producer Event in the **Activity Description** field. By default, the **Activity Type** field displays as Event Producer and is read-only.
- c. Select the appropriate status from the **Status** drop-down.
- d. Select **Yes** or **No** from the **Exclude Task** drop-down.
- e. In the **Producer Properties** section, select the required type of message for the metadata from the **Message Datafield** drop-down.
- f. Select the required topics from the **Topics** drop-down.
Topics is a virtual group(s) that stores or publishes data. It can have multiple consumers subscribing for the information.
- g. Select the required event type from the **Event Type** drop-down.
The type of classification at the Parent level for the various tasks.
For example:
The type of the product such as Insurance, Loan, and Deposits.

- h. Select the required event subtype from the **Event Sub Type** drop-down.

The further classification of the Parent-level Event Type.

For example:

The subtype for the Loan Event Type such as long-term loans, short-term loans, and loan transfers.

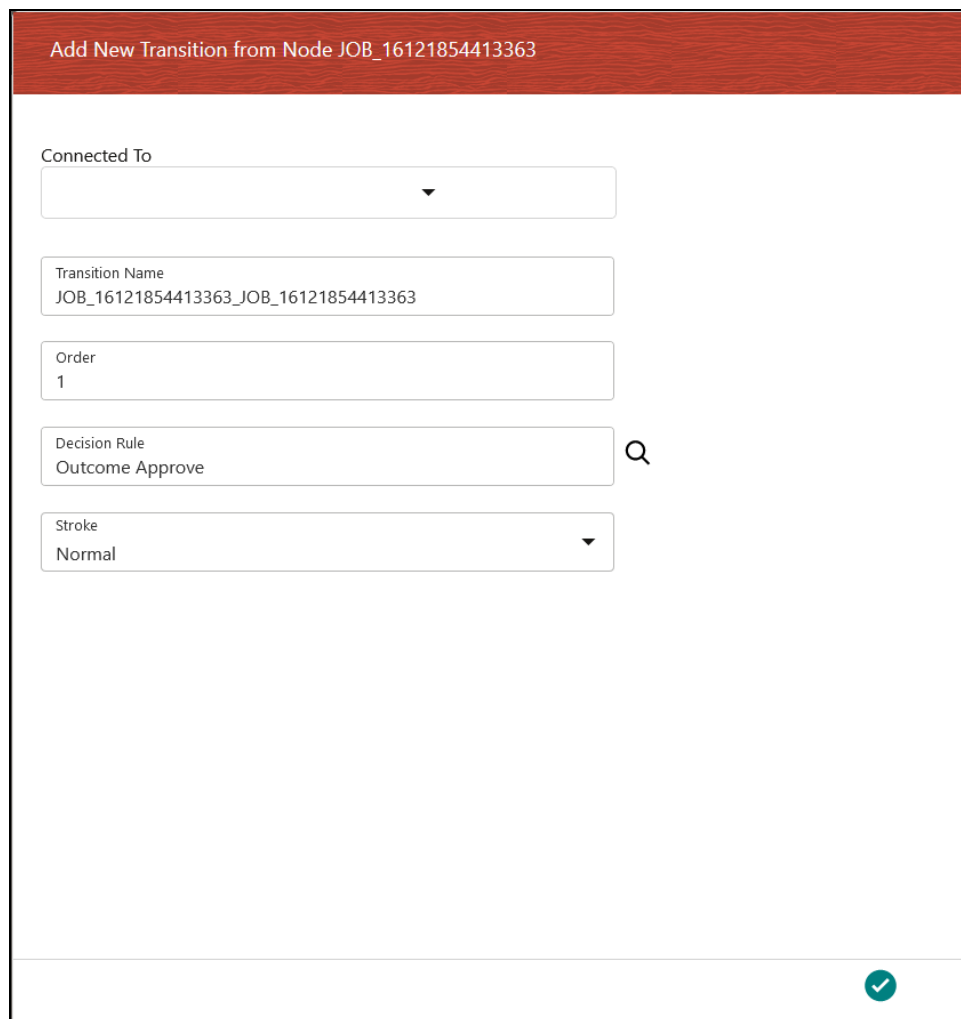

- i. Select the required source OFSAA application from the **Source** drop-down.

The **Event Description** field is populated based on the selection in the **Event Sub Type** drop-down.

- j. After entering the details, click the **Accept**  icon to save the details.

To configure details in the Transition tab, follow these steps:

Figure 5: The Transition Tab

The screenshot shows a web form titled "Add New Transition from Node JOB_16121854413363". The form contains several input fields:

- Connected To:** A dropdown menu.
- Transition Name:** A text field containing "JOB_16121854413363_JOB_16121854413363".
- Order:** A text field containing "1".
- Decision Rule:** A text field containing "Outcome Approve" with a search icon (magnifying glass) to its right.
- Stroke:** A dropdown menu containing "Normal".

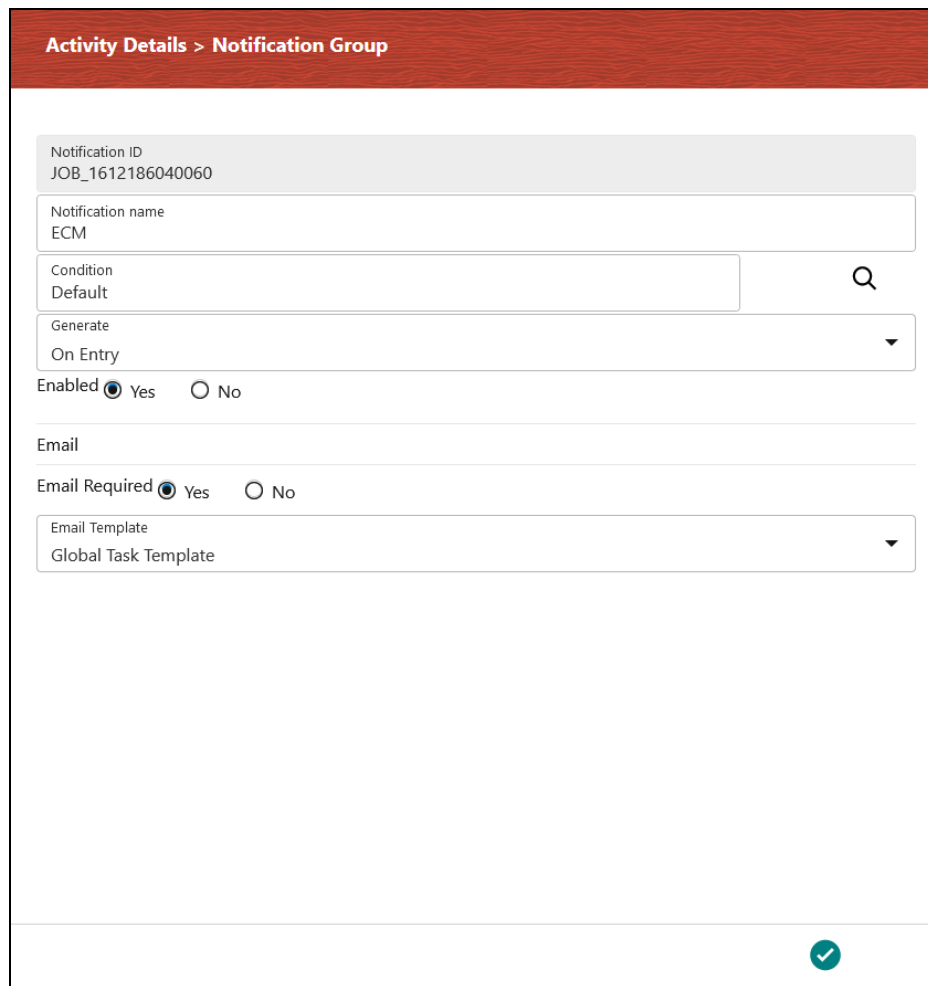

A green checkmark icon is located in the bottom right corner of the form area.

- a. Click the **Transition** tab.

- b. Click the  icon to display the fields required for transition details.
- c. Select the required job to be connected to from the **Connected To** drop-down.
- d. Enter a name for the transition in the **Transition Name** field.
- e. Enter the order of execution in the **Order** field. For example, 1 marks the order as to be executed first.
- f. Click the **Search** icon from the **Decision Rule** drop-down and select the required application rule. Click the **Accept**  icon to save the details.
- g. Select the stroke format from the **Stroke** drop-down.
- h. After entering the details, click the **Accept**  icon to save the details.

To configure details in the Notifications tab, follow these steps:

Figure 6: The Notifications Tab

Activity Details > Notification Group

Notification ID
JOB_1612186040060

Notification name

Global Task Template

- a. Click the **Notifications** tab.

