### **Copyright Notice**

Copyright © 2014, 2024, Oracle and/or its affiliates.

### **License Restrictions**

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or de-compilation of this software, unless required by law for interoperability, is prohibited.

### **Warranty Disclaimer**

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

### **Restricted Rights Notice**

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

### **Hazardous Applications Notice**

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

**Trademark Notice**

Oracle, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

**Third-Party Content, Products, and Services Disclaimer**

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

# Preface

---

## About This Document

This document provides an overview of federated SSO login. It explains how to configure federated SSO login with SAML for the ORMB Cloud Service.

## Intended Audience

This document is intended for the following audience:

- End-Users
- System Administrators
- Consulting Team
- Implementation Team

## Organization of the Document

The information in this document is organized into the following sections:

Section No.	Section Name	Description
Section 1	Federated Single Sign-On using SAML 2.0	Explains how to use the OpenID Connect and SAML 2.0, which provide secure mechanisms to transmit authentication credentials and related information between different web applications.

## Conventions

The following conventions are used across the document:

Convention	Meaning
<b>boldface</b>	Boldface indicates graphical user interface elements associated with an action, or terms defined in the text.
<i>italic</i>	Italic indicates a document or book title.
<code>monospace</code>	Monospace indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or information that an end-user needs to enter in the application.

## Acronyms

The following acronyms are used in this document:

Acronym	Meaning
IDCS	Oracle Identity Cloud Service

Acronym	Meaning
IDP	External Identity Provider
JWT	JSON Web Tokens
OCI	Oracle Cloud Infrastructure
OIDC	OpenID Connect
ORMB	Oracle Revenue Management and Billing
ORMBCS	Oracle Revenue Management and Billing Cloud Service
SAML	Security Assertion Markup Language
SP	Service Provider
SSO	Single Sign-On
WTSS	Web Tier Security Service

## Related Documents

You can see the following documents for more information:

Document Name	Description
<i>Oracle Revenue Management and Billing Cloud Service Release 8.1.1 Release Notes</i>	Lists the feature enhancements and client platforms and browsers that are supported in this release. It highlights different roles and responsibilities of Oracle and Customer in deploying, configuring, and maintaining the Oracle Revenue Management and Billing Cloud Service. It also highlights the known issues in this release.
<i>Oracle Revenue Management and Billing Cloud Service Licensing Guide</i>	Lists different features which are offered when you acquire a license for the following cloud services: <ul style="list-style-type: none"> <li>• Oracle Financial Services Revenue Management and Billing</li> <li>• Oracle Insurance Revenue Management and Billing</li> </ul> It also provides the licensing information of Oracle software and third-party JARs and components which are included in the above-mentioned cloud services.
<i>Oracle Revenue Management and Billing Cloud Service REST Services Configuration Guide</i>	Explains how to configure federated Web service login to access protected REST services on the ORMB Cloud environments.

Document Name	Description
<i>Oracle Revenue Management and Billing Cloud Service SFTP Authentication and Access Permissions Guide</i>	Explains how to configure SFTP authentication for the ORMB Cloud Service. It also explains how to access the SFTP server using WinSCP, how to create the directories and files on the SFTP server, and how to set the read, write, and execute permissions for a file or folder on the SFTP server.
<i>Oracle Revenue Management and Billing Cloud Service OAS Reporting Solution</i>	Provides an overview of the ORMB SaaS reporting architecture. It also explains how to use Oracle Analytics Server (OAS) for ORMB SaaS reporting.
<i>Oracle Revenue Management and Billing Cloud Service End-User Onboarding Using IDCS</i>	Explains how to setup the security administrator account for the ORMB Cloud Service. It explains how to manage users and groups for the ORMB Cloud Service. In addition, it explains how to import and export bulk users and groups for the ORMB Cloud Service and how to use SAML on the Cloud environment for single sign-on.
<i>Oracle Revenue Management and Billing Chatbot Configuration Guide</i>	Explains how to integrate Oracle Digital Assistant (ODA) with the ORMB Cloud Service.
<i>Oracle Revenue Management and Billing Chatbot User Guide</i>	Explains how to use the menu based Chatbot introduced in the ORMB Cloud Service.
<i>Oracle Revenue Management and Billing ML Integration Guide</i>	Explains how to integrate Machine Learning (ML) with the ORMB Cloud Service for anomaly detection.

## Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

# 1. Federated Single Sign-On using SAML 2.0

Federated single sign-on (SSO) standards such as OpenID Connect (OIDC) provide secure mechanisms for passing credentials and related information between different web applications that have their own authorization and authentication systems. The OpenID Connect is a simple identity layer on top of the OAuth 2.0 protocol. It allows clients to verify the identity of the end-user based on the authentication performed by an authorization server and obtain basic profile information about the end-user in an interoperable and REST-like manner. OpenID Connect has become the leading standard for single sign-on and identity provision on the Internet. Its formula for success is simple JSON-based identity tokens (JWT), delivered via OAuth 2.0 flows designed for web, browser-based and native or mobile applications.

ORMB Cloud Service uses 'Authorization Code Flow'. This flow is the commonly used flow, intended for traditional web applications. It involves an initial browser redirection to and from the OpenID Provider or Identity Provider for user authentication and consent, then a second back-channel request is sent to retrieve the ID token. This flow offers optimal security, as tokens are not revealed to the browser and still the client can be authenticated.

ORMB Cloud Service provides two types of configuration options:

- Customer can integrate Oracle Identity Cloud Service (IDCS) (as SP) with their On Premise Identity Provider using the SAML protocol
- Customer can leverage Oracle Identity Cloud Service (IDCS) as their identity provider

## 1.1 OpenID Connect Terminology

The SAML 2.0 specification provides a Web Browser SSO Profile, which describes how web applications can achieve Single Sign-On. The following are the main players in OpenID Connect:

- **Client** - This is how the user is interacting with the resource server, like a web application being served through a web browser.
- **Identity Provider (Authorization Server)** – This server owns the user identities and credentials and authenticates the user.
- **SAML Token** - The term SAML token refers to SAML Assertion, often compressed, encoded, possibly encrypted. SAML Assertion is just an XML node with certain elements.
- **Metadata:** Metadata defines how SAML 2.0 shares configuration information between two communicating entities. You can access and share the Access Manager Metadata information with the federated application. You can also access and share the federated application metadata with Access Manager.

## 1.2 Federated SSO Login Overview

With federated login, an External Identity Provider (IDP), such as an on-premises corporate login system, is used to authenticate the user ID and password and, if successful, a token (SAML assertion) is generated by the IDP and used to grant access to the target application.

## 1.2.1 Login Method 1

In the Login Method 1, the login process is as follows:

1. User accesses the ORMB Cloud Service through the Web Tier Security Service (WTSS) URL.
2. WTSS intercepts the request and identifies the user is not authenticated.
3. WTSS redirects the user to the configured IDCS.
4. An external identity provider as configured in IDCS should do the authentication. It creates a SAML 2.0 request and responds to the browser with a redirect to the IDP.
5. The IDP is invoked with the SAML request and the IDP challenges the user with a login prompt.
6. The IDP authenticates the user and responds with a SAML 2.0 assertion and IDCS validates the assertion.
7. IDCS generates an access token and returns to WTSS through the callback URL.
8. WTSS redirects the user back to the originally requested resource.
9. WebLogic validates the JWT assertion token and then redirects to the ORMB Cloud Service.

