Result Sequence Nbr:	1	

Below the table, there are two form fields:

- Student Shift:** A text box containing the value '3' and a dropdown menu showing 'ST - Shift 3 - rate + factor'.
- Formal Description:** A large text area for entering a description.

The screenshot above provides an example of common attributes set up for the activity result in the IAM. The fields that appear on the Attributes page are customer-specific and are defined on the Common Attributes and Record Context pages. The record context used for the IAM is the Activity Results (SSR_IAM_RESULT) record. The entity names used for the IAM have an "IAM" prefix.

See "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)"Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

Understanding Reassessment

Reassessment, or resits, are supported in Activity Management. Resits are defined in the Resit Option inclusion record for content items in the Activity Registry and carried forward to the Activity Manager, where they can be overridden as necessary. Users define the number of times a piece of coursework can be attempted during a specific time period and how it is reassessed. Users also define on the result scale which result rows are eligible for a resit.

Coursework can be reassessed in one of two ways. Students can be reassessed in the same piece of coursework or they may be required to undertake a supplemental piece of coursework. Regardless of the method of reassessment, the characteristics of the resit defined in the Activity Manager are associated with the student who enrolls in the course root. Student progress in these reassessed activities is tracked in the IAM. Students are allowed to resit an exam in the same term as well as the next existing term.

The determination of a student's resit eligibility and the calculation of a resit result are done using integration with the Rules Engine.

A result that is entered is deemed resit eligible when the result row on the Result Scale is identified as resit eligible. The activity itself must also be identified with the Resit Allowed flag on the Resit Option. When both these conditions are met, the activity status for the attempt is automatically updated to Resit Candidate. This status change can also be performed manually if a student is given permission to resit even with a result that is not indicated as resit eligible.

Once the activity status is set to *Resit Candidate* users run the IAM Resit Evaluation. This process uses a Population Selection process to identify specific resit candidate populations and calls the Rules Engine where a number of evaluations are performed to determine whether the student meets the attempt allowed criteria defined for the specific activity. If a student meets the criteria, the current attempt row is changed to Reassessed and a new row is inserted (for supplemental resits, this row already exists. The inserted row is assigned the status *Selected as Resit*. If the student does not meet the eligibility criteria, the initial attempt row is set to *Resit Not Allowed*). It is essential that resit activities for exams are created with a future exam academic period.

However, if the Resit Option is set to Student Selection and the student is deemed eligible for a resit, only the current attempt row is set to Resit Allowed.

Note: Resit activities are not initially displayed within the IAM course root of the student. The resit activities only become available when a student is resit eligible and satisfies the resit evaluation requirements.

See [Understanding the Delivered Rules in Activity Management](#).

Evaluating Reassessment Eligibility

Access the IAM Resit Evaluation page (Records and Enrollment >Individual Activity Manager >IAM Resit Evaluation).

Image: IAM Resit Evaluation page

This example illustrates the fields and controls on the IAM Resit Evaluation page. You can find definitions for the fields and controls later on this page.

Running the process calls the Rules Engine where attempts allowed are analyzed and resit rows and resit statuses are inserted.

Population Selection

Population Selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The delivered queries include the following:

`SSR_IAM_RESIT_EVAL_BY_INST` evaluates all resit candidates for the institution. Prompts users to enter the institution.

`SSR_IAM_RESIT_EVAL_BY_PERIOD` evaluates all resit candidates for a given academic period. Prompts users to enter the institution and the academic period.

`SSR_IAM_RESIT_EVAL_BY_STUDENT` evaluates a specific student. Prompts users to enter the institution and ID.

`SSR_IAM_RESIT_EVAL_BY_TERM` evaluates all resit candidates for a given term. Prompts users to enter the institution and the term.

You can create additional queries as needed.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Resit Example 1 – Exam Resit

The exam activity is identified as resit allowed and the student is allowed two attempts to pass the exam.

Image: Exam resit allowed

This example illustrates a course exam with two attempts allowed. Note the Limit 2 link displayed in the Attempts Allowed column.

Expand / Collapse	Content Description	Activity ID	Activity Status	Select	Exenuating Circumstances	Results	Attempts Allowed	Lock	Select for Calculation

Image: Attempts allowed

The attempts allowed link displays the resit limits defined for the activity. The attempts limit section indicates the student is allowed two attempts while enrolled in their academic program. Depending on setup, this may be the next regular exam period, or the next regular resit exam period.

Individual Activity Manager - Resit Limit

Activity ID: ACT00000398

Content Type: 4000 Exam

Content Item ID: ITX-000050 Course Exam

Resit Options

Resits Allowed **Calculation Option:**

Supplemental Resit **Supplemental Activity:**

Resit Period Options

Resit Period Assignment:

Student Can Refuse

Attempt Limits

Attempt Time Period	Allowed Attempts
<input type="text" value="Academic Program"/>	<input type="text" value="2"/>

Image: Resit candidate

Once the exam is graded and the mark entered is indicated as resit eligible, the activity status is updated to Resit Candidate.

[-]	[-] Course Exam	ACT00000398	Resit Candidate	<input checked="" type="checkbox"/>	<input type="text"/>		+	Limit 2		
	[-] [-] Course Exam Section	ACT00000399	Enrolled		<input type="text"/>		+			

Users can use the IAM Resit Evaluation process to evaluate the students' attempts against the Attempt Time Period. As indicated on the Resit Limit page indicated above, the student can attempt the exam twice during their enrollment in their academic program.

Image: Insert attempt

The result of the evaluation indicates the student is eligible to attempt the exam again. The Rules Engine triggers an action to generate an IAM Resit request that changes the status of initial activity to *Reassessed* and insert a new attempt. The new attempt is assigned the status of *Selected as Resit*. As part of the evaluation, it was determined that the student should be assigned to the next available exam period. Once the new exam period is assigned, a horizontal scroll appears to allow navigation between the multiple attempts. Users can select the Display All Attempts flag in the IAM header to display both attempts in the content tree. Record 1 of 2 is the initial attempt with a status of *Reassessed*, while the second attempt (2 of 2) has been selected as a resit but has not yet had results assigned.

[-] [-] Course Exam	1 of 2	<input checked="" type="checkbox"/>	ACT00000398	Reassessed	<input checked="" type="checkbox"/>		Limit 2

[-] [-] Course Exam Section			ACT00000495	Enrolled	<input checked="" type="checkbox"/>			

Image: Assignment of academic period

This example illustrates the exam period assigned. This data is visible on the Class & Exam Info tab of the IAM.

[-] [-] Course Exam	1 of 2	<input checked="" type="checkbox"/>	ACT00000494	Reassessed	FALL 2012	COURSE EXAM	Course Exam
[-] [-] Course Exam Section			ACT00000495	Enrolled			
[-] [-] Course Exam	2 of 2	<input checked="" type="checkbox"/>	ACT00000182	Selected as Res	2013 FALL EP	COURSE EXAM	Course Exam
[-] [-] Course Exam Section			ACT00000183	Enrolled			

Note: A standard resit can also be applied to non-exam assessment items. The difference for non-exam assessment items is that an exam period is not assigned. While an exam period is not assigned for an assessment item resit, users can define an extended due date on the Activity Detail page.

Image: Assigning the resit result

Once a result is entered for the resit, the Resit Calculation process is called. Resit calculation is determined by the Calculation Option that is defined in the Activity Manager. The following example indicates that the calculation option is set as Average All Marks.

In the example, the result is the average of the first (55.00) (not shown) and second attempt (65.00). The calculation process inserts a row on the current attempt with a message, the Result Sub-Type is set to *Resit Calc*, and the Include in Calc is set on the calculated result. Adding this row allows the calculation to use the correct result value.

Delete	Result Idbr	Process Status	*Result Type	Result Sub-Type	*Result Scale	Show Result Scale	*Result Status	Include in Calc	Earned Mark	Maximum Mark	Grade	Outcome	SE Post Status	PE Post Status	Result Notes
	2	Rest Calculated Mark	AM RESULT	Rest Calc	100 PT		10-Calculated	<input checked="" type="checkbox"/>	60.00000	100.00000	D	Pass			
	1		AM RESULT		100 PT		05-Manual		65.00000	100.00000	D	Pass			

Resit Example 2 – Supplemental Resit

The following example walks a user through a supplemental resit option.

Supplemental Resits can be created for exams, assessment items and category content items. A student cannot resit a supplemental item. As displayed in the Attempts Allowed column, the maximum

attempts allowed are 2 — the original attempt and one supplemental attempt. The ^ symbol indicates a supplemental resit. It cannot be assigned until the original attempt is denoted as failed.

A supplemental resit and a nonsupplemental resit work identically in that, statuses are assigned the same way and an exam period is assigned for exams. The only difference is that the supplemental is created in the tree initially (unlike standard resits) and when it is selected as a resit, the supplemental activity is physically moved into the tree display right under the previous attempt.

Image: Example of a supplemental resit activity

This example illustrates a supplemental resit activity.

Image: IAM Batch Generator using Student Enrollment page: example using a filtered selection

This example illustrates the fields and controls on the IAM Batch Generator using Student Enrollment page (a filtered selection).

This page changes depending on the batch generation method you select. This component enables you to generate IAMs for students based on their class enrollment. The process identifies the student population and creates and processes the request to create the student IAM. The component offers two methods to identify the student population.

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The delivered query, SSR_IAM_ENR_BY_INST_TERM, prompts users to enter the institution and the term. You can create additional queries as needed.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Filtered Selection

A second method of generation is the Filtered Selection. Here you can filter the selection within the Institution and Term boundaries by EmplID, Session, Academic Career, Academic Organization, Subject, Academic Item ID (if Program Enrollment is enabled), and Course Activity ID. Select the appropriate Request Status, *Create* (to create the IAM) or *Delete* (to delete the IAM). Once again, you can preview results before actually running the process.

Transaction

Regardless of method, you can view data from the last transaction by clicking the Get/Refresh Last Request button.

Creating IAMs in Batch Using APT

Access the IAM Batch Generator using APT (EOC) page (Records and Enrollment > Individual Activity Manager > IAM Gen using APT (EOC)).

Image: IAM Batch Generator using APT (EOC) page

This example illustrates the fields and controls on the IAM Batch Generator using APT (EOC) page. You can find definitions for the fields and controls later on this page.

This component enables you to generate IAMs in batch for students enrolled in EOCs. This process is based on courses that are identified as *Exam Only* on the student's Academic Progress Tracker (APT). The process identifies the student population and creates and processes the request to create the student IAM. Adding EOCs not defined on an APT must be done manually in the IAM component.

Because the Academic Period is not required on the APT for an EOC, you should associate a term with an academic period on the Academic Period setup table. In this way the system can tie together the term with which the course is associated on the APT to the appropriate academic period. The term used from the APT is the term associated with the individual student on the Academic Item Attempt Schedule or the term extrapolated from the study period based on the enrollment cohort. However, if a term is associated with multiple academic periods and course roots for the EOC exist in multiple academic periods, the system will not be able to determine the academic period. In this instance, the batch process generates an error on those students. We recommend that you add those students manually to the batch process or add the academic period directly onto the student's APT for the course.

When creating IAMs in batch for EOC students, the Academic Period Start Date is considered as the maximum date when IAM records are created. The Max EOC Program Date provides the ability to override the Start Date to a later date for the creation of IAM records.

Note: To add non-Program Enrollment students to an EOC you must manually add an IAM record on the Individual Activity Manager component.

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The delivered Population Selection query, `SS_IAM_ENR_BY_INST_PERIOD`, prompts users to enter the institution and the academic period into which the students are assigned. You can create additional queries as needed.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Filtered Selection

In this group box, you can filter the selection within the Institution boundary with Term, Session, Academic Period ID, Academic Career, Academic Organization, Academic Program, Academic Item ID, Subject, Enrollment Category, Advisor Approval Status, Year of Program, Academic Year, and Progress Level. The latter five filters are specific to Program Enrollment.

Manual entry by Student & Course

The final method of generation is by manually entering individual students.

Generating an IAM Student Block

Access the IAM Students Block page (Records and Enrollment > Individual Activity Manager > IAM Block Generation > IAM Students Block).

Image: IAM Students Block page

This example illustrates the fields and controls on the IAM Students Block page. You can find definitions for the fields and controls later on this page.

Fill Student Lists

This component enables you to create a block of students to whom activities are assigned. Two methods are delivered: student manual entry or population selection.

Student Block ID	Displays the unique identifier of the student block.
Description	Enter a description of the student block.
ID	Enter the EmplID of the student.
Academic Career	Enter the student's academic career.

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The delivered Population Selection query, SSR_IAM_STD_CAREER_PROG, prompts users to enter the institution, career, and academic program. You can create additional queries as needed.

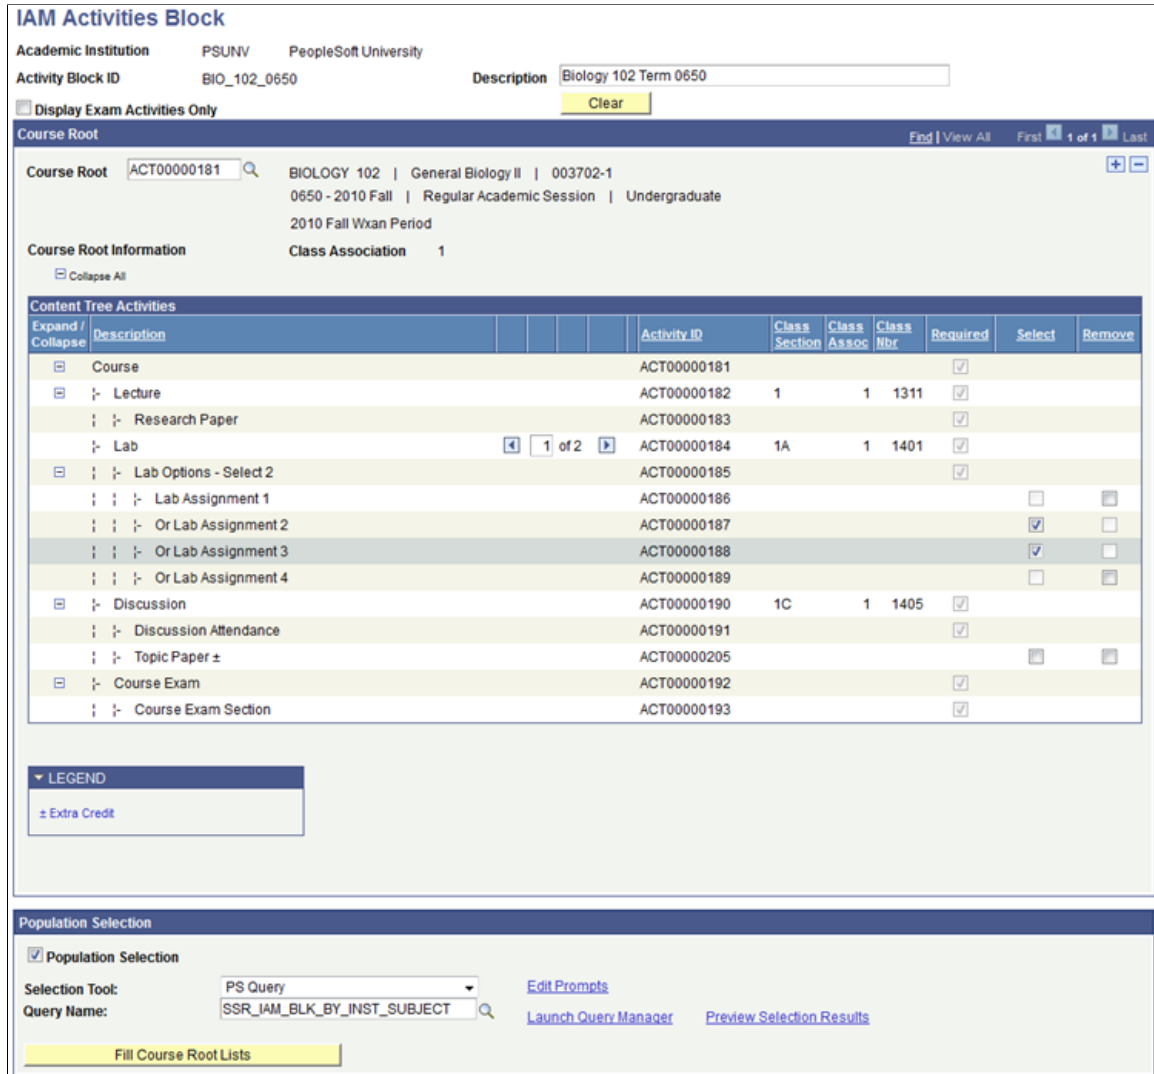

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Generating an IAM Activity Block

Access the IAM Activities Block page (Records and Enrollment > Individual Activity Manager > IAM Block Generation > IAM Activities Block).

Image: IAM Activities Block page

This example illustrates the fields and controls on the IAM Activities Block page. You can find definitions for the fields and controls later on this page.

This component enables you to create a block of course roots against which you can select optional activities. The system displays course roots and their associated coursework. Users can enter individual course roots or use Population Selection to identify a group of course roots.

Activity Block ID Displays the unique identifier of the activity block.

Description Enter a description of the activity block.

Display Exam Activities Only Select this check box to display only the course roots' exams and exam sections.

Course Root Enter the Activity ID for the course root to display the specific content tree.

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The delivered Population Selection query, `SSR_IAM_BLK_BY_INST_SUBJECT`, prompts users to enter the institution, term, and subject. You can create additional queries as needed.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Using the IAM Batch Generator

Access the IAM Batch Generator using Block Process page (Records and Enrollment > Individual Activity Manager > IAM Block Generation > IAM Gen Using Block Process).

Transaction

[Get/Refresh Last Request](#)

This component enables you to merge the student and activities blocks and assign the selected activities to the students. Users can opt to not set up a student block and use Population Selection on this page instead.

Activity Block ID

Select the activity block ID.

Transaction Violation Action

Indicate how the system should handle overrides of previous selections. If a student already meets the selection requirement (for example, they have already had two of four lab assignments selected), decide whether the system should Remove previous

selections and replace them with the process results or generate an Error for the given student.

Student Block Selection

If you choose not to use Population Selection, select the Student Block ID.

Student Block ID

Select the student block ID.

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The delivered Population Selection query, SSR_IAM_BLK_BY_CAR_AND_PROG, prompts users to enter the institution, career, and academic program. You can create additional queries as needed.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Reviewing IAM Requests

Access the IAM Activity Request page (Records and Enrollment > Individual Activity Manager > IAM Activity Request).

Image: IAM Activity Request page

This example illustrates the fields and controls on the IAM Activity Request page.

Seq #	ID	Name	Institution	Career	Request Action	Activity ID	Activity Seq#	Root ID	Request Status	Source
1	SRAM0002	Chris Walker	PSUNV		Delete	ACT00000541	1	ACT00000541	Message	Stdnt Enrl

Use this component to troubleshoot IAM requests generated from the creation of the IAM from the Enrollment Event, from the IAM batch processes, and from the AM-to-IAM sync process.

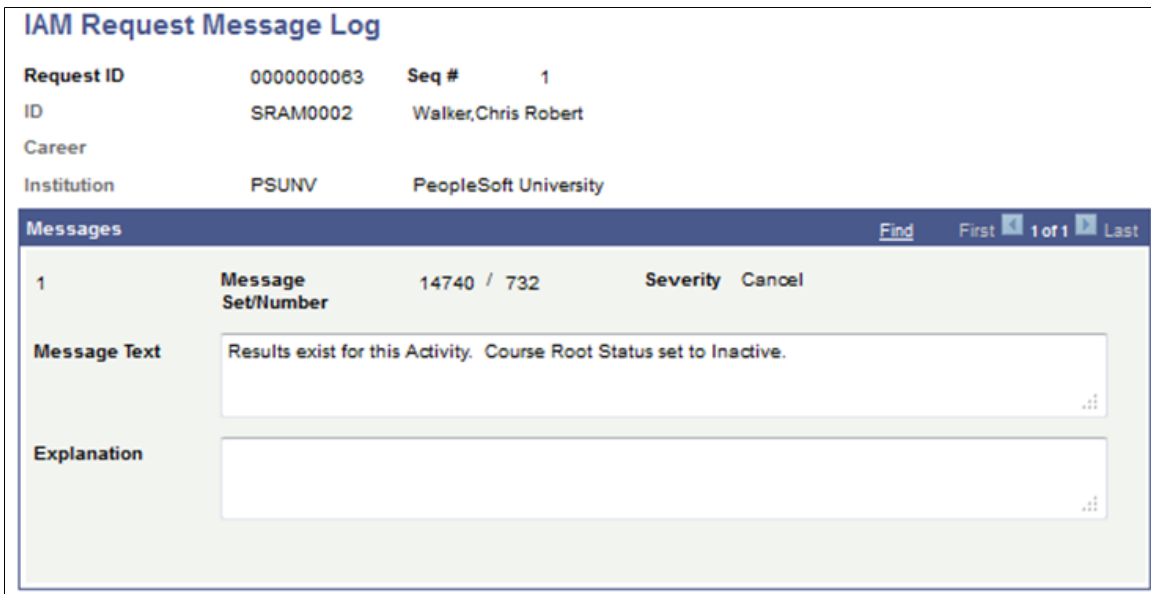

The page is accessed using the Request ID from the above processes. Users can view transaction statuses and view any messages generated.

Reviewing the IAM Activity Request Log

Access the IAM Request Message Log page (click the Messages link on the IAM Activity Request page).

Image: IAM Request Message Log page

This example illustrates the fields and controls on the IAM Request Message Log page.

Managing Course Rosters

This section discusses how to:

- Manage the roster summary.
- Manage the activity roster.
- View activity roster student details.
- Manage the result roster.
- View overall activity results.
- View activity root roster student details.
- Post student results.
- Calculate the primary result in batch.

Pages Used to Manage Course Rosters

Page Name	Definition Name	Navigation	Usage
Activity Roster Summary	SSR_ACR_SUMM_PG	Curriculum Management > Activity Management > Activity Roster > Activity Roster	Access the activity roster and the result roster and review enrollment and result counts.

Page Name	Definition Name	Navigation	Usage
Activity Roster	SSR_ACR_ROSTER	Click the Activity Roster icon on the Activity Roster Summary page.	Review academic information for students associated with the specific activity (administrative).
Activity Roster – Students Detail	SSR_ACR_IAM_TREE	Click the Assign Student Activities icon on the Activity Roster page.	Review an individual student's IAM and review and select activities.
Results Roster	SSR_ACR_RESULT	Click the Results Roster icon on the Activity Roster Summary page.	Manually enter activity results for students associated with a specific activity (administrative).
Activity Root Roster	SSR_ACR_MASTR	Curriculum Management > Activity Management > Activity Roster > Activity Root Roster	Review assigned and calculated results for all students in a course root. Drill down to individual student results.
Activity Root Roster – View Student Detail	SSR_ACR_STDNT_TREE	Click any mark for a specific student on the Activity Root Roster page.	Review an individual student's result record for a particular result type.

LEGEND

* Individualized Activity

Administrative users have access to both Activity Rosters and Result Rosters for a specific course root. The Activity Roster is similar to a class roster – showing students’ academic information and enrollment status – but is available for each activity of a course root. Use the Result Roster to enter or view student results for each activity of a specific course root.

Accessing the Roster Summary

The roster summary component is available as soon as the class or EOC has activity IDs generated in the Activity Generator. Rosters for classes are accessed by the term while exam-only rosters are accessed by an academic period. Access into the component is controlled by Academic Organization security. You must also have access to the SSR_ACR_ROSTER and SSR_ACR_RESULT pages to gain access to the specific rosters.

The Activity Roster and Activity Result icons become visible to the user once students are associated with an activity. In addition, an activity must have been identified as *Assessed* on the detail page of the Activity Manager before the Activity Result icon can appear.

Header Information

The system displays the following information related to the course root: Term, Session, Institution, Career, and Academic Period.

Course Information

Indicates the Activity ID assigned to the course root as well as the Subject, Catalog Number, Description, and the Course ID/ Course Offer Number.

Primary Activity Result Type

This is the result type that was defined as the primary on the Academic Institution 9 page. The count for the Active Students

Without Result is based upon the results assigned for this result type.

Activity Root Roster

Select this link to access the Activity Root Roster for this course root.

Calculate

Once activities have been marked, you can run the primary result calculation process on all the students in the course. The Calculate button calls the IAM Result Entity coding and the rules engine for processing.

Select the appropriate Select for Calculation flags in the grid, and then click the Calculate button. Results for students are inserted in the IAM record, but can be viewed here via the Result Roster.

See [Understanding the Delivered Rules in Activity Management](#).

Select to Print

Select which activity or result rosters to print. (Future)

Expand/Collapse

Select to open or close levels of the activity tree.

Content Description

Description of the activity.

Activity ID

Unique identifier of the activity. Select the Activity ID to see a display-only view of the activity detail.

Active Student Count

The count of students with an active status for the activity. Active statuses include:

Assigned

Enrolled

Enrolled – confirmation req'd

Enrolled – Confirmed

Resit Allowed

Resit Candidate

Resit Not Allowed

Selected

Selected as Resit

Selected by Default

Click this icon to access the Activity Roster page.

Activity Roster

Result Roster

Click this icon to access the Result Roster page.

Active Students Without Result

Displays the count of students who lack a result (of the primary result type) for the activity.

Select for Calculation

This check box indicates at which level you want the primary result calculation to occur.

The check box appears at the parent activity level. When you select the check box, all child items that are eligible to be used in the calculation are also selected. Eligibility for assessment items is based on the due date or the extended due date, whichever is later. Clear any check box for an item that you do not want to use in the calculation.

Consider an example in which all marks are entered for a course except the exam, which has not yet occurred. If you select the Include at Calculation check box for the course activity, all child items are also selected. To exclude the exam, clear the exam activity check box.

After making all your selections, click the Calculate button at the top of the page to begin the calculation process.

See [Understanding the Delivered Rules in Activity Management](#).

Anonymous ID

Indicates when the activity is selected to be marked using anonymous grading. (Future)

Select All

Select this link to set the Select to Print to *Yes* for every activity. (Future)

Clear All

Select this link to set the Select to Print to *No* for every activity. (Future)

Activity Roster

Select to print the activity roster for the selected activities. (Future)

Result Roster

Select to print the result roster for the selected activities. (Future)

Display in Print Format

Select to generate the roster in print format. (Future)

Legend

This section indicates when an activity is: 1) an extra-credit activity, 2) an individualized content activity, or 3) a supplemental resit activity.

Managing the Activity Roster

Access the Activity Roster page (click the Activity Roster icon on the Activity Roster Summary page).

Image: Activity Roster page

This example illustrates the fields and controls on the Activity Roster page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Activity Roster' page for course ACT00000387 (BIOLOGY 102 | General Biology II | 003702-1). It displays activity information for 'Lab Assignment 3' with 3 active students. A filter section allows selection by Program Enroll (PE, Not PE, All) and Activity Status (Active, Inactive, Unassigned, Restricted). The student roster table lists three students: Nigel Beaque, Grace Dublin, and Sharon Katz, all with 'Selected' status and '100 PT' result scale.

Activity ID	Description	Active Student Count
ACT00000394	Lab Assignment 3	3

Select	ID	Name	Activity Status	Assign	Assign Students Activities	Result Scale	Program and Plan
<input type="checkbox"/>	SR13038	Nigel Beaque	Selected	<input checked="" type="checkbox"/>		100 PT	Liberal Arts Undergraduate - Undeclared Undergraduate
<input type="checkbox"/>	SR13037	Grace Dublin	Selected	<input checked="" type="checkbox"/>		100 PT	Fine Arts Undergraduate - Undeclared Undergraduate
<input type="checkbox"/>	SR12200	Sharon Katz	Selected	<input checked="" type="checkbox"/>		100 PT	Liberal Arts Undergraduate - Undeclared Undergraduate

This roster enables administrative users to view students assigned to the course root and their status for the related activity. Users can edit optional activity statuses for individual students and drill down to the students' IAM.

Display All Exam Sections

This check box appears when you access an exam section activity and multiple sections exist for a single exam. Select this check box to group all students enrolled in the exam sections on one roster. Clear the check box to display only students enrolled in the specific exam section activity.

Activity Status

You can filter by activity status. Options are *Active*, *Inactive*, *Unassigned*, and *Restricted*. The count for each is displayed by the status label.

- Active statuses include:

Assigned (A)

Enrolled (E)

Enrolled – Confirmation Req'd (EX)

Enrolled – Confirmed (EC)

Resit Allowed (RA)

Resit Candidate (RC)

Resit Not Allowed (RN)

Selected (S)

Selected as Resit (SR)

Selected by Default (SD)

- Inactive statuses Include:

Dropped (D)

Withdrawn (WD)

Waitlisted (WL)

- *Unassigned* – student has eligible selections to make.
- *Restricted* – student has met the condition requirement and this activity is not eligible for selection.

Resit Status

This filter option is available for activities that include the Resit Inclusion (set in the Activity Registry or Activity Manager). Users can filter for students with non-resit activities, resit activities or both. The count for each is displayed by the status label.

Attempt

This column appears only when there are students who have resit attempts.

Select

Select to identify students for whom the activity should be selected or deleted (using the Mass Update) or to whom you want to send a notification (using Notify Selected Students).

Student Roster

Listing of students associated with the Activity ID. Includes student ID, Name, Activity Status, the Result Scale for the activity, and the student primary Program and Plan.

Assign

This field is available for selection when the student still has conditional activities to be assigned.

Assign Students Activities

Click this icon to drill down to the student's IAM, where you can manage activities assignments for a specific student.

Mass Update

This setting allows you to set a status — assign, remove, confirm or unconfirm — to selected students.

notify selected students

Select the button to open a notification window. All selected students with a stored email address are listed in the To field.

display in print format

Select the button to format a print version of the roster. (Future)

Reviewing Activity Roster Student Details

Access the Activity Roster – Students Detail page (click the Assign Student Activities icon on the Activity Roster page).

Image: Activity Roster – Students Detail page

This example illustrates the fields and controls on the Activity Roster – Students Detail page.

LEGEND

* Individualized Activity

This limited view of the student IAM allows users to review class information and edit any optional activities. Once an activity has a result, users can no longer edit optional activities.

In the example above, a user could deselect Lab Assignment 1 and select either Lab Assignment 3 or 4, but Lab Assignment 2 already has a result so it is not editable. The user could also assign the Topic Paper, which was set up as an Individualized Activity item.

Managing the Result Roster

Access the Result Roster page (click the Result Roster icon on the Activity Roster Summary page).

Image: Activity Result Roster page

This example illustrates the fields and controls on the Activity Result Roster page. You can find definitions for the fields and controls later on this page.

Update Multiple Student Result Status

Result Status:

Summary Page Activity Roster

This roster enables administrative users to manually enter activity results for students associated with a specific activity. The page is also used to view results entered by faculty or calculated results updated by the Rules Engine. For the icon to appear, at least one student must be assigned to/enrolled in the activity and the activity must be flagged as an *Accessible* item on the Activity Detail page of the Activity Manager.

Activity Information

The following information is provided for the Activity: Activity ID, Description, Active Student Count, Active Students Without Results, Weight, Minimum Passing Mark/Grade, and Mandatory Pass. Due Date appears for assessment items.

Display All Exam Sections

This check box appears when you access an exam section activity and multiple sections exist for a single exam. Select this check box to group all students enrolled in the exam sections on one roster. Clear the check box to display only students enrolled in the specific exam section activity.

Activity Status

You can filter by activity status. Options are *Active*, *Inactive*, *Unassigned*, and *Restricted*. The count for each is displayed by the status label.

- Active statuses include:

Assigned (A)

Enrolled (E)

Enrolled – Confirmed (EC)

Enrolled – Confirmation Req'd (EX)

Resit Allowed (RA)

Resit Candidate (RC)

Resit Not Allowed (RN)

Selected (S)

Selected as Resit (SR)

Selected by Default (SD)

- Inactive statuses Include:

Dropped (D)

Withdrawn (WD)

Waitlisted (WL)

- *Unassigned* – student has eligible selections to make.
- *Restricted* – student has met the condition requirement and this activity is not eligible for selection.

Resit Status

This filter option is available for activities that include the Resit Inclusion (set in the Activity Registry or Activity Manager). Users can filter for Non-Resit activities, resit activities or both. The count for each is displayed by the status label.

Activity Result

You can filter for students with results, students without results or both. The count for each is displayed by the status label. Students with results are those where a value exists (score, mark, grade, or outcome) from the associated result scale.

Result Type

You can filter using any result type that exists for the given content type as defined on the Result Type setup. The default when entering the page is the primary result type that was defined on the Academic Institution Table.

Result Sub-Type

Users can filter using a subtype. Subtypes include *Capped*, *Insuff Mrk*, *Late Pen*, *Mand Fail*, and *Mid Term*. Rows for insufficient mark, late penalty, and mandatory fail are inserted automatically based on Rules Engine calculation.

Result Scale

You can filter using any result scale that exists for the given content type as defined on the Result Type setup page.

When assigning grades, the grading basis associated with the student's enrollment must match an existing grading scheme/basis on the corresponding result scale.

Result Status

This filter option looks at the result status of each student. Those statuses include: *Undetermined (00)*, *Manual (05)*, *Imported (07)*, *Calculated (10)*, *Awaiting Approval (20)*, *Approved (30)*, *Overriden (40)*, and *Final (50)*. A blank row here returns all result statuses.

Display Maximum Mark

Select this check box to add the Maximum Mark column to the Student Results group box. The default value is set on the Installation Student Admin page.

Display Student ID and Name

Select to display the student's student ID and name alongside the student's anonymous ID. This check box appears only when you set up the Activity Roster to access anonymous IDs.

See [Configuring Access to Anonymous IDs](#).

Default Submission Date To Due Date / This Date

This group of fields appear for assessment items. You can prepopulate the Submission Date field for the entire grid by selecting Due Date, where the due date for the activity is populated or This Date, which allows the user to define the Submission Date. When using Due Date, if an Extended Due Date exists for a particular student then the system populates the field with that date.

Accept Late Penalty Without Warning

This field appears for assessment items. Clear this check box to turn off the system warning that the late penalty rule will be applied to any activities submitted after the due date or extended due date, if one exists.

Select

Use this check box to insert a new value against an existing Result Type. Select the check box and then select the Update Selected Result button. The system inserts a new row for the Result Type in which values can be updated.

Anonymous ID

This value appears if you've generated an anonymous ID for the student.

See [Generating Anonymous IDs](#).

Extended Due Date

This column only appears if any student has had an extended due date entered on their IAM.

Result Nbr

Indicates the number of the result.

Result Type

This column only appears when no result type is entered in the filter above. If a result type is entered in the filter section above, the system displays only the rows for that result type and does not display them in the grid.

Result Sub-Type

Subtypes include *Capped*, *Insuff Mrk*, *Late Pen*, *Mand Fail*, and *Mid Term*. Rows for insufficient mark, late penalty, and mandatory fail are inserted automatically based on component processing that triggers the primary result calculation.

See [Understanding the Delivered Rules in Activity Management](#)

Result Scale

The result scale, associated with each activity, defines the scores, mark, grade, outcome combination that can be used as a result for the given activity. The Result Scale defaults from the

Activity Manager as long as the result scale is represented on the Result Type table. It can be overridden as necessary.

Show Result Scale 

Select the icon to view the result scale mapping for the specific result scale.

Result Status

When you select Create Initial Result Row, the Result Status defaults to *00-Undetermined*. When the status is changed to a different value the Include in Calc, Earned Mark, Grade, and Outcome fields are displayed as applicable. When the Create Initial Result Row option is cleared, the Result Status defaults to *05-Manual*. The delivered translate (SSR_IAM_RSLT_STAT) values for result status are:

00-Undetermined

05-Manual

07-Imported

10-Calculated

20-Awaiting Approval

30-Approved

40-Overridden

50-Final

Submission Date

This column appears for assessment item activities. The default value is based on the setting for the Default Submission Date To above, either the due date or a date entered. Regardless of default setting, you can override the value as needed.

If the date entered here is later than the due date for the activity or the extended due date of a specific student, and a late penalty rule exists, then the entry of the mark triggers the Rules Engine and the system inserts a row with the subtype *Late Pen* in addition to the calculated late penalty mark.

Include in Calc

The system automatically calculates this value, but you can clear the check box to exclude the mark from a calculation.

Mark

Enter the student-earned mark for this activity. This mark should be in the range of the minimum and maximum mark defined on the Result Scale.

Maximum Mark

This column appears if the Display Maximum Mark is invoked and selected on the Installation Student Admin page. The maximum value defined on the Result Scale appears.

Grade

When you enter a mark, the system populates a grade based on the result scale mapping. You can override the populated grade as necessary. When you enter a grade instead of a mark (and

the mark field exists) the system populates the mark field with the minimum mark of the grade range. Students must possess the grading basis for the grade being assigned on the student enrollment record.

Outcome

Enter the student outcome for this activity. The system populates this value automatically based on the Earned Mark (result scale mapping), but you can override it with any other outcome that is applicable to the mark range for the selected scale. Delivered values available on the result scale include: *Audit (A)*, *Fail (F)*, *Incomplete (I)*, *Pass (P)*, and *Withdrawn (W)*. The values entered here (SSR_IAM_OUTCOME) should match the values on SSR_RESULTS_STATUS.

Result History

Select this icon to transfer to the Activity Result History page where you can review a student's entire result history for the activity. Common Attributes defined for a result are accessible through the Result History icon. The initial result row must be saved for this icon to appear.

Extenuating Circumstance

Institutionally defined value where users can associate an action reason with the given result. This value prompts from the Extenuating Circumstance table.

Result Notes

Enter any comments applicable to the given result.

Created By

Displays the User ID of the original result entry.

Created

Displays the Date/Time Stamp of the original result entry.

Updated By

Displays the User ID of the last result entry.

Last Update Date/Time

Displays the Date/Time Stamp of the last result entry.

notify selected students

Click this button to open a notification window. All selected students with a stored email address are listed in the To field.

display in print format

Click this button to format a print version of the roster. (Future)

Update Multiple Student Result Status

Use this group box to update the result status for multiple students. You can update the result status only if the student already has an existing result. If the student you select has no existing result and you try to update the Result Status, a Process Status of "Status not updated" is assigned to the student. However, if the result status is successfully updated, the Result Status is correctly reflected in the table, and the Result Number is incremented by 1. The student's Process Status becomes "Status Updated".

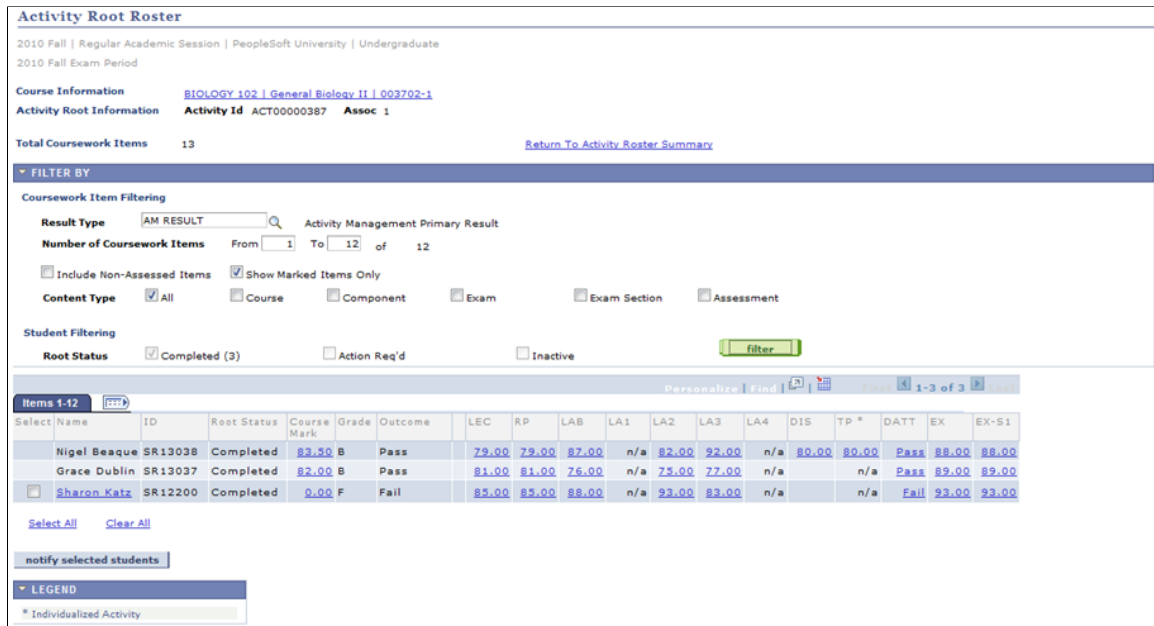

Make sure you click Save to save your changes.

Viewing Overall Activity Results

Access the Activity Root Roster page (Curriculum Management > Activity Management > Activity Roster > Activity Root Roster).

Image: Activity Root Roster page

This example illustrates the fields and controls on the Activity Root Roster page. You can find definitions for the fields and controls later on this page.

The activity root roster provides a view of all results for all students in a course root. Users can filter result views and drill down on individual students to access their IAM record.

Course Information

Click this link to access an Activity Manager view of the course root.

Return to Activity Roster Summary

This link appears when you access the component from the Activity Roster Summary page. Click the link to return to the Activity Roster Summary page.

Coursework Item Filtering

The fields in this section enable users to filter the results that appear in the grid below.

Result Type

Enter the result type for the view.

Include Non-Assessed Items

Select this check box to only view coursework items created as nonassessed.

Show Marked Items Only

Select this check box to only view coursework items that were previously marked.

Number of Coursework Items

This field allows you to filter the results to a certain number of coursework items.

Content Type

Select any combination of content types to display.

Root Status

Select options to narrow the display by student status. The values include *Complete*, *Action Required*, and *Inactive*.

Mark links

Select a mark to drill down to that result and the underlying student IAM.

Viewing Activity Root Roster Student Details

Access the Activity Root Roster – View Student Detail page (click any mark for a specific student on the Activity Root Roster page).

Image: Activity Root Roster – View Student Detail page: Most Recent Result tab

This example illustrates the fields and controls on the Activity Root Roster – View Student Detail page: Most Recent Result tab.

Below the table is a 'LEGEND' section with the following items:

- * Individualized Activity
- * Extra Credit

The tabs of this page provide an overall view of an individual student's result record for a particular result type. It provides grading data used to calculate the student's most recent result, each result's history, the last date/time updated, and the class and exam enrollment information.

Posting Student Results

Access the IAM Result Posting page (Records and Enrollment > Individual Activity Manager > IAM Result Posting).

Image: IAM Result Posting page

This example illustrates the fields and controls on the IAM Result Posting page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'IAM Result Posting' page. It includes a 'Run Control ID' field with the value 'PS' and a 'Run' button. Below this are fields for '*Institution' (PSUNV), 'Posting Option' (Student & Program Enroll), and '*When Grade Exists in Stdnt Enr' (Apply Grade Change). A 'Population Selection' section is expanded, showing a checked checkbox for 'Population Selection', a 'Selection Tool' dropdown (PS Query), and a 'Query Name' field (SSR_IAM_RSLT_PST_BY_TERM). There are also links for 'Edit Prompts', 'Launch Query Manager', and 'Preview Selection Results'.

Institution	Enter the Institution for which you wish to run the posting process.
Posting Option	Defaults from the Institution setting. This setting controls if the result is posted to student enrollment and/or the student's APT record.
When Grade Exists in Stdnt Enr	Select the option to update the student's enrollment record if a result already exists. The options include: <i>Apply Grade Change</i> (replaces the existing grade), and <i>Keep Current Grade</i> (keeps existing grade and disregards the posting update).

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

There are two delivered Population Selection queries, `SSR_IAM_RSLT_PST_BY_TERM`, and `SSR_IAM_RSLT_PST_EXAM_ONLY` which prompt users to enter the institution, and term or academic period. You can create additional queries as needed.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community).

Calculating the Primary Result in Batch

Access the IAM Result Calculation page (Records and Enrollment >Individual Activity Manager >IAM Result Calculation).

Image: IAM Result Calculation page

This example illustrates the fields and controls on the IAM Result Calculation page. You can find definitions for the fields and controls later on this page.

In addition to running the primary result calculation for an individual student on the IAM and for a class on the Activity Roster Summary, users can run the process for larger groups of students using the IAM Result Calculation component.

Use the IAM Result Calculation page to initiate a primary result calculation for a group of students within a specific term, or a specific subject area within a term. All students enrolled in Exam-Only Courses (EOC) can also be calculated based on a specific academic period.

Institution Select the institution for which the calculation should be run.

Include Content Types

Select the content types for which to run the calculation process.

Warning! You must be familiar with the content types used for the courses in which the run the process. If you deselect content types that have results but should be used in the calculation, you may get unexpected results.

Population Selection

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

The following queries are available; you can create additional queries as needed.

- SSR_IAM_CALC_RSLT_BY_PERIOD
- SSR_IAM_CALC_RSLT_BY_SUBJECT
- SSR_IAM_CALC_RSLT_BY_TERM

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community).

Chapter 31

Performing Batch Term Activation

Understanding Term Activation

This section lists prerequisites and discusses term activation.

Prerequisites

Before you can activate students into a term, you must activate students into academic programs and plans for that term.

Related Links

[Understanding Program Actions and Statuses](#)

[Maintaining Student Program Stacks](#)

Term Activation

Each term, activating students is a prerequisite process for enrolling students, posting transfer credit, and calculating tuition. To successfully activate a student into a term for a specific academic program, the term activation request must meet the following three criteria:

- The maximum program effective date for the activation term must be later than or equal to the effective date of the student's academic program record.
- The term must be later than or equal to the student's admit term into the academic program.
- The term must have an academic calendar defined in the system.

You can activate the students after they have a valid academic program and plan. Term activation is the process by which you inform the system that admitted and matriculated students are eligible for enrollment, transfer credit posting to their records, and tuition calculation.

Before each enrollment period, you activate students into terms by one of the following three methods:

- Use the batch Term Activation process (SRTRMAC.SQR) to activate groups of students into terms with Process Scheduler, something that you would typically do only once per term.
- Perform a quick term activation, activating students individually into academic programs and terms, using the Student Program/Plan component and the Term Activation page.

You should use this method on an exception basis.

See [Processing a Quick Activation](#)

- Use the Quick Admit component to create a program stack row and term activate an individual student into a term.

See [Processing Enrollment Transactions Through the Quick Enrollment Component](#).

[Using the Term Activation Component](#)

Running Batch Term Activation

This section provides an overview of batch term activation and discusses how to:

- Define global exclusions.
- Define degree status rules.
- Enter required and high-level criteria for processing.
- Enter detailed criteria for processing.
- Enter enrollment lapse rules for processing.
- Enter process control options.
- Create custom populations for processing.

Understanding Batch Term Activation

You can activate individual students and also groups of students. You can use the Term Activation process (SRTRMAC.SQR) to target and activate specific groups of students.

Through the Term Activation setup and process components, you specify selection criteria that enable you to include and exclude students for term activation. For example, you can create rules that prevent or require activation for students with specific program actions, academic standing actions, service indicators, and degree checkout status. You can also prevent or allow activation based, for example, on student groups or academic programs. If you still need more options, you can define custom populations of students. Regardless of the options that you select, the process looks at the student's program stack to ensure that the student is active in an academic program, then it creates a row for the student in the student term table (STDNT_CAR_TERM).

After you have begun the Term Activation process (SRTRMAC.SQR) you can monitor the process, especially to see if any errors occurred. The process logs all messages to log files, which it writes to a directory on the computer (generally an application server) where the process is run. The process determines the exact location to write the log files by the FILEPREFIX variable, which is set in the SETENV.SQC. If this variable is not set, the process writes the log files to the same directory that houses the SRTRMAC.SQR program.

After you activate students into terms, you can modify certain aspects of a student's term record, including enrollment limits and terms in residence. You do so through the Term Activation component.

Global Exclusion and Degree Status Rules

The Term Activation setup component enables you to specify predefined rules, called *global exclusion rules*, that you can subsequently attach to an instance of the Term Activation process (SRTRMAC.SQR). Global exclusion rules control which students can be activated in a term through the application process. Global exclusion rules comprise global exclusions and degree status rules. You can define multiple global exclusion rules for an academic institution, assigning each rule within an academic institution a unique identification code. Because you define your rules for an academic institution, you also have the added flexibility to create rules specific to each academic institution of a multi-institution college.

For example, your academic institution might have different term activation policies for summer terms as opposed to regular terms. In such a case, your academic institution could set up one global exclusion rule for the summer term and another for the regular term.

When you later run the Term Activation process, you can choose to include the rule in the run parameters. The Term Activation process connects the global exclusions and degree status rules of a global exclusion rule with an implied *or* between each part. Thus, as illustrated on the Global Exclusions and Degree Status Rules pages shown in this section, a global exclusion rule might read as such:

```
(UGRD/PRB2 or UGRD/PRB3) or (RADM/PET or RADM/AMN) or (RGL or SFl/NOPAY) or ((Degree Checkout Status = APPLIED) and (Activation Term < Expected Graduation Term))
```

Important! Global restrictions override any corresponding selections on the Term Activation process run control pages. If you attach a global exclusion rule to a run of the Term Activation process, the rule overrides any conflicting run control parameters.

Technical Aspects of the Term Activation SQR Process

Before the Term Activation process (SRTRMAC.SQR) begins, the program loads all of the selection criteria on the run control pages into memory, including the details of any global exclusion rule that you attached. If the program finds multiple rows of data from scrollable frames, it loads these values into arrays. The program enforces limits on the amount of selection criteria that you can enter on the run control pages during data entry. For example, if you insert too many rows in the Program Action Selection group box on the Selection 2 page, the program ignores any rows beyond the allowable limit and generates a message to the process log indicating that you have exceeded the allowable limit. Most of the selection criteria in the program allow up to 100 rows (arrays). You can run the Term Activation process in either the *Insert* run mode or *Update* run mode, which you specify on the Selection 1 page. The run mode determines the execution path of the program.

When you set the run mode to insert, the main program routine (or initial SELECT statement) selects against the ACAD_PROG table to identify the target population for the process run. For all of the fields on the first page except Student Group, Global Exception Rules, and Student Type, the process determines whether a student is eligible for term activation based on the values it finds for the student on the ACAD_PROG table. The process evaluates each field and constructs a dynamic WHERE clause so that only students that meet the basic criteria can even be considered for term activation.

When you set the run mode to update, the main program routine (or initial SELECT statement) selects against the STDNT_CAR_TERM table instead of the ACAD_PROG table to identify the target population of the process run. Because we are only interested in students who have an existing term row in the STDNT_CAR_TERM table, this enables the process to be much more efficient in accomplishing its task.

In both the Insert and Update run modes, the initial SELECT statement accommodates only some of the possible selection criteria that you provide. After the primary SELECT statement identifies the students

eligible for term activation, the process performs various filters on these student records to determine whether each student in this target population meets all of the specified selection criteria and global exclusions.

First, the Term Activation process (SRTRMAC.SQR) writes into memory all academic programs for which a student is *active* for the activation term. For each of a student's active programs, the Term Activation process then takes three passes at the page selection criteria, comparing this selection criteria to the values on ACAD_PROG and STDNT_CAR_TERM records for each student on a program-by-program basis to see if the student is eligible for term activation. If the student does not meet just one of the selection criteria at any point in the compare process, then the process marks the student as ineligible to enroll for that academic program, writes a message to the process log, and moves to the student's next program. For example, if the student is ineligible due to an academic standing restriction, then the process writes a message about this to the process log and moves on to the student's next program. After the process finds one reason for the student being ineligible for term activation for the given program, it does not check for remaining inclusion and exclusion criteria. This methodology dramatically enhances the performance of the process. After the process runs all of the edits against all of a student's active programs, it checks to see if any of these programs are still eligible for term activation. The Term Activation process can only activate a student for one program—her or his primary academic program. When a student has multiple eligible programs, the process selects the primary academic program by taking the program with the lowest STDNT_CAR_NBR and the highest EFFSEQ.

When you set the Selection Criteria field on the Selection 1 page to *Custom*, the Term Activation process executes its task through an entirely different path. In this case, the process combines the selection criteria in the component with the list of students found in the PS_TRMAC_CUST_PPLT table. We deliver this table with the application. You can populate this table by devising an SQR script or through the Custom Population page found in the Term Activation component. However you populate the table, the Term Activation process activates students for all rows in this table, provided that the student passes the referential integrity check and meets the additional page selection criteria that you selected. A key feature of the *Custom* option is that you can activate students for multiple terms in the same run, whereas the *Panel* option (the alternative option) restricts you to one term per process run.

Pages Used to Run Batch Term Activation

Page Name	Definition Name	Navigation	Usage
Global Exclusions	TRMAC_SETUP1	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Setup > Global Exclusions	Define the academic standing and program action exclusions for an academic institution's global exclusion rule.
Degree Status Rules	TRMAC_SETUP2	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Setup > Degree Status Rules	Define the service indicator and degree status exclusions for an academic institution's global exclusion rule.
Term Activation - Selection 1	RUNCNTL_TRMAC_1	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Selection 1	Enter values for the required fields of the Term Activation process (SRTRMAC), and enter additional high-level selection criteria to narrow the population of students who qualify for term activation.

Page Name	Definition Name	Navigation	Usage
Term Activation - Selection 2	RUNCNTL_TRMAC_2	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Selection 2	Enter further the students that the Term Activation process should consider as eligible for term activation for the process run.
Term Activation - Selection 3	RUNCNTL_TRMAC_3	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Selection 3	Enter required enrollment terms or enrollment lapse rules for a single run of the Term Activation process.
Term Activation - Process Control	RUNCNTL_TRMAC_4	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Process Control	Enter how the Term Activation process initializes or sets various values in your Campus Solutions system.
Custom Population	RUNCNTL_TRMAC_5	Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Custom Population	Create a custom list of students to activate into terms. Or, retrieve, view, and edit an existing custom list of students.

Defining Global Exclusions

Access the Global Exclusions page (Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Setup > Global Exclusions).

Image: Global Exclusions page

This example illustrates the fields and controls on the Global Exclusions page. You can find definitions for the fields and controls later on this page.

Global Exclusions

Degree Status Rules

Academic Institution: PSUNV PeopleSoft University

Global Exclusion Rule: UGEXCL1 ***Descr:**

Academic Standing Exclusions Find | View All | First 1-2 of 2 Last

*Career	*Academic Standing Action	
<input type="text" value="UGRD"/> Undergraduate	<input type="text" value="PRB2"/> Probation 2	Subj Dism + -
<input type="text" value="UGRD"/> Undergraduate	<input type="text" value="PRB3"/> Probation 3	Subj Dism + -

Program Action Exclusions Find | View All | First 1 of 1 Last

*Program Action	Action Reason
<input type="text" value="RADM"/> Readmit	<input type="text"/>

Service Indicator Exclusions Find | View All | First 1 of 1 Last

Service Indicator Cd	Service Ind Reason Code
<input type="text"/>	<input type="text"/>

Academic Institution

The academic institution for which the global exclusion rule applies.

Global Exclusion Rule

A rule that you can define to prevent the Term Activation process from term-activating students that have certain parameters on their student career term records (STNDT_CAR_TERM table).

Academic Standing Exclusions**Career**

Select the academic career for which you want to exclude an academic standing action from the Term Activation process (SRTRMAC).

Academic Standing Action

Select the actions (within the academic career) to exclude from the Term Activation process.

The Term Activation process connects each academic standing exclusion using an implied *Or* statement. For example, in the page above, PSUNV can use the rule to prevent undergraduates that are subject to dismissal (academic standing action equals PRB2 *or* PRB3) from being activated in regular terms.

Program Action Exclusions**Program Action**

Select the program action to exclude from the Term Activation process. This field prompts you with program actions only relevant to term activation.

Action Reason

To exclude a program action only when a particular reason is attached to that action, select a reason. The system prompts you with only the program action reasons related to the program action. When you specify reasons, you must list all of the reasons within that program action that you want the Term Activation process to exclude.

If you want to exclude a program action regardless of the reason, leave this field blank. The Term Activation process excludes all students that have that program action and meet the other run criteria.

The Term Activation process evaluates each academic program-action/action-reason exclusion using an implied *Or* statement.

Therefore, never indicate a program action and reason combination and then, for the same program action, leave this field blank. In such a case, the process excludes all actions regardless of the reason you specified. For example, if you list a program action of *RADM* with an action reason of *PET*, then add another row with an action of *RADM* and the reason left blank, the Term Activation process ignores the first entry and assume

that any student with the program action of *RADM*, independent of the reason, must be prevented from term activation.

Service Indicator Exclusions

Service Indicator Cd (service indicator code)

Select the service indicator code to exclude from the Term Activation process.

Service Indicator Reason Cd (service indicator reason code)

To exclude a service indicator code only when a particular reason is attached to that code, select a reason. The system prompts you with only the service indicator reasons related to the service indicator you select. When you specify a reason, you must list all of the reasons within that service indicator that you want the Term Activation process to exclude.

To exclude a service indicator regardless of the reason, leave this field blank. The Term Activation process excludes all students that have that service indicator and meet the other run criteria.

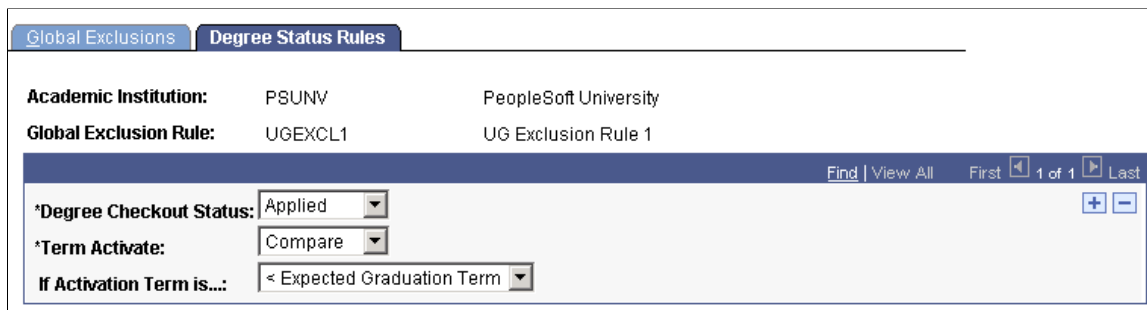

The Term Activation process evaluates each service indicator/reason exclusion using an implied *Or* statement. Therefore, never indicate a service indicator/reason combination and then, for the same service indicator, leave the reason blank. In such a case, the process excludes all reasons regardless of the one specified. For example, if you list a service indicator of *ALL* with a service indicator reason of *BILL*, then add another row with a service indicator of *ALL* and the reason left blank, the Term Activation process ignores the first entry and assumes that any student with the service indicator of *ALL*, independent of the reason, must be prevented from term activation.

Defining Degree Status Rules

Access the Degree Status Rules page (Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Setup > Degree Status Rules).

Image: Degree Status Rules page

This example illustrates the fields and controls on the Degree Status Rules page. You can find definitions for the fields and controls later on this page.

This page enables you to define the students who *can* be term-activated based on their degree checkout status. You also have the option to further define the students who can be term-activated by comparing the activation term to students' expected graduation term. This page works in conjunction with the Degree Checkout Status field on the Student Degrees page in the Student Program/Plan component. If your institution maintains the Degree Checkout Status field, you can then use this functionality. If your institution does not maintain the Degree Checkout Status field, the student will always pass the degree checkout status inclusion when you run the Term Activation process (SRTRMAC).

In the example on the page above, any student who has a degree checkout status of *Applied* qualifies for term activation so long as their activation term is less than their expected graduation term.

Degree Checkout Status

Select the degree checkout status that you want the Term Activation process to either exclude or evaluate for exclusion: *Applied, Approved, Awarded, Denied, In Review, and Pending*.

Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort.

Term Activate

Select from the following choices how you want the Term Activation process to evaluate the degree checkout status of students.

Never: Indicates that you want the Term Activation process to never term-activate students that have the degree checkout status you specified. The If Activation Term is... field becomes unavailable to edit.

Compare: Indicates that you want the Term Activation process to determine the students that it excludes from term activation by comparing the student's activation term to the expected graduation term for students who have the degree checkout status that you specified. The If Activation Term is field becomes available to edit.

For example, if a student has an expected graduation term of spring 2000, you might want to term-activate the student for the spring 2000 term but not the fall 2000 term. You can use the Compare option and the other Degree Status Exclusion fields to set up a run parameter to meet this need.

If Activation Term is...

If you select the *Compare* option in the Term Activate field, this field becomes available and required. Select how you want the Term Activation process to compare the student's activation term to the expected graduation term. For example, by setting the Degree Checkout Status field to *Applied* and this field to *< Expected Graduation Term*, you can exclude all students from term activation that *do not* match these two criteria. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort.

[Verifying and Updating Student Degree Data](#)

Entering Required and High-Level Criteria for Processing

Access the Term Activation - Selection 1 page (Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Selection 1).

Image: Term Activation - Selection 1 page

This example illustrates the fields and controls on the Term Activation - Selection 1 page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Selection 1' tab in a web application. At the top, there are navigation tabs: 'Selection 1' (active), 'Selection 2', 'Selection 3', 'Process Control', and 'Custom Population'. Below the tabs, the 'Run Control ID' is 'PS'. There are links for 'Report Manager' and 'Process Monitor', and a yellow 'Run' button. The 'Required Fields' section contains the following fields:

Institution:	PSUNV	PeopleSoft University	*Run Mode:	Insert
Acad Career:	UGRD	Undergraduate	*Selection Criteria:	Panel
Actvtn Term:	0570	2006 Fall	*Student Type:	Both
*Commit Freq:	1000			

Below the 'Required Fields' section, there are additional fields:

Acad Group:	LBART	College of Liberal Arts	Program Action Date Range	
Acad Prog:	LAU	Liberal Arts Undergraduate	Start Date:	
Acad Plan:			End Date:	
Student Group:				
Global Exclusion Rule:	UGEXCL1			

The Term Activation process (SRTRMAC.SQR) provides extensive selection functionality for activating specific student populations into terms by academic career. On the Term Activation setup component you predefine rules of exclusion and inclusion, whereas on the Term Activation process component you define characteristics for the population of students that you want to include in batch term activation. You can also attach a global exclusion rule to a given process instance. All of the selection criteria in this component are additive and meant for you to broaden or narrow the scope of your target population for batch term activation. If you want to perform a basic run of the Term Activation process without specifying inclusions and exclusions, you can select values for all of the fields found in the Required Fields group box on the first page. After you enter values for these fields, you can run the process at any time, ignoring the other fields in the component.

Note: You can only run the Term Activation process for one academic career at a time. If you want to activate students in terms across academic careers, you must run the process for each academic career.

Required Fields

This group box contains all the fields necessary to run the Term Activation process (SRTRMAC). The remaining fields on this page and the other pages in the component are optional. Use them to further restrict who is eligible for term activation on a specific run.

Institution

Select an academic institution. The Term Activation process considers only students active in that academic institution as eligible for term activation.

Run Mode

Select from the following choices the mode in which you want the Term Activation process to run. To ensure optimal performance, the process only allows you run in one mode at a time.

Insert: The Term Activation process considers for term activation only the students not yet activated in the activation term. If eligible, the process adds a new row of term data to the student's career term record (STDNT_CAR_TERM table).

Update: The Term Activation process considers for record modification only the students who already have been activated in the activation term. If eligible, the process updates the student's existing career term data (found in the STDNT_CAR_TERM table). Use other fields in this component to further control how the update function operates.

Acad Career (academic career)

Select an academic career. The Term Activation process only considers students who are active in that academic career as eligible for term activation. The Term Activation process enables you to activate students in only one academic career per process run. To activate students for multiple academic careers, you must run the process for each academic career.

Selection Criteria

Select from the following choices the type of selection criteria that you want the Term Activation process to use for the run.

Panel: Use the fields available in the component to specify the criteria that determines the students who are eligible for term activation. (Default)

Custom: Activate a custom population of students, or large batches of students, for one term or across multiple terms. For example, use this option when you need criteria beyond what the component provides, or when you want to perform a student records conversion.

By selecting this option, you direct the Term Activation process to look at the delivered PS_TRMAC_CUST_PPLT table to determine who should be term-activated. If desired, you can create your own SQR to populate this table.

The Term Activation process, when run with the *Custom* option, selects custom populations from the PS_TRMAC_CUST_PPLT table based on run control ID and user ID. If you select the *Custom* option, you can edit or enter, on the Custom Population page (which is found in this component), the students and the terms for which you want to activate them. Otherwise, the Custom Population page is unavailable to edit.

Actvtn Term (activation term)

Select the term for which you are running the process, known as the activation term. Students that meet all run criteria are activated for this term. If you select a value of *Panel* in the Selection Criteria field, then this field is required. If you select a value of *Custom* in the Selection Criteria field, the Term Activation process uses the term for the student on the PS_TRMAC_CUST_PPLT table or on the Custom Population page in this component.

Student Type

Select from the following choices the type of student to activate. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort.

New: Activate only students newly admitted to your academic institution.

Continuing: Activate only continuing students.

Both: Activate both new and continuing students simultaneously in a single run. (Default)

Note: The Term Activation process defines new and continuing students by comparing the activation term against the admit term. Students that have the same activation term and admit term are new. Students with an admit term prior to the activation term are continuing.

Commit Freq (commit frequency)

Select how many table rows of information (students) you want to process before committing changes to the database.

The default is 1,000. Consult your institution's database administrator for the appropriate setting for your institution. If you set the commit value to higher than the number of rows the program processes, then the program commits data only once at the end of the run. The commit logic for this field is platform independent.

Optional Fields

The use of the Acad Prog (academic program), Acad Plan (academic plan), Acad Group (academic group), and the Program Action Date Range group box fields can improve the performance of the Term Activation process. However, excessive use of global exclusions and other selection criteria, such as academic standing actions, service indicator codes, and required enrollment terms might slow the process.

Acad Group (academic group)

Select an academic group to narrow the population of students to term-activate.

Acad Prog (academic program)

Select an academic program to narrow the population of students to term-activate.

Acad Plan (academic plan)

Select an academic plan to narrow the population of the students to term-activate. You can specify an academic plan

independently of an academic program. For example, if you specify both an academic program and plan, then only students active in both the academic program *and* plan are eligible for term activation. However, if you specify an academic plan alone, then only students active in that academic plan regardless of their academic program are eligible for term activation.

Start Date and End Date

The beginning and end of the program action date range.

Use these fields to narrow the population of students to term-activate to a specific range of program action dates. For example, you can use this date range to limit term activation to only the students that have been activated or matriculated into an academic program since the last run of the Term Activation process. The Term Activation process compares this date range to the Action Date field on the Student Program page. The action date is the transaction date on which the student gets activated into an academic program, *not* the effective date. If the action date is greater than or equal to the start date and less than or equal to the end date, the student qualifies for term activation.

To use these fields you must enter values for both. By default, the end date equals the start date.

Student Group

Select a student group to narrow the population of students to term-activate. The process only activates students within that student group who also meet the other selection criteria of the component.

Global Exclusion Rule

If you want to use a global exclusion rule on this run to further narrow the population of students to term-activate, use this field's prompt to select a rule. If you do not want to use global exclusions, leave this field blank. You can specify a different global exclusion rule for each run of the process.

[Creating Custom Populations for Processing](#)

Entering Detailed Criteria for Processing

Access the Term Activation - Selection 2 page (Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Selection 2).

Image: Term Activation - Selection 2 page

This example illustrates the fields and controls on the Term Activation - Selection 2 page. You can find definitions for the fields and controls later on this page.

This page enables you to narrow your target population for term activation by selecting the program action, action reason, academic standing action, and service indicator data that you want to include.

Note: The Term Activation process (SRTRMAC) connects academic standing, program action, and service indicator selections with an implied *and* between each selection type. The process connects the criteria with an implied *or* within each selection type.

Program Action Selection

Program Action

Select the program action that you want to include for the Term Activation process. In Insert run mode, the system prompts you only with the actions that are eligible for term activation. In Update run mode, the system prompts you with all available actions. You can enter a program action that conflicts with a global exclusion. However, the global exclusion always takes precedence over the selection criteria.

Action Reason

If you want to include a program action only when a particular reason is attached to that action, select a reason in this field. The system prompts you with only the program action reasons related to the program action you specify. When you specify a reason, list all of the reasons within that program action that you want the Term Activation process to include.

If you leave this field blank, the Term Activation process includes all students that have that program action and meet the other run criteria, regardless of the program action reason.

The Term Activation process evaluates each program action and reason combination using an implied *Or* statement. Therefore, never indicate a program action and reason combination and then for the same program action leave the action reason blank. In such a case, the process include all actions regardless of the reason you specified. For example, if you list a program action of *MATR* with an action reason of *FDEP*, then add another row

with an action of *MATR* and the reason left blank, the Term Activation process ignores the first entry and assumes that any student with the program action of *MATR*, independent of the reason, is eligible for term activation.

Important! The values you enter in this group box must exist on the student's most current effective-dated academic program row in order for the student to be selected.

Academic Standing Selection

Academic Standing Action

Select the academic standing action that you want the Term Activation process to include.

The Term Activation process connects each academic standing using an implied *Or* statement. For example, PSUNV might want to make eligible for term activation only students with *GOOD* or *GREA* (great) academic standing that also meet the other run criteria.

Service Indicator Selection

Service Indicator Cd (service indicator code)

Select the service indicator code that you want to include in the Term Activation process.

Service Indicator Reason Cd (service indicator reason code)

If you want to include a service indicator code only when a particular reason is attached to that code, select a reason. The system prompts you with only the service indicator reasons related to the service indicator you specify. When you specify a reason, you must list all of the reasons within that service indicator that you want the Term Activation process to include.

If you select a service indicator code and leave this field blank, the Term Activation process includes all students that have that service indicator code and meet the other run criteria, regardless of the service indicator reason.

The Term Activation process evaluates each service indicator/reason combination using an implied *Or* statement. You should therefore never indicate a service indicator/reason combination and then, for the same service indicator, leave the action reason blank. In such a case, the process includes all reasons. For example, if you list a service indicator of *ALL* with a service indicator reason of *BILL*, then add another row with a service indicator of *ALL* and the reason left blank, the Term Activation process ignores the first entry and assumes that any student with the service indicator of *ALL*, independent of the reason, must be eligible for term activation.

Entering Enrollment Lapse Rules for Processing

Access the Term Activation - Selection 3 page ((Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Selection 3).

Image: Term Activation - Selection 3 page

This example illustrates the fields and controls on the Term Activation - Selection 3 page. You can find definitions for the fields and controls later on this page.

Connector	*Line	*Enrollment Term	Term
	20	0530	2004 Fall
AND	30	0522	2004 Summer
OR	40	0530	2004 Fall
AND	50	0518	2004 Spring

If you use this page, a student *must* be enrolled in a term or terms according to the rules you specify to be eligible for term activation in the term specified on the Selection 1 page of this component. You can use the Selection 3 page, for example, to prevent the term activation of students who lack enrollment records for the previous term.

Campus Solutions defines a class enrollment as the existence of a row in the STDNT_ENRL table. The procedure that calculates what is and is not a class enrollment is a program file named SRENRLCK.SQC. The SQC is separate from the Term Activation process (SRTRMAC) so that your institution can modify the code that determines what is a class enrollment based on your institution's business needs without concern about future changes to the Term Activation process that might affect the modification. The SQC contains only one procedure, named SELECT-ENROLLMENT. The procedure description describes how the user should proceed with making modifications.