- b. Click the  icon to display the fields required for the Notifications.
- c. Enter a name for the notification in the **Notification Name** field. The **Notification ID** field is auto-populated based on the ID from the application.
- d. Click the **Search** icon from the **Condition** drop-down and select the required application rule. Click the **Accept**  icon to save the details.
- e. Select the condition to generate the notification from the **Generate** drop-down.
- f. Select **Yes** in the **Enabled** field to activate the notification.
- g. In the **Email** section, select **Yes** in the **Email Required** field to select to receive the notification through email. Select **No** to disable this option.
- h. Select the required email template from the **Email Template** field.
- i. Click the **Accept**  icon to save the details.

16.6 Configure an Event Consumer

After adding an Event Consumer activity on the Canvas, configure the activity. You can add details for Activity, Consumer, Implementation, and Notifications.

To configure an Event Consumer, follow these steps:

1. Click an Event Process Flow in the **Process Modeller** window to display it in the PMF Canvas.
2. Double-click the **Event Consumer**  activity icon, or click the **Edit Activity**  icon that displays when you mouse over the activity, to display the activity configuration details in the **Producer Activity** drawer window.

The window displays four tabs: **Activity** , **Consumer** , **Implementation** , and **Notifications** . The details in the Notification tab are optional.

To configure details in the Activity tab, follow these steps:

Figure 7: The Consumer Activity Tab

Screening Transaction Msg

Activity Name

Consumer Capacity
200

- a. Enter a name for the Consumer Event in the **Activity Name** field.
- b. Enter a description for the Consumer Event in the **Activity Description** field. By default, the Activity Type field displays as Event Consumer and is read-only.
- c. Select the appropriate status from the **Status** drop-down.
- d. Select **Yes** or **No** from the **Exclude Task** drop-down.
- e. In the **Consumer Properties** section, the following fields are displayed based on the selection in the [Configure an Event Producer](#) window:
 - f. The selected topic from the **Topics** drop-down.
 - g. The selected event type from the **Event Type** drop-down.
 - h. The selected event subtype from the **Event Sub Type** drop-down.
 - i. The selected source OFSAA application from the **Source** drop-down.

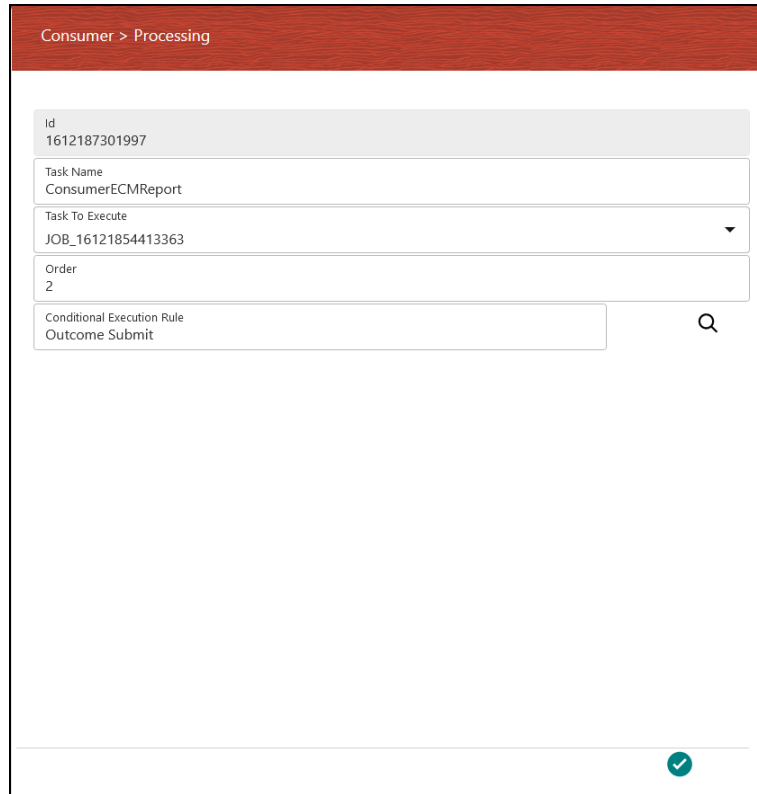

The **Event Description** field is populated based on the selection in the Event Sub Type drop-down.
- j. Consumer Count – The number of threads to be created for a given consumer.
- k. Consumer Capacity – indicates the number of messages that each of the threads can process.

NOTE By default, the Consumer Count is 2 and Consumer Capacity is 200.

- I. After entering the details, click the **Accept**  icon to save the details.

To configure details in the Consumer tab, follow these steps:

Figure 8: The Consumer Tab

The screenshot shows a configuration form for a consumer task. The breadcrumb at the top reads "Consumer > Processing". The form contains the following fields:

- Id:** 1612187301997
- Task Name:** ConsumerECMReport
- Task To Execute:** JOB_16121854413363 (selected from a dropdown menu)
- Order:** 2
- Conditional Execution Rule:** Outcome Submit (with a search icon to the right)

A green checkmark icon is visible at the bottom right of the form, indicating the configuration is complete.

- a. Enter a name for the consumer task in the **Task Name** field. By default, the **ID** field displays the unique identifier for the consumer task.
- b. Select the appropriate jobs from the **Tasks To Execute** drop-down.
- c. Enter the order of execution in the **Order** field. For example, 1 marks the order as to be executed first.
- d. Click the **Search** icon from the **Conditional Execution Rule** drop-down and select the required application rule. Click the **Accept**  icon to save the details.

To configure details in the Implementation tab, follow these steps:

Figure 9: The Implementation Tab

JOB_16121854413374

Post Rule
None

- Click the **Implementation** tab to select the rules required for the execution.
- Select the required infodom from the **Infodom** drop-down.
- Click the  icon to display the popup with fields required for the **Parameters** section.
- Select the required job to be connected to from the **Connected To** drop-down.
- Select the required data field from the **Data Fields** drop-down.
- Select the required parameter type from the **Parameter Type** drop-down. The options are **Dynamic** and **Static**. If you select **Static**, then enter the value in the **Value** field. Click the **Accept**  icon to save the details.
- In the Pre/Post Processing section, click the **Search** icon from the **Pre Rule** drop-down and select the required application rule to be executed before the processing of the event. Click the **Accept**  icon to save the details.
- Click the **Search** icon from the **Post Rule** drop-down and select the required application rule to be executed after the processing of the event. Click the **Accept**  icon to save the details.
- After entering the details, click the **Accept**  icon to save the details.

To configure details in the Notifications tab, follow these steps:

Figure 10: The Notifications Tab

The screenshot shows a configuration form for a notification. The header is 'Activity Details > Notification Group'. The form has several sections:

- Notification ID:** JOB_1612186040060
- Notification name:** ECM
- Condition:** Default (with a search icon to the right)
- Generate:** On Entry (with a dropdown arrow)
- Enabled:** Yes (selected with a radio button), No
- Email:** (empty field)
- Email Required:** Yes (selected with a radio button), No
- Email Template:** Global Task Template (with a dropdown arrow)

A green checkmark icon is located at the bottom right of the form.

- a. Click the **Notification** tab.
- b. Click the **Add**  icon to display the fields required for the Notifications.
- c. Enter a name for the notification in the **Notification Name** field. The **Notification ID** field is auto-populated based on the ID from the application.
- d. Click the **Search** icon from the **Condition** drop-down and select the required application rule. Click the **Accept**  icon to save the details.
- e. Select the condition to generate the notification from the **Generate** drop-down.
- f. Select **Yes** in the **Enabled** field to activate the notification.
- g. In the **Email** section, select **Yes** in the **Email Required** field to select to receive the notification through email. Select **No** to disable this option.
- h. Select the required email template from the **Email Template** field.

- i. Click the **Accept**  icon to save the details.

16.7 Use Case: Event-Based Framework Execution in Real-time Transaction Monitoring

The operational mechanism of the Event Processing Pipeline is better understood with a Use Case that describes the execution of real-time Transaction Monitoring.

The following steps describe the Use Case Configuration:

1. The transactions that are to be monitored and honored are published by the Core Banking System, or the Payment Gateway, to a predefined Kafka Topic.
2. The Process Modeling Framework facilitates the configuration of a Kafka Consumer which listens to the Topic.
3. The Consumer allows configuring an Event Processing Hook (Handler) which auto-pilots any further processing that is to be done by the Handler. The Business Processing Logic starts as a part of the tasks processed by the Handler.
4. The Handler computes a complex score based on the various fields that are part of the message.

For example, the transaction amount added to the transaction withdrawal profile set for the customer for a specific look-back period exceeds a threshold and so cannot be honored.