The following figure graphically illustrates the flow of Login Method 1:

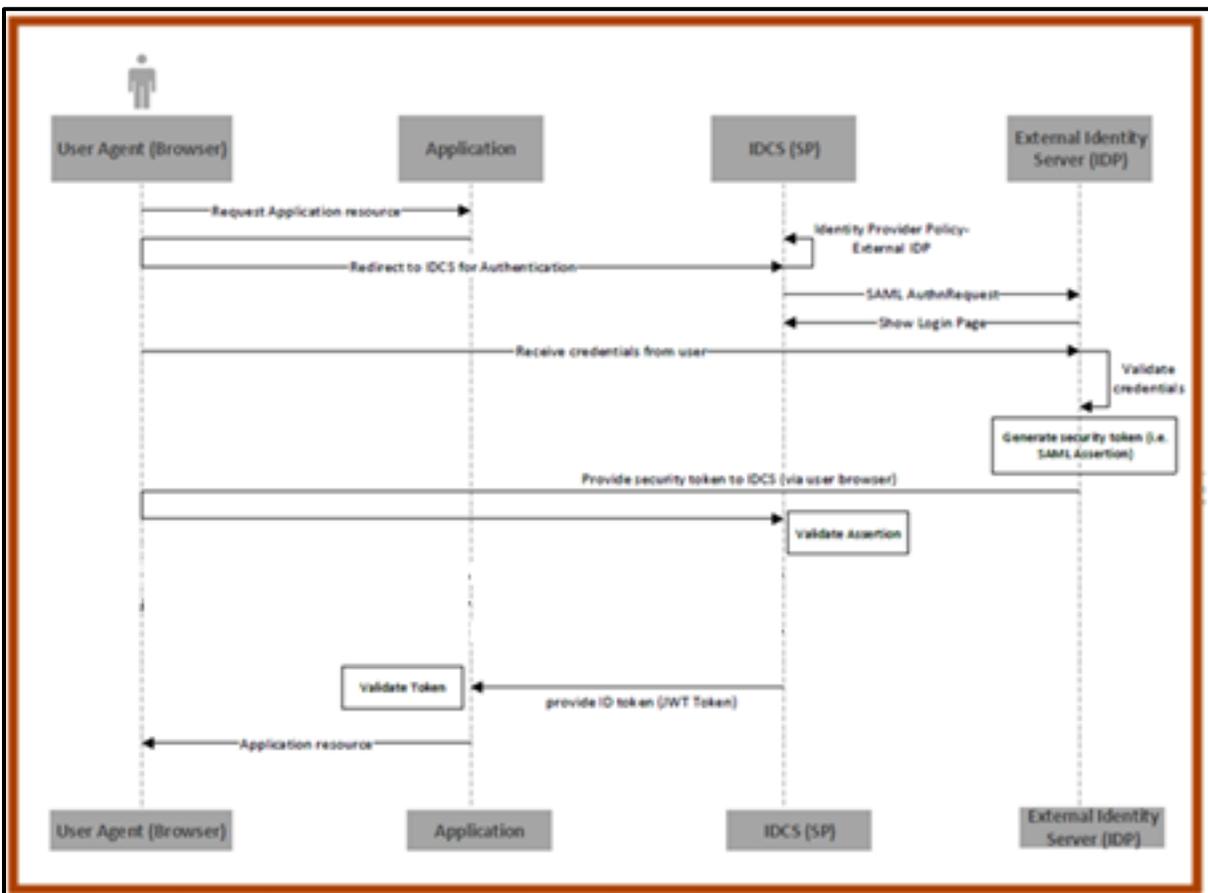

Figure 1: Method 1 – Screen Login Flow

## 1.2.2 Login Method 2

In the Login Method 2, the login process is as follows:

1. User accesses the ORMB Cloud Service through the Web Tier Security Service (WTSS) URL.
2. WTSS on the ORMB application server intercepts the request and identifies the user is not authenticated.
3. WTSS redirects the user to the configured IDCS. IDCS challenges the user to enter the credentials.
4. IDCS authenticates the user and if successfully authenticated, generates an access token and returns to WTSS through the callback URL.
5. WTSS redirects the user back to the originally requested resource.
6. WebLogic validates the JWT assertion token and then redirects to the ORMB Cloud Service.