Important! Although we provide this feature with significant flexibility, it is always best to keep the rules simple. Enforcing these rules requires complex rule evaluation and possible increased database activity for each student. Too many rules might result in performance issues.

Connector Type

Use the Connector Type group box to specify how the Term Activation process should group individual enrollment requirement lines for evaluation to determine if students qualify for term activation. By choosing a connector type (AND, OR) and either saving the page or clicking the Set Parentheses button, the system displays parentheses so that you can visualize how the Term Activation process interprets the rules.

AND and OR

Connector types indicating the main (default) Boolean operator to be used in the equation that contains the detail lines.

Select the main connector type (AND, OR) for this term activation criteria. Detail lines joined by the opposite of the main connector type are grouped into one partition. Detail lines joined by the main connector are considered as individual components (or partitions) of the equation. A partition is each detail line in the equation or each set of detail lines grouped by parentheses. For example, if the connector type is AND, and the detail lines are A OR B AND C OR D AND E, then the detail appears on the page as (A OR B) AND (C OR D) AND E. The first partition is (A OR B), the second partition is (C OR D), and the third partition is E. The main connector (that is, the connector that joins the partitions) is AND. The connector joining components within a partition is always the opposite of the main connector type. In another example, if the main connector is OR and the detail lines are A OR B AND C OR D, then the detail appears on the page as A OR (B AND C) OR D. The first partition is A, the second partition is (B AND C), and the third partition is D.

Set Parentheses

Click to parse the individual lines based upon the connector type and the visible parentheses on the page. The parentheses serve as a visual cue to describe how the process evaluates the criteria. You can also save the page to have the system automatically recalculate the parentheses. You might need to reset the parentheses when you add additional lines, change the line order, or change the connector type.

Parentheses cannot be explicitly set to group detail rows.

If the main connector type is AND, then the system automatically creates partitions where AND is the main connector. For example, if A OR B AND C OR D is entered, then the implied statement is (A OR B) AND (C OR D).

If the main connector type is OR, then the system creates partitions where OR is the main connector. For example, if A OR B AND C OR D is entered, then the implied statement is A OR (B AND C) OR D.

Required Enrollment Terms

Use this grid to specify rules about the terms that students must be enrolled in to qualify for term activation.

Connector

Select a connector to indicate how this detail line is connected with the prior detail line. Values are *AND* or *OR*.

Line

This field displays a sequential line number, which the system automatically generates in increments of 10. It determines the order in which the process evaluates the line arguments. Use the Line column to manually reorder the criteria. After manually changing the line numbers, save the page or click the Set

Parentheses button to visibly reorder the lines and recalculate the parentheses.

Enrollment Term

Select the term in which students must be enrolled to qualify for term activation. The Term Activation process determines class enrollment by locating a row for students in the STDNT_ENRL table for the specified term.

In the example depicted in the page above, the rule specified requires that the student have at least one class enrollment in the STDNT_ENRL table for one of the two concurrent terms.

Specifically, a student could satisfy this rule and thereby be included in the term activation selection by being enrolled in (fall 2004 AND summer 2004) OR by being enrolled in (fall 2004 AND spring 2004). This structure supports any combination of requirements.

Entering Process Control Options

Access the Term Activation - Process Control page (Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Process Control).

The upper frame of this page enables you to control how the Term Activation process (SRTRMAC) populates certain values on the student's career term record. The lower frame of the page enables you to specify the type and detail of information for the Term Activation process to write to the log files on any given run of the process. This page is available in both the Insert and Update run modes.

Term Value Control

Use the fields in this group box to define how the Term Activation process interacts with various fields in the STDNT_CAR_TERM table. In Insert run mode, you can define how the process initializes various fields in the table. In Update run mode, you can define how the process updates various fields in the table.

Tuition Calc Required (tuition calculation required)

Student Financials uses this field to determine if tuition must be calculated or recalculated for students. The option that you select determines the value of the TUIT_CAL_REQ field on the STDNT_CAR_TERM table, setting the value to either *Y* or *N* on the student's career term record. When your institution calculates tuition, the tuition calculation process references this field to determine if a student's tuition needs to be recalculated. Select from the following choices.

Busn Unit: Tells the Term Activation process to use the corresponding field on the Business Unit SF Table to determine the value of the corresponding flag on the student's career term record. When you are in Insert run mode, the system automatically populates this field with the business unit and it is unavailable to edit.

No Change: When you are in Update run mode this is the default value. If you run the Term Activation process with this

value set, the process leaves the corresponding field on the STDNT_CAR_TERM table unchanged.

No: Select this option to have the Term Activation process set the TUIT_CAL_REQ field on the STDNT_CAR_TERM table to *N* on each affected student's career term record. When your institution calculates tuition, the tuition calculation process does not recalculate this student's tuition.

Yes: This option is available in Update run mode only. Select this option to have the Term Activation process set the TUIT_CAL_REQ field on the STDNT_CAR_TERM table to *Y* for all students whose career term records it has updated. When your institution calculates tuition, the tuition calculation process will recalculate tuition for these students.

Form of Study

Select how you want to set the form of study for the student's career term record. Values for this field are *Default*, *No Change*, and all of the other delivered translate values for form of study. The *Default* and *No Change* translate values have coding attached to them and should not be modified. You can, however, add other values to the translate table.

In Insert run mode, if the activated student has an activation row for a previous term within the same academic career and you select either the *Default* or *No Change* options, the system carries forward the value from the previous term. If, however, you select *Default* and the student has never been term-activated for the same academic career, the value of this field gets set by default to *Enrollment* (ENRL).

In Update run mode, if you select either the *Default* or *No Change* options, the Term Activation process leaves the Form of Study field unchanged. If you set the field value to anything else while in the Update run mode, the Term Activation process changes the STDNT_CAR_TERM value to the value that you select from the list of translate values.

Note: If you select any value besides *Default*, *No Change*, or *Enrollment* the Academic Load field becomes available and required.

FA Stats Calc Required (financial aid statistics calculation required)

Select from the following choices how you want the Term Activation process to set the FA_STATS_CALC_REQ flag on the STDNT_CAR_TERM table. The Financial Aid Term Build process uses the value of the FA_STATS_CALC_REQ flag to determine if a STDNT_CAR_TERM record should be built or rebuilt for the student term. If the FA_STATS_CALC_REQ flag is set to *Y*, then the Financial Aid Term Build process builds or rebuilds the Financial Aid Term record for the student term. If the FA_STATS_CALC_REQ flag is set to *N*, then the Financial Aid Term Build process assumes no significant changes have been made and skips the student.

Yes: Sets the FA_STATS_CALC_REQ flag to *Y* on each student's STDNT_CAR_TERM record.

No: Sets the FA_STATS_CALC_REQ flag to *N* on each student's STDNT_CAR_TERM record.

Default: Sets the FA_STATS_CALC_REQ flag to *Y* on each student's STDNT_CAR_TERM record.

No Change: Leaves the value of the FA_STATS_CALC_REQ flag unchanged.

Academic Load

In the Update run mode, this value becomes available and required when the Form of Study field value is set to a value other than *Enrollment*, *No Change*, or *Default*. Select the academic load for the student's updated career term record.

Eligible to Enroll

Select from the following choices whether students activated in a term through this process are then eligible to enroll in that term. This field is available in both Insert and Update run modes.

Yes: Select this value to set the Eligible to Enroll flag on the STDNT_CAR_TERM record to *Y*, making students activated in a term through this process eligible to enroll in that term.

No: Select this value to set the Eligible to Enroll flag on the STDNT_CAR_TERM record to *N*, thus making students activated in a term through this process ineligible to enroll in that term.

Default: Select this value to have the process look at the value of the student's Eligible to Enroll flag on her or his STDNT_CAR_TERM record for a prior term within the same academic career. In Insert run mode, if the student does not have a term activation row for a prior term within the same academic career, the process sets the flag on the student's career term record for the current term to *Yes*, making the student eligible to enroll. If the student does have a term activation row for a prior term within the same academic career, the process carries forward the value of the Eligible to Enroll flag to the current term activation row.

No Change: In Update run mode, select this option to have the Term Activation process leave the value of the Eligible to Enroll flag on the STDNT_CAR_TERM record unchanged.

Refresh Term Cntrl Dates (refresh term control dates)

Controls how the Term Activation process carries down certain term control dates from the academic calendar (ACAD_CALTRM_TBL) to the individual student career term record.

The process refreshes the dates in the following fields on the student career term record: Fully Enrolled Date, Show Enrollment on Transcript Date, Show Statistics on Transcript Date, and Fully Graded Date. Values are *Yes* and *No*.

In Insert run mode, the system populates this field with *Yes* because the Term Activation process always carries down the term control dates from the academic calendar. In this mode the field is unavailable to edit.

In Update run mode, the system populates this field with *No* to indicate that the process should leave the term control dates unchanged. However, you can change this value to *Yes*, which is especially useful if students have already been activated in a term and you need to change any of the control dates for that term.

Process Log Control

Use the fields in this group box to select how you want the Term Activation process to log statistics by selecting the type and level of detail information that you need. The selected system defaults are *Activated Students*, *Excluded Students*, and *Run Criteria*. The system assigns a unique process number to the log file `srtrmac.dat` that you generate so that you can retain and track online versions of the log files. The log includes processing totals on students activated, students updated, and students ineligible. You can view the log by accessing the Report/Log Viewer page and clicking the Trace File link. Access the Report/Log Viewer page either by clicking the Report Manager link on the run control page then the appropriate View link on the Report List page, or by clicking the Process Monitor link on the run control page, the appropriate Details link on the Process Requests page, then the View Log/Trace link. If you only want a count of the students included or excluded from term activation, clear all check boxes.

Activated Students

Select to log students who are included in term activation. The log file provides employee ID, activation term, action taken by the process, academic institution, academic career, and primary academic program.

Excluded Students

Select to log students who are excluded from term activation. The log file provides employee ID, activation term, action taken by the process, academic institution, academic career, and primary academic program.

Activated Students Detail

Select to log students who are included in term activation in greater detail. The log file provides employee ID, academic career, career number, activation term, academic group, academic program, academic plan, program action, program action reason, admit term, effective date, term activation action, and term activation exclusion reason.

Excluded Students Detail

Select to log students who are excluded from term activation in greater detail. The log file provides employee ID, academic career, career number, activation term, academic group, academic program, academic plan, program action, program action reason, admit term, effective date, term activation action, and term activation exclusion reason.

Run Criteria

Select to log all page selection criteria and run control options, including the global exclusion rule, for the process instance.

Creating Custom Populations for Processing

Access the Custom Population page (Records and Enrollment > Term Processing > Term Activation > Term Activation Batch Process > Custom Population).

The system transfers this data to and from the PS_TRMAC_CUST_PPLT table by OPRID (operator ID) and run control ID. Rather than manually entering students into the table, you can populate the table using a specialized SQR script that your institution develops to accomplish the task.

When you run the Term Activation process (SRTRMAC) for a custom population, the process knows which students to run from the PS_TRMAC_CUST_PPLT table by looking at the OPRID and run control ID. It processes all valid rows of data it finds in the PS_TRMAC_CUST_PPLT table, provided that you have set the Selection Criteria field on the Selection 1 page to *Custom*. Otherwise, the system makes this page unavailable and the process disregards the data in the table.

A key feature of the *Custom* option is that you can activate students for multiple terms in the same run, whereas the *Panel* option (which is the alternative option) restricts you to one term per process run. In addition, the *Custom* option enables you to use other selection criteria fields in the component (except the Term field on the Selection 1 page) to narrow your population selection. Please note, however, that the process supports only one academic institution and one academic career at a time. You specify the academic institution and academic career on the Selection 1 page, which is the first page in this component. If you load the table with an SQR script (thus bypassing the page edits) and subsequently try to run the process for more than one academic institution and academic career at a time, the process halts and writes an error message to the process log.

Note: The Term Activation process functions independently of the rows visible for viewing in the page grid. You do not need to retrieve and load the data into the page before running the process.

Warning! Loading a large amount of data into the page can adversely affect performance.

Term	Select the term for which you want to retrieve rows of data from the PS_TRMAC_CUST_PPLT table. If you want to search on all terms for an academic institution and academic career (as specified on the Selection 1 page), then leave this field blank.
ID (employee ID)	Select an student identification number to retrieve, from the PS_TRMAC_CUST_PPLT table, rows of data on a specific person. The system prompts against the PS_TRMAC_CUST_PPLT table and displays all applicable student IDs in that table according to user ID, run control ID, term for which you are searching, and academic institution and academic career (as specified on the Selection 1 page).
Refresh	Click to retrieve rows of data from the PS_TRMAC_CUST_PPLT table that match the criteria you entered in the Term and ID fields. This feature is optional, letting you view and edit your custom population before running the Term Activation process.
ID (employee ID)	The grid displays data rows retrieved from the PS_TRMAC_CUST_PPLT table according to your search criteria in the Term and ID fields above the grid. The system displays the employee identification number of the person to which the row of data pertains.

To add to the list of retrieved data or to make a new custom list, select a student ID. The system prompts against a view of the ACAD_PROG table (STDNT_PROG_VW), which lists all student IDs with a program row (active or inactive).

Name

The system displays the name of the person to which this row of data pertains, as retrieved from the PS_TRMAC_CUST_PPLT table. If you are inserting an additional row or creating a custom list, the system displays the person's name when you exit the ID field.

Term

Select the term for which you want to activate the student. If you have searched for and retrieved the data row from the PS_TRMAC_CUST_PPLT table, the system displays the term for which you searched. You can change the term.

Performing Quick Activation

Processing a Quick Activation

Frequently, you might have to activate a student quickly, bypassing the Activate Applications matriculation process (ABPCPPRC) in Recruiting and Admissions and moving the student rapidly into Student Records, assuming that the student's name and address are in the system.

To process a quick activation:

1. Activate the student into an academic program and plan through the Student Program/Plan component by updating the program action code on the Student Program page to *ACTV* (active).

The student must have an active academic program and plan for you to activate the student into a term. Select Records and Enrollment > Career and Program Information > Student Program/Plan.

2. Activate the student into a term through the Term Activation page.

Select Records and Enrollment > Student Term Information > Term Activate a Student. When you save the information on this page, you have completed the quick activation process. The student is now ready to enroll in classes for the term.

Creating Student Blocks

Understanding Student Blocks

Important! Mass Change is a deprecated product. Support will be maintained for this product, but no new development will be produced for Mass Change. It is strongly recommended that you use Application Engine instead. For more information on Application Engine, see *PeopleTools: Application Engine*.

A student block is a grouping of student information into blocks based on a number of common academic characteristics. Student blocks can be essential during enrollment because they enable you to mass enroll groups of students into blocks of courses.

You can create student blocks on the Create Student Block Page (STDNT_BLOCK) by manually entering student IDs into a student block, but this becomes inefficient when dealing with large groups of students. For example, you may want to enroll hundreds of first year computer science students into a common, core curriculum based on their academic level and academic plan.

To meet this need for mass enrolling large student blocks, your system includes a mass change type and mass change template called Create Student Block. With these mass change tools, you can create and run mass change definitions that will generate SQL for large student blocks based on your criteria and defaults.

After you create your student block through a mass change definition, you can use the Mass Enrollment process to create a course enrollment block, associate the student block with the course block, and then post the enrollment transactions.

Mass Change

Mass change is a SQL generator that you can use to develop and perform custom applications. Using mass change, a developer can set up a series of INSERT, UPDATE, or DELETE SQL statements that the end user can run to perform business functions.

When you use mass change, you are essentially running SQL statements to manipulate the data in the application. The overall structure of mass change is similar to that of Query, except that Query retrieves data from the database, while mass change actually updates the database.

Updating Mass Change Operator Security

Important! Mass Change is a deprecated product. Support will be maintained for this product, but no new development will be produced for Mass Change. It is strongly recommended that you use Application Engine instead. For more information on Application Engine, see *PeopleTools: Application Engine*.

In order for end users to be able to select the Create Student Block template when creating a mass change definition, the template must be added to the user security for the user or class profile to which the end users belong.

This section discusses how to update operator security.

Page Used to Update User Security

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Security	MC_OPER_SECURITY	PeopleTools > Security > Mass Change Operator Security > Security	Grant access to the Create Student Block mass change template to permission lists so that users can run the Create Student Block mass change process.

Updating Operator Security

Access the Security page (PeopleTools > Security > Mass Change Operator Security > Security).

Mass Change Template ID

Select the *Create Student Block* template ID.

Creating a Student Block Mass Change Definition

Important! Mass Change is a deprecated product. Support will be maintained for this product, but no new development will be produced for Mass Change. It is strongly recommended that you use Application Engine instead. For more information on Application Engine, see *PeopleTools: Application Engine*.

This section provides an overview of mass change definitions and discusses how to:

- Create mass change definitions.
- Specify Student Administration parameters.
- Specify student block criteria and defaults.
- Generate mass change SQL text for student blocks.
- View mass change execution history.

Understanding Mass Change Definitions

Mass change definitions are built using mass change templates and are generally created and run by end users. Mass change definitions are used to specify the values and operators for each field in the WHERE clause of the SQL statement, to specify the values for default fields, and to generate the actual SQL statements. When you create a definition, all information defaults from the associated mass change type and template, except for the criteria and default field values and operators.

If any changes occur to the mass change template, the system requires that you create a new mass change definition because existing mass change definitions will not recognize the changes.

Pages Used to Create a Student Block Mass Change Definition

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Description	MC_DEFN_00	Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Description	Select the template with which you will create the mass change definition.
Student Administration	MC_DEFN_SA	Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Student Administration	Set parameters such as aid year, academic career, and institution for the mass change definition.
Criteria and Defaults	MC_DEFN_01	Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Criteria and Defaults	Specify the operators and values for the criteria and default fields so that the mass change properly runs the SQL statements.
Generate SQL	MC_DEFN_02	Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Generate SQL	Generate and view the SQL statements, based on the Create Student Block type, template, and definition, before actually running the mass change. Select the option of running the SQL when you save the page.

Page Name	Definition Name	Navigation	Usage
Execution History	MC_DEFN_03	Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Execution History	View the history of all of your SQL runs for this definition.

Creating Mass Change Definitions

Access the Description page ((Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Description).

Mass Change Definition

Select the *Create Student Block* template. The system enters the description of the template in the Description field.

Specifying Student Administration Parameters

Access the Student Administration page (Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Student Administration).

Mass Change Default Status

Select the status that the system will assign to the records created when you generate this mass change.

As Of Date and **As Of Date/Time**

Enter the date and time for the default status.

Aid Year, Academic Career, SetID, Institution, and Stdnt Fin Business Unit (student financials business unit)

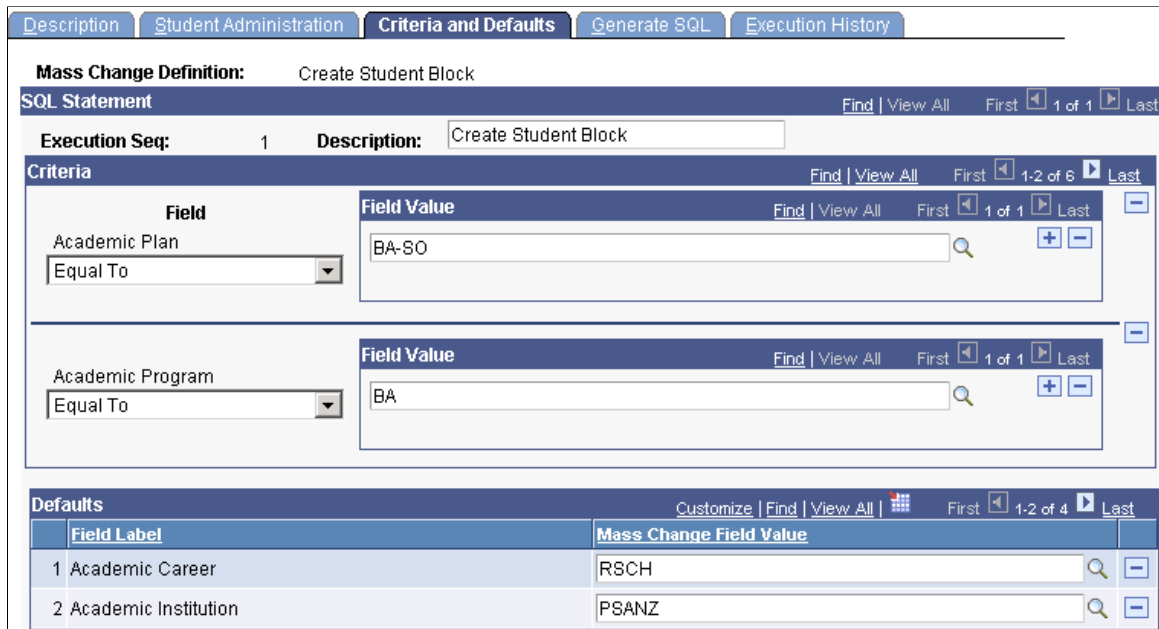

Enter values as needed for the SQL to filter the data that the process retrieves.

Specifying Student Block Criteria and Defaults

Access the Criteria and Defaults page (Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Criteria and Defaults).

Image: Criteria and Defaults page

This example illustrates the fields and controls on the Criteria and Defaults page. You can find definitions for the fields and controls later on this page.

The Criteria and Defaults page is the heart of a Mass Change definition and is the key to running effective SQL statements and creating a student block. The Create Student Block mass change runs two SQL statements to create a student block, inserting these statements into the STDNT_BLOCK_HDR record and the STDNT_BLOCK_DTL record so that you can select to use your student block during the Mass Enrollment process.

Important! To properly run the mass change and generate the student block that you want, it is essential that you know the exact values of the criteria and default fields. For example, if you want to create a student block for all students with the academic plan equal to BA-SO, an academic program equal to BA, and a projected academic level equal to 20 (sophomore), then you must enter these values in the respective criteria fields and leave the remaining criteria fields blank.

Criteria

Field and Field Value

Specify the operators and values of each field as necessary to restrict and unrestrict the data set that mass change selects to generate the student block you want.

Mass change will add this criteria to the end of the insert SQL statements that it generates.

The following criteria fields are delivered with the Create Student Block template:

- Academic Program
- Academic Plan
- Term

- Academic Level - Projected
- Academic Load
- Total Grade Points

Defaults

Mass Change Field Value

Specify values for each default field. Mass change uses the default values in the insert statements.

For example, you must input a value for the Student Enrollment Block code and description in order for your student block to appear as a choice during mass enrollment.

Following are the default fields that the application delivers with the Create Student Block template:

- Academic Career: Mass change inserts this value in the STDNT_BLOCK_DTL record.
- Academic Institution: Mass change inserts this value in the STDNT_BLOCK_DTL record.
- Student Enrollment Block Code: This is the unique identifier for the student enrollment block.

Mass change inserts this value in the STDNT_BLOCK_DTL record. During mass enrollment, this value appears as a choice from the prompt box for the Student Enrollment Block field on the Mass Enrollment page.

- Student Enrollment Block Description: Mass change inserts this value in the STDNT_BLOCK_HDR record.

During mass enrollment, this value appears as a choice from the prompt box for the Student Enrollment Block field on the Mass Enrollment page.

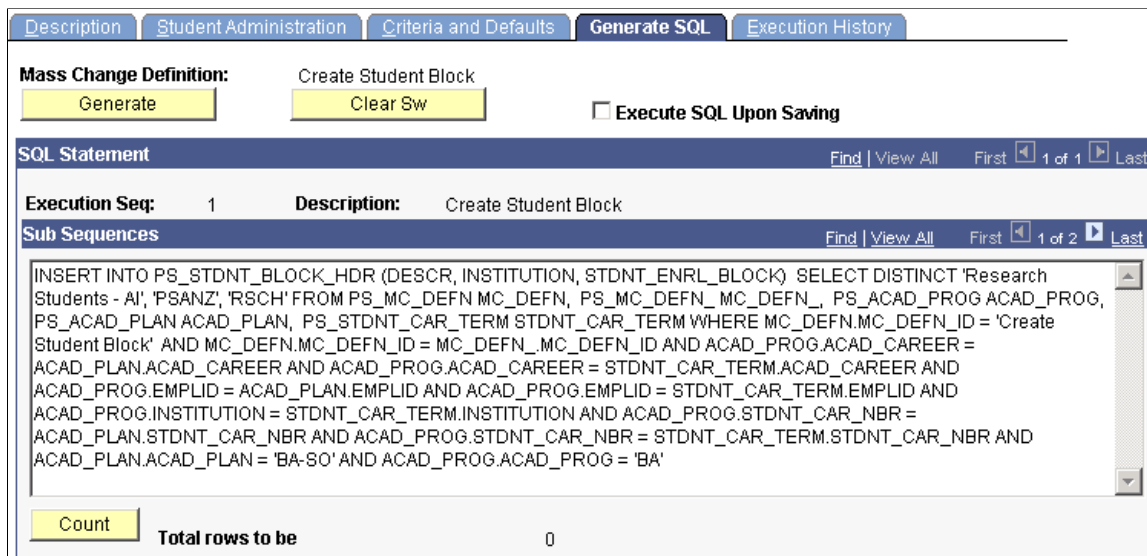

Warning! Do not delete Default rows from your definition. This prevents the mass change definition from running properly.

Generating Mass Change SQL Text for Student Blocks

Access the Generate SQL page (Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Generate SQL).

Image: Generate SQL page

This example illustrates the fields and controls on the Generate SQL page. You can find definitions for the fields and controls later on this page.

The mass change user ID (shown on the Description page) must be the same as the ID of the person running the mass change. Thus, if you created the mass change definition, then only you can run the mass change. Otherwise, you must create a new mass change definition using the appropriate template and save the newly created definition with your ID.

After you run the SQL, the system populates the STDNT_BLOCK_HDR record and the STDNT_BLOCK_DTL record with the student block values that you created. You can then select to use the student block that you create in the Mass Enrollment process. Your student block will appear as a choice in the prompt box for the Student Enrollment Block field on the Mass Enrollment page. You can also view your student block on the Mass Enrollment Student Block page.

Clear Sw (mass change clear switch) Click when you first open the page and want to generate a new SQL.

Also click this button if you are unhappy with the SQL that the mass change generates and need to rewrite the definition to better fulfill your needs.

Execute SQL Upon Saving Select if you are positive that you want to run the SQL. If you select this option and then click the Generate SQL button, mass change runs the SQL as soon as you click the Save button.

If you do not select this check box, you can save the mass change definition, then run it in the background using a run control.

Generate SQL Click to have mass change generate the SQL statements based on the mass change type, template, and definition.

SQL Statement Displays the SQL statement text for you to review.

Verify that any FROM and WHERE clauses reference the proper tables, fields, and values.

Count

Click to display the total number of rows affected by each statement. If the totals are what you expect, select the Execute SQL Upon Saving check box and save the definition.

If the count is not what you expected, redefine the definition.

After you run the SQL statements for your Create Student Block mass change definition, you should look at the STDNT_BLOCK_HDR and STDNT_BLOCK_DTL tables to make sure that the inserts have successfully created the records. You can also view this from the Mass Enrollment Student Block page. If you have successfully run the SQL statements, you can use the Mass Enrollment process to create a course enrollment block, attach the course enrollment block to this student block, and post the enrollment transactions.

Viewing Mass Change Execution History

Access the Execution History page (Records and Enrollment > Enroll Students > Block Enrollment > Mass Change Definition > Execution History).

The fields on this page are the same as the fields on the Criteria and Defaults page.

Chapter 34

Maintaining Student Career Term Records

Prerequisites for Maintaining Student Career Term Records

Before you can use all of the elements in the Term Activation component, you must:

- Activate the student in an academic program.
- Set up default enrollment limits on the Term Enrollment Limits page of the Academic Program Table component.
- Define term control date default values on the academic calendar.

Using the Term Activation Component

This section discusses how to:

- Maintain a student's career term record.
- Maintain a student's term enrollment limits.
- Maintain a student's session data.
- Maintain a student's terms in residence.
- Maintain a student's term control dates.
- Track and maintain a student's external study agreements.
- (AUS) Set student term default values.
- (NZL) Maintain single data return (SDR) reporting data for a student.

Pages Used to Maintain Student Career Term Records

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Term Activation	STDNT_ACTIVATION	Records and Enrollment > Student Term Information > Term Activate a Student > Term Activation	Maintain a student's career term record or activate a student into a term.

Page Name	Definition Name	Navigation	Usage
Loan Election	SSR_LOAN_ELEC_AUS	Records and Enrollment > Student Term Information > Term Activate a Student > Loan Election	<p>Note: This page is for Australian institutions only. To activate the page, select the Australia DEST, HECS, Centrelink, TAC check box on the Academic Institution 6 page.</p> <hr/> <p>Set default values for the student's career number and liability status for course enrollments.</p>
SDR (single data return)	SSR_STD_CRTRM_NZL	Records and Enrollment > Student Term Information > Term Activate a Student > SDR	<p>Note: This page is for New Zealand institutions only. To activate the page, select the New Zealand Catalog, SDR, EFTS, StudyLink check box on the Academic Institution 6 page.</p> <hr/> <p>Enter fee information for the student's program for SDR reporting.</p>
Enrollment Limit	STDNT_ENRL_LIM	Records and Enrollment > Student Term Information > Term Activate a Student > Enrollment Limit	Maintain a student's term enrollment limits.
Student Session	STDNT_SESSION	Records and Enrollment > Student Term Information > Term Activate a Student > Student Session	Maintain a student's session data within the student's career term record.
Terms In Residence	STDNT_CAREER_RES	Records and Enrollment > Student Term Information > Term Activate a Student > Terms In Residence	Maintain a student's terms in residence or adjust a student's transfer credit values.
Term Control Dates	STDNT_TERMCNTRL_DT	Records and Enrollment > Student Term Information > Term Activate a Student > Term Control Dates	Maintain a student's term control dates, including the fully enrolled date, fully graded date, and dates for showing enrollment and statistics on transcripts.
External Study	STDNT_EXT_STUDY	Records and Enrollment > Student Term Information > Term Activate a Student > External Study	Track and maintain external study programs, such as study abroad, that apply towards a student's career term record.

Maintaining a Student's Career Term Record

Access the Term Activation page (Records and Enrollment > Student Term Information > Term Activate a Student > Term Activation).

Image: Term Activation page

This example illustrates the fields and controls on the Term Activation page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Term Activation' page for student Ana Beck (SR0400). The page has several tabs: Term Activation, Enrollment Limit, Student Session, Terms In Residence, Term Control Dates, and External Study. The 'Term Activation' tab is active. The page displays the following fields and values:

- Academic Career:** Undergraduate
- *Academic Institution:** PSUNV PeopleSoft University
- *Term:** 0505 2003 Fall Semester
- Student Career Nbr:** 0 Liberal Arts Undergraduate
- Override All Academic Levels:**
- Override Projected Level:**
- Academic Level - Projected:** Freshman
- Academic Level - Term Start:** Freshman
- Academic Level - Term End:** Freshman
- Level Determination:** Units
- Activation Date:** 01/20/2003
- Academic Year:** 2004
- Load Determination:** Units
- *Form of Study:** Enrollment
- Academic Load:** No Units
- *Billing Career:** UGRD
- Eligible To Enroll:**

Academic Career

This field displays all of a student's career term records by academic career.

Academic Institution

The system supplies an academic institution from the User Defaults component. You can specify any valid academic institution here, but you can add a record only if the student is active in an academic program at that academic institution as of the start date of the specified term.

Term

The system displays all active terms for a student. If you are performing a quick activation, enter the term in which to activate the student.

Student Career Nbr (student career number)

By default, the system sets the student career number to zero, which is the first academic program in the student's program stack and identifies the student's primary academic program. The system uses the student career number to perform various calculations, including the calculation of the student's academic level and load. You can override the student career number, for instance, for students in dual programs. After you override the student career number in one term, it rolls from term to term.

Override All Academic Levels

Select to modify all academic level fields on this page. This selection carries over to the next term, so when you add a new row to activate the student in the next term, this check box is selected by default. Also, when you override all academic levels, the system sets all academic levels for the next term to

the end of term level for the prior term row. You should select this check box sparingly, because doing so prevents the system from automatically determining the student's academic levels.

If you clear this check box, the system uses the academic level defaults that are established on the Academic Level Table page.

Override Projected Level

Select to modify the student's projected academic level. When you select this check box the Academic Level - Projected field becomes available to edit. If you clear this check box, the system recalculates the academic level projected if the level rule uses units or term progression.

Academic Level - Projected

The system displays the student's projected academic level at the start of the term, which is the student's actual academic level, provided that the student passes all in-progress units from previous terms. The system uses this field for enrollment restriction checking and tuition calculation, among other things.

You can override this field value if you select either the Override Projected Level check box or the Override All Academic Levels check box. You might override a student's projected academic level when you know that your academic institution will be receiving the student's transfer credit, but the credit has not yet been entered into the student's official record.

When you override all academic levels, the system sets by default the academic levels for the next term to the value that is in the Academic Level - Term End field for the prior term row.

Note: When a student is activated for a term, either through the batch Term Activation (SRTRMAC.SQR) process or in the Term Activate a Student (STDNT_ACTIVATION) component, the Override Projected Level check box is cleared and the Academic Level - Projected field becomes unavailable for edit.

Level Determination

By default, the system displays the level determination value from the Level/Load Rules Table component, based on the level load rule that is attached to the student's primary academic program for the current career and term row

Load Determination

By default, the system displays the load determination value from the Level/Load Rules Table component, based on the level load rule that is attached to the student's primary academic program for the current career and term row.

Academic Level - Term Start

By default, the system displays the student's academic level at the beginning of the term, based on cumulative completed units from previous terms or transfer units. You can override this field value if you select the Override All Academic Levels check box. When you override all academic levels, the system sets by default the academic levels for the next term to the value that is in the Academic Level - Term End field for the prior term row.

Academic Level - Term End	<p>By default, the system displays the student's academic level at the end of the term, based on cumulative completed units, including work completed in this term and transfer units. You can override this field value if you select the Override All Academic Levels check box. When you override all academic levels, the system sets by default the academic levels for the next term to the value that is in the Academic Level - Term End field for the prior term row.</p>
Academic Year	<p>By default, the system displays the academic year, based upon the term that you enter.</p>
Academic Load	<p>The system displays the student's academic load, which is calculated in units enrolled if the level load rule is set to determine load based on units. Alternatively, the rule could determine load using a default value—assigned on the level load rule itself—or the load could be determined manually.</p>
Form of Study	<p>The system, by default, sets the student's form of study to <i>Enrollment</i>, but you can override this default value. The value of <i>Enrollment</i> tells the system that this form of study is unit-based. You can modify these translate values, with the exception of the <i>Enrollment</i> value.</p>
Eligible To Enroll	<p>The system, by default, selects this check box, which informs the enrollment engine that the student is eligible to enroll in classes for the specified term. Clear this check box to prevent the student from enrolling in classes for the specified term.</p> <p>You might clear this check box when posting transfer credit to a student's career term record in which the student will not be eligible to enroll until a later date. The transfer credit posting process requires that a student is active in the term to which you are posting transfer credit.</p>
Billing Career	<p>The system, by default, sets the student's billing career to the academic career in the student's career term record. The tuition calculation process uses the student's billing career to calculate the student's tuition.</p> <p>If the student is active in more than one academic career in the same term, you might want to consolidate tuition calculation and billing under a single academic career. If so, then point the billing career for all of the student's career term records to the same academic career. For example, a student might be enrolled in a term as both a graduate student and an undergraduate student. If you want to consolidate tuition calculation to just the undergraduate career, you would select undergraduate as the billing career for both the student's undergraduate term record and graduate term record.</p> <p>If you decide to use a single billing career for all of a student's academic careers within a term, note that to perform a term or</p>

session withdrawal, the student must be enrolled in at least one class within the academic career that you select as the student's billing career. Otherwise, the term withdrawal and session withdrawal processes halt processing and instruct you to change the student's billing career to an academic career in which the student has enrollments for the term.

Calculate Tuition

Click to go to the Tuition Calc (tuition calculation) page so that you can calculate tuition and fees for this student.

[Processing Withdrawals and Cancellations](#)

"Calculating Tuition for Multiple Students" (PeopleSoft Campus Solutions 9.2: Student Financials)

(AUS) Setting Student Term Default Values

Access the Loan Election page (Records and Enrollment >Student Term Information >Term Activate a Student >Loan Election).

Image: Loan Election page

This example illustrates the fields and controls on the Loan Election page. You can find definitions for the fields and controls later on this page.

Student Career Nbr (student career number)

Select a career number for the student. You can enter multiple rows when the student has multiple programs/career numbers.

Liability Status

Enter a liability status. This value defaults to the enrollment pages.

Eligible to defer HECS	Select if the student is eligible to defer HECS-HELP payments when they have nominated to pay up-front and have not paid their fees in full.
Subject to Fixed HECS	Select if the student qualifies to pay the fixed HECS fee for class enrollment.
Scholarship Type	Select the appropriate scholarship type for this student. When you generate the DIISRTE Commonwealth Learning Scholarship file, the system includes all students who have a scholarship type of 3, 4, or 5. Type 5 scholarships have two records, one for CECS and one for CAS. <u>Generating the Student Data Files that Allow Revision</u>
Overseas Fee	Enter any overseas fees for the student.
Research End-User Codes	Select a code for each of the five fields. Each code indicates the type of research end-user engagement undertaken by a Higher Degree by Research student (element 593).

(NZL) Maintaining SDR Reporting Data for a Student

Access the SDR page (Records and Enrollment > Student Term Information > Term Activate a Student > SDR).

Student Career Nbr (student career number)	Select a career number for the student.
Foreign Fee	Enter any foreign fee for the student.
MAX Exempt Fee	Enter the sum of all non-maxima fees charged to this student.

Maintaining a Student's Term Enrollment Limits

Access the Enrollment Limit page (Records and Enrollment > Student Term Information > Term Activate a Student > Enrollment Limit).

Image: Enrollment Limit page

This example illustrates the fields and controls on the Enrollment Limit page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Enrollment Limit' page for student Ana Beck (SR0400). The page is divided into several sections:

- Navigation:** Term Activation, Enrollment Limit (selected), Student Session, Terms In Residence, Term Control Dates, External Study.
- Student Information:** Ana Beck, SR0400.
- Academic Career:** Undergraduate.
- Academic Institution:** PeopleSoft University.
- Term:** 2003 Fall Semester.
- Primary Academic Program:** Liberal Arts Undergraduate.
- Academic Group of Advisor:** LBART.
- *Approved Academic Load:** Full-Time (dropdown menu).
- Override Unit Limits:**
- Max Total Units:** 18.00
- Max Audit Units:** 3.00
- Max No GPA Units:** 6.00
- Max Wait List Units:** 12.00
- Min Total Units:** 8
- Max Total Courses:** (empty field)

Approved Academic Load

The system, by default, displays the student's approved academic load for their primary academic program for the term. You can override this value.

The student's approved academic program is set on the Student Program page (Records and Enrollment > Career and Program Information > Student Program/Plan > Student Program).

Override Unit Limits

Select to override the student's term enrollment limits for the approved academic load that you selected. The unit limit fields become available for entry. When processing enrollment requests with this override, the enrollment engine uses the term enrollment limits that you define on this page rather than the ones that are defined on the Enrollment page of the Academic Program Table component. When using this override, the enrollment engine *does not* include the wait list units in the maximum total unit limit. For example, assume that you limit the student to 18 maximum total units, 3 maximum no GPA units, 3 maximum audit units, and 9 maximum wait list units. The student can enroll in a maximum of 18 units for the term. Of these 18 units, the student can take 9 no GPA units (including 3 audit units). In addition to the 18 maximum total units, the student can take an additional 9 wait list units.

Clear this check box to have the enrollment engine use the term enrollment limits that are set on the Enrollment page of the Academic Program Table component.

Max Total Units (maximum total units)

Enter the maximum number of units that the student can enroll in for the term.

- Max Audit Units** (maximum audit units) Enter the maximum number of units that the student can take with an audit-grading basis for the term.
- Max No GPA Units** (maximum no GPA units) Enter the maximum number of units that the student can enroll in with a non-GPA-grading basis for the term.
- Max Wait List Units** (maximum wait list units) Enter the maximum number of wait list units that the student can have for enrollment for the term.
- Min Total Units** (minimum total units) Enter the minimum number of units that the student must enroll in for the term. The enrollment engine references this value only when a student attempts to drop a class or make a units adjustment for a class.
- Max Total Courses** (maximum total courses) The system displays by default the maximum number of courses in which a student can enroll for the term according to the value set on the Course Count Limits page.

"Setting Up Term Enrollment Limits for Academic Programs" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Maintaining a Student's Session Data

Access the Student Session page (Records and Enrollment > Student Term Information > Term Activate a Student > Student Session).

Image: Student Session page

This example illustrates the fields and controls on the Student Session page. You can find definitions for the fields and controls later on this page.

This page displays all of a student's academic careers, terms, and sessions.

Session	Select the type of session in which the student will enroll into classes for the specified academic program and term.
Academic Load	By default, the system displays the student's academic load for the term. You can change the value for an individual session within the term. The system calculates academic load based on the number of units for which the student is enrolled. This field is unavailable for edit if the form of study for the session is <i>Enrollment</i> .
Form of Study	<p>By default, the system displays the same form of study as defined for the term on the Term Activation page of this component. You can change the form of study for sessions that differ from the term value. For example, a student's form of study for the term is <i>Enrollment</i>, but the student is studying abroad for one session of that term. Values are <i>Abroad</i>, <i>Candidacy</i>, <i>Detached</i>, and <i>Enrollment</i>. You can modify these translate values with the exception of the <i>Enrollment</i> value.</p> <p>By default, the system displays the student's approved academic load according to the value that is set on the Term Enrollment Limits page of the Academic Program Table component. You can override this field for an individual session within the term.</p>
Fully Enrolled Date	<p>The date that the system considers the student fully enrolled for financial aid load calculations and billing purposes. The system, by default, sets the student's fully enrolled date to the corresponding date for the session, as defined in the academic calendar. You can override this date.</p> <p>If you override the fully enrolled date because the student's account is due a refund, you must recalculate the student's tuition. You can calculate a student's tuition through the Tuition Calculation page in Student Financials.</p>
Approved Academic Load	Enter the student's approved academic load, such as <i>Full-Time</i> or <i>Part-Time</i> .
Override Billing Units	Select if want to calculate the student's tuition bill with criteria other than the number of units in which the student enrolls. If you set billing units as a part of tuition calculation, the system displays the number of the student's projected billing units.

Related Links

"Calculating Tuition for a Single Student" (PeopleSoft Campus Solutions 9.2: Student Financials)

Maintaining a Student's Terms in Residence

Access the Terms In Residence page (Records and Enrollment > Student Term Information > Term Activate a Student > Terms In Residence).

Use terms in residence to track to the number of terms in which a student is activated. Course work can be completed and easily tracked in terms. In addition, work that is accomplished outside the classroom—such as fieldwork and dissertation preparation—is also tracked by term even if the student is not enrolled in formal classes. For students affected by level load rules that are not based on terms, one term row equals one term in residence. For students affected by term-based level load rules, a term row can be greater than, equal to, or less than one term depending on the resident terms adjustment factor of the level load rule.

Academic Advisement does not use the term value that is stored here to calculate derived list terms in residence. Instead, the Advisement engine creates one term in residence for every term in which a student was enrolled at the academic institution.

Current in Residence Terms

The system, by default, displays the current number of terms in which the student is in residence within his or her primary academic program and term. If the level load rule that applies to the student has a resident terms adjustment factor, the system uses the student's approved academic load and the resident terms adjustment factor to determine the default value. Otherwise, the system displays *1* as the default value. You can override the value in this field.

Transfer in Residence Terms

Enter the number of terms that the student has transferred from another organization.

Cumulative in Residence Terms

The system displays the student's total number of current, past, and transfer terms. The value is the cumulative total of residency terms.

TC Units Adjustment (transfer credit units adjustment)

When you save this component, the system assigns the student to an academic level by adding up the student's transfer credit—for careers in which academic level is determined by units—and subtracting the value that is entered here. This enables you to decrease a student's transfer credit for the purposes of assigning the student to a lower academic level. This calculation does not affect the student's term or cumulative statistics, and the recalculated unit total is not displayed or stored in the system. The calculated sum affects only this student's academic level.

For example, you might allow a student to transfer in a total of 75 units for degree progress purposes, even though the student must remain a sophomore, which means she cannot have more than 59 units based on your level rule setup. To adjust the student's transfer credit units and assign the student to the appropriate academic level, enter *16* in this field. You can view the student's projected academic level, academic level at term start, and academic level at term end, on the Term Activation page. The system uses the value in the TC Units Adjustment field to calculate all of these levels.

Additionally, a field edit prevents you from entering more units in this field than the student has transfer units. So if the student has 10 transfer units, you cannot enter *11* in this field. Therefore,

the TC Units Adjustment field subtracts only from transfer units.

Copy TC Units (copy transfer credit units)

Click to complete the transfer credit posting process. When you try to post transfer credit statistics for a student in a particular academic program and for a particular articulation term, the system checks whether the student is active in the term and academic program that you select. If the student is not active in either the academic program or the articulation term, the system sets the status to *Complete*. This enables you to evaluate transfer credit and store the statistical information for a student prior to the completion of the Activate Applications matriculation process (ABPCPPRC) in Recruiting and Admissions.

After you activate a student in the appropriate academic program and in the articulation term that you selected, you *must* click this button to transfer the student's transfer credit to the STDNT_CAR_TERM table in Student Records, thereby completing the transfer credit posting process. If you do not copy transfer credit units after term activation, the student's career term record will not reflect the student's transfer credit units for the term. Remember to save your changes after you click this button. The system does not update the STDNT_CAR_TERM table until the save is performed.

If you select a term without a transfer credit model status of *Complete*, the system displays a message informing you that there is nothing to update.

Maintaining a Student's Term Control Dates

Access the Term Control Dates page ((Records and Enrollment > Student Term Information > Term Activate a Student > Term Control Dates).

Fully Enrolled Date

Enter the date on which this student is considered fully enrolled in the specified term. As of this date, the student's coursework appears on the student's transcripts. This date is also used for financial aid load calculations and billing purposes. The system, by default, displays the corresponding value from the Term Calendar 3 page for the specified term based on the student's primary academic program for the term.

Show Enrollment On Transcript

Enter the date on which the system displays the student's work in progress on the transcript.

Show Statistics On Transcript

Enter the date on which the system displays the student's academic statistics on the transcript.

Fully Graded Date

Enter the date on which the system considers this student's enrollment record for the specified term as fully graded. This value comes from the academic calendar by default. When you define transcript types, you can indicate whether the transcript processes should use this date and display grade information.

Tracking and Maintaining a Student's External Study Agreements

Access the External Study page (Records and Enrollment > Student Term Information > Term Activate a Student > External Study).

External Org ID (external organization ID)

Select the identification number of the external organization that is sponsoring the student's external study program.

Country

Select the country in which the external organization resides.

Study Agreement

Select the study agreement that describes the student's external study program.

Start Date and **End Date**

Enter the dates on which the student's external study program begins and ends.

Querying for Academic Level Differentials

Use the delivered public query `STDENT_TERM_ADMIT_LEVEL` to identify individuals with differences between their academic level on the admissions application, as defined on the Application Data page, and their academic level at term start, as seen on the Term Activation page. This query, which you can access through Query Manager, compares an individual's academic level in the Recruiting and Admissions table `ADM_APPL_DATA` to that same individual's academic level in the Student Records table `ACAD_PROG` through a view. If the values are different, the query captures these rows and displays them for you in Query Manager.

If the individual's academic level in the `ACAD_PROG` table is lower than the academic level in the `ADM_APPL_DATA` table and you want to increase the `ACAD_PROG` academic level, you must complete one of the following actions:

- Grant the student additional other credit units for a special course through the transfer credit process, provided that the student's academic program bases level and load determination on units.

- Grant the student additional terms in residence credit through the Transfer In Residence Terms field on the Terms In Residence page of the Term Activation component, provided that the student's academic program bases level and load determination on terms.

If the individual's academic level in the ACAD_PROG table is higher than the academic level in the ADM_APPL_DATA table and you want to decrease the ACAD_PROG academic level, you must complete one of the following actions:

- Enter a negative credit amount in the TC Units Adjustment field on the Terms in Residence page of the Term Activation component, provided that the student's academic program bases level and load determination on units.
- Enter a negative terms in residence amount in the Transfer In Residence Terms field on the Terms In Residence page of the Term Activation component, provided that the student's academic program bases level and load determination on terms.

Managing Enrollment and Validation Appointments

Understanding Enrollment and Validation Appointments

Enrollment appointments enable you to manage and prioritize class enrollment processing for your students. Student Records offers you the flexibility to assign enrollment appointments in mass through a process that you can run multiple times within the same term or to assign enrollment appointments on a student-by-student basis.

Validation appointments function similarly to enrollment appointments. If your institution has licensed Campus Self Service, your students can use the self-service enrollment and academic planning functionality to store the classes in which they plan to enroll in a staging area, before they are allowed to enroll. They can then validate their selection against a subset of Enrollment Engine edits. So in essence, students can plan their schedules before they can enroll by choosing several combinations of classes and checking to see if the enrollments will be successful. When students validate their schedules, the system calls the Enrollment Engine. Therefore, it might be necessary to assign students appointments during which they can validate their schedules to prevent a prohibitively large number of students from accessing the system at the same time. The process for assigning validation appointments is the same as for assigning enrollment appointments.

To create enrollment or validation appointments:

1. If you want to assign validation appointments, you must select the Allow Validation check box and at least one edit option on the Enrollment page when you set up Student Records Self Service (Set Up SACR, Common Definitions, Self Service, Student Records, Enrollment).
2. (Optional) Define on the Appointment Limits Table page all of the possible appointment limit IDs and their corresponding part-time and full-time maximum unit limits for each session of a term at your academic institution.

When using appointment limits you must also indicate the Appointment Control Unit Limit on the Academic Career Table.

See "Defining Academic Careers" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

3. Define student appointment blocks on the Student Appointment Blocks page.
4. Define appointment blocks for enrollment appointments on the Enrollment Appointment page in the Appointment Table component.

An appointment block is a block of appointment numbers.

5. Define appointment blocks for validation appointments on the Validation Appointment page in the Appointment Table component.

6. Assign validation or enrollment appointments to students in batch by merging an appointment block, a student appointment block, and appointment limits on the Assign Appointments page, or assign a single student an enrollment or validation appointment on the Student Enrollment Appointment page.
7. Review and update the enrollment or validation appointments for individuals as necessary through the Student Enrollment Appointment page.

You can run the Assign Students Appointment process as many times as needed within the same term and session, either adding new appointments or deleting existing appointments. Each time you run the process, it produces a hardcopy report for you. When the Create Communications check box is selected, the process also populates the communication table, providing you with the option to generate enrollment appointment notification mailers for your students.

Note: Each time you run the process with the check box selected, the system puts a new entry in the communication table. Only use this option when you are sure your appointments are final.

Setting Up Enrollment and Validation Appointments

This section provides an overview of enrollment and validation appointment setup and discusses how to define enrollment appointment limits.

Understanding Enrollment and Validation Appointment Setup

This section discusses:

- The Validation feature.
- The Appointment Limit table.

The Validation Feature

To have access to the Validation feature, your institution must have:

- Licensed Campus Self Service.
- Enabled the Validation feature on the Enrollment page when you set up Student Records Self Service.

See "Defining Student Records Setup" (PeopleSoft Campus Solutions 9.2: Self Service).

The Appointment Limit Table

Set up the Appointment Limit table if you want to be able to reuse appointment limits across terms and sessions. You do not need to set up the Appointment Limit table if:

- You want to define appointment limits each time you assign individual appointments.
- You want the Enrollment Engine to only enforce academic program term and session enrollment limits—set up on the Enrollment page in the Academic Program Table component—and you do not want to define limits specifically for the appointment.

When checking enrollment unit limits, the enrollment engine first checks the academic program's term limits. If the student meets the enrollment unit limits for the term, the enrollment engine checks the

enrollment limits for the session, as defined on the Enrollment page of the Academic Program Table component, if units limits have been defined for the session. If the student meets the enrollment limit requirements for the session—or if no limits were defined for the session—the enrollment engine checks the enrollment unit limits for the appointment, if the open enrollment date has not been reached. Appointment enrollment unit limits only apply prior to the open enrollment period.

Page Used to Set Up Enrollment and Validation Appointments

Page Name	Definition Name	Navigation	Usage
Appointment Limits Table	SSR_APPT_LIMIT	Records and Enrollment > Term Processing > Appointments > Appointment Limits Table > Appointment Limits Table	Define appointment limit IDs and the full-time and part-time maximum unit limits for each session of a term at your academic institution. You are not required to use appointment limit IDs, but if you do use them, you should define a separate appointment limit ID for each group at your academic institution that has varied enrollment unit restrictions.

Defining Enrollment Appointment Limits

Access the Appointment Limits Table page (Records and Enrollment > Term Processing > Appointments > Appointment Limits Table > Appointment Limits Table).

Image: Appointment Limits Table page

This example illustrates the fields and controls on the Appointment Limits Table page. You can find definitions for the fields and controls later on this page.

Appointment Limits Table

Academic Institution: PSUNV PeopleSoft University

Academic Career: UGRD Undergraduate

[Find](#) | [View All](#) | [First](#) 8 of 11 [Last](#)

Appointment Limit ID	STND		+ -
*Description	<input type="text" value="STND"/>		
Full Time Max Total Units:	<input type="text" value="18.00"/>	Part Time Max Total Units:	<input type="text" value="9.00"/>
Full Time Max No GPA Units:	<input type="text" value="12.00"/>	Part Time Max No GPA Units:	<input type="text" value="6.00"/>
Full Time Max Audit Units:	<input type="text" value="6.00"/>	Part Time Max Audit Units:	<input type="text" value="3.00"/>
Full Time Max Wait List Units:	<input type="text" value="12.00"/>	Part Time Max Wait List Units:	<input type="text" value="6.00"/>
Include Wait List in Total:	<input checked="" type="checkbox"/>		

Note: When using enrollment appointment limits, you must also set the Appointment Control Unit Limit on the Academic Career Table, to indicate whether the limits are restricted to a specific session or apply to a student's enrollment across all sessions of a term.

See "Defining Academic Careers" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Appointment Limit ID	Enter an appointment limit ID for every group at your academic institution that has varied enrollment unit restrictions. For example, each appointment limit ID that you define might have different full-time and part-time maximum and minimum units.
Full Time Max Total Units and Part Time Max Total Units	Enter the maximum number of units that a full-time and part-time student can enroll in during the specified enrollment appointment.
Full Time Max No GPA Units (full time maximum number grade point average units) and Part Time Max No GPA Units (part time maximum number grade point average units)	Enter the maximum number of units that a full-time and part-time student can enroll in with a non-GPA grading basis during the specified enrollment appointment.
Full Time Max Audit Units and Part Time Max Audit Units	Enter the maximum number of units that a full-time and part-time student can audit during the specified enrollment appointment.
Full Time Max Wait List Units and Part Time Max Wait List Units	Enter the maximum number of wait-list units that a full-time and part-time student can take during the specified enrollment appointment.
Include Wait List in Total	<p>If you select this check box, the enrollment engine includes wait listed units towards the appointment maximum.</p> <p>For example: A student has an appointment maximum unit limit of 18 and a maximum wait list unit limit of 12. The student is enrolled in 6 units and wait listed in 6 units. If the check box is selected, the student can enroll and/or wait list in an additional 6 units only, because the 6 wait listed units are applied to the overall limit of 18.</p>

Example

For example, the registrar at PSUNV wants to create enrollment appointments on a ranking basis: seniors with a higher GPA enroll first, then seniors with a lower GPA. This same pattern works down to the freshman level. Graduate students can enroll any time. In addition, PSUNV limits the number of units in which a freshman can enroll. All other undergraduates require the same unit limit.

At least two appointment limit codes are required to represent the variable maximum units. In our example, it is not necessary to create an appointment code for graduate students because they can enroll at any time *and* because we have set the open enrollment date early enough on the Session Table page for the graduate academic career. Thus, we would create one appointment limit ID for freshman that specifies the appropriate unit limits, and a second appointment limit ID for all other undergraduates that specifies the appropriate unit limits. The mass enrollment appointment process handles the GPA ranking.

Creating Student Appointment Blocks

This section provides an overview of student appointment blocks and discusses how to

- Define student appointment blocks.
- Define processing priorities for student appointment blocks.

Understanding Student Appointment Blocks

When you define a student appointment block you are selecting criteria—such as academic career, academic program, cumulative GPA, and academic level—that will constitute a particular population of your student body for whom you want to assign enrollment or validation appointments. For example, you might want to assign appointments based solely on academic level, so your freshmen, sophomore, junior, and seniors have different appointments, or you might want to assign particular appointments to all senior undergraduate honors students with a cumulative GPA of 3.5 or better. You can define as many appointment blocks as you want on the Student Appointment Block page and reuse them term after term.

You can also create a custom student appointment block by selecting specific student IDs for the block.

You use student appointment blocks when assigning appointments in batch on the Assign Appointments page. On this page, you select an appointment block—created on the Enrollment Appointment or Validation Appointment pages—and then you select a student appointment block. The Assign Students Appointment process assigns the appointment numbers from the appointment block to the students who fit the criteria of the student appointment block. The processing priorities that you define on the Processing Priorities page for the student appointment block determine the order in which the system assigns students appointment numbers.

Pages Used to Create Student Appointment Blocks

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Appointment Block	SSR_APPT_STDT_BLK	Records and Enrollment > Term Processing > Appointments > Student Appointment Block > Student Appointment Block	Define a student appointment block to be used when assigning appointments to students using the Assign Students Appointment process on the Assign Appointments page.
Add Programs	SSR_APPT_STDT_SEC	Click the Add Programs link on the Student Appointment Block page.	Add additional academic programs to the student appointment block.
Processing Priorities	SSR_APPT_STDT_PRIO	Records and Enrollment > Term Processing > Appointments > Student Appointment Block > Processing Priorities	Define ranking priorities for the student appointment block. The Assign Appointment process obeys these rankings when assigning enrollment appointments to students.

Defining Student Appointment Blocks

Access the Student Appointment Block page (Records and Enrollment > Term Processing > Appointments > Student Appointment Block > Student Appointment Block).

Image: Student Appointment Block page

This example illustrates the fields and controls on the Student Appointment Block page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Student Appointment Block' page with the following fields and controls:

- Academic Institution:** PSUNV (PeopleSoft University)
- Academic Career:** UGRD (Undergraduate)
- *Student Appointment Block:** FRESHM
- *Description:** Freshmen
- Use Custom Selection
- Academic Program:** LAU (Liberal Arts Undergraduate)
- Academic Level - Projected:** [Empty]
- Academic Level - Term Start:** 10 (Freshman)
- Academic Level - Term End:** [Empty]
- Student Group:** [Empty]
- Cumulative GPA From:** [Empty]
- Cumulative GPA To:** [Empty]
- Cumulative Units From:** 1.00
- Cumulative Units To:** 20.00
- Include in Progress Units
- Term:** 0450 (2001 Fall)
- Get # Students in Block:** Students in Block for Term: 18

Student Appointment Block and Description Enter a name, up to six characters, and a description for this student appointment block.

Use Custom Selection Select this check box if you want to create this student appointment block by selecting individual student IDs. The ID field appears.

ID Add individual students, by ID, to this student appointment block. All students within this academic career are available.

Academic Program Select an academic program to limit this student appointment block to students who are active in this academic program. If you do not select an academic program, the available options in the academic level fields includes all levels for all programs in

this career. This enables you to select all freshman in this career, for instance, regardless of their academic programs.

Add Programs

Select to choose particular programs for this student appointment block. The Add Programs page appears. When you add programs, the academic level fields will include all of the levels for every program that you select.

Note: All academic programs might not contain all the same academic levels. When selecting multiple programs and levels for an appointment block, be sure to validate that the expected population was included in your block.

Academic Level - Projected

Select a projected academic level to limit this student appointment block to students with this projected academic level. Only the levels for the academic program that you selected are available. If no academic program is selected, then all levels for all programs within this career are available. If multiple academic programs are selected, all levels for all of the selected programs are available.

Academic Level - Term Start

Select a value to limit this student appointment block to students who are assigned this academic level at the start of the term. Only the levels for the academic program that you selected are available. If no academic program is selected, then all levels for all programs within this career are available. If multiple academic programs are selected, all levels for all of the selected programs are available.

Academic Level - Term End

Select a value to limit this student appointment block to students who are assigned this academic level at the end of the term. Only the levels for the academic program that you selected are available. If no academic program is selected, then all levels for all programs within this career are available. If multiple academic programs are selected, all levels for all of the selected programs are available.

Student Group

Select a student group to limit this student appointment block to students who are assigned to this student group. Assign students to student groups on the Student Group page.

Cumulative GPA From

Enter a value to limit this student appointment block to students who have at least this cumulative GPA on the CUM_GPA table.

Cumulative GPA To

Enter a value to limit this student appointment block to students who have up to this cumulative GPA on the CUM_GPA table.

Cumulative Units From

Enter a value to limit this student appointment block to students who have at least this amount of cumulative units on the TOT_CUMULATIVE table. When you navigate out of this field the Include in Progress Units check box appears.

- Cumulative Units To** Enter a value to limit this student appointment block to students who have up to this amount of cumulative units on the TOT_CUMULATIVE table. When you navigate out of this field the Include in Progress Units check box appears.
- Include in Progress Units** Select to include in progress units in the cumulative unit totals. Selecting this check box adds the TOT_INPROG_GPA and TOT_INPROG_NOGPA records to the calculation.
- Term** Select a term to determine how many students fit this student appointment block criteria for a specific term.
- Get # Students in Block** Click to run an ad hoc query to determine how many students fit this student appointment block for the selected term. This functionality is available to assist you in assigning appointments appropriately.

Defining Processing Priorities for Student Appointment Blocks

Access the Processing Priorities page (Records and Enrollment > Term Processing > Appointments > Student Appointment Block > Processing Priorities).

Image: Processing Priorities page

This example illustrates the fields and controls on the Processing Priorities page. You can find definitions for the fields and controls later on this page.

Priority Ranking 1, Priority Ranking 2, and Priority Ranking 3

Define ranking priorities for this student appointment block. The Assign Appointment process obeys these rankings when assigning enrollment appointments to students. You can override these values on the Assign Appointments page. Select from:

Units Completed: The Assign Students Appointment process uses a student's total cumulative units (TOT_CUMULATIVE) as found on the student's career term record (STDNT_CAR_TERM). This includes a student's total transfer credit (TOT_TRNSFR), total other credit (TOT_OTHER), and total test score credit (TOT_TEST_CREDIT).

Cumulative GPA: The Assign Students Appointment process uses a student's total cumulative GPA (CUM_GPA) as found on the student's career term record. Inclusion of transfer credit, test credit, and other credit depend on how your institution sets up these various types of credit.

Academic Level - Projected: The Assign Students Appointment process uses a student's projected academic level as found on the student's career term record.

Academic Level - Term End: The Assign Students Appointment process uses a student's academic level at term end as found on the student's career term record.

Academic Level - Term Start: The Assign Students Appointment process uses a student's academic level at term start as found on the student's career term record.

If you leave these fields empty, or when multiple students are ranked the same, such as when multiple students have the same cumulative GPA, the system sorts those students by ID. A simple randomization feature loads the students into a temporary table and randomly assigns them a sequential number. Then, the system assigns the students appointments based on their number. This prevents a student from receiving an undesirable appointment every term based on his or her ID.

Creating Enrollment and Validation Appointments

This section provides an overview of enrollment and validation appointments and discusses how to:

- Select an appointment control session.
- Create enrollment appointment blocks.
- Create validation appointments.

Understanding Enrollment and Validation Appointments

An appointment consists of an appointment number, a start and end date, and a start and end time. In Student Records, appointments are organized into appointment blocks. An appointment block is a group of appointments. Because you can define multiple appointment blocks you can set up a variety of appointment types. For example, you can create one block with many appointments in 15 minute increments, and another with appointments in hourly increments. And you can create another block that contains appointments with varying lengths of time. You can also create multiple appointment blocks to allow some or all of the same students to have more than one appointment.

To create an appointment block you can manually enter appointment numbers, dates, and times, or you can use a variety of criteria to generate appointments in batch. We provide functionality that enables you an immense amount of flexibility and control in defining when appointments will begin and end, and how long they will last. Additionally, you can easily define the maximum number of students in each appointment and you can see how many students are actually assigned to a particular appointment. The system updates the number of students actually assigned to an appointment when the Assign Students Appointment process assigns an appointment to a student, when you assign an appointment

to an individual student on the Student Enrollment Appointment page, or when you delete a student appointment.

You create validation appointments the same way that you create enrollment appointments. Like enrollment appointments, validation appointments use appointment blocks, and you can create appointments in batch using the flexible start, end, and number of students per appointment criteria, or manually. The Validation Appointment page only appears if you have enabled the Validation feature on the Self Service Options page in the Academic Career Table component.

You create appointment blocks by session. You can reuse the appointment blocks that you created for one session for another session by selecting the first session as the appointment control session. When you select an appointment control session, the Enrollment Appointment and Validation Appointment pages become unavailable for that session.

Pages Used to Create Enrollment and Validation Appointments

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Appointment Table	SSR_APPT_TBL_HDR	Records and Enrollment > Term Processing > Appointments > Appointment Table > Appointment Table	Set an appointment control session, if applicable, and indicate if you want to display enrollment and validation appointments in self service.
Enrollment Appointments	APPOINTMENT_TBL	Records and Enrollment > Term Processing > Appointments > Appointment Table > Enrollment Appointments	Define enrollment appointments, by appointment block, for the session. For each enrollment appointment, define the valid date and time ranges, length of appointments, and the number of students allowed per appointment. Regardless of whether you decide to assign appointments manually or through the Assign Students Appointment process, you must create the parameters of each appointment ID on this page.
Validation Appointments	SSR_VALIDAT_TBL	Records and Enrollment > Term Processing > Appointments > Appointment Table > Validation Appointments	Define validation appointments, by appointment block, for the session. For each validation appointment, define the valid date and time ranges, length of appointments, and the number of students allowed per appointment. This page is available if you selected the Enable Validation Feature check box on the Self Service Options page for this academic career.

Selecting an Appointment Control Session

Access the Appointment Table page (Records and Enrollment > Term Processing > Appointments > Appointment Table > Appointment Table).

Appointment Control Session

Enter a session to which you want to point this session's appointment information. This enables a student to register in both sessions with a single appointment. For example, by pointing the appointment control session for a 12-week session and a 6-week session to a regular session, the appointment information defined for the regular session becomes valid for both the 12-week and 6-week sessions. When you select an appointment control session, the Enrollment Appointment and Validation Appointment pages for this session becomes unavailable for edit.

Note: This field is only available for entry if this session has no students assigned to it. If no students are assigned to the session for which you are setting an appointment control session value, the appointments from the session are deleted.

Enrollment Appointments

Select this check box if you want the system to display the enrollment appointments for this session in self-service pages. Clear this check box if you want to add and delete appointments and test the results of different enrollment appointment criteria before enrollment appointments are visible in self-service pages.

Validation Appointments

Select this check box if you want the system to display the validation appointments for this session in self service. Clear this check box if you want to add and delete appointments and test the results of different validation appointment criteria before enrollment appointments are visible in self service.

This field is available if you selected the Enable Validation Feature check box on the Self Service Options page for this academic career.

Session Dates

These dates appear as defaults from the Session Table page. They appear here to assist you when assigning appointment date ranges on the Enrollment Appointments page.

Note: Appointment start and end dates must be within the first day and last day to enroll date range set up on the Session Table page.

Creating Enrollment Appointment Blocks

Access the Enrollment Appointments page (Records and Enrollment > Term Processing > Appointments > Appointment Table > Enrollment Appointments).

Appointment Blocks

Appointment Block

Enter a name or code for this appointment block. An appointment block is a group of appointments. You can define one or several appointment blocks for a session. For example, you can define one appointment block for all student appointments in a session, or you can define one appointment block that contains appointments in 15 minute increments, while another might have appointments in hourly increments. Then, you can create one appointment block that has varying lengths of time. You can also set up multiple appointment blocks to allow the same block of students to have more than one appointment. Appointment block is now a key on the Appointment table.

When you run the Assign Students Appointment process (SRAPPT.sqr), you merge a student appointment block with this appointment block. Also, when you assign individual students to appointments on the Student Enrollment Appointment page, you can select appointments by appointment block.

Create Appointments

Start with Appointment Nbr (start with appointment number)

Indicate to the system where you want to start the appointment numbers in this appointment block. You can enter any numerical value. This enables you to segment appointment numbers if you want to leave gaps that can be filled later. If no value is entered, the system starts the appointment numbers with the next available number.

Appointments Start - Date/Time Range

Appointment Start Date and
Appointment End Date

Enter a range of dates in which your appointments can start. For example, if you enter 08/01/2005 in the Appointment Start Date field and 09/01/2005 in the Appointment End Date field, the first appointment in the block will start on 08/01/2005, and the last appointment in the block will start on 09/01/2005. Appointments might end on a later date than 09/01/2005, but they will not start later than that date.

The appointment start and end dates will be edited against the first date and last date to enroll for the session. If the date being added is not within the range, an error message will appear.

Appointment Start Time and
Appointment End Time

Enter a range of times at which you want your appointments to start. For example, if you enter a start of 8:00 a.m. and an end time 5:30 p.m., the first appointment of the day will start at 8:00 a.m., and the last appointment of the day will start no later than 5:30 p.m. Appointments might end later than 5:30 p.m., but they will not start later than that time.

Appointments Start Every

Length, Minutes, Hours, and Days Enter the length of time between the start time for each appointment. For example, if you enter 30 minutes, then appointments will start in 30 minute increments.

Appointments End

When The Next Appt Starts (when the next appointment starts) Select to have the system schedule appointments immediately following one another. For example, if one appointment ends at 9:25 a.m., the next appointment would start at 9:25 a.m.

All Last Same Length of Time Select to manually enter the length of time that you want each appointment to last.

Length, Minutes, Hours, and Days These fields become available when you select the All Last Same Length of Time option. Enter the length of time that you want appointments to last.

All End at the Same Time Select to indicate a specific date and time that you want all appointments in this appointment block to end. The End Date and End Time fields appear.

End Date This field becomes available when you select the All End at the Same Time option. Enter the date on which you want all appointments in this appointment block to end.

End Time This field becomes available when you select the All End at the Same Time option. Enter the time at which you want all appointments in this appointment block to end.

Additional Elements

Number of Students per Appt (number of students per appointment) Enter how many students you want assigned to each appointment. You can change this for individual appointments in the Number of Students per Appt field.

Create Appointments Click to create enrollment appointments in batch based on the criteria you defined.

Appointments

The system populates this grid when you click the Create Appointments button. You can also manually add and delete appointments here.

Note: You cannot delete an appointment in which students are already assigned.

Appt Nbr (appointment number) The system starts the appointment numbers with the value you entered in the Start with Appointment Nbr field. You can override this value. If no value is entered in the Start with Appointment Nbr field, the system will start the appointment numbers with the next available number.

The system assumes appointments are assigned in numerical order. Therefore, appointment 0002 begins after appointment 0001. Through the Assign Appointments and Student Enrollment Appointment pages, you can assign appointment numbers to students.

Number of Students per Appt
(number of students per appointment)

When you create appointments in batch, The system populates this value based on the value you entered in the Number of Students per Appt field in the Create Appointments group box. You can change this value here.