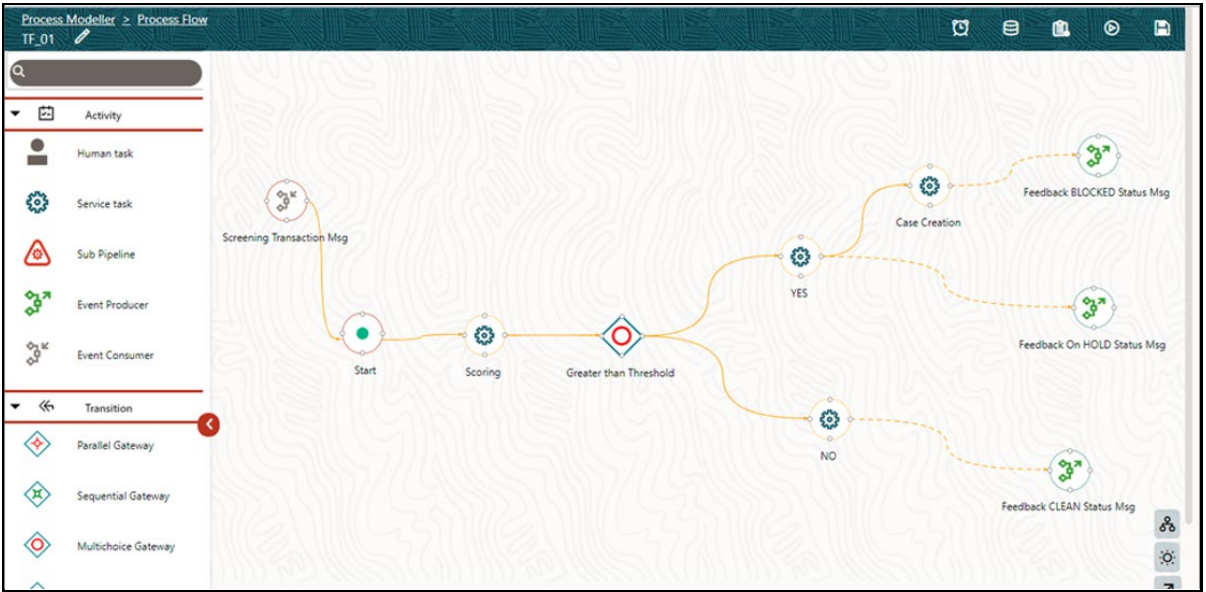

5. A Decision Rule is configured in the Process Modelling Framework, which takes a different decision path of honoring the transaction, or rejecting the transaction, or set it up to be reviewed by a transaction filtering flow.
6. The Event Producer, which shows up further in the flow, is configured to send an appropriate message to the Core Banking System, or the Payment Gateway, based on a decision of honoring the transaction or blocking it. The Handler can be configured to produce the message and publish it back to a Topic for the Core Banking System, or Payment Gateway, to listen.
7. A loosely coupled Pipeline Event can be orchestrated using the event processing capability built in the Process Modelling Framework.

Figure 11: Use Case Flow Chart for Transaction Monitoring

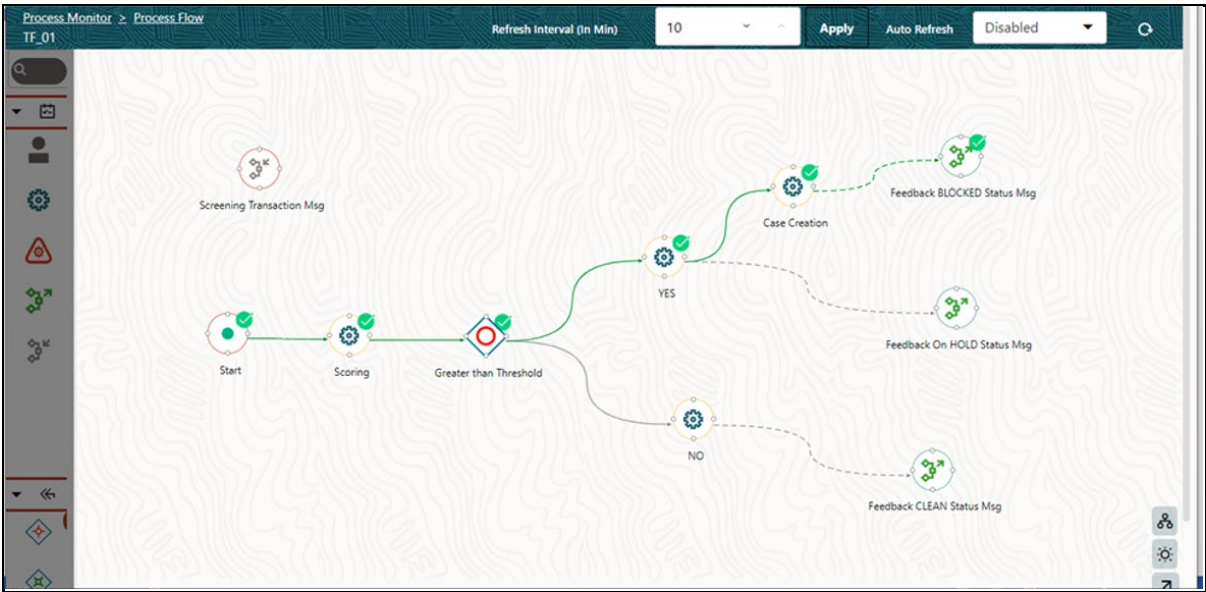

The following illustrations of the Process Monitoring Window provide a visual view of the execution path the message has traveled:

Figure 12: Process Monitoring Window Showing Execution Path

The execution path of the transactions and the various data fields that determined the execution path can be monitored using the monitoring capability within PMF. The information shows the lineage of the data flow which has resulted in the transaction being honored or blocked or put on hold.

Figure 13: Process Monitoring Window Showing Lineage of Data Flow

17 Timer

You can use the Timer feature in Process Modeller to execute activities within a Process Flow, at a set time and frequency in the future. If you have set Timers to auto-trigger the execution of the PMF process, then after a certain duration it will re-trigger, if activities pause.

Topics:

- [Configure a Timer](#)
- [Use Case: Timer Execution on a Questionnaire Workflow](#)

To access the **Timer Details** drawer window, follow these steps:

1. Click a Process Flow from the list in the **Process Modeller** window to display it in the PMF Canvas.
2. Click the **Timer**  icon from the header of the PMF Canvas to display the **Timer List** drawer window.

Figure 14: The Timer in the PMF Canvas Header

3. Click the following icons in the **Timer List** window for specific features:

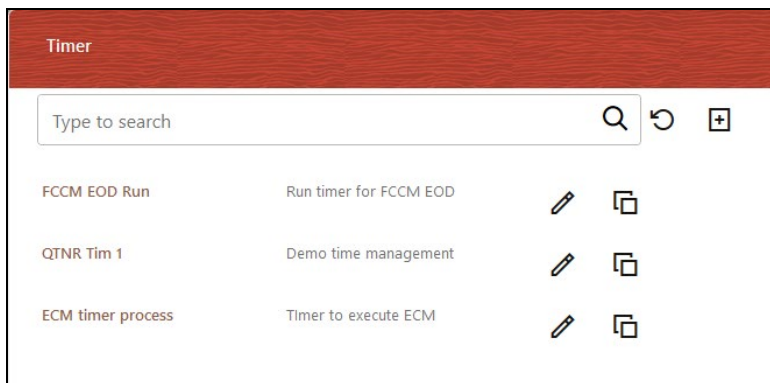

- **Add**  : To add a Timer.
- **Edit**  : To edit a Timer.
- **Copy**  : To copy a Timer and create another with similar details.

Figure 15: The Timer List Window

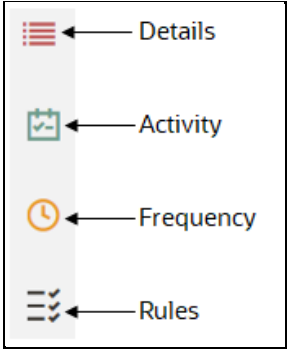

Click the icons in the **Timer List** window to display configuration details in the **Timer Details** drawer window. The window displays the following tabs:

- **Details:** The window to configure timer identification details.
- **Activity:** The window to map activities that are in the process to the timer.

- **Frequency:** The frequency of execution of the timer.
- **Rules:** The list of all application rules mapped to the process flow.

Figure 16: Tabs in the Timer Details Window

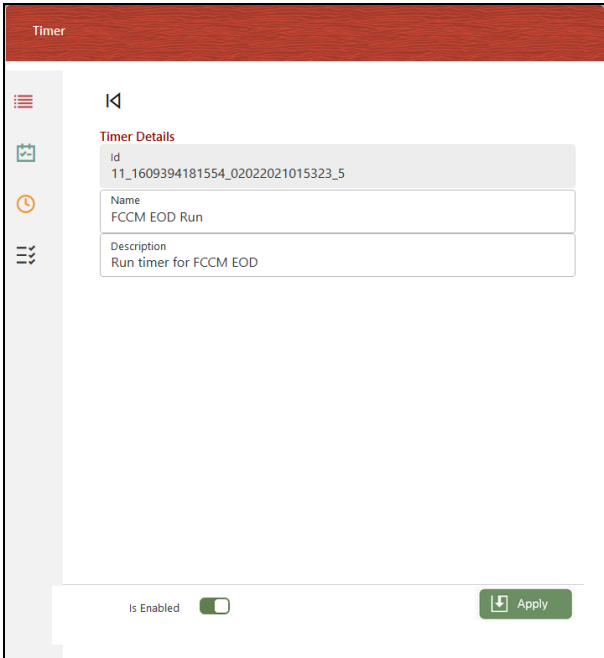

17.1 Configure a Timer

To configure a Timer, follow these steps:

1. Click a Process Flow in the **Process Modeller** window to display it in the PMF Canvas.
2. Click the **Timer**  icon from the toolbar to display the **Timer** drawer window.
3. Click the **Add**  icon to configure in the **Timer Details** window.