The following figure graphically illustrates the flow of Login Method 2:

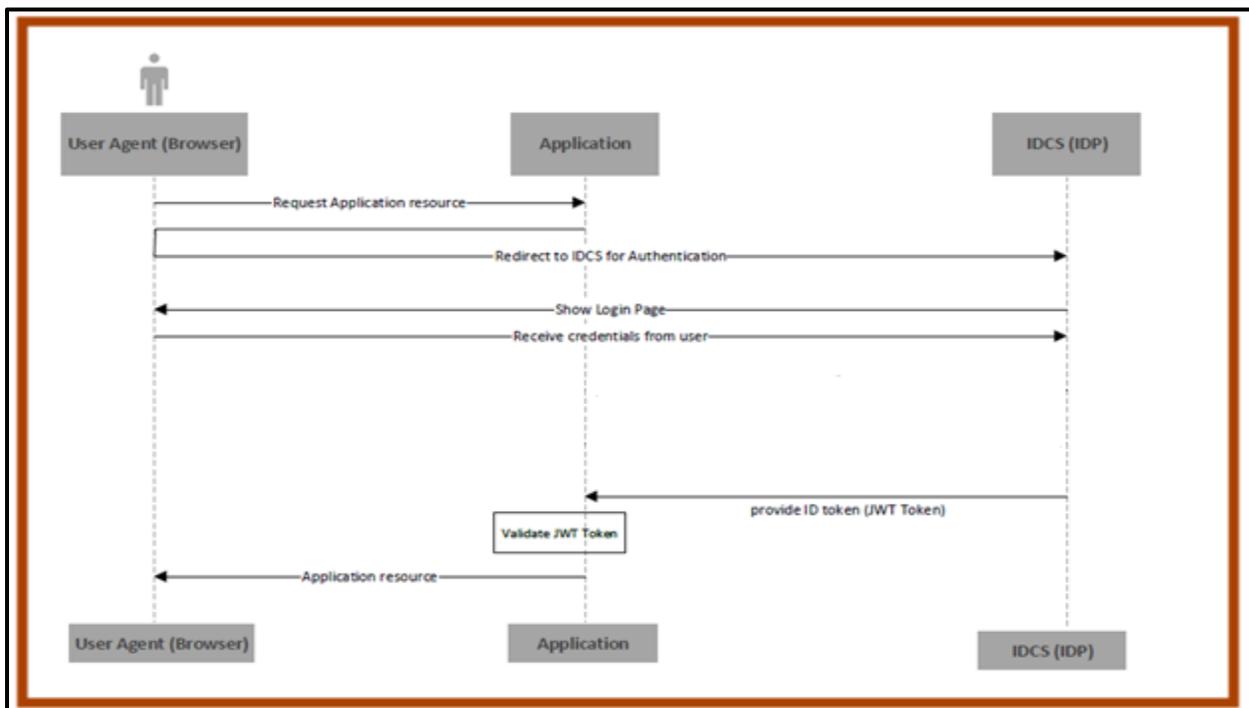

Figure 2: Method 2 - Screen Login Flow

## 1.3 OpenID Connect Implementation

IDCS OAuth key used for signing the JWT Access Token is imported in the ORMB application server (WebLogic) using chef automation script. These exchanges of signing keys will happen over SFTP or email. ORMB application server validates JWT Access Token through JWT Identity Assessor using JWT signing certificate.

## 1.4 SAML 2.0 Implementation (Only for Method 1)

External Identity Provider (IDP) will handle the sign-in process and will eventually provide the authentication to the ORMB Cloud Service users. Users are authenticated through SAML Assertion in IDCS. Any changes you perform on premise accounts (namely first name, last name, and email) is synced back to the ORMB account through external REST services. The user data that is necessary for ORMB is a user ID for each user, the user's first name, last name and email. ORMB does not store passwords.

### 1.4.1 Configure SAML 2.0 Compliant Identity Provider

This section graphically explains how to configure SAML 2.0 Identity Provider to federate with ORMB application server to enable Single Sign-On access to one or more ORMB Cloud Service using the OpenID Connect protocol. The SAML 2.0 relying party for ORMB Cloud Service used in this scenario is External IDP and service provider is IDCS.