Number of Student Assigned

The number of students actually assigned to this appointment ID appears here. The system updates this number when a student appointment is deleted or when a student is assigned an appointment in batch on the Assign Appointments page or individually on the Student Enrollment Appointment page.

Creating Validation Appointments

Access the Validation Appointments page (Records and Enrollment > Term Processing > Appointments > Appointment Table > Validation Appointments).

Create validation appointments the same way that you create enrollment appointments. This page is available if you selected the Enable Validation Feature check box on the Self Service Options page for this academic career.

[Creating Enrollment Appointment Blocks](#)

Assigning Enrollment and Validation Appointments in Batch

This section provides an overview of assigning appointments in batch, lists prerequisites, and discusses how to assign appointments in batch.

Understanding Assigning Appointments in Batch

The Assign Students Appointment process (SRAPPT.sqr) assigns or deletes enrollment or validation appointments in batch for a career, term, and session. The process:

1. Identifies the students that fit the criteria of the student appointment block.
2. Ranks the students according to the priority rankings set up on the student appointment block, or, based on the override rankings selected on the Assign Appointments page.
3. Ranks the students further, if necessary, based on a simple randomization feature that loads the student IDs into a temporary table and then randomly assigns them a number.
4. Assigns the students, based on their ranking, an appointment number and unit limit information.

The process stores this data on the Student Appointment table (STDNT_ENRL_APPT).

If your institution has licensed Campus Solutions Self Service, students can view their appointments online as soon as you assign them, so long as you have enabled appointments to be displayed in Campus Self Service on the Appointment Table page for this session.

Assigning or deleting appointments using the Assign Students Appointment process updates the Number of Students Assigned field for the assigned appointments on the Enrollment Appointments or Validation Appointments pages.

Prerequisites

The Assign Students Appointment process can create communications giving you the option to generate enrollment appointment notification mailers for your students. Each time you run the Assign Students Appointment process, with the Create Communications check box selected, it creates a new communication for the affected students. Before you run the Assign Students Appointment process, you must define enrollment appointment mailers on the communications tables. We deliver an example enrollment appointment mailer that you can use as a model.

Note: Select the Create Communications check box only if you are ready to create communications.

To set up an enrollment appointment mailer:

Note: The system uses the STRM Administrative function and the APPTMR communication key. You must define an appointment communication key in the STRM Administrative Function for your institutions.

1. In the Build Community - Communications menu, use the Standard Letters page to create a standard letter for the enrollment appointment mailer, such as an *APP* letter.
2. Use the Communication Context page to define a communication context for the enrollment appointment mailer, such as *APPTI*.

In the Communication Context Method group box, select in the Letter Code field the standard letter that you have defined for the enrollment appointment mailer, which in this example is *APP*.

3. Use the Communication Categories page to set up a communication category for Student Records, such as *SREC*.

In the Communication Context group box, insert a row for the communication context that you have defined for the enrollment appointment mailer, which in this example is *APPTI*.

4. Use the Communication Speed Keys page to set up the administrative function for the enrollment appointment mailer, such as *STRM*.

In this example, you would set the Category field to *SREC*, the Context field to *APPTI*, and the Letter Code field to *APP*. Alternatively, you can create appointment communications in batch by institution career and term after you have assigned all of your appointments through the Appointment Communications page.

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Assign Appointments	SSR_RUNCTL_APPT	Records and Enrollment > Term Processing > Appointments > Assign Appointments > Assign Appointments	Define parameters for and run the Assign Students Appointment process to assign students to appointments in batch.
Assign Appointments - Search for an Appointment	SSR_RUNC_APPT_SEC	Click the Find Appointment From or Find Appointment To link on the Assign Appointments page.	Search for appointment IDs within the selected appointment block by start date, end date, start time, or end time.

Assigning Appointments in Batch

Access the Assign Appointments page (Records and Enrollment > Term Processing > Appointments > Assign Appointments > Assign Appointments).

Academic Institution, Academic Career, and Term

Enter the academic institution, academic career, and term for which you want to assign enrollment appointments to students.

Process Mode

Select *Add Appointments* to have the Assign Students Appointment process find students based on the criteria that you specify and assign them the selected appointments. Select *Delete Appointments* to have the Assign Students Appointment process find students based on the criteria that you specify and delete those students' appointments. Added and deleted appointments will be correctly reflected in the Number of Student Assigned field on the Enrollment Appointments page.

Note: Because the Process Mode field is on level one, deleting appointments deletes all appointments for all rows on this page. If you want to delete just one student appointment block, add that student appointment block to a new run control.

Create Communication

Select this check box to record appointment information to be able to later generate enrollment appointment notifications for students. When you select this check box, the Assign Students Appointments process populates the communication table with an administrative function of APP and records for each affected student the action of add or delete, the appointment type of enrollment or validation appointment, and the student block and appointment block.

See [Creating Appointment Communications in Batch](#).

Session

Select the session for which you want to assign enrollment appointments to students.

Do not Allow Multiple Appts (do not allow multiple appointments)	Select this check box to prevent the system from assigning multiple appointments to a student who meets the criteria of multiple student appointment blocks.
	<hr/> Note: To ensure students receive the best appointment possible, organize your run control so that the most favorable student appointment block runs first. <hr/>
Student Appointment Block	Select the student appointment block for which you want to create appointments. Define student appointment blocks on the Student Appointment Block page.
Override Block Priorities	Select this check box to override the priority ranking set up for the student appointment block on the Processing Priorities page.
Priority Ranking 1, Priority Ranking 2, and Priority Ranking 3	These fields become available when you select the Override Block Priorities check box. Use these fields to override the priority ranking set up for the student appointment block on the Processing Priorities page. The Assign Appointment process obeys these rankings when assigning enrollment appointments to students. Select from: <i>Units Completed:</i> The Assign Students Appointment process uses a student's total cumulative units (TOT_CUMULATIVE) as found on the student's career term record (STDNT_CAR_TERM). This includes a student's total transfer credit (TOT_TRNSFR), total other credit (TOT_OTHER), and total test score credit (TOT_TEST_CREDIT). <i>Cumulative GPA:</i> The Assign Students Appointment process uses a student's total cumulative GPA (CUM_GPA) as found on the student's career term record. Inclusion of transfer credit, test credit, and other credit depend on how your institution sets up these various types of credit. <i>Academic Level - Projected:</i> The Assign Students Appointment process uses a student's projected academic level as found on the student's career term record. <i>Academic Level - Term End:</i> The Assign Students Appointment process uses a student's academic level at term end as found on the student's career term record. <i>Academic Level - Term Start:</i> The Assign Students Appointment process uses a student's academic level at term start as found on the student's career term record.
Appointment Type	Indicate whether the appointments you are assigning are enrollment or validation appointments.
Use Program Term/Session Limit	Select this check box if you want the Enrollment Engine to enforce term/session limits for the students you are assigning appointments based on the limits of the students'

academic programs. You must select this check box or enter an appointment limit ID.

Appointment Limit ID

Assign an appointment limit ID to the students to whom you are assigning appointments. The Enrollment Engine enforces appointment limits set up for the appointment limit ID. Only those appointment limit IDs for this academic career appear in the search dialog.

You must select the Use Program Term/Session Limit check box or enter an appointment limit ID.

Based on the Appointment Control Unit Limit option selected on the Academic Career Table 2 page, the unit limit defined on the Appointment Limit ID applies to either each individual session for which a student's appointment is valid or applies across all the sessions covered by the appointment.

See "Defining Academic Careers" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Appointment Block

Select the appointment block to which you want to assign students. Use the Appointment Table to create appointment blocks.

Appointment Number From

Select the appointment number within the specified range of appointment numbers to further narrow where you want the process to *begin* its assignment of appointments for students that meet the processing parameters of this row of the request.

Appointment Number To

Select the appointment number within the specified range of appointment numbers to further narrow where you want the process to *end* its assignment of appointments for students that meet the processing parameters of this row of the request.

Find Appointment From and Find Appointment To

Click to search for appointments. The Assign Appointments - Search for an Appointment page appears.

Run the Assign Students Appointment process as needed. The process produces a hard-copy report for you that displays each student's appointment number, the time and date range of each appointment, the student's name, and the student's ID. The process also populates the communication table with students for whom you have generated appointments so that you have the option to generate enrollment appointment notification mailers to inform your students. The mailer contains the date, student's name and address, salutation, enrollment appointment information, and instruction about how the student can enroll in classes during appointment time. You can make changes to the mailer.

Assigning and Maintaining Appointments for Individual Students

This section discusses how to assign and maintain appointments for individual students.

Pages Used to Assign and Maintain Appointments for Individual Students

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Enrollment Appointment	STDNT_ENRL_APPT	Records and Enrollment > Term Processing > Appointments > Student Enrollment Appointment > Student Enrollment Appointment	Assign enrollment appointments on a student-by-student basis. You can also use this page after you've run the Assign Students Appointment process to verify that a student's appointments has indeed been scheduled and to edit a student's appointment as necessary.
Student Enrollment Appointment - Search for an Appointment	SSR_ENRL_APPT_SEC	Click the Find Appointment link on the Student Enrollment Appointment page.	Search for appointment IDs by start date, end date, start time, or end time and appointment block.

Assigning and Maintaining Appointments for Individual Students

Access the Student Enrollment Appointment page (Records and Enrollment > Term Processing > Appointments > Student Enrollment Appointment > Student Enrollment Appointment).

Image: Student Enrollment Appointment page

This example illustrates the fields and controls on the Student Enrollment Appointment page. You can find definitions for the fields and controls later on this page.

Session Limits

Session

Select the session for which you want to assign enrollment appointments to the student.

Only Use Term Limits

Select if you want the enrollment engine to use term unit limits (defined on the Enrollment page of the Academic Program Table component), rather than session unit limits (defined on the Session page of the Academic Program Table component). The enrollment engine still checks appointment limits, even if this check box is selected.

Override Maximum Units

Select to override the session unit limits set for the student's primary academic program of the enrollment term. When you select this check box, the system makes available the Max Total Units, Max Audit Units, Max No GPA Units, and Max Wait List Units fields and displays the values set on the Session page of

the Academic Program Table component. You can then override the values for this student's enrollment appointment. If you are assigning a new enrollment appointment to the student and you want to use this override, you must first select this check box and save the page. Clear this check box to use the previously defined session unit limits set for the student's primary academic program of the enrollment term.

Note: Selecting this check box does not override a student's term unit limits for the student's primary academic program within the enrollment term, as set on the Enrollment page of the Academic Program Table component.

Max Total Units

Enter the maximum number of units that the student can enroll in for all of the enrollment appointments within the specified session.

Max No GPA Units (maximum number grade point average units)

Enter the maximum number of units that the student can enroll in with a non-GPA grading basis for all of the enrollment appointments within the specified session.

Max Audit Units

Enter the maximum number of units that the student can take in audit status for all of the enrollment appointments within the specified session.

Max Wait List Units

Enter the maximum number of wait-list units that the student can take for all of the enrollment appointments within the specified session.

Include Wait List in Total

If you select this check box, the enrollment engine includes wait listed units towards the appointment maximum.

For example: A student has an appointment maximum unit limit of 15 and a maximum wait list unit limit of 9. The student is enrolled in 6 units and wait listed in 6 units. If the check box is selected, the student can enroll and/or wait list in an additional 3 units only, because the 6 wait listed units are applied to the overall limit of 15.

Max Total Courses

By default, the system displays the maximum number of courses that this student can take for the specified session. The system determines this value according to the maximum courses that a student can take for the specified session *and* the term category of the specified term, as defined for the student's primary academic program for the specified term. Set total maximum course values by academic load for term category and session combinations within an academic program on the Course page in the Academic Program Table component. If you have cleared the Only Use Term Limits check box for the specified session on the Session Enrollment Limits page, this field is unavailable.

Enrollment Appointments

Appt Block (appointment block)

Enter an appointment block from which you want to assign an appointment. You can also search for an appointment by clicking the Find Appointment link.

Appt Nbr (appointment number)

Enter the appointment number that you want to assign to the student. You must enter a valid appointment number for the appointment block that you entered. You can also search for an appointment number by clicking the Find Appointment link. Define appointments on the Enrollment Appointments page in the Appointment Table component. The system displays the start and end dates and the start time of the enrollment appointment that you select.

Find Appointment

Click to search for an appointment by appointment block or by date and time. The Student Enrollment Appointment - Search for an Appointment page appears.

Select Limits for Appointment

Indicate how you want to enforce appointment limits for this individual.

Use Program Term/Session Limit

Select this option if you want the Enrollment Engine to enforce the enrollment limits of the term and session—set up on the Enrollment page in the Academic Program Table component—for the appointment limits.

Use Appointment Limit ID

Select this option if you want the Enrollment Engine to enforce the appointment limits set up for the appointment limit ID. When you select this option, the Limit ID field appears.

Limit ID

The field appears when you select the Use Appointment Limit ID option. Enter the appointment limit ID that you want to use to enforce appointment limits. Define appointment limit IDs on the Appointment Limit ID page.

Based on the Appointment Control Unit Limit option selected on the Academic Career Table 2 page, the unit limit defined on the Appointment Limit ID applies to either each individual session in which a student is enrolled or applies to all the sessions in which a student is enrolled.

See "Defining Academic Careers" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Set Maximum Units

Select this option if you want to define appointment limits here. Although you can enter higher limits than those defined for the session and term, the Enrollment Engine still enforces the session and term limits. For example, if the maximum total units for the session is 18, and you enter 20 in the Max Total Units field on this page, the Enrollment Engine does not let this student enroll in more than 18 units.

Max Total Units	Enter the maximum number of units that the student can enroll in during this enrollment appointment.
Max No GPA Units	Enter the maximum number of units that the student can enroll in with a non-GPA grading basis during this enrollment appointment.
Max Audit Units	Enter the maximum number of units that the student can audit during this enrollment appointment.
Max Wait List Units	Enter the maximum number of wait-list units that the student can take during this enrollment appointment.

Validation Appointments

This group box appears if you select the Enable Validation Feature on the Self Service Options page for this academic career.

Appt Block (appointment block)	Enter an appointment block from which you want to assign an appointment. You can also search for an appointment by clicking the Find Appointment link.
Appt Nbr (appointment number)	Enter the appointment number that you want to assign to the student. You must enter a valid appointment number for the appointment block that you entered. You can also search for an appointment number by clicking the Find Appointment link. Define appointments on the Validation Appointments page in the Appointment Table component. The system displays the start and end dates and the start time of the validation appointment that you select.
Find Appointment	Click to search for an appointment by appointment block or by date and time. The Student Enrollment Appointment - Search for an Appointment page appears.

Creating Appointment Communications in Batch

This section lists prerequisites and discusses how to create appointment communications in batch.

Prerequisites

The Create Appts Communications process populates the communications tables, providing you with the option to generate enrollment appointment notification mailers for your students. Each time you run the Create Appts Communications process, it repopulates the communication tables with the newest enrollment appointment information for the affected students. Before you run this process, you must define enrollment appointment mailers on the communications tables. We deliver an example enrollment appointment mailer that you can use as a model.

Page Used to Create Appointment Communications in Batch

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Appointment Communications	SSR_RNCTL_COM_APPT	Records and Enrollment > Term Processing > Appointments > Appointment Communications > Appointment Communications	Run the Create Appts Communications (SRAPCOMM.sqr) process to create appointment communications in batch.

Creating Appointment Communications in Batch

Access the Appointment Communications page (Records and Enrollment > Term Processing > Appointments > Appointment Communications > Appointment Communications).

When you run the Create Appts Communications process, the process uses the administrative function STRM and populates the communication tables with the letter code APP for every student within the selected institution, career, and term who has been assigned an appointment. In addition to the letter code of APP, the process records for each affected student the action of add or delete, the appointment type of enrollment or validation appointment, and the student block and appointment block.

After you populate the communication tables, you can generate enrollment appointment notification mailers for students.

Viewing Appointments Through Self Service

If your institution has licensed Campus Self Service, your students can view their enrollment and validation appointments directly over the web. Advisors can also view enrollment and validation appointment information over the web.

Processing Class Enrollment Transactions

Understanding Class Enrollment Processing

After you schedule classes for a term, activate students into that term, and assign enrollment appointments, you are ready to enroll students into classes. Student Records has flexible and robust enrollment processing where all the rules that you have set up in your schedule of classes and course catalog come to fruition.

This section discusses:

- Class enrollment processing.
- Enrollment request processing for drops.
- Date and time stamps on student enrollment records.

Important! Numerous common page elements are shared between the various enrollment components. We explain all page elements for the Quick Enroll component. For other enrollment components, however, we refer you back to the discussion of the Quick Enroll component for descriptions of these common elements. Therefore, a knowledge of the page elements in the Quick Enroll component is essential to understanding the functionality of the page elements in all enrollment components.

Class Enrollment Processing

The class enrollment processing tools in Student Records provides maximum flexibility when dealing with enrollment transactions and other enrollment-related activities. Five components and one self-service application, all of which post enrollment records to the same table (STDNT_ENRL), are available for you to process enrollment transactions.

You can process enrollment requests on a student-by-student basis through the Quick Enroll and Enrollment Request components. You can process enrollment requests for blocks of students and classes through the Block Enrollment component. Through the Mass Enrollment component, you can post a range of enrollment requests. Enrollment requests from all of these components go through the powerful enrollment engine during the posting process. The enrollment engine verifies that for every class requested, the student meets all rules for requisites, deadlines, permissions, and so on. Optionally, the enrollment engine also warns of potential repeats.

The Enrollment component, in contrast, bypasses the enrollment engine and all of its checkpoints, posting enrollment transactions directly to a student's enrollment record as soon as you save the data in the component. The Enrollment component is intended for use by only a select few power users at your academic institution and should not be made available to a wide user population.

If your academic institution has licensed Campus Self Service, your students can also submit enrollment requests over the internet during their scheduled enrollment appointment times. These requests function

the same as all other enrollment requests in your Student Administration system, writing data directly to your application tables.

When a user submits an enrollment request for an open entry/exit (OEE) class, the enrollment engine evaluates the student's primary academic program to verify that the academic program permits OEE enrollment. If the academic program does not permit OEE enrollment, the system returns an error message notifying the user that enrollment is not allowed in the chosen class. If the academic program does permit OEE enrollment, the enrollment engine then performs all of the existing edits as usual (such as class limits and requisite checks).

If the request successfully passes these edits, the enrollment process uses the OEE dynamic date rule assigned to the class to calculate a class end date and all the other dynamic calendar dates for the student. If no OEE dynamic date rule has been defined for the class, the enrollment process uses the rule established for the course offering. If no rule exists for the course offering, the request fails and the process returns an error message.

If the request is successful, you can view the dates calculated by the process using the academic calendar link on the Study List or by accessing the Student OEE Enroll Data page.

To submit an enrollment transaction for a student, the student must have a personal data record, have been activated in an academic program within the academic career to which the classes belong, and have been activated in the necessary term for that same academic career.

Diagram of Enrollment Engine Logic

The following diagrams show a high-level process flow of the enrollment engine:

Image: Enrollment engine logic (1 of 3)

Diagram 1 of 3 showing enrollment engine logic:

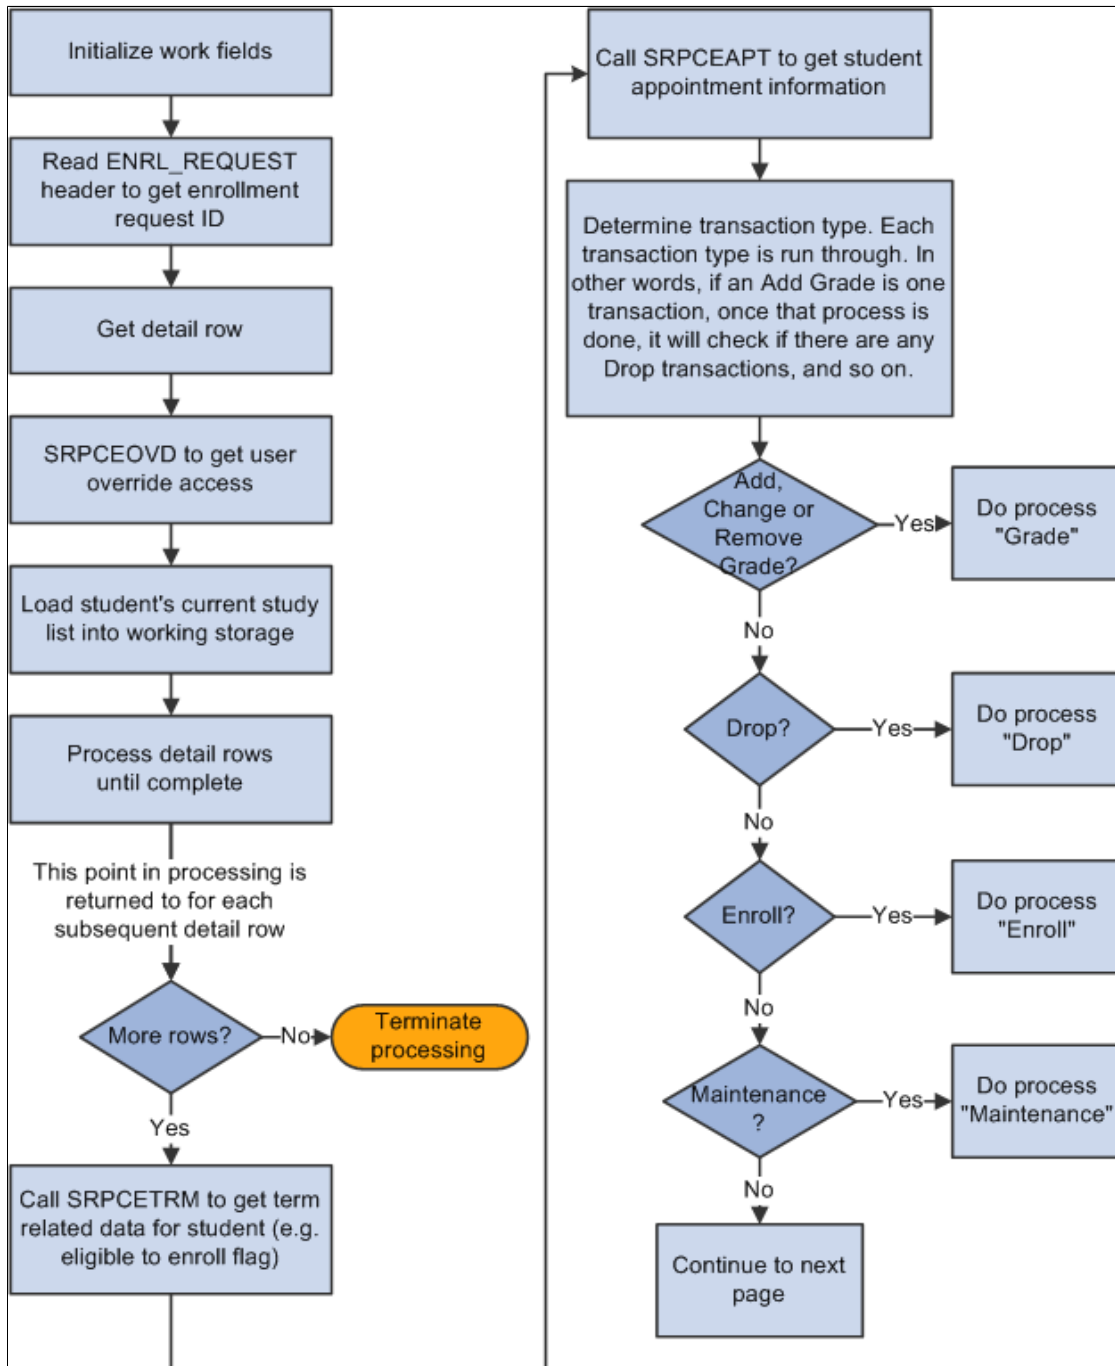

Image: Enrollment engine logic (2 of 3)

Diagram 2 of 3 showing enrollment engine logic:

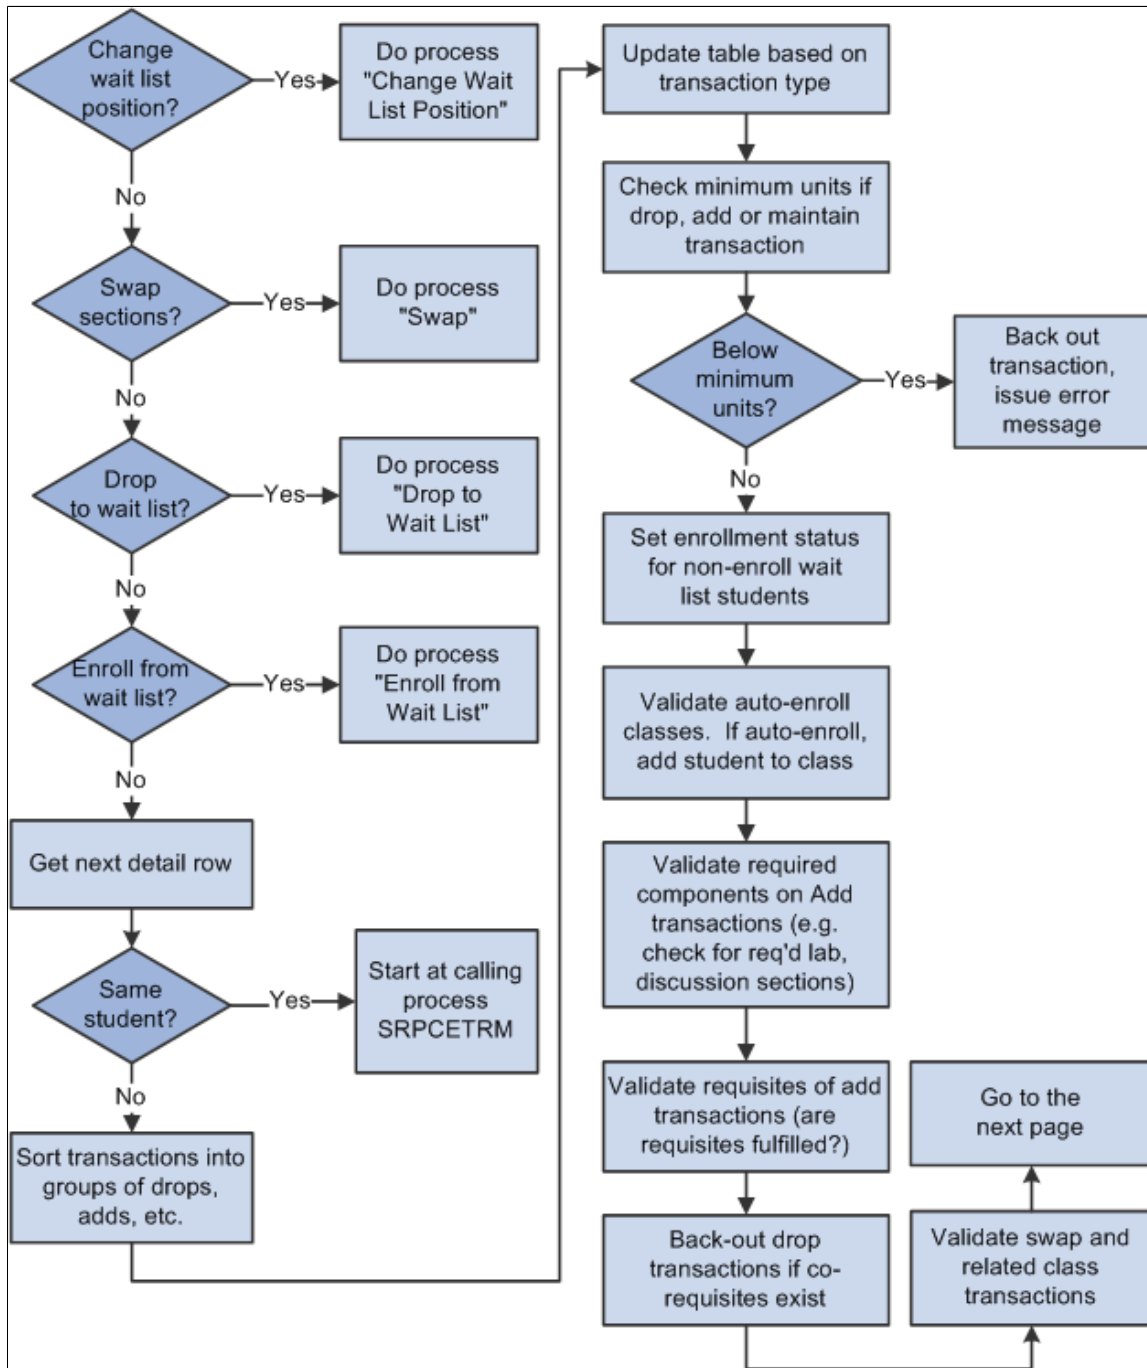

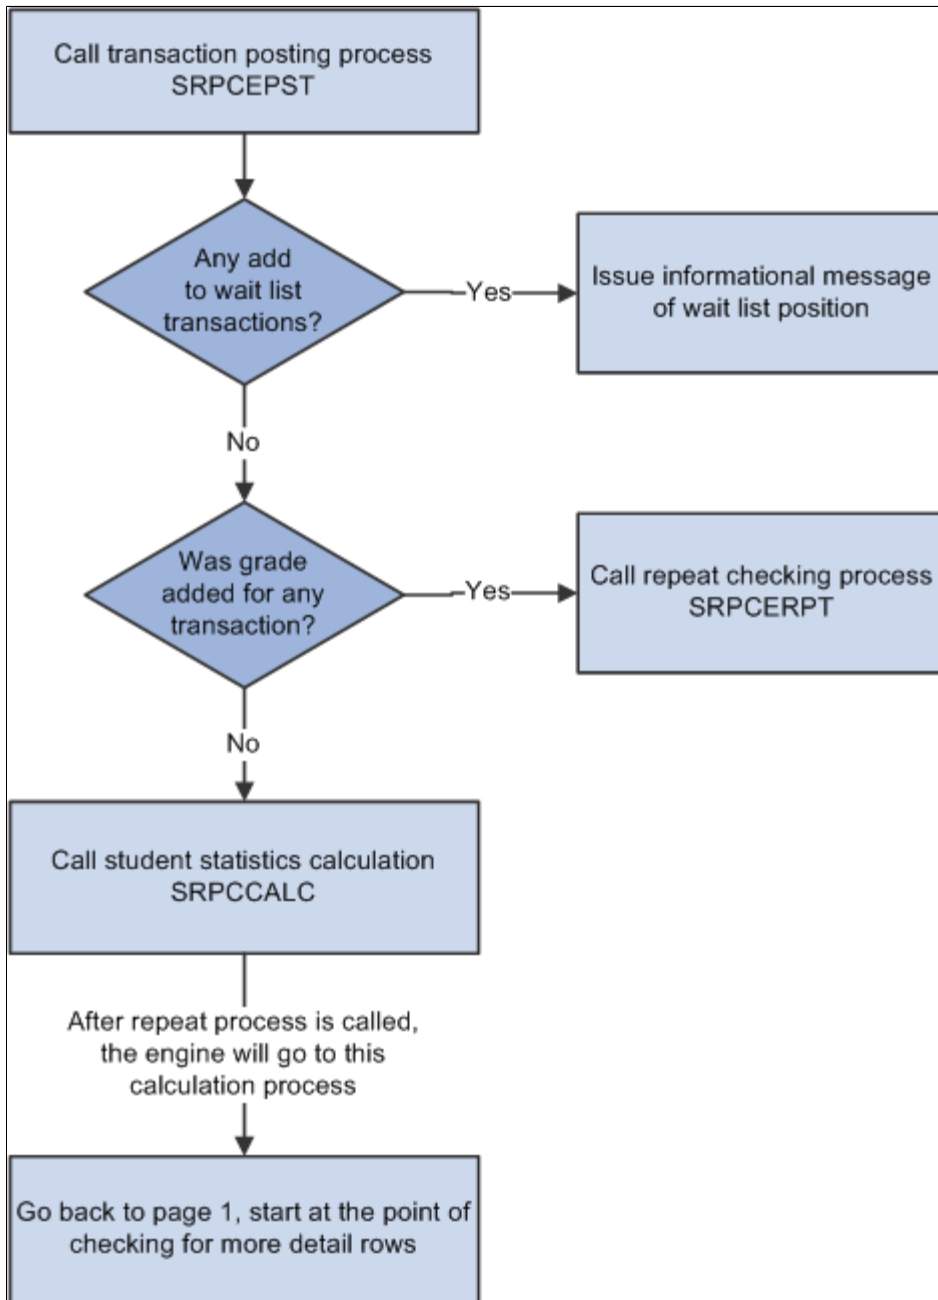

Image: Enrollment engine logic (3 of 3)

Diagram 3 of 3 showing enrollment engine logic:

"Understanding Dynamic Academic Calendars" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Enrollment Request Processing for Drops

When processing enrollment requests with an enrollment action of drop through the Quick Enroll, Enrollment Request, and Block Enroll components or self-service enrollment, the enrollment engine

must determine the drop deadlines, reasons, grading bases, and grades with which to update the impacted student enrollment records (STDNT_ENRL).

The enrollment engine determines drop deadlines, grading bases, and grades differently depending on the class enrollment type (traditional, dynamic date, OEE).

When requesting to drop a traditional class enrollment, the enrollment engine:

- Determines the deadlines according to the values set on the Academic Calendar 2 page.
- Determines if a drop or withdrawal grade has been defined for the grading basis (based on the student's grading basis in the class) on the Grading Scheme Table page.

If there is no grade set on that page, the enrollment engine uses the grading schemes and grades set on the Session Calendar 2 page.

See [Defining Grading Schemes](#).

When requesting to drop a dynamic date class enrollment, the enrollment engine:

- Determines the deadlines according to the values that the Dynamic Class Dates process calculates and displays on the Dynamic Class Data page.

If you have not calculated the academic calendar dates for the class, the enrollment engine determines the deadlines according to the values set on the Academic Calendar 2 page.

- Determines if a drop or withdrawal grade has been defined for the grading basis (based on the student's grading basis in the class) on the Grading Scheme Table page.
 - If there is no grade set on that page and you *have* calculated the academic calendar dates for this class, the enrollment engine uses the grading schemes and grades set on the Dynamic Date page of the Academic Program Table component.

If there is no grading scheme and grade set on that page, the enrollment engine uses the grading scheme and grades set on the Session Calendar 2 page.

- If there is no grade set on the Grading Scheme Table page and you *have not* calculated the academic calendar dates for this class, the enrollment engine uses the grading scheme and grades set on the Session Calendar 2 page.

When requesting to drop an OEE class enrollment, the enrollment engine:

- Determines the deadline according to the values it calculates upon enrollment and displays on the Student Enroll OEE page.

If the deadlines have not been calculated, the request fails.

- Determines the grading scheme and grade, if applicable, according to the value set on the Grading Scheme Table page.

If there is no grade set on that page, the enrollment engine uses the grading schemes and grades set on the Dynamic Date page of the Academic Program Table component. If there is no grading scheme and grade set on that page, the request fails.

Regardless of the class enrollment type, the enrollment engine determines the reason according to the enrollment action reason that you enter on the enrollment processing page. If you do not enter a value on the enrollment processing page, then, for drop transactions during the drop retain record period only, the enrollment engine uses the reason set on the Session Calendar 2 page. Otherwise, the engine assigns no reason.

If your institution wants to retain student enrollment records during the drop delete period, you can add an enrollment action reason to the drop and it will be retained subject to the time period associated with the enrollment action reason.

Note: The enrollment engine does not prevent enrollment request transactions after the drop deadlines. If you submit a request to drop after the latest drop deadline, the enrollment engine processes the request and generates a message that says that the drop was processed after the deadline.

"Defining Enrollment Action Reasons" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Date and Time Stamps on Student Enrollment Records

Whenever you post an enrollment transaction that adds, drops, or updates a student enrollment record (STDNT_ENRL), the system populates the appropriate, enrolled, dropped, or updated row with date and time stamps based on the system date. These values are not viewable on any application pages. Student Financials uses these date and time stamps to correctly calculate adjustments in situations where your academic institution charges by term and adjusts by session. Classes are associated with sessions. The date and time stamp fields are as follows:

Field	Description
LAST_ENRL_DT_STMP	The date of the last enroll action or equivalent action.
LAST_ENRL_TM_STMP	The time of the last enroll action or equivalent action.
LAST_DROP_DT_STMP	The date of the last drop action or equivalent action.
LAST_DROP_TM_STMP	The time of the last drop action or equivalent action.
LAST_UPD_DT_STMP	The date of the last action.
LAST_UPD_TM_STMP	The time of the last action.

Processing Enrollment Transactions Through the Quick Enrollment Component

This section provides an overview of the Quick Enroll component and discusses how to:

- Add or update quick class enrollment requests.
- Inquire about enrollment request messages.

Understanding Quick Enroll

The Quick Admit component, Quick Enroll component, and Quick Admit process component are a variation on the fuller processes of admitting students and enrolling them into classes. Typically, you'll use these components in conjunction with each other to accelerate admissions and enrollment procedures where immediate formal processing is not required or is unavailable for students. In addition, collecting admissions information on students who have been quick enrolled might be useful for various funnel reports.

The Quick Admit component and Quick Enroll component, when used together, enable you to rapidly add or update a student's personal data in your system; activate the student in an academic career, academic program, or term; and enroll the student in classes—all in a matter of minutes.

Important! The Recruiting and Admissions documentation for the Quick Admit use component and Quick Admit process component is essential reading for understanding how to quickly admit and enroll students. You should read that documentation to fully grasp the potential of the Quick Enroll component.

The Quick Enroll component enables you to enter, update, and post class enrollment requests for both new and continuing students on a student-by-student basis. The Quick Enroll component has the exact same functionality as the Enrollment Request component, using the same enrollment engine processing and performing the same edit checks. Transactions entered into the Quick Enroll component can be accessed through the Enrollment Request component and vice versa, giving you more flexibility and control over your enrollment requests.

Note that you cannot use the Quick Enroll component to view enrollment transactions processed through the Enrollment page because those transactions do not generate an enrollment request, nor can you view enrollment transaction processed through the Block Enrollment component because those transactions have more than one ID associated with the enrollment request. You can view the latter two enrollment sources only through their respective components.

When you access the Quick Enroll component, a dialog box prompts you to enter the key values of the transaction. The key values are:

ID	Select from a list of existing student IDs.
Academic Career	Select the academic career to which you want to add or update enrollment requests for the specified student. The system prompts you with only the academic careers in which the student is active. You can activate students in academic careers through either the Quick Admit component or the Student Program/Plan component.
Academic Institution	Select the academic institution in which you want to add or update enrollment requests for the specified student.
Term	Select the term for which you want to add or update enrollment requests for the specified student. The system displays only the

terms in which the student is active for the academic career that you selected.

Enrollment Request ID

This identifies the enrollment request as unique from other enrollment requests. The Quick Enroll component uses enrollment request as a key to access transactions. In Add mode, this field is unavailable for edit because the system generates a unique enrollment request ID for you when you save the data in the Quick Enroll component. In other modes, select the enrollment request ID that you want to access.

OK

Click to open the component with the specified key values.

"Adding New Prospects and Applications with Quick Admit" (PeopleSoft Campus Solutions 9.2: Recruiting and Admissions)

"Viewing, Assigning, or Removing Service Indicators" (PeopleSoft Campus Solutions 9.2: Campus Community)

Pages Used to Process Enrollment Transactions Through the Quick Enroll Component

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Quick Enrollment	QUICK_ENROLL3	Records and Enrollment > Enroll Students > Quick Enroll a Student > Quick Enrollment	Add or update enrollment request transactions for both new and continuing students. The Quick Enroll component has the exact same functionality as the Enrollment Request component. Transactions that you process through the Quick Enroll component can also be accessed through the Enrollment Request component and vice versa.
Enrollment Message Log	ENRLREQ_MSGLOG_SBP	Click the Errors link or Messages link in the Status field on the Quick Enrollment page.	View error message text for a specific row in the enrollment request.

Adding or Updating Quick Enrollment Requests

Access the Quick Enrollment page (Records and Enrollment > Enroll Students > Quick Enroll a Student > Quick Enrollment).

When you use this page for continuing students and a student has a positive or negative service indicator assigned to his or her record, the system displays the corresponding Service Indicator button at the top of the page. Click the button that appears to view the details of specific service indicators.

General Page Elements

Request ID

Identifies the enrollment request as unique from other enrollment requests. The Enrollment Request component uses an enrollment request as a key to access transactions. In Add mode, this field is unavailable for edit because the system generates a unique enrollment request ID for you when you save the data in the Enrollment Request component. In other modes, select the enrollment request ID upon accessing the component.

ID

The ID of the student for whom you are submitting the enrollment request.

Career

The academic career of the student for whom you are submitting the enrollment request.

Institution

The academic institution for which you are submitting the enrollment request.

Term

The term for which you are submitting the enrollment request.

Click the Show All Columns button to display all of the fields at the bottom of the page in a single, scrollable grid rather than in separate tabs.

Click the Show Tabs button to display all of the fields at the bottom of the page in separate tabs rather than a single, scrollable grid.

Submit

Click to process all nonposted rows of the enrollment request for the student. The enrollment engine performs validations as necessary at this time. If the enrollment engine encounters any errors, the system displays an enrollment request status of *Errors* on the corresponding row of the request. You can view the error messages in the appropriate row's Error Messages group box.

Note: You can also save the enrollment request and post groups of them on the Mass Enrollment page.

Class Enrollment Tab

Action

An enrollment action is the action performed on the enrollment record. The system by default sets the enrollment action for the request to *Enroll*, but you can override this default value. Values for this field are delivered with your system as translate values.

Do not modify these values in any way. Any modifications to these values require a substantial programming effort. Select from the following choices.

Add Grd (add grade): Select to add a grade to the student's enrollment record for the corresponding class.

Change Grd (change grade): Select to change a grade on the student's enrollment record for the corresponding class.

Chg WL Pos (change wait list position): Select to change the student's wait list position for the corresponding class.

Drop: Select to drop the student from the corresponding class.

Drop to WL (drop to wait list): Select to drop the student from the corresponding class and move the student to the wait list for that class.

Enroll: Select to enroll the student into the corresponding class.

Warning! Enrollment request transactions with an action value of *Add Grade* or *Change Grade*, are the only types of transactions that create Student Incomplete rows when you assign an Incomplete grade (as defined on the Academic Program Table—Incomplete page). If you use an action of *Enroll* and populate the grade with an incomplete grade, the system does not create a Student Incomplete row.

Norm Maint (normal maintenance): Select to update the student's enrollment record for the corresponding class in normal maintenance mode. Items available for update include grading basis, units, permission, course count, notes, requirement designation, repeat code, and instructor ID. You can use the normal maintenance action to update these items, rather than dropping the class and re-adding it with the new information.

Remove Grd (remove grade): Select to remove a grade from the student's enrollment record for the corresponding class.

Swap: Select to enable the student to swap the corresponding class in which he or she is enrolled for a different class. The *Change To* field becomes available for you to enter the new class section in which the student wants to enroll. You can also use this option to swap a student's enrollment from one related class section to another related class section. List the enrollment class section in both the *Class Nbr* (class number) and *Change To* fields, select a different related class, then post the enrollment transaction.

You cannot use the swap option to add or drop optional nonenrollment component sections. For example, if a student enrolls in a class section without designating the optional nonenrollment component section as a related class, then you cannot use the swap option to add the optional nonenrollment component section to the student's enrollment record. Instead, you must drop the student from the enrollment section, then process another enrollment request to add the student back into the enrollment section and also the optional nonenrollment component section. Likewise, if a student initially enrolls in

both the enrollment section and the optional nonenrollment component section but wants to drop the optional nonenrollment component section altogether, you must drop the student from both sections and process another enrollment request to add the student back into the enrollment section only.

Class Nbr (class number)

If you are submitting a new enrollment transaction, enter the number of the class for the term. The system generates a class number when you schedule classes for a term. The class number also appears on the schedule of classes.

If you do not know the class number from the schedule of classes, click the Search button to view the Basic Class Search page, where you can search the schedule of classes for the class that you want to use for the enrollment transaction.

Change To

This field becomes available when you select an enrollment action of swap. Enter the number of the new class in which the student wants to be enrolled.

Class Description

The Class Description link becomes available after you enter a class number. The text for this link changes according to the title of the class that you selected. Click this link to access the Class Detail page, where you can view detail about the selected class.

Sect (section)

The system displays the section of the class that you selected.

Start Date

When a student attempts to enroll in a class scheduled within an OEE session, the system prompts you to enter a class start date. The date that a student starts an OEE class drives the open entry/open exit processing. A class start date is required for enrollment in OEE classes.

Status (unlabeled)

The system displays the status of the enrollment request.

Errors: The enrollment engine was unable to post the submitted enrollment request due to errors. Click this link to view the errors on the Enrollment Message Log page.

Pending: The enrollment request is pending submission for enrollment processing.

Messages: The enrollment engine was able to successfully post the enrollment request and has returned an informational message, such as the student's wait list position. Click this link to view the messages on the Enrollment Message Log page.

Success: The enrollment engine was able to successfully post the enrollment request.

Academic Program

Enter the student's academic program for this enrollment. This field appears if you select the Select Acad Prog During Enroll check box on the Academic Institution 5 page. This field is editable only if the student is active in more than one academic program for this term. In this case, the student's

primary academic program for this term appears by default. You can change this value.

Related 1

If you have select an enrollment action of *Enroll* or *Swap*, the Related 1 and Related 2 fields become available for edit. If the class has a related class that is not an auto-enroll class, select that class number in this field. The values that appear are those associated sections that are scheduled for the class in the schedule of classes.

Related 2

If the class has another related class that is not an auto-enroll class, select that class number in this field.

Units and Grade Tab

Select the Units and Grade tab.

Unit Taken

The system uses units taken to calculate the transcript GPA and the enrollment load. The enrollment engine uses units taken to calculate the number of units a student can take in a term.

Units taken appear by default from minimum units on the Class Associations page. If minimum units and maximum units are different on the Class Associations page, then the class is defined as having variable units. This field becomes active, and you must enter the number of units the student selects in this field.

Course Count

Indicates the value of the course towards a degree. Some institutions count courses towards a degree as well as units towards a degree. This field indicates the value of the course towards degree progress. This field appears by default from the Course Count field on the Class Associations page.

Grade Base

The system displays the grading basis for the class according to the value set in the corresponding field on the Class Components page of the Class Associations component. If your institution has set the grading basis of the class to *student option* on the Class Components page, then this field becomes available for edit and students can select their own grading basis. The system determines the prompt values according to the grading scheme for the academic career to which the course belongs, as defined on the Academic Career Table page. However, if your institution has mapped the grading basis from one academic career to another through a grading basis mapping rule (on the Career Pointer Exception Rule page), then the system determines the prompt values according to the grading basis attached to the mapping rule.

Grade Input

This is the final grade given to the student for the class. You can enter the grade here, or you can use the grade roster generator. When a grade is entered and posted, the system displays the grade here.

Note: Posting grades through the Quick Enroll, Enrollment Request, and Block Enrollment components automatically runs the repeat checking process if the Repeat Grade Check option is set to *all crse* (all courses) for the student's academic program.

Repeat Code

Select a repeat code for the enrollment transaction, if applicable.

Repeat codes work in conjunction with repeat rules to determine whether a repeated class violates your repeat policies. When the repeat checking process runs, it searches the student's enrollment history to find class enrollments with matching course IDs. When it finds a match, it determines whether the repeat is legal based on the repeat rules that you define.

As part of your repeat rule criteria, you can specify that any class enrollment into a course with a particular repeat code should be ignored by the repeat checking process. So, even if the class enrollment violates the total attempts criteria (for example) as defined in the repeat rule, the process does not consider it in violation of the rule, as long as the class enrollment contains the required repeat code.

For example, a repeat rule could specify that courses can be repeated only three times. However, you could stipulate that students can repeat the course more than three times if they have permission from the instructor. Thus, you could define a *PERM* (permission) repeat code and assign it to the class enrollment here. When the repeat checking process identifies this class enrollment as a repeat course, it looks to see if the *PERM* repeat code is assigned. If *PERM* is assigned, the repeat checking process does not consider this class enrollment in violation of the repeat rule.

You can also define your repeat rules so that the repeat checking process *requires* that a particular repeat code be assigned to a class enrollment for the repeated course to be evaluated in a particular repeat rule. For example, you could specify that any class enrollment with the *ILGL* repeat code assigned to it is in violation of the rule.

When the repeat checking process identifies a course that violates a repeat rule, the process assigns the class enrollment a repeat code. This repeat code determines how the class enrollment is treated in the student's academic statistics, such as whether the grade is used to calculate the student's grade point average. The repeat code that the repeat checking process assigns appears here.

Requirement Designation

Use this field to select a requirement designation for the class enrollment.

Requirement Designation Option

If there is a requirement designation specified for the corresponding row of the enrollment transaction *and* that

requirement designation is at the student's option, select whether the student elects to take the requirement designation.

RD Grade (requirement designation grade)

You can enter the student requirement designation grade for the class enrollment on this page or through the grade roster.

Usually, it is more convenient for you to enter grades for groups of students and classes through the grade roster. Values are *Satisfied* or *Not Satisfied*.

Other Class Info Tab

Select the Other Class Info tab.

Permission

If the student has a general permission for enrollment, enter the number in this field. The system reserves the permission number for the student.

Drop if Enroll

The system displays this field only when the Action field is set to *Enroll*. Enter the class section that the student wants to drop.

The system drops the student from this class section only if the student is successfully enrolled in the class section that the student is currently requesting. The system does not drop the student if he or she is put on a wait list. So if you select the Wait List Okay check box and the student is put on the wait list, the system will not drop the student. When you later run the Wait List process (SRPCWAIT) for the requested class section and the process successfully enrolls the student in that section, the Wait List process then drops the student from the class section that you specify in this field.

Ind Study Instructor (independent study instructor)

If the Instructor Edit field on the Class Associations page is set to anything but *No Choice*, then this field becomes available for edit. Select the instructor ID responsible for the class if the class is an independent study.

Action Reason

Select the enrollment action reason for the enrollment action. If you select a reason, the enrollment engine automatically retains the student enrollment record even if you are dropping a student from a class during the drop delete period. If you do not select a reason and you are dropping a student from a class during the drop retain record period, the enrollment engine uses the default reason set on the Session Calendar 2 page subject to the time period associated with that reason.

Create Transcript Note

Click to access the Transcript Note page, where you can enter a free-form text that prints on the student's transcript for the class enrollment.

General Overrides Tab

Select the General Overrides tab.

Note: Only overrides that you are authorized to access are available.

Appointment	Select to override the student's enrollment appointment date, time, and maximum enrollment units. This enables you to enroll the student in the class on the corresponding row of the enrollment request, regardless of the student's enrollment appointment.
Unit Load	Select to have the enrollment engine skip all unit limit checks, including the unit load for the student's enrollment appointment, the term and session unit load, the term and session course count load, the term and session no grade point average (GPA) units, the term and session audit units, and the minimum unit enrollment check.
Time Conflict	Select to disable time conflict checking for class sections when you process the enrollment request.
Action Date	Select to override the action date. The Action Date field becomes available to edit.
Action Date	Select the date that you want to use as the action date for processing this enrollment transaction. The action date is the date that you process the corresponding row of the enrollment transaction. The system records the action date to track the date that you process information. By default, the system uses the current system date. When you are processing an enrollment request and you select to override the action date, this field becomes available for edit.
Requirement Designation	Select to override the requirement designation for the corresponding row of an enrollment request. The Requirement Designation field becomes available to edit.
Career	Select to override academic career pointers and career pointer exception rules for the student's academic career.
Service Indicator	Select to override service holds that have been placed on the student's record.
Requisites	Select to have the enrollment engine bypass requisite checking when you submit the corresponding row of an enrollment request for processing.

Class Overrides Tab

Select the Class Overrides tab.

Note: Only overrides that you are authorized to access are available.

Closed Class	Select to indicate that the class is closed due to capacity size.
---------------------	---

Class Links

Select to allow students to add and drop class sections without having to do likewise for the required related component sections in a class association group, to allow students to enroll in a nonenrollment type section, and to allow multiple student enrollment in a course.

Class Units

Select to override the *Units Taken* field value for both fixed and variable unit classes.

Grading Basis

Select to allow students to enroll into a class with a grading basis other than the one established for the class. The Grading Basis field becomes available for edit so that you can select a different grading basis for the class enrollment.

Note: If you select the Grading Basis check box on the Class Overrides tab when you add or change a grade using the Enrollment Request or Quick Enroll components, the STDNT_ENRL.OVRD_GRADING_BASIS is set to Y if the request posts successfully.

If you perform an enrollment action on an existing STDNT_ENRL row (that is, the action is not Enroll or Swap), the Grading Basis check box on the Class Overrides tab is automatically selected (ENRL_REQ_DETAIL.OVRD_GRADING_BASIS is set to Y), if the class has an overridden grading basis (STDNT_ENRL.OVRD_GRADING_BASIS = Y).

If the enrollment action is *Remove Grade*, the Grading Basis check box is not available for edit, regardless of a user's enrollment override security, to prevent a grade override being reversed.

For actions other than *Remove Grade*, if you clear the Grading Basis check box on the Class Overrides tab for a class that has an overridden grading basis, the STDNT_ENRL.OVRD_GRADING_BASIS is updated to N.

Class Permission

Select to override general permission and student-specific permission requirements, academic career pointers, and career pointer exception rules.

Note: A student with a valid class permission can override course consent, academic career pointers, career pointer exception rules, class capacity size, and prerequisite checking.

Wait List Okay

Select to allow the student to wait list into a class section even if the class section, combined section, and reserve capacity are full provided that space is available on the wait list and the last date to wait list has not passed.

Wait List Pos (wait list position)

Click this link to access the Wait List Position page, where you can view the student's position on the wait list. This link is available only for enrollment requests in which the student is already on the wait list for the specified class section.

(AUS) Australian Data Tab

Select the Australian Data tab.

Note: This tab is available only if you select the Australia DEST, HECS, Centrelink, TAC check box on Academic Institution 6 page.

Student Career Nbr (student career number) Select the student's career number.

Liability Status If the student has a liability status on the Term Activation - Loan Election page, the system enters that value here.

You can override that value for this course enrollment.

Cohort Year If the student has a cohort year on the Student Program/Plan - AUS Student Program page, the system enters that value here.

New Zealand Data Tab

Select the New Zealand Data Tab.

Note: This tab is available only if you select the New Zealand Catalog, SDR, EFTS, StudyLink check box on the Academic Institution 6 page.

Funding Source The system enters this value from the student's program.

Enter the funding source for the student's program on the Student Program page.

Course Classification The system enters this value from the Acad Prog NZL (academic program New Zealand) page for course classifications defined with the type *Program*. For course classifications defined with the type *Course*, the system enters the value from the course catalog.

Set up course classifications on the Course Classifications page.

See [Defining Course Classifications](#).

Funding Category If the student's program has a course classification type of *Program*, the first character on the Academic Program table is concatenated with the second character of the course catalog value, otherwise the course catalog value is used.

EFTS Factor The system enters this value from the course catalog.

Go To Links

View Enrollment Access If your enrollment security is by enrollment access ID, click this link to access the Access to Enrollment Functions page, where

you can view your security status for each enrollment function possibility.

Calculate Tuition

Click to access the Tuition Calculation page, where you can calculate tuition for the student.

Tuition calculation is located within the Quick Enroll component because when you have changes to a student's academic status that can affect their charges for tuition and fees, you can perform the tuition calculation immediately without having to defer the task. However, tuition calculation is most likely performed by your Student Financials department and should be done by other users only if it concurs with your business rules.

The student must be active in at least one career and at least one term before you can use this page, but the student does not necessarily have to be enrolled in any classes. It is possible to calculate tuition for a student if your term fees are set up to use anticipated (projected) billing units. Also, you must have defined appropriate term fees and at least one tuition group.

Study List

Click to access the Student Study List page, where you can view the student's class schedule for the specified term.

Enrollment Appointments

Click to access the Student Enrollment Appointment page, where you can view the student's enrollment appointments for the specified term.

Term/Session Withdrawal

Click to access the Term History component, where you can view all of a student's term statistics for each term of the student's academic career, withdraw the student from the specified term or session, and more.

Inquiring About Enrollment Request Messages

Access the Enrollment Message Log page (click the Errors link or Messages link in the Status field on the Quick Enrollment page).

Message Severity

The posting process displays the severity of each message that it writes to the message log for the corresponding request. For example, if the posting process is unable to post a request due to errors, it displays a severity value of *Error*.

Message Text

The posting process displays the message text and a detailed explanation of each message that it writes to the message log for the corresponding request. You can view and update messages in the Message Catalog within the appropriate message set.

Requisite Checking for Adds

When a student fails to satisfy either a catalog requisite or class association requisite while enrolling in a class, the system returns not only a "requisites not met" error but also the Requirement Group long description for both on the Enrollment Message Log page. If a class has a course catalog level requisite and a class association level requisite, the system returns the requirement group description for both, even if the student has met one or the other. Catalog and class association requisites are set up on the Class Requisites page.

For example, a student has failed to satisfy either a catalog or a class association requisite. Depending on how class requisites are set up, the system displays both descriptions if the student satisfies the catalog requisite but not the class association requisite.

Requisite Checking for Drops

When a student attempts to drop a class, the Requisite Checking process runs if one or more of the student's other enrolled classes has a Requirement Group with a requisite type of *Co-Requisite*. If the dropped class is required as a co-requisite for another enrolled class, the system returns an error message. The system now returns the description for the Requirement Groups with the Co-Requisite requisite type. Catalog and class association requirement groups are set up on the Class Requisites page.

For example, a student is trying to drop class A and class A is a co-requisite for enrolled classes B and C. The system returns the enrollment requirement group description for both of those classes.

Requisite Checking for Self Service

The system displays the long description of the requirement group in error messages not only for administrative but also for student self-service enrollment pages. The Campus Self Service documentation provides details about how to set up self service to enable this functionality.

See "Setting Up Self-Service Features for Student Records" (PeopleSoft Campus Solutions 9.2: Self Service)

Processing Enrollment Transactions Through the Enrollment Component

The Enrollment component is similar to the Enrollment Request and Quick Enroll components but has some unique features that make it the most powerful component in which to process enrollment transactions. The Enrollment component enables you to:

- Bypass all requisite, requirement, deadline, and other rules.
- Post enrollment immediately when you save the transaction.

It does this quickly because the system does not check the enrollment against all the rules that you set up.

- Skip the enrollment request process and post enrollment immediately.

To keep the powerful capability of this component secure and avoid complications in your enrollment business practices, grant access for this component only to a limited number of users, and these select few should use the component infrequently.

This section discusses how to:

- Enter class enrollment information.
- View enrollment transaction information.
- Add transcript notes and text.
- Indicate requirement designation options and independent study instructors.
- View last enrollment action information.
- (AUS) Enter HECS data.
- (CAN) Enter ESIS student data.
- (NZL) Enter funding information.
- (NLD) Indicate student paper information.

Pages Used to Process Enrollment Transactions Through the Enrollment Component

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Enrollment 1	STDNT_ENRL1	Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 1	Enter class enrollment information by student, bypassing all enrollment rules and requirements. Saving this page posts the enrollment transaction to the student's enrollment record.
Student Enrollment 2	STDNT_ENRL2	Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 2	View information about adds, drops, and other items for enrollment transactions processed through the Enrollment component.
Student Enrollment 3	STDNT_ENRL3	Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 3	Add transcript notes and text to a student's enrollment record for an enrollment transaction processed through the Enrollment component.
Student Enrollment 4	STDNT_ENRL4	Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 4	Indicate options for requirement designations and assign an independent study instructor to enrollment transactions processed through the Enrollment component.
Last Enrollment Action	STDNT_ENRL_LAST	Records and Enrollment > Enroll Students > Enrollment > Last Enrollment Action	View information about the last enrollment action processed on a student's enrollment record through the Enrollment component. The page provides a basic audit trail of information about the most recent enrollment action.
AUS Student Enroll (Australian student enrollment)	SSR_STDNT_ENRL_AUS	Records and Enrollment > Enroll Students > Enrollment > AUS Student Enroll	Enter HECS data for a student. Note: This page appears only if you select the Australia DEST, HECS, Centrelink, TAC check box on the Academic Institution 6 page.

Page Name	Definition Name	Navigation	Usage
Cdn Student Enrollment (Canadian student enrollment)	CAN_RPT_STDNT_CRSE	Records and Enrollment > Enroll Students > Enrollment > Cdn Student Enrollment	Define ESIS student enrollment data. Note: This page appears only if you select the Canadian Government Reporting check box on the Academic Institution 6 page.
NZL Student Enroll (New Zealand student enrollment)	SSR_STDNT_ENRL_NZL	Records and Enrollment > Enroll Students > Enrollment > NZL Student Enroll	Enter funding information for the student. Note: This page appears only if you select the New Zealand Catalog, SDR, EFTS, StudyLink and NZQA check boxes on the Academic Institution 6 page.
NLD Student Paper (Dutch student paper)	SAD_BR_SPAP_NLD	Records and Enrollment > Enroll Students > Enrollment > NLD Student Paper	This page appears if you select the Use Dutch Functionality check box on the Student Admin Installation page. Use this page to record the student's end thesis for BRON reporting purposes. This information is used in the exam result data set for VAVO, which is the 331 file sent to BRON.

Entering Class Enrollment Information

Access the Student Enrollment 1 page (Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 1).

Image: Student Enrollment 1 page

This example illustrates the fields and controls on the Student Enrollment 1 page. You can find definitions for the fields and controls later on this page.

Calculate End Date

This button becomes available when you select to add a class section within an OEE session and you enter a value in the Start Date field. Click this button to have the system calculate the end date of the OEE class section based on the start date that you enter.

Class Nbr (class number)

Select the class in which you want to add or drop the student. Class values for other fields appear according to the schedule of classes and class associations.

Status

The system displays the student's current enrollment status in the class section. The system sets the student's status based on the enrollment action that you process. If you have added or are adding the student to the specified class section through this component, the system displays the status as *Enrolled*. If you have dropped the student from the specified class section through this component, the system displays the status as *Dropped* up through the drop retain record period. After this period has passed, the system displays the status as *Enrolled* and assigns the corresponding penalty grade to the student enrollment record.

Statuses are: *Enrolled*, *Waiting*, and *Dropped*.

Reason

The system displays the reason associated with the student's current enrollment status in the class section. If you have added or are adding the student to the specified class section through this component, the system displays the reason as *Enrolled*. If you have dropped the student from the specified class section through this component, the system displays the reason as *Dropped (was enrolled)*.

Status Date	The date that you process the enrollment transaction for the corresponding row of the request. The system records the status date to track the date that you process information. The system uses the current system date for new enrollment transactions.
Action	<p>Select from the following choices the action to perform on the enrollment record. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort. Choices are as follows:</p> <p><i>Drop:</i> Select to drop the student from the corresponding class section.</p> <p><i>Manual Add:</i> Select to manually enroll the student into the corresponding class section, bypassing all enrollment rules and requirements.</p>
Reason	If you are dropping the student from the specified class section, select the reason for the enrollment action, such as whether the student is dropping the class or the class has been canceled. A reason value is not required.
Program	Enter the student's academic program for this enrollment. This field appears if you selected the Select Acad Prog During Enroll check box on the Academic Institution 5 page. This field is editable only if the student is active in more than one academic program for this term. If this is the case, the student's primary academic program for this term appears by default. You can change this value.
Grade In / Official	<p>The grade in is the final grade given to the student for the class. You can enter the grade here, or you can use the grade roster generator. When a grade is entered and posted, the system displays the grade here.</p> <hr/> <p>Note: Posting grades on the Student Enrollment 1 page <i>does not</i> automatically run the repeat checking process.</p> <hr/> <p>The grade lapse process does not include incomplete grades entered on the Student Enrollment 1 page.</p> <p>The grade official is the official grade for calculation and transcript purposes. The Grading Basis automatically translates the grade In to another value in this field, if appropriate.</p>
Units Earned	The system uses units earned to determine academic level, as well as to grant actual credit to the student. This field is separate from units taken to accommodate the granting of partial credit for a class while continuing to have the class count fully towards GPA, academic load, or billing. Units earned default from units taken. When you add an enrollment for a student using another enrollment component, the units earned also

defaults to the same value as units taken. Regardless of the enrollment component, you must adjust units earned on the Student Enrollment 1 page.

Note: Units earned can be entered at any time, although they do not apply to a student's transcript until the class is graded.

Progress

Indicates the number of units the system uses, in conjunction with the billing factor, to calculate billing units. The system also uses progress units to calculate academic load. The system by default sets the value of this field to the academic progress units value on the Class Associations page.

Billing Units

In Student Financials, all per unit term fees, per unit course fees, and per unit class fees are driven off of the billing units. Billing units are calculated for an enrollment record by multiplying the billing factor, which is set on the Class Associations page, and the academic progress units for the selected class. Because the system by default sets the billing factor 1, billing units are usually equal to academic progress units. The Student Enrollment 1 page is the only place where you can override billing units for an individual enrollment. For example, if you set the billing factor to 2 and the academic progress units to 3, the billing units would be 6. This would be multiplied by whatever amount per billing unit you establish in Student Financials. But if you want to discount the class for a specific student, you could change the billing units here on the Student Enrollment 1 page back to 3.

FA Progress (financial aid progress) Indicates units towards financial aid progress.

Term History link Click to access the Term History component, where you can view all of a student's term statistics for each term of the student's academic career, withdraw the student from the specified term or session, and more.

Enrollment Summary link Click to access the Enrollment Summary component, where you can view a summary of a student's enrollment information and term statistics.

Save Click to post enrollment immediately to the student's enrollment record.

Warning! The system performs no checks against your enrollment rules.

Viewing Enrollment Transaction Information

Access the Student Enrollment 2 page (Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 2).

Image: Student Enrollment 2 page

This example illustrates the fields and controls on the Student Enrollment 2 page. You can find definitions for the fields and controls later on this page.

Student Enrollment 1		Student Enrollment 2		Student Enrollment 3		Student Enrollment 4		Last Enrollment Action	
Ana Beck		SR0400							
Term:	2003 Spr	Career:	Undergrad	Institution:	PeopleSoft University				
								Find View All First 1 of 1 Last	
Class Nbr:	1003	Advanced Sculpture		Seminar					
Subject:	Art	Catalog Nbr:	145	Class Section:		1			
Academic Group:	College of Fine Arts	Undergrad		Session:		Regular			
Status / Reason:	Enrolled	Enrolled			Status Date:	11/19/2004			
Enrollment Add Date:	11/19/2004			Enrollment Drop Date:					
Grade Date:				Primary Program:	Liberal Arts Undergraduate				
Grading Basis Date:	11/19/2004			Repeat Date:			<input checked="" type="checkbox"/> Include in GPA <input type="checkbox"/> Audit Grading Basis <input checked="" type="checkbox"/> Earn Credit <input type="checkbox"/> Mandatory Grading Basis		
Grade Points Per Unit:	0.000			Repeat Scheme:	Undergraduate				
Grade Points:	0.000			Units Attempted:	In Progress				
Grading Scheme:	Undergraduate Grading Scheme								

Note: The system bases tuition calculation on the following dates. These dates are critical for initial billing as well as refunds.

Enrollment Add Date	The date that you added the class section to the student's enrollment record.
Enrollment Drop Date	If you have dropped the student from the class section, the system displays the date that you processed the drop.
Grade Date	The date that you graded the student.
Primary Program	The student's primary academic program for the specified career and term combination.
Grading Basis Date	The date that you last changed the grading basis on the Student Enrollment 1 page. If you have not changed the grading basis, the system sets this field to the date that you added the class section to the student's enrollment record. To avoid potential repeat checking problems, this date must always be greater than or equal to the session first date to enroll value. The repeat checking process uses this value to determine which effective-

dated grading basis row to use for the student. This value is also available as a Student Financials fee calculation variable on the Equation Detail page.

Note: The grade posting process does *not* reference this field to determine which grading basis row to use for grading. Instead, the grade posting process uses the term begin date.

Repeat Date	The date that you last changed the repeat code on the Student Enrollment 1 page.
Grade Points Per Unit	The system bases this value on the grade definition that corresponds to the grading basis and grade for this enrollment row. The system sets the value of this field to 0 until the student receives a grade for the class.
Repeat Scheme	The repeat scheme for the student's academic career, as defined on the Academic Career Table component. The repeat scheme controls how the system evaluates this course for repeat checking.
Grade Points	The system bases this value on the grade definition that corresponds to the grading basis and grade for this enrollment row. The value of this field equals the grade points per unit multiplied by the units taken.
Units Attempted	The status of the student's progress in the class. The units attempted value remains <i>In Progress</i> until the student receives a grade for the class, in which case the value updates to <i>Yes</i> .
Grading Scheme	The system displays the value of this field according to the grading scheme of the student's primary academic program for the specified academic career and term, as defined on the Academic Program Table component.
Include in GPA	The system displays the value of this field according to the grading basis on the Student Enrollment 1 page, as defined on the Grading Scheme Table page.
Audit Grading Basis	The system displays the value of this field according to the grading basis on the Student Enrollment 1 page, as defined on the Grading Scheme Table page.
Earn Credit	The system displays the value of this field according to the grading basis on the Student Enrollment 1 page, as defined on the Grading Scheme Table page.
Mandatory Grading Basis	The system selects this check box if the grading basis for the class is mandatory. The system clears this check box if the grading basis for the class is elective.

Adding Transcript Notes and Text

Access the Student Enrollment 3 page (Records and Enrollment > Enroll Students > Enrollment > Student Enrollment 3).

Image: Student Enrollment 3 page

This example illustrates the fields and controls on the Student Enrollment 3 page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Student Enrollment 3' page for student Ana Beck (SR0400) at PeopleSoft University. The page is divided into several sections:

- Header:** Student Enrollment 1, Student Enrollment 2, **Student Enrollment 3**, Student Enrollment 4, Last Enrollment Action.
- Student Information:** Ana Beck, SR0400.
- Enrollment Details:** Term: 2003 Spr, Career: Undergrad, Institution: PeopleSoft University.
- Class Information:** Class Nbr: 1003, Subject: Art, Catalog Nbr: 145, Class Section: 1, Academic Group: College of Fine Arts, Session: Regular.
- Status:** Status: Enrolled, Reason: Enrolled, Status Date: 11/19/2004.
- Student Position:** (Field for wait list processing).
- Note ID:** LAST (Selected), Last Course Multi Term Sequenc.
- Transcript Note Section:** *Transcript Note, 1 *Transcript Note Sequence Nbr, Note From Incomplete Process (checkbox).

Student Position

The student's enrollment position in the class section, which it uses for wait list processing.

Tuition Group

The tuition group to which this class section is tied. A tuition group is the shared characteristics among students. When you register students, the system automatically assigns them to the appropriate tuition groups. When you run the tuition calculation process, it sees that this class section is associated with the tuition group that you specify, and thus charges all students in the tuition group the fees for this class section of the course offering. You can tie all class sections of a course offering to a tuition group on the Course Catalog - Offerings page. You can tie specific class sections of a course offering to a tuition group on the Class Associations page.

Note ID

Select a standard transcript note for the class, if applicable.

Transcript Note

Enter additional free-form text about the specified transcript note. The system prints the text that you enter onto the student's transcript.

Transcript Note Sequence Nbr (transcript note sequence number)

Enter the sequence number of the transcript note. The sequence number indicates the printing order of the transcript notes that you specify.

Note From Incomplete Process

The system automatically selects this check box when the note is added during the incomplete/grade lapse process.

Action The last enrollment action taken for this student through the Enrollment component.