To configure Timer details in the Details tab, follow these steps:

Figure 17: The Timer Details Tab

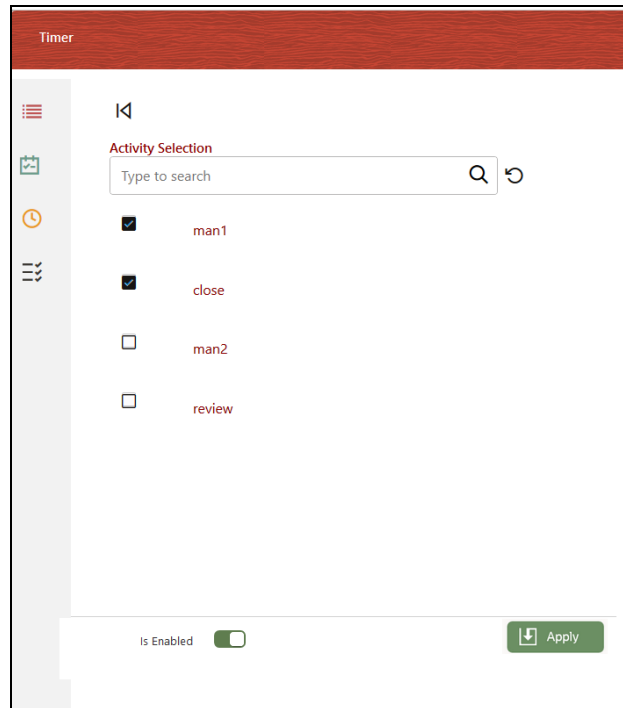

- a. Enter a name for the Timer in the **Name** field. The application auto-populates the **Id** field with a unique identifier and is read-only.
- b. Enter a description for the Timer in the **Description** field.

You have to map the Timer to an activity on the canvas from the Activity tab.

To configure details in the Activity tab, follow these steps:

Figure 18: The Activity Tab

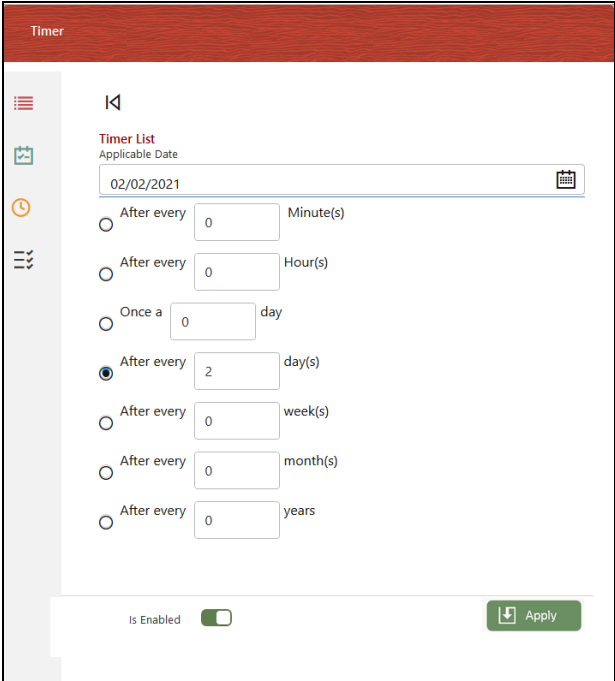

- a. Click the **Activity** tab.
- b. Select the required activities from the list. These activities are the activities that exist in the Process Flow Canvas.

After mapping an Activity to the Timer, you must set the frequency of execution of the rule on the activity from the Frequency tab.

To configure details in the Frequency tab, follow these steps:

Figure 19: The Frequency Tab

- a. Click the **Frequency** tab to set the frequency of execution of the timer.
- b. Select the date from which the timer is required to start executing in the **Applicable Date** date-picker.
- c. Select the required frequency from the following and enter a value:
 - After every Minute(s)
Enter the number of minutes after which to execute the Timer. The timer is executed recurringly after the entered number of minute(s) elapses.
 - After every Hour(s)
Enter the number of hours after which to execute the timer. The timer is executed recurringly after the entered number of hour(s) elapses.
 - Once a day
Select the Once a day option if you want the timer to run only once.
 - After every days(s)
Enter the number of days after which to execute the timer. The timer is executed recurringly after the entered number of day(s) elapses.
 - After every weeks(s)
Enter the number of weeks after which to execute the timer. The timer is executed recurringly after the entered number of week(s) elapses.
 - After every month(s)

Enter the number of months after which to execute the timer. The timer is executed recurringly after the entered number of month(s) elapses.

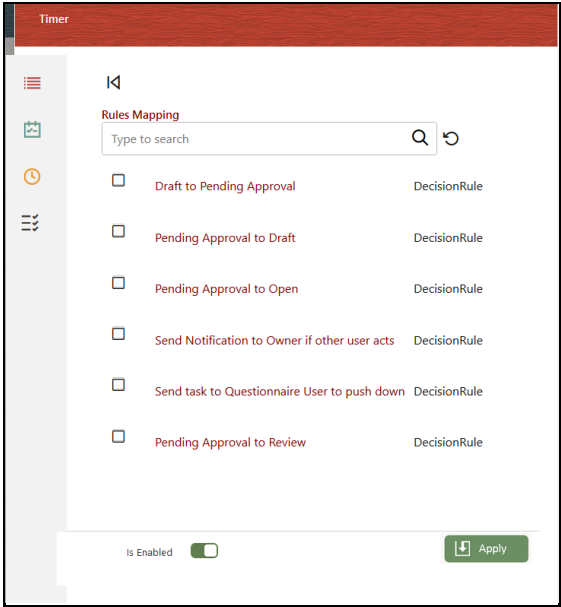

— After every year(s)

Enter the number of years after which to execute the timer. The timer is executed recurringly after the entered number of year(s) elapses.

After you set the frequency, you must map the activity to execute the selected rule(s). The Timer executes the selected rules on the activity for the set frequency.

To map rules to the Timer from the Rules tab, follow these steps:

Figure 20: The Rules Tab

- a. Click the **Rules** tab.
- b. Select the rules required from the list.

NOTE You can select only:

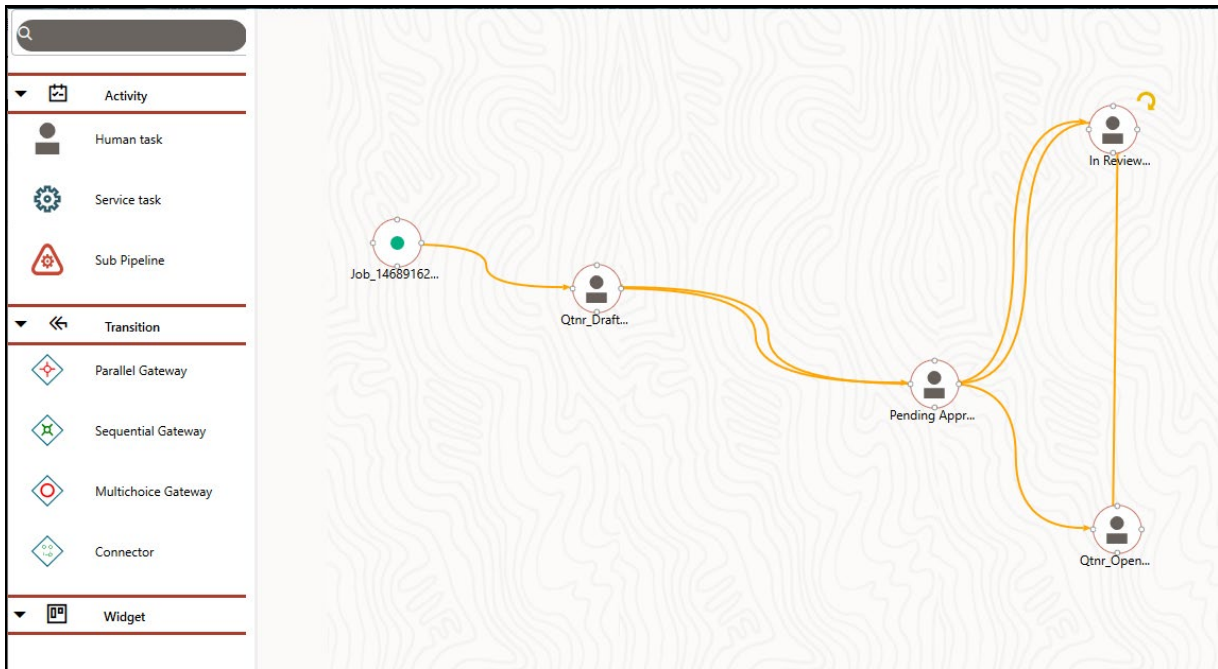

- 1. Decision and Execution Rules from the Rules Mapping list.
- 2. One Decision Rule from the Rules Mapping list to avoid conflict in the Decision Rule execution.
- 3. After the execution of a decision rule, the Timer stops retriggering or executing.