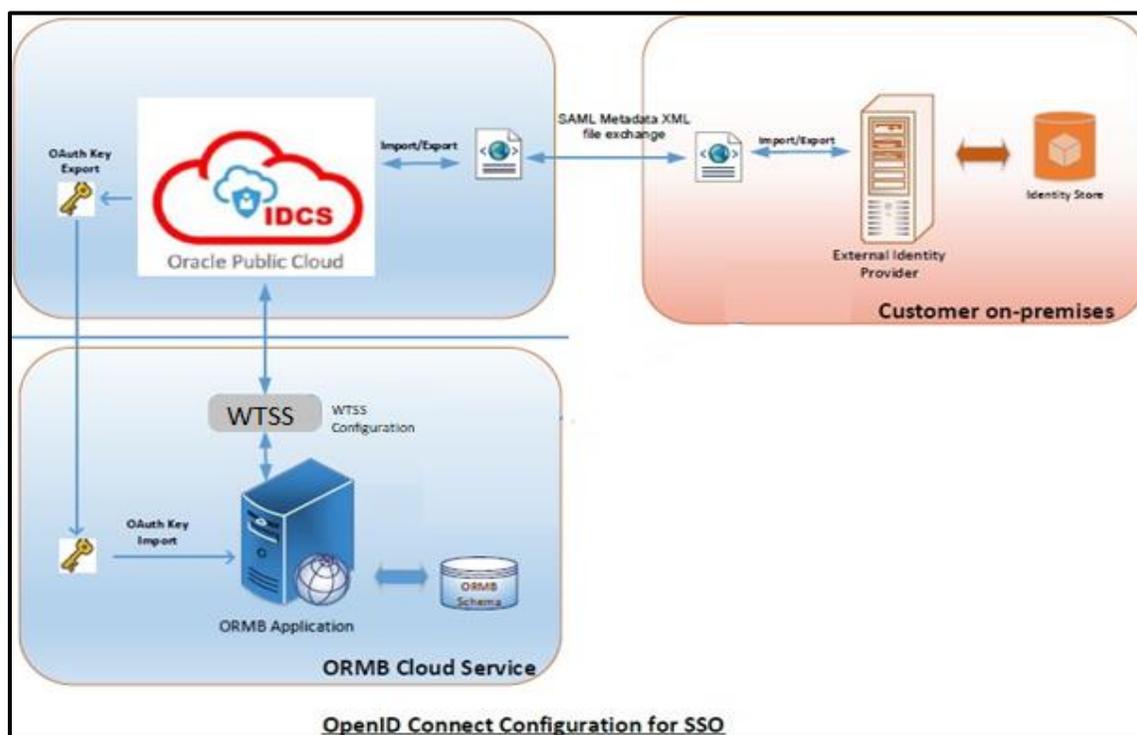

Figure 3: SAML Configuration

### 1.4.2 SAML Metadata

IDP imports IDCS's SAML metadata and thereby exchange public keys, IP addresses and communication information. Thus, Oracle IDCS provides you with the SAML metadata XML file, including the correct X509 certificates. It is recommended that you always import the latest ORMB metadata when configuring SAML 2.0 identity provider.

The following figure illustrates a sample SAML 2.0 metadata XML:

Figure 4: Sample SAML Metadata XML

**Note:** The metadata XML varies from server to server.

### 1.4.3 User Provisioning

For user provisioning, external identity server must be compatible with JWT. Customer needs to create users in the ORMB Cloud Service through REST services. For detailed instructions, see *Oracle Revenue Management and Billing Cloud Service REST Services Configuration Guide*. User must be present in the ORMB Cloud Service.

## 1.5 Why SAML?

The benefits of SAML include:

- **Platform Neutrality** - SAML abstracts the security framework away from platform architectures and particular vendor implementations. Making security more independent of application logic is an important principle of Service-Oriented Architecture.
- **Loose Coupling of Directories** - SAML does not require user information to be maintained and synchronized between directories.
- **Improved Online Experience for End-users** - SAML enables Single Sign-On by allowing users to authenticate in an Identity Provider and then access service providers without additional authentication. Additionally, identity federation (linking of multiple identities) with SAML provides better customized user experience for each service while ensuring privacy.