Process The process used for the last enrollment action. The possible values for this field are *Enrollment*, which refers to this page; *Enrollment Request*, which refers to the enrollment engine; *Grade Post*, which refers to the grade posting process; and *Class Cancelled*.

User ID The user ID of the user who performed the last enrollment action for this class enrollment.

ID The individual ID of the user who performed the last enrollment action for this class enrollment.

(AUS) Entering HECS Data

Access the AUS Student Enroll page (Records and Enrollment > Enroll Students > Enrollment > AUS Student Enroll).

Image: AUS Student Enroll page

This example illustrates the fields and controls on the AUS Student Enroll page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'AUS Student Enroll' page for student Amali Peterson (SRAUS001) in the Spring 2005 term. The student is an Undergraduate at PeopleSoft Australia Uni. The class details are for Class Nbr 1040, Subject Econ, Catalog Nbr 104, and Class Section 001. The enrollment status is 'Enrolled'. The 'Aus Enrollment Details' section includes the following fields:

- HECS Band ID: 2 (Band 2)
- HECS Band Charge: 300.00
- HECS Load Factor: 0.12500
- EFTSL Load: 0.12500
- Student Career Nbr: 0
- Cohort: 0000
- Liability Status: 202
- CAN Print Date: (empty)
- HECS Up-Front Discount: (empty)
- VET Course Assurance Indicator E619
- VET Recognition of Prior Learning Code E577: (dropdown menu)

HECS Band ID	The system enters this value from the course catalog.
HECS Band Charge	The system enter the HECS band charge for the band ID.
HECS Load Factor	Enter the HECS load factor for this enrollment.
EFTSL Load	Enter the equivalent full-time student load for this enrollment.
Student Career Number	The system enters the value from the Student Term Activation page.
Cohort Year	The system enters this value from the Student Term Activation page.
Liability Status	The system enters this value from the Student Term Activation page.
CAN Print Date (Commonwealth Assistance Notice print date)	The date the CAN was printed for this student.
VET Course Assurance Indicator E619	Select to indicate whether the student's enrollment in the unity of study is partially or fully covered by an approved course assurance arrangement.
VET Recognition of Prior Learning Code E577 (RPL)	Select: <ul style="list-style-type: none"> • 1 to indicate the unit of study consists entirely of RPL. • 2 to indicate the unity of study has a component of RPL.

(CAN) Entering ESIS Student Data

Access the Cdn Student Enrollment page ((Records and Enrollment > Enroll Students > Enrollment > Cdn Student Enrollment).

See [Defining PSIS Student Enrollment Data](#).

(NZL) Entering Funding Information

Access the NZL Student Enroll page (Records and Enrollment > Enroll Students > Enrollment > NZL Student Enroll).

Image: NZL Student Enroll page

This example illustrates the fields and controls on the NZL Student Enroll page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'NZL Student Enroll' page for student Ronald Bradley (SRNZL2001). The page is divided into several sections:

- Header:** Ronald Bradley, SRNZL2001
- Term:** Aut 2005, **Career:** Undergrad, **Institution:** Silver Fern University
- Class Nbr:** 1002, **Intro to Financial Accounting**, **Lecture**
- Subject:** Acct, **Catalog Nbr:** 100, **Class Section:** 001
- Academic Group:** Faculty of Business, **Undergrad**, **Session:** Regular
- Status:** Enrolled
- Funding Source:** 03 (Full Fee Domestic Student)
- EFTS Factor:** 0.1250
- Course Classification:** 03 (Arts; Humanities; Social Sciences)
- Funding Category:** A2 (Arts & Soc Sci - Degree)

Funding Source

The system enters this value from the student's program.

Enter the funding source for the student's program on the Student Program page.

EFTS Factor

The system enters this value from the course catalog.

Course Classification

The system enters this value from the Acad Prog NZL (academic program New Zealand) page for course classifications defined with the type *Program*. For course classifications defined with the type *Course*, the system enters the value from the course catalog.

Set up course classifications on the Course Classifications page.

See [Defining Course Classifications](#).

Funding Category

If the student's program has a course classification type of *Program*, the first character from the Academic Program table

is concatenated with the second character of the course catalog value, otherwise the course catalog value is used.

(NLD) Indicating Student Paper Information

Access the NLD Student Paper page (Records and Enrollment > Enroll Students > Enrollment > NLD Student Paper).

Image: NLD Student Paper page

This example illustrates the fields and controls on the NLD Student Paper page. You can find definitions for the fields and controls later on this page.

Student Enrollment 2		Student Enrollment 3		Student Enrollment 4		Last Enrollment Action		NLD Student Paper	
Ana Beck		SR0400							
Term:	2003 Spr	Career:	Undergrad	Institution:	PeopleSoft University				
Class Nbr:	1003	Advanced Sculpture		Seminar					
Subject:	Art	Catalog Nbr:	145	Class Section: 1					
Academic Group:	College of Fine Arts	Undergrad		Session: Regular					
BRON Course ID:	000068	Psychology 1A							
Title Paper:	The Function of Language in Memory								
Result Paper	Good								
Grade Date:	05/23/2003								
Application Paper	In exam Year								

BRON Course ID

Select a BRON course ID to link to the student's end thesis.

Title Paper

Enter the title of the student's end thesis.

Result Paper

Select the result of the student's end paper. Values are *Adequate*, *Good*, and *Insufficient*.

Grade Date

Enter the date the student received the grade for the end paper.

Application Paper

Enter whether the student completed the paper *In exam Year*, or, if not, whether the reason was *Dispensation*—meaning the student was excused from completing the paper—*Exchanged for Diploma*, or *Passed without Grade*.

"Understanding BRON" (PeopleSoft Campus Solutions 9.2: Recruiting and Admissions)

Processing Enrollment Transactions Through the Block Enrollment Feature

Important! Mass Change is a deprecated product. Support will be maintained for this product, but no new development will be produced for Mass Change. It is strongly recommended that you use Application Engine instead. For more information on Application Engine, see *PeopleTools: Application Engine*.

This section provides an overview of the Block Enrollment feature and discusses how to:

- Predefine student enrollment blocks.
- Predefine class enrollment blocks.
- Set class enrollment block defaults.
- Merge, retrieve, and post data for block enrollment requests.
- Create custom student enrollment blocks.
- Create custom class enrollment blocks.
- View block enrollment request details.
- Maintain detail for a student's block enrollment request.

Understanding the Block Enrollment Feature

Student Records provides robust functionality to process groups of enrollment requests at one time. These groups of enrollment requests are known as block enrollment requests. Through the Block Enrollment feature, you can merge a block of students with a block of classes and post these merged blocks as enrollment requests all in one procedure.

After merging student blocks with course blocks, you can opt to use the Block Enrollment component to retrieve and review this data before posting the block enrollment request.

Student and Class Enrollment Blocks

This section discusses how to predefine blocks of classes and blocks of students for use in the block enrollment request processing. You can predefine student blocks on the Block Enrollment Students page (add students one by one or use Population Selection), or you can predefine student blocks based on specified criteria using the Mass Change feature.

Later when you process a block enrollment request, you can merge blocks of classes with blocks of students and submit a single enrollment transaction. Because you store predefined blocks in your database when you save them, you can reuse the blocks for any later block enrollment request. This is especially useful in professional schools where all students enroll in the same classes year to year, or in certain undergraduate curricula where multiple classes are clustered as first year corequisites.

If you need to use the block of students or the block of classes only one time *and* you will not be editing the blocks at a later time, then as an alternative you can create custom blocks during processing.

Block Enrollment Requests

This section also discusses how to process block enrollment requests, which is done through the Block Enrollment component. The Block Enrollment component is the core of the block enrollment functionality. You can merge predefined student blocks with predefined course blocks, create and merge custom blocks of students and custom blocks of classes, or any combination of the two. When you run the Structured Query Report (SQR) process to perform the merge, the process combines the students in the student block with the courses in the course block, thus creating an enrollment request that contains all of the merged records. This enrollment request is keyed by an enrollment request ID.

When you are ready, you can, with the click of a button, process all of the individual enrollment requests included in the block enrollment request. Alternatively, you can note the enrollment request ID and run the enrollment posting process using the Mass Enrollment page. The button enables you to process block enrollment requests directly through the Block Enrollment component by Remote Call, while the Mass Enrollment component enables you to process block enrollment requests through Process Scheduler.

After running the posting process, use the Block Enrollment component to review the processing results to see whether each student got enrolled into the requested classes or whether the enrollment engine encountered errors. To correct errors, adjust each affected student's enrollment request or term record as necessary, save your changes, then post the block enrollment request again—either through the Block Enrollment component or the Mass Enrollment page.

Note: The Block Enrollment feature is *not* intended as a vehicle for converting historical enrollment records, nor should it be used as a vehicle to convert these records.

Mass Change and Enrollment Blocks

Note: You can create student blocks using Population Selection on the Block Enrollment Students page.

Using the Mass Change feature, you can create enrollment blocks based on specified criteria. Campus Solutions delivers the Create Student Block mass change type and Create Student Block mass change template, which you use to create a mass change definition. The Create Student Block mass change template contains the following fields:

- Academic plan
- Academic program
- Academic load
- Academic level - projected
- Term
- Total grade points

Using these fields you can select specific criteria by which to create a student enrollment block. For example, you can specify that the academic plan equals English, the academic program equals Liberal Arts Undergraduate, and the term equals 0550. When you run the mass change the system creates an enrollment block with every student active in program Liberal Arts Undergraduate, plan English, and term 0550. You also select default values for academic institution, academic career, student enrollment block, and definition. These are the key values for the enrollment block that you are creating.

Pages Used to Process Enrollment Transactions Through the Block Enrollment Feature

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Block Enrollment Students	STDNT_BLOCK	Records and Enrollment > Enroll Students > Block Enrollment > Create Student Block > Block Enrollment Students	Define groups of students for block enrollment purposes. You can then merge blocks of students with blocks of classes by using the Block Enrollment component.
Block Enrollment Classes	CRSE_BLOCK	Records and Enrollment > Enroll Students > Block Enrollment > Create Class Block > Block Enrollment Classes	Define groups of classes for block enrollment purposes. You can then merge blocks of classes with blocks of students by using the Block Enrollment component.
Class Block Defaults	CRSE_BLOCK_DEFAULT	Click the Class Block Defaults link on the Block Enrollment Classes page.	Set defaults for each class that you add to the course block. You can set up defaults for the enrollment action, action reason, and enrollment overrides. Enrollment security is enforced so that you cannot override anything to which you do not have access.
Block Enroll Merge	BLOCK_ENROLL_MERGE	Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enroll Merge	Create custom student blocks and course blocks, merge predefined or custom student blocks with predefined or custom course blocks, post block enrollment requests, and retrieve data and process results about merged blocks and posted blocks.
Create Custom Student Block	BLK_ENRL_STDNT_SEC	Click the Detail/Create link under the Student Block field on the Block Enroll Merge page.	Create a custom block of students to use for block enrollment. This feature enables you to enroll one or more students into a class or block of classes without having to predefine a student enrollment block on the Block Enrollment Students page, thus simplifying the block enrollment process. You can also use this feature to perform class maintenance where only a few students need changes to their enrollment records.

Page Name	Definition Name	Navigation	Usage
Create Customized Class Block	BLK_ENRL_CRSE_SEC	Click the Detail/Create link under the Class Block field on the Block Enroll Merge page.	Create a custom block of classes to use for block enrollment. This feature enables you to enroll students into one or more classes without having to predefine a class enrollment block on the Block Enrollment Classes page, thus simplifying the block enrollment process. You can also use this feature to perform class maintenance where only a few students need changes to their enrollment records.
Block Enroll Detail	BLOCK_ENRL_DETAIL	Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enroll Detail	View, for a specific block enrollment request, a list of the student and class combinations that have been merged or that have been posted to the students' records. The list appears in grid format with a row for each student and class combination. These student and class combinations are term specific.
Block Enrl Detail1 (block enroll detail 1)	BLOCK_ENRL_DTL1	Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enrl Detail1	Maintain the details of a block enrollment request for a specific student and class.
Block Enrl Detail2 (block enroll detail 2)	BLOCK_ENRL_DTL2	Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enrl Detail2	Maintain the details of a block enrollment request for a specific student and class.

Predefining Student Enrollment Blocks

Access the Block Enrollment Students page (Records and Enrollment > Enroll Students > Block Enrollment > Create Student Block > Block Enrollment Students).

Academic Institution

The academic institution to which the student enrollment block belongs. Select an academic institution upon entering the page.

Student Enrollment Block

Enter a description of the student enrollment block code.

ID

Select the identification code of the student you want to include in the group. The system prompts you with IDs from the STDNT_ID_SRCH table.

Academic Career

Select the student's academic careers that you want to include in the block. The system prompts you with values from the

STDNT_CAREER table. This field is required whenever you select an ID.

Academic Program

Select the student's academic programs that you want to include in the block.

Add Merge Process

Click to access the Block Enrollment component, where you can process block enrollment requests.

See [Understanding the Block Enrollment Feature](#)

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool to identify IDs for a specific transaction, you must use it.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Selection Tool

Select *External File* or *PS Query*.

Query Name

The following queries are delivered as samples:

- SSR_STD_ENR_BLK_CAR_PROG (prompts on Institution, Academic Career, and Academic Program)
- SSR_STD_ENR_BLK_CAR_PROG_TRM (prompts on Institution, Academic Career, Academic Program, and Term)

When you create queries for use with Student Enrollment Blocks, you must use the bind record SSR_ENR_BLK_BND.

Fill Student Block

Populates the student block grid with the results of the Population Selection query (EMPLID, Academic Career, and Academic Program (if this field is exposed). Rows can be deleted or added as needed.

Predefining Class Enrollment Blocks

Access the Block Enrollment Classes page (Records and Enrollment > Enroll Students > Block Enrollment > Create Class Block > Block Enrollment Classes).

Image: Block Enrollment Classes page

This example illustrates the fields and controls on the Block Enrollment Classes page. You can find definitions for the fields and controls later on this page.

Academic Institution

The academic institution to which the class enrollment block belongs. Select an academic institution upon entering the page.

Class Enrollment Block

Enter a description of the class enrollment block code.

Class Block Defaults

Click to access the Class Block Defaults page, where you can set default values for security access overrides of enrollment functions. The overrides that you set on this page are used for each new class enrollment block detail that you enter.

Term

Select the term for which you want to enroll students in a specific class. Later on this page you specify the specific class in the Class Nbr field. You can add classes from multiple terms to the enrollment course block. Define terms on the Term Table page.

Add Merge Process

Click to access the Block Enrollment component, where you can process block enrollment requests.

Overrides

This group box contains multiple check boxes that identify what aspects of enrollment validation you want to override for this particular class enrollment block. Only overrides that you are authorized to access are available.

Related Links

[Setting Class Enrollment Block Defaults](#)

Processing Enrollment Transactions Through the Quick Enrollment Component

Setting Class Enrollment Block Defaults

Access the Class Block Defaults page (click the Class Block Defaults link on the Block Enrollment Classes page).

Action	Select a value for this field to set the default enrollment action for the class enrollment block. The system by default sets the enrollment action to <i>Enroll</i> , but you can change this default value.
Reason	Select the reason for the enrollment action, such as whether the students are adding or dropping classes in this class enrollment block.

Overrides

This group box contains multiple check boxes that identify what aspects of enrollment validation you want to override for this particular class enrollment block. Only overrides that you are authorized to access are available.

Access ID	The system displays the access ID, which describes the amount of enrollment access you have.
OK	Click to return to the Block Enrollment Classes page.

Related Links

"Setting Up Enrollment Access IDs" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Merging, Retrieving, and Posting Data for Block Enrollment Requests

Access the Block Enroll Merge page (Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enroll Merge).

With block enrollment, you can use any combination of custom student blocks and class blocks with predefined blocks. For example, you might have a predefined course block for first year law students that you want to merge with some late admits to the law school. Instead of predefining a student block for the new students, you might choose to merge the predefined course block for first year law students with a custom student block.

General Fields

Enrollment Request ID	The system displays the identification number for the block enrollment request. As soon as you merge the student enrollment block with the class enrollment block, the system generates an enrollment request ID that is unique to the block enrollment request. The same number is assigned to each student and class combination in the block enrollment request.
------------------------------	---

Request Status

The status of the block enrollment request:

Errors: The enrollment engine was unable to post the submitted enrollment request due to errors.

Pending: The request is pending submission for enrollment processing.

Success: The enrollment engine successfully posted the request.

Merging Student and Class Enrollment Blocks**Academic Institution**

Select the academic institution for which you want to process this block enrollment request.

Student Block

Select a predefined student enrollment block, or leave this field blank and click the Detail / Create link beneath the field to define a custom student enrollment block.

Important! If you create a custom student enrollment block, the system does not store the block for future retrieval.

Detail / Create

Click this link below the Student Block field either to view the detail for the student enrollment block that you selected, or to define a custom student enrollment block.

To view the detail for a predefined student enrollment block, select a value for the Student Block field and then click this link. The system launches a new application window to display the Student Enrollment Block page. Edit the student block as necessary.

To define a custom student enrollment block, leave the Student Block field blank and click this button. The system displays the Create Custom Student Block page, where you can define the students that you want to include in the student enrollment block.

Class Block

Select a predefined class enrollment block, or leave this field blank and click the Detail / Create link below the field to define a custom class enrollment block.

Important! If you create a custom class enrollment block, the system does not store the block for future retrieval.

Detail / Create

Click this link below the Class Block field either to view the detail for the class enrollment block that you selected, or to define a custom class enrollment block.

To view the detail for a predefined class enrollment block, select a value for the Class Block field, then click this link. The system launches a new application window to display the Class Enrollment Block page. Edit the class block as necessary.

To define a custom class enrollment block, leave the Class Block field blank and click this button. The system displays the Create Customized Class Block page, where you can define the classes that you want to include in the class enrollment block.

Merge

Click to run the SQR process that merges the student block with the class block. Your process request is scheduled in Process Scheduler. You can view the status of your merge using the process monitor. After the process completes the merge, the merge process updates the enrollment status of the block enrollment request to *pending* and the fields in the Merge Blocks group box become available for entry. You are now ready to retrieve and review the results of the merge process (optional) and post your block enrollment request, all of which can be done using the Block Enrollment component.

Note: The merge process combines student blocks with course blocks for all students in the student block, regardless whether a student activated in the term to which the class belongs. When you post the block enrollment request, if the enrollment engine encounters a student not activated in the term to which the class belongs, it cancels processing of that student's enrollment request and logs an error message. You can retrieve and view the error message through the Block Enrollment component.

Retrieving Data for Merged Blocks or Posted Block Enrollment Requests

Use the fields in the Filtering Criteria group box to retrieve the results of the merging process or the posting process. To narrow your search, enter specific filtering criteria.

Academic Career

Select the academic career for which you want to retrieve detail for this block enrollment request. If you want to search for detail in all academic careers, leave this field blank.

Term

Select the term for which you want to retrieve detail for this block enrollment request. If you want to search for detail in all terms, leave this field blank.

Note: If your filtering criteria include a term, you must enter an academic career value prior to selecting a term.

Class Nbr (class number)

If you want to retrieve detail for a specific class within this block enrollment request, select the class. Otherwise, leave this field blank to retrieve all classes within this block enrollment request.

Note: If your filtering criteria include a class number, you must enter the valid academic career and term prior to entering or searching for the class number.

Click the Enter Search Criteria button to access the Basic Class Search page, where you can search the schedule of classes for the class that you want to retrieve.

Detail Status

Select from the following choices the status of the block enrollment request for which you want to retrieve detail lines.

None: The system retrieves all detail lines within this block enrollment request.

Errors: The system retrieves all detail lines within this block enrollment request that the system was unable to post due to errors.

Pending: The system retrieves all detail lines within this block enrollment request that are pending submission for enrollment processing.

Success: The system retrieves all detail lines within this block enrollment request that the enrollment engine has successfully posted.

ID

If you want to retrieve detail lines within this block enrollment request for a specific student, enter the student's ID.

Retrieve

Click to retrieve the results of the merging process or the posting process that match your filtering criteria. The system displays the Block Enroll Detail page, where you can view the results of your selection. If you want to view all detail lines within this block enrollment request, click this button without entering any filtering criteria. To narrow your search, enter values for any of the filtering criteria on the Block Merge Enroll page. For example, if you want to view only the errors found during the posting process, select *Errors* in the Detail Status field, then click this button.

Note: While you can view several thousand rows of merged data through the Block Enrollment component, it is possible to merge more data than the component can display. If you have merged more than several thousand rows of data, you should specify some filtering criteria before clicking the Retrieve button.

Posting Block Enrollment Requests

Submit

Click to process the block enrollment request for all detail lines within this block enrollment request. The enrollment engine posts all successful class enrollment requests to the appropriate student's enrollment record. Whenever you post a block enrollment request a subsequent time, the enrollment engine processes all requests within a block enrollment request that are not yet posted. The enrollment engine does *not* process

detail lines within the block enrollment request that have already posted successfully.

If you want to post the block enrollment request later, you can set up Process Scheduler to run the posting process automatically, or you can use the Mass Enrollment page to post the block enrollment request. To successfully complete a block enrollment request, however, you first must merge the student enrollment block with the class enrollment block on the Block Enroll Merge page.

If any entry in the block enrollment request fails to post to the student's enrollment record, the entire block enrollment request has an error status because all requests within the block are tied to the same enrollment request ID. This, however, does *not* mean that everything was in error. Some detail lines within the block enrollment request might be successful, while some others have errors.

To correct errors, adjust each affected student's detail line of the block enrollment request or term record as necessary, then post the block enrollment request again.

Note: The posting process can handle as much data as you want to send to it. However, if the posting process takes too long to complete, you might get a remote call timeout error that prevents the process from completing successfully. The remote call timeout error depends on your timeout settings and the size of the batch you are posting. A system administrator can increase the timeout setting on the Remote Call tab of Configuration Manager. Alternatively, if the block enrollment request is too large, you can note the enrollment request ID and use the Mass Enrollment page to post the block enrollment request. The Mass Enrollment page uses Process Scheduler and is therefore not subject to remote call timeout errors.

OK	Enter the appropriate class data that you want to include in the custom class enrollment block, adding a new row for each class. Then click this button to return you to the Block Enroll Merge page.

Viewing Block Enrollment Request Details

Access the Block Enroll Detail page (Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enroll Detail).

If the enrollment engine posting process encounters errors and cannot post the student's enrollment request, you can drill down to the enrollment request detail for any student and class combination found on the list to view the errors. Change the individual's enrollment request or career term record, then post the block enrollment request again.

Enrollment Request ID	The system displays the identification number for the block enrollment request. As soon as you merge the student enrollment block with the class enrollment block, the system generates an enrollment request ID that is unique to the block enrollment request. The same number is assigned to each student and class combination in the block enrollment request. View an individual student's request within a block enrollment request through this component, or use this enrollment request ID to view an individual student request through the Enrollment Request and Quick Enroll components.
Seq # (sequence number)	Indicates the sequence in which the student and class combination resides in the block enrollment request. It is for internal processing purposes only.
ID	The identification number of the student to which this detail line of the block enrollment request relates.
Name	The name of the student to which this detail line of the block enrollment request relates.
Term	The term in which this detail line of the block enrollment request relates. A block enrollment request can have student and class combinations in multiple terms for the same student.
Career	The academic career to which this detail line of the block enrollment request relates.

Class Nbr (class number)	The specific class in which this detail line of the block enrollment request relates. Each class requested for a student appears on its own detail line.
Action	The enrollment action for the student's requested class.
Status	The enrollment status for the student's requested class.
Detail	<p>After you merge a student enrollment block with a course enrollment block, click this button for a specific student and class combination to view and edit the details of that detail line of the block enrollment request. The system populates the Block Enrl Detail1 and Block Enrl Detail2 pages, then displays the Block Enrl Detail1 page for you to view the information.</p> <p>After you post the block enrollment request, you can click this button for a specific student and class combination to review the detail results of the enrollment posting process. If the detail line of the block enrollment request successfully posted to the student's record, you can view the details on the Block Enrl Detail1 and Block Enrl Detail2 pages (they are unavailable for edit). If the enrollment posting process encounters errors for any of the detail lines of the block enrollment request, you can view the message text about the errors, change the affected student's enrollment request or career term record as necessary, and then go to the Block Enroll Merge page and post the block enrollment request again.</p>

Note: If you encounter errors for multiple students in the block enrollment request and you want to override these errors, you must save the overrides for each student and class combination before proceeding to the next error.

Maintaining Detail for a Student's Block Enrollment Request

Access the Block Enrl Detail1 page (Records and Enrollment > Enroll Students > Block Enrollment > Block Enroll Merge > Block Enrl Detail1).

Image: (AUS) Block Enrl Detail1 page

This example illustrates the fields and controls on the (AUS) Block Enrl Detail1 page. You can find definitions for the fields and controls later on this page.

Non-associated related class component TUT; Enrollment did not take place. (14640,159) The related class section was not defined as part of the class association for the class components. The graded section was being defined as a single stand alone class component, but another related class component (perhaps defined as association 9999 and not associated to the graded section) is being used for this request. Remove the related course from the request or verify that the related section was not inadvertently left out when courses were established.							

Important! After you merge the student and class enrollment blocks but before you post the block enrollment request, you can use this page to edit each individual student's enrollment request. However, you *must* save your changes for *each* student and class combination of the block enrollment request prior to posting to have the changes included in the posting process.

(AUS) Australia Data

The system enters values in the Student Career Nbr, Liability Status, and Cohort Year fields from the student's primary academic program and term of enrollment.

Processing Enrollment Transactions Through the Enrollment Request Component

The Enrollment Request component has the exact same functionality as the Quick Enroll component. Transactions that you process through the Enrollment Request component can also be accessed through the Quick Enroll component and vice versa. You'll use the Enrollment Request component most often to enter enrollment information on a student-by-student basis either through an Interactive Voice Response

(IVR) interface or through the pages themselves. You generate enrollment requests, which you can post in the page or in a background process. The enrollment engine posting process validates the requests against all of the rules that you have created, such as rules for requisites and requirements. Depending on how you set up your enrollment security, you might be permitted to override just certain aspects of your enrollment rules, such as class limits or prerequisites.

Enrollment security plays an important role in defining who has access to add class enrollments to a student's enrollment record. Use the Update/Display mode to post unsuccessful enrollment requests or to view the enrollment request data.

This section discusses how to:

- Add or update student enrollment request transactions.
- Add transcript notes to enrollment requests.

Related Links

"Understanding Student Records Security" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Pages Used to Process Enrollment Transactions Through the Enrollment Request Component

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Enrollment Request	ENRL_REQUEST	Records and Enrollment > Enroll Students > Enrollment Request > Enrollment Request	Add or update enrollment request transactions for students.
Transcript Note	ENRL_REQ_NOTE	Click the Transcript Note link on the Enrollment Request page or the Create Transcript Note link on the Quick Enrollment page.	Add and update transcript notes on an enrollment request.
Access to Enrollment Functions	ENRL_REQ_ACCESS	Click the Operator Enrollment Access link on the Enrollment Request page or the View Enrollment Access link on the Quick Enrollment page.	View your security access to enrollment functions.

Adding or Updating Student Enrollment Request Transactions

Access the Enrollment Request page (Records and Enrollment > Enroll Students > Enrollment Request > Enrollment Request).

Image: Enrollment Request page (1 of 2)

This example illustrates the fields and controls on the Enrollment Request page (1 of 2). You can find definitions for the fields and controls later on this page.

Image: Enrollment Request page (2 of 2)

This example illustrates the fields and controls on the Enrollment Request page (2 of 2). You can find definitions for the fields and controls later on this page.

User ID

The system displays the identification code of the user who created the enrollment request, providing you with a visible audit trail of the changes made to enrollment requests.

Sequence Nbr (sequence number)	The system sets the sequence number to <i>1</i> and increases it by one for each class section added to the enrollment request. The number specifies the order in which the enrollment engine processes rows within the request.
End Date	<p>If an OEE enrollment transaction successfully posts to a student's enrollment record, the system displays the calculated end date of the OEE class. The enrollment process calculates the end date and all the other dynamic calendar dates for the student based on the OEE dynamic date rule assigned to the class. If no OEE dynamic date rule has been defined for the class, the enrollment process uses the rule established for the course offering. If no rule exists for the course offering, the enrollment process fails the transaction and the system returns an error message.</p> <p>You can view the other dynamic academic calendar dates that the enrollment process calculates for the student's OEE enrollment by clicking the academic calendar link on the Study List or by accessing the Student OEE Enroll Data page.</p>
Error Messages	
Message Sequence	The posting process displays a sequence number for each message that it writes to the message log for the corresponding request.
Severity	The posting process displays the severity of each message that it writes to the message log for the corresponding request. For example, if the posting process is unable to post a request due to errors, it displays a severity value of <i>Error</i> .
Last Update Date Time	The posting process displays the last date and time that it updated the message log for the corresponding request.
Message Text (unlabeled)	The posting process displays the message text and a detailed explanation of each message that it writes to the message log for the corresponding request. You can view and update messages in the Message Catalog within the appropriate message set.

Important! The remaining page elements are described in context of the Quick Enrollment page.

(AUS) Entering Australia Data

When enrolling students in an Australian institution, the Australia Data group box appears.

Image: Enrollment Request page, Australia Data group box

This example illustrates the Enrollment Request page, Australia Data group box.

Australian Data	
Student Career Nbr	<input type="text" value="0"/>
Liability Status	<input type="text" value="110"/> HECS-HELP Deferred pre2005
Cohort Year	<input type="text" value="2005"/> Cohort 2005

The system enters the field values on this page from the Student Term Activation page.

(NZL) Entering New Zealand Data

When enrolling students in a New Zealand institution, the New Zealand Data group box appears.

Image: Enrollment Request page, New Zealand Data box

This example illustrates the Enrollment Request page, New Zealand Data box.

New Zealand Data	
Funding Source	<input type="text" value="FullFeeDom"/> Full Fee Domestic Student
Classification	<input type="text" value="03"/> Arts; Humanities; Social Sciences
Funding Category	<input type="text" value="A2"/> Arts & Soc Sci - Degree
EFTS Factor	<input type="text"/>

The system enters the field values on this page from the Course Catalog component.

Adding Transcript Notes to Enrollment Requests

Access the Transcript Note page (click the Transcript Note link on the Enrollment Request page or the Create Transcript Note link on the Quick Enrollment page).

Transcript Note ID	Select a standard transcript note for the class, if applicable.
Transcript Note	Enter additional free-form text about the specified transcript note. The system prints the text you enter onto the student's transcript.
Transcript Note Nbr (transcript note number)	Enter the sequence number of the transcript note. The sequence number indicates the printing order of the transcript notes that you specify.

Processing Enrollment Transactions Through Self Service

If your institution has licensed Campus Self Service, your students can perform enrollment transactions directly over the web.

"Understanding Self-Service Enrollment" (PeopleSoft Campus Solutions 9.2: Self Service)

Posting Mass Enrollment Requests

This section discusses how to post enrollment requests in mass.

Page Used to Post Mass Enrollment Requests

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Mass Enrollment	RUNCTL_SRPCEMSS	Records and Enrollment > Enroll Students > Mass Enrollment > Mass Enrollment	Post a group of enrollment requests. Although enrollment processing is designed for you to generate and post requests online, Campus Solutions also provides this batch posting process as a means to speed data entry for registration officials who want to post large groups of enrollments at the same time rather than waiting for the enrollment engine to post each request at the time it is made.

Posting Enrollment Requests in Mass

Access the Mass Enrollment page (Records and Enrollment > Enroll Students > Mass Enrollment > Mass Enrollment).

You can also use the Mass Enrollment page to post block enrollment requests, especially larger requests that might be subject to a remote call timeout error if you were to click the Post button on the Block Enroll Merge page. Because the mass enrollment process uses Process Scheduler to post enrollment requests, you avoid possible remote call timeout errors.

Run the Mass Enrollment COBOL/SQL process (SRPCEMSS) as needed. All the rules checking (requisites, permissions, repeat checking, and so on) still occur.

Note: If you are using Program Enrollment or Activity Management, you must run the PSJob process (SREMSSJB).

See the Student Enrollment Event document in My Oracle Support (ID 1400723.1).

See [Managing APT Enrollment](#)

See [Understanding Activity Management](#)

Note: You should use the Mass Enrollment page and its corresponding process for converting historical enrollment records.

**From Enrollment Request ID and
To Enrollment Request ID**

Enter the start enrollment request ID in the From Enrollment Request ID field, and enter the last enrollment request ID to post in the To Enrollment Request ID field. Enrollment request ID values are generated by the system when you enter student enrollment requests. If you are entering only one enrollment request ID, such as for posting a single block enrollment request, enter the value in the From Enrollment Request ID field.

Working with Enrollment Request Messages

Acting on Enrollment Request Messages

This section lists the most frequent messages that the enrollment engine displays when you process an enrollment request, as well as the actions that you should take to resolve these messages. You can access the Message Catalog by navigating to PeopleTools > Utilities > Use > Message Catalog. In the English language, select message set number 14640.

<i>Number</i>	<i>Severity</i>	<i>Message Text</i>	<i>Explanation</i>	<i>Action</i>
3	Error	Not Enrolled in Class, Drop Not Processed.	The requested drop transaction was not processed. No enrollment records for the specified class for this term were found. Verify the class number and term, and resubmit the request.	Check the student's class schedule.
4	Error	Already In Drop Status.	The requested drop transaction was not processed. The class is already in drop status for the term specified. Verify the term and class number, and resubmit the request.	Check student's enrollment status in the class.
5	Error	Already Enrolled in Class, Add Not Processed.	The enrollment request was not processed; an enrollment record already exists for the class and term specified. Verify class number and term, and resubmit the request.	Check student's enrollment status in the class.
6	Error	Class %1 Not Enrolled, Class And Wait List Are Full.	The requested enrollment add was not processed. The enrollment limit for the class has been reached, and there is no room on the wait-list.	The class enrollment and wait-list capacities have been reached. Verify these limits on the Schedule of Classes - Enrollment Control page.

Number	Severity	Message Text	Explanation	Action
7	Error	Not Enrolled, Class %1 Full.	The requested enrollment add was not processed. The enrollment limit for the specified class has been reached. To attempt to wait-list, resubmit the request with the Wait List option selected.	The class enrollment capacity has been reached. Verify the enrollment limit on the Schedule of Classes - Enrollment Control page. The system also displays this message if the available space in the class is subject to reserve capacity requirements.
11	Error	Class Table In Use, Not Available For Drop Request.	The class table is being used by another system resource and is not available for the specified class. The drop request was not processed. Resubmit the request.	Another user is maintaining the class being dropped.
12	Error	Enrollment Record In Use, Not Available For Drop Request.	The Enrollment record is in use by another system resource and is not available to process the drop request. Try again later.	Another user or process is accessing the student's enrollment record.
13	Error	Unable to Drop class, will drop below required minimum units for enrollment.	The requested drop transaction was not processed.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
14	Error	Unable to Drop class, Corequisites exist.	The requested drop transaction was not processed. Enrollment exists in a corequisite class. Classes must be dropped together.	The class being dropped is a corequisite to another class in the student's class schedule. Check the requisites for the other classes in the student's class schedule. Override requisites if necessary.
17	Error	Time Scheduling Conflict for class %1 and %2, not enrolled.	A scheduling conflict exists with a currently enrolled class. Select another class, or override the time conflict.	Refer to Explanation column.

Number	Severity	Message Text	Explanation	Action
18	Error	Requisites not met for Class, not enrolled.	Requirements have not been met to enroll in the specified class. The enrollment transaction was not processed.	Refer to Explanation column.
19	Error	Corequisites Not Met For Class, Not Enrolled.	Corequirements necessary to enroll in the class have not be met. The enrollment request was unsuccessful.	The class requires concurrent enrollment in another class. Check the requisites for this class. Override requisites if necessary.
20	Error	Class taken previously, Repeat not allowed.	None.	Review the repeat-for-credit rules for the class on the Course Catalog - Basic Data page.
29	Error	Class %1 Not Waitlisted, Waitlist is Full.	The Drop-To-Waitlist transaction was not processed.	Check the wait-list capacity for the class.
30	Error	Maximum term Unit Load exceeded.	Add transaction not processed. The maximum term unit load would be exceeded.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
31	Error	Record Not Changed, Not on Waitlist	The Change-Waitlist-Position transaction was not processed.	The student is not wait-listed for this class.
32	Error	Enrollment is not allowed for this class: It is outside the Career of Study.	The Add transaction was not processed. Enrollment in this class is not allowed for this academic career.	The student's career has a career pointer rule, or the student's program references a career pointer exception rule, which prevents enrollment in this academic career.
36	Error	Error With Grade and Grade Basis For Penalty Drop Reason.	There is a setup error for drops with penalty. The grade is not compatible with the grade basis. Correct the setup. Drop not processed.	Check the drop-with-penalty setup on the Session Calendar 2 page or the Academic Program - Dynamic Date page for the student's primary academic program.

Number	Severity	Message Text	Explanation	Action
38	Error	%1 to Enroll in Class, Add Not Processed.	Consent is needed to enroll in the class. The add transaction was not processed.	The student must have a permission number to enroll in this class. A permission number can be generated, or a student-specific permission can be granted on the Class Permission page.
39	Message	Permission Number Entered Is Not Valid.	The permission number used is invalid. The transaction was processed without the permission number.	Check the Class Permissions page.
45	Message	Enrollment Drop Date is Past Drop With Penalty Date.	The enrollment drop date is past the pre-established drop with penalty date. Drop was processed as within drop with penalty date.	The class is being dropped after the drop-with-penalty or drop-with-greater-penalty deadline. The enrollment engine still processes the drop and uses the rule from last penalty date defined on the Session Calendar 2 page.
48	Error	Auto Enroll Not Processed, Section Not Associated with the Enrollment Section.	The class specified for the auto enrollment function is not associated with the enrollment section of the add transaction. Auto enrollment was not performed.	Check the setup on the Schedule of Classes component. All enrollment sections within the same class association must use the same component.
50	Error	Class Number %1 Not in Active Status. Cannot Enroll.	The add transaction was not processed. The class to be added is not in <i>ACTIVE</i> status for enrollment.	Verify the class status on the Schedule of Classes - Enrollment Control page.
53	Error	Related Class Enrollment Not Completed, Section Not Associated with Enrollment Section.	The related class enrollment function was not processed. The <i>related to</i> class is not associated with the enrollment section of the add transaction.	Check the setup on the Schedule of Classes component. All enrollment sections within the same class association must use the same component.

Number	Severity	Message Text	Explanation	Action
59	Message	Invalid Access to Override Class Limit.	User does not have access to override class limits. The transaction was processed without the override.	A user's enrollment access ID determines override access. The enrollment engine typically gives this message when an enrollment access group controls enrollment security. The enrollment access ID attached to the user's enrollment access group does not permit this override, or the user does not have time period access to the enrollment function. Check the setup on the Enrollment Group Access page.
60	Message	Invalid Access to Override Grade Basis.	User does not have access to override grade basis. The transaction was processed without the override.	See 59.
61	Message	Invalid Access to Override Class Units.	User does not have access to override class units. The transaction was processed without the override.	See 59.
62	Message	Invalid Access to Override Unit Load.	User does not have access to override unit load. The transaction was processed without the override.	See 59.
63	Message	Invalid Access to Override Class Links.	User does not have access to override class links. The transaction was processed without the override.	See 59.
64	Message	Invalid Access to Override Class Permission.	User does not have access to override class permission. The transaction was processed without the override.	See 59.
65	Message	Invalid Access to Override Requisites.	User does not have access to override requisites. The transaction was processed without the override.	See 59.

Number	Severity	Message Text	Explanation	Action
66	Message	Invalid Access to Override Time Conflict.	User does not have access override time conflicts. The transaction was processed without the override.	See 59.
67	Message	Invalid Access to Override Career.	User does not have access to override career. The transaction was processed without the override.	See 59.
68	Message	Invalid Access to Wait List Function.	User does not have access to the wait-list functionality. The transaction was processed without the override.	See 59.
69	Error	Invalid Access to Enrollment Transaction.	User does not have access to enrollment transaction. The transaction was not processed.	The enrollment access ID does not permit access to this function. Check the time period security for the access ID on the Enrollment Security Table page and the session time period deadline on the Session Time Period Table page.
70	Error	Invalid Access to Enrollment With Permission Transaction.	User does not have access to the Enrollment With Permission transaction. The transaction was not processed.	See 69.
71	Error	Invalid Access to Drop Transaction.	User does not have access to the drop transaction. The transaction was not processed.	See 69.
73	Error	Invalid Access to Update Grade Basis.	User does not have access to update grade basis. The transaction was not processed.	See 69.
74	Error	Invalid Access to Update Units.	User does not have access to update units. The transaction was not processed.	See 69.

Number	Severity	Message Text	Explanation	Action
75	Error	Invalid Access the Change Wait List Transaction.	User does not have access to the change wait-list transaction. The transaction was not processed.	See 69.
76	Error	Invalid Access to the Add Grade Transaction.	User does not have access to the add grade transaction. The transaction was not processed.	See 69.
77	Error	Invalid Access to Change Grade.	User does not have access to the change grade transaction. The transaction was not processed.	See 69.
78	Error	Class Table in Use, Not Available for Add Request.	The Class Table is being used by another process and is unavailable for updating. Retry request.	Another user or process is maintaining the class number used for the enrollment transaction.
79	Error	No Valid Appointment Found And Open Enrollment Period Has Not Begun.	The open enrollment period has not begun and no valid enrollment appointment was found. The enrollment request was not processed.	Use the Student Enrollment Appointment page to verify if the student has a valid appointment.
80	Error	Wait List Period Has Ended.	The wait-list request was not processed.	The last date for wait-list defined on the Session Table page has passed.
83	Error	Invalid Drop Date; Drop Date is Prior To Add Date.	The drop date entered is prior to the add date of the class being dropped. Re-enter the transaction with the correct date.	Verify the add date for the class. This error condition can occur when attempting to process a retroactive drop.
84	Error	Unit Limit Exceeded For Appointment Period.	The class add transaction was not processed. Adding the class would exceed the unit limit allowed for the appointment period.	Check the student's appointment limits using the Student Enrollment Appointment page.
85	Message	Invalid Access to Override Enroll Action Date.	User does not have access to override enroll action date. The transaction was processed without the override.	See 60.

Number	Severity	Message Text	Explanation	Action
86	Error	Swap not processed, Hold on record.	There is a hold on this record preventing the swap transaction from being processed. The hold must be removed before the swap is processed.	Check the student's service indicators.
87	Error	Hold on record, Add not processed.	There is a hold on this record, preventing the add from being processed. You must remove the hold to process the add transaction.	Check the student's service indicators.
88	Error	A Required Related Class (component %1) must also be Selected.	There is an additional component required for enrollment that is missing.	The class requires enrollment in a related component. Related components can be selected using the Related 1 and Related 2 fields.
89	Message	Invalid Access To Override Service Indicator	The user does not have access to override the service indicator. The transaction was processed without the override.	See 60.
90	Message	Invalid Access to Override Appointment Times.	The user does not have access to override the appointment times. The transaction was processed without the override.	See 60.
91	Error	Maximum Session Unit Load Exceeded.	The maximum session unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the student's session limits using the Student Enrollment Appointment page.
92	Error	Maximum Term Course Load Exceeded.	The maximum term course load would be exceeded with the addition of this class. The add transaction was not processed.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.

Number	Severity	Message Text	Explanation	Action
93	Error	Maximum Session Course Load Exceeded.	The maximum session course load would be exceeded with the addition of this class. The add transaction was not processed.	Check the student's course limit on the Student Enrollment Appointment page.
94	Error	Unable To Process Drop, Session Calendar Record Missing.	There is no Academic Session Calendar Record defined for the session of the drop transaction. A session must be defined to process the drop.	A session calendar row must be present to drop a regularly scheduled class. Check the academic calendar setup for the session on the Academic Calendar component.
97	Error	Maximum Session No GPA Units Exceeded.	The maximum session No GPA unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the student's session unit limits on the Student Enrollment Appointment page.
98	Error	Maximum Session Audit Units Exceeded.	The maximum session audit unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the student's session unit limits on the Student Enrollment Appointment page.
99	Error	Maximum Session Wait Units Exceeded	The maximum session wait unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the student's session unit limits on the Student Enrollment Appointment page.
100	Error	Maximum Term No GPA Units Exceeded.	The maximum term No GPA unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
101	Error	Maximum Term Audit Units Exceeded.	The maximum term audit unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.

Number	Severity	Message Text	Explanation	Action
102	Error	Maximum Term Wait Units Exceeded.	The maximum term wait unit load would be exceeded with the addition of this class. The add transaction was not processed.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
116	Message	Invalid Access to Override Requirement Designation.	The user does not have access to override the requirement designation. The transaction was processed without the override.	See 60.
120	Error	Appointment Audit Unit Limit Exceeded, Class Not Added.	Add transaction not processed. Adding this class would exceed the appointment audit unit limit.	Check the student's unit limits on the Student Enrollment Appointment page.
121	Error	Appointment No GPA Unit Limit Exceeded, Class Not Added.	Add transaction not processed. Adding class would exceed the appointment No GPA unit limit.	Check the student's unit limits on the Student Enrollment Appointment page.
123	Error	Maximum Term Load Exceeded, Units Not Changed.	Units not changed. The maximum term unit limit would be exceeded.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
124	Error	Maximum Session Load Exceeded, Units Not Changed.	Units not changed. The maximum session unit load would be exceeded.	Check the student's session limits on the Student Enrollment Appointment page.
125	Error	Maximum Appointment Unit Load Exceeded, Units Not Changed.	Units not changed. The maximum appointment unit load would be exceeded.	Check the student's unit limits on the Student Enrollment Appointment page.
126	Error	Maximum No GPA Session Load Exceeded, Units Not Changed.	Units not changed. The maximum No GPA session unit load would be exceeded.	Check the student's session limits on the Student Enrollment Appointment page.

Number	Severity	Message Text	Explanation	Action
127	Error	Maximum Term No GPA Load Exceeded, Units Not Changed.	Units not changed. The maximum term No GPA load would be exceeded.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
128	Error	Maximum Session Audit Load Exceeded, Units Not Changed.	Units not changed. The maximum session audit unit load would be exceeded.	Check the student's session limits on the Student Enrollment Appointment page.
129	Error	Maximum Audit Term Units Exceeded, Units Not Changed.	Units not changed. The maximum audit term units would be exceeded.	Check the unit limits for the student's primary academic program on the Academic Program Table - Enrollment page.
130	Error	Maximum Appointment No GPA Load Exceeded, Units Not Changed.	Units not changed. The maximum appointment No GPA unit load would be exceeded.	Check the student's unit limits on the Student Enrollment Appointment page.
131	Error	Maximum Appointment Audit Load Exceeded, Units Not Changed.	Units not changed. The maximum appointment audit unit load would be exceeded.	Check the student's unit limits on the Student Enrollment Appointment page.
133	Message	Permission to enroll in this class is required.	The class falls outside of the career of study.	The career pointer rules for the student's career or a career pointer exception rule for the student's primary academic program requires that the student have permission to take this class. Assign a permission number on the Class Permission page.
137	Error	Withdrawn from Term - Changes are not allowed	The transaction was not processed.	The student has been withdrawn for this term. Verify the student's status in this term on the Term History component.
138	Error	Warning - Enrollment status is Withdrawn.	Although enrollment status is <i>Withdrawn</i> , changes would be applied.	The enrollment engine gives this message when a grade change is made for a student who has been withdrawn from the term.

Number	Severity	Message Text	Explanation	Action
139	Error	Enrollment status is Cancelled for Term - No Enrollment Activity Allowed	Transaction not processed.	The student enrollment has been cancelled for this term. Verify the student's status in this term on the Term History component.
141	Message	The Requirement Designation Options was set to 'YES' by the enrollment process.	None.	This message appears when a student is enrolled in a class with an optional requirement designation and the Yes option was selected. The enrollment engine displays the same message when the requirement designation is required and is therefore set to <i>yes</i> for all students enrolling in the class.
142	Message	Only those with Academic Plan %1 are allowed to take Requirement Designation %2.	The enrollment process set the designation option to <i>NO</i> .	The enrollment engine displays this message when a student is enrolled in a class with an optional requirement designation and the Yes option is selected, but the student failed to meet the requirements for the requirement designation. The same message would appear for a non-optional requirement designation where the student does not meet the requirements.
143	Message	Class %1 is Full, Resectioned to Class %2	The selected class for enrollment is full; the request was processed with the resectioned class.	The enrollment engine displays this message when the Resection option is used in class enrollment control. The system enrolls the student in the resectioned section if the original choice is closed.

Number	Severity	Message Text	Explanation	Action
144	Message	A Grade of %1 has been assigned for this Drop Request.	The drop transaction assigned a grade to the student, leaving the student in <i>drop enrolled</i> status.	The class has been dropped during the drop-with-penalty or drop-with-greater-penalty period defined on the Session Calendar 2 page or the dates calculated by the Dynamic Class Dates process. For dynamically dated classes, use the Dynamic Class Dates page to view or maintain the dates. For OEE classes, use the Student OEE Enroll Data page.
146	Error	Multiple Enrollment not allowed for course, add not processed.	Multiple enrollment for this course is not allowed. The transaction was not processed.	A student can enroll in a the same course only once per term, unless the course permits multiple enrollments in a term (this option is set on the Course Catalog - Catalog Data page). The system also displays this message when a swap between different sections of the same course would result in a penalty grade on the swap from class.
160	Error	Requested change will put units below minimum Term Load. Not processed.	None.	As a result of a drop or swap transaction, the student will drop below the minimum units required by his or her academic program.
165	Warning	Auto Enroll sections used, related classes not used.	When specifying both auto enroll sections and related class sections, only the auto enroll sections are used for enrollment. The related classes were ignored.	
195	Message	First Date to Enroll has not been reached - not enrolled	The first date for enrollment has not been reached for the session or from the dynamic class data. Enrollment not allowed.	Check the Session Table page's First Date to Enroll field, or, for dynamically dated classes, the Dynamic Class Dates page.

Number	Severity	Message Text	Explanation	Action
196	Message	Last Date to Enroll has expired.	The last date for enrollment has expired for the session or from the dynamic class data. Enrollment not allowed.	Check the Session Table page's Last Date to Enroll field, or, for dynamically dated classes, the Dynamic Class Dates page.
197	Message	Student not eligible for enrollment in an OEE course	Student is attempting to enroll in an OEE course but neither the student's career nor student's primary academic program allows OEE enrollment.	The student's primary academic program does not permit enrollment into OEE classes. Verify that the Allow OEE Enrollment option is set correctly on the Academic Program Table component.
203	Message	OEE Date Calc Error: %1, %2.	The OEE date calculation routine has encountered a setup or data problem. Review the type of error in the message text. Enrollment was not processed.	The enrollment engine did not find an OEE dynamic date rule on the dynamic class dates table or at the course offering level. Review the course offering and dynamic class date setup for the class.
205	Message	Missing Drop Retain Reason Code	When dropping a course, the enrollment drop retain reason code was not defined from either the Academic Calendar Session, or, if dynamic dates or OEE enrollment are used, the drop retain reason code was not defined from the Academic Program table. The drop was not processed.	An enrollment action reason is required for drop/retain processing. Check the Session Calendar 2 page for regularly scheduled courses. For dynamically dated classes, including OEE classes, the drop/retain reason is entered on the Academic Program Table - Dynamic Dates page.
206	Error	Invalid access to the Requirement Designation Change Transaction	User does not have access to the change Requirement Designation transaction. The transaction was not processed.	See 69.

Number	Severity	Message Text	Explanation	Action
209	Error	Optional component class %1 is full. Resubmit without this component or waitlist all components.	The requested enrollment add was not processed. The enrollment limit for the specified class has been reached. To attempt to wait-list, resubmit the request with the wait-list option specified. To enroll in the class without the optional component, delete the optional component class number and resubmit.	To attempt to wait-list all components of the class, select the Wait List Okay check box and resubmit the request. To attempt to enroll in the class without the optional component, remove the optional component class number from the related class field and resubmit the request.
210	Error	Optional Related Class %1 add not processed. Class and Waitlist are full.	Optional related component is closed, and there is no room on the wait-list. To enroll in the class without the optional component, delete the optional component class number and resubmit.	To attempt to enroll in the class without the optional component, remove the optional component class number from the related class field and resubmit the request.
211	Error	Swap not allowed because the 'swap from' class would receive a penalty grade	This swap would result in a penalty grade for the swap from class, and the swap to class is a different section of the same course.	This message is given if the class does not allow multiple enrollments in a term.
212	Error	Class%1 already wait listed. Enrollment not processed.	Already wait-listed for this related component	The student needs to drop the wait-listed class before he or she can wait-list in another section with the same related non-enrollment section.
213	Error	Available Seats are reserved. Reserved Seat Requirements are not met. Student not enrolled	Available seats are subject to reserve capacity requirements.	Although the class may appear as open in Class Search, the remaining open seats are subject to one or more Reserve Capacity requirements.
214	Error	Permission is required to enroll in this class	This class is scheduled in a session that now requires permission to enroll in classes.	The Enrolment Time period for this session has passed, and students must now obtain instructor or department consent to enroll in classes.

Using Enrollment-Related Processes

Creating Historical Enrollment Records

This section discusses how to record historical enrollment records.

Pages Used to Create Historical Enrollment Records

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Historical Course Enrollment	HIST_CRSE_ENROLLMT	Records and Enrollment > Enrollment Summaries > Historical Course Enrollment > Historical Course Enrollment	Record enrollment data when you do not have access to your Campus Solutions system, to your historical course catalog, and to a schedule of classes. When you use this page to convert historical enrollment records to Campus Solutions you will most likely run a Structured Query Report (SQR) or other such program to populate the application tables that supports this page. These application tables are HIST_TERM and HIST_TERM_ENRL. You can then access this page to make corrections as necessary.
Historical Course Enrollment - Transcript Text	HIST_CRSE_TRNS_TXT	Click the Transcript Text button on the Historical Course Enrollment page.	Enter free-form transcript text. This information, along with the historical enrollment information, appears on the student's transcript.

Recording Historical Enrollment Records

Access the Historical Course Enrollment page (Records and Enrollment > Enrollment Summaries > Historical Course Enrollment > Historical Course Enrollment).

Academic Institution

Select the academic institution for which you want to record historical enrollment data for the student.

Term

Select the term for which you want to record historical enrollment data for the student. The term that you select must be less than or equal to the last term for historical enrollment data for the specified academic career.

Enroll Seq (enrollment sequence)	Indicates the sequence in which a student enrolled in each course within a term. The system by default displays a chronological enrollment sequence number starting with 1, but you can override this default value for any row.
Subject Area	Select the subject area of the course for which you want to record historical enrollment data for the student.
Catalog Number	Enter the catalog number of the course for which you want to record historical enrollment data for the student. Because this is a standalone page, it has no connection to your current course catalog.
Units Taken	Enter the number of units that the student took for the course.
Units Passed	Enter the number of units that the student passed for the course.
Official Grade	Enter the official grade that the student received for the course.
Grade Points	Enter the grade points that the student received for the course.
Description	Enter the title of the course.
Transcript Text	Click to access the Historical Course Enrollment - Transcript Text page, where you can enter free-form transcript text. This information, along with the historical enrollment information, appears on the student's transcript.

Note: Courses entered on the Historical Course Enrollment page *do not* impact Academic Advisement's analysis processes or academic statistics. To include historical courses in advisement processes and academic statistics, you must treat them as transfer courses. Create a fictional academic institution, use the transfer credit process to create pseudo incoming courses, and then map those courses to your academic institution's course equivalencies.

"Understanding Data Conversion" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Managing Wait Lists

This section provides an overview of wait list management and discusses how to:

- View a student's wait list position.
- Move students from wait lists to enrollment.
- Purge students from wait lists.

Understanding Wait List Management

The wait list management functionality in Student Records enables you to set processing parameters that define the groups of students to move from wait lists to enrollment into classes within a specific enrollment period. This section discusses:

- Waitlist position numbers.
- Automatic enroll from waitlist.

Waitlist Position Numbers

When a student enrolls or is waitlisted into a class the Enrollment process assigns the next available student position number to the student. For instance, the first student to enroll in a class would get a student position number of 10, the second 20, the third 30, and so on. Student position numbers identify the order in which students enroll into a class. In addition, student position numbers determine the position students hold on the waitlist: the student with the wait list position number of 1 is the student who has the lowest student position number and an enrollment status of waiting.

For example, suppose Mia is the 31st student to try to enroll into a class with an enrollment capacity of 30. She is put on the wait list (has an enrollment status of waiting) and the Enrollment process gives her a student position number of 310. Her waitlist position number is 1, because she is the only student in the class with an enrollment status of waiting. Then a second student, Mitch, puts himself on the waitlist. The system gives him a student position number of 320. Because Mia has a lower student position number than Mitch, the system gives Mitch a waitlist position number of 2. If there is one seat available when you run the Waitlist process, Mia, the student with the lowest waitlist position number, is enrolled (the Enrollment process changes her enrollment status from waiting to enrolled). Mitch then has the lowest position number with an enrollment status of waiting. Therefore, his waitlist position number changes to 1.

In multiple component classes, the Enrollment process assigns students the next available student position number for each component. For this reason, a single student often has different waitlist position numbers for each component. For example, a student could have a student position number of 130 and a wait list position number of 1 for one component, and a student position number of 60 and a waitlist position number of 3 for the related component (depending on how many students were already enrolled and were on the waitlist for each component at the time the student received a student position number).

When the process runs on a class section, it creates an enrollment request. The enrollment request includes all related components of the class. For the enrollment engine to process an enrollment request successfully, all related components must have a seat available for that request. If all related components have a seat available for that request, the enrollment engine enrolls the student into all of the related components. If at least one related component is full, the enrollment engine would produce an error for the request, and the student would not be enrolled into any of the related components.

Note: The Waitlist process runs on non enrollment components as well as on enrollment components. The process creates enrollment requests for students based on their positions on the waitlist in the section on which the process is running (which is not necessarily the enrollment component). Thus, the order in which the process runs on class sections is important, because the process might not enroll students in the order that they would expect, if they expect to be enrolled based on their waitlist position number in a section that was run after a related section.

You can run the Wait List process on a term, session, subject area, course, or class. The process runs on classes in sequential order based on the criteria on which you run the process, and on the key structure of

the CLASS_TBL (course ID, course offering number, term, session code, and class section). For example, when you run the process on a term, the process first runs in order of course ID: 000001, 000002, and so on. If two courses have course ID 000001, it runs by course offering number: course 000001, course offering number 1, course 000001, course offering number 2, and so on. In the same way, the process would then use session code (unless you select session as one of your criteria on the Wait List Process page), and then class number. So within a course, course offering number, and session, the process would run on class section 1, class section 2, and so on. Because the Wait List process runs by class section, it would run on a multiple component class that has two lectures (sections 1 and 2) and two labs (sections 1A and 1B), in the following order: section 1, 1A, 1B, 2.

As you can see, the order of your classes and sections in the schedule of classes determine the order in which students are moved from the waitlist into the class for multiple component classes. Suppose you had two multiple component classes that shared a component, such as two biology lectures that share a lab, which have the following class sections: 1 (lecture), 1A (lab), and 2 (lecture). When you run the waitlist process on this class, the process creates enrollment requests for waitlisted students for section 1 and for its related class, section 1A. If seats are available in section 1 and 1A, the process moves students from the waitlist into both components. Then the process runs on section 1A (because section 1A is sequentially next based on the key structure of the CLASS_TBL). If students are still on the waitlist in section 1A (because they are on the waitlist for section 2, which has not yet been run), the process creates enrollment requests for those students. Again, if seats are available in section 1A and section 2, the enrollment engine processes the requests successfully. Finally, the process runs on section 2.

For example, Mia has a waitlist position number of 1 in section 2, and a waitlist position number of 5 in the related section 1A. Additionally, Mitch has a waitlist position number of 3 in section 1A. Because the Wait List process runs on section 1A first, Mia is put into the class after Mitch. The Wait List process evaluates Mia based on her position on the waitlist in section 1A, even though section 2 is the enrollment component.

Automatic Enroll from Waitlist Feature

The Wait List feature is controlled by the Auto Enroll From Wait List and Wait List Capacity options (on the Enrollment Control page of the schedule of classes) and the Last Day For Wait List date (on the Session Table page for classes with traditional academic calendars and on the Dynamic Class Dates page for classes with dynamic academic calendars). In addition, students have a wait list unit limit defined by academic load for terms and sessions within their primary academic programs on the Enrollment page and Session page of the Academic Program Table component.

If you select the Auto Enroll From Wait List option for a class, you can use the wait list process to move qualified students from the class wait list to enrollment into that class as space becomes available. If you do not select this option, you can manually move students from the wait list to enrollment into a class by selecting Override Class Limit on the enrollment processing component. The manual process is best monitored by the instructor of the class.

As you manage your wait lists, you can use the Class Roster page to view students on the wait list for a particular class section. The system performs corequisite and prerequisite checking before placing a student on the waitlist. However, the system does *not* check for a scheduling time conflict before it places a student on a wait list. Scheduling time conflicts and all of the other enrollment edits are performed when the system attempts to move a student from the wait list to enrollment in a class. You can view an individual student's position and status on the wait list for a class by clicking the Wait List Position link. This link appears only for applicable enrollment requests on the enrollment request processing pages.

Enabling the Wait List Process

To enable the wait list process:

1. Set the last date for wait list for sessions on the Session Table page of the Term/Session Table component.
2. Define the maximum wait list units for terms within academic programs on the Enrollment page of the Academic Program Table component.
3. Define the maximum wait list units for sessions within academic programs on the Session page of the Academic Program Table component.
4. Select the Auto Enroll From Wait List check box for classes on the Enrollment Control page of the schedule of classes.

[Viewing Class Rosters](#)

Pages Used to Manage Wait Lists

Page Name	Definition Name	Navigation	Usage
Wait List Position	ENRL_REQ_WL	Click the Wait List Position link on the corresponding enrollment processing page.	View a student's status and position on the wait list for a class section.
Wait List Process	RUNCTL_SRWTLST	Records and Enrollment > Term Processing > Waitlist > Waitlist Process > Wait List Process	Move groups of students from class wait lists to enrollment into classes. If you need to manually move students from the wait list to enrollment into a class, you must drop the student from the wait listed class then add the student into the class with the appropriate overrides selected.
Wait List Purge	RUNCTL_SRWTLSTPURG	Records and Enrollment > Term Processing > Waitlist > Waitlist Purge > Wait List Purge	Run the Wait List Purge process to delete groups of students in waiting status based on the run parameters that you specify. The Wait List Purge process enables you purge the wait list for more than just one class. You can use the process to purge the wait list for all classes in an entire term, academic career, session, subject area, or campus based on your run parameters. Run the purge process on past terms when information about a student being waitlisted is no longer pertinent.

Viewing a Student's Wait List Position

If your institution has licensed PeopleSoft Campus Self Service, your students can also view their statuses and positions directly over the web. Wait list position numbers appear on the class schedule.

"Viewing a Class Schedule" (PeopleSoft Campus Solutions 9.2: Self Service)

Moving Students from Wait Lists to Enrollment

Access the Wait List Process page (Records and Enrollment > Term Processing > Waitlist > Waitlist Process > Wait List Process).

Institution	Select the academic institution for which you want to move groups of students from class wait lists to enrollment into a class.
Term	Select the term for which you want to move groups of students from class wait lists to enrollment into a class.
Session	If you want to limit wait list processing to a specific session, select a value.
Subject Area	If you want to limit wait list processing to a specific subject area, select a value. If you select a value for this field, the Course ID field and Class Nbr field become unavailable for edit.
Course ID	If you want to limit wait list processing to a specific course, select a value. If you select a value for this field, the Subject Area field and Class Nbr field become unavailable for edit.
Class Nbr (class number)	If you want to limit wait list processing to a specific class, select a value. If you select a value for this field, the Subject Area field and Course ID field become unavailable for edit.
Wait List Process Switch	<p>The wait list process switch instructs the process how to evaluate wait list candidates. Select <i>Y</i> to process all <i>new</i> wait list candidates eligible for wait list evaluation. Select <i>A</i> to process <i>all</i> wait list candidates eligible for wait list evaluation.</p> <p>For example, a class has five students on the wait list and three spaces become open in the class. When you run the wait list process, it fills the three spaces, and two students remain on the wait list. At this point the class is no longer new to the wait list process. The only way it would be evaluated again is if space opened in the class and you selected <i>A</i> as the wait list process switch value.</p>
Run	Based on the Campus Solutions features that you are using, run either the Wait List COBOL/SQL process (SRPCWAIT) or the Wait List PSJob process (SRWAITJB).

SRPCWAIT Process

Run the Wait List COBOL/SQL process (SRPCWAIT) if you are *not* using Program Enrollment or Activity Management, or have *not* set up wait list notifications via Campus Mobile.

The process generates a new enrollment request for the student and displays one of the following enrollment status reasons on the new request: *RCAP* (reserve slots full), *FULL* (section is full), *CREQ* (corequisite enrollment), *ALIM* (appointment limit exceeded), *TLIM* (term limit exceeded), *SLIM* (session limit exceeded), *TIME* (time conflict exists), *RCMP* (related component), *TIMR* (time conflict resolved), or *EWAT* (enrolled from wait list). You can view these enrollment requests through the Block Enroll component.

If a class has reserve capacity rules and space opens in a reserve capacity group, the process evaluates whether students on the wait list meet these reserve capacity rules. If no students meet the rules, then the process moves no one from the class wait list to enrollment into the class. If a class has multiple reserve capacity groups and space opens in more than one group *and* a student matches the criteria of more than one reserve capacity group, the system enrolls the student into the first reserve capacity group it finds where the student meets the reserve capacity rules.

SRWAITJB Process

You must run the Wait List PSJob process (SRWAITJB) if you have set up wait list notifications via Campus Mobile.

See "Setting Up Campus Mobile Within Campus Solutions" (PeopleSoft Campus Solutions 9.2: Self Service)

See "Accessing Campus Mobile Functionality" (PeopleSoft Campus Solutions 9.2: Self Service)

See "Setting Up and Consuming the Notifications Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)

You must also run the Wait List PSJob process if you are using Program Enrollment or Activity Management.

See the 'Student Enrollment Event' document in the Program Enrollment Additional Documentation pdf package in My Oracle Support (ID 1400723.1).

See [Managing APT Enrollment](#)

See [Understanding Activity Management](#)

Purging Students From Wait Lists

Access the Wait List Purge page (Records and Enrollment > Term Processing > Waitlist > Waitlist Purge > Wait List Purge).

Sequence Number

The system displays a default sequence number. It is for internal processing purposes only.

Academic Institution

Select the academic institution for which you want to purge students from wait lists.

Term	Select the term for which you want to purge students from wait lists.
Academic Career	If you want to purge students from wait lists for classes within a specific academic career, select a value for this field.
<hr/>	
Note: This field and the remaining fields on this page are optional. They provide the means of searching for wait lists by various parameters.	
<hr/>	
Session	If you want to purge students from wait lists for classes within a specific session, select a value for this field.
Subject Area	If you want to purge students from wait lists for a specific class subject area, select a value for this field.
Class Nbr (class number)	If you want to purge students from wait lists for a specific class, select a value for this field.
Campus	If you want to purge students from wait lists for classes at a specific campus, select a value for this field.
From Date	If you want to purge from wait lists the students in waiting status with a class start date greater than or equal to a certain date, enter the date in this field.
To Date	If you want to purge from wait lists the students in waiting status with a class start date less than or equal to a certain date, enter the date in this field. The system displays, by default, the value in the From Date field.
Last Date for Wait List	Enter a value in this field to have the process search for active wait lists in which the class <i>last date for wait list</i> value is less than or equal to the value that you specify here. Define last date for wait list values on the Session Table page for classes with traditional academic calendars.

Processing Withdrawals and Cancellations

This section provides an overview of withdrawal and cancellation processing, lists common elements, and discusses how to:

- Post withdrawals and cancellations for terms.
- Post withdrawals and cancellations for sessions.
- Resubmit failed withdrawal and cancellation requests.
- View withdrawal and cancellation request status.

"Calculating Tuition for Multiple Students" (PeopleSoft Campus Solutions 9.2: Student Financials)

Understanding Withdrawal and Cancellation Processing

In Student Records, you can enter and post withdrawals or cancellations for a term or session on a student-by-student basis through the Student Records Term Withdrawal COBOL/SQL process (SRPCWDPR). When you withdraw or cancel a student from a term, the process performs a series of session withdrawals or cancellations to complete the term withdrawal or cancellation. A student cannot be cancelled from a session, and therefore a term, in which grades have been posted. The system prevents this with an error message and does so because enrollments for cancelled terms and sessions are always excluded from the transcript. Withdrawals can be processed when grades are present; however, the classes with grades will be excluded from the process. A warning message appears when you select the withdrawal code for a session or term where grades are present.

Important! If you have not calculated the landmark calendar dates for the affected class enrollments, the Student Records Term Withdrawal process fails the entire withdrawal or cancellation request.

For term and session *withdrawals*, the Student Records Term Withdrawal process determines the deadline by comparing the last date of attendance entered on the Term Withdrawal or Session Withdrawal page to the withdrawal deadlines that you set on the Session Calendar 1 page or to the withdrawal deadlines that the Dynamic Class Dates process calculates and displays on the Dynamic Class Data page or Student Enroll OEE page. The Student Records Term Withdrawal process then generates and processes the enrollment requests for each impacted student enrollment record (STDNT_ENRL).

For withdrawals from traditional class enrollments, the process updates the impacted student enrollment records as follows:

- If the last date of attendance is less than or equal to the withdraw-without-penalty deadline on the Session Calendar 1 page, the process updates the last enrollment action reason to the withdraw-without-penalty reason set on the Session Calendar 1 page.
- If the last date of attendance is less than or equal to the withdraw-with-penalty deadline, the process determines the student's grading basis for the class, then assigns to the impacted student enrollment record the penalty grade value that is set on the Grading Scheme Table page for that grading basis.

If the penalty grade is not defined, the process assigns the penalty grade according to the grading basis and grade set on the Session Calendar 1 page. Depending on how the grade is set up, the process can reduce in progress units, which can potentially affect the student's academic load and financial aid load.

- If the last date of attendance is less than or equal to the withdraw-with-greater-penalty deadline, the process functionality parallels that of the withdraw-with-penalty functionality.

For withdrawals from dynamic date and OEE class enrollments, the process updates the impacted student enrollment records as follows:

- If the last date of attendance is less than or equal to the withdraw-without-penalty deadline on the Dynamic Class Data page or Student Enroll OEE page, the process updates the last enrollment action reason to the corresponding reason value set on the Dynamic Date page of the Academic Program Table component for the student's primary academic program.

- If the last date of attendance is less than or equal to the withdraw-with-penalty deadline on the Dynamic Class Data page or Student Enroll OEE page, the process determines the class grading basis, then assigns to the impacted student enrollment record the penalty grade value that is set on the Grading Scheme Table page for that grading basis.

If the penalty grade is not defined, the processes assigns the penalty grade according to the grading basis and grade set on the Dynamic Date page of the Academic Program Table component for the student's primary academic program. Depending on how the grade is set up, the process can reduce in progress units, which can potentially affect the student's academic load and financial aid load.

- If the last date of attendance is less than or equal to the withdraw-with-greater-penalty deadline on the Dynamic Class Data page or Student Enroll OEE page, the process functionality parallels that of the withdraw-with-penalty functionality.