- 4. Click the **Apply**  icon to save the details. Select the **Is Enabled**  toggle button to enable the Timer. If you keep it in the Deselect state, the Timer will not be enabled. However, you can enable it later when required.

17.2 Use Case: Timer Execution on a Questionnaire Workflow

The application and functioning of the Timer feature can be better understood by showing it to you in a use case. In this scenario, suppose that the Questionnaire in PMF is orchestrated with a workflow as shown in the following illustration:

Figure 21: Example of a Questionnaire Workflow Orchestrated on the Canvas

On the canvas, you see a process flow of activities, which are manual. In other words, they depend on human intervention for the execution of actions to move to the next activity. Use Timers to execute certain application rules recurrently on the activities on the canvas after a while lapse if the manual activity has not been executed.

Let us configure a Timer system on the preceding Questionnaire Process Flow.

NOTE For instructions on how to configure the Timer details in the PMF UI, see the [Configure a Timer](#) section.

Figure 22: List of Timers Created for the Questionnaire

Timer		
<input type="text" value="Type to search"/> 🔍 ↺ +		
PendAppr2InRev	A Timer to move Questionnaires in Pending Approval status to In Review recurringly after 2 days.	✎ 📄
Draft2PenAppr	A Timer to move Questionnaires in Draft status to Pending Approval recurringly after 5 days.	✎ 📄

As shown in the previous illustration, there are two timers created: one for the Draft activity on the canvas and the other for the Pending Approval activity. We will go into the details in the following on how to configure these Timers to execute these activities.

Timer to execute the movement of questionnaires in the Draft status to the Pending Approval status every five days.

- a. Details: Entered name and description for the Timer.
- b. Activity: Selected the Questionnaire Draft activity from the list of activities. So, the timer is mapped to this activity.
- c. Frequency: Selected After Every _ Days and entered 5 in the field after selecting the applicable date. The frequency of the execution of the timer is set to execute application rules on the activity every five days.
- d. Rules: Selected the Draft to Pending Approval Decision Rule. The activity is mapped to execute the rule.

The result is that the Timer will execute the application rule and might move a questionnaire that has been in the Draft status for five days to the Pending Approval status if users do not move it manually.

Similarly, the Timer to execute the movement of a questionnaire in the Pending Approval status to the In Review status every two days is configured.

The result is that the Timer will execute the application rule and might move a questionnaire that has been in the Pending Approval status for two days to the In Review status if users do not move it manually.

18 Appendix A

Topics:

- [Configuring Group Approval for Human Tasks](#)
- [JsonPath Expressions](#)
- [Delegation](#)
- [JSON Definition for Events](#)

18.1 Configuring Group Approval for Human Tasks

Group approval/Group Consensus can be used to decide whether the flow has to move to a particular activity based on the response of a single member, majority of members of the group, or all members of the group. If more than one group is present, then you can design to move the flow to a particular activity based on the response of a single group, all groups, or the majority of groups.

18.1.1 Configuring Parallel Group Approval

Parallel group approval is used when you want to send the task to all users in the task group simultaneously.

To configure parallel group approval:

1. Log in to the OFSAA Application.
2. Click **Administration**  from the **Header** to display the administration tasks in the **Tiles** menu.
3. Select the required **Information Domain** from the drop-down list.
4. Select **Process Modelling Framework** to display a submenu.
 1. Select **Process Modeller** from the submenu to display the **Process Modeller** window.
 2. From the **Process Modeller** window, select the required Process and click to open. The **Process Flow** tab is displayed.
 3. Double-click the Activity for which you want to configure user approval.
 4. On the window, click the  icon to display the **Actions** window.
 5. Click **Group Approval** to configure group approval to display the **Group Approval Details** window.

Figure 87: Group Approval Details Window to Configure Parallel Group Approval

The screenshot shows a window titled "Group Approval" with a red header. Under "Routing Policy", the "Parallel" radio button is selected. Under "Parallel Voting Policy", there is a table with two rows. The first row has "Target Activity" as "JOB_16179594612354", "Voting Formula" as "Approved by anyone from ev...", and "Value" as an empty field. The second row has "Target Activity" as "JOB_1617712889162", "Voting Formula" as "Approved by overall majority", and "Value" as "51%". Below the table is a "Default Target Activity" dropdown menu. A green checkmark icon is in the bottom right corner.

6. Select **Parallel** to configure parallel group approval.
7. Click **Add**. A row is added to define the voting formula for target activity.

NOTE

It is recommended that you define the voting formula for all activities. If a voting formula is not defined for an activity and if someone in a task group selects that activity, the workflow moves to that activity.

8. Select the required **Target Activity** from the drop-down list.
9. Select the required option from the **Voting Formula** drop-down list. The options are:
 - **Approved by anyone**- If any one of the users from any task group chooses the selected **Target Activity**, the flow moves to the selected activity. If no one chose it, it checks for the voting formula defined for the next Target Activity.
 - **Approved by anyone from every Group**- If at least one user from every task group chooses the selected **Target Activity**, the flow moves to that activity.
 - **Approved by overall majority**- If the majority of the users from all task groups choose the selected **Target Activity**, the flow moves to that activity. For example, if there are 2 task

groups and 15 users in each group, then at least 16 users (majority of 30 users) should choose the selected **Target Activity**, for the flow to proceed to that activity.

- **Approved by majority from each Group**- If the majority of the users from each task group choose the selected **Target Activity**, the flow moves to that activity. For example, consider there are 3 task groups and each group has 15 users, then from each group, at least 8 users should favor the Target Activity to move the flow to that activity.
 - **Approved by everyone**- All the users in all the task groups should choose the selected **Target Activity** for the flow to move to that activity.
 - **Approved by overall percentage**- If the specified percentage of users in the task group chooses the selected **Target Activity**, the flow moves to that activity. Enter the percentage in the **Value** field.
10. Select the **Default Target Activity** from the drop-down list. This is the activity that is executed if none of the conditions is satisfied.
 11. Click the **Accept**  icon to save it

18.1.2 Configuring Sequential Group Approval

Sequential Group approval is used when you have multiple tasks for an activity.

To configure sequential group approval:

1. Log in to the OFSAA Application.
2. Click **Administration**  from the **Header** to display the administration tasks in the **Tiles** menu.
3. Select the required **Information Domain** from the drop-down list.
4. Select **Process Modelling Framework** to display a submenu.
5. Select **Process Modeller** from the submenu to display the **Process Modeller** window.
6. From the **Process Modeller** window, select the required Process and click to open.
The **Process Flow** tab is displayed.
7. Double-click the Activity for which you want to configure user approval.
8. On the window, click the  icon to display the **Actions** window.
9. Click **Group Approval** to configure group approval to display the **Group Approval Details** window.

Figure 88: Group Approval Details Window to Configure Sequential Group Approval

The screenshot shows a configuration window titled "Group Approval". Under "Routing Policy", the "Sequential" radio button is selected. Under "Sequential Voting Policy", the "Condition to trigger intragroup" dropdown is set to "Responded By Everyone in Each Group". Below this, there are three fields: "Target Activity" (empty), "Voting Formula" (set to "Approved by overall percenta..."), and "Value" (set to "51%"). Under "Trigger", the "Immediately Trigger Voted Outcome when minimum percentage is met" radio button is selected, and the "Default Target Activity" dropdown is empty. A green checkmark is visible in the bottom right corner of the window.

10. Select **Sequential** to configure sequential group approval.
11. Select the **Condition to trigger intragroup** from the drop-down list. Intragroup is the task group of each task in a particular activity. The sequence in which each intragroup will be considered for voting is based on the sequence in which the tasks are added in the **Task Stage** window in the **Actions** tab. The options are:
 - **Responded by a Member from the Group**- If anyone from the task group of the first task responds, it goes to the next task group and waits till someone from that task group responds and so on.
 - **Responded by Overall Majority**- If the majority of users in the task group of the first task respond, it goes to the next task group and waits till the majority of users in the task group of the second task respond and so on.
 - **Responded by Everyone in each Group**- Once all users in the task group of the first task have responded, it moves to the next task group. Then it waits till everyone in the second task group responds and so on.
12. Click **Add**. A row is added to define the voting formula for target activity.