Note: The system uses the session calendar (if it exists) when it fails to find a Dynamic Class Dates table row or the appropriate Academic Program table dynamic dates field when processing withdrawals from non-OEE dynamically dated classes.

Regardless of the enrollment and withdrawal types, the Student Records Term Withdrawal process also does the following for term and session withdrawals.

- Updates the withdraw code on the affected student session (STDNT_SESSION) records to a value of withdrew.
- Updates the withdraw code on the affected student career term (STDNT_CAR_TERM) records to a value of withdrew for term withdrawals only.

Note: The process does not update the student career term record for session withdrawals so that the student can still enroll in other sessions within the term.

For term and session *cancellations*, the cancel deadlines (Session, Dynamic Date, or OEE) are used only to provide a warning to the user because the cancellation process always has the same impact—any enrolled (but not graded) classes are dropped without penalty and the student's session and term (for term cancellations) withdraw codes are updated to Cancelled.

Note: Note. A student cannot be cancelled from a session, and therefore a term, in which grades have been posted. The system prevents this with an error message and does so because enrollments for cancelled terms and sessions are always excluded from the transcript.

Common Elements Used to Process Withdrawals and Cancellations

Errors

If reasons exist that prevent a successful withdrawal or cancellation, click this link to access the Term Withdrawal Run Status page, where you can check the run status and error message text for the request.

Last Date of Attendance

The system by default sets the last date of attendance to the withdrawal/cancel date, but you can override the value. The Student Records Term Withdrawal process uses the last date of attendance to determine the deadlines, reasons, grading bases, and penalties for withdrawals from dynamic class date and OEE enrollments. The process also uses this date for financial aid

and refund calculation purposes. If you override the last date of attendance value, you must recalculate the student's tuition based on the new date you enter.

Post Session Withdrawal

See definition for Post Term Withdrawal.

Post Term Withdrawal

Click to post the withdrawal or cancellation to the student's record.

Before completing the posting request, the system verifies that the student has other enrollments for the term or session within the academic career. If the posting request causes the student to have no other enrollments in the term or session within the academic career, the system then identifies the student's billing careers on the student's career term record. If the student has a billing career that is the same as the academic career from which the student is withdrawing, the system stops processing the posting request and instructs you to change the student's billing career to an academic career in which the student has enrollments for the term or session. This edit prevents you from inadvertently billing a student based on an academic career in which the student has no enrollments for the term. Define a student's billing career by academic career on the Term Activation page.

For example: a student is active in a term as both a graduate and undergraduate, and the student's billing career for both academic careers within the term is her or his undergraduate career. If the student is enrolled for classes in both the graduate and undergraduate career for the term and you attempt to withdraw the student from her or his undergraduate career for the term, the system stops processing and issues you a warning instructing you to change the billing career for that student's graduate career term record to an academic career other than the undergraduate career.

Note: If the Auto Calculate Term Withdrawal check box is selected for the term on the Tuition Calculation Controls page, then the Post Term Withdrawal button renders as Post Term Withdrawal and Calculate Tuition & Fees. When an administrative user posts a term withdrawal, tuition calculation runs, whether or not the user has Tuition Calculation security access.

See "Specifying Tuition Calculation Parameters" (PeopleSoft Campus Solutions 9.2: Student Financials)

Success

Click to access the Term Withdrawal Run Status page, where you can view the message log for the request.

Withdrawal \ Cancel

Select whether you want to process a withdrawal or cancellation. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any

modifications to these values require a substantial programming effort.

Cancelled: Select to cancel all of the student's class enrollments for the specified term or session. Posting a student's term cancellation request refunds 100% of her or his fees.

Withdrew: Select to withdraw the student from all class enrollment for the specified term or session. Posting a student's term withdrawal request refunds her or his fees according to the adjustment calendar associated with the student's tuition group.

Withdrawal \ Cancel Date

Enter the date that the Student Records Term Withdrawal process uses as the action date for the withdrawal or cancellation.

Withdrawal \ Cancel Reason

Select the withdrawal/cancel reason that Student Financials uses for adjustments. Modification of these translate values requires significant programming effort.

Pages Used to Process Withdrawals and Cancellations

Page Name	Definition Name	Navigation	Usage
Term Withdrawal	WITHDRAWAL	Records and Enrollment > Student Term Information > Term History > Term Withdrawal	Process student withdrawals and cancellations for all sessions within an entire term.
Session Withdrawal	STDNT_SESSION_WDWL	Records and Enrollment > Student Term Information > Term History > Session Withdrawal	Process student withdrawals and cancellations for one session within a term rather than from all sessions within the entire term.
Term Withdrawal / Cancellation	RUNCTL_SRPCWDPS	Records and Enrollment > Term Processing > Withdrawal and Cancellation > Term Withdrawal/Cancellation > Term Withdrawal / Cancellation	Resubmit failed term and session withdrawal or cancellation requests. The Withdrawal / Cancellation process is designed specifically to resubmit failed withdrawal requests. You can view the status of a request on the Term Withdrawal Run Status page. The process impacts Student Financials because withdrawals and cancellations affect tuition calculation.

Page Name	Definition Name	Navigation	Usage
Term Withdrawal Run Status	TERM_WD_RUN_STATS	Records and Enrollment > Term Processing > Withdrawal and Cancellation > Term Withdrawal Status > Term Withdrawal Run Status	View the status and process messages for enrollment requests generated by the withdrawal and cancellation process so that you can determine the changes that you must make to a request or a student's records To successfully post a request. You can also use this page as a record for all withdrawal and cancellation requests submitted through the Term History component.

Posting Withdrawals and Cancellations for Terms

Access the Term Withdrawal page (Records and Enrollment > Student Term Information > Term History > Term Withdrawal).

Image: Term Withdrawal page

This example illustrates the fields and controls on the Term Withdrawal page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Term Withdrawal' page for student Ana Beck (SR0400). The page has several tabs: Term Statistics, Cumulative Statistics, Term Withdrawal (selected), Session Withdrawal, Academic Standing, and Student Grade Review. The main content area displays the following information and controls:

- Academic Career:** Undergraduate
- Academic Institution:** PeopleSoft University
- Term:** 2012 Fall
- Academic Level - Term Start:** Freshman
- Pro-Rata Eligible:**
- *Withdrawal \ Cancel:** Withdrew (dropdown menu)
- Withdrawal \ Cancel Reason:** (empty dropdown menu)
- Withdrawal \ Cancel Date:** 10/10/2012 (calendar icon)
- Last Date of Attendance:** 10/10/2012 (calendar icon)
- Override Withdrawal Schedule:** (empty text field with search icon)
- *Tuition Calc Required:**
- Post Term Withdrawal** (yellow button)

Important! Posting a student's term cancellation request refunds 100 percent of the student's fees. Posting a student's term withdrawal request refunds her or his fees according to the adjustment calendar associated with the student's tuition group.

Note: Documentation about some fields on this page is provided in the earlier topic: Common Elements Used to Process Withdrawals and Cancellations.

Academic Institution	The academic institution for which you want to process the student's withdrawal or cancellation request.
Term	The term for which you want to process the student's withdrawal or cancellation request.
Academic Level - Term Start	The student's academic level at the start of the specified term.
Pro-Rata Eligible	Select to enable pro-rata refunding—a refund to a student attending your academic institution for the first time and withdrawing on or before the 60 percent point in time. Clear this check box to not have the student considered for such a refund. Most U.S. academic institutions do not issue refunds after the 60 percent point in time.
Override Withdrawal Schedule	Select the override withdrawal schedule value. These values are specifically for refund calculations and are defined by Student Financials.

Posting Withdrawals and Cancellations for Sessions

Access the Session Withdrawal page (Records and Enrollment > Student Term Information > Term History > Session Withdrawal).

Image: Session Withdrawal page

This example illustrates the fields and controls on the Session Withdrawal page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Session Withdrawal' page for student Ana Beck (SR0400). The page is divided into several sections:

- Academic Career:** Undergraduate
- Academic Institution:** PeopleSoft University
- Term:** 2003 Spring
- Session:**
 - Units Taken for Progress:** 0.000
 - *Withdrawal \ Cancel:** Withdraw
 - Withdrawal \ Cancel Reason:** (empty)
 - Withdrawal \ Cancel Date:** 10/01/2004
 - Last Date of Attendance:** 10/01/2004

A 'Post Session Withdrawal' button is highlighted in yellow.

Session Select the session for which you want to process the student's withdrawal or cancellation request.

Units Taken for Progress The system displays the student's in-progress units for the specified session.

Resubmitting Failed Withdrawal and Cancellation Requests

Access the Term Withdrawal / Cancellation page (Records and Enrollment > Term Processing > Withdrawal and Cancellation > Term Withdrawal/Cancellation > Term Withdrawal / Cancellation).

When the Term Cancellation process is run in the Student Financials application, that process generates a cancellation request. To process the cancellation request, enter the request number on this page and run the Student Records Term Withdrawal process (SRPCWDPR).

From Term Withdrawal Request Enter the request number for the beginning of the range of failed term withdrawal and cancellation requests that you want to resubmit for processing.

To Term Withdrawal Request Enter the request number for the end of the range of failed term withdrawal and cancellation requests that you want to resubmit for processing.

Term Withdrawal Run Status Click to access the Term Withdrawal Run Status page, where you can view the message log for a specific term withdrawal or cancellation request.

Run the Term Withdrawal COBOL/SQL process (SRPCWDPR) as needed.

Viewing Withdrawal and Cancellation Request Status

Access the Term Withdrawal Run Status page (Records and Enrollment > Term Processing > Withdrawal and Cancellation > Term Withdrawal Status > Term Withdrawal Run Status).

Purging Drop Enrollment Records

Class drops are kept in the student's academic record if a student drops from a course while the *drop retain record* date is defined on the academic calendar for the session in which the student was enrolled. At some point, your institution might decide to purge the system of these retained drop enrollment records. The drop purge process affords you this functionality. Run the purge process on past terms only when information about a student's drop enrollment record is no longer pertinent.

This section discusses how to delete drop enrollment records from your system.

Page Used to Delete Drop Enrollment Records

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Drop Purge Process	RUNCTL_SRDROPPURGE	Records and Enrollment > Term Processing > End of Term Processing > Drop Purge > Drop Purge Process	Run the Drop Purge SQR process (SRDRPURG) to delete drop enrollment records from your system based on the parameters you specify.

Deleting Drop Enrollment Records

Access the Drop Purge Process page (Records and Enrollment > Term Processing > End of Term Processing > Drop Purge > Drop Purge Process).

Academic Institution	Select the academic institution for which you want to purge drop enrollment records.
Term	Select the term for which you want to purge drop enrollment records.
Sequence Number	The system displays a default sequence number. It is for internal processing purposes only.

Note: This field and the remaining fields on this page are optional. They provide the means of purging drop enrollment records by various parameters.

Academic Career	If you want to purge drop enrollment records within a specific academic career, select a value.
Session	If you want to purge drop enrollment records within a specific session, select a value.
From Date	If you want to purge student enrollment records with a class start date (as defined on the CLASS_TBL) greater than or equal to a specific date, enter the date.
To Date	If you want to purge student enrollment records with a class start date (as defined on the CLASS_TBL) less than or equal to a specific date, enter the date.
Subject Area	If you want to purge drop enrollment records for a specific class subject area, select a value.
Class Nbr (class number)	If you want to purge drop enrollment records for a specific class, select a value.
Campus	If you want to purge drop enrollment records at a specific campus, select a value.
Enrollment Status Reason	If you want to purge only the drop enrollment records that have a specific enrollment status reason attached to them, select the enrollment status reason. For example, you can purge drops that have an enrollment status reason of <i>Drop Wait</i> and that meet your other criteria. Enrollment status reasons appear in the Status/Reason field on pages within enrollment components.

Purging Shopping Cart Records

This section discusses how to purge Shopping Cart records.

Page Used to Purge Shopping Cart Records

Page Name	Definition Name	Navigation	Usage
Shopping Cart Purge	SSR_RUN_WSHLST_PRG	Records and Enrollment > Term Processing > End of Term Processing > Shopping Cart Purge	Run the Shopping Cart Purge application engine process (SSR_WISHLPRG) to purge Shopping Cart data for past terms.

Purging Shopping Cart Records

Access the Shopping Cart Purge page (Records and Enrollment > Term Processing > End of Term Processing > Shopping Cart Purge).

The Shopping Cart Purge page displays in a grid all existing rows in the Shopping Cart table (SSR_REGFORM) grouped by distinct institution, academic career and term combinations. Select the records that you want to purge and run the Shopping Cart Purge process.

Managing Post Enrollment Requirement Checking

Understanding Post Enrollment Requirement Checking Setup

Complete these steps to set up post enrollment requirement checking:

1. Define your enrollment requirements (See Setting Up Enrollment Requisites)
2. Attach enrollment requirements to course offerings and/or class association records.
3. Define student records installation related to enrollment requirements.
4. Define enrollment requirement note values.
5. Enroll students.

If you plan to use communications for post enrollment requirement checking, use the instructions in the following document to set up communications and then use the 3Cs process to create and generate the communication:

See: PERC Communications Setup and Processing.pdf in My Oracle Support (ID 1982691.1).

Managing the Enrollment Requirement Roster

This section discusses how to:

- Use the Enrollment Requirement Roster (Summary) page
- Track post enrollment requirement checking transaction history.

Pages Used to Manage Enrollment Requirement Rosters

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Enrollment Requirement Roster (Summary)	SSR_REQS_RSTR_SUMM	Curriculum Management > Enrollment Requirements > Post Enroll Req Checking > Enrollment Requirement Roster > Enrollment Requirement Roster (Summary)	View the Enrollment Requirement Roster, track the enrollment requirement status of students, run post enrollment requirement checking, and process drop requests for non-compliance in on-line mode.
Enrollment Requirement Roster (Detail)	SSR_REQS_RSTR_DTL	Select the Detail View option on the Enrollment Requirement Roster (Summary) page.	View detailed information about how the status on the requirement was evaluated.
Enrollment Message Log	SSR_REQS_ENRL_MSG	Click the Process Status link on the Enrollment Requirement Roster (Summary) page.	View messages that are generated by the enrollment for the transaction requested.
Tracking of Key Transactions & User Notes	SSR_REQS_TRACKING	Click the Tracking link in the Audit / Information Links tab on the Enrollment Requirement Roster (Summary) page.	View post enrollment requirement checking transaction history and view and add notes.

Using the Enrollment Requirement Roster (Summary) Page

Access the Enrollment Requirement Roster (Summary) page (Curriculum Management > Enrollment Requirements > Post Enroll Req Checking > Enrollment Requirement Roster > Enrollment Requirement Roster (Summary)).

Image: Enrollment Requirement Roster (Summary) page (1 of 2)

This example illustrates the fields and controls on the Enrollment Requirement Roster (Summary) page (1 of 2). You can find definitions for the fields and controls later on this page.

Override Action Date to:

The Course Information and Enrollment Requirements group boxes can be collapsed and expanded. Use the Student Records Installation-Enrollment Requirement Roster page to select a default appearance for the group boxes.

Click a class link to access the Class Detail page. View the enrollment requirements for the class as defined on Adjust Class Associations, Class Requisites page.

Go To

The Go To links appear for page processing if the related check boxes—Allow Post Enrollment Requirement Checking to be run from Enrollment Requirement Roster and Allow Drop Processing to be run from Enrollment Requirement Roster—are selected on the Student Records Installation-Enrollment Requirement Processing page. Click the Go To links to access the related group boxes further down this page. If the

check boxes are not selected on setup, the Go To links are not available.

Review Complete for Batch Drop Processing

This check box appears if the check box for Drop Review for Batch Processing is selected on the Student Records Installation-Enrollment Requirement Roster page. Select the check box to indicate that the post enrollment requirement status has been reviewed for non-compliant students—the batch drop process selects only those classes for which the check box has been selected.

Select Display Option

The Enrollment Requirement Roster is available in two views: a summary view and a detailed view. Select the Summary View option to see the enrollment and post requirement status of students enrolled in the class. The Summary view page is discussed in this documentation.

Select the Detail View option to see detailed information about how a student has or has not met the enrollment requirements for the class. The Post Enrollment Requirement Status area of the page displays status information based on the last time that post enrollment requirement checking was run for the student.

The Detail view allows you to access the Audit and Information Links as found on the Summary view. You can also view or set the Drop Request /Approved indicator.

Set Filter Options

The Set Filter Options group box can be collapsed and expanded. Use the Student Records Installation-Enrollment Requirement Roster page to select a default appearance for the group box.

The selections in this group box appear by default based on the setup page. You can change the selections here.

Enrollment Status and Most Recent Requirement Status

Select the statuses that you want to view in the Enrollment Requirement Roster student grid.

OEE Start Date

The OEE Start Date field appears when a class is scheduled within an OEE session. It is an optional field. Enter the date for which you want to filter students who have an OEE start date equal to or later than the defined date.

Most Recent Requirement Status: Display students in non-compliance and Most Recent Requirement Status: Display other students

The count for each status is shown in parentheses next to the status. Although the Enrollment Status count includes all students, the Most Recent Requirement Status count is based on the number of students with the selected Enrollment Status—for example, if you are viewing only Enrolled Students, the count shown for Most Recent Requirement Status includes only those students with an Enrollment Status of *Enrolled*.

The statuses are:

- **Not Satisfied:** The student has not met the enrollment requirement status for the class.
- **Conditionally Satisfied:** The student has conditionally met the enrollment requirement using in-progress course work. After the course work is completed and grades are posted, post enrollment requirement checking should be run to determine if the student has satisfied the enrollment requirement.
- **Enrollment Component:** The student was enrolled using the enrollment component, which does not check for enrollment requirements.
- **Permitted:** The enrollment requirement for the class was satisfied through a permission.

Note: If the process is run for students with this status, the permission is not considered as part of the post enrollment requirement checking process. The student is re-evaluated.

- **Overridden:** The enrollment requirement for this class was satisfied by using an enrollment requirement override.

Note: If the process is run for students with this status, the override is not considered as part of the post enrollment requirement checking process. The student is re-evaluated.

- **Satisfied:** The student has met the enrollment requirement for this class.
- **Unknown:** No requirement status exists. This value typically appears when a requirement was added to the class after the student was enrolled or the student was enrolled in the class before post enrollment requirement processing was implemented.

Note: Students who enrolled in classes before the implementation of the Post Enrollment Requirement Checking feature will not have an enrollment requirement status and will appear as Unknown on the Enrollment Requirement Roster.

If you choose to run Post Enrollment Requirement Checking for the roster, the appropriate post enrollment requirement status will be assigned.

Filter

Click the filter button to refresh the Enrollment Requirement Roster student grid.

Enrollment Requirement Roster Student Grid: Requirement Data Tab

Select the Requirement Data tab.

Select

Use this check box to:

- Select students to whom a notification is to be sent.
- Select students to be included in page processing—run post enrollment requirement checking or process drops for non-compliance of enrollment requirements.

Process Status

Sometimes a Process Status column appears between the Select and ID columns. Click the Process Status link to access the Enrollment Message Log page. Examples include when post enrollment requirement checking is run and the message displays information about the new status—for example, Enrollment Requirement is met conditionally. It is likely that this is due to a pending grade from a previous term. Another example is Enrollment Requirement is not met for the Class, action required. Enrollment Requirements for the class have not been met. The student may need to be administratively dropped from the class for non-compliance of enrollment requirements.

Drop/Approved Indicator

This is an optional field. The field is available after post enrollment requirement checking has been run. The field is available only for students who have a non-compliant post enrollment requirement status of *Conditional* or *Not Satisfied* and an enrollment status of *Enrolled* or *Waitlisted*.

Decision makers can set the indicator value to *Approved* for enrolled students if they consider the student should remain enrolled in the class even if the student's post enrollment status is non-compliant. An example might be if a cumulative GPA of 3.0 is required for the course and as a result of the student's grades from the previous term, the student now has a 2.9 GPA.

Set the indicator value to *Drop Request* if an enrolled student is to be dropped from the class for non-compliance of enrollment requirements. If a student is wait listed, and the student should be dropped from the waitlist for non-compliance, set the value to *Drop Request*. Use the indicator if you will be dropping students using the option: *when Drop Request Indicator is selected*.

Enrollment Req Status (Enrollment Requirement Status)

Displays the enrollment requirement status of a student at the point of registration. Click on the Enrollment Req Status link for a student to access the Enrollment Requirement Roster–Detail View with the enrollment requirement status information area expanded.

Post Enroll Req Status (Post Enrollment Requirement Status)

The post enrollment requirement status appears after the post enrollment requirement status checking process has been run. The process can be run multiple times. The value shown is the most current post enrollment requirement status. Click on the Post Enroll Req Status link for a student to access the

Enrollment Requirement Roster–Detail View with the post enrollment requirement status information area expanded.

Status

This column appears only if more than one enrollment status is selected within the Set Filter Options group box. When more than one status is selected, the student's enrollment status appears in this field.

Status Note

This column displays additional information such as a student's wait list position, penalty grade, graded, previously waitlisted, withdrawn, and if the drop was initiated by PERC. For example, if a student is dropped through the Post Enrollment Requisite Checking process the status note reads *PERC Drop*.

Note: When a class is dropped using the action reason code of *PERC*, the enrollment record is retained regardless of the Academic Calendar date for the drop delete deadline.

notify selected students

Click the Notify Selected Students button to access the Send Notification (SSS_NOTIFY) page to send email notifications to selected students. If a notification failure occurs, the sender receives a message indicating the type of failure, for example, host unknown. If no email account exists for a selected student, then on the Enrollment Requirement Roster, a Process Status column appears with the message *No Email Address* next to the student.

Transaction

Select students with the following status

The check box settings appear by default from the Roster and Batch Processing Filter Default Settings group box on the Student Records Installation-Enrollment Requirement Roster page but you can change them here.

Note: Because post enrollment requirement checking cannot be run for dropped students, an enrollment status of Dropped is not available for selection on this page.

Enrollment Status

Select the enrollment statuses for which you are running post enrollment requirement checking.

Most Recent Requirement Status

Select the most requirement statuses for which you are running post enrollment requirement checking. Typically the process is run for students with a status of *Not Satisfied* and *Conditionally Satisfied*.

For documentation about the status values, refer to the previous documentation about the Enrollment Requirement Roster (Summary) page.

Action

The Action group box is available if the Allow Drop Request Indicator to be set for Students in Non-Compliance check box is selected for batch processing on the Student Records Installation-Enrollment Requirement Processing page. The check box settings appear by default from the setup page but you can change them here. Select one or both check boxes to indicate the statuses for which the batch process should set the Drop Request Indicator for non-compliant students.

Population Selection

Select this check box to run post enrollment requirement checking using population selection. Population selection is a method for selecting the IDs and/or courses to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (PS Query, Equation Engine equation, or external file) to identify IDs and/or courses for a specific transaction, you must use it.

"Understanding the Population Selection Group Box" (PeopleSoft Campus Solutions 9.2: Campus Community)

"Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Note: If you select the query using the catalog number, use wild cards to assist you with the query. For example, to search for all SOC 100 level courses, enter %1__ or _1%.

If the Enforce Academic Organization Security check box is selected on the Student Records Installation-Enrollment Requirement Roster page, academic organization security is also enforced for population selection.

Note: You can use population selection and/or class select. By default, the Population Selection and Use Class Select check boxes are cleared.

Query Name

These predefined queries are delivered:

- SSR_REQS_ACAD_GRP
- SSR_REQS_ACAD_ORG
- SSR_REQS_CAMPUS
- SSR_REQS_CAREER
- SSR_REQS_SESSION
- SSR_REQS_SUBJECT
- SSR_REQS_SUBJECT_CATNBR
- SSR_REQS_TERM

Manual entry by class

Use Class Select

Select this check box to run post enrollment requirement checking using class select.

Class Nbr class number

Enter the class number for each class that is to be included in post enrollment requirement checking.

Note: To search for the catalog number using the look up prompt, use wild cards to assist you. For example, to search for Biology 100, enter %100% or _100.

If the Enforce Academic Organization Security check box is selected on the Student Records Installation-Enrollment Requirement Roster page, academic organization security is also enforced for manual entry by class.

Transaction

After the process has completed, select the Get/Refresh Last Request button to access information about the process that was just run. Information includes the Enrollment Request ID (from Block Enrollment), the Request Status, the time that the process ran, the total number of transactions, the number of transactions in error, and the number of transactions with messages. You can click on the Enrollment Request ID to go directly to the Block Enrollment component for this group of transactions. This is of more importance when you run the drop process. The post enrollment requirement checking process just updates or assigns the students post enrollment requirement status.

Here is an example:

Image: Transaction group box example

This example illustrates the fields and controls on the Transaction group box example. You can find definitions for the fields and controls later on this page.

The screenshot shows a 'Transaction' group box with a blue header. Below the header is a yellow button labeled 'Get/Refresh Last Request'. Underneath the button are two columns of data. The left column contains three fields: 'Enrollment Request ID' with the value '0000002692', 'Request Status' with the value 'Success/Messages', and 'Last Update DateTime' with the value '02/18/2011 9:01:15AM'. The right column contains three summary statistics: 'Number of Transactions' with the value '8', 'Transactions in Error' with the value '0', and 'Transactions with Message' with the value '8'.

Transaction	
Get/Refresh Last Request	
Enrollment Request ID	0000002692
Request Status	Success/Messages
Last Update DateTime	02/18/2011 9:01:15AM
Number of Transactions	8
Transactions in Error	0
Transactions with Message	8

Printing Batch Enrollment Requirement Rosters

This section discusses how to print enrollment requirement rosters in batch.

Page Used to Print Enrollment Requirement Rosters in Batch

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Print Enrollment Requirement Rosters	SSR_REQS_RC_RPT	Curriculum Management > Enrollment Requirements > Post Enrollment Req Checking > Print Enrollment Req Roster > Print Enrollment Requirement Rosters	In batch mode, print enrollment requirement rosters for multiple classes.

Printing Enrollment Requirement Rosters in Batch

Access the Print Enrollment Requirement Rosters page (Curriculum Management > Enrollment Requirements > Post Enrollment Req Checking > Print Enrollment Req Roster > Print Enrollment Requirement Rosters).

Image: Print Enrollment Requirement Rosters page

Transaction

Get / Refresh Last Request

Non-Compliance Selection

The check box settings appear by default from the Student Records Installation setup pages but you can change the settings here.

Note: Because there is no need to process drops for students who have already dropped the class, the *Dropped* enrollment status is not available here.

Enrollment Status	Select only the enrollment statuses that you want included in the processing for non-compliance of enrollment requirements.
Drops will only be processed for classes where Drop Review is set to Complete	If the Enrollment Requirement Rosters must be reviewed prior to batch processing of drops check box is selected on the Student Records Installation-Enrollment Requirement Roster page, this message appears.
Process Drops for	Select the option for which you want to process drops: either students for whom the Drop Request Indicator is selected or students with a non-compliant post enrollment requirement status. If you select the status option, the Conditionally Satisfied and Not Satisfied check boxes become available and you can select one or both.

For documentation about the Action, Population Selection, and Manual Entry by Class group boxes, refer to similar documentation in the earlier section: *Running Batch Post Enrollment Requirement Checking for Multiple Classes*.

Running the Batch Drop Process

From the Process Scheduler Request page, you can select one of two options:

- **Generate and Process Drops (SRRQDROP):** Full processing in which the drop transactions are generated and then the drops are processed.
- **Generate Drop Transactions (SSR_REQS_DRP):** The drop transactions are generated but the drops are not processed—use this option if you want to review the transactions in the Block Enroll component before processing drops.

Transaction

After the process has completed, select the Get/Refresh Last Request button to access information about the process that was just run. Information includes the Enrollment Request ID (from Block Enrollment), the Request Status, the time that the process ran, the total number of transactions, the number of transactions in error, and the number of transactions with messages.

Click on the Enrollment Request ID to go directly to the Block Enrollment component for this group of transactions. You are taken to the Block Enroll Detail page. View the Status column for any transactions in error. Or, to view only errors, click on the Block Enroll Merge tab and under Filtering Criteria, set Detail Status to *Errors*, and click the Retrieve button. You are taken back to the Block Enroll Detail page—however only those transactions with errors appear. Click on the detail link for further information and decide if you want to resolve any transaction issues.

You can view an example of the Transaction group box in the earlier section: *Running Batch Post Enrollment Requirement Checking for Multiple Classes*.

Defining Enrollment Requirement Note Types

This section discusses how to define enrollment requirement note types.

*Academic Institution: PeopleSoft University

*Term:

Population Selection

Population Selection

Selection Tool: [Edit Prompts](#)

Query Name: [Launch Query Manager](#) [Preview Selection Results](#)

Manual entry by class

Use Class Select Clear List

*Class Nbr	Subject	Catalog Nbr	Class Section	Title		
1 <input type="text" value="3028"/> <input type="button" value="Q"/>	BUSADM	620	1	Corp Strategy II	<input type="button" value="+"/>	<input type="button" value="-"/>

Note: Purging should be done with caution. If you purge post enrollment requirement data for previous terms, the affected records will be deleted from the following tables:

- SSR_REQS_HEADR: holds the enrollment requirement status and post enrollment requirement status.
- SSR_REQS_RSLTS: holds the requirement status of the requirement group line and requirement line level.
- SSR_REQS_CRSEU: holds the course work that was used to identify the status of the requirement group line or requirement line.
- SSR_REQS_COMM: holds the notes data.
- SSR_REQS_ACTN: holds the drop request or approval action.
- SSR_REQS_CLASS: holds the drop review flag.

For documentation about the fields on this page, refer to the documentation about similar fields in the earlier section: *Running Batch Post Enrollment Requirement Checking for Multiple Classes*.

Using Enrollment Web Services

Understanding Enrollment Web Services

Enrollment Web Services support self-service enrollment regardless of the user interface through which students interact with an institution. Any user interface that is web-service enabled and SOAP compliant can access EWS.

For detailed information about EWS, see *Enrollment Web Services Developers Guide* and *Enrollment Web Services Users Guide* in My Oracle Support (ID 1371391.1).

Chapter 41

Managing Program Planning and Enrollment

Understanding the Academic Progress Tracker

The Academic Progress Tracker (APT):

- Records the Academic Items (or program requirements/components) that a student accumulates as the student progresses through a program of study.
- Maintains the structure of a student's program requirements (as defined in AIR) so that results can be calculated at user-defined levels and progress can be tracked.
- Provides a user-defined structure of results and statistics (total credits, grade points, and so on) that is not subject to the constraints imposed by the core term based structure which has a strictly defined set of fields.

While APT provides this flexibility, the core Campus Solutions system is still used to manage admission and enrollment. A student still must have a valid Student Records program stack and, for enrollment purposes, a valid term row. In most cases therefore, the APT instance will be built after a person becomes a student (through the core Campus Solutions process).

Linking an APT Instance to the Student Program

If the Enable Program Enrollment check box is selected on the Academic Institution 9 page, the APT Instance and Year of Program fields appear on the Admissions Application Program Data page and the Student Records Program Data page. The check box is deselected by default; you must select the check box to use the Academic Progress Tracker.

See [Setting Up for the Academic Progress Tracker](#)

This section discusses how to:

- Create an APT Instance from core Admissions.
- Create an APT Instance from core Student Records.

[APT API Detail](#)

Pages Used to Link an APT Instance to the Student Program

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Application Program Data	ADM_APPL_PROG_ENT ADM_APPL_PROG_MNT	Student Admissions > Application Entry > Add Application > Application Program Data Student Admissions > Application Maintenance > Maintain Applications > Application Program Data	Create an APT instance.
Student Program	STDNT_PROG	Records and Enrollment > Career and Program Information > Student Program/Plan > Student Program	Create an APT instance.

Creating an APT Instance from Admissions

Access the Application Program Data page (Student Admissions > Application Entry > Add Application > Application Program Data).

Image: Application Program Data page example for Program Enrollment

This example illustrates the fields and controls on the Application Program Data page for Program Enrollment. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Application Program Data' page for a student named Rochelle Lewis. The page is organized into several sections:

- Personal Information:** Name: Rochelle Lewis; Academic Institution: PeopleSoft University; Academic Career: Undergraduate; Application Number: 00024917.
- Program Data:** Program Number: 0; Admit Term: 0730 (2014 Fall); Effective Date: 09/27/2013; Expected Graduation Term: 0780 (2017 Spr); Academic Program: BALAU (BALibArts); Campus: MAIN (Main); Academic Load: Full-Time.
- Program Enrollment:** Cohort Tag: FALL-ADMIT; Year of Program: 1st Year; APT Instance: (empty).
- Program Status:** Status: Applicant; Action Date: 09/27/2013; Program Action: APPL (Application); Action Reason: (empty); Last Updated On: 09/27/2013 3:34:51PM By: PS; Career Number: 0.
- Plan Data:** Academic Plan: ECONOMICS (Economics); Course: BA.
- Sub-Plan Data:** Sub-Plan: (empty).

Cohort Tag

This field appears only if the Enable Program Enrollment check box is selected on the Academic Institution 9 page. This value is obtained in the application process and indicates the point within a term (typically a session) that the applicant is expected to enroll.

APT Instance

This field appears only if the Enable Program Enrollment check box is selected on the Academic Institution 9 page.

Note: The rules governing the generation of the instance at the admission stage and the process to generate the instance are planned for the future.

Year of Program

This field appears only if the Enable Program Enrollment check box is selected on the Academic Institution 9 page.

This value is obtained in the application process and indicates the student’s start point in a program of study, for example, a student could apply as a second year student.

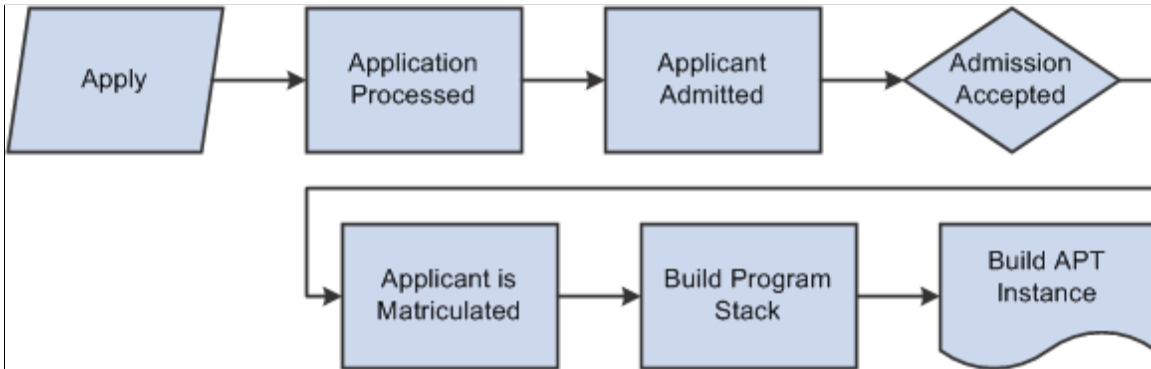

See "Adding New Applications Manually" (PeopleSoft Campus Solutions 9.2: Recruiting and Admissions)

See [Enabling Program Enrollment](#)

Creating an APT Instance from Admissions

Image: Creation of an APT Instance

Creation of an APT Instance:

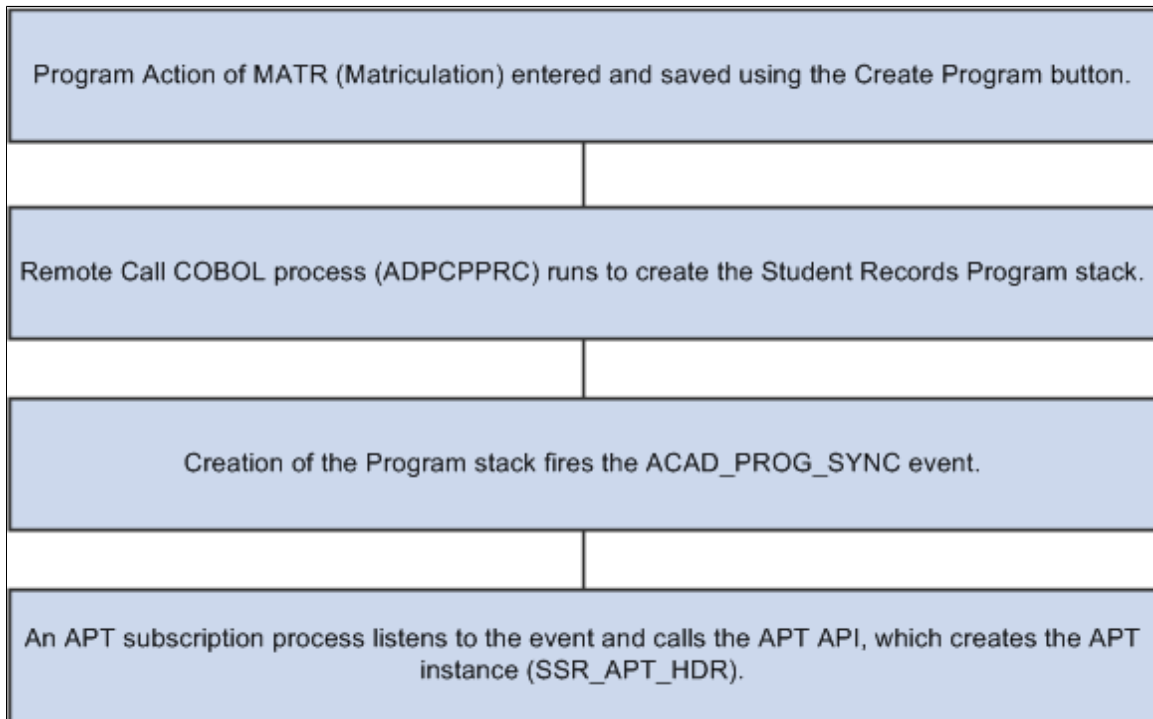

When the matriculation process creates the Student Records program stack, if a student is in a program/plan/sub-plan combination that is mapped to an AIR program, an API (SSR_APT.API) is called. The API creates an APT instance for the student, linking that instance to the program created by the matriculation process.

APT Instance Creation from Admissions Application Maintenance Component

An APT instance can be created directly from the Admissions Application Maintenance component when a user creates the student program using the matriculation (MATR) action.

Image: APT Instance Creation from Admissions Application Maintenance Component

The following diagram provides an overview of the processing that takes place:

APT Instance Creation from Admissions Activate Applicants Process

The Admissions Activate Applicants batch process also creates an instance for a student when a mapping exists to an AIR program. When the process (ADPCPPRJ) creates Student Records program stack entries, this action fires the same ACAD_PROG_SYNC event described above. This is detected by the APT subscription service, which in turn calls APT API to build an instance.

See "Understanding How to Evaluate Applicants Using Automatic Processing" (PeopleSoft Campus Solutions 9.2: Recruiting and Admissions)

Related Links

[APT API Detail](#)

Creating an APT Instance from Student Records Program/Plan Component

Access the Student Program page (Records and Enrollment > Career and Program Information > Student Program/Plan > Student Program).

Image: Student Program page example for Program Enrollment

This example illustrates the fields and controls on the Student Program page for Program Enrollment. You can find definitions for the fields and controls later on this page.

The screenshot shows a web interface for a student program. At the top, there are tabs for 'Student Program', 'Student Plan', 'Student Sub-Plan', 'Additional Information', 'Student Attributes', 'Student Degrees', and 'AUS Student Program'. The main content area displays details for student Rochelle Lewis, SRPE1007. The 'Academic Career' is 'Undergraduate' and the 'Status' is 'Active in Program'. The 'Effective Date' is 01/01/2012, and the 'Program Action' is 'ACTV'. The 'Academic Institution' is 'PSUNV' (PeopleSoft University) and the 'Academic Program' is 'BALAU' (BA Liberal Arts Programs). The 'Admit Term' and 'Requirement Term' are both '0710' (2013 Fall). The 'Year of Program' is '01 - First Year' and the 'APT Instance' is '1'. The 'Cohort Tag' is 'FALL-ADMIT'. On the right side, there are fields for 'Effective Sequence' (1), 'Action Date' (08/01/2013), 'Joint Prog Appr.' (checkbox), 'Admissions' (checkbox 'From Application'), 'Application Nbr' (0), 'Application Program Nbr' (0), '*Campus' (MAIN), '*Academic Load' (Full-Time), and 'Academic Shift'. The page is updated on 09/30/2013 at 1:50:14PM by user PS.

Year of Program

This value is gathered in the application process and indicates the student’s start point in a program of study: for example, a student could apply as a second year student. The value is copied from the Admissions program stack by the matriculation process.

APT Instance

This field is populated with number of the APT Instance. This could be generated during the Admissions activation/ matriculation process, the APT Request process or from this component (see “Adding a New Program” below).

Click the APT Instance link to access the Academic Progress Tracker component. From that component, click the Student Career Nbr link to return to the Student Program page.

See [Creating and Managing APT Instances Using the Academic Progress Tracker Component](#)

Cohort Tag

This value is obtained in the application process and indicates the point within a term (typically a session) that the applicant is expected to enroll.

An APT instance can be created from the Program/Plan component when a user adds a new program stack (or career number) or makes changes to an existing program stack: the APT API is called from this component to create an APT instance.

Adding a New Program

An APT instance can be created from the Program/Plan component when a user adds a new program stack (or career number) or makes changes to an existing program stack: the APT API is called from this component to create an APT instance. When a new career number is added and the component is saved, the APT API is called.

The API:

- Checks to see if mapping exists for the student's program in the Academic Program Table Program Enrollment Mapping table. (SSR_PE_PRG_MAP).
- If mapping exists, finds a row which maps to the combination of Plan(s) Sub-Plan(s) and Approved Academic Load. If mapping does not exist, uses the default (a default is required).
- Creates an APT Instance for the mapped AIR program (process creates a row in the APT header table).
- Updates the Instance number (ACAD_PROG.SSR_APT_INSTANCE).
- The component returns a message to the user, confirming that an instance has been created.

See [Mapping Campus Solutions Academic Programs, Plans and SubPlans to AIR Based Programs of Study](#)

Changes to Existing Program Data

When a user inserts a new effective dated row and saves, an edit is performed to see if the new data – academic program, approved academic load, academic plan(s) or sub-plan(s) – has changed the program mapping from the previous row. If such a change has occurred:

- A message is returned to the user to ask if a new instance should be created.
- If the user answers yes, the API is called and the steps described in the previous Adding a New Program section are performed.

It is also possible that a student's program data could change in such a way that a new effective dated row could map to a prior APT instance. For example, a student might change from full-time (Instance 1) to part-time (Instance 2) and then subsequently change back to full-time. When this occurs, and the new data maps to a program on a prior instance:

- The user is prompted to create a new instance (because the mapping has changed).
- If a match is found on a prior instance, the user is prompted to point the new effective dated row to that instance.
- If the user answers yes, the instance number from the previous instance is used; otherwise a new instance is created.

[Maintaining Student Program Stacks](#)

[APT API Detail](#)

Creating and Managing APT Instances Using the APT Request Process

As previously mentioned, an APT instance can be generated after an applicant has been activated, or directly from the Student Program/Plan component when you add a new program stack or when a change is made to an existing program stack. The APT Request process allows you to create new instances for groups of students and to maintain those instances by adding and activating new program nodes as they progress through a program of study.

The process of generating an APT instance can, depending on the processing action, involve two main steps:

1. The creation of a header record, which creates the keys of the instance and the academic item ID for the assigned program.
2. The population of the instance with the academic items or program requirements for a selected program item.

For detailed information about each of the operations performed by the APT API, see [APT API Detail](#).

This section discusses how to run the APT Request process.

Page Used to Run the APT Request Process

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
APT Request	SSR_APT_REQ_RUNCNT	Records and Enrollment > Program Enrollment > APT Request	Run the APT Request process.

Running the APT Request Process

Access the APT Request page (Records and Enrollment > Program Enrollment > APT Request).

Image: APT Request page

This example illustrates the fields and controls on the APT Request page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'APT Request' page with the following fields and controls:

- Run Control ID:** PS, [Report Manager](#), [Process Monitor](#), and a **Run** button.
- *Academic Institution:** PSUNV (with a search icon).
- *APT Action:** Create Plan Node(s) (dropdown menu).
- *Program Format ID:** UG_4YR_REG (with a search icon) and a [View Tree](#) link.
- Create Plan Node** (radio button) and **Create Selected Plan node(s)** (radio button).
- Population Selection** section:
 - Population Selection
 - Selection Tool:** PS Query (dropdown) and [Edit Prompts](#) link.
 - Query Name:** SSR_APT_REQ_PRG_TERM (with a search icon) and [Launch Query Manager](#) and [Preview Selection Results](#) links.
- Term Activate and Activate Planning Node
- Create Next Node(s)/Attempt Options** section with a table:

Planning Node	Description	Attempt Status	Attempt Outcome	Action Mode
1	10 Year 1	Activated	Passed	Next Planning Node

APT Action

These actions determine how the APT Request process (SSR_APT_REQ) builds a new APT instance or interacts with an existing instance. Select an action:

- *Create Instance:* Builds a new APT Instance by creating a header record (SSR_APT_HDR) containing the keys and other high level data for the instance. This action emulates the processing that occurs as a result of an Admissions program activation or from the Student Program/Plan component. This action updates the student program/plan stack with the instance number.
- *Create Ins and Plan Node Attempt:* Creates a new instance and builds on the first planning node attempt, along with any child program format tree nodes as well as any other items for which the Automatically Move to APT check box is selected on the Enrollment Category page. This action updates the student program/plan stack with the instance number.

See [Setting Up Enrollment Categories for Program Requirements](#)

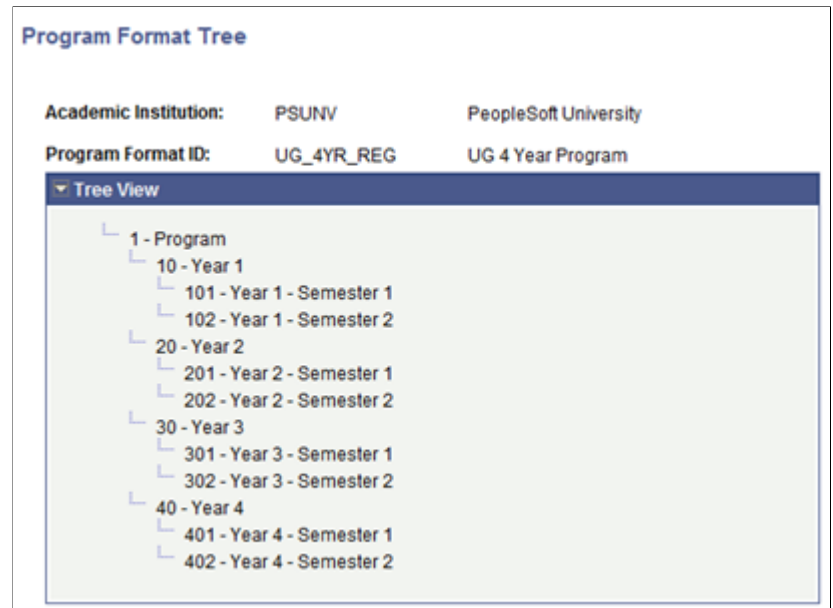

- *Create Plan Node(s):* Builds out the next planning node or specified planning node of the program, depending on whether the Create Plan Node or Create Selected Plan Node(s) option is selected (see documentation later in this section). The process creates the planning node item and attempt along with any items (for that node) for which the Automatically Move to APT check box is selected on the Enrollment Category page. The next node is the next node

in the student's program after the current or maximum node in APT. For example, if the program planning nodes are defined as years, node 100 (year 1), 200 (year 2), 300 (year 3) and the maximum node in APT is currently 200, the next node is year 3 (300). When you select this action, the Create Next Node/Attempt Options grid becomes available.

- *Activate Planning Node*: Sets the Attempt Status field (on the APT Items page) to *Activated* for the items representing the planning node and child program format tree nodes. For example, with a program format like this:

Image: Program Format example for APT (Academic Progress Tracker)

This example illustrates the fields and controls on the Program Format example for APT (Academic Progress Tracker). You can find definitions for the fields and controls later on this page.

where *Year* is the Planning Node, this action would activate the Year and both of its child Semester items. Activation occurs on the current planning node in APT: that is, the maximum sequenced planning node with an attempt status equal to null.

Program Format ID

This field prompts against the Program Format Table for the selected institution. Use the View Tree link to view the Program Format definition. The value that is selected here serves as a high level control for the run control. Only students (identified by the population selection or entered manually) in programs with a matching program format ID are considered for processing.

Create Plan Node

When this option is selected, the APT request process sequentially identifies which planning node should be created for a student. For example, if the student's program format has four planning nodes, 10, 20, 30 and 40 and the action is *Create Ins and Plan Node Attempt*, the process creates the lowest planning node ID, 10.

This option is selected by default.

Create Selected Plan Node(s)

If this option is selected, the user must identify which plan node (within a Program Format) should be created for the run. This allows planning nodes to be created in a user defined order when necessary.

For example, you could define a Program Format where it is necessary to create and activate multiple planning nodes at the same time. Refer to the following example.

Image: Program Format example Create Selected Plan Node(s)

This example shows a dual major program format, where planning nodes (years) are defined under each major:

Program Format

Institution PeopleSoft University

Format ID 3-YR-MAJOR

***Description** -

Item Type Usage

Planning Node	YEAR	Year
Year of Program	YEAR	Year
Equates to Term	YEAR	Year

Add Session Level

Date Controls

Student Planning Term/Session Table

Tree View

- 1 - Program of Study
 - 10 - Major 1
 - 20 - Year 1
 - 30 - Year 2
 - 40 - Year 3
 - 50 - Major 2
 - 60 - Year 1
 - 70 - Year 2
 - 80 - Year 3

The Create Selected Plan Node(s) option can be used to identify, create and activate each year for each major. To activate the student in Year 1 for both Majors, Node IDs 20 and 60 would be specified.

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool to identify IDs for a specific transaction, you must use it.

Selection Tool Select *External File* or *PS Query*.

Query Name

The following queries are delivered as samples:

- SSR_APT_REQ_SAMPLE (prompts on Institution only).
- SSR_APT_REQ_PRG_TERM (prompts on Institution, Academic Career, AIR Program item ID and APT Cohort Term)

When you create queries for use with APT Request, you must use the bind record SSR_APT_PROG_VW.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Manual Selection**Academic Career**

Enter a valid academic career for the institution/student combination.

Student Career Nbr

Prompts against a view of the student's program stack for the selected ID/Academic Career.

Academic Program

Enter a valid academic program value for the student.

APT Instance

If the APT Action is *Create Instance* or *Create Instance and Plan Node Attempt*, this field is not displayed and defaults to 0. For other actions (where the process acts on an existing instance) the APT instance number attached to the selected Student Career Number will default.

Activating Terms and Planning Nodes**Term Activate**

When this check box is selected, the process term activates (that is, creates student term/STDNT_CAR_TERM rows) for all terms within the planning node. This check box is available for all APT actions except *Create Instance*.

Activate Planning Node

When this check box is selected, the process activates the planning node (and any child program format tree nodes) as they are created. This check box is available when the APT Action is *Create Ins and Plan Node Attempt* or *Create Plan Node(s)*.

Create Next Node(s)/Attempt Options

When the APT Action is *Create Plan Node(s)*, the Create Next Node(s)/Attempt Options grid becomes available (as in the page example above).

Planning Node

Available only when the Create Selected Plan Node option has been selected. Select a planning node from the prompt values for the Program Format. The value that you select here is used in one of two ways, depending on the value selected in the Action Mode field (see below). The value represents either the node ID of the planning node to be created in this run or it

represents the student(s) current planning node and the process should create the next planning node in the sequence.

Attempt Status

The value that you select here is the Attempt Status of the current planning node for the students being processed. The values are: *Activated*, *Completed*, and *Finalized*. Only students with the attempt status that you select are processed.

Attempt Outcome

The value that you select here is the Attempt Outcome of the current Planning node for the students being processed. The values are: *Passed* and *Not Passed*. Only students with the attempt outcome that you select are processed.

Action Mode

Determines whether the process should create a specified planning node or the next planning node or a new attempt against the current planning node. The values are:

- *Create Plan Node*: This value is available only when the Run Control mode is Create Selected Plan Node. You must enter a value in the Planning Node field. The process creates this planning node if it does not already exist in the student's APT instance.
- *Next Planning Node*: Builds out the next planning node, including any child program format tree nodes and items for which the Automatically Move to APT check box is selected on the Enrollment Category page.
 - If the Run Control mode is Create Plan Node, this process uses the student's current (that is, maximum) planning node to determine the next planning node in sequence for the student.
 - If the Run Control mode is Create Selected Plan Node, you must enter a value in the Planning Node field. The process uses this value to determine the next planning node.
- *New Attempt*: Creates a new attempt against the current planning node, if that planning node has been flagged as Eligible for Retake in the student's APT instance. When this is true, the process creates a new attempt against the planning node and also creates new attempts against any program format tree nodes flagged as Eligible for Retake.
 - If the Run Control mode is Create Plan Node, the process creates a new attempt against the student's current (that is, maximum) planning node.
 - If the Run Control mode is Create Selected Plan Node, you must enter a value in the Planning Node field. The

process creates a new attempt against this planning node if it exists in the student's APT instance.

Creating and Managing APT Instances Using the Academic Progress Tracker Component

This section discusses how to:

- Add an APT instance.
- Manage APT instance statuses.
- Use the AIR Tree.
- Use the APT Tree.
- Manage APT Items.
- Use the APT timeline.

Pages Used to Create and Manage APT Instances

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Header	SSR_APT_HDR	Records and Enrollment > Program Enrollment > Academic Progress Tracker > Header	Add an APT instance.
AIR Tree	SSR_APT_AIR_TREE	Records and Enrollment > Program Enrollment > Academic Progress Tracker > AIR Tree	View program requirements and add academic items to APT.
APT Tree	SSR_APT_TREE	Records and Enrollment > Program Enrollment > Academic Progress Tracker > APT Tree	View the academic items within an APT instance.
APT Items	SSR_APT_ITM	Records and Enrollment > Program Enrollment > Academic Progress Tracker > APT Items	Manage APT items.
Timeline	SSR_APT_TIMETABLE	Records and Enrollment > Program Enrollment > Academic Progress Tracker > Timeline.	Use the APT timeline.

Adding an APT Instance

Access the Header page (Records and Enrollment > Program Enrollment > Academic Progress Tracker > Header).

Image: Header page

This example illustrates the fields and controls on the Header page. You can find definitions for the fields and controls later on this page.

Header AIR Tree APT Tree APT Items Timeline

*Curriculum Term 0710 2013 Fall

Instance Locked

An APT Instance is created by EMPLID, INSTITUTION and SSR_APT_INSTANCE. In addition to providing a link to the student’s program stack, the Instance Header record also captures key high level data about the student’s program of study.

Delete

You can delete an instance if no Instance Number exists on the Student Program page and no result rows exist for which the Include in Calculation check box is selected on APT Items page and the Result Status is Undetermined.

See [Linking an APT Instance to the Student Program](#)

See [Managing APT Items](#)

Academic Career	Select an academic career. A student must have an active STDNT_CAREER row for the selected career.
Student Career Nbr	Select a student career number. The field prompts against all active student program stacks for the selected academic career. Click the related link to access the Program Plan component for the selected career number.
Effective Date and Sequence	Displays effective date and sequence of the current row for the student's program/plan stack.
Program Status	Displays the status of the program associated with the selected career number.
Academic Load	Displays the approved academic load for the program.
Academic Plan/Sub Plan	Display only.
Academic Item ID	Select an academic item ID. The prompt lists all valid academic items with an academic item type of Program (SSR_AIR_HDR.SSR_ITEM_TYPE = 'PRG'). This is a delivered academic item type value.
Format ID	Displays the program format ID attached to PRG Academic Item. This value is used to assign an enrollment cohort to a student (see Cohort Term).
Cohort Tag	This value is obtained in the application process and indicates the point within a term (typically a session) that the applicant is expected to enroll. If present, this value is used to assign an enrollment cohort to a student (see Cohort Term).
Cohort Term	The admit term of the student (ACAD_PROG.ADMIT_TERM) appears by default but can be changed. This value is used to assign an enrollment cohort to a student. The system uses the institution, career, program format ID, approved academic load, cohort term and cohort tag (if it exists - it is not required) to point to an enrollment cohort definition for the student. If a student does not have a Cohort Tag, the system looks for matches in the Enrollment Cohort Table where the Cohort Tag value is null. See Setting Up Enrollment Cohorts
Curriculum Term	The value of the requirement term for the selected career number appears by default. You can change the value.
Instance Locked	Select this check box to lock the entire APT instance, preventing any updates. Note: This feature is planned for the future.
Instance Attributes	The scroll area allows you to assign attributes and values to an APT instance. Associate instance attributes for use with APT Instances on the Common Attributes – Record Context page.

See "Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

Generate

Click this button to launch the process that fetches all academic items that are attached to the PRG academic item ID. The following documentation explains the generate process.

Generating Academic Items

As mentioned previously, the process of adding an APT instance involves two steps. The first is the creation of a header record using the fields described above. The second step is the generation of the academic items or program requirements for a selected program item. This could be a single item (for the program itself) if the program item is a shell for a customized student specific program, or it could be an extensive list of requirements that are nested under the program item in a series of layers or levels. The item generation process does the following:

1. Evaluates the TERM_TBL to find the start date of the student's Requirement Term (SSR_APT_HDR.REQ_TERM).
2. Using that date, it retrieves the maximum active effective dated row for the PRG item (from SSR_AIR_HDR) where the effective date is less than or equal to the Curriculum Term start date.
3. Retrieves all Academic Item rows for the PRG item and its children, all child items of the PRG's children and so on.

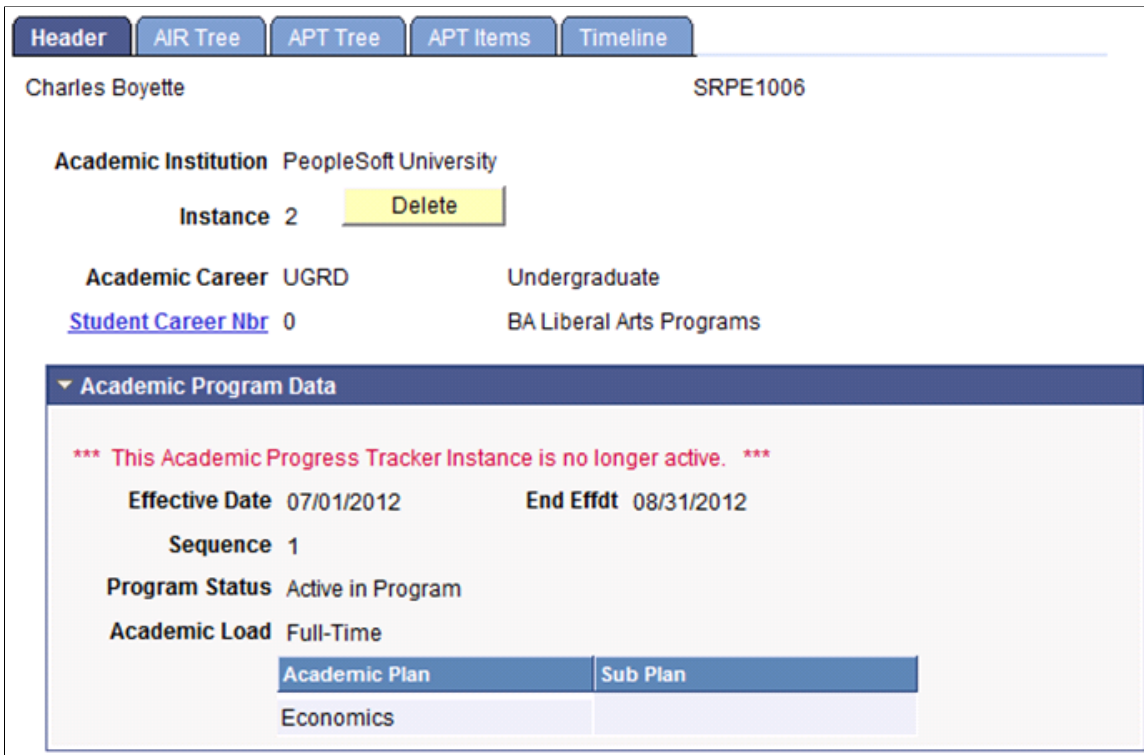

The list of items returned (on the AIR Tree page) represents a view of all the items that are tied to the PRG academic item in the header. These are the items that can be added from AIR to the student's APT instance.

Managing APT Instance Statuses

An APT Instance is essentially an extension of the student's program/plan stack, and the status of the instance (active or inactive) is conferred by the most current effective dated row on the program stack.

Image: Header page example of inactive instance

When an APT instance is inactivated, the instance is marked as inactive and an *end effective date* is displayed as in the following example:

An APT instance can be rendered inactive when one of the following events occurs on the program/plan stack:

- An effective dated row is added which inactivates the program stack (for example, the program row is discontinued or suspended).
- A change occurs in the program stack data (such as a program or plan change) which initiates the creation of a new APT instance as of a certain date.

For example, Student A has instance 1, which is active as of 07/01/2012. Student A changes Plan with an effective date of 08/01/2013. This plan change maps to a new AIR program which leads to the creation of a new instance for the student, instance 2. In this case, the APT Header data would look like this:

<i>Instance</i>	<i>Effective Date</i>	<i>End Effective Date</i>
1	07/01/2012	07/31/2013
2	08/01/2013	

Using the AIR Tree

The AIR Tree provides a view of a student’s program requirements as they are defined in the Academic Item Registry. When you click Generate on the Header page, all of the academic items attached to the

student’s academic program item (that is, the value in the Academic Item ID field on the Header page) are rendered in a view that represents both program structure and content.

See [Setting Up Academic Item Registry Entries, Item Details, and Item Security](#)

Access the AIR Tree page (Records and Enrollment > Program Enrollment > Academic Progress Tracker > AIR Tree).

Image: AIR Tree page (1 of 2)

This example illustrates the fields and controls on the AIR Tree page (1 of 2). You can find definitions for the fields and controls later on this page.

Enrollment Category

A value appears in this column when the academic item has an enrolment category. An Enrollment Category is a user defined code that is used to control how an academic item is moved to an APT instance.

See [Setting Up Enrollment Categories for Program Requirements](#)

APT Action

In the APT Action column, the Create Planning Node icon or Add icon can appear.

The Create Planning Node icon appears when the item has not yet been added to APT. The icon appears only for the academic items that are identified as Planning Nodes in the Program Format definition for the program (SSR_PROG_FORM.SSR_ITEM_TYPE_PLN). Planning Nodes in the Program Format indicate the level at which a student can start to plan and enrol (for example, year by year).

See [Setting Up Program Formats](#)

The Add icon appears for all academic items other than grading items.

APT Item Seq

This column appears as soon as one item is added to APT. The sequence number is generated as items are added to APT and therefore sequencing depends on the order in which items are

added. Click the link to access the APT Items page and view the expanded item detail section for the selected item.

See [Managing APT Items](#)

AIR Item ID

This column lists the Academic Item IDs that are associated with the PRG item selected in the header – that is, child items of the PRG item and of all of its related items. Click the link to access the AIR component for the selected academic item.

Using the Create Planning Node Function

The Create Planning Node function simulates the APT Request action of *Create Plan Node(s)* by inserting all of the academic items for the first or subsequent sections of a student's program of study by adding academic item(s) identified as Planning Nodes (in the Program Format definition).

See [Setting Up Program Formats](#)

The placement of the planning node (and selected child items) will open that particular section of the program—for example a stage, year or semester—for planning and enrollment.

The Create Planning Node function adds:

- The selected item (that is, the item identified as a Planning Node and where the icon appears).
- All ancestors in the lineage that are not already in APT.
- AND
- All non-COURSE immediate child items (for example a 'stage' or 'study period').
- Any descendent items that have an enrollment category for which `SSR_ENRL_CAT.SSR_AUTOMOVE_APT = 'Y'`.

Image: AIR Tree page example 1

In the following example, each phase is a Planning Node. The Enrollment Category of Mandatory is defined as one for which items should be automatically moved to a student's APT:

Expand / Collapse	AIR Item Description	Item Type	Enrollment Category	APT Action	APT Item Seq	AIR Item ID
	B.A. Economics	Program of Study			0000000010	0000001753
	- B.A. Economics Part I	Phase				0000001754
	- BA Econ - Year 1	Stage				0000001755
	- BA Econ - Year 1 - Semester 1	Study Period				0000001756
	- ECON 2: Macroeconomic Principles	Course	Mandatory			0000000388
	- and ECON 3: Microeconomic Principles	Course	Mandatory			0000000389
	- and ECON 10: Introduction to Intl Economics	Course	Mandatory			0000000346
	- and POL SCI 1: Intro to US Govt and Politics	Course	Mandatory			0000000100
	- and STATS 101: Statistical Analysis I	Course	Mandatory			0000000566
	- and BA Econ - Year 1 - Semester 2	Study Period				0000001757
	- ECON 1001B: Economic Principles II	Course	Mandatory			0000000422
	- and ECON 1004B: Economic Methods II	Course	Mandatory			0000000446
	- and ECON 112: Intl Political Economy	Course	Mandatory			0000000529
	- and Economics Year 1 Options	Requirement	Mandatory			0000001749
	- Economics Year 1 Option List A	Course List	Required Electives			0000001743
	- (ECON 1011: Industrial Economics	Course	Required Electives			0000000397
	- and SOC 103: Social Problems)	Course	Required Electives			0000000019
	- or (ECON 1014: Economics of Social Problems	Course	Required Electives			0000000400
	- and SOC 180: World Pop Probs)	Course	Required Electives			0000000171
	- or Economics Year 1 Option List B	Course List	Required Electives			0000001744
	- (ECON 1012: Intntl Political Economy	Course	Required Electives			0000000398
	- and POL SCI 101: Introduction to Government)	Course	Required Electives			0000000095
	- or (ECON 1013: Public Sector Economics	Course	Required Electives			0000000399
	- and POL SCI 105: Intro to World Politics)	Course	Required Electives			0000000097

When Phase 1 is created, the following items will be added to APT:

<i>AIR Item Description</i>	<i>Item Type</i>	<i>AIR Item ID</i>
BA Economics	Program of Study	0000001753
Part 1 – BA Economics Program	(Program Phase)	0000001754
Year 1 B.A Economics	Stage	0000001755
Year 1 – Semester 1	Study Period Plus all Mandatory items, in this case all courses	0000001756

AIR Item Description	Item Type	AIR Item ID
Year 1– Semester 2	Study Period Plus all Mandatory items: all three mandatory courses plus the mandatory Economics Year 1 Options item (but not its children, which do not have the Automatically move to APT check box selected on the Enrollment Category page, because the student needs to choose.)	00000001757

See [Setting Up Enrollment Categories for Program Requirements](#)

Using the Add Function

You can also add academic items to an APT instance on an individual basis using the Add function. For example the Add button can be used to add courses when you must select one or more courses from a list. When items are added to a student’s APT in this way however, the relationship of that item to other items in the AIR tree must be recorded in order to maintain the structure of the program at an individual student level. Because it is possible to add an item without also adding its parent, the *ancestors* of an item are also added if they have not themselves been added to the APT instance.

In most cases the Add function adds the selected item to APT as well as all ancestors in the lineage, up through the PRG root, that do not already exist in APT. The exception is course items that are not associated with an item that equates to Term.

See [Assigning Term Values to Courses](#)

Image: AIR Tree example 2

This example illustrates the AIR Tree as explained below.

[-] [-] [-] and Part 2 - BA Economics Program	Program Phase		00000000573
[-] [-] [-] and Economics - Part 2 Required Courses	Course List	Required Courses	00000000565
[-] [-] [-] [-] ECON 2011: Company, Finance and Strategy	Course	Required Courses	00000000406
[-] [-] [-] [-] and ECON 2012: Corporate Finance	Course	Required Courses	00000000407
[-] [-] [-] [-] and ECON 3005: U.S. and the Intl Economy	Course	Required Courses	00000000426
[-] [-] [-] [-] and ECON 3004: The International Economy	Course	Required Courses	00000000417
[-] [-] [-] [-] and Year 2 - B.A. Economics	Stage		00000000579
[-] [-] [-] [-] [-] Year 2 - Semester 1	Study Period		00000000580
[-] [-] [-] [-] [-] [-] ECON 2001: Microeconomic Analysis I	Course	Mandatory	00000000400
[-] [-] [-] [-] [-] [-] and ECON 2003: Mainstream Macroeconomics I	Course	Mandatory	00000000402
[-] [-] [-] [-] [-] [-] and ECON 2005A: Economic Investigation I	Course	Mandatory	00000000404
[-] [-] [-] [-] [-] [-] and Year 2 - Semester 2	Study Period		00000000581
[-] [-] [-] [-] [-] [-] [-] ECON 2002: Microeconomic Analysis II	Course	Mandatory	00000000401
[-] [-] [-] [-] [-] [-] [-] and ECON 2004: Mainstream Macroeconomics II	Course	Mandatory	00000000403
[-] [-] [-] [-] [-] [-] [-] and Economics Year 2 Options	Course List	Electives	00000000568
[-] [-] [-] [-] [-] [-] [-] [-] [-] ECON 220: Labor Economics	Course	Electives	00000000511
[-] [-] [-] [-] [-] [-] [-] [-] [-] or ECON 224: Health Economics	Course	Electives	00000000512

In the example above, if you added course ECON 220 (highlighted in the example page) and no other items had been added to the APT for Part 2 B.A. Economics, the following items would also be added:

- ECON 220 (00000000511– selected item)
- Economics Year 2 Options (Course List: 00000000568 – parent of selected item)
- Year 2 - Semester 2 (Study Period: 00000000581 – parent of Course List)
- Year 2- B.A. Economics (Stage: 00000000579 – parent of Study Period)
- Part 2 - BA Economics Program (Phase: 00000000578– parent of Stage)

Using the APT Tree

The APT Tree provides a view of all of the academic items within a particular APT instance, the status of those items (completed or not completed) and the relationships between those items. Although APT data is sourced from data that is defined in a tree-like structure (AIR) it is possible that these relationships can be changed after the items are placed in an APT instance. A course could be moved from one stage to another, for example, such that the parent item is changed from STAGE 1 to STAGE 2. The individual student program tree structure presented in this way is used to calculate results at various levels in the program. Note. This feature is planned for the future.

Access the APT Tree page (Records and Enrollment > Program Enrollment > Academic Progress Tracker > APT Tree).

Image: APT Tree page

This example illustrates the fields and controls on the APT Tree page. You can find definitions for the fields and controls later on this page.

Status

Indicates whether an item is *Completed* or *Not Completed*.

This value will ultimately be set based on the APT item status (planned for the future). For now, the status can be set manually at the APT item level.

See [Managing APT Items](#)

Indicates the status of the item is *Completed*.

Indicates the status of the item is *Not Completed*.

For information about the Enrollment Category, APT Item Seq, and AIR Item ID columns, refer to the previous documentation about these fields for the AIR Tree page.

Managing APT Items

The APT Items page provides a view of all items in an APT instance and their related detail. The three levels of data for an APT item are:

1. The APT Item Sequence level (SSR_APT_ITEM) which holds high level data such as the item sequence, weight, and status.
2. The Academic Item Attempt level: An academic item can have multiple attempts attached to it. An item such as COURSE can be repeated without altering the structure of the program. For example, a first year course can be repeated during the second year, but the outcome/credits apply to the first year requirements. Data such as academic year and term are also tracked at this level.
3. The Academic Item Attempt Results level: Each attempt can have multiple results associated with it. There can be multiple Result Types and the structure also accommodates multiple instances of the same result type. This structure allows you to define your own result profile – where the institution determines what type of data is used to track results. It also allows for different versions of results – for example, *preliminary*, *board approved*.

As you can see in the following page example, an Academic Item Attempt can have Attempt Schedule data (sibling) and can have multiple Results rows. The same structure is available for all academic items - the course item shown in the example page has the same basic APT structure as the Study Period item shown above it on the example page.

Access the APT Items page (Records and Enrollment > Program Enrollment > Academic Progress Tracker > APT Items).

Image: APT Items page (1 of 3)

This example illustrates the fields and controls on the APT Items page (1 of 3). You can find definitions for the fields and controls later on this page.

The screenshot shows the 'APT Items' page with the following elements:

- Navigation Tabs:** Header, AIR Tree, APT Tree, **APT Items**, Timeline
- User Information:** Anthony Sage, SR0448
- Academic Institution:** PeopleSoft University
- APT Instance:** 1
- Instance Status:** Active
- Buttons:** Expand All Sections, Collapse All Sections
- Item List:**
 - 0000000010 - Program of Study: B.A. Economics
 - 0000000020 - Phase: B.A. Economics Part I
 - 0000000030 - Stage: BA Econ - Year 1
 - 0000000040 - Study Period: BA Econ - Year 1 - Semester 1

Image: APT Items page (2 of 3)

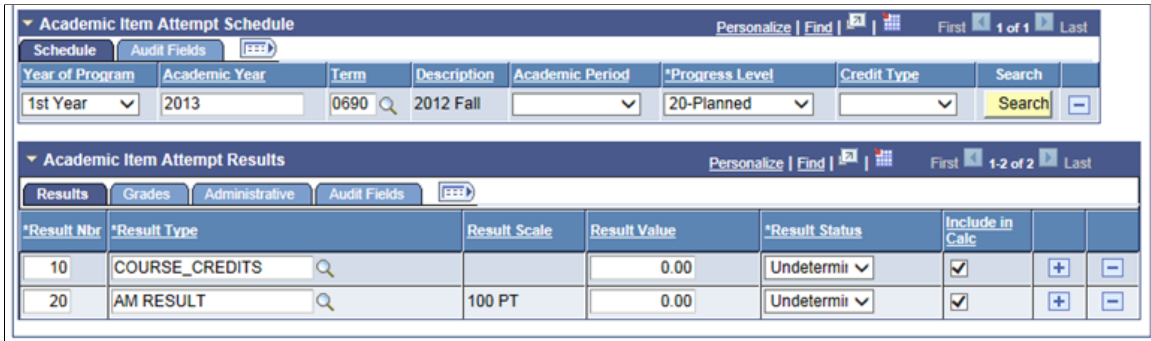

This example illustrates the fields and controls on the APT Items page (2 of 3). You can find definitions for the fields and controls later on this page.

The screenshot shows the configuration for a specific APT item and its attempt:

- Item Header:** 00000000370 - Course: SOC 230: Sociological Methods I
- Fields:**

Image: APT Items page (3 of 3)

This example illustrates the fields and controls on the APT Items page (3 of 3). You can find definitions for the fields and controls later on this page.

APT Items Page: APT Item Sequence Level

Process Substitution

See: Substituting APT Items

Add

See: Adding Child Items

Delete

Item Delete is available for all APT items, however delete is prevented on save if the item being deleted has child items.

Add Notes

Click to access a secondary page Item Notes where you can add notes and comments.

Lock

Click to lock the item and all of its child items. A locked item cannot be updated: all fields at the item, attempt and result level are display only.

Unlock

Click to unlock the item and child items that are locked.

APT Item Seq

The APT Item Sequence is assigned as items are added to an APT Instance. You can change the value to reorder items when required.

Parent Item Seq Nbr

This value is the APT Item Seq value of the parent item. You can change this value if you need to move an item to a different area of a student’s program (for example, from one stage to another).

Go

Use the Go icon to quickly navigate to the parent academic item.

Academic Item ID and Academic Item Type

Displays the Academic Item ID and Academic Item Type of the item copied from the AIR program structure to the student’s APT.

Grading Item Type	Display only. This check box is selected when the APT row was created to represent a (child) grading item from AIR.
Item Weight	If an item has a weighting value (in the context of its parent), it is moved to this field when the item is saved to APT. You can change this value, to override the contribution of a particular item to a higher level calculated result.
Authorized Exception	This field displays only when an item that has been added to the instance does not exist in the Academic Item Registry as an item for the student's program. There is currently only one value: <i>Admin Addition</i> .
Satisfied	Select <i>Yes</i> , <i>No</i> , or <i>Waived</i> . A value of <i>Yes</i> indicates that the requirements for an item have been satisfied and that the item (in combination with the Include in Calculation check box) can be used towards program completion/results calculation.
Exam Only Option	Select this check box to indicate that an item (and all child items) will be satisfied by exam only – that is, no course enrollment is required. This feature is planned for the future.
Include in Calculation	When this check box is cleared, all attempts/results for this item are ignored for result calculation purposes by the Rules Engine and system calculated results. Note: This feature is planned for the future.

APT Items Page: Adding Child Items

In most cases, the items (courses and so on) that are added to an APT instance will be drawn from the items that are linked to the student's program. However, in some cases it might be necessary to make changes to a student's program by adding items that are not linked directly to the student's program of study or to remove items that are part of the program requirements defined in AIR. A typical example is where the student, usually in consultation with an advisor, is allowed to create a personalized or customized set of courses. This could apply to whole program or to a section of a program - a year or semester for example. In this case, it is likely that you will define an item that is really a placeholder for the program itself, or the year of program, to which you will add child items to represent the student's *custom* program. However, the Add feature allows you to add child items to an APT item with some exceptions.

When you add an item, you are presented with a list of values that is compiled as follows:

- If the current item is a Program Format Tree Node, the prompt lists all academic items that have an academic type specified as a valid child item in the Academic Item Type Matrix.

See [Identifying Child Item Types and Syncing Entities](#)

- The prompt also excludes those items that have an item type defined as a Program Format Tree Node. This ensures that any changes to the program structure conform to the Program Format for the item.

- All available COURSE items (unless the item is being added as a child of a COURSE – *except where* the current item is a Course Group, in which case a secondary page will list the courses that match the Course Group parameters).

Example: Add Child item to Year 1 of Program BA Economics:

- BA Economics has a Program Format comprised of Academic Item Types: PRG (Program), PHASE (Part 1 and 2), STAGE (Year), and STUDYPERIOD (term/semester).
- Year 1 has an Academic Item Type of Year with an Item Type of STAGE.
- Therefore, the available items to be added as child items would be all valid child items (according to the Item Type matrix) of the item type STAGE, excluding PRG, PHASE, STAGE, STUDYPERIOD, plus all available COURSE items.

APT Items Page: Substituting APT Items

The APT Item structure supports the need to substitute prescribed program content (academic items) with courses or other types of academic items. The substitution process typically involves the swapping of one course for another, but it is also possible to substitute different types of academic items, as well as the replacement of one item with many items. It is also possible to replace an item of one type with one (or more) of a different type.

Note: Not all academic items can be substituted: the Process Substitution button is hidden when an item has an academic type identified as a program format tree node, or if the item itself has been replaced with another APT item. The button is also hidden for any item that has child items in APT. For example, a Course List item, from which child item courses have been placed in APT cannot be substituted.

Image: Process Substitution example

The Process Substitution button invokes a look up against Academic Item Registry for the institution attached to the student’s APT instance.

Parent Item Type: STUDYPERIOD
Academic Institution: PSUNV

Academic Item ID: begins with
Description: begins with

[Basic Lookup](#)

Search Results

Only the first 300 results can be displayed.

View 100 First 1-300 of 300

Item Type	Academic Item ID	Description
CLUSTER	00000001731	Introductory Foreign Languages
COURSE	00000000001	MATH 101: College Algebra
COURSE	00000000002	MATH 10: Remedial Algebra
COURSE	00000000003	ART 101: Art Survey
COURSE	00000000004	ART 140: 2D Design
COURSE	00000000005	ART 100: Basic Studio in Art
COURSE	00000000006	ART 111: Introductory Art Seminar

The prompt lists all non-program format tree node academic items (with effective dated logic) that are *valid child items (according to item type matrix) of the parent item of the item which is being substituted.*

After an item has been selected, the Substitution function performs the following actions:

Substituted Item

- Selects the Substituted check box for the item.
- Creates a pointer on the substituted item to the *Replaced with* items.

Image: Process Substitution Example 2

This example further illustrates process substitution:

The *Replaced with* item is inserted into the APT Instance:

- Sets the parent value of the item to that of the substituted item.
- Ties the new item to the substituted item by recording that APT Item Sequence number of the substituted item.
- Note: The Process Substitution button is not available for the replacement item(s).

Image: Process Substitution Example 3

This example further illustrates process substitution:

Reversing an APT Item Substitution

To reverse a substitution:

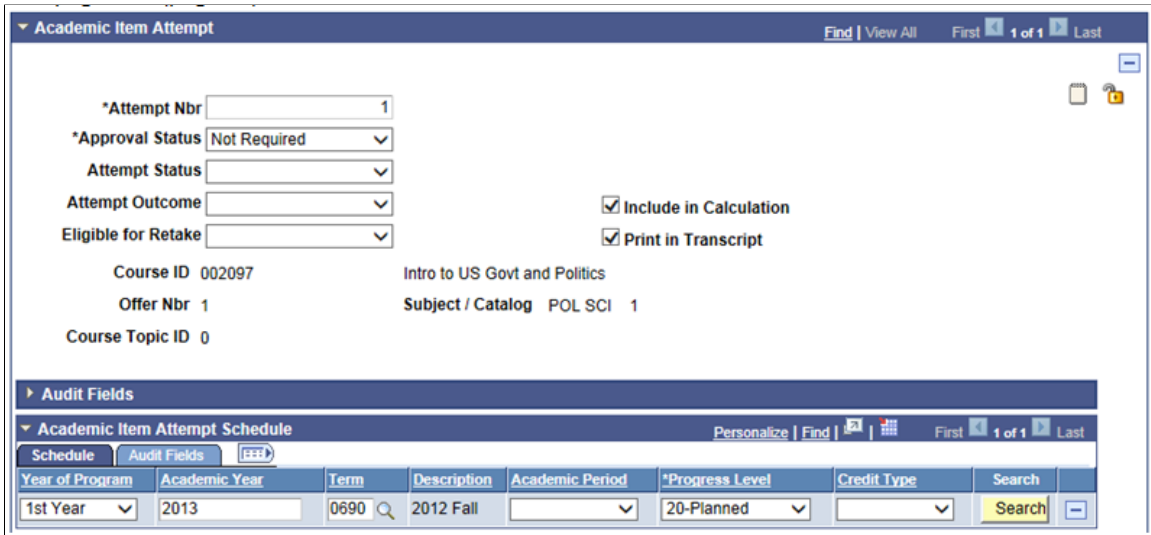

- On the substituted item: Delete the *Replaced with* value(s) using the Replaced with delete button.
- Delete the replacement item using the Item Delete button.

APT Items Page: Academic Item Attempt Level

An APT item can have multiple attempts. For example, if a student needs to retake a Year 1 course during Year 2, you could add a new attempt row under the Year 1 item, rather than moving that item from year to year. Each attempt has attributes attached to it.

Image: APT Items page: Academic Item Attempt level

This example illustrates the fields and controls on the APT Items page (Academic Item Attempt level). You can find definitions for the fields and controls later on this page.

 **Create New Attempt**

This button is available if the attempt Eligible for Retake check box is selected (see information about this check box later in this section). When you click this button, a new attempt row is created for this item. The system also creates new attempts for any unlocked child item attempts for which the Eligible for Retake check box is selected. This is optional.

 **Add Notes**

Transfers to a secondary page Item Attempt Notes where you can add notes and comments.

Locks the attempt. A locked item attempt cannot be updated: all fields at the attempt and result level are display only.

Unlocks the item attempt.

Attempt Nbr

A system assigned value. Multiple attempts can exist for an APT item.

Approval Status

This field is used when approval is required for enrollment planning - that is, when an advisor must approve the course entries in the student's APT for a particular stage/study period before the student enrolls. The approval requirement is based on the Requires Approval check box on the Academic Item Registry page.

Note: This feature is planned for the future.

Attempt Status

This field indicates that enrollment/credit requirements for an item attempt have been completed (20: Completed) and when

the attempt can be counted towards satisfying the item itself and for result calculation (60: *Finalized*).

Attempt Outcome

This field will indicate whether the item attempt was successfully completed.

Print in Transcript

This value can be used to determine if an item attempt is included in user defined transcript or report.

Eligible for Retake

If the value in this field is *Yes*, the item can be retaken. This field is used to determine whether a new attempt is created.

Refer to the “Managing Retake Processing” documentation section later in this topic.

Include in Calculation

When multiple attempts exist, select this check box to indicate which attempt should be used to determine the status/result for an academic item. The check box is selected by default.

Course ID, OfferNbr, and Course Topic ID

These values display for Course academic items

Academic Item Attempt Schedule grid:

For information about Personalized Timeline,

See [Using the APT Timeline](#)

Seq Nbr

A system assigned number. An academic item attempt can have more than one schedule sequence. This could happen if a student completes an item over a number of terms. A typical example might be where a program is organized into Year 1, Year 2 and so on and where a part time student could take more than the prescribed 2 semesters to complete the requirements.

Year of Program

This field is populated when:

- APT row has an Academic Item Type which is equated to Year of Program (in the program format definition for the program).
- APT row has an Academic Item Type which is equated to Term (in the program format definition for the program).
- APT row has an Academic Item Type of COURSE.

Academic Year

This field is populated when

- The student’s APT header has an Enrollment Cohort value which been mapped to term values (this is not required) or a Personalized Timeline has been established and
- APT row has an Academic Item Type which is equated to Term (in the Program Format definition for the program).

Term

- APT row has an Academic Item Type of COURSE.

This field is populated when:

- The student's APT header has an Enrollment Cohort value which been mapped to term values (this is not required) or a Personalized Timeline has been established and
- APT row has an Academic Item Type which is equated to Term (in the Program Format definition for the program).
- APT row has an Academic Item Type of COURSE.

Session

This field is populated when:

- The student's APT header has an Enrollment Cohort value which been mapped to term and session values (this is not required) or a Personalized Timeline has been established and
- APT row has an Academic Item Type which is equated to Term (in the Program Format definition for the Program).
- APT row has an Academic Item Type of COURSE.

See: Assigning Year of Program, Academic Year and Term (STRM) Values to Academic Items added to APT later in this section.

Academic Period

This field is for future use.

Start Date and End Date

The start and end dates for the academic item. These fields are intended primarily for non-course based academic items that might not necessarily be scheduled in term/session—an internship for example. These dates can be used to provide a time frame for an item that is not tied to a formal academic teaching period.

For course items, the Start Date and End Date fields are replaced with the other fields as in the following example page.

Image: APT Items Page: Course item example

This example illustrates the fields and controls on the APT Items Page (Course item example). You can find definitions for the fields and controls later on this page.

Schedule

Year of Program	Academic Year	Term	Description	Academic Period	*Progress Level	Credit Type	Search
1st Year	2013	0690	2012 Fall		40-In Progress	Enrollment	<input type="button" value="Search"/>

Career	Term	Class Nbr	Enrollment Status	Units	Grade Scheme	Grading Basis	Official Grade
Undergraduate	2012 Fall	1728	Enrolled	3.00	Undergraduate Grading Scheme	Graded	

Progress Level

Indicates the status of the COURSE being applied to this item/ attempt.

When a course item is added to APT, this value is set to *Planned*. After a student is enrolled in a class section of the course, the value is set to *In Progress*. If the student subsequently drops the class section and it is deleted from STDNT_ENRL or retained in 'Dropped' status, the Progress Level value is set to *Dropped*. The level is set to *Completed* after a grade is present in STDNT_ENRL (the grade must earn credit).

See [Managing APT Enrollment](#)

See the Student Enrollment Event document in My Oracle Support (ID 1400723.1).

Credit Type Indicates whether the course is being completed or was completed through class enrollment or from transfer credit.

Search Launches a process to find a match for the COURSE item in STDNT_ENRL or Transfer Credit Model (including Test and Other Credit).

Career Displays the student’s career for the matching STDNT_ENRL row (as opposed to the course career).

Values appear in the remaining fields based on the matching STDNT_ENRL row.

Here is an example in which the Credit Type is Transfer Credit:

Image: APT Items page: Credit Type example

This example illustrates the fields and controls on the APT Items page (Credit Type example). You can find definitions for the fields and controls later on this page.

Academic Item Attempt Schedule Personalize | Find | First 1 of 1 Last

Schedule Audit Fields

Year of Program	Academic Year	Term	Description	Session	Academic Period	*Progress Level	Credit Type	Search
1st Year	2014	2140	2014-2015 Academic Year	Semester 1		60-Completed	TC-Course	<input type="button" value="Search"/>

Career	Transfer Model Nbr	Articulation Term	Group	Seq#	Units	Grade Scheme	Grading Basis	Official Grade
Undergraduate	1	2014-2015 Academic Year	1	1	15.000	Alpha Grading Scale	Alpha Graded Scale	A-

Values in the fields such as Career, Transfer Model Nbr and so on appear based on the matching Transfer Credit row.

APT Items Page: Attempt Schedule Search

This feature simulates the processing that occurs after a student is enrolled by providing a link to the source of the course credit. For enrollment, this link is established by an Enrollment Sync process that performs updates to a student's APT instance after enrollment is processed by the enrollment engine.

See [Managing APT Enrollment](#)

See the Student Enrollment Event document in My Oracle Support (ID 1400723.1).

The Search function creates this link by finding a match for a particular course and save the keys to the enrollment or transfer credit row in the appropriate table. The search process attempts to find a match in STDNT_ENRL and Transfer Credit, using the EMPLID and INSTITUTION of the instance as well as the CRSE_ID, CRSE_OFFER_NBR, and CRSE_TOPIC_ID (if they are present). If more than one match is found, you can select from the results.

Enrollment (STDNT_ENRL):

- When the matching row is selected, the row is saved to a new table SSR_APT_ENRL.
- Academic Year/Term on the schedule row is updated if the term of the matching course is different. For example, if a course is assigned to 0690 and the only match is in 0630, the term and academic year values are updated.

Transfer Credit

- When the matching row is selected, the row is saved to a new table SSR_APT_TRCR.
- Academic Year/Term on the schedule row is updated if the articulation term of the matching course is different. For example, if a course is assigned to 0690 and the only match is in 0630, the term and academic year values are updated.

APT Items Page: Assigning Year of Program, Academic Year and Term (STRM) Values to Academic Items added to APT

Although the APT data is not defined by term, you still need to track data by academic year/term as well as by the Year of Program (YOP) attribute. Using a combination of the Program Format definition attached to the PRG item and (if one exists) the Enrollment Cohort term and definition for the student, data is recorded as items are added to the APT so that you can query the data by academic year, term, or a student's year of program.

Here is an example of Program Format/Enrollment Cohort data:

Image: Program Format / Enrollment Cohort example 1

Program Format data:

600	320	Year 3 - Semester 2	0780	2017 Spring	999999999999	Always Open	+	-

The Program Format nodes which are equated to Year of Program and Term determine which academic items will be used to record year of program, academic year, and term data in APT.

A session level can also be defined for use in term configurations where a term (STRM) value represents an academic year and a session (SESSION_CODE) is used to represent ‘term’ (for example, semester 1, semester 2). See: Academic Year and Term Data with Session Level section below.

See [Setting Up Program Formats](#)

Equates to Year of Program Items: Year of Program Data:

Image: APT Items page: Equates to Year of Program example

Equates to Year of Program example:

The screenshot displays the configuration for an Academic Item (ID: 0000001755) titled 'BA Econ - Year 1'. It is a 'Stage of Program' type, with a weight of 1 and is set to be included in calculations. The parent item is 'B.A. Economics Part I' (ID: 0000001754). The 'Academic Item Attempt' section shows it is attempt 1, 'Not Required', and 'Activated'. Below, the 'Academic Item Attempt Schedule' table lists two entries: '2012 Fall' (Term 0690) and '2013 Spring' (Term 0700), both for the '1st Year'.

*Seg Nbr	Year of Program	Academic Year	Term	Description	Academic Period	Start Date	End Date	Search
1	1st Year	2013	0690	2012 Fall				Search
2	1st Year	2013	0700	2013 Spring				Search

- A year of program value is assigned as the academic items equated to Year of Program (in the Program Format definition) are added to the APT.

Academic Year, Term and Session (if applicable) values are also assigned. In this case the term value is assigned based on the term values that are assigned to the child equates to term item (BA Econ Year 1 - Semester 1 - see below).

- The example above shows Year 1 – B.A. Economics. When Year 2 is added (as a result of seeding or a course being added to APT) this will be assigned to 2nd Year and so on.

Equates to Term (EQT) Items: Year of Program, Academic Year and Term Data:

This data is recorded for the following:

- Academic Item(s) equated to Term (in the program format definition for the program).
- All COURSE academic items.

A year of program, academic year (derived from the term) and term are recorded for each of these.

*Seq Nbr	Year of Program	Academic Year	Term	Description	Academic Period	Start Date	End Date	Search
1	1st Year	2013	0690	2012 Fall				Search

For information about Personalized Timeline,

See [Using the APT Timeline](#)

Year of Program

If the item is also equated to year of program, this value is taken from the Program Format definition; otherwise the value is determined using the program definition value for a parent, grandparent and so on. In this example, the YOP value from the parent STAGE item is used to determine the value for the STUDYPERIOD.

Academic Year

The TERM_TBL.ACAD_YEAR value for the term value (STRM) returned from the Enrollment Cohort or Personalized Timeline (see Term).

Term

Uses the Node ID associated with the Academic Item Type in the Program Format definition, to fetch the term value from the student's Enrollment Cohort or Personalized Timeline (if one exists). In this example, the STUDYPERIOD academic item has been identified as equating to term. A look-up is performed on the Enrollment Cohort using the Node IDs defined in the Program Format (this should be consistent if programs are defined using Build Program by Format).

Session

If the Program Format includes session level and the Enrollment Cohort or Personalized Timeline has Equates to Term nodes

mapped to combinations of Term and Session, a session value will also be assigned.

Academic Year and Term Data with Session Level:

Year of Program and Equates to Term (and Session) levels can be tracked separately if the program format is defined this way. The following example shows an enrollment cohort based on a program format that has distinct equates to term (YEAR) and session (SEMESTER) items and how this data is recorded in APT:

Course Items:

YOP, Academic Year and Term data is recorded for COURSE items as they are added to APT (either through the seeding process or as an individual course is added). The values are assigned in one of two ways:

1. The value is derived from the parent item when that item is equated to YOP and/or term (for example if a course is the child of a study period). See a) below.
2. If the COURSE (or its parent) is not directly linked to an item that is equated to a term, the value is manually assigned by the user selecting from a list of values. See b) below and also see the following section “Assigning Term Values to Courses”.

Audit Fields

Academic Item Attempt Schedule Personalize | Find | 📄 📁 | First 1 of 1 Last

Schedule	Audit Fields	EEE						
Year of Program	Academic Year	Term	Description	Session	Academic Period	*Progress Level	Credit Type	Search
1st Year	2013	2130	2013-2014 Academic Year	Semester 1		20-Planned		<input type="text" value="Search"/>

a) If the value is derived as the COURSE is added:

- Year of Program: If the COURSE (or its parent, grandparent) is linked to an academic item that equates to both YOP and term, the YOP from this item is used; otherwise the YOP value is derived from the parent of the item that equates to term. In this example, the COURSE is a child of a STUDYPERIOD (which equates to term), the STUDYPERIOD is child of STAGE which equates to YOP, and therefore the value from the parent STAGE is used here.
- Academic Year: The TERM_TBL.ACAD_YEAR value for the term value (STRM) returned from the Enrollment Cohort or Personalized Timeline (see Term).

- Term: If the COURSE is linked to an academic item which equates to term, the value is derived from parent/grandparent and so on.
- Session: If the Program Format includes session level and the Enrollment Cohort or Personalized Timeline has Equates to Term nodes mapped to combinations of Term and Session, a session value will also be assigned.

b) If the value is selected by a user:

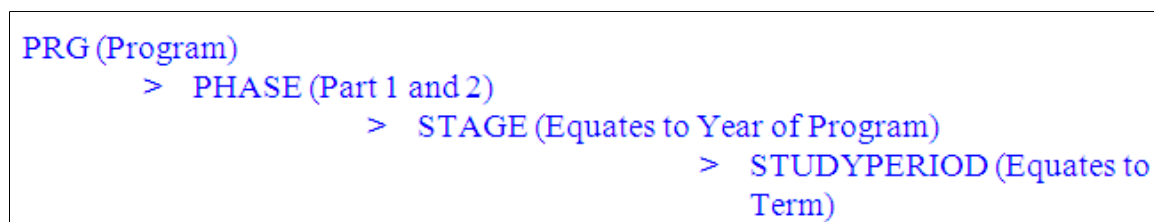

- Year of Program: Is assigned by using the YOP value from the academic item (if the academic item equates to term and also equates to YOP); otherwise the YOP value is derived from the parent of the Equates to Term item.
- Academic Year: The TERM_TBL.ACAD_YEAR value for the term value (STRM) returned from the Enrollment Cohort or Personalized Timeline (using the academic item selected during term choice).
- Term: The TERM_TBL.STRM value from the Enrollment Cohort or Personalized Timeline for the item selected during term choice (using the academic item).
- Session: If the Program Format includes session level and the Enrollment Cohort or Personalized Timeline has Equates to Term nodes mapped to combinations of Term and Session, the user will actually select a combination of term and session.

APT Items Page: Assigning Term Values to Courses

This section discusses choosing a “term” for a COURSE item that is not associated (according to lineage) with an academic item equating to term.

Image: AIR Program Structure example

An AIR COURSE, COURSELIST, COURSEGROUP or any user defined grouping of courses can be placed at any level in a program structure. A COURSELIST could be situated in the structure in such a way that while a student is required to complete them, they may do so at any point in the program. The program used in this example has a basic structure like this:

Any COURSE items that are associated with STUDYPERIOD items can be assigned a term using the Enrollment Cohort or Personalized Timeline (if one exists). However, you cannot know the term in which a COURSE associated with items above that level (PRG, PHASE, STAGE) is to be taken until the student actually plans/enrolls. In the example program used in this document, “Part 2” is comprised of two stages (Year 2 and 3) but there is a list of courses that the student must complete at some point during those two years.

Image: Item Details page: example for assigning term values to courses

This example illustrates the Item Details page (assigning term values to courses).

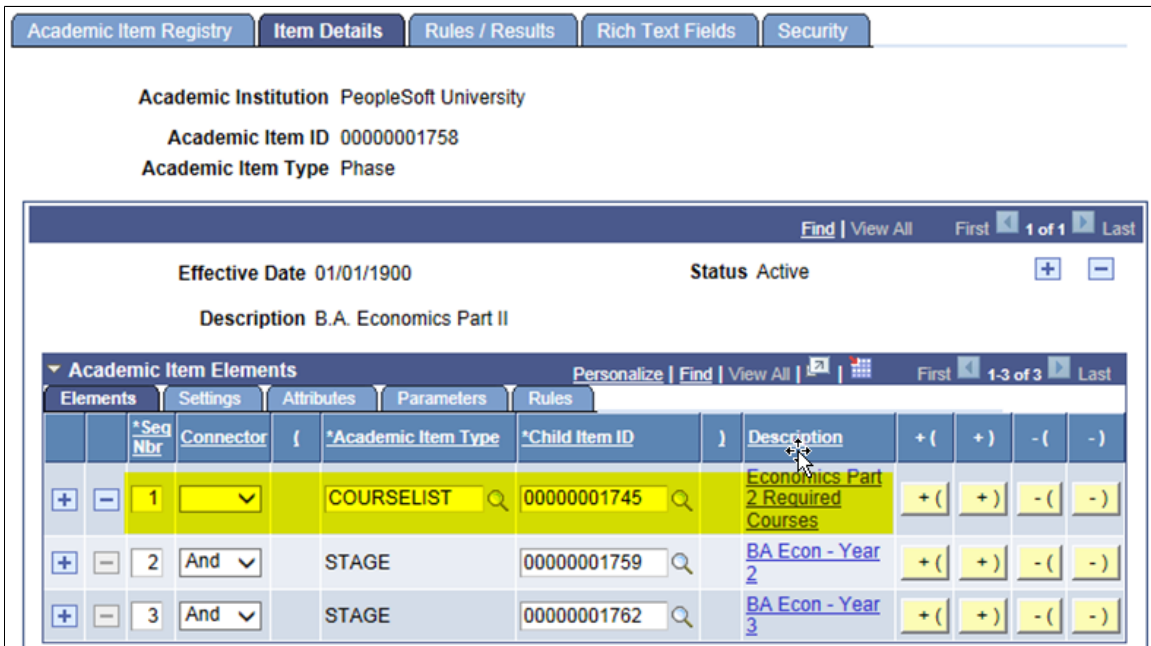

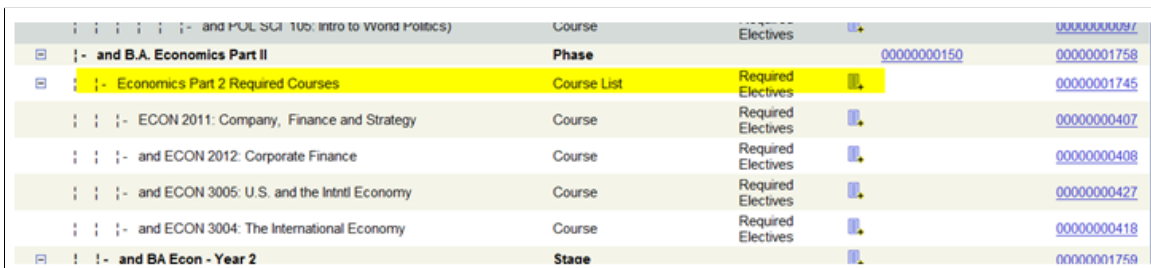

Image: APT example: assign term values to courses

This will be represented in APT as follows:

The Course List is a direct child of Part 2 and is not associated with a Stage (which equates to Year of Program) or Study Period (which equates to Term).

When a student (or advisor/administrator) selects a course that is placed in a program structure in this way, it ultimately must be assigned to a term for planning and enrollment purposes. To do this, the system must:

- Evaluate the children of the item where the course is situated.
- Determine which of those child items equates to term (this is determined by Program Format, where an Equates to Term value is required).
- Return a list of those items and prompt the user to assign one to the course.

In the example above, the courses are tied to the Phase level of the program structure. The immediate children of the PHASE item (other than the COURSELIST itself) are STAGE items, which equate to YOP. So in this particular case the system must go down another level. The STAGE items each have two child STUDYPERIOD items, which equate to term. All four of these must be available to the user, because this is the level at which enrollment will take place:

- User adds a course to APT:

Image: APT example: add course step 1

This example illustrates adding a course to APT (step 1).

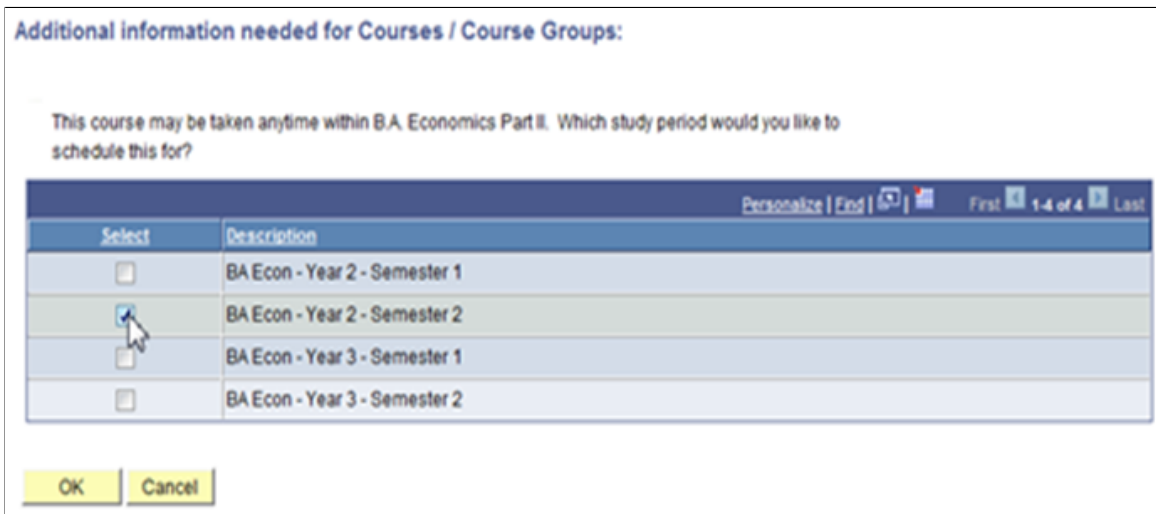

- Child items equating to term are retrieved

The choices can be presented with user defined (message catalog text)

Image: APT example: add course step 2

This example illustrates adding a course to APT (step 2).

- The item is saved to APT. The lineage (as defined in AIR) is preserved, in this example BA Econ = Year 2 – Semester 2.

For Year of Program/Term reporting purposes however, the course selection is associated with 2nd Year, Term 0730.

Image: APT example: add course step 3

This example illustrates adding a course to APT (step 3).

The screenshot displays the APT system interface for adding a course. The top section is titled "0000000210 - Course: ECON 2012: Corporate Finance". It includes fields for:

- *APT Item Seq: 210
- Parent Item Seq Nbr: 190
- Academic Item ID: 0000000408
- AIR Parent Item ID: 00000001745
- Academic Item Type: Course
- Enrollment Category: Required Electives
- Item Weight: 1
- Reason Code: (empty)
- *Satisfied: No
- ECON 2012: Corporate Finance
- Economics Part 2 Required Courses
- Grading Item Type (checkbox)
- Exam Only Option (checkbox)
- Substituted (checkbox)
- Include in Calculation (checkbox, checked)

 Below this is the "Academic Item Attempt" section, which includes:

- *Attempt Nbr: 1
- *Approval Status: Not Required
- Attempt Status: (empty)
- Attempt Outcome: (empty)
- Eligible for Retake: (empty)
- Include in Calculation (checkbox, checked)
- Print in Transcript (checkbox, checked)

 At the bottom, there is an "Academic Item Attempt Schedule" table with columns: Year of Program, Academic Year, Term, Description, Academic Period, *Progress Level, Credit Type, and Search. The table shows a row for "2nd Year", "2015", "0730", "2014 Fall", and "20-Planned".

Managing Retake Processing

The Eligible for Retake field determines whether an academic item can be repeated at a future point in a student’s program of study.

If the Item is a Program Format tree planning node: the APT Request process can be used to build a new attempt for that planning node as well as any child program format tree nodes and other child items (such as courses) that are eligible for retake. If a student needs to re-take an entire program node, such as a year or semester, we recommend the following steps:

- Set the Eligible for Retake field to *Yes* on the Planning Node and any child Equates to Term/Session nodes (if applicable). Also identify all child items (courses, course lists etc.) that must be retaken.
- Create a Personalized Timeline and adjust the term mapping as required. For example, if a student attempted Year 1 in term 2014 Academic year (term code 2014) and is required to re-take Year 1 during the next academic year, the personalized timeline would need to be adjusted such that Year 1 is now mapped to the term code for 2015 Academic Year, with any subsequent years adjusted accordingly.

See [Using the APT Timeline](#)

- Use the APT Request process to create a new attempt against the Year 1 planning node. This creates new attempts for all eligible academic items and assigns those items to the appropriate term/session.

See [Creating and Managing APT Instances Using the APT Request Process](#)

A course retake can be handled in one of two ways, depending on whether or not the retake needs to occur at a specific point in the remainder of the student's program of study:

- Retake at a specific point: if a student needs to retake the item at a set point in time, for instance retaking Year 1 course during Year 2:
 - Set the Eligible for Retake field to *Yes* on the original attempt.
 - Use the Create New Attempt button to create a new attempt against the course in APT.
 - Enter Academic Item Attempt schedule data for the new attempt.
 - Create and activate the next planning node (Year 2 , to use the same example) using APT Request.

In student self-service, this makes the course available as an item to be retaken in the specified term/session node on the My Education Plan component *once the term/session node for the original attempt has been finalized*.

- Student is allowed to retake at any point during the remainder of the program:
 - Set the Eligible for Retake field to *Yes* on the original attempt.
 - Create and activate the next planning node (Year 2 , to use the same example) using APT Request.

This option allows the student to select the course on the My Education Plan in any subsequent (active) term node once the term/session node for the original attempt has been finalized. When the course is selected, a new attempt is created for the course, with the schedule data for the term node where it was selected. If the student decides not to take the course at that point, the attempt and associated schedule data are removed from APT when the course is de-selected and the My Education Plan component is saved.

Recording Term-Related Data in APT When Students Are Not Assigned to an Enrollment Cohort or Personalized Timeline

The ability to auto-assign term-related data as items are added to APT without referencing a predefined cohort or personalized timeline is planned for the future.

APT Items Page: Academic Item Attempt Results Level

The APT structure is not delivered with a predefined set of fields for statistics and results (total units, grade points and so on). You must define the types of statistics and results that you want to track for your students, using the Result Type component. The number and type of results associated with a particular academic item (for example, a course, semester) are determined by the academic item definition (in AIR), where you indicate which results will be tracked for a particular academic item.

See [Setting Up Result Types](#)

This level of the structure allows you to track multiple versions of the same result type. For example, a Year of Program might have a Result Type of *Weighted Average Mark* associated with it. An institution might need to record the *calculated* version of this result (that is, the result calculated by a rules engine or uploaded from an external source) and the *finalized* version (which could be different from the calculated version) delivered from an exam or other review board. In this case, the Results grid would have two

rows for the result type *Weighted Average Mark*. Obviously only one of the results would be used for calculating higher level results and for transcript purposes, but both results would be recorded.

Select the Results tab:

Image: APT Items page: Results tab

This example illustrates the fields and controls on the APT Items page: Results tab. You can find definitions for the fields and controls later on this page.

*Result Nbr	*Result Type	Result Scale	Result Value	*Result Status	Include in Calc		
10	COURSE_CREDITS		0.00	00-Undete	<input type="checkbox"/>	+	-
20	COURSE_RESULT	REG-100	0.00	00-Undete	<input type="checkbox"/>	+	-
30	GRADE_POINTS		0.000	00-Undete	<input type="checkbox"/>	+	-

An academic item attempt can have multiple result types associated with it.

Result Nbr

System assigned sequence number.

Result Type

Prompts against Result Type table for the Institution.

Note: The Result Type view has been modified to include Result Types that have Result Scales marked as Grade only. Any result types created before October 2014 should be saved again so that that they are available in the Result Type prompt.

Result Scale

You assign a Result Scale to a Result Type on the Result Type page (Set Up SACR, Product Related, Student Records, Program Enrollment, Result Type). Result Type inherits the field definition (Numeric) from the Result Scale – for example, a 10.0 point scale.

Result Value

This value is based on the Result Type setup.

Result Status

Indicates the status of the result. You can use this field to record a change to an existing Result Type row, or to indicate the status of a new instance of the same result type.

Include in Calc

Indicates that a Result Type row should be used in calculating a higher level result. When there is more than one instance of the same result type, only one has the check box selected. Note: This feature is planned for the future.

See [Setting Up Result Types](#)

Select the Grades tab:

Image: APT Items page: Grades tab

This example illustrates the fields and controls on the APT Items page: Grades tab. You can find definitions for the fields and controls later on this page.

*Result Nbr	*Result Type	Grading Scheme	Grading Basis	Grade	Grade Points	Outcome
10	COURSE_CREDITS					
20	COURSE_RESULT	GRA	GRC	B	3.000	Passed
30	GRADE_POINTS					

Grading Scheme

Controls the Grade prompt. Available if the Result Type has a Result Scale which is configured to allow include grade.

Grading Basis

Controls the Grade prompt. Available if Result Type has a Result Scale configured to allow include Grade. The field prompts against the Grading Basis for the selected Grading Scheme.

Grade

Allows for the recording of a core grade for the result type. Available if Result Type has a Result Scale configured to allow include grade. The field prompts against the Grade table for the selected Grading Scheme/Basis.

Grade Points

Displays the grade point value (from the GRADE_TBL) for the grade.

Outcome

If a result scale is associated with the result type, the result outcome can default from the result value or grade. It can also be set based on the evaluation of a rule, that is, the rule calculates the result and updates the result row with the result and outcome. The conditional value is used to record a result that must be confirmed by an exam board or other body. The result could be confirmed by the creation of another row with a Passed or Failed outcome.

Select the Administrative tab:

Image: APT Items page: Administrative tab

This example illustrates the fields and controls on the APT Items page: Administrative tab. You can find definitions for the fields and controls later on this page.

*Result Nbr	*Result Type	Reason Code	Description	Notes	Locked	Show Student
10	COURSE_CREDITS	COMP	Result Compensation		<input checked="" type="checkbox"/>	<input type="checkbox"/>
20	COURSE_RESULT	EXC	Exception		<input checked="" type="checkbox"/>	<input type="checkbox"/>
30	GRADE_POINTS	COMP	Result Compensation		<input checked="" type="checkbox"/>	<input type="checkbox"/>

Reason Code

You can enter a reason code for a result row. For example, a student may be granted a higher result and compensation due to

ill-health or other mitigating circumstances or a result may be excluded due to plagiarism.

See [Setting Up APT Reason Codes](#)

Show Student

This field can be used when defining the logic of the XMLP Results Template, which is user-defined. The logic within this template could use this field to determine whether the result should be displayed for the student.

APT Items Page: Assigning Result Types to APT Academic Items

Result Types are associated with academic items in AIR using the Result Types grid to indicate which Result Types are attached to a particular academic item.

See [Defining Academic Item Details](#)

When an item is added to an APT instance, Academic Item Attempt Result rows are created for all result types linked to that academic item in AIR.

Using the APT Timeline

Access the Timeline page (Records and Enrollment > Program Enrollment > Academic Progress Tracker > Timeline).

Image: Timeline page

This example illustrates the fields and controls on the Timeline page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Timeline' tab selected in a navigation bar. Below the navigation bar, the student's name 'Robert Jones' and ID 'SR13564' are displayed. The academic institution is 'PeopleSoft University'. The APT Instance is '1' and the Instance Status is 'Active'. A table titled 'Enrollment Cohort Timeline' is shown with columns for Node ID, Description, Term, Description, and Academic Year. The table contains six rows of enrollment data. Below the table is a button labeled 'Create Personalized Timeline'.

Node ID	Description	Term	Description	Academic Year
110	Year 1 - Semester 1	0630	2009 Fall	2010
120	Year 1 - Semester 2	0640	2010 Spring	2010
210	Year 2 - Semester 1	0650	2010 Fall	2011
220	Year 2 - Semester 2	0660	2011 Spring	2011
310	Year 3 - Semester 1	0670	2011 Fall	2012
320	Year 3 - Semester 2	0680	2012 Spring	2012

View a student's enrollment cohort data and override that data if necessary.

Create Personalized Timeline

If you click this button, the enrollment cohort is copied down to the APT level and you can change term/session data. After it is

created, the personalized timeline is used to assign YOP, Term and Session in APT.

Image: Timeline page: personalized timeline example

Here is an example of a personalized timeline:

Personalized Timeline							Personalize	Find	View All	First	1.9 of 9	Last
Node ID	Description	Term	Description	Session	Description	Academic Year						
10	Year 1	2100	2010-2011 Academic Year			2010						
101	Sem 1	2100	Semester 1	SM1	Semester 1							
102	Sem 2	2100	Semester 2	SM2	Semester 2							
20	Year 2	2120	2012-2013 Academic Year			2012						
201	Sem 1	2120	2012-2013 Academic Year	SM1	Semester 1	2012						
202	Sem 2	2120	2012-2013 Academic Year	SM2	Semester 2	2012						
30	Year 3	2130	2013-2014 Academic Year			2013						
301	Sem 1	2130	Semester 1	SM1	Semester 1							

Using Item Attributes to Extend APT Instance Header Data Elements

The Common Attribute Framework allows you to extend the delivered APT_HDR data structure without customizations, by enabling you to add different types of data elements to your APT instances.

See "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)

The Common Attribute Framework allows you to associate attributes with a functional area by a Record Context. Common Attributes have been enabled for the Academic Progress Tracker at the Instance level, which has its own Common Attribute Framework Record Context and Attribute Record.

APT Header

- Record Context: SSR_APT_HDR
- Attribute Record: SSR_APT_HDR_ADD

Attributes associated with this Record Context/Attribute Record combination are attached to an APT Instance header record and can be assigned on the Header page of the Academic Program Tracker component.

Steps for Creating Common Attributes for APT

To create common attributes for APT:

1. Define the attribute using the Common Attribute component (Set Up SACR, Common Definitions, Common Attributes Setup, Common Attribute).

2. Attach that attribute to the APT Header Record Context (SSR_APT_HDR) (Set Up SACR, Common Definitions, Common Attributes Setup, Record Context).

Note: If you implemented Program Enrollment before April 2013, you must run the processes listed here after you apply the April 2013 updates.

3. Item Type Matrix Sync Entities

Navigate to the Item Type Matrix component (Set Up SACR, Product Related, Student Records, Program Enrollment, Item Type Matrix) and run the SSR_PE_SYNC process. The sync process ensures that the newly added attribute(s) are recognized as valid properties of the designated APT Entities (or all APT Entities if specific entities were not specified):

- Click the Sync Entities button. This initiates the SSR_PE_SYNC process.
- Check the Process Monitor to ensure that the process completes successfully.

This process can be scheduled using the process scheduler.

4. Entity Property Sync

Navigate to the Entity Property Sync page (SACR, System Administration, Entity, Entity Property Sync) and:

- Click the Sync All Entities button.
- Check the Process Monitor to ensure that the process completes successfully.

5. Wipe Entity Cache

Remain on the Entity Property Sync page and:

- After the Sync All Entity Properties process has completed successfully, click the Wipe Entity Cache button.
- Check the Process Monitor to ensure that the process completes successfully.

See [Identifying Child Item Types and Syncing Entities](#)

See "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Understanding Entity Registry" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Synchronizing Entity Properties" (PeopleSoft Campus Solutions 9.2: Campus Community)

Using Item Attributes for the Academic Progress Tracker

As explained above:

- The Attribute Type determines the type of data that you can enter in the Item Attributes grid in AIR.
- An Attribute can be required when associated with a particular record context (the Required check box is selected on the Record Context page in Common Attributes setup). If an attribute associated with the SSR_APT_HDR context is set to required, the attribute will be added automatically when a user creates a new APT instance and a value will be required to save the component (if a default has not been assigned in the attribute definition). Note that a user must provide a value even if they add a non-required attribute.
- Attributes can also be repeatable if this property is enabled in the Record Context definition (the Repeatable check box is selected on the Record Context page in Common Attributes setup).

See "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

However, despite these variations, you always use the same process to add attributes for an APT instance—select the Attribute and then enter or select a Value—for example, date, text, numeric value, or a code where the code is a member of the List of Values defined for the attribute, a Table value, or XLAT value.

An APT Instance Header:

- Can have multiple attributes.
- Can have multiple rows for the same item attribute as long as the attribute is repeatable, and the Value is different (for example Attribute A, with Value 1, Attribute A with Value 2).

Image: Header page example: attributes

Attributes are assigned using the Instance Attributes scroll area:

Attribute The name of the attribute. This value comes from the description entered for the attribute on the Common Attribute component.

Value This field changes depending on the type of attribute. This could be a numeric, date, time or text field. Alternatively, the field could prompt against a list of values if one has been defined for the attribute.

See "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

Managing APT Enrollment

Use the APT Enrollment component to enroll students based on APT course entries or to save classes in which students can enroll using Self Service.

This section provides an overview of APT enrollment processing and discusses how to process APT enrollment transactions.

Understanding APT Enrollment Processing

When a student is enrolled in a class using the APT enrollment process or through the self-service Schedule Builder feature, that enrollment data must be tied to an APT course item. This link is established as follows:

- Enrollment Request is submitted (from the self-service Schedule Builder or the APT Enrollment process).
 - An Enrollment Request is created and saved.
 - An APT Request (SSR_APT_REQUEST) is created and saved. One APT request row is created per APT Course, with an action of Enroll. So if the student is enrolling in three courses, three APT request rows are generated.
 - At this time, a cross reference between the Enrollment Request and the APT request is also created. A row is created in the SSR_APT_REQXREF table for each request, and the companion enrollment request ID is saved for each row. So if the student is enrolling in three courses, three APT cross reference rows are created. Each has a distinct APT request ID, but all three rows share the Enrollment Request ID. This cross reference table allows APT data to be referenced if an enrollment request needs to be resubmitted.
- COBOL engine is called and processes each detail row in the request.
 - Enrollment Engine updates the Enrollment Request (Success, Error, Message).
 - Rows are created in SSR_ENRL_BEVNT table if the SSR_ENROLLMENT_SYNC service operation is active.
- APT API is called.
 - API updates the APT Request Row.
 - If the enrollment was successful, a row is created in the SSR_APT_ENRL table.
 - If it is active, the SSR_ENROLLMENT_SYNC service operation is triggered.

Note: When a student drops a class through the self-service My Classes feature, the APT request process is initiated by the SSR_ENROLLMENT_SYNC service operation.

See the Student Enrollment Event document in My Oracle Support (ID 1400723.1).

See "Using Program Enrollment Self-Service Features" (PeopleSoft Campus Solutions 9.2: Self Service)

Page Used to Process APT Enrollment Transactions

Page Name	Definition Name	Navigation	Usage
APT Enrollment	SSR_APT_ENR_RUNCNT	Records and Enrollment > Program Enrollment > APT Enrollment	Enroll students based on APT course entries.

Processing APT Enrollment Transactions

Access the APT Enrollment page (Records and Enrollment > Program Enrollment > APT Enrollment).

Image: APT Enrollment page

This example illustrates the fields and controls on the APT Enrollment page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'APT Enrollment' page interface. At the top, there is a 'Run Control ID' field with the value 'ps' and a 'Run' button. Below this are several filter fields: 'Academic Institution' (PSUNV - PeopleSoft University), 'Academic Career' (UGRD - Undergraduate), 'Term' (0690 - 2012 Fall), 'Session' (Regular Academic Sessi), and 'Process mode' (Enroll). A 'Population Selection' section includes a checked checkbox, a 'Selection Tool' dropdown (PS Query), and a 'Query Name' field (SSR_APT_ENR). Below this is a 'Fetch Classes' button. A 'Transaction' section contains a 'Get / Refresh Last Transaction' button and a summary table:

Enrollment Request ID	000000000	Number of Transactions	0
Request Status		Transactions in Error	0
Last Update DateTime		Transactions with Message	0

The following values determine the keys that are used to fetch rows from the CLASS_TBL for this run and also determine the values that are used as prompts when defining the student population. If the run control values are Institution: *PSUNV*, Term: *0690*, then the Population Selection query (or a manually entered list of students) must use the same values to select rows from APT (SSR_APT_SCHD).

Academic Institution Select an Institution value.

Academic Career Select an Academic Career value.

This value is required for prompting against the TERM_TBL (which is keyed by INSTITUTION, ACAD_CAREER and STRM).

Term and Session

Select a Term and Session value. These values, along with the Institution value are used to fetch rows from the CLASS_TBL.

APT Enrollment can be used to create (and process) enrollment requests or to save classes so that they are accessible for the student to enroll in, using Self Service.

Process Mode

Enroll: Select this mode to create an Enrollment Request (one request per run) which can be processed directly from this component, or retrieved, adjusted if necessary and posted using the Block Enroll component.

Schedule Builder: If you select this mode, classes are saved directly to the SSR_REGFORM table where the student can retrieve them using the self-service Schedule Builder component to complete the enrollment process.

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool to identify IDs for a specific transaction, you must use it.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

This query is delivered as a sample: SSR_APT_ENR. It is intended as an example and is therefore based on very broad criteria. When you create queries for use with APT Enrollment, you must use the bind record SSR_APT_ENR_TGT.

Manual Selection

When the Population Selection check box is cleared, the Manual Selection grid is available for entry:

Image: APT Enrollment – Manual Selection grid

This example illustrates the fields and controls on the APT Enrollment page – Manual Selection grid. You can find definitions for the fields and controls later on this page.

Manual Selection						Personalize Find View All First 1-2 of 2 Last	
ID	APT Instance	APT Item Seq	Course ID	Class Description			
1	SRDEV071	1	666669	Economics 2	+	-	
2	SRDEV071	1	666670	Economics 3	+	-	

APT Instance

Prompts against a view of the SSR_APT_HDR table for the selected student.

APT Item Seq(sequence)

Prompts against a view of APT Items and returns all items with an item type of COURSE:

- Where the Term value in the APT Item Attempt Table (SSR_APT_SCHD.STRM) is equal to the Run Control Term value.
- If the student’s Attempt Schedule contains a session value (that is, the enrollment cohort also records session values) a match is also made on the SSR_APT_SCHD.SESSION_CODE value and the Run Control session value.

See Creating and Managing APT Instances Using the Academic Progress Tracker Component

Course ID and Class Description

The Course ID and Class Description (Subject Catalog Nbr) for the COURSE item are displayed when you use the Fetch Classes button (see the following documentation for Fetch Classes).

Fetching Classes and Using the Class Sections Grid

Use the Fetch Classes button to preview the class sections that will be used to create enrollment requests or to populate a student’s schedule builder. You can run the APT Enrollment process without fetching classes.

Fetch Classes

The Fetch Classes process fetches rows from the CLASS_TBL using:

- Run Control INSTITUTION, STRM, SESSION_CODE and
- Population Select Result/Manual Selection: Distinct CRSE_ID/CRSE_OFFER_NBR combination(s)
- for which CLASS_TYPE is E (enrollment section).

The fetched rows are displayed in the Class Sections grid.

When Manual Selection is used, the Fetch Classes button also populates the Course ID and Subject Catalog Nbr for the selected APT Item (Course) in the Manual Selection grid.

Image: APT Enrollment Class Sections grid

Here is an example of the Class Sections grid:

Class Sections									
Class Enrollment		Enrollment Options		Capacities		Personalize Find View All First 1-4 of 4 Last			
	Class Nbr	Section	Course ID		Related 1	Related 2	Auto Enroll 1	Auto Enroll 2	
1	1194	1	001308	MATH 102			-	-	
2	2360	1	002097	POL SCI 1			-	-	
3	1728	1	666669	ECON 2			-	-	
4	2356	1	666670	ECON 3	2366	2370	1F	1T	

Results are ordered by CLASS_SECTION. The process returns the lowest CLASS_SECTION value when multiple sections of a class exist. The process also evaluates the CLASS_COMPONENT parts of the selected section for required related components and returns any related sections (related 1 and 2). Here again the lowest section number is used for each related component.

Class Enrollment tab:

Class Nbr Displays the CLASS_NBR value for the lowest CLASS_SECTION value with a CLASS_TYPE of E. You can select a different value if other sections are available.

Class Description Click the Class Description link (SUBJECT and CATALOG_NBR) to access the Class Detail page and view enrollment capacity and totals.

Related 1 and Related 2 Displays the CLASS_NBR value for the lowest CLASS_SECTION value for related components (a maximum of two, neither of which is auto-enroll). You can select different values if they are available.

Auto Enroll 1 and Auto Enroll 2 Click the links to access the Class Detail page and view enrollment capacity and totals.

Enrollment Options tab:

Image: APT Enrollment Class Sections grid – Enrollment Options tab

This example illustrates the fields and controls on the APT Enrollment Class Sections grid – Enrollment Options tab.

	Units	Wait List Okay	Instructor ID	Start Date	Requirement Designation	Take RD Option	
1 MATH 102	3	<input type="checkbox"/>				<input type="checkbox"/>	-
2 POL SCI 1	3	<input type="checkbox"/>				<input type="checkbox"/>	-
3 ECON 2	3	<input type="checkbox"/>				<input type="checkbox"/>	-
4 ECON 3	3	<input type="checkbox"/>				<input type="checkbox"/>	-

Units Displays the unit value for the class. The value is editable for variable unit/credit classes.

Wait List OK When this check box is selected, the enrollment engine attempts to wait list students in this class if the class is closed at the time when enrollment is processed. When the class(es) are processed by the enrollment engine, the User ID that creates the Run Control is checked for access to the Wait List OK function. If the User ID does not have this access, the wait list option is ignored and a closed class error is returned.

Instructor ID You can edit this field if the class allows a choice of instructor.

Start Date You can edit this field if the class is scheduled in the OEE session.

Take RD Option

You can edit this field if the Requirement Designation is optional.

Capacities tab:

Image: APT Enrollment Class Sections grid – Capacities tab

This example illustrates the fields and controls on the APT Enrollment Class Sections grid – Capacities tab.

Class Sections							
Class Enrollment		Enrollment Options		Capacities			
		No. of Students	Enrollment Capacity	Enrollment Total	Related 1	Related 2	
1	MATH 102	1	30	21	-	-	[-]
2	POL SCI 1	7	35	1	-	-	[-]
3	ECON 2	7	30	1	-	-	[-]
4	ECON 3	7	30	1	2366	2370	[-]

No. of Students

Displays the total number of students in the selected population that need to be enrolled in the section of this course.

Enrollment Capacity

Displays the enrollment capacity of the selected enrollment section.

Enrollment Total

Displays the current enrollment total for the selected enrollment section.

Viewing Transaction Data

View APT Enrollment transaction data in the Transaction group box:

Image: APT Enrollment Transaction group box

This example illustrates the fields and controls on the APT Enrollment Transaction group box. You can find definitions for the fields and controls later on this page.

Transaction

[Get / Refresh Last Transaction](#)

Enrollment Request ID: [000002582](#)

Request Status: Errors Found

Last Update DateTime: 02/28/2013 2:38:19PM

Number of Transactions	3
Transactions in Error	1
Transactions with Message	0

Get / Refresh Last Transaction

Click to retrieve the last enrollment request generated for this Run Control/User ID (can be used when the same Run Control is used for multiple runs).

Enrollment Request ID

Displays the last enrollment request generated for this Run Control/User ID. An enrollment request is generated only when the Process Mode is *Enroll*.

- Request Status** Displays the status of the Enrollment Request (ENRL_REQ_HEADER.ENRL_REQ_PROC_ST).
- Last Update Date Time** Displays the time stamp value for the enrollment request (ENRL_REQ_HEADER.DTTM_STAMP_SEC).
- Number of Transactions** Displays the number of Enrollment Request detail rows (the number of Student/Class number combinations within the request).
- Transactions in Error** Displays the number of Enrollment Request detail rows that resulted in error (ENRL_REQ_DETAIL.ENRL_REQ_DETL_STAT = E).
- Transactions with Message** Displays the number of Enrollment Request detail rows that were processed successfully but for which an informational message was returned (ENRL_REQ_DETAIL.ENRL_REQ_DETL_STAT = M): for example, a student was added to a wait list or a student was enrolled in a class but the repeat check process returned a repeat warning.

Running the APT Enrollment Process

The Population Selection (or Manual Entry) populates a result table (SSR_APT_ENR_TGT) with the following values returned from the APT Item Attempt table for items where the item type is COURSE and where the APT Item Schedule (SSR_APT_SCHD) term (and session if the enrollment cohort uses session level) match the run control term value:

Image: APT Enrollment Result Table example

This example illustrates the fields and controls on the APT Enrollment Result Table. You can find definitions for the fields and controls later on this page.

	ID	Institution	Instance	Seq Nbr	Course ID	Offer Nbr
1	AA0002	PSUNV	1	50 666669		1
2	AA0002	PSUNV	1	60 666670		1
3	AA0002	PSUNV	1	70 007181		1
4	AA0002	PSUNV	1	80 002097		1
5	AA0002	PSUNV	1	90 666917		1
6	SR13435	PSUNV	1	60 666669		1
7	SR13435	PSUNV	1	70 666670		1
8	SR13435	PSUNV	1	80 007181		1

- Institution and Instance** Displays the Institution and Instance values for the selected instance.
- Seq Nbr** Displays the SSR_APT_ATT.SSR_APT_ITEM_SEQ value.
- Offer Nbr** Displays the Course Offering value if it exists (not required).

The process also fetches class section rows for each distinct CRSE_ID/CRSE_OFFER_NBR combination (these values are written to the table: SSR_APT_ENR_CLS). If a CRSE_OFFER_NBR value does not exist, the process fetches the first class section for the CRSE_ID, regardless of offering. If the Fetch Classes button has been used, this step is skipped because the sections have already been saved to the SSR_APT_ENR_CLS table.

When the Process mode is *Enroll*:

- Data from the student and class results tables is merged and a single enrollment request is created containing a detail row for each EMPLID/CLASS_NBR combination in the result set.
- The process calls the Enrollment Engine and the enrollment request is processed.
- When Enrollment processing is completed, the enrollment request ID is returned to the calling SSR_APT_ENR process and the ID is displayed on the Run Control component.

When the Process mode is *Schedule Builder*:

- Data from the student and class results tables are merged in the same way, however the resulting merged rows are inserted into the SSR_REGFORM table.
- Any existing rows with the same keys are overwritten.

See the Student Enrollment Event document in My Oracle Support (ID 1400723.1).

See "Using Program Enrollment Self-Service Features" (PeopleSoft Campus Solutions 9.2: Self Service)

Deleting Planning Nodes

The Delete Planning Node process allows you to delete planning node(s) that may have been created in error. Alternatively, planning nodes might need to be deleted if program requirements were changed after APT instances had been built or updated for a group of students. Whatever the reason, the APT Delete process is intended for use on an *exceptional* basis and it is expected that a very limited group of users would have access to run the process. As a safeguard against accidental deletes, the process never deletes a planning node if there has been any activity or update performed on it.

The process does not delete (that is, the selected student/planning node is skipped) if any of the following conditions are true:

- The APT Attempt Status of the Planning Node is a status other than *activated* or *null*.
- The Satisfied check box is selected for an APT Item (for the planning node or child items).
- The APT Item outcome is not null.
- Results exist for the Planning node or one of its child items.
- The APT Item Attempt (for the planning node) approval value is anything other than *Not Required*.
- The Planning Node item/attempt or one of its child items/attempt is locked.
- Child Course Academic Item(s) have a progress level other than *planned*.
- No Enrollment or Transfer Credit data exists for the planning node.
- No Items within the planning node are substitutes/replacements for other items in the instance.

This section discusses how to run the Delete Planning Nodes process.

Page Used to Delete Planning Nodes

Page Name	Definition Name	Navigation	Usage
Delete Planning Node(s)	SSR_APT_DEL_RUNCNT	Records and Enrollment > Program Enrollment > Delete Planning Nodes	Delete planning nodes.

Running the Delete Planning Nodes Process

Access the Delete Planning Node(s) page (Records and Enrollment > Program Enrollment > Delete Planning Nodes).

Image: Delete Planning Node(s) page

This example illustrates the fields and controls on the Delete Planning Node(s) page. You can find definitions for the fields and controls later on this page.

Program Format ID

Prompts against the Program Format Table for the selected institution. Use the View Tree link to view the Program Format definition. The value selected here serves as a high level control for the run control. Only students (whether identified by population selection or entered manually) in programs with a matching program format ID are processed.

Node ID

Select a planning node from the list. The prompt lists all planning nodes for the selected Program Format ID.

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool to identify IDs for a specific transaction, you must use it.

Selection Tool

Select *External File* or *PS Query*.

Query Name

The following queries are delivered as samples:

- SSR_APT_DELETE_PLANNING_NODE (prompts on Institution and Program Format ID).
- SSR_APT_DELETE_PLAN_NODE (prompts on Institution, Academic Career, Planning Node Item Type, Academic Item ID, Program Item ID, Cohort Term and Curriculum Term).

When you create you own queries, you must use the bind record SSR_APT_HDR.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Manual Selection

The Manual Selection grid is available if you do not select the Population Selection check box. Use the grid to enter a list of students for processing:

Image: Delete Planning Nodes page Manual Selection grid

This example illustrates the fields and controls on the Delete Planning Nodes page Manual Selection grid. You can find definitions for the fields and controls later on this page.

ID

Enter a student ID (EMPLID). The prompt includes only those students in programs with the program format ID equal to the Run Control value.

APT Instance

Select an APT Instance for the student.

Managing the APT Administrative Roster

Institutions need to be able to apply academic decisions in program curricula for selected students, such as replace a course that is no longer taught for a particular term or semester. Using a batch process, administrators can use the APT Administrative Roster component to add, remove, and substitute academic items for selected students. They can also use the component to enter, calculate, or evaluate results for selected students for any academic item within the Academic Item Registry (AIR) program structure.

This topic discusses how to:

- Process APT Administrative Roster transactions.
- Monitor APT Action processes.

Pages Used to Manage the APT Administrative Roster

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
APT Administrative Roster	SSR_APT_ADMN_REQ	Records and Enrollment > Program Enrollment > APT Administrative Roster	Add, remove and substitute academic items, and enter results.
Search Item ID in AIR Program	SSR_PROG_ITEM_PT	Select the prompt for an Item field on the APT Administrative Roster page.	Select the academic item for which the APT Action is to be performed.
Request History by Process	SSR_APT_REQ_HIST	Records and Enrollment > Program Enrollment > Request History by Process	View APT Action processes, outcomes and statuses.

Processing APT Administrative Roster Transactions

Access the APT Administrative Roster page (Records and Enrollment > Program Enrollment > APT Administrative Roster).

Image: APT (Academic Progress Tracker) Administrative Roster page

This example illustrates the fields and controls on the APT (Academic Progress Tracker) Administrative Roster page. You can find definitions for the fields and controls later on this page.

Process Options

Manual Entry

Select specific student IDs to process for an APT Action.

Selection Criteria

Use this option to further filter of students on an academic program based on the APT.

- **Academic Career**
Select the Academic Career of the Program. Academic Career is disabled if you set a value for As of Date.
- **Curriculum Term**
Use the Curriculum (Requirement) Term start date to determine the Academic Item effective-dated row to display for the Program Structure modal page when adding or removing items. Items leading up to this date are displayed. This field is disabled if you set a value for As of Date.
- **As of Date**
Use this field to determine which Academic Item effective-dated row to display for the Program Structure modal page when adding or removing items. Items leading up to this date are displayed. This field is disabled if you set a value for Academic Career.
- **Academic Program**
Select an academic program. The prompt lists all valid academic items with an academic item type of Program (SSR_AIR_HDR.SSR_ITEM_TYPE = 'PRG') for the selected institution. This is a delivered academic item type value.

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. For the APT Administrative Roster page, only the Selection Tool *PS Query* is delivered, to ensure data consistency within the APT. Population Selection is also based on user security.

The following queries are delivered as samples to be modified by the institution:

- SSR_APT_ADMIN_ROSTER_SAMPLE (prompts on Institution, Program and Item ID)
- SSR_APT_ADMIN_ROSTER_RSLT_RSCA (prompts on Institution, Program ID, Item ID, Result Type and Result Scale)
- SSR_APT_ADMIN_ROSTER_STAT (prompts on Institution, Program ID, Item ID)
- SSR_APT_ADMIN_ROSTER_GRSC (prompts on Institution, Program ID, Item ID, Result Type and Result Scale). This query is used for result scales that are grade-only.

When you create result based queries, the bind record SSR_APT_ITMRSLT should be used. All other APT Action queries should include the bind record SSR_APT_HDR.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community).

Select update action: Add Item

APT Action

Add Item: Add a child academic item from outside the AIR program structure to a parent academic item within the AIR program selected for an individual or group of students in batch. In the APT Administrative Roster page example, ECON 2 does not exist in the B.A Business Management program. This course is being added from outside the AIR program, as a child to the parent B.A. Bus Mgt Semester 1.

The *Add Item* action also populates the Enrollment Category in the APT Tree (SSR_APT_TREE) if selected or available, and also indicates that this item addition was an administrative addition within the APT. See [Using the APT Tree](#)

Parent Item ID

This prompt opens the Search Item ID in AIR Program page which provides a view of the AIR program. Select the parent item to which the child item will be added.

Note: The academic items available for selection are controlled by APT Action Security. See [Setting Up APT Action Security](#)

Child Item ID to Add

If the current item is a program format tree node, the Child Item ID to Add prompt lists all academic items that have an academic type specified as a valid child item in the Academic Item Type Matrix.

See [Identifying Child Item Types and Syncing Entities](#)

The prompt excludes items that have an item type defined as a program format tree node. This ensures that any changes to the program structure conform to the program format for the item.

Enrollment Category

This field appears only if the Requires Enrollment Category check box has been selected for the academic item type that is being added. Select a value in the Enrollment Category field before submitting the process. See [Defining Academic Item Type Attributes](#)

The documentation about the *Add Item* action and the following documentation about other update actions discusses the Search Item ID in AIR Program page.

Image: Search Item ID in AIR Program page

Here is an example of the Search Item ID in AIR Program page:

Search Item ID in AIR Program

Academic Institution: PeopleSoft University
 Academic Program: 0000002138 B.A. Business Management
 Format ID: UG_4YR_REG UG 4 Year Program

- 1 - Program
 - 10 - Year 1
 - 101 - Year 1 - Semester 1
 - 102 - Year 1 - Semester 2
 - 20 - Year 2
 - 201 - Year 2 - Semester 1
 - 202 - Year 2 - Semester 2
 - 30 - Year 3
 - 301 - Year 3 - Semester 1
 - 302 - Year 3 - Semester 2
 - 40 - Year 4
 - 401 - Year 4 - Semester 1

[]	[-] and ECON 1004B: Economic Methods II	Course	Mandatory	0000000446	

Note: The academic items available for selection are controlled by APT Action Security. See [Setting Up APT Action Security](#)

Select update action: Remove Item

APT Action

Remove Item: Examples of when you might use this action are: program requirements were changed after APT Instances had been built or updated for groups of students; to replace a course that is no longer taught in the semester or term. It is expected that a limited group of users, controlled by APT Action Security, will have access to remove items. See [Setting Up APT Action Security](#)

As a safeguard against accidental deletes, the process never deletes an academic item if there has been any activity or update performed on it.

Note: If you remove a Program academic item (PRG), all content on the student's APT Tree is removed. Therefore, such security access should be provided only in *exceptional* circumstances. The same is true for program format tree nodes.

The process does not remove an academic item if certain conditions are true. The conditions are the same as those listed

in the documentation about deleting planning nodes. See [Deleting Planning Nodes](#)

Item ID

This prompt opens the Search Item ID in AIR Program page where you can select the academic item to be removed (controlled by APT Action Security).

Select update action: Create Substitution

APT Action

Create Substitution: The substitution process typically involves the swapping of one course for another. For example, academic decisions often allow students to substitute a course from the prescribed program curricula for another course that may be part of another program, structure or even a standalone course offered by the institution.

You can also substitute different types of academic items and replace an item of one type with a different type.

Note: You cannot create a substitution for the following items:
 An item which is identified as a program format tree node;
 An item which has been replaced with another APT item;
 An item which has child items in APT (for example, a Course List item, from which child item courses have been placed into APT).

Item to Substitute

This prompt opens the Search Item ID in AIR Program page where you can select the academic item to be substituted (controlled by APT Action Security).

Substitute Item

The prompt lists all non-program format tree node academic items (with effective dated logic) that are *valid child items (according to item type matrix) of the parent item of the item* which is being substituted.