NOTE

It is recommended that you define a voting formula for all activities. If a voting formula is not defined for an activity and if someone in a task group selects that activity, the workflow moves to that activity.

13. Select the required **Default Target Activity** from the drop-down list. This is the activity which will be executed if none of the condition is satisfied.
14. Select the required option from the **Voting Formula** drop-down list. The options are:
 - **Approved by anyone from all the groups**- If anyone selects the Target Activity, the flow moves to that activity.
 - **Approved by Overall Majority**- If the majority of the users select the Target Activity, the flow moves to that activity.
 - **Approved by Everyone in each group**- If everyone in the group selects the Target Activity, the flow moves to that activity.
 - **Approved by Overall Percentage**- Provide the percentage in the Value field. If the specified percentage of the users select the Target Activity, the flow moves to that activity.
15. Select the activity which needs to be executed if the condition fails, from the **Default Target Activity** drop-down list.

18.2 JsonPath Expressions

JsonPath expressions always refer to a JSON structure in the same way as XPath expression is used in combination with an XML document. The "root member object" in JsonPath is always referred to as \$ regardless if it is an object or array.

JsonPath expressions can use the dot-notation

```
$.store.book[0].title
```

or the bracket-notation

```
$('#store')['book'][0]['title']
```

18.2.1 Operators

Table 28: Operator Description table

Operator	Description
\$	The root element to query. This starts all path expressions.
@	The current node being processed by a filter predicate.
*	Wildcard. Available anywhere a name or numeric are required.
..	Deep scan. Available anywhere a name is required.
.<name>	Dot-notated child

Operator	Description
['<name>' (, '<name>')]	Bracket-notated child or children
[<number> (, <number>)]	Array index or indexes
[start:end]	Array slice operator
[? (<expression>)]	Filter expression. The expression must evaluate to a boolean value.

18.2.2 Functions

Functions can be invoked at the tail end of a path - the input to a function is the output of the path expression. The function output is dictated by the function itself.

Table 29: Function Description table

Function	Description	Output
min()	Provides the min value of an array of numbers	Double
max()	Provides the max value of an array of numbers	Double
avg()	Provides the average value of an array of numbers	Double
stddev()	Provides the standard deviation value of an array of numbers	Double
length()	Provides the length of an array Integer	Integer

18.2.3 Filter Operators

Filters are logical expressions used to filter arrays. A typical filter would be `[?(@.age > 18)]` where `@` represents the current item being processed. More complex filters can be created with logical operators `&&` and `||`. String literals must be enclosed by single or double quotes

```
[?(@.color == 'blue')] or [?(@.color == "blue")]
```

Table 30: Filter Operators table

Operator	Description
==	Left is equal to the right (note that 1 is not equal to '1')
!=	Left is not equal to the right
<	Left is less than right
<=	Left is less or equal to the right

Operator	Description
>	Left is greater than right
>=	Left is greater than or equal to the right
=~	Left matches regular expression [?(@.name =~ /foo.*?/i)]
in	Left exists in right [?(@.size in ['S', 'M'])]
nin	Left does not exist in right
subsetof	Left is a subset of right [?(@.sizes subsetof ['S', 'M', 'L'])]
size	Size of the left (array or string) should match right
empty	Left (array or string) should be empty

18.2.4 Path Examples

```
{
  "store": {
    "book": [
      {
        "category": "reference",
        "author": "Nigel Rees",
        "title": "Sayings of the Century",
        "price": 8.95
      },
      {
        "category": "fiction",
        "author": "Evelyn Waugh",
        "title": "Sword of Honour",
        "price": 12.99
      },
      {
        "category": "fiction",
        "author": "Herman Melville",
        "title": "Moby Dick",
        "isbn": "0-553-21311-3",
        "price": 8.99
      }
    ]
  }
}
```

```

        "category": "fiction",
        "author": "J. R. R. Tolkien",
        "title": "The Lord of the Rings",
        "isbn": "0-395-19395-8",
        "price": 22.99
    },
    ],
    "bicycle": {
        "color": "red",
        "price": 19.95
    }
},
"expensive": 10
}

```

18.3 Delegation

This feature facilitates you to delegate the tasks/notifications assigned to you to another user. The delegate can be your peer, someone from your immediate subordinate, or someone from your all subordinates. Additionally, you can revoke active delegations whenever required. Your user group should be mapped to the function role WFDELACC (Process Delegation User) if you want to define delegation.

Figure 89: Delegations defined by the Logged-in user

Sel	Delegator	Delegator	Delegate To	Start Date	End Date	Status
<input type="radio"/>	1475137557	ORMUSER	CP	2016-10-01	2016-10-14	REVOKED
<input type="radio"/>	1475146608	ORMUSER	undefined	2016-09-29	2016-09-29	ACTIVE

This window displays all the delegations that are defined by the logged-in user with details such as Delegation ID, Delegator, Delegate To, Start Date, End Date, and Status. You can add a new Delegation, view, modify, delete and revoke a delegation.

18.3.1 Adding a Delegate

To add a delegate

1. From the **Delegation** window, click  **Add**. The **Delegation Details** window is displayed.

Figure 90: Delegation Details Window

The screenshot shows a 'Delegation Details' window with the following fields and values:

- Delegation ID ?**: 1477473481896
- Delegator ?**: Tom Harley
- Identify Delegate ?**: (Empty dropdown)
- Delegate To ?**: (Empty dropdown)
- Start Date ?**: 10/26/16
- End Date ?**: 10/26/16
- Notification Required ?**:
- Filter ?**: Delegator X On Execution X
- Notification Message ?**: (Empty dropdown)
- Scope ?**: (Empty dropdown)
- Application ?**: (Empty dropdown)
- Process ?**: All
- Comments ?**: (Empty text area)

A 'Save' button is located at the bottom center of the window.

2. Enter the details as tabulated:

Table 31: Delegation Details Description

Field Name	Description
Delegation ID	Displays the auto-generated Delegation ID.
Delegator	Displays the User ID of the logged-in user. If your user group is mapped to the function role WFDELGADM, you can select the delegator from the drop-down list.

Field Name	Description
Identify Delegate	Select the required option from the drop-down list. The options are: <ul style="list-style-type: none"> • Peers – Select this option if you want to delegate your tasks to your peer, who reports to your manager. • Subordinates- Select this option if you want to delegate your tasks to your immediate subordinates. • All subordinates – Select this option if you want to delegate your tasks to someone who comes under you in your organization.
Delegate To	Select the user to whom you want to delegate your tasks from the drop-down list. Based on the selected option from the Identify Delegate drop-down list, the users are displayed in this drop-down list. For example, if Peers is selected as Identify Delegate, this drop-down list displays all the peers in your organization. The data is fetched from the AAI_EMPLOYEE_MASTER table.
Start Date and End Date	Specify the duration for which you want to delegate your tasks by selecting the Start Date and End Date from the calendar.
Notification Required	Turn ON the toggle button if you want to send a notification to the delegate or delegator.
Filter	This field is enabled only if the Notification Required toggle button is turned ON. Select to whom you want to send the notification. You can set to send a notification to Delegator and Delegate. Select when you want to send the notification. The options are On Defining and On Execution.
Notification Message	This field is enabled only if the Notification Required toggle button is turned ON. Select the notification message you want to send to the delegate or delegator.
Scope	Select the scope of the delegation from the drop-down lists. The options are: <ul style="list-style-type: none"> • All- Select this option to delegate all your tasks. • Application- Select this option if you want to delegate all your tasks for a particular Application only. • Process- Select this option if you want to delegate all your tasks for a particular Process only.
Application	This field is enabled only if Application or Process is selected as Scope. Select the required Application from the drop-down list. All your tasks related to the selected application are delegated to the selected user.
Process	This field is enabled only if Process is selected as Scope. Select the required Process from the drop-down list. The list displays all processes related to the selected Application. All your tasks related to the selected process are delegated to the selected user.
Comments	Enter if you want to add any comments for the delegation.

3. Click **Save**.

18.3.2 Viewing Delegation

This option allows you to view the details of existing delegations.

From the **Delegation** window, select the required delegation and click **View**. You can view the Delegation details.

18.3.3 Modifying Delegate Details

To modify delegate details

1. From the **Delegation** window, select the delegation you want to modify and click  **Edit**. The **Delegation Details** window is displayed.
2. Modify the required details.

For more information, see [Adding a Delegate](#) section.

18.3.4 Revoking Delegation

You can revoke only active delegations.

To revoke delegation

1. From the **Delegation** window, select the delegation you want to revoke and click  **Revoke**.
2. Click **OK** in the confirmation message box.

18.3.5 Deleting Delegation

You cannot delete active delegations.

To delete a delegation

1. From the **Delegation** window, select the delegation you want to delete and click  **Delete**.
2. Click **OK** in the confirmation message box.

18.4 JSON Definition for Events

The JSON definition created by Producers consists of metadata fields and payload. The metadata field contains data to identify the event type used by the Event Framework and the payload consists of data that is used by the Consumer.

For more information about Producers, see the [Producer Activity](#) section.

The following is an example for the format of the JSON definition:

```
{
  "EVENT_TYPE": "VALUE" ,
```

```

"EVENT_SUB_TYPE": " VALUE " ,
"EVENT_SOURCE": " VALUE " ,
"EVENT_KEY": "VALUE",
"EVENT_REF_ID": " VALUE"
"CORRELATION_ID": " VALUE " ,
"EVENT_TIMESTAMP": " VALUE " ,
"PAYLOAD": {
//business specific JSON definition of the data being passed
}
}

```

The description for the JSON parameters in the preceding example are as follows:

- **EVENT_TYPE:** The type of event at the parent level. For example, CASE.
- **EVENT SUB TYPE:** The subtype of the event. For example, CLOSURE, CREATE, UPDATE.
- **EVENT SOURCE:** The source application where the event occurs. For example, ECM
The Type, Sub Type, and Source determine the action to be executed by the consuming service.
- **CORRELATIONID:** The identifier to use in case of a request or response model. It is a unique value and in alphanumeric format. For example, A45211B11. Service A sends an event to B and in return expects event B to send a response that maps the response to the original request.
- **EVENT_KEY:** The key used by the Producer for the event. For example, 100.
- **EVENT_REF_ID:** The unique ID created by the sender for the event that will be used to handle duplicate messages. For example, 100.
- **EVENT_TIMESTAMP:** The date and time of the creation of the event. Check the latency or determine the date on which the event is applicable. For example, 02/029/2021 12:49.
- **PAYLOAD:** The business data required by the consumer service in the JSON format. The event framework not only parses the payload but also expects the consuming service to interpret and process the message.

An example for the payload is shown in the following:

```

{
  "payload": {
    "infodom": "INFODOM",
    "applicationparams": {
      "sourceApplicationId": "APP-123456",
      "onboardSystemCaseId": "0000",
      "onboardSystemCaseStatus": "",
      "gkycId": "xxx123yy123-abc123de456",
      "gkycCaseId": "CASE12345",
      "event": "Response Returned",

```

```
    "ACTION": "CASE90000",
    "comments": [
      "comment:RFI_response sent in document",
      "comment:RFI_document attached"
    ],
    "createdDate": "mm-dd-yyyy hh-mm-ss UTC"
  },
  "userid": "EXAMPLE_USER",
  "objecttype": "DA_DCA",
  "locale": "en_US",
  "objectid": "OBJID0000",
  "securitymap": {}
}
}
```

19 Appendix B: Support APIs for Java External APIs

Topics:

- [Connection API](#)
- [Logging API](#)

19.1 Connection API

For establishing a connection with the Database, the ConnectionAdapter class provided by PMF can be used.

19.1.1 Jar Files Required

The following jar available at \$FIC_HOME/ficweb/webroot/WEB-INF/lib folder contains the ConnectionAdapter class that contains connection-related APIs.

```
aai-pmf-common.jar
```

Referenced Files in Jar for Connection:

The aai-pmf-common.jar provides the following classes that can be used for query execution.

- ConnectionAdapter
- PreparedStatementDecorator

19.1.2 ConnectionAdapter Methods

The ConnectionAdapter class has the following API's:

```
public static Connection getDBConnections() - For Config Connection
public static Connection getDBConnections(String infodom, Boolean
isMetaConnection) - For Atomic Connection
public static void closeResultSet(ResultSet rs)
public static void closePreparedStatement(PreparedStatement ps)
public static void closeConnection(Connection conn)
public static void commitTransaction(Connection conn)
public static void rollBackTransaction(Connection conn)
```

19.1.3 Connection to Config Schema

To open a Config Schema connection, the getDBConnections method of ConnectionAdapter has to be invoked.

```
Connection configConn = ConnectionAdapter.getDBConnections();
```

For example:

```
public boolean testMethod(String attr1) {
    Connection configConn = null;
```

```

PreparedStatementDecorator prepStatement = null;
ResultSet rs = null;
try {
    configConn = ConnectionAdapter.getDBConnections();
    prepStatement = new PreparedStatementDecorator(configConn, query);
    prepStatement.setString(1, attr1);
    rs = prepStatement.executeQuery();
    while (rs.next()) {
        return true;
    }
}
catch (Exception e) {
    WorkflowUtil.logDebug("Error while updating process execution status...+ e);
}
finally {
    ConnectionAdapter.closeResultSet(rs);
    ConnectionAdapter.closePreparedStatement(prepStatement);
    ConnectionAdapter.closeConnection(configConn);
}
return false;
}

```

19.1.4 Connection to Atomic Schema

Opening Connection: To open an atomic connection the `getDBConnections` method of `ConnectionAdapter` has to be invoked with `infodom` and `isMetaConnection` as parameters.

```
Connection atomicConn = ConnectionAdapter.getDBConnections(infodom, false);
```

For example:

```

public boolean testMethod(String attr1) {
    Connection atomicConn = null;
    PreparedStatementDecorator prepStatement = null;
    ResultSet rs = null;
    try {
        atomicConn = ConnectionAdapter.getDBConnections(infodom, false);
        prepStatement = new PreparedStatementDecorator(configConn, query);
        prepStatement.setString(1, attr1);
        rs = prepStatement.executeQuery();
        while (rs.next())

```

```
        {
            return true;
        }
    }
catch (Exception e)
{
WorkflowUtil.logDebug("Error while updating process execution status...+ e);
}
finally {
ConnectionAdapter.closeResultSet(rs);
    ConnectionAdapter.closePreparedStatement(preparedStatement);
    ConnectionAdapter.closeConnection(configConn);
}
return false;
}
```

19.2 Logging API

For logging into an application, the WorkflowUtil class provided by PMF can be used.

19.2.1 Jar Files Required

The following jar available at \$FIC_HOME/ficweb/webroot/WEB-INF/lib folder contains the WorkflowUtil class that contains logging-related APIs.

aai-pmf-common.jar

Referenced File in Jar:

The aai-pmf-common.jar provides the following class that can be used to implement Logging.

- WorkflowUtil

19.2.2 Debug Message

Debug messages can be used to log information that is required for debugging.

Signature

```
public static void logDebug(String logMessage)
```

Examples:

```
WorkflowUtil.logDebug( "Your Message");
```

```
WorkflowUtil.logDebug( "Message" + variableName);
```

19.2.3 Error Message

An error message can be used to log an exception.

Signature:

```
public static void logError(Exception e)
```

For example:

```
WorkflowUtil.logError(e);
```

20 Appendix C: Set Up Event Framework Metadata

To configure additional details, you must set up the Event Framework Metadata. The sections in this topic provide detailed information for the configuration.

Topics:

- [Prerequisites](#)
- [Set Up Topics](#)

20.1 Prerequisites

The Kafka Server must be installed and running.

20.2 Set Up Topics

To store and publish data from a Producer writing to a Kafka Topic for Consumers to read the data in the Topic in the OFSAA System certain configurations are required for Topic Metadata details and creation of the Topic in the Kafka Server, which is available in the following sections.

20.2.1 Create a Topic in the Kafka Server

The instruction in this section is an example for reference on how to create Topics in the Kafka Server.

To create a Topic in the Kafka Server, follow these steps:

- a. Open the `kafka-topics.sh` file in the `$FIC_HOME/ficdb/bin` directory.
- b. Execute the `kafka-topics.sh` file in the format shown in the following:

```
./kafka-topics.sh --create --zookeeper <host of zookeeper:<port in
zookeeper.properties> --replication-factor 1 --partitions <more than
given while creating topic in PMF> --topic <topic_name>
```

For example,

```
./kafka-topics.sh --create --zookeeper 192.0.2.1:7780 --replication-
factor 1 --partitions 4 --topic ECM_TF_SWIFT
```

20.2.2 Add Topic Metadata Details

To add the details for Topic Metadata, configure the arguments and Run the script in the following format which adds data to the relevant table in the AAI Config Schema:

```
./saveTopic.sh <TOPIC_NAME> <BOOTSTRAP_SERVERS> <TOTAL_PARTITIONS>
```

Table 27: Argument Description Table for Topic Metadata

Argument	Description
TOPIC_NAME	The name of the Topic that you want to add. Topics is a virtual group(s) that stores or publishes data. It can have multiple consumers subscribing for the information.
BOOTSTRAP_SERVERS	The details of the server on which Kafka is installed. The Topic listens to this Server.
TOTAL_PARTITIONS	The total number of partitions for the Topic.