Select update action: Enter Results

APT Action

Enter Results: Enter results by result type and result scale (if one exists) for selected students. Results, Grades, Outcomes, Result Status, Reason Code, Include in Calc and Show Student can be updated for any academic item within the AIR Program selected on the roster page. You can also update a result already submitted. A new result row is created in APT when the process is submitted, to preserve the history of results recorded and for audit purposes. The Include in Calc check box is moved from the previous row to the latest row for the result type.

Item ID

This prompt opens the Search Item ID in AIR Program page where you can select the academic item for which results should be entered (controlled by APT Action Security).

Result Type and Result Scale

The Result Type field prompts against Result Type table (SSR_RESULT_TYPE) for the institution.

You assign a Result Scale to a Result Type on the Result Type page (Set Up SACR, Product Related, Student Records, Grading, Result Type). See [Setting Up Result Types](#)

The question mark icon opens a secondary page to view the selected result scale.

Select update action: Enter APT Status**APT Action**

Enter APT Status

This action updates the APT Attempt Status, Attempt Outcome, and Satisfied status for an academic item for selected students.

For example, once all the results have been recorded for an academic term like a course list, the student's APT can be updated to represent the final outcome of the academic item that has been attempted, such as:

- Attempt Status is Finalized
- Attempt Outcome is Passed
- Satisfied status is Yes

Item ID

Select to open the Search Item ID in AIR Program page. On this page, you can select the academic item for which APT Statuses should be entered. This is controlled by APT Action Security.

Select update action: Calculate Results**APT Action**

Calculate Results

When you click the Calculate button on the APT Administrative Roster page, this action calls a calculation rule from the Rules Engine Manager for selected students. A result row is inserted into the student's APT for the calculated result. The result outcome is also brought back to the roster page, including messages that indicate why a student result cannot be calculated.

You can also recalculate results from the roster page. When the result is recalculated, a new result row is created in APT. The new result row is used to preserve the existing result history and for audit purposes.

Item ID

Select to open the Search Item ID in AIR Program page. On this page, you can select the academic item for which results will be calculated. This is controlled by APT Action Security.

Result Type and Result Scale

The Result Type field prompts against the institution's Result Type table (SSR_RESULT_TYPE).

You assign a Result Scale to a Result Type on the Result Type page (Setup SACR, Product Related, Student Records, Grading, Result Type).

See [Setting Up Result Types](#).

The question mark icon opens a secondary page to view the selected result scale.

See *Using the Rules Engine for Calculation and Evaluation: System/Example Data* in My Oracle Support (ID 1400723.1).

Select update action: APT Status Evaluation

APT Action

APT Status Evaluation

This action evaluates all results for an academic item, and updates the APT Statuses (Attempt Status, Attempt Outcome, and Satisfied) based on the outcome of this evaluation. For example, a student must achieve a mark of over 60.00, and have earned 3 credits to satisfy the requirements for a course list or semester. The student achieves a mark of 85.00 which earns the student 3 credits. The evaluation rule based on this example would be able to update the course list academic item statuses to an Attempt Status of 'Finalized', Attempt Outcome of 'Passed', and Satisfied status of 'Yes'. The results of the evaluation are updated in the student's APT and displayed on the roster page, along with the ability to check any error messages if APT statuses have not been updated.

Item ID

Select to open the Search Item ID in AIR Program page. On this page, you can select the academic item for which results will be calculated. This is controlled by APT Action Security.

Rule Search

Select the Evaluation Rule that you wish to use to evaluate APT statuses for the selected academic item.

See *Using the Rules Engine for Calculation and Evaluation: System/Example Data* in My Oracle Support (ID 1400723.1).

Select Students

Use this grid to select criteria base on the Academic Progress Tracker (APT) to further filter students on an academic program.

Academic Career

Select a career from the Academic Career table (ACAD_CAREER_TBL). This field is disabled if you select an academic career in the Process Options grid.

Cohort Tag

Select an academic cohort from the Academic Cohort table (SSR_COHORT_TBL) to identify students who commenced their program at a particular point in the academic year.

Cohort Term and Curriculum Term Select a term from the Term Values table (TERM_VALUES_TABLE). The Curriculum Term field is disabled if you select a Curriculum Term in the Process Options grid.

Node ID Select a planning node to filter against students' APT Academic Item Attempt Schedule for the academic item you selected.

Term and Attempt Status Use these fields to filter against students APT Academic Item Attempt Schedule for the academic item you selected.

Generate Student List

Click the Generate Student List button after you select criteria using Selection Criteria or Population Selection. When the student data is retrieved, you can access (view or update) the APT Instance or Program Stack data for a student directly from the roster page.

Image: APT (Academic Progress Tracker) Administrative Roster page: Generate Student List grid

This example illustrates the fields and controls on the APT (Academic Progress Tracker) Administrative Roster page: Generate Student List grid. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Select students' interface. It includes search filters for Academic Career (UGRD), Cohort Tag, Cohort Term, and Curriculum Term (0770, 2016 Fall). Below these is an 'Attempt/Schedule' section with dropdowns for Node ID, Term, and Attempt Status. A yellow 'Generate Student List' button is present. The main area contains a table with columns: Select, ID, Name, APT Instance, APT, Cohort Tag, Cohort Term, and Student Results. The table lists five students: Barker, Samantha; Grainger, Stewart; James, Siobhan; Robertson, Gary; and Short, Suzzane. Below the table are links for 'Select All', 'Deselect All', and 'Add Row'. At the bottom, there is a 'Submit' section with a text input for '*Process Description' (containing 'Add ART 299: Art Studio'), a 'Submit' button, and a 'View Request History' link.

Select	ID	Name	APT Instance	APT	Cohort Tag	Cohort Term	Student Results
<input type="checkbox"/>	0081	Barker, Samantha	1	APT		2016 Fall	Results
<input type="checkbox"/>	0080	Grainger, Stewart	1	APT		2016 Fall	Results
<input type="checkbox"/>	0076	James, Siobhan	1	APT		2016 Fall	Results
<input type="checkbox"/>	0078	Robertson, Gary	1	APT		2016 Fall	Results
<input type="checkbox"/>	0079	Short, Suzzane	1	APT		2016 Fall	Results

To process students for an APT Action, select individual students or Select All. Click Add Row to add a student to the list. The Student Results column provides access to the student's XMLP results page. This is the same view as the student in Program Enrollment Self Service.

See *Using BI Publisher and the XMLP Results Template to Display Students' Results and Outcomes in Program Enrollment Self Service: Sample Template* in My Oracle Support (ID 1400723.1).

The generated student list grid example is the same for all APT Actions except Enter Results, Enter APT Status, Calculate Results and APT Status Evaluation.

Image: APT Administrative Roster page: Generate Student List grid_Result Data

Here is an example of the Generate Student List grid for the Enter and Calculate Results action:

Select	ID	Name	APT Instance	Results Exist	Result Value	Grading Scheme	Description	Grading Basis	Grade	Grade Points	Outcome	Result Status	Reason Code	Include in Calculation	Show Student	Student Results
<input type="checkbox"/>	0071	Basonby,Alison	1	<input checked="" type="checkbox"/>	96.00	UGD	Undergrad	GRD	A	4.000	Passed	Approved		<input checked="" type="checkbox"/>	<input type="checkbox"/>	Results
<input type="checkbox"/>	0079	Bywaters,Helen	1	<input checked="" type="checkbox"/>	96.00	UGD	Undergrad	GRD	A	4.000	Passed	Approved		<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Results
<input type="checkbox"/>	0072	Kingston,Alexandra	1	<input type="checkbox"/>	0.00	UGD	Undergrad	GRD				Undetermine		<input type="checkbox"/>	<input type="checkbox"/>	Results
<input type="checkbox"/>	SRPE3053	Mainwaring,Patricia	1	<input checked="" type="checkbox"/>	99.00	UGD	Undergrad	GRD	A	4.000	Passed	Approved	TEST	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Results

The APT Action *Enter Results* displays a results roster grid when the Generate Student List is selected for the specific academic item. The results entry process observes the same functionality of entering results for individual students on the APT component; grades can default from the mark entered using the results scale mapping. The minimum and maximum mark from the result scale is also observed along with decimal places.

The outcome now defaults when entering the mark or grade based on the result scale mapping, and the Include in Calculation flag is also checked on entry of a result. The APT Action *Calculate Results* also uses the same results grid. If a result cannot be calculated for a student, a message column is displayed.

Image: APT (Academic Progress Tracker) Administrative Roster page: Result Messages for APT Action Calculate Results

This example illustrates the APT (Academic Progress Tracker) Administrative Roster page: Result Messages for APT Action Calculate Results. You can find definitions for the fields and controls later on this page.

Select	ID	Name	APT Instance	Results Exist	Result Value	Grading Scheme	Description	Grading Basis	Grade	Grade Points	Outcome	Result Status	Reason Code	Include in Calculation	Show Student	Message Log	Student Results
<input checked="" type="checkbox"/>	0071	Basonby,Alison	1	<input checked="" type="checkbox"/>	96.00	UGD	Undergrad	GRD	A	4.000	Passed	Approved		<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Messages	Results

When retrieving groups of students for result entry for an academic item, the roster page identifies whether a result already exists for a student. If a result or calculation exists, the Result Exists check box is selected and the row is display-only mode. To update a result, select the student ID; the Result field is then available for edit. When a result is updated, a new result row for the result type is created in APT.

Note: If a result exists for Manual Entry, the row is immediately available for edit and update.

Result Value

This value is based on the Result Type setup and is validated against the Result Scale.

Grading Scheme

Controls the Grade prompt and is available if the Result Type has a Result Scale which is configured to allow include grade. The value defaults into the roster page.

Grading Basis

Controls the Grade prompt. This field is available if the Result Type has a Result Scale which is configured to include grades. The field prompts against the Grading Basis for the selected Grading Scheme. The value defaults into the roster page.

Note: The grading basis default value on the roster page and APT component is taken from the default grading basis in the Program Enrollment mapping, which is done on the Academic Program configuration page.

Grade	Allows for the recording of a core grade for the Result Type and is available if the Result Type has a Result Scale configured to allow include grade. The field prompts against the Grade table for the selected Grading Scheme/basis. Defaults from the entry of a Result value based on the Result Scale if configured.
Grade Points	Displays the grade point value (from the GRADE_TBL) for the grade.
Attempt Outcome	Records the outcome of the result, for example, <i>Passed</i> or <i>Failed</i> . If the result scale is associated with a result type, the outcomes can default on entry of a result based on the result scale mappings.
Result Status	Records the current result status, for example, <i>Awaiting Approval</i> or <i>Approved</i> . Prompts on Results Status translate values, and requires data entry (does not default).
	<hr/> Note: If built in the rule calculation, the APT Action Calculate Results can populate the result status as <i>Calculated</i> . <hr/>
Reason Code	Prompts on the APT Reason Code table and requires data entry. Use this field to record reasons why specific results were awarded, for example, compensation, mitigation, health reasons. This is not used in the delivered sample calculation.
Include in Calculation	Select the check box if this result should be included in calculating a higher level result. This is selected in the delivered sample rule calculation.
Show Student	This field can be used when defining the logic of the XMLP Results Template, which is user-defined. The logic within this template can use this field to determine whether the result should be displayed for the student.
Student Results	Provides a link to the XMLP student results page.

Note: The APT action Calculate Results can return all or some of the fields to the roster page. And depending on how the rule is built, it can insert a result into the APT.

For Results Calculation, see *Using the Rules Engine for Program Enrollment Student Self-Service: System/Example Data document* in My Oracle Support (ID 1400723.1).

Image: APT (Academic Progress Tracker) Administrative Roster page: APT Action - Enter APT Status

This example illustrates the fields and controls on the APT (Academic Progress Tracker) Administrative Roster page: APT Action - Enter APT Status. You can find definitions for the fields and controls later on this page.

Select	ID	Name	APT Instance	Attempt Status	Attempt Outcome	Satisfied	Student Results
<input checked="" type="checkbox"/>	0071	Basonby, Alison	1	Finalized	Passed	Yes	Results

The APT Action *Enter APT Status* displays a grid when the Generate Student List is selected for the specific academic item. Using the grid, you can update the values for the APT statuses Satisfied, Attempt Outcome, and Attempt Status.

When you enter the APT status for groups of students for an academic item, the roster page identifies whether an APT status exists for a student. If an APT status exists, the row is display-only mode. To update any of the statuses, you must select the student ID so that the row is in edit mode. The same grid is displayed for APT Status Evaluation, and like the Calculate Results grid, a message column appears if there are any errors in the evaluation of a student’s APT statuses.

For APT Status Evaluation, see *Using the Rules Engine for Program Enrollment Student Self-Service: System/Example Data document* in My Oracle Support (ID 1400723.1).

Attempt Status Records the overall attempt status of the academic item, for example, Finalized.

Attempt Outcome Records the overall attempt outcome of the academic item, for example, Passed.

Satisfied Records whether the academic item has been satisfied or not.

See [Managing APT Items](#)

See [Setting Up Result Types](#)

See [Setting Up APT Reason Codes](#)

Submit APT Actions (Add Item, Remove Item, Create Substitution, Enter Results, Enter APT Status)

You can run the APT action *Submit* as a background process. Alternatively, after submitting, you can view the process using the View Request History link and access the Request History by Process page.

See [Monitoring APT Action Processes](#).

Use the Process Description field on the roster page to provide specific descriptions for each process that you submit, for example, *Add Course Econ 2: Macroeconomic Principles*. These descriptions are recorded in the process and can also be used when you search for specific processes in the Request History by Process component.

Calculate - APT Action (Calculate Results)

The APT action *Calculate Results* does not use the Submit grid. The Calculate button calls the rule from the Rules Engine, inserts a results row in APT, and also displays the result outcome on the roster page. If a student result cannot be calculated, a message is also displayed.

Evaluate - APT Action (Evaluate APT Status)

The APT action *APT Status Evaluation* also does not use the Submit grid. The Evaluate button calls the rule from the Rules Engine, updates the APT statuses of Satisfied, Attempt Outcome, Attempt Status, and also displays the outcome on the roster page. If an outcome status cannot be evaluated, a message is also displayed.

Monitoring APT Action Processes

Use the Request History by Process page to monitor the details and outcomes of all APT Action processes submitted on the APT Administrative Roster page. You can monitor the request as it is submitted (the process instance ID is passed to the Request History by Process component), or view later after running the process in the background. You can also use the page to search for previous process instances submitted. If errors are returned during the submit process, you can fix them in the student's APT or program stack directly from this page, and then resubmit the process.

Although the APT actions Calculate Results and APT Status Evaluation are not submitted to the process scheduler from the roster page, you can still access the results of the rules for these APT actions using the Request History component.

Access the Request History by Process page (Records and Enrollment > Program Enrollment > Request History by Process).

Alternatively, access the page from the APT Administrative Roster page using the View Request History link.

Image: Request History by Process page

This example illustrates the fields and controls on the Request History by Process page. You can find definitions for the fields and controls later on this page.

Request History by Process

Select Requests

APT Action: Remove Item

Process Description: Remove EON 2: Macroeconomic Principles

Process Instance From: 2731 To: []

Run Date From: 08/06/2014 To: 08/06/2014

Run Status: Success

Resubmit Selected

Filter

Use the Filter grid to filter results based on different outcome statuses. For example, you can display the students that have an error status to resolve the data for those students.

Select

This check box appears only for those students who have an Error status. You can select student IDs for resubmission.

Outcome

The Outcome status is display only unless the outcome is an error, when a link provides details about the error message.

Resubmit Selected

You can resubmit the APT Action process for an individual or group of students. After the error has been resolved, select the student ID in the grid and click the Resubmit Selected button. You are returned to the APT Administrative Roster page where you can change the Process Description. Submit the process

from the APT Administrative Roster page as previously, and then return to the Request by History process using the View Request History link to view the outcome of the process.

Note: For APT actions Calculate Results and APT Status Evaluation, resubmission is not available from the Request History component. The error messages are displayed on the roster page, which allows recalculation directly from the roster.

APT API Detail

The following section provides further detail on the operations and processing performed by SSR_APT:API. Please note that when called from the Application Maintenance component, the Admissions Activate Applications process and the Student Program Plan component, the API creates *only the APT Instance* (SSR_APT_HDR). All other actions are performed when the API is called from the APT Request SSR_APT_REQ application engine.

See "Understanding Entity Registry" (PeopleSoft Campus Solutions 9.2: Campus Community)

SSR_APT:API

Class APTAPI

Summary

Property Summary:

Data Type	Name and Description
public APTHeader	<p>APTHeader</p> <p>The APT Header APT Entity object that is populated when the getHeader() method is invoked.</p>
public BasicEntity	<p>CONTEXT_ROOT</p> <p>The APT Entity object which is set as the root context for all method processing in the API. This is usually set as the planning node or equates to term node APT item. This property is set by consumers of the API so that only items that fall under this root item are processed. If this property is blank, the APT Header is considered as the root item. This property is set when the setContextRoot() method is invoked.</p>

Data Type	Name and Description
public BasicEntity	<p>CONTEXT_ROOT_AIR</p> <p>The AIR Entity object which is set as the root context for all method processing in the API. This is usually set as the planning node or equates to term node AIR item. This property is set by consumers of the API so that only items that fall under this root item are processed. If this property is blank, the PoS property is considered as the root item. This property is set when the setContextRoot() method is invoked.</p>
public string	<p>CRSE_FILTER</p> <p>This property determines if the APT structure should fill completed and in-progress courses. Set value 'Y' if the Course should ignore completed and in-progress courses.</p>
public EnrollmentCohort	<p>EnrollmentCohort</p> <p>The enrollment cohort object corresponding to the APT Header in context.</p>
public boolean	<p>FILL_COURSE_GROUP</p> <p>Set this property to true if the course group entities should be populated in the AIR structure.</p>
public boolean	<p>FILL_COURSE_OFFERING</p> <p>Set this property to false to turn off loading course offering details entity under AIR Course, default is true.</p>
public boolean	<p>FILL_NON_PFN_ITEMS</p> <p>Set this property to false if non planning node items should be excluded from the AIR structure.</p>
public boolean	<p>PERFORM_VALIDATE</p> <p>Set this property to false if validation logic should be ignored when save() method is invoked. By default validation logic is processed when save method is invoked.</p>
public BaseAIREntity	<p>PoS</p> <p>The Program of Study AIR Entity object corresponding to the APT Header object. This property is automatically instantiated along with the APTHeader APT Entity object when the getHeader() method is invoked.</p>

Data Type	Name and Description
public ProgramFormatSetup	Program Format The program format object corresponding to the APT Header in context.
public boolean	TERM_ACTIVATE Set this property to true to term activate into terms defined in the equates to term items on save.

Constructor Summary:

Return Data Type	Name and Description
public void	APTAPI()

Method Summary:

Return Data Type	Name and Description
public boolean	activateCurrentPlanningNode (MessageLogBase p_Messages out) Activates the current planning node and all its program format tree node child items by setting the APT Attempt status to 'Activated'. This method will perform this operation only if the attempt status of the current planning node is null.
public boolean	activateCurrentPlanningNodeInAPTHeader(string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out) Activates the current planning node and all its program format tree node child items by setting the APT Attempt status to 'Activated'. This method will perform this operation only if the attempt status of the current planning node is null.
public boolean	activateProgFormatNode(BaseAPTEntity p_APT_Entity, MessageLogBase p_Messages out) Activates the Program Format node entity object passed in as a parameter.

Return Data Type	Name and Description
public boolean	<p>addIAMEnrollDataForItem(number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Adds Individual Activity Management (IAM) enrollment information to a student's APT course item.</p>
public boolean	<p>addIAMEnrollDataForItemInAPTHeader(string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Adds Individual Activity Management (IAM) enrollment information to a student's APT course item.</p>
public BaseAPTEntity	<p>addItem (string p_AIR_Item_ID, MessageLogBase p_Messages out)</p> <p>Adds an AIR Item to a student's APT. This method takes care of automatically adding the parent items (if they do not exist) and adds child items based on the enrollment category of the item being added.</p> <p>This method requires that an APT header record already exists for the student and it should be populated in the APTAPI property APTHeader by invoking the getHeader method.</p>
public BaseAPTEntity	<p>addItemToAPTHeader(string p_Emplid, string p_Institution, number p_Instance, string p_AIR_Item_ID, MessageLogBase p_Messages out)</p> <p>Adds an AIR Item to a student's APT. This method takes care of automatically adding the parent items (if they do not exist) and adds child items based on the enrollment category of the item being added. This method requires that an APT header record already exists for the student.</p>
public BaseAPTEntity	<p>addItemUnderAPTItem (string p_Emplid, string p_Institution, number p_Instance, string p_Parent_Item_ID, string p_Child_Item_ID, MessageLogBase p_Messages out)</p> <p>Adds an AIR Item as a child to a specific APT item. This method can be used to add an item that is not present in the AIR hierarchy.</p>

Return Data Type	Name and Description
public BaseAPTEntity	<p>addItemUnderAPTItemV2(string p_Emplid, string p_Institution, number p_Instance, string p_Parent_Item_ID, number p_Parent_Item_seq, string p_Child_Item_ID, MessageLogBase p_Messages out)</p> <p>Adds an AIR Item as a child to a specific APT item. This method can be used to add an item that is not present in the AIR hierarchy.</p>
public APTAttempt	<p>createAPTAttemptForItem (BaseAPTEntity p_parent, BaseAIREntity p_parent_AIR_Entity, MessageLogBase p_Messages out)</p> <p>Adds a new APT Attempt row for an APT item. This method also creates the APT schedule and APT Result data for the newly created APT Attempt.</p>
public boolean	<p>createAPTHeader (string p_Emplid, string p_Acad_career, number p_Student_car_nbr, string p_Institution, MessageLogBase p_Messages out)</p> <p>Creates a new APT Header record. To save the newly created APT Header to the database invoke the save method.</p> <hr/> <p>Note: The student program stack ACAD_PROG.SSR_APT_INSTANCE is not updated by this method.</p> <hr/>
public boolean	<p>createAPTHeaderFromEntity (StudentProgram p_StudentProgram, MessageLogBase p_Messages out)</p> <p>Creates a new APT Header record. This method uses a pre-populated entity object SSR_CAREER_TERM:Accessors:StudentProgram. This method holds the core logic for creating the APT header and is invoked by all the other methods that create APT header. To save the newly created APT Header to the database invoke the save method.</p> <hr/> <p>Note: The student program stack ACAD_PROG.SSR_APT_INSTANCE is not updated by this method.</p> <hr/>

Return Data Type	Name and Description
public boolean	<p>createAPTHeaderFromRecord (Record p_recACAD_PROG, MessageLogBase p_Messages out)</p> <p>Creates a new APT Header record. This method is meant to be used from online components by passing the ACAD_PROG component buffer record as the parameter. To save the newly created APT Header to the database invoke the save method.</p> <hr/> <p>Note: The student program stack ACAD_PROG.SSR_APT_INSTANCE is not updated by this method.</p>
public BaseAPTEntity	<p>createAPTItem (BasicEntity p_parent, string p_SSR_ITEM_ID, BaseAIREntity p_AIR_Entity, boolean p_full_mode, MessageLogBase p_Messages out)</p> <p>Creates one APT item under a parent APT item. This also creates the APT attempt, schedule and result records. Child academic items are also created based on the mode parameter and the enrollment category associated with the item.</p>
public void	<p>createCounterRecord(string p_Emplid, string p_Institution, number p_Instance)</p> <p>This method should be called to set up the counter record SSR_APT_ITM_CNT. If a row already exists for the given emplid, institution and APT instance key values, it verifies if the counter value is correct and updates it to the right value if it is not. If a counter row does not exist for the given keys then it creates a new row with the correct counter value.</p>
public boolean	<p>deleteAPTHeader (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Deletes APT Header record. Delete is only allowed if there are no references in student program stack or admissions application stack.</p>
public boolean	<p>dropEnrolledItem (number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Deletes enrollment information from a student's APT course item.</p>

Return Data Type	Name and Description
public boolean	<p>dropEnrolledItemInAPTHeader (string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Deletes enrollment information from a student's APT course item.</p>
public boolean	<p>enrollItem (number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Adds enrollment information to a student's APT course item.</p>
public boolean	<p>enrollItemInAPTHeader (string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Adds enrollment information to a student's APT course item.</p>
public BaseAPTEntity	<p>findAPTElementByItemSequence (BaseAPTEntity p_tree, number p_SSR_APT_ITEM_SEQ, array of string p_breadcrumbs out)</p> <p>Searches for and returns an entity object based on the APT item sequence number specified. It can be used only in APT trees.</p>
public BasicEntity	<p>findElementByItemID (BasicEntity p_tree, string p_SSR_ITEM_ID, array of string p_breadcrumbs out)</p> <p>Searches for and returns an entity object based on the item ID specified. It can be used for both AIR and APT trees.</p>
public BaseAIREntity	<p>getAIRItemByNodeID(number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the AIR entity object from the student's APT based on the node ID of the item in Program Format. The APT Header should be populated in the APTAPI property APTHeader by invoking the getHeader method prior to calling this method.</p>
public BaseAIREntity	<p>getAIRItemByNodeIDInAPTHeader(string p_Emplid, string p_Institution, number p_Instance, number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the AIR entity object from the student's APT based on the node ID of the item in Program Format.</p>

Return Data Type	Name and Description
public void	<p>getAllItemIDsByType (BasicEntity p_tree, string p_SSR_ITEM_TYPE, array of string p_Items out)</p> <p>This method returns a list of all item IDs that match the parameter p_SSR_ITEM_TYPE in the entity tree p_tree.</p>
public void	<p>getAllItemsByType (BasicEntity p_tree, string p_SSR_ITEM_TYPE, array of BasicEntity p_Items out)</p> <p>This method returns all items under &p_tree that match the item type value provided in &p_SSR_ITEM_TYPE.</p>
public BaseAPTEntity	<p>getAPTItemByNodeID (number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the APT entity object from the student's APT based on the node ID of the item in Program Format. The APT Header should be populated in the APTAPI property APTHHeader by invoking the getHeader method prior to calling this method.</p>
public BaseAPTEntity	<p>getAPTItemByNodeIDInAPTHHeader(string p_Emplid, string p_Institution, number p_Instance, number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the APT entity object from the student's APT based on the node ID of the item in Program Format.</p>
public string	<p>getCurrentPlanningNodeItemID (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Finds the current planning node item ID of the student from the APT. This method examines AIR and APT structures of the student and determines the planning node item ID.</p>
public void	<p>getHeader (string p_Emplid, string p_Institution, number p_Student_car_nbr)</p> <p>Retrieves an existing header, allows adding/editing of children.</p>
public void	<p>getHeaderEfficiently (string emplid, string institution, number instance)</p> <p>Retrieves an existing header, allows adding/editing of children. This method is more efficient from a performance perspective than getHeader().</p>

<i>Return Data Type</i>	<i>Name and Description</i>
public string	<p>getNextPlanningNodeItemID (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Finds the planning node item ID that should be activated next. This method examines AIR and APT structures of the student and determines the next planning node item ID that should be activated.</p>
public void	<p>Initialize()</p> <p>Initializes state properties ProgramFormat, EnrollmentCohort and PoS based on the current APTHeader value.</p>
public boolean	<p>removeIAMEnrollentDataForItem(number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Removes Individual Activity Management (IAM) enrollment information from a student's APT course item.</p>
public boolean	<p>removeIAMEnrollentDataForItemInAPTHeader(string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Removes Individual Activity Management (IAM) enrollment information from a student's APT course item.</p>
public boolean	<p>removeItem (string p_APT_Item_ID, MessageLogBase p_Messages out)</p> <p>Removes an APT Item from the student's APT structure. Invoke the APT API save() method to really delete it from the backend tables. The APT Header should be populated in the APTAPI property APTHeader by invoking the getHeader method prior to calling this method.</p>
public boolean	<p>removeItemFromAPTHeader (string p_Emplid, string p_Institution, number p_Instance, string p_APT_Item_ID, MessageLogBase p_Messages out)</p> <p>Removes an APT Item from the student's APT structure. Invoke the APT API save() method to really delete it from the backend tables.</p>

Return Data Type	Name and Description
public boolean	<p>removeSubstituteItem (string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Remove a substitute item from the student's APT structure. This method must be used instead of removeItem or removeItemFromAPTHHeader methods to remove a substitute item. The APT Header should be populated in the APTAPI property APTHHeader by invoking the getHeader method prior to calling this method.</p>
public boolean	<p>removeSubstituteItemInAPTHHeader (string p_Emplid, string p_Institution, number p_Instance, string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Remove a substitute item from the student's APT structure. This method must be used instead of removeItem or removeItemFromAPTHHeader methods to remove a substitute item.</p>
public MessageLogBase	<p>Save()</p> <p>Saves the header and all children, if it is a new header creates a counter row.</p>
public void	<p>saveExceptionToLog (string p_component, Exception p_exception)</p> <p>This method will write debugging information to the SOA log file/table (based on SOA setup) based on the passed in exception object.</p>
public boolean	<p>setContextRoot (string p_itemID)</p> <p>Provide an EQT or Planning node item ID as parameter to set it as the API's context root item. This will help the API perform certain operations faster as it operates within the APT sub-tree of the planning/term node. This is not mandatory, but greatly improves performance of the APIT methods.</p>
public boolean	<p>substituteItem (string p_Item_ID, string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Substitutes one APT Item with another in the student's APT structure. The APT Header should be populated in the APTAPI property APTHHeader by invoking the getHeader method prior to calling this method.</p>

Return Data Type	Name and Description
public boolean	<p>substituteItemInAPTHeader (string p_Emplid, string p_Institution, number p_Instance, string p_Item_ID, string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Substitutes one APT Item with another in the student's APT structure.</p>
public boolean	<p>TermActivate (BaseAPTEntity p_APTEntity, MessageLogBase p_Messages out)</p> <p>This method creates a new row in STDNT_CAR_TERM for the term value specified in the APT schedule.</p>

Details

Property Detail:

Name	Details
APTHeader	<p>APTHeader</p> <p>The APT Header APT Entity object that is populated when the getHeader() method is invoked.</p>
CONTEXT_ROOT	<p>public BasicEntity</p> <p>The APT Entity object which is set as the root context for all method processing in the API. This is usually set as the planning node or equates to term node APT item. This property is set by consumers of the API so that only items that fall under this root item are processed. If this property is blank, the APT Header is considered as the root item. This property is set when the setContextRoot() method is invoked.</p>
CONTEXT_ROOT_AIR	<p>public BasicEntity</p> <p>The AIR Entity object which is set as the root context for all method processing in the API. This is usually set as the planning node or equates to term node AIR item. This property is set by consumers of the API so that only items that fall under this root item is processed. If this property is blank, the PoS property is considered as the root item. This property is set when the setContextRoot() method is invoked.</p>
CRSE_FILTER	<p>public string</p> <p>This property determines if the APT structure should fill completed and in-progress courses. Set value 'Y' if the Course should ignore completed and in-progress courses.</p>

Name	Details
EnrollmentCohort	public EnrollmentCohort The enrollment cohort object corresponding to the APT Header in context.
FILL_COURSE_GROUP	public Boolean Set this property to true if the course group entities should be populated in the AIR structure.
FILL_COURSE_OFFERING	public Boolean Set this property to false to turn off loading course offering details entity under AIR Course, default is true.
FILL_NON_PFN_ITEMS	public Boolean Set this property to false if non planning node items should be excluded from the AIR structure.
PERFORM_VALIDATE	public Boolean Set this property to false if validation logic should be ignored when save() method is invoked. By default, validation logic is processed when save method is invoked.
PoS	public BaseAIREntity The Program of Study AIR Entity object corresponding to the APT Header object. This property is automatically instantiated along with the APTHeader APT Entity object when the getHeader() method is invoked.
ProgramFormat	public ProgramFormatSetup The program format object corresponding to the APT Header in context.
TERM_ACTIVATE	public boolean Set this property to true to term activate into terms defined in the EQT items on save.

Constructor Detail:

Name	Details
APTAPI	public APTAPI ()

Method Detail:

Name	Details
activateCurrentPlanningNode	<p>public boolean activateCurrentPlanningNode (MessageLogBase p_Messages out)</p> <p>Activates the current planning node and all its program format tree node child items by setting the APT Attempt status to 'Activated'. This method will perform this operation only if the attempt status of the current planning node is null.</p> <p>Parameters:</p> <p>MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object</p> <p>Returns:</p> <p>boolean</p>
activateCurrentPlanningNodeInAPTHHeader	<p>public boolean activateCurrentPlanningNodeInAPTHHeader (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Activates the current planning node and all its program format tree node child items by setting the APT Attempt status to 'Activated'. This method will perform this operation only if the attempt status of the current planning node is null.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
<p>activateProgFormatNode</p>	<p>public boolean activateProgFormatNode(BaseAPTEntity p_APT_Entity, MessageLogBase p_Messages out)</p> <p>Activates the Program Format node entity object passed in as a parameter.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BaseAPTEntity p_APT_Entity - The program format node APT entity that should be activated. • MessageLogBase p_Messages(out) <p>Returns:</p> <p>boolean</p>
<p>addIAMEnrollentDataForItem</p>	<p>public boolean addIAMEnrollentDataForItem (number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Adds Individual Activity Management (IAM) enrollment information to a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • number p_SSR_APT_ITEM_SEQ - APT item sequence of the item to be updated • number p_ATTEMPT_NBR - APT attempt number of the item to be updated • string p_Term • string p_SSR_ACTIVITY_ID - IAM activity ID • number p_SSR_ACT_ID_SEQ_NBR - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
addIAMEnrollentDataForItemInAPTHeader	<p>public boolean addIAMEnrollentDataForItemInAPTHeader (string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Adds Individual Activity Management (IAM) enrollment information to a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • number p_SSR_APT_ITEM_SEQ - APT item sequence of the item to be updated • number p_ATTEMPT_NBR - APT attempt number of the item to be updated • string p_Term • string p_SSR_ACTIVITY_ID - IAM activity ID • number p_SSR_ACT_ID_SEQ_NBR - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
<p>addItem</p>	<pre>public BaseAPTEntity addItem (string p_AIR_Item_ID, MessageLogBase p_Messages out)</pre> <p>Adds an AIR Item to a student's APT. This method takes care of automatically adding the parent items (if they do not exist) and adds child items based on the enrollment category of the item being added.</p> <p>This method requires that an APT header record already exists for the student and it should be populated in the APTAPI property APTHHeader by invoking the getHeader method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_AIR_Item_ID - Item ID of the AIR item that must be added to the student's APT • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>BaseAPTEntity</p>
<p>addItemToAPTHHeader</p>	<pre>public BaseAPTEntity addItemToAPTHHeader (string p_ Emplid, string p_Institution, number p_Instance, string p_AIR _Item_ID, MessageLogBase p_Messages out)</pre> <p>Adds an AIR Item to a student's APT. This method takes care of automatically adding the parent items (if they do not exist) and adds child items based on the enrollment category of the item being added. This method requires that an APT header record already exists for the student.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • string p_AIR_Item_ID - Item ID of the AIR item that must be added to the student's APT • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>BaseAPTEntity</p>

Name	Details
addItemUnderAPTItem	<pre>public BaseAPTEntity addItemUnderAPTItem (string p_ Emplid, string p_Institution, number p_Instance, string p_ Parent_Item_ID, string p_Child_Item_ID, MessageLogBase p _Messages out)</pre> <p>Adds an AIR Item as a child to a specific APT item. This method can be used to add an item that is not present in the AIR hierarchy.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • string p_Parent_Item_ID - Item ID of the parent APT item under which the new item must be created as a child • string p_Child_Item_ID - Item ID of the AIR item to be created • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>BaseAPTEntity</p>

Name	Details
<p>addItemUnderAPTItemV2</p>	<pre>public BaseAPTEntity addItemUnderAPTItem(string p_ Emplid, string p_Institution, number p_Instance, string p_ Parent_Item_ID, number p_Parent_Item_seq, string p_Child_ Item_ID, MessageLogBase p_Messages out)</pre> <p>Adds an AIR Item as a child to a specific APT item. This method can be used to add an item that is not present in the AIR hierarchy.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • string p_Parent_Item_ID - Item ID of the parent APT item under which the new item must be created as a child • number p_Parent_Item_seq - APT Item sequence (SSR_APT_ITEM_SEQ) of the parent APT item under which the new item must be created as a child • string p_Child_Item_ID - Item ID of the AIR item to be created • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>BaseAPTEntity</p>

Name	Details
createAPTAttemptForItem	<p>public APTAttempt createAPTAttemptForItem (BaseAPTEntity p_parent, BaseAIREntity p_parent_AIR_ Entity, MessageLogBase p_Messages out)</p> <p>Adds a new APT Attempt row for an APT item. This method also creates the APT schedule and APT Result data for the newly created APT Attempt.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BaseAPTEntity p_parent - Parent APT item under which this new APT Attempt must be created • BaseAIREntit p_parent_AIR_Entity – The corresponding AIR item of the p_parent APT item • MessageLogBase p_Messages(out) <p>Returns:</p> <p>APTAttempt</p>
createAPTHeader	<p>public boolean createAPTHeader(string p_Emplid, string p_Acad_career, number p_Student_car_nbr, string p_Institution, MessageLogBase p_Messages out)</p> <p>Creates a new APT Header record. To save the newly created APT Header to the database invoke the save method.</p> <hr/> <p>Note: The student program stack ACAD_PROG.SSR_APT_INSTANCE is not updated by this method.</p> <hr/> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Acad_career - The student's academic career in program/plan • number p_Student_car_nbr - The student's career number in program/plan • string p_Institution - The Institution value • MessageLogBase p_Messages(out) - Messages/Warnings if any will be added to this object. <p>Returns:</p> <p>boolean</p>

Name	Details
<p>createAPTHeaderFromEntity</p>	<p>public boolean createAPTHeaderFromEntity (StudentProgram p_StudentProgram, MessageLogBase p_Messages out)</p> <p>Creates a new APT Header record. This method uses a pre-populated entity object SSR_CAREER_TERM:Accessors:StudentProgram. This method holds the core logic for creating the APT header and is invoked by all the other methods that create APT header.</p> <p>To save the newly created APT Header to the database invoke the save method.</p> <hr/> <p>Note: The student program stack ACAD_PROG.SSR_APT_INSTANCE is not updated by this method.</p> <hr/> <p>Parameters:</p> <ul style="list-style-type: none"> • StudentProgram p_StudentProgram - ACAD_PROG entity object • MessageLogBase p_Messages(out) - Messages/Warnings if any will be added to this object <p>Returns:</p> <p>boolean</p>
<p>createAPTHeaderFromRecord</p>	<p>public boolean createAPTHeaderFromRecord (Record p_recACAD_PROG, MessageLogBase p_Messages out)</p> <p>Creates a new APT Header record. This method is meant to be used from online components by passing the ACAD_PROG component buffer record as the parameter. To save the newly created APT Header to the database invoke the save method.</p> <hr/> <p>Note: The student program stack ACAD_PROG.SSR_APT_INSTANCE is not updated by this method.</p> <hr/> <p>Parameters:</p> <ul style="list-style-type: none"> • Record p_recACAD_PROG - ACAD_PROG component buffer record object • MessageLogBase p_Messages(out) - Messages/Warnings if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
createAPTItem	<p>public BaseAPTEntity createAPTItem (BasicEntity p_parent, string p_SSR_ITEM_ID, BaseAIREntity p_AIR_Entity, boolean p_full_mode, MessageLogBase p_Messages out)</p> <p>Create one APT item under a parent APT item. This also creates the APT attempt, schedule and result records. Child academic items are also created based on the mode parameter and the enrollment category associated with the item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BasicEntity p_parent - Parent APT item under which this new APT item must be created • string p_SSR_ITEM_ID - AIR item ID of the APT item to be created • BaseAIREntity p_AIR_Entity - The corresponding AIR entity object of the APT item to be created • boolean p_full_mode - If true then it creates all children and cascades to create grandchildren and so on, if false only creates itself and any children which have enrollment category auto add option turned on • MessageLogBase p_Messages(out) <p>Returns:</p> <p>BaseAPTEntity</p>
createCounterRecord	<p>public void createCounterRecord(string p_Emplid, string p_Institution, number p_Instance)</p> <p>This method should be called to setup the counter record SSR _APT_ITM_CNT. If a row already exists for the given emplid, institution and APT instance key values, it verifies if the counter value is correct and updates it to the right value if it is not. If a counter row does not exist for the given keys then it creates a new row with the correct counter value.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student

Name	Details
deleteAPTHeader	<p>public boolean deleteAPTHeader (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Deletes APT Header record. Delete is only allowed if there are no references in student program stack or admissions application stack.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • MessageLogBase p_Messages(out) - Messages/Warnings if any will be added to this object <p>Returns:</p> <p>boolean</p>
dropEnrolledItem	<p>public boolean dropEnrolledItem (number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Deletes enrollment information to a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • number p_SSR_APT_ITEM_SEQ • number p_ATTEMPT_NBR • string p_Term - Term into which the enrollment was made • number p_classNumber - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
dropEnrolledItemInAPTHeder	<p>public boolean dropEnrolledItemInAPTHeder(string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Deletes enrollment information from a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • number p_SSR_APT_ITEM_SEQ • number p_ATTEMPT_NBR • string p_Term - Term into which the enrollment was made • number p_classNumber - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
enrollItem	<p>public boolean enrollItem(number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Adds enrollment information to a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • number p_SSR_APT_ITEM_SEQ • number p_ATTEMPT_NBR • string p_Term - Term into which the enrollment was made • number p_classNumber - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>
enrollItemInAPTHeder	<p>public boolean enrollItemInAPTHeder(string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, number p_classNumber, MessageLogBase p_Messages out)</p> <p>Adds enrollment information to a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • number p_SSR_APT_ITEM_SEQ • number p_ATTEMPT_NBR • string p_Term - Term into which the enrollment was made • number p_classNumber - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
findAPTElementByItemSequence	<p>public BaseAPTEntity findAPTElementByItemSequence (BaseAPTEntity p_tree, number p_SSR_APT_ITEM_SEQ, array of string p_breadcrumbs out)</p> <p>Searches for and returns an entity object based on the APT item sequence number specified. It can be used only in APT trees.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BaseAPTEntity p_tree - The root node from where the search should start • number p_SSR_APT_ITEM_SEQ - The Item ID of the item to be found • array of string p_breadcrumbs(out)- This array of string will be populated with entity IDs of the parent items from the element (being searched for) to the root. <p>Returns:</p> <p>BaseAPTEntity</p>
findElementByItemID	<p>public BasicEntity findElementByItemID (BasicEntity p_tree, string p_SSR_ITEM_ID, array of string p_breadcrumbs out)</p> <p>Searches for and returns an entity object based on the item ID specified. It can be used for both AIR and APT trees.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BasicEntity p_tree - The root node from where the search should start • string p_SSR_ITEM_ID - The Item ID of the item to be found • array of string p_breadcrumbs(out) - This array of string will be populated with entity IDs of the parent items from the element (being searched for) to the root. <p>Returns:</p> <p>BasicEntity</p>

Name	Details
<p>getAIRItemByNodeID</p>	<p>public BaseAIREntity getAIRItemByNodeID(number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the AIR entity object from the student's APT based on the node ID of the item in Program Format. The APT Header should be populated in the APTAPI property APTHeader by invoking the getHeader method prior to calling this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • number p_nodeID - The node ID from Program Format • MessageLogBase p_Messages(out) <p>Returns:</p> <p>BaseAIREntity</p>
<p>getAIRItemByNodeIDInAPTHeader</p>	<p>public BaseAIREntity getAIRItemByNodeIDInAPTHeader(string p_Emplid, string p_Institution, number p_Instance, number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the AIR entity object from the student's APT based on the node ID of the item in Program Format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • number p_nodeID - The node ID from Program Format • MessageLogBase p_Messages(out) <p>Returns:</p> <p>BaseAIREntity</p>

Name	Details
getAllItemIDsByType	<p>public void getAllItemIDsByType (BasicEntity p_tree, string p_SSR_ITEM_TYPE, array of string p_Items out)</p> <p>This method returns a list of all item IDs that match the parameter p_SSR_ITEM_TYPE in the entity tree p_tree.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BasicEntity p_tree • string p_SSR_ITEM_TYPE • array of string p_Items(out)
public void	<p>getAllItemsByType (BasicEntity p_tree, string p_SSR_ITEM_TYPE, array of BasicEntity p_Items out)</p> <p>This method returns all items under parameter p_tree that match the item type value provided in p_SSR_ITEM_TYPE.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BasicEntity p_tree • string p_SSR_ITEM_TYPE • array of BasicEntity p_Items(out)
getAPTItemByNodeID	<p>public BaseAPTEntity getAPTItemByNodeID(number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the APT entity object from the student's APT based on the node ID of the item in Program Format. The APT Header should be populated in the APTAPI property APTHeader by invoking the getHeader method prior to calling this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • number p_nodeID - The node ID from Program Format • MessageLogBase p_Messages(out) <p>Returns:</p> <p>BaseAPTEntity</p>

Name	Details
<p>getAPTItemByNodeIDInAPTHeder</p>	<p>public BaseAPTEntity getAPTItemByNodeIDInAPTHeder (string p_Emplid, string p_Institution, number p_Instance, number p_nodeID, MessageLogBase p_Messages out)</p> <p>Retrieves the APT entity object from the student's APT based on the node ID of the item in Program Format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • number p_nodeID - The node ID from Program Format • MessageLogBase p_Messages(out) <p>Returns:</p> <p>BaseAPTEntity</p>
<p>getCurrentPlanningNodeItemID</p>	<p>public string getCurrentPlanningNodeItemID (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Finds the current planning node item ID of the student from the APT. This method examines AIR and APT structures of the student and determines the planning node item ID.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>string</p>

Name	Details
getHeader	<p>public void getHeader (string p_Emplid, string p_Institution, number p_Student_car_nbr)</p> <p>Retrieves an existing header, allows adding/editing of children.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value of the student • number p_Student_car_nbr - The student's career number in program/plan
getHeaderEfficiently	<p>public void getHeaderEfficiently(string emplid, string institution, number instance)</p> <p>Retrieves an existing header, allows adding/editing of children. This method is more efficient from a performance perspective than getHeader().</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string emplid • string institution • number instance
getNextPlanningNodeItemID	<p>public string getNextPlanningNodeItemID (string p_Emplid, string p_Institution, number p_Instance, MessageLogBase p_Messages out)</p> <p>Finds the planning node item ID that should be activated next. This method examines AIR and APT structures of the student and determines the next planning node item ID that should be activated.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>string</p>

Name	Details
Initialize	<p>public void Initialize()</p> <p>Initializes state properties ProgramFormat, EnrollmentCohort and PoS based on the current APTHeader value.</p>
removeIAMEnrollentDataForItem	<p>public boolean removeIAMEnrollentDataForItem(number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Removes Individual Activity Management (IAM) enrollment information from a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • number p_SSR_APT_ITEM_SEQ - APT item sequence of the item to be updated • number p_ATTEMPT_NBR - APT attempt number of the item to be updated • string p_Term • string p_SSR_ACTIVITY_ID - IAM activity ID • number p_SSR_ACT_ID_SEQ_NBR - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
removeIAMEnrollentDataForItemInAPTHeader	<p>public boolean removeIAMEnrollentDataForItemInAPTHeader(string p_Emplid, string p_Institution, number p_Instance, number p_SSR_APT_ITEM_SEQ, number p_ATTEMPT_NBR, string p_Term, string p_SSR_ACTIVITY_ID, number p_SSR_ACT_ID_SEQ_NBR, MessageLogBase p_Messages out)</p> <p>Removes Individual Activity Management (IAM) enrollment information from a student's APT course item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • number p_SSR_APT_ITEM_SEQ - APT item sequence of the item to be updated • number p_ATTEMPT_NBR - APT attempt number of the item to be updated • string p_Term • string p_SSR_ACTIVITY_ID - IAM activity ID • number p_SSR_ACT_ID_SEQ_NBR - The class enrolled into • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
removeItem	<p>public boolean removeItem (string p_APT_Item_ID, MessageLogBase p_Messages out)</p> <p>Removes an APT Item from the student's APT structure. Invoke the APT API save() method to really delete it from the backend tables.</p> <p>The APT Header should be populated in the APTAPI property APTHeader by invoking the getHeader method prior to calling this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_APT_Item_ID - Item ID of the AIR item that must be removed from the student's APT • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>
removeItemFromAPTHeader	<p>public boolean removeItemFromAPTHeader (string p_Emplid, string p_Institution, number p_Instance, string p_APT_Item_ID, MessageLogBase p_Messages out)</p> <p>Removes an APT Item from the student's APT structure. Invoke the APT API save() method to really delete it from the backend tables.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • string p_APT_Item_ID - Item ID of the AIR item that must be removed from the student's APT • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
removeSubstituteItem	<p>public boolean removeSubstituteItem (string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Remove a substitute item from the student's APT structure. This method must be used instead of removeItem or removeItemFromAPTHHeader to remove a substitute item. The APT Header should be populated in the APTAPI property APTHHeader by invoking the getHeader method prior to calling this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Substitute_Item_ID - Item ID of the APT substitute item that must be removed • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>
removeSubstituteItemInAPTHHeader	<p>public boolean removeSubstituteItemInAPTHHeader (string p_Emplid, string p_Institution, number p_Instance, string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Remove a substitute item from the student's APT structure. This method must be used instead of removeItem or removeItemFromAPTHHeader methods to remove a substitute item.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • string p_Substitute_Item_ID - Item ID of the APT substitute item that must be removed • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
save	<p>public MessageLogBase Save()</p> <p>Saves the header and all children, if it is a new header creates a counter row.</p> <p>Returns:</p> <p>MessageLogBase</p>
saveExceptionToLog	<p>public void saveExceptionToLog(string p_component, Exception p_exception)</p> <p>This method will write debugging information to the SOA log file/table (based on SOA setup) based on the passed in exception object.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_component - Name of the component/process/ event that encountered the exception. Used for identifying the source of entry in the log. • Exception p_exception - The exception object. Error message and stack trace information will extracted from this object to be saved to the log.
setContextRoot	<p>public boolean setContextRoot (string p_itemID)</p> <p>Provide an EQT or Planning node item ID as parameter to set it as the API's context root item. This will help the API perform certain operations faster as it operates within the APT sub-tree of the planning/term node. This is not mandatory, but greatly improves performance of the APIT methods.</p> <p>Parameters:</p> <p>string p_itemID - APT item ID of a planning or equates to term node in the APT</p> <p>Returns:</p> <p>boolean</p>

Name	Details
substituteItem	<p>public boolean substituteItem (string p_Item_ID, string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Substitutes one APT Item with another in the student's APT structure. The APT Header should be populated in the APTAPI property APTHeader by invoking the getHeader method prior to calling this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Item_ID - Item ID of the AIR item that must be substituted • string p_Substitute_Item_ID - Item ID of the AIR item that must be substituted • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>
substituteItemInAPTHHeader	<p>public boolean substituteItemInAPTHHeader (string p_Emplid, string p_Institution, number p_Instance, string p_Item_ID, string p_Substitute_Item_ID, MessageLogBase p_Messages out)</p> <p>Substitutes one APT Item with another in the student's APT structure.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • string p_Emplid - The Employee ID of the student • string p_Institution - The Institution value • number p_Instance - The APT instance number of the student • string p_Item_ID - Item ID of the AIR item that must be substituted • string p_Substitute_Item_ID - Item ID of the AIR item that must be substituted • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Name	Details
TermActivate	<p>public boolean TermActivate (BaseAPTEntity p_APTEntity, MessageLogBase p_Messages out)</p> <p>This method creates a new row in STDNT_CAR_TERM for the term value specified in the APT schedule.</p> <p>Parameters:</p> <ul style="list-style-type: none"> • BaseAPTEntity p_APTEntity - The APT entity whose scheduler STRM should be used for term activation • MessageLogBase p_Messages(out) - Messages/Warning if any will be added to this object <p>Returns:</p> <p>boolean</p>

Chapter 42

Managing Research Tracking

Managing Research Candidates

Research candidate records can be created through the following methods:

- Entry of an admissions application to a research eligible program or plan.
- Updating an existing admissions application to a research eligible program or plan.
- Using the Quick Admit process to a research eligible program or plan.
- Using the Student Program/Plan component to assign a research eligible program or plan.

Note: Research candidate information can be accessed through the Candidate Management component only after a candidate has been matriculated. Prior to matriculation, candidate information is accessed through the Admissions Application Entry and Application Maintenance components.

This section provides an overview of consumption and discusses how to:

- Review candidate information.
- Track research topics.
- Search for research topics.
- Assign candidate supervisors.
- Search for supervisors.
- Track consumption and submission.
- Track additional candidate assignments.
- Create assignments for multiple students.
- Update candidate management data using Admissions components.

Pages Used to Manage Research Candidates

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Candidate Management – Information	SSR_RS_CAND_HDR	Records and Enrollment > Graduate Research Management > Candidate Management > Information	View summary information about candidates.

Page Name	Definition Name	Navigation	Usage
Candidate Management – Research Topic	SSR_RS_TOPIC	Records and Enrollment > Graduate Research Management > Candidate Management > Research Topic	View and edit information about a candidate’s research topic.
Topic Search	SSR_RS_TPCSRCH_SEC	Click the Topic Search button on the Candidate Management - Research Topic page.	Search for available research topics.
Candidate Management – Supervisors	SSR_RS_SUPERVISORS	Records and Enrollment > Graduate Research Management > Candidate Management > Supervisors	Assign supervisors and edit supervisor information for the candidate’s research project.
Supervisor Search	SSR_RS_SUPSRCH_SEC	Click the Supervisor Search button on the Candidate Management – Supervisors page.	Search for and select supervisors for the candidate's research project.
Consumption and Submission	SSR_RS_CONSMPTN	Records and Enrollment > Graduate Research Management > Candidate Management > Consumption and Submission	Assign and edit the candidate's thesis submission dates and research load.
Other Assignments	SSR_RS_OTHER_REQ	Records and Enrollment > Graduate Research Management > Candidate Management > Other Assignments	Add any new requirements that must be tracked on the Candidate Management component.
Create Assignments	SSR_RS_BAT_ASSIGN	Records and Enrollments > Graduate Research Management > Create Assignments	Create multiple new assignments for multiple students.
Candidature Details	SSR_RS_CNDDTRE_ADM	Student Admissions > Application Entry > Add Application > Candidature Details Student Admissions > Application Maintenance > Maintain Applications > Application Data	Access and update candidate management data using Admissions components.

Reviewing Candidate Information

Access the Candidate Management - Information page (Records and Enrollment > Graduate Research Management > Candidate Management > Information).

Image: Candidate Management - Information page

This example illustrates the fields and controls on the Candidate Management - Information page. You can find definitions for the fields and controls later on this page.

This example illustrates the fields and controls on the Candidate Management - Research Topic page 2 of 2. You can find definitions for the fields and controls later on this page.

Comments

Comment [Rich Text Editor: New Surgical Techniques for Left handers]

Display Comment to Student

*Status: RIP Review in Progress

*Status Date: 09/17/2013

Use the Research Topic page to track the status of a research topic. Initial entry of the research topic is accomplished in one of two ways:

- Select a predefined research topic.
- Create a new research topic proposal.

The page supports the entry of multiple research topics, but only one should be active after the candidate is matriculated. The thesis title is displayed in the Thesis Management component.

Research Topic

This scroll area is used to insert and delete research topics. Use the Add or Delete buttons to perform these actions.

Sequence

Each number corresponds to a different research topic. Use the Add button at the Research Topic level to insert additional research topic records.

The Sequence number is incremented for each research topic added. Note that the 3Cs buttons are placed at this level so that communications created from this page are for a specific research topic. The Administrative function of TOPC supports this.

Attachments

Click this link to view or add attachments specific to the individual research topic. The number in parentheses indicates the number of attachments currently stored for the research topic.

In the File Attachments grid, the Visible to Student check box allows you to set whether or not the attachment is visible to students in the Candidate Center self service pages. By default, this check box is:

- Deselected in administrator pages so attachments are not visible to students.
- Selected in Candidate Center self-service pages when candidates add attachments.

Create Topic

Click this button to open the fields on the page for update to allow the creation of a new topic. This bypasses the Topic Search functionality because a new research topic is being created instead of searching and selecting predefined research topics.

Topic Search

Click this button to display a search page to search for previously defined research topics.

Additional Information

This link appears only if common attributes have been created for the candidate's research topic using the Common Attribute Framework. Click the link to access a Common Attributes subpage where you can enter or modify the additional information.

Note: The fields that can be entered on this subpage are different from the fields that can be entered on the Research Topic Setup – Additional Information page.

See:

- "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)
- "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)
- "Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

Comments

This field is intended for administrators to add contextual notes to the current row of data. When a new effective data row is entered, the field is reset to blank. When the user scrolls through the row of the record, the comment scroll area automatically opens so that the comment is not missed. In addition, candidates will have the ability to enter comments through the Candidate Center by initiating a Research Service Item.

Display Comment to Student

Select to allow candidates to view the comment in the Candidate Center. By default, this check box is:

- Deselected in administrator pages. Select this option if you would like to share the comment with the candidate.
- Selected in the Candidate Center self-service pages when candidates add comments.

Searching for Research Topics

Access the Research Topic Search page (click the Topic Search button on the Candidate Management - Research Topic page).

Image: Research Topic Search page

This example illustrates the fields and controls on the Research Topic Search page. You can find definitions for the fields and controls later on this page.

Use this page to search for available research topics for the candidate. By default, the candidate’s academic program and plan will automatically be used to search for available research topics, but you can modify the filtering criteria, specifying Academic Program, Academic Plan, Academic Sub-Plan,

and Category, and then use the Search button to locate additional available topics. Select a topic from the results grid to select the topic and display its details in the Research Topic page.

You should only select research topics where both the Academic Program and Academic Plan of the topic match the candidate's values. A warning message is displayed if the topic selected does not match the candidate's Academic Program and Academic Plan. You can click the Cancel button to return to the main page without making a selection.

Assigning Candidate Supervisors

Access the Candidate Management - Supervisors page (Records and Enrollment > Graduate Research Management > Candidate Management > Supervisors).

Image: Candidate Management - Supervisors page

This example illustrates the fields and controls on the Candidate Management - Supervisors page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Supervisors' page for candidate Maya Morris. The page is divided into several sections:

- Information:** Maya Morris, Academic Institution: PeopleSoft University, Academic Career: Medical School, Academic Program: Medicine, SRRS0032, Candidate Number: 000000000013, Student Career Nbr: 0, Academic Plan: Human Testing Research.
- Supervisors:** Sequence: 1, Attachments (0).
- Supervisor Details:**
 - *Effective Date: 03/03/2014, *Effective Sequence: 1, *Effective Status: Active.
 - Supervisor Search:** Supervisor: FA0802, Kabahit,Joel.
 - Start Date: 03/04/2014, End Date: 09/03/2014.
 - Supervision Percentage: 100.00, Supervisor Role: RSUP, Research Supervisor.
 - Funding Percentage: (empty), Affiliation Code: PROF_TMPL.
 - Budget Department: (empty), Primary Supervisor.
 - Academic Organization: ENDOCRIN, Endocrinology.
 - Advisory Committee: (empty).
- Comments:** A rich text editor with a toolbar (Format, Font, Size, Bold, Italic, Underline) and a text area. Below the editor is a checkbox for 'Display Comment to Student'.
- Status:** *Status: (empty), Status Date: 03/03/2014.
- Transfer To:** (dropdown menu) and a 'Go' button.

Use this page to assign supervisors to the candidate. Multiple supervisors are supported.

Supervisors

Use this scroll area to insert and delete supervisor positions, using the Add and Delete buttons. The Sequence number increments for each supervisor position added. Note that the 3Cs buttons are placed at this level so that communications created from this page will be for a specific supervisor. The Administrative function of SUPR supports this.

Attachments

Click this link to view and add attachments to the selected supervisor sequence. The number in parentheses indicates the number of attachments currently stored for the supervisor.

In the File Attachments grid, the Visible to Student check box allows you to set whether or not the attachment is visible to students on the Candidate Center self-service pages. By default, this check box is:

- Deselected in administrator pages so attachments are not visible to students.
- Selected in Candidate Center self-service pages when candidates add attachments.

Supervisor Details

This scroll area maintains additional, candidate-specific information about the supervisor. In addition, schools can use this section to track the selection and approval of the supervisors. A supervisor position can be created without an actual person assigned until a later date. Research supervisors are defined in the Administrator Profile component.

Supervisor Search

Click this button to display the Supervisor Search page, where you can search for and select valid supervisors to include on the Supervisors page. A valid supervisor is one whose Academic Program or Academic Plan matches that of the candidate.

Define supervisors using the Affiliations feature, the Academic Institution 10 page, and the Administrator Profile Management page.

See [Setting Up Research Administrators](#).

Status

The status values are defined in the Research Status Code setup component. The available research status codes are those defined with the System Usage value equal to *Supervisor*.

Schools will likely create status codes to track the approval of the research supervisors as well as track the availability of the supervisor over time. This is a required field.

Note: This field has underlying PeopleCode that supports 3C Engine triggers that occur in real time or store in a trigger table for processing later. Essentially, communications can be triggered automatically based on assigning a specific status value.

Additional Information

This link appears only if common attributes have been created for the candidate's research topic using the Common Attribute Framework. Click the link to access a Common Attributes subpage where you can enter or modify the additional information.

See:

- [Using Common Attribute Framework for Research Tracking](#)
- "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

Comments

This field is intended for administrators to add contextual notes to the current row of data. When a new effective data row is entered, the field is reset to blank. When the user scrolls through the row of the record, the comment scroll area automatically opens so that the comment is not missed. In addition, candidates will have the ability to enter comments through the Candidate Center by initiating a Research Service Item.

Display Comment to Student

Select to allow candidates to view the comment in the Candidate Center. By default, this check box is:

- Deselected in administrator pages. Select this option if you would like to share the comment with the candidate.
- Selected in the Candidate Center self-service pages when candidates add comments.

["Defining 3C Engine Triggers"](#) (PeopleSoft Campus Solutions 9.2: Campus Community)

Searching for Supervisors

Access the Supervisor Search page (click the Supervisor Search button on the Supervisors page).

Image: Supervisor Search page

This example illustrates the fields and controls on the Supervisor Search page . You can find definitions for the fields and controls later on this page.

Use this page to search on Academic Program, Academic Plan, and Academic Sub-Plan in order to locate specific supervisors. Eligible research supervisors are defined in the Administrator Profile component. Select a topic from the results grid to display its details in the Supervisors page.

You can select only supervisors for whom either the Academic Program or Academic Plan relevant to the supervisor matches that of the candidate. Other supervisors in the search results are display-only.

Use the Cancel button to return to the main page without making a selection.

For information about the Administrator Profile component, see [Setting Up Research Administrators](#).

Tracking Consumption and Submission

This section discusses consumption and how to use the Consumption and Submission page.

Understanding Consumption

A challenge in monitoring research candidates is that they often do not follow an academic calendar while conducting their research. Research candidates are usually allocated a set amount of time to complete their research and submit their thesis for evaluation, so a method called Consumption is used to determine when the candidate has reached the limit of his or her allocated time.

This method is optional for schools to implement and does not replace the current methods for monitoring academic progress. As consumption is monitored, schools must determine the administrative action to be taken as the time allocated to a research candidate runs down.

The consumption process takes the amount of time allocated by the department to complete the research project, the rate at which research work is conducted (load), and the candidate’s start date to determine the date at which the candidate’s time runs down to zero. This is known as the final submission date. A current measure of the candidate’s remaining time is maintained. Administrators can monitor this time remaining and initiate actions necessary to insure that the candidate is making progress.

Here is an example of a consumption calculation:

A research project is determined to require 90 days to complete at a full time rate. An applicant has accepted the research project set to begin on January 1, 2013, but will be conducted at a load of half time (.50). The consumption calculation would adjust the 90 full time days to reflect its consumption at a half

time rate (90 days/50) and calculate 180 days to consume the allocated time. A final thesis submission date of June 30, 2013 is calculated.

The candidate begins his or her research as planned. On February 2 (32 days later), the consumption calculation would determine that the candidate has consumed 16 days (equals 32 calendar days x .5 consumption load) and has 74 days remaining (90 total allocated – 16 consumed).

Administrators can override the consumption settings for individual research candidates. For example, an adjustment to the start date may be required due to the nature of the research project or additional time may need to be added due to the availability of research topic. Adjustments made to a candidate's start date, total allocated days, and load result in a recalculation of the submission dates.

Note: If the consumption feature is not implemented for some or all of an institution's research candidates, schools still have the option of manually managing the load, begin date, and submission date fields for their research candidates. These fields may still be useful in monitoring the progress of their candidates.

Image: Consumption and Submission page example (Model is None)

Here is an example of the Consumption and Submission page if the consumption feature is not used (Consumption Model is None):

The screenshot displays the 'Consumption and Submission' page for Laurence Fournier (ID: 0067). The page is divided into several sections:

- Navigation Tabs:** Information, Research Topic, Supervisors, Consumption and Submission (active), Other Assignments.
- Candidate Information:** Laurence Fournier, 0067.
- Academic Details:**
 - Academic Institution: French University
 - Academic Career: Research
 - Academic Program: Doctorate in English
 - Candidate Number: 000000000015
 - Student Career Nbr: 0
 - Academic Plan: English Literature
- Attachments:** (0)
- Consumption Section:**
 - *Effective Date: 01/18/2013
 - *Eff Seq: 1
 - *Effective Status: Active
 - Consumption Model: None Days
 - Ovrd Load: [input field]
 - Begin Date: 09/14/2009
 - Early Submission Date: [input field]
 - Final Submission Date: [input field]
- Comments Section:**
 - Comment: [Rich text editor with toolbar]
 - Display Comment to Student
- Status:** [input field]
- Status Date:** 01/18/2013

Suspending, Resuming, and Resetting Consumption

In addition to being able to make adjustments to the consumption calculation to more accurately reflect an individual research candidate's circumstances, administrators also have the ability to suspend (and later resume) or even reset the process. An example where suspension of the calculation may be applied is when the candidate takes a leave of absence from the university. The administrator must determine if suspension is required. For example, the candidate's research topic suddenly becomes unavailable

for study. If consumption is suspended, any further calculations are halted. The days remaining, days consumed, and the submission dates become locked while the suspension is in place. When the candidate returns from leave, consumption would then be resumed. When consumption is resumed, the time period of the suspension is ignored (not counted as consumed), and the submission dates are recalculated based on the resumption date.

The option to reset the consumption calculator can be used in the case where a candidate has already started his or her research project, but at some point the administrator wants to restart the consumption process, but preserve the previous consumption information. The old information is preserved for audit purposes, but the information is not used once the reset has been implemented. For example, a research candidate has been working on an approved research topic. For some reason, the research topic can no longer be studied and the candidate must change to another research area. The administrator could choose to perform a reset instead of other options such as making adjustments to the current consumption data (adding more days, changing the research load), or requiring the candidate to reapply for admissions under the new topic.

Program Stack Changes and Consumption

Similar to all students in the Campus Solutions system, the academic status of the research candidate is maintained in the program stack. Changes in the candidate's program status may have a downstream impact on how consumption should behave. Using the leave of absence example earlier: to grant the leave of absence, the status must first be entered in the Student Program/Plan component to update the program stack. Next, the consumption status in the Candidate Management component would need to be updated. To assist in coordinating program status and consumption status changes, an optional feature to automatically update the candidate's consumption information based on changes made to the program stack is available. A specific program action and action reason combination entered in the Student Program/Plan component can be made to trigger the insertion of a new consumption row for research candidates who have consumption enabled. Administrators can cause the consumption process to suspend, resume previously suspended consumption, or simply insert a new informational row to document that a change in the program stack had occurred. The new consumption row uses the same effective date as the new program action row.

An example of the sequence of events that may take place to process a leave of absence:

1. A candidate applies for a leave of absence by submitting a service request.
2. The request is administered in the Service Request Management component.
3. If the leave of absence is approved, a new row is saved in Student Program/Plan using a Program Action of LOA and an Action Reason of SUSP (suspend consumption).
4. A row is then automatically inserted in the Consumption record in the Candidate Management component. How the fields on the Consumption and Submission page are updated depends on the setup on the Program Action Process Setup page. For example, if the setup indicates that when the Program Action in Student Program/Plan is *LOA* and the Action Reason is *SUSP*, then the Consumption Action should be *Suspend* and the Status (consumption status) should be *LOA*—the Consumption Indicator and Status fields on the Consumption and Submission page are updated accordingly.
5. Consumption is calculated up to the date that the leave of absence takes effect.

See:

- [Setting Up Consumption Actions for Program Actions](#)

- [Managing Service Requests](#)
- [Maintaining Student Program Stacks](#)

Using the Consumption and Submission Page

Access the Consumption and Submission page (Records and Enrollment > Graduate Research Management > Candidate Management > Consumption and Submission).

Image: Consumption and Submission page

This example illustrates the fields and controls on the Consumption and Submission page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Consumption and Submission' page for candidate SRRS0039. The page is divided into several sections:

- Navigation Tabs:** Information, Research Topic, Supervisors, Consumption and Submission (active), Other Assignments.
- Candidate Information:**
 - Border Marks: SRRS0039
 - Academic Institution: PeopleSoft University
 - Academic Career: Medical School
 - Academic Program: Medical Research Lab
 - Candidate Number: 000000000031
 - Student Career Nbr: 0
 - Academic Plan: Lab Research Site 1
 - Days Remaining: 1200.00
- Attachments:** (3)
- Consumption Section:**
 - *Effective Date: 02/01/2014
 - *Eff Seq: 1
 - *Effective Status: Active
 - Consumption Model: None Days
 - Consumption Indicator: [Dropdown]
 - Overd Load: FULL (Full Time)
 - Consumption Rate: 1.00
 - Begin Date: 08/30/2014
 - Calculated Values: Total Days (1200.00), Days Remaining (1200.00), Days Consumed (0.00)
 - Early Submission Date: 08/14/2017
 - Early Submission %: 90
 - Final Submission Date: 12/12/2017
 - Recalculate button
- Comments Section:**
 - Comment: Student will be enrolled full time.
 - Display Comment to Student
 - *Status: P (Pending Finalization)
 - Status Date: 02/01/2014
- Transfer To:** [Dropdown] [Go]

The Consumption and Submission page can be accessed only after a research candidate is matriculated into the program. Prior to matriculation, you can view and update consumption and submission data on the Candidature Management page in Admissions.

See [Updating Candidate Management Data Using Admissions Components](#).

Consumption Model

Indicates whether consumption calculations will be performed. Available fields change based on the model selected. After research has begun, the field cannot be changed. If the model

is None, the page limits the display to the Load, Status, and Submission Date fields.

Load	The consumption load of the candidate. If the load is changed, the submission dates are recalculated to reflect the change. A recalculation is performed either by pressing the recalculate button, or by a successful save of the page.
Begin Date	The date that the research program begins. After the research begins, you cannot override the date. If you need to override the date, delete all the consumption rows dated after the begin date, or use the consumption reset functionality.
Total Days	The time allocated to the candidate to complete his or her research. If modified, the submission dates are recalculated.
Days Remaining	Display-only field that shows the time remaining as of the effective date of the record. This value is calculated by subtracting the Days Consumed from the Total Days.
Days Consumed	Display-only field reflecting the amount consumed as of the effective date.
<hr/> <p>Note: The Days Remaining field located at level zero on the page always displays the amount consumed as of the current date. The value is not adjusted to reflect calendar days.</p> <hr/>	
Early Submission Date	A calculated date based on the default consumption settings used for the candidate.
Final Submission Date	The calculated date when the Days Remaining becomes zero.
Status	Select a status from the available list. The status values are defined in the Research Status Code setup component. The available research status codes are those defined with the System Usage value equal to Consumption. This is a required field.
	This field can be automatically updated when a row is saved in the Student Program/Plan, as explained in the “Understanding Consumption” section.
Consumption Indicator	Indicates whether the consumption calculation is suspended, resumed, or reset, as explained in the “Understanding Consumption” section.
Ovrd (override)	The column labeled Ovrd indicates whether the corresponding field (Begin Date, Total Days, Early Submission Date, Final Submission Date) has been overridden by the user.
	The Ovrd check box is automatically selected when the user changes the default values derived from setup (begin date, total days) or from the initial consumption calculation (dates). The check boxes are deselected if the original value is restored.