For example:

```
./saveTopic.sh ECM_TF_SWIFT 192.0.2.1:7780 4
```

20.2.3 Activate Consumer Group

The script to activate a Consumer Group is used to activate deactivated Consumer Groups. The Consumers are initialized and instantiated at Server startup. Only Consumer Groups that are active are instantiated at Server startup. The activation sets the Active Flag to 'Y' for a given Consumer.

The Consumer ID and Topic ID have to be passed to the Shell Script which requires activation. Configure the arguments and run the following script in the Event tables in the AAI Config Schema:

```
./activateconsumergroup.sh <N_CONSUMER_ID> <N_TOPIC_ID>
```

Table 27: Argument Description Table for Activate Consumer Group

Argument	Description
N_CONSUMER_ID	The Unique Identifier of the Consumer.
N_TOPIC_ID	The Unique Identifier of the Topic.

For example:

```
./activateconsumergroup.sh 1612 SWIFT_TF_01
```

20.2.4 Deactivate Consumer Group

The script to deactivate a Consumer Group is used to deactivate a Consumer Group that is active. The Consumers are initialized and instantiated at Server startup. Only Consumer Groups that are active are instantiated at Server startup. The activation sets the Active Flag to 'N' for a given Consumer. The Consumer Groups that are deactivated are not be instantiated.

The Consumer ID and Topic ID have to be passed to the Shell Script which requires deactivation.

Configure the arguments and Run the following script in the Event tables in the AAI Config Schema:

```
./deactivateconsumergroup.sh <N_CONSUMER_ID> <N_TOPIC_ID>
```

Table 27: Argument Description Table for Deactivate Consumer Group

Argument	Description
N_CONSUMER_ID	The Unique Identifier of the Consumer.
N_TOPIC_ID	The Unique Identifier of the Topic.

For example:

```
./deactivateconsumergroup.sh 1612 SWIFT_TF_01
```

20.2.5 Decrease Consumers

This script is used to decrease the number of running Consumers for a given Consumer Group Name, Topic, and Application Node. It applies only till the current application instance is running.

Configure the arguments and run the following script in the Event tables in the AAI Config Schema:

```
./consumerdecrease.sh <TOPIC_NAME> <CONSUMERGRPNAME> <DECREASEBY>
<HOSTNAME:PORT>
```

Table 27: Argument Description Table for Decrease Consumers

Argument	Description
TOPIC_NAME	The name of the Topic.
CONSUMERGRPNAME	The name of the Consumer's Group.
DECREASEBY	The number of Consumers that you want to decrease.
HOSTNAME:PORT	The details of the server on which Kafka is installed.

For example:

```
./consumerdecrease.sh ECM_TF_SWIFT ECM Users 15 192.0.2.1:7780
```

20.2.6 Increase Consumers

The script is used to increase the number of running Consumers for a given Consumer Group Name, Topic, and Application Node. It applies only till the current application instance is running.

Configure the arguments and run the following script in the Event tables in the AAI Config Schema:

```
./consumerincrease.sh <TOPIC_NAME> <CONSUMERGRPNAME> <INCREASEBY>
<HOSTNAME:PORT>
```

Table 27: Argument Description Table for Increase Consumers

Argument	Description
TOPIC_NAME	The name of the Topic.
CONSUMERGRPNNAME	The name of the Consumer's Group.
INCREASEBY	The number of Consumers that you want to increase.
HOSTNAME:PORT	The details of the server on which Kafka is installed.

For example:

```
./consumerincrease.sh ECM_TF_SWIFT ECM Users 15 192.0.2.1:7780
```

20.2.7 Replay Messages

This script replays messages persisted to the Message Audit Tables to reprocess messages for failure cases or other reasons. The message is picked from the audit tables and processed instead of the Kafka Topic. The Event ID, which is available as a key in the Message Audit Tables, is used to replay the message. Any message that is read from the Kafka Topic is persisted to Message Audit Table with a Unique Event ID and processed later.

Configure the arguments and run the following script in the Event tables in the AAI Config Schema:

```
./replaymessage.sh <EVENT_ID>
```

Table 27: Argument Description Table for Replay Messages

Argument	Description
EVENT_ID	The unique identifier of the Event.

For example:

```
./replaymessage.sh JOB1234
```

20.2.8 Save Consumer Properties

This script adds or updates Consumer Properties for a given Consumer ID (Consumer Group). The Properties are used to fine-tune the functioning of the Kafka Consumers.

The Shell Script accepts Consumer ID, Kafka Consumer Property Name, Value, and Datatype.

The properties have to be as given by the Kafka Consumer API. See the following link for a list of properties:

<https://docs.confluent.io/platform/current/installation/configuration/consumer-configs.html>

Configure the arguments and Run the following script in the Event tables in the AAI Config Schema:

```
./saveConsumerProperties.sh <CONSUMER_ID> <CONSUMER_PROP_NAME>
<CONSUMER_PROP_VALUE> <CONSUMER_PROP_DATATYPE>
```

Table 27: Argument Description Table for Save Consumer Properties

Argument	Description
CONSUMER_ID	The Unique Identifier of the Consumer.
CONSUMER_PROP_NAME	The name of the Consumer Property that is related to the selected Consumer ID.
CONSUMER_PROP_VALUE	The value of the Consumer Property.
CONSUMER_PROP_DATATYPE	The data type of the Consumer Property.

For example:

```
./saveConsumerProperties.sh 1612 ECM_WR WRITE CHAR
```

20.2.9 Save Producer Properties

This script adds or updates Consumer Properties for a given Producer ID. The properties are used to fine-tune the functioning of the Kafka Producer.

The Shell Script accepts Producer_ID, Kafka Producer Property Name, Value, and Datatype.

The properties have to as given by the Kafka Producer API. See the following link for a list of properties:

<https://docs.confluent.io/platform/current/installation/configuration/producer-configs.html>

Configure the arguments and run the following script in the Event tables in the AAI Config Schema:

```
./saveProducerProperties.sh <PRODUCER_ID> <PRODUCER_PROP_NAME>
<PRODUCER_PROP_VALUE> <PRODUCER_PROP_DATATYPE>
```

Table 27: Argument Description Table for Save Producer Properties

Argument	Description
PRODUCER_ID	The Unique Identifier of the Producer.
PRODUCER_PROP_NAME	The name of the Producer Property that is related to the selected Producer ID.
PRODUCER_PROP_VALUE	The value of the Producer Property.
PRODUCER_PROP_DATATYPE	The data type of the Producer Property.

For example:

```
./saveProducerProperties.sh PROD1234 ECM_SWIFT_WR WRITE CHAR
```

20.2.10 Start Consumers

This Shell Script is used to start Consumers that are stopped for a given Application Node, Consumer Group Name, and Topic.

If you pass ALL in place of the consumergroupname argument, it results in the start of all Consumers in the given Application Node and Topic.

If the number of running Consumers is equal to the configured count in the Consumer Config Tables, no action is applied.

Configure the arguments and Run the following script in the Event tables in the AAI Config Schema:

```
./startconsumers.sh <TOPIC_NAME> <CONSUMERGRPNAME>/<ALL>
<HOSTNAME:PORT>
```

Table 27: Argument Description Table for Start Consumers

Argument	Description
TOPIC_NAME	The name of the Topic.
CONSUMERGRPNAME	The name of the Consumer's Group.
ALL	This value is passed to select all Consumers.
HOSTNAME:PORT	The details of the server on which Kafka is installed.

For example:

```
./startconsumers.sh ECM_TF_SWIFT ECM Users/ALL 192.0.2.1:7780
```

20.2.11 Stop Consumers

This shell script is used to stop consumers for a given Application Node, Consumer ID (Consumer Group Name), and Topic. After the servers are restarted, the consumers are initialized and instantiated.

If you pass ALL in place of the consumergroupname argument, it results in the stop of all Consumers in the given Application Node and Topic.

Configure the arguments and Run the following script in the Event tables in the AAI Config Schema:

```
./stopconsumers.sh <TOPIC_NAME> <CONSUMERGRPNAME>/<ALL> <HOSTNAME:PORT>
```

Table 27: Argument Description Table for Stop Consumers

Argument	Description
TOPIC_NAME	The name of the Topic.
CONSUMERGRPNAME	The name of the Consumer Group.
ALL	This value is passed to select all Consumers.

Argument	Description
HOSTNAME:PORT	The details of the server on which Kafka is installed.

For example:

```
./stopconsumers.sh ECM_TF_SWIFT ECM Users 15 192.0.2.1:7780
```

Send Us Your Comments

Oracle welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual?

If you find any errors or have any other suggestions for improvement, indicate the title and part number of the documentation along with the chapter/section/page number (if available) and contact the Oracle Support.

Before sending us your comments, you might like to ensure that you have the latest version of the document wherein any of your concerns have already been addressed. You can access My Oracle Support site that has all the revised/recently released documents.