Calculated Values: Total Days	Displays the default value derived from setup. When the actual Total Days field is modified, the Ovrld check box is selected when the two value do not equal.
Calculated Values: Days Remaining	This is the actual Days Remaining value adjusted to reflect the number of calendar days (divide the actual days remaining by the Consumption Rate).
Calculated Values: Early Submission Date	Calculated from the current consumption settings displayed on the page. The Ovrld check box is selected when the actual Early Submission Date does not match.
Calculated Values: Final Submission Date	Calculated from the current consumption settings displayed on the page. The Ovrld check box is selected when the actual Final Submission Date does not match.
Recalculate	When you click this button, a recalculation of consumption for the current row occurs. By default, the button is not available unless a new row is inserted or a field that impacts the consumption calculation in the current row is modified. Note that when the consumption record is saved, a recalculation is always performed.

Comments

This field is intended for administrators to add contextual notes to the current row of data. When a new effective data row is entered, the field is reset to blank. When the user scrolls through the row of the record, the comment scroll area automatically opens so that the comment is not missed. In addition, candidates will have the ability to enter comments through the Candidate Center by initiating a Research Service Item.

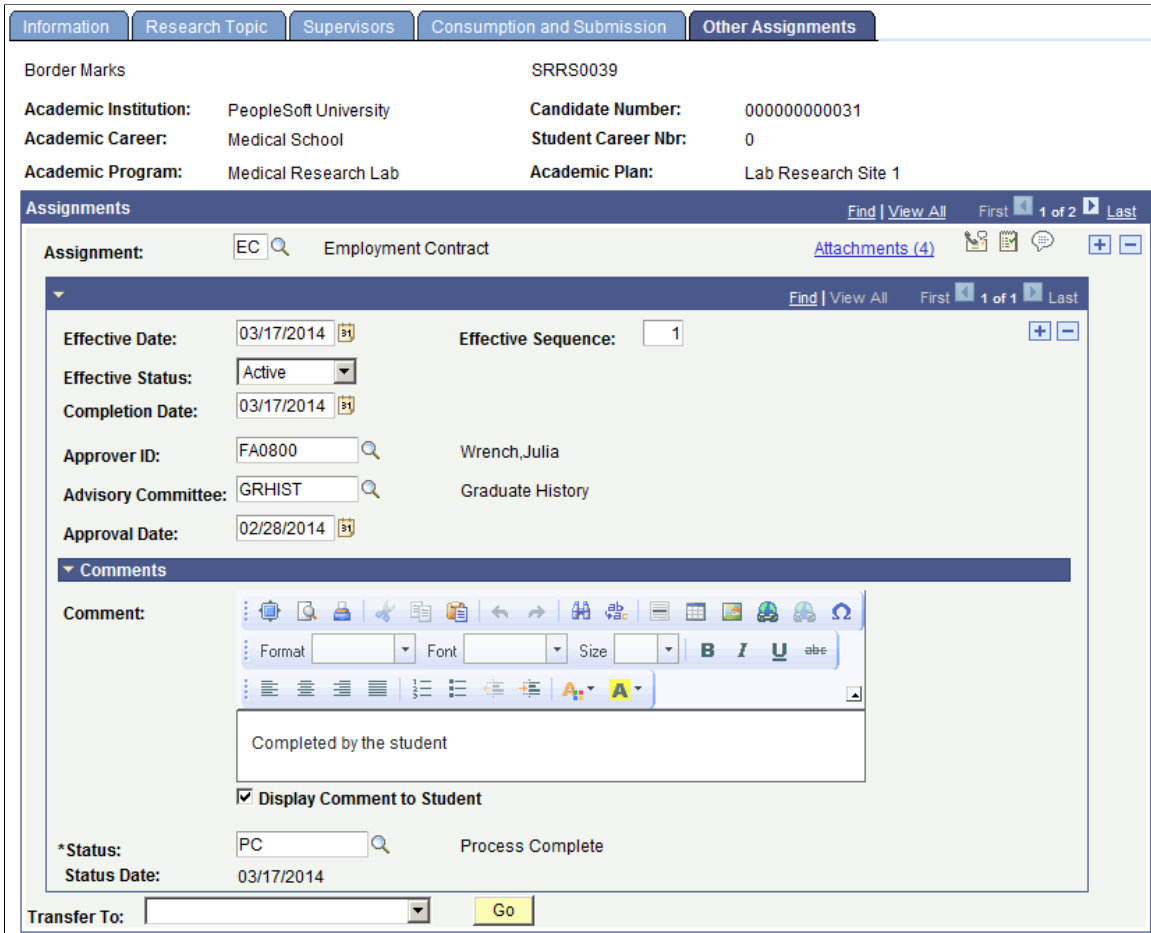

Display Comment to Student	Select to allow candidates to view the comment in the Candidate Center. By default, this check box is: <ul style="list-style-type: none"> • Deselected in administrator pages. Select this option if you would like to share the comment with the candidate. • Selected in the Candidate Center self-service pages when candidates add comments.
-----------------------------------	--

Tracking Additional Candidate Assignments

Access the Other Assignments page (Records and Enrollment > Graduate Research Management > Candidate Management > Other Assignments).

Image: Other Assignments page

This example illustrates the fields and controls on the Other Assignments page. You can find definitions for the fields and controls later on this page.

Use this page to add new assignments to be tracked on the Candidate Management component.

For information about how to create assignments for multiple students, see [Creating Assignments for Multiple Students](#).

For information about how to set up assignments, see [Defining Additional Business Assignments](#).

The setup determines the fields that are displayed for the assignment. Multiple assignments are supported.

Assignment

Use this area of the page to add and delete assignments. Note that the 3Cs buttons are placed at this level so that communications created from this page will be for a specific assignment. The Administrative function of RREQ supports this.

Assignment

Assignments are defined in the Assignment Types component.

Attachments

Click this link to view and add attachments to the selected assignment. The number in parentheses indicates the number of attachments currently stored for the supervisor.

In the File Attachments grid, the Visible to Student check box allows you to set whether or not the attachment is visible to students on the Candidate Center self-service page. By default, this check box is:

- Deselected in administrator pages so attachments are not visible to students.
- Selected in Candidate Center self-service pages when candidates add attachments.

Detail

At this level, the fields that appear are controlled by the Assignment definition performed in setup. The possible fields that may appear are:

Completion Date	The expected or actual completion date of the assignment.
Approver ID	The person who approves the assignment.
Committee ID	The committee that approves the assignment.
Approval Date	The date of the approval.
Comments	<p>A rich text format field for free-form comments.</p> <p>This field is intended for administrators to add contextual notes to the current row of data. When a new effective-dated row is entered, this field is reset to blank. When the user scrolls through the row of the record, the comment scroll area automatically opens so that the comment is not missed.</p> <p>In addition, candidates will have the ability to enter comments through the Candidate Center by initiating a Research Service Item.</p>
Display Comment to Student	<p>Select to allow candidates to view the comment in the Candidate Center. By default, this check box is:</p> <ul style="list-style-type: none"> • Deselected in administrator pages. Select this option if you would like to share the comment with the candidate. • Selected in the Candidate Center self-service pages when candidates add comments.

Several fields will always appear in this section: these include the Effective Date, Effective Sequence and Effective Status.

Status	<p>Select a status from the available list. Available statuses include those assigned to a research group code that is associated with a user defined requirement type.</p> <p>The status values are defined in the Research Status Code setup component. The available research status codes are those</p>
---------------	---

defined with the System Usage value equal to Requirement.
This is a required field.

Note: This field has underlying PeopleCode that supports 3C Engine triggers that occur in real time or store in a trigger table for processing later. Essentially, communications can be triggered automatically based on assigning a specific status value.

Additional Information

This link appears only if common attributes have been created for the candidate's research topic using the Common Attribute Framework. Click the link to access a Common Attributes subpage where you can enter or modify the additional information.

See:

- [Using Common Attribute Framework for Research Tracking](#)
- "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)
- "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

Creating Assignments for Multiple Students

Access the Create Assignments page (Records and Enrollments > Graduate Research Management > Create Assignments).

 Completion Date: 09/30/2013
 Comment:

Use this page to insert multiple, new assignments into existing research and project records.

This Application Engine process enables you to create assignment records for a group of EmplIDs, instead of using the Candidate Management-Other Assignments page or the Project Management-Additional Details page to create assignments for individual students.

You can either use the Population Selection framework to identify a population of students or manually enter a list of EmplIDs in the Student Override region.

Population Selection

Select this check box to run the process using Population Selection.

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (PS Query, Equation Engine equation, or external file) to identify IDs for a specific transaction, you must use it.

Campus Solutions delivers a sample query (SSR_RS_BAT_ASSIGN) for the Create Assignments process.

If you select the Population Selection check box, the Student Override check box is unavailable for entry.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community).

Student Override

Select this check box to specify one or more EmplIDs for which you want to run the Create Assignments process.

If you select the Student Override check box, the Population Selection check box is unavailable for entry.

Note: If you select the Student Override option, only those EmplIDs that have an active Candidate Header or Project record are available. However, the system cannot enforce this rule if you use Population Selection. It is important to review the delivered sample query or sample Equation Engine equation to see how to select your target populations. In addition, use the SSR_PROJECT_IND field to distinguish between research candidate and student project records.

When you run the Create Assignments process using Population Selection, if the process finds an EmplID without an active Candidate Header or Project record, then the process skips the record and moves on to the next EmplID in the selection. The process message log displays the EmplIDs for all assignments created and those that were skipped.

After the process creates the new assignments, use the Candidate Management-Other Assignments page and the Project Management-Additional Details pages to manage them.

Assignment Details

For information about these fields, see [Tracking Additional Candidate Assignments](#).

Note: If an assignment record exists for a particular assignment type, the process does not create a duplicate record for the same.

Updating Candidate Management Data Using Admissions Components

Access the Candidature Details page (Student Admissions > Application Entry > Add Application > Candidature Details).

Image: Candidature Details page (1 of 3)

This example illustrates the fields and controls on the Candidature Details page (1 of 3). You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Candidature Details' page for Daphne Ferrer. The page is divided into several sections:

- Header:** Navigation tabs for 'Application School/Recruiting', 'Application Student Response', 'Additional Details', and 'Candidature Details'.
- Candidate Information:** Name: Daphne Ferrer, ID: SRRS0020. Academic Institution: PeopleSoft University. Academic Career: Medical School. Academic Program: Medical Research Field. Academic Plan: Lab Research Site 2. Application Number: 00025858. Candidate Number: 000000000043.
- Attachments:** A link for 'Attachments (0)'.
- Consumption Section:** Includes fields for 'Effective Date' (03/19/2014), 'Eff Seq' (1), and 'Effective Status' (Active). It also features 'Consumption Model' (Days), 'Ovrd Load' (FULL), 'Begin Date' (08/30/2014), 'Total Days' (1250.00), 'Early Submission Date' (01/31/2018), and 'Final Submission Date' (01/31/2018). A 'Recalculate' button is present.
- Comments Section:** A rich text editor with a toolbar and a text area containing the comment: 'Set total days to 1250.' There is a checkbox for 'Display Comment to Student'.
- Status:** 'Status' is set to 'P' (Pending Finalization) and 'Status Date' is 03/19/2014.

Image: Candidature Details page (4 of 4)

This example illustrates the fields and controls on the Candidature Details page (4 of 4). You can find definitions for the fields and controls later on this page.

This page is available only if the candidate has a research-eligible academic program or academic plan (the Use Research Processing check box is selected on the Research Processing Options page in the Academic Program Table or Academic Plan Table components).

See:

- [Setting Up Research Tracking Options for Academic Programs](#)
- [Setting Up Research Tracking Options for Academic Plans](#)

Each subpage follows the design of, and behaves similarly to, the pages used in the Candidate Management component (Records and Enrollment, Graduate Research Management, Candidate Management).

Attachments

Click this link to view and add attachments to the candidate. Attachments uploaded to this link are stored at the candidate level. The number in parentheses indicates the number of attachments currently stored.

In the File Attachments grid, the Visible to Student check box allows you to set whether or not the attachment is visible to students on the Candidate Center self-service page. By default, this check box is:

- Deselected in administrator pages so attachments are not visible to students.

- Selected in Candidate Center self-service pages when candidates add attachments.

Additional Information

If common attributes have been created for the candidate's consumption and submission information, this link appears.

Click the link to access a Common Attributes subpage where you can enter or modify the additional information.

See:

- [Using Common Attribute Framework for Research Tracking](#)
- "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)

Comment

This field is intended for administrators to add contextual notes to the current row of data. When a new effective data row is entered, the field is reset to blank. When the user scrolls through the row of the record, the comment scroll area automatically opens so that the comment is not missed. In addition, candidates will have the ability to enter comments through the Candidate Center by initiating a Research Service Item.

Display Comment to Student

Select to allow candidates to view the comment in the Candidate Center. By default, this check box is:

- Deselected in administrator pages. Select this option if you would like to share the comment with the candidate.
- Selected in the Candidate Center self-service pages when candidates add comments.

For information about Research Topic, Supervisors, and Assignment sections of this page, refer to the documentation about the related pages in the Candidate Management component earlier in this section.

The following information is about the Consumption section of the page. (The example page above shows data for an applicant who has not been matriculated).

Admissions Processing: Understanding Consumption

By its definition, consumption does not begin until the candidate begins their research program. During the admissions process, you can establish the inputs to the consumption calculation and submission dates can be calculated; none of the values are finalized until the candidate has been admitted and matriculated. The following explains the consumption behavior during the admissions cycle.

Research-Eligible Application is Submitted:

A program or plan is research-eligible if the Use Research Processing check box is selected on the Research Processing Options page in the Academic Program Table or Academic Plan Table component.

When a research-eligible application is submitted, consumption information is populated in the Admissions component.

Candidate is Admitted into the Research Program:

During the Admissions process, before matriculation, an administrator might make changes to the application data that affect consumption calculation—for example, a change to the load or the time allocated for a candidate to complete the research.

Candidate is Matriculated into the Research Program:

After a candidate is matriculated, you must use the Candidate Management component (Records and Enrollment, Graduate Research Management, Candidate Management) to update candidate information, including consumption.

Consumption Model

This value appears by default from the value in the Consumption Controls group box on the (Academic Program or Academic Plan) Research Processing Options page.

Ovrd(override)

This check box is selected for fields for which you have changed the value. For example if you change the value for Begin Date, the Ovrd check box is selected for that field. A recalculation of the Submissions dates occurs using the new Begin Date value. The exception is that if the Early Submission Date or Final Submission Date fields have been overridden, the overridden Submission date values remain.

Load

The rate and intensity at which the candidate's research is conducted. This is similar in concept to Academic Load, but is based on the candidate's research effort, not on enrollment.

The Load value appears by default from the Consumption Load value in the Consumption Controls group box on the (Academic Program or Academic Plan) Research Processing Options page. You can change the load—the Submission dates are recalculated (except if the dates have been overridden).

Begin Date

Derived from the start date of the Admit Term. You can change the date—the Submission dates are recalculated (except if the dates have been overridden).

Total Days

The value appears here by default from the Candidacy Duration – Days value on the (Academic Program or Academic Plan) Research Processing Options page. You can change the number of days—the Submission dates are recalculated (except if the dates have been overridden).

Note: Time is not consumed until after matriculation and therefore Days Remaining is never calculated/does not appear in the Admissions components (it appears in the Candidate Management component after matriculation).

Early Submission Date

The earliest date on which candidates can submit their thesis for review. This date is initially calculated based on the Consumption Controls setup in the Academic Program Table or Academic Plan Table components. The Early Submission Date is recalculated if a change is made to the Load, Begin Date,

or Total Days (except if the Early Submission Date has been overridden).

Final Submission Date

The latest date on which the candidate can submit the thesis for review. This date is initially calculated based on the Consumption Controls setup in the Academic Program or Academic Plan components. It is recalculated if changes are made to the Load, Begin Date, or Total Days (except if the Final Submission Date has been overridden).

Status

This is the Consumption status. Values appear here based on the values defined on the Research Status Code Setup page (System Usage value is Consumption).

The Status codes should be used to describe the reason that the consumption record was modified. This is a required field.

Note: This field has underlying PeopleCode that supports 3C Engine triggers that occur in real time or store in a trigger table for processing later. Essentially, communications can be triggered automatically based on assigning a specific status value.

Calculated Values

When the system recalculates consumption (due to a change in load, for example), then if the Early Submission Date or Final Submission Date values (or the Remaining Days value after the student is matriculated) have been overridden, the system also calculates consumption based on the original values from setup (it ignores the overridden values) and provides that data here in the Calculated Values fields.

Consumption Rate and Early Submission %

These values appear by default from the (Academic Program or Academic Plan) Research Processing Options page.

Recalculate

This button is available when you enter a new row or change a value in a field, so that you can see the calculation results before you save the page. Regardless of whether you use the Recalculate button, a recalculation occurs when you save the page.

"Updating Applications" (PeopleSoft Campus Solutions 9.2: Recruiting and Admissions)

Managing a Candidate's Thesis

This section provides an overview of thesis management and discusses how to:

- Enter thesis details.

- Enter thesis evaluation.
- Enter thesis comments.
- Enter additional information.
- Store thesis attachments.

Understanding Thesis Management

The Thesis Management component is the main administrative component that tracks the progress of the thesis and its evaluation. A single thesis record is part of the research candidate structure, and you can enter information after the research candidate has been created. The component interacts with the Evaluation Management feature to capture the evaluation status and any prize or honors recommendations.

See "Understanding Evaluation Management" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Understanding Evaluation Management Setup" (PeopleSoft Campus Solutions 9.2: Campus Community)

Pages Used to Manage a Candidate’s Thesis

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Thesis Submission	SSR_RS_THESIS_MAIN	Records and Enrollment > Graduate Research Management > Thesis Management > Thesis Submission	This is the main thesis management page, containing the general details of the thesis.
Thesis Management – Evaluation	SSR_RS_THESIS_FNL	Records and Enrollment > Graduate Research Management > Thesis Management > Evaluation	After results are obtained, complete the details on this page and review any awards for the candidature.
Thesis Management – Comments	SSR_RS_THESIS_CMNT	Records and Enrollment > Graduate Research Management > Thesis Management > Comments	Enter and review comments relating to the candidate’s thesis.
Thesis Management – Additional Information	SSR_RS_THESIS_CA	Records and Enrollment > Graduate Research Management > Thesis Management > Additional Information	Enter and review Common Attribute fields associated with the candidate’s thesis. This page appears only if Common Attribute fields have been created using the Common Attribute Framework.
Thesis Management – Attachments	SSR_RS_THESIS_ATTCH	Records and Enrollment > Graduate Research Management > Thesis Management > Attachments	View and add attachments associated with the thesis.

Entering Thesis Details

Access the Thesis Submission page (Records and Enrollment > Graduate Research Management > Thesis Management > Thesis Submission).

Image: Thesis Submission page

This is the main thesis management page containing the general details of the thesis from the time the request for a Notice of Intention to Submit is issued through the submission of the thesis. The Thesis Management record is created when the system first recognizes the person as a research candidate. The thesis record structure is effective dated, so you must insert a new effective dated row in the component as data is modified. Central to this is the updating of the Thesis Status, which should explain the reason for the data modification.

Any user with access to the Thesis Management component can view or edit this page. Generally, however, update access is restricted to staff in the Research Office or Heads of Department (or similar level academic staff members).

Note: Because the thesis record becomes linked to the evaluation records created in the Evaluation Management System, validations have been placed to prevent deleting all related thesis data rows if an evaluation record has already been created.

For information about the Send Notification button,

See [Using Online Notifications](#)

Thesis Submission Nbr (Thesis Submission Number)

A counter field that generally corresponds to a separate evaluation. The initial value is *1*, and the value is generated by the system each time a new Submission row is inserted (as distinct from a new effective dated row), by clicking the Resubmit Thesis button. An example of use: The initial value of *1* is used to track the submission and evaluation of the thesis. The evaluation results in a request for the thesis to be modified and resubmitted for evaluation. The number is incremented by one to track the resubmission of the thesis and to create a new evaluation.

Principal Supervisor

The current supervisor nominated as being principally responsible for the candidature. This principal supervisor is the person identified in the Candidate Management, Supervisor page with the Principal Supervisor check box selected.

Thesis Title

Enter a thesis title. If you are using the Thesis Title field on the Research Topic page to develop the candidate's thesis title, that value is automatically copied if the field here is blank.

Transcript Level

Select the Transcript Level at which you want the Thesis Title information to be published.

Print on Transcript

Select this check box if you want to print the Thesis Title information on the transcript.

Note: It is possible to print multiple Thesis Titles from a single thesis record. The transcript process selects the most recent row for each unique thesis submission number where the transcript level is set and the Print on Transcript option is selected.

Thesis Status

This field works closely with the Effective Date and Effective Sequence fields to indicate the current stage of the candidate's thesis.

The Status values are defined in the Research Status Code setup component. The available research status codes are those defined with the System Usage value equal to *Thesis*. This is a required field.

Note: This field has underlying PeopleCode that supports 3C Engine triggers that occur in real time or store in a trigger table for processing later. Essentially, communications can be triggered automatically based on assigning a specific status value.

Resubmit Thesis

Occasionally it is necessary for a candidate to completely rewrite a thesis after the first examination and resubmit it several months later, possibly with new examiners. This effectively restarts the thesis examination and grading process.

Clicking the Resubmit Thesis button enables the processing of a resubmission by inserting a new row and resetting all fields to the correct values ready for a new Notice of Intention to Submit and the resubmission of the thesis.

Note: Inserting a new effective-dated row without using the Resubmit Thesis button carries forward all field values from the previous row; because the resubmission process is used infrequently, use the button instead and thus ensure that the correct values are set automatically.

If clicking the Resubmit Thesis button causes the maximum number of submissions to be exceeded (based on the maximum defined on the Research Processing Options page) a Warning message appears.

See [Setting Up Research Tracking Options for Academic Programs](#)

Candidate Management

Click this link to navigate to the Candidate Management component.

Submission

These fields relate to the Notice of Intent to Submit (NOITS) process which generally must be completed before the thesis can be evaluated.

Intent to Submit Approval

This field specifies whether the supervisor has approved the candidate's intent to submit the thesis.

Intended Submission Date

This is the date when the candidate plans to submit the thesis in the NOITS (and when it has been approved by the supervisor). The Research Administrator manually enters this date.

Actual Submission Date

This field indicates when the thesis was actually delivered to the Research Administrator, ready to be examined.

Num of Copies Submitted (Number of Copies Submitted)

This field indicates the number of copies of the thesis submitted for examination.

Details Declared Correct

Select this check box to indicate that the candidate's supervisor has declared that the details provided by the student in the NOITS are correct. The check box is deselected by default.

Ready for Completion Seminar

Select this check box to notify the Head of Department to schedule the seminar using the Events module. The check box is deselected by default.

Return of Thesis Requested

Select this check box to indicate that the candidate has requested the return of the thesis after examination. The check box is deselected by default.

Embargo

These fields relate to the treatment of the thesis and examiners once the evaluation process has been completed.

Embargo Type

The reason for the withholding the thesis from the public (Embargo). Select from: *Intellectual Property*, *Ethical Considerations*, *National Security*, and *Unembargoed* (default value).

Start Date and End Date

The start and end dates of the embargo period.

See "Understanding Evaluation Management" (PeopleSoft Campus Solutions 9.2: Campus Community).

Entering Thesis Evaluation

Access the Thesis Management – Evaluation page (Records and Enrollment > Graduate Research Management > Thesis Management > Evaluation).

Image: Thesis Management – Evaluation page

This example illustrates the fields and controls on the Thesis Management – Evaluation page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Evaluation' tab of the Thesis Management interface. At the top, there are navigation tabs: Thesis Submission, Evaluation (selected), Comments, Additional Information, and Attachments. Below these, candidate details are listed: Sarah Connors, Academic Institution: PeopleSoft University, Candidate Number: SRRS0019, Career Nbr: 0, Academic Program: Medicine, and Academic Plan: Animal Testing Research 1. Submission dates and remaining days are also shown.

The main content area includes:

- Effective Date:** 09/17/2013, **Effective Sequence:** 1, **Thesis Submission Nbr:** 1
- Thesis Status:** Evaluation in Progress
- Examination Section:**
 - Exam Supervisor Approval:** A dropdown menu.
 - Exam Initiated:** A checkbox.
 - Certificate Final Approval:** A dropdown menu.
 - Certificate Approver:** A text input field with a search icon.
 - Oral Defense Date:** A date picker.
- Result Section:**
 - Evaluation Status:** A link to 'Review Evaluations'.
 - Recommendation:** A dropdown menu.
 - Recommended Prize:** A dropdown menu.
 - Honors and Awards:** A table with columns 'Honor/Award' and 'Description'. A link 'Honors/Awards' is present.
 - Degree:** MD, M.D., Doctor of Medicine. A link 'Student Career/Program' is present.
- Finalization Section:**
 - Candidate Advised
 - Examiner Payments Processed
 - Library Submission Made
 - Proceed to Graduation

After all the results required to determine the outcome of the candidature have been obtained, the appropriate *prescribed authority* completes the details on this page and records the award for the candidature. Generally, only members of a specific senior academic role should update this page, consistent with the role of Chair of Examiners, Dean, or similar.

Examination

Exam Initiated

Select this check box to indicate that the candidate has submitted the examination certificate. You can select this check box only if the Intent to Submit Required check box on the Research Processing Options page has been selected.

Exam Supervisor Approval

This field indicates whether the candidate’s supervisor has approved or rejected the examination certificate. If the Exam Certificate Required check box is selected on the Research Tracking Options page, you must enter a value in this field.

Certificate Final Approval

This field indicates whether the Head of Department (or perhaps the Dean or Chair of Examiners) has approved or rejected the examination certificate, which has been endorsed by the

supervisor. If the Exam Certificate Required check box is selected on the Research Tracking Options page, you must enter a value in this field.

Certificate Approver

This field defaults to the current user. Because it is likely that the thesis data will be updated by an administrator or some other user on behalf of a professor or a dean, you can look up and select an approver from an available list.

See [Setting Up Research Tracking Options for Academic Programs](#)

See [Setting Up Research Tracking Options for Academic Plans](#)

Result

Evaluation Status

This display-only field from the Evaluation Management component shows the current value of the Evaluation Status field for the highest evaluation number row for the subject candidate number. This is the current overall status of the thesis evaluation.

Review Evaluations

Click this link to begin the evaluation process. When you click the link for the first time, you are prompted to create the candidate's evaluation records in the Manage Evaluation component, in which the actual evaluation detail takes place. The Evaluation Category and Evaluation Code parameters that have been defined for the candidate's academic program or academic plan are used to create the appropriate evaluation committee schemes and rating components. You can override these settings if a different evaluation makeup is necessary.

If an existing evaluation has previously been created for the candidate, the link takes you to the Manage Evaluation component to view this information.

Recommendation

This field is read-only and displays data from the Recommendation field in the Manage Evaluation component. This information is displayed only when the candidate's evaluation code is equal to that specified in the Final Evaluation Result Code field; if no result code is shown, the evaluation process is not yet complete.

Recommended Prize

This read-only field shows the prize nominations (if any) for the candidate in the Manage Evaluations component.

Honors and Awards

More than one Honor or Award can be associated with the final result. They are displayed in this table.

Honors/Awards

Click this link to access the Honors and Awards Table (Set Up SACR, Product Related, Campus Community, Define Campus Community, Setup, Honors and Awards Table). The Prescribed Authority reviews the prize nominations and identifies the prize awarded to the candidate here (usually following a determination by the relevant committee).

Degree	This field displays the name of the degree with which the candidate is eligible to graduate. This is a read-only field of the degree granted the academic plan.
Student Career/Program	Click this link to access the Student Program/Plan component.
Finalization	
Candidate Advised	Select this check box when the candidate has been or is about to be advised of the outcome of the thesis examination and overall grade.
Examiner Payments Processed	Select this check box to indicate that the thesis examiner's payments have been processed. You manually set this field after determining that all payment processing is completed.
Library Submission Made	Select this check box to indicate that the archival copy of the final thesis has been sent to the University Library.
Proceed to Graduation	Select this check box to indicate that this candidate is ready to be processed for graduation (and is now moving out of the responsibility of Thesis Management).

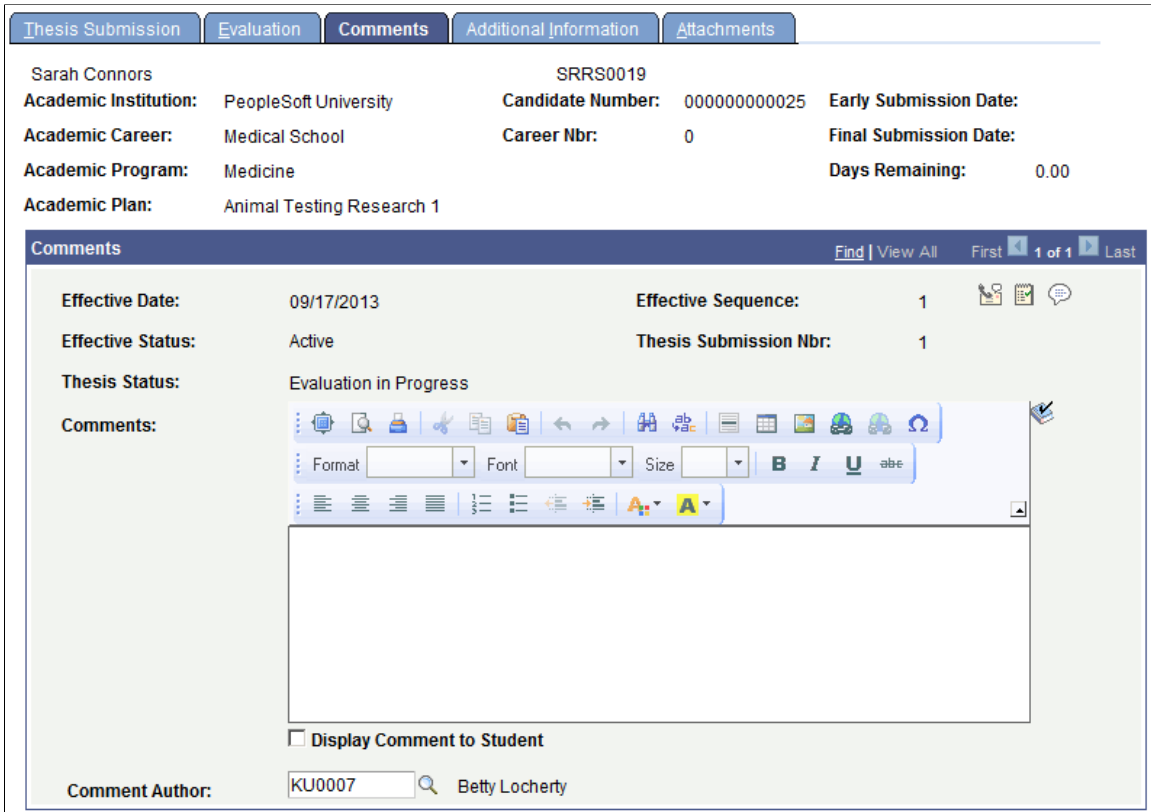

See "Managing Evaluations" (PeopleSoft Campus Solutions 9.2: Campus Community)

Entering Thesis Comments

Access the Thesis Management – Comments page (Records and Enrollment > Graduate Research Management > Thesis Management > Comments).

Image: Thesis Management – Comments page

This example illustrates the fields and controls on the Thesis Management – Comments page. You can find definitions for the fields and controls later on this page.

Any user with access to the Thesis Management component can view or edit this page. You can add or delete comments only through the Thesis Submission page. Comments are specific to each effective dated row and will reset to blank each time a new row is inserted.

Comments

Enter your comments in the text box. By default, the field is empty.

Display Comment to Student

Select to allow candidates to view the comment in the Candidate Center. By default, this check box is:

- Deselected in administrator pages. Select this option if you would like to share the comment with the candidate.
- Selected in the Candidate Center self-service pages when candidates add comments.

Comment Author

Select the OPRID of the user who updated the comment field from the available list. The Author defaults to the current user, but it is likely that the thesis data will be updated by an administrator or some other user on behalf of a professor or a dean. The name associated with the OPRID is also displayed on the page.

Entering Additional Information

Access the Thesis Management - Additional Information page (Records and Enrollment > Graduate Research Management > Thesis Management > Additional Information).

Image: Thesis Management - Additional Information page

This example illustrates the fields and controls on the Thesis Management - Additional Information page. You can find definitions for the fields and controls later on this page.

Enter and review Common Attribute fields associated with the candidate's thesis. This page appears only if Common Attribute fields have been created using the Common Attribute Framework.

See:

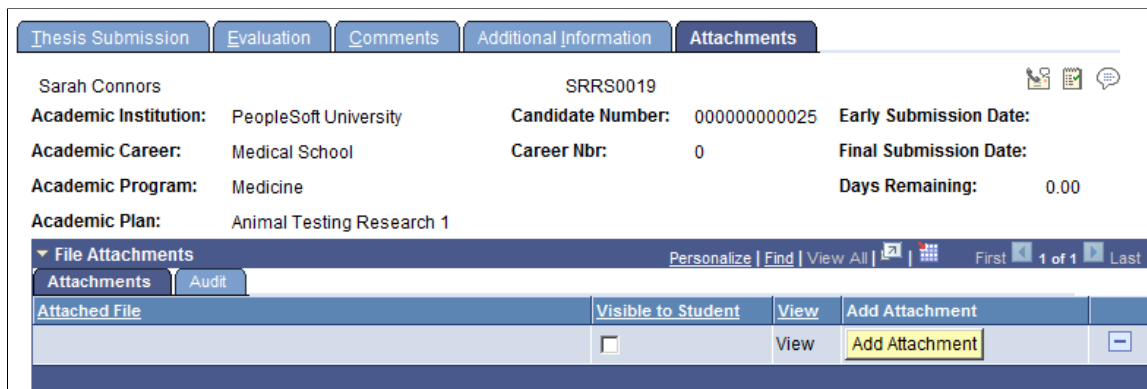

- [Using Common Attribute Framework for Research Tracking](#)
- "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)
- "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

Storing Thesis Attachments

Access the Thesis Management - Attachments page (Records and Enrollment > Graduate Research Management > Thesis Management > Attachments).

Image: Thesis Management - Attachments page

This example illustrates the fields and controls on the Thesis Management - Attachments page. You can find definitions for the fields and controls later on this page.

This page is used to store thesis-specific attachments.

Visible to Student

Select to set whether or not the attachment is visible to students on the self service page. By default, attachments added to administrator pages are not visible to students.

Add Attachment

Click this button to add an attachment to the page.

Managing Service Requests

A service request is any request that research candidates might make to their department for which the department would want to track and maintain the status of each request. Examples of service requests can include:

- Appointment requests.
- Leave of absence requests.
- Return from leave notifications.
- Change of research topic.
- Request for extension of the thesis due date.
- Request for a new supervisor.
- Submission of the thesis for review.

See [Setting Up Research Service Requests](#)

See "Creating and Updating Service Requests (Candidates)" (PeopleSoft Campus Solutions 9.2: Self Service)

See "Administering Service Requests (Administrators)" (PeopleSoft Campus Solutions 9.2: Self Service)

See [Setting Up Service Request Assignments](#)

Page Used to Manage Service Requests

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Service Request Management	SSR_RS_REQUESTS	Records and Enrollment > Graduate Research Management > Service Request Management	Manage service requests.

Managing Service Requests

Access the Service Request Management page (Records and Enrollment > Graduate Research Management > Service Request Management).

Image: Service Request Management page

This example illustrates the fields and controls on the Service Request Management page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Service Request Management' interface. At the top, the user 'Jeremy Dann' is logged in, and the request ID is 'SRRS0002'. The academic institution is identified as 'PSUNV' (PeopleSoft University). The request details include: Category: OTHER (Other), Type: OTR (Non-specified request), Request Number: 4, Request ID: 1, and Candidate Number: (blank). The 'Service Request Details' section shows Sequence ID: 1, Assigned To: FA0800 (Wrench, Julia), and Request Date: 05/03/2013. A comment is present: 'How many research programs are offered at the medical campus?'. The status is 'RECVD' (Request Received) with a Status Date of 07/03/2013. The request was updated by 'Locherty, Betty' on 18/09/2013 at 7:50:07PM. A 'File Attachments' table is shown below, with one row for an attached file, including 'View' and 'Add Attachment' buttons. At the bottom, there is a 'Transfer To:' dropdown menu and a 'Go' button.

Service requests that result in changes to the candidate’s information require changes to be made in the Candidate Management component.

Use this page to review and process service requests made by the candidate—for example, a request for a leave of absence.

For information about the Send Notification button,

See [Using Online Notifications](#)

Category (service request category)

The values available here are defined on the Service Request Categories page.

Type (service request type)	The values available here are defined on the Service Request Type page.
Subtype (service request subtype)	The values available here are defined on the Request Subtype group box of the Service Request Type page. This is a required field if the institution has defined a subtype for the service request type.
Candidate Number	Because service requests can be submitted prior to the candidate being admitted to a research program, this field may initially be blank. Once assigned to a research program, assign the candidate number if the service request is related.

Service Request Details

This effective dated section of the page tracks the initial service request details and then documents the review and resolution of the request by the administrator.

Request Date	Enter the date of the service request.
Comment	A rich text format field for free form comments.
Display Comment to Student	Select if you want the text entered in the Comment field to be displayed on the My Request Detail self-service page for the student.
Assigned To	Displays the EmplID of the administrator to whom the service request is assigned. The system automatically assigns the service request to an administrator. Users can reassign the service request to another administrator if needed. See Setting Up Service Request Assignments
Approver ID	If required, select the EmplID of the person that approved the service request.
Status	Select a status from the available list. Available statuses include those assigned to a research group code that is associated with a user defined requirement type. The Status values are defined in the Research Status Code setup component. The available research status codes are those defined with the System Usage value equal to <i>Requests</i> . This is a required field.
Status Date	The date when the status was entered.
Updated By	The user who last updated the service request.
Last Updated	The date and time when the service request was last updated.
File Attachments	Add and view attachments for the specific service request.

Managing Candidate Eligibility Edit Messages

This section provides an overview of candidate eligibility edits and discusses how to review and override candidate information.

Understanding Candidate Eligibility Edits

Research candidates are determined to be research-eligible based on their participation in an eligible academic program or academic plan. When a candidate changes his or her academic program or plan, edits reevaluate the candidate's research eligibility. These edits are triggered by the components in which a modification of the candidate's academic program or academic plan can be made.

When a change to the candidate's academic program or academic plan warrants a review of the candidate's records, two things occur:

1. Every time the candidate's records are viewed in the Candidate Management component, a warning message appears. The warning message continues until the conditions that caused the warning are removed.
2. A *Candidate Review Required* message appears on the top of the Candidate Management component.

Use the Candidate Management Override component to resolve both conditions.

Page Used to Review A Candidate's Edit Messages

Page Name	Definition Name	Navigation	Usage
Candidate Management Override	SSR_RS_CAND_OVRD	Records and Enrollment > Graduate Research Management > Candidate Management Override > Candidate Management Override	Review records that have been flagged for review due to program or plan discrepancies.
Candidate Management Messages	SSR_RS_MSGS_SEC	Click the Messages link on the Candidate Management Override page.	Read the messages that indicate why the candidate's records must be reviewed.

Reviewing and Overriding Candidate Information

Access the Candidate Management Override page (Records and Enrollment > Graduate Research Management > Candidate Management Override > Candidate Management Override).

Image: Candidate Management Override page

This example illustrates the fields and controls on the Candidate Management Override page. You can find definitions for the fields and controls later on this page.

Sub-Plan:

Use this page to review records that have been flagged for review due to program or plan discrepancies. The page includes three sections: information from the Candidate Header Record (the main identifying record in the research data structure), information from Admissions, and information from Student Records.

When a candidate makes a change to his or her academic program or academic plan, the change does not automatically update the candidate section after matriculation. The main reason for this is that the impact of the change (on the research topic, supervisors, and thesis submission dates) cannot be determined by the system. The administrator must make the appropriate adjustments to the candidate's information and then, if the candidate remains eligible, update the Candidature Header information so that the academic program and plans now match the Student Record values.

You can override the Candidate Header Academic Program or Academic Plan values in order to sync with the admissions or program information.

For information about the Send Notification button,

See [Using Online Notifications](#)

Candidature Header Record Information

The fields displayed in this section contain the main research candidate records: Academic Career, Student Career Number, Candidate Number, Academic Program, and Academic Plan. Additional fields include the following:

Assigned

If this check box is selected, it indicates that the research candidate information on display is assigned to the candidate and is considered *active*. If the check box is deselected, it indicates that the information is unassigned, meaning that this represents an inactive set of candidature information. For example, if a research candidate changes his or her academic program or academic plan and no longer is research eligible, the Assigned check box is deselected and the student is no longer treated as a research candidate. If this occurs during the admissions process, the Candidate page on the admissions components will no longer be visible.

Messages

This becomes a link if any edit messages have been triggered. The link opens Candidate Management Messages page where you can read the messages which indicate why the candidate's records must be reviewed.

Update

Click this button to make the Academic Program, Academic Plan, and Student Career Nbr fields editable.

Reviewing Messages

Access the Candidate Management Messages page (click the Messages link on the Candidate Management Override page).

Image: Candidate Management Messages page

This example illustrates the fields and controls on the Candidate Management Messages page.

Candidate Management Messages						
Message Set	Message Number	Message Severity	Message Text	Description	Created	
1	14751	48 Message	The academic program or plan has been changed, please verify the candidate's research information.		11/18/2011 1:38:54PM	

Using Administrative Functions for Research Tracking

Campus Solutions delivers the administrative functions that can be used to create 3C communications for Research Tracking.

See "Understanding Administrative Functions" (PeopleSoft Campus Solutions 9.2: Campus Community)

The functions are available from the Candidate Management and Thesis Management components.

Using Online Notifications

Use the Create Notification page to send online notifications. This page uses the Notification Framework to send predefined alerts, emails, or SMS to persons defined in the Campus Solutions database.

Page Used to Create Online Notifications

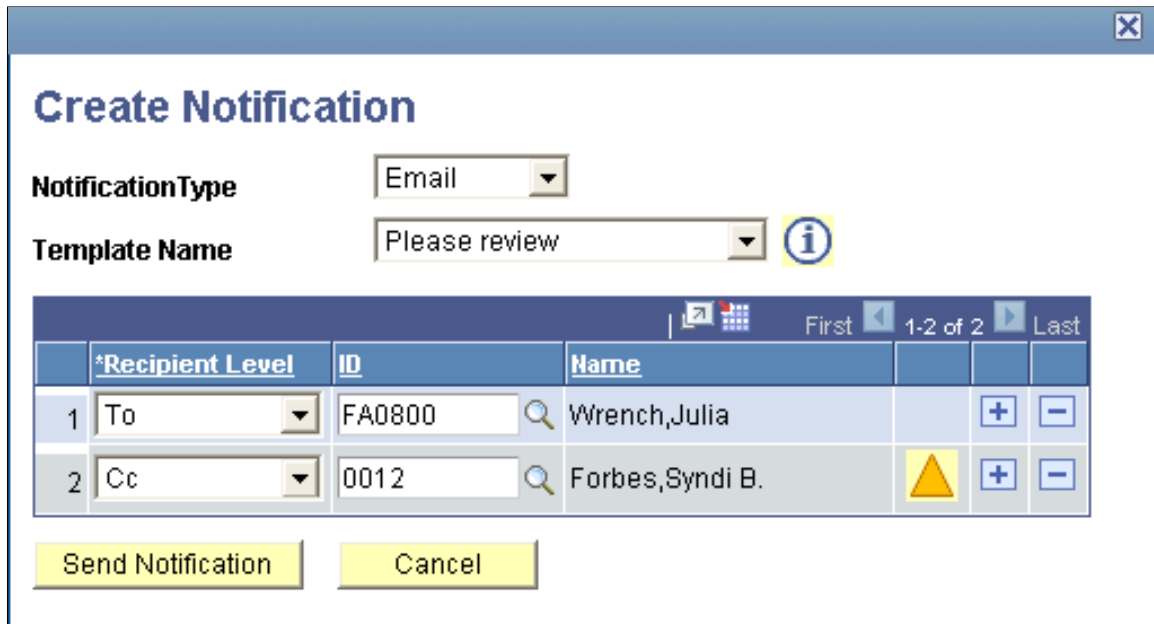

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Create Notification	SCC_NTF_ADHOC	Click the Send Notification button on various Research Tracking and Academic Project pages.	Initiate online notifications using predefined notification templates.

Creating Online Notifications

Access the Create Notification page (click the Send Notification button on various Research Tracking and Academic Project pages).

Image: Create Notification page showing the permissions warning icon

This example illustrates the fields and controls on the Create Notification page (showing the permissions warning icon). You can find definitions for the fields and controls later on this page.

The Send Notification button which launches the Create Notification page appears on the following pages in Research Tracking and Student Academic Project components only if the Notification Consumer ID defined for the component has been set up and is set to Active:

- Candidate Management - Information page
- Candidate Management Override page
- Thesis Submissions page
- Administrator Profile Management page
- Project Management page
- Service Request Management page
- Service Request Dashboard (self service)

Notification Type The values available here (for example Alert, Email) are defined by the user based on the notification requirements of the administrator component.

Template Name The templates available here are the active templates defined for the selected notification type. Click the Template Details button to view details about the template.

The selected notification type and template determine valid recipient levels (To, Cc, Bcc). Depending on the notification type, you can notify multiple recipients but at least one of them must be addressed as the To recipient. When the notification type is email or SMS, the system verifies that the recipient has granted permission to be notified. If permission has not been granted, a warning icon appears with an explanatory

message. You can also configure the Create Notification page to capture and include ad hoc comments in the notifications.

Image: Create Notification page showing the Comment box

This example illustrates the Create Notification page (showing the Comment box).

Create Notification

NotificationType: Email

Template Name: Thesis Review Request

*Recipient Level	ID	Name
1 To	FA0800	Wrench, Julia

Send Notification Cancel

See [Setting Up Online Notifications](#)

See "Setting Up and Consuming the Notifications Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)

Viewing Sent Notifications

Administrators can use the Notifications Administration Overview page (Campus Community, Notifications, Admin Notifications) to view all notifications sent to a person. They can also use the self-service Notification Center for this purpose (Self Service, Notifications Center).

See "Using Admin Notifications" (PeopleSoft Campus Solutions 9.2: Campus Community)

Viewing Administrator Notifications

Administrators can use the Service Request Dashboard Notifications pagelet to view all their notifications.

See "Administering Service Requests (Administrators)" (PeopleSoft Campus Solutions 9.2: Self Service)

Managing Student Academic Projects

Creating and Managing a Student Academic Project

Student Academic Projects was developed to address the needs of institutions for enhanced management of student projects such as thesis and dissertations. Student Milestones has previously used to track these types of academic projects. Student Academic Projects utilizes many of the functions developed for the Graduate Research Management (Research Tracking) feature such as the ability to define topics of study, the ability to define supervisors for the project, and the utilization of the Evaluation Management System to score the completed project by a committee of evaluators, or individuals. Projects can be associated to a specific term, term session, or enrolled class.

This section discusses how to:

- Create and manage a student academic project.
- Enter additional details for a student academic project.

Pages Used to Create and Manage a Student Academic Project

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Project Management	SSR_PROJ_MGMT	Records and Enrollment > Academic Projects > Student Project Management > Project Management	Track the development of the project and access the Evaluation Management component to conduct and score the formal evaluation.
Additional Details	SSR_PROJ_MGMT2	Records and Enrollment > Academic Projects > Student Project Management > Additional Details	Assign supervisors to the project. Multiple supervisors are supported. Add any new requirements that must be tracked for the project.

Creating and Managing a Student Academic Project

Access the Project Management page (Records and Enrollment > Academic Projects > Student Project Management > Project Management).

Image: Project Management page

This example illustrates the fields and controls on the Project Management page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Project Management' page with the following sections and fields:

- Project Management / Additional Details:**
 - Sylvia Fouls
 - Academic Institution: PeopleSoft University
 - Academic Career: Medical School
 - Academic Program: Medicine
 - Academic Plan: Animal Testing Research 3
 - SRRS0033
 - Project Number: 000000000031
 - Student Career Nbr: 0
 - Program Status: Active in Program
- Form Fields:**
 - *Effective Date: 06/05/2014
 - *Effective Status: Active
 - Topic: Honors Project
 - *Project Type: HON (Honors Project)
 - *Status: COMPLETE (Honors Project Complete)
 - Effective Sequence: 1
 - Submission Nbr: 1
- Project Submission:**
 - Project Title: Adaptation and Convergence - Indigenous Media for a Christian Context in Central Mexico
 - Transcript Level: Print on Official
 - Submission Deadline: [Field]
 - Actual Submission: [Field]
 - Oral Defense Date: [Field]
 - Print on Transcript: [Checked]
 - Review Evaluations
 - Resubmit Project
- Results and Approval:**
 - Evaluation Status:
 - Recommendation:
 - Grading Scheme: [Field]
 - Grade Input: [Field]
 - Final Approval: [Field]
 - Recommended Prize: [Field]
 - Grading Basis: [Field]
 - Approved By: [Field]
- File Attachments:**
 - Table with columns: Attached File, Visible to Student, View, Add Attachment.
 - Row 1: [Field], [Field], View, Add Attachment.

When you access this page in the Add mode to create a student academic project, you must specify the ID (EmplID), Academic Institution, and Academic Career of the matriculated student.

Academic Institution, Academic Career, Academic Program, Academic Plan, Student Career Number, Program Status

Derived from the Student Program/Plan record.

Project Number

The system generates a unique project number when you add a new student academic project.

Project Header Detail

Click to view the student's academic program and academic plan at the time when the academic project was created. This link will only appear if the student's program or plan values at the time of project creation do not match the student's current program or plan.

Depending on the type of project and the institution's business rules, a change in the student's academic program or academic plan after the student has started the project may require a review and approval by the administrator. When this condition occurs, the system displays the Project Header Detail link and the link enables the administrator to review the change and make the appropriate adjustments, if necessary.

Additional Information

Click to access the Common Attributes subpage. This page uses the thesis common attributes record.

See [Using Common Attribute Framework for Research Tracking](#)

For information about the Send Notification button,

See [Using Online Notifications](#)

Topic

Enter a topic in this field. Or click the Topic Search button to select a topic that you have set up in the Academic Project Topics – Topic Setup page.

Term and Class

Click to access the Term and Class page where you can associate the project with a term, session and class number.

Project Type

Select one of the values defined on the Academic Project Types page. You must select a project type to be able to enter a Status value.

Status

The status codes available here are determined by the group code defined for the project type. The status values of the group code are defined on the Process Status Codes page with the *Project* system usage value.

See [Setting Up Research Status Codes](#)

Project Submission

Project Title

Enter the project title in this field.

Transcript Level

Select the Transcript Level at which you want the Project Title information to be published.

Print on Transcript

Select this check box if you want to print Project Title information on the transcript.

Note: It is possible to print multiple Project Titles from a single project record. The transcript process selects the most recent row for each unique submission number where the Transcript Level is set and the Print on Transcript option is selected.

Submission Deadline

Date when the student should submit the project for evaluation.

Actual Submission	Track the actual submission of the project for evaluation.
Oral Defense Date	Enter the date of the oral defense, if required.
Review Evaluations	<p>Click to access the Manage Evaluation component. If no matching evaluation record exists, the system prompts you to select an Evaluation Category and Evaluation Code to create the evaluation records.</p> <p>See "Managing Evaluations" (PeopleSoft Campus Solutions 9.2: Campus Community)</p>
Resubmit Project	<p>Click if you want a new evaluation to be administered. This may be necessary if the first evaluation results in a non-passing score. Resubmitting the project will preserve the information and evaluation of the first project. A new evaluation will be generated for the resubmitted project. There is no limit to the number of times a project can be re-evaluated.</p> <p>When you click this button, the system adds a new row to the page with the Submission Number incremented and the page fields reset to blank.</p>
Results and Approval	
Evaluation Status, Recommendation, Recommended Prize	Displays the values from the Manage Evaluation component.
Grading Scheme, Grading Basis, Grade Input	<p>The system prompts you from the Grading Scheme Table page for these fields. The Grade Input represents the final grade assigned to the project.</p> <p>See Defining Grading Schemes</p>
Final Approval	Select <i>Approved</i> or <i>Rejected</i> to indicate whether the Head of Department (or perhaps the Dean or Chair of Examiners) has approved or rejected the project.
Approved	EmplID of the person who has given the final approval.

Entering Additional Details for a Student Academic Project

Access the Additional Details page (Records and Enrollment > Academic Projects > Student Project Management > Additional Details).

Image: Additional Details page

This example illustrates the fields and controls on the Additional Details page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Additional Details' page for a project. At the top, there are tabs for 'Project Management' and 'Additional Details'. Below the tabs, the project information is shown:

- Beatrice Geary (SR0411)
- Academic Institution: PeopleSoft University
- Academic Career: Graduate Business
- Academic Program: Masters of Business Admin
- Academic Plan: Marketing (MBA)
- Project Number: 00000000276
- Student Career Nbr: 0
- Program Status: Active in Program

The 'Supervisors' section is expanded to show details for a supervisor:

- Sequence: 1
- Attachments: (0)
- Supervisor Details:
 - *Effective Date: 03/25/2013
 - *Effective Sequence: 1
 - *Effective Status: Active
 - Supervisor: 0002 Jones, Susan
 - Affiliation Code: PROJ_SUP
 - Supervisor Role: PSUP Primary Supervisor
 - *Status: APPROVED Supervisor Approved
 - Status Date: 03/25/2013

The 'Assignments' section is expanded to show details for an assignment:

- Assignment: IP Intellectual Property Ownership
- Attachments: (0)
- Assignment Details:
 - Effective Date: 03/25/2013
 - Effective Sequence: 1
 - Effective Status: Active
 - Advisory Committee: GRBUSN Graduate Business
 - Approval Date: [empty]
 - Comment: [Rich text editor with toolbar]
 - *Status: IP Review In Progress
 - Status Date: 03/25/2013

The Supervisors scroll area is used to assign the project supervisor(s). The prompt values for the Supervisor field are limited to records created in the Academic Projects – Administrator Profile Management page with the project supervisor role and are eligible to be assigned to the project.

See [Assigning Candidate Supervisors](#)

See [Defining and Managing Administrator Profiles](#)

The Assignments scroll area is used to track any school defined assignments for the project. This is similar to the Candidate Management - Other Assignments page.

See [Tracking Additional Candidate Assignments](#)

Related Links

[Creating Assignments for Multiple Students](#)

Creating Student Academic Projects in Batch

This section discusses how to create Student Academic Projects using a batch process.

Pages Used To Create Student Academic Projects in Batch

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Create Project Records	SSR_PROJ_BATPR	Records and Enrollment > Academic Projects > Student Project Management > Create Project Records	Create student academic project records in batch for a group of students.

Creating Student Academic Projects in Batch

Access the Create Project Records page (Records and Enrollment > Academic Projects > Student Project Management > Create Project Records).

This Application Engine process enables you to create student academic project records for a group of EmplIDs. The process creates the same records as done through the Add mode of the Student Project Management component.

You can either use the Population Selection Framework to identify the population of students or can manually enter a list of EmplIDs in the Student Overrides region.

Note: For the process to create an academic project, the EmplID must have an active ACAD_PROG record. The system enforces this selection rule if you use the Student Overrides region. The ID fields in the Student Overrides region prompt you with only those EmplIDs that have an active ACAD_PROG record. However, the system cannot enforce this rule if you use Population Selection. It is important to review the delivered sample query or sample Equation Engine equation to see how to select your target populations. Note that when you run the Create Project Records process using Population Selection and if the process finds an EmplID which does not have an active ACAD_PROG record, then the process will skip the EmplID record and move on to the next EmplID in the selection. The process message log will display the EmplIDs of all projects records created and those that were skipped.

After the process creates the student academic project records, use the Project Management and Additional Details pages to manage these records.

Population Selection

Select this check box to run the process using Population Selection.

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (PS Query, Equation Engine equation, or external file) to identify IDs for a specific transaction, you must use it.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Campus Solutions delivers a sample query (SSR_CREATE_ACADPROJ) and sample equation (SRPSSACADPROJ) for the Create Project Records process.

See "Queries for Population Selection" (PeopleSoft Campus Solutions 9.2: Campus Community)

When you select the Population Selection check box, the Student Override check box becomes unavailable for entry.

Student Override

Select this check box to specify one or more EmplIDs for whom you want to run the Create Project Records process.

When you select the Student Override check box, the Population Selection check box becomes unavailable for entry.

Project Details

Use the fields in this group box to specify default field values that the process will assign to the project records.

Effective Date

Select the date that the process should assign as Effective Dates and Status Dates to the project records. If left blank, then the process will use the current date.

Project Type

This field displays the same prompt values that the Project Type field in the Project Management page displays. You must select a project type to be able to enter a Status value.

Status

This field displays the same prompt values that the Status field in the Project Management page displays. This is a required field.

Topic Code

This field displays the same topics that the Topic Search button in the Project Management page displays.

Term

Term values are defined on the Term Table page.

Session

This field is available for edit only if you have selected an academic institution and term.

Class Nbr

This field is available for edit only if you have selected an academic institution and term.

Grading Scheme

This field displays the same prompt values that the Grading Scheme field in the Project Management page displays.

Grading Basis

This field is available for edit only if you have selected a grading scheme. The field displays the same prompt values that the Grading Basis field in the Project Management page displays.

Supervisor

This field displays the same prompt values that the Supervisor field in the Additional Details page displays. The process

is limited to adding a single supervisor record. Additional supervisors must be added directly in the Student Project Management component after the project record has been created.

Supervisor Role

Required if you have selected a supervisor. This field displays the same prompt values that the Supervisor Role field in the Additional Details page displays.

Supervisor Status

Required if you have selected a supervisor. This field displays the same prompt values that the (Supervisor) Status field in the Additional Details page displays.

Assignment

This field displays the same prompt values that the Assignment field in the Additional Details page displays. The process is limited to adding a single assignment record. Additional assignments must be added directly in the Student Project Management component after the project record has been created.

Assignment Status

Required if you have selected an assignment. This field displays the same prompt values that the (Assignment) Status field in the Additional Details page displays.

Duplicate checking edits

A student may have more than one project during their matriculation. In fact, a student can have multiple active projects occurring at the same time. The system supports this capability. At the same time, care must be taken to prevent the accidental creation of duplicate project records.

The Create Project Records process will perform the following check to detect a possible duplicate project record being created: If there already exists a project record with the same institution, career, project type, topic code, term, session, and class number that matches the run control settings, the record will be skipped and the message log will indicate that no project record was created due to it being a potential duplicate record. If you still want to create the project record, this must be done manually using the Student Project Management component.

Creating Assignments for Multiple Student Academic Projects

Use the Create Assignments page to insert new assignments into existing academic project records for multiple students.

See [Creating Assignments for Multiple Students](#)

Viewing Class Enrollment Data

Viewing Enrollment Request History

This section discusses how to search for and view enrollment requests.

Page Used to View Enrollment Request History

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Enrollment Request Search	ENRL_REQ1_INQUIRY	Records and Enrollment > Enroll Students > Enrollment Request Search > Enrollment Request Search	Search for and view enrollment request history.

Searching for and Viewing Enrollment Requests

Access the Enrollment Request Search page (Records and Enrollment > Enroll Students > Enrollment Request Search > Enrollment Request Search).

The enrollment engine keeps a history of all enrollment requests that it processes successfully. The system queries against these transactions, as well as any enrollment transactions posted through the Grade Roster component, and displays all of the enrollment request transactions that meet your search criteria in a grid at the bottom of this page. You must enter at least two search criteria. For example, you can search to find out how a student was dropped from a class, or you can view a list of students enrolled in a class that has been cancelled.

Warning! Access to this inquiry component should be restricted to key individuals in the institution because sensitive student information, such as course grades, is visible in this component.

Academic Career	Enter the academic career for which you want to search for enrollment transaction history.
Term	Enter the term for which you want to search for enrollment transaction history.
Enrollment Request ID	Enter the enrollment request ID for which you want to search for the enrollment transaction history.
Enrollment Request Source	Enter the enrollment request source for which you want to search for the enrollment transaction history. The enrollment request source is the process that generated the enrollment request.

The Self Service Grade Posting (SG) code distinguishes instructor enrollment requests (such as grade changes) from student self-service (such as adds and drops).

The system uses this code to exclude instructor self-service grade change requests from the search views for the Enrollment Request and Quick Enroll components. These types of requests cannot be viewed from these two components because they are intended to create and view enrollment requests that contain a single ID only. You can view instructor self-service grade change requests in the Enrollment Request Search or Block Enroll components.

Enrollment Request Action	Enter the enrollment request action for which you want to search for the enrollment transaction history.
Enrollment Action Reason	Enter the enrollment action reason for which you want to search for the enrollment transaction history.
User ID	Enter the user ID of the person who processed the enrollment transactions that you want to view.
ID	Enter the ID of the student whose enrollment transactions you want to view. The system prompts you with IDs from the personal data table (PERSONAL_DATA).
Class Nbr (class number)	Enter the class for which you want to view the enrollment transactions within a term. To use this field, you must also specify a term in the Term field so that the system knows which term's schedule of classes is valid.
From Date and End Date	Specify the date range for the enrollment action. For example, search for all enrollment requests for which students were dropped from a class through the Mass Enrollment component due to a canceled class during the fall quarter.
From Date Time and Thru Date Time (through date time)	Enter a time range during which the enrollment requests were last updated.
Search	Click to query the enrollment tables and retrieve enrollment transaction history based on your search criteria. The system displays your search results in the Enrollment List grid at the bottom of the page.
Refresh Previous Search Result	If you select this check box, the system populates the Enrollment List grid at the bottom of this page with only the latest search results and clears previous data from the list.

Enrollment List

The system populates the grid in the lower portion of the page with each enrollment request transaction that matches your search criteria. Each row contains 46 fields of pertinent information about the enrollment request, dispersed over eight tabs. Click the tabs to view additional fields.

Viewing Student Statistics

Student Records enables you to view summary information at various points during a student's academic career, with numerous ways to access the information. You can view summaries of both enrollment and term statistics.

This section discusses how to:

- View student enrollment summaries.
- View term statistics.
- Calculate term statistic values.
- View cumulative statistics for multiple terms.
- Calculate cumulative statistic values.
- View student terms.

Pages Used to View Student Statistics

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Enrollment Summary	STDNT_ENRL_INQ	Records and Enrollment > Enrollment Summaries > Enrollment Summary > Enrollment Summary	View a summary of enrollment information. The student must first enroll in classes.
Enrollment Summary - Term Statistics	TERM_STATISTICS2	Records and Enrollment > Enrollment Summaries > Enrollment Summary > Term Statistics	View term statistics for a specific term. The student must first enroll in classes, have posted transfer credits, or both.
Term History - Term Statistics	TERM_STATISTICS	Records and Enrollment > Student Term Information > Term History > Term Statistics	View term statistics for all terms within an academic career. The student must first enroll in classes, have posted transfer credits, or both.
Cumulative Statistics	CUM_STATISTICS	Records and Enrollment > Student Term Information > Term History > Cumulative Statistics	View cumulative statistics for all terms within an academic career. The student must first enroll in classes, have posted transfer credits, or both.
Student Term Search	STDNT_TERM_SRCH	Records and Enrollment > Career and Program Information > Student Term Search > Student Term Search	View all terms in which a student has been active.

Viewing Student Enrollment Summaries

Access the Enrollment Summary page (Records and Enrollment > Enrollment Summaries > Enrollment Summary > Enrollment Summary).

View all classes in which a student is successfully enrolled for the term.

Click the Course Detail button to access the Class Detail page, where you can view details about the class listed on the Enrollment Summary page.

Print Study List

Click to print the student's enrollment summary.

View enrollment and transfer credit statistics for all terms in which the student has been or is enrolled. You can view this information for an individual term in the Enrollment Summary component.

Summary of Student Enrollment for the Term

The following information refers to the example screen shot:

- 4 Units with Grade A (for GPA) – 16 grade points
- 3 Units with Grade F (for GPA) – 0 grade points
- 3 Units with Grade Pass (Not For GPA)
- 4 Units with no grade (in progress) (class will be For GPA after grading)
- 3 Units with an Audit grade basis

Enrollments

Graded Units - For GPA(graded units - for grade point average) Displays the total number of units that are taken for a grade (A, B, C, D, F) and accumulate in the GPA.

Graded Units - Not For GPA (graded units - not for grade point average) Displays the total number of units that are taken for a grade (Pass, Fail, Satisfactory, Unsatisfactory) and do not accumulate in the GPA.

Note: The Graded Units - For GPA and Graded Units - Not for GPA fields do not include classes that are in a withdrawn status and classes that are taken with the audit grade basis.

Grade Points - For GPA (grade points - for grade point average) Displays a number that is calculated by taking the grade points received for each grade (on a 4-point grading scale, an A equals 4 points), and multiplying that number by the number of units taken for each class for which a grade accumulates in the GPA.

GPA - For GPA (grade point average - for grade point average) Displays the grade point average which is calculated by dividing the grade points for GPA by the graded units for GPA.

Use the GPA Rounding/Truncating Option field on the Student Records Installation page (Set Up SACR, Install, Student Records Installation) to indicate to how many decimal places you want to round or truncate the grade point average.

Note: No values appear in the Not For GPA row for the Grade Points and GPA fields.

Earned Units - For GPA (earned units - for grade point average) Displays the total number of units that are passed with an earned credit grade (A, B, C, D) and accumulate in the GPA.

Earned Units - Not For GPA (earned units - not for grade point average) Displays the total number of units that are passed with an earned credit grade (Pass, Satisfactory) and do not accumulate in the GPA.

In Progress Units - For GPA (in progress units - for grade point average) Displays the total number of units that are not yet completed and for which the future assigned grade will accumulate in the GPA.

In Progress Units - Not For GPA (in progress units - not for grade point average) Displays the total number of units that are not yet completed and for which the future assigned grade will not accumulate in the GPA.

Units Taken Towards Acad Load (units taken towards academic load) Displays the total number of units taken for progress. This total is used in Student Records to determine academic load.

Units Earned Towards Acad Load (units earned towards academic load) Displays the total number of units passed for progress. This total is used in Student Records to determine academic load and academic level.

Note: For Units Taken Towards Acad Load and Units Earned Towards Acad Load, the units are summed regardless of academic load determiner set on Level/Load Rules.

Units Taken For Audit Displays the total number of audit units taken for the term.

Summary of Student Transfer Credit for Term

The following information refers to the example screen shot:

- 3 Units with Grade B (for GPA) for a model where the Include in GPA check box is selected on the Transfer Course Entry page.
- 3 Units with Grade T for a model where the Include in GPA check box is cleared on the Transfer Course Entry page.

Transfer Credit

The statistics in this group box include both internal and external transfer credits.

Graded Units - For GPA (graded units - for grade point average)	Displays the total number of units that are transferred for a grade (A, B, C, D, F) and accumulate in the GPA for models where the Include in GPA check box is selected on the Transfer Course Entry page.
Graded Units - Not For GPA (graded units - not for grade point average)	Displays the total number of units that are transferred for a grade (T) and do not accumulate in the GPA for models where the Include in GPA check box is selected on the Transfer Course Entry page.
Grade Points - For GPA (grade points - for grade point average)	Displays a number that is calculated by taking the grade points received for each grade (on a 4-point grading scale, an A equals 4 points), and multiplying that number by the number of units taken for each transferred class for which a grade accumulates in the GPA.
GPA - For GPA (grade point average - for grade point average)	Displays the grade point average which is calculated by dividing the grade points for GPA by the graded units for GPA. Use the GPA Rounding/Truncating Option field on the Student Records Installation page (Set Up SACR, Install, Student Records Installation) to indicate to how many decimal places you want to round or truncate the grade point average.
<hr/>	
Note: No values appear in the Not For GPA row for the Grade Points and GPA fields.	
<hr/>	
Earned Units - For GPA (earned units - for grade point average)	Displays the total number of transferred units that are passed with an earned credit grade (A, B, C, D) and accumulate in the GPA for models where the Include in GPA check box is selected on the Transfer Course Entry page.
Earned Units - Not For GPA (earned units - not for grade point average)	Displays the total number of transferred units that are passed with an earned credit grade (T) and do not accumulate in the GPA for models where the Include in GPA check box is selected on the Transfer Course Entry page.
Graded Transferred Units GPA / No GPA (graded transferred units for grade point average / not for grade point average)	Displays the sum of transferred units for which received grades both accumulate and do not accumulate in the GPA for models where the Include in GPA check box is selected on the Transfer Course Entry page.
For Units Only	Displays the total number of transferred units that are passed with an earned credit grade and do not accumulate in the GPA for models where the Include in GPA check box is cleared on the Transfer Course Entry page.
Units Adjustment	Displays the total number of units that were manually removed from the student's overall transfer credit units. This field is updated on the Terms in Residence page in the Term Activation component.

Note: This number displays as a positive value, but is stored as a negative value.

Total Adjusted Transferred Units Displays the sum of graded transfer units (for GPA and not for GPA), plus the value in the Units Only field, minus the value in the Units Adjustment field.

Combined (Enrollment + Transfer Credit Units)

Graded Units - For GPA (graded units - for grade point average) Displays the sum of all enrollment and transfer credit units that are taken and transferred for a grade (A, B, C, D, F) and accumulate in the GPA.

Graded Units - Not For GPA (graded units - not for grade point average) Displays the sum of all enrollment and transfer credit units that are taken and transferred for a grade (Pass, Fail, Satisfactory, Unsatisfactory, T) and do not accumulate in the GPA.

Grade Points - For GPA (grade points - for grade point average) Displays the sum of all grade points for enrollment and transfer credit units that accumulate in the GPA.

GPA - For GPA (grade point average - for grade point average) Displays the grade point average which is calculated by dividing the grade points for GPA by the graded units for GPA.

Use the GPA Rounding/Truncating Option field on the Student Records Installation page (Set Up SACR, Install, Student Records Installation) to indicate to how many decimal places you want to round or to truncate the grade point average.

Note: No values appear in the Not For GPA row for the Grade Points and GPA fields.

Earned Units - For GPA (earned units - for grade point average) Displays the sum of all enrollment and transfer credit units that are passed with an earned credit grade (A, B, C, D) and accumulate in the GPA.

Earned Units - Not For GPA (earned units - not for grade point average) Displays the sum of all enrollment and transfer credit units that are passed with an earned credit grade (Pass, Satisfactory, T) and do not accumulate in the GPA.

In Progress Units - For GPA (in progress units - not for grade point average) Displays the total number of units that are not yet completed and for which the future assigned grade will accumulate in the GPA.

In Progress Units - Not For GPA (in progress units - not for grade point average) Displays the total number of units that are not yet completed and for which the future assigned grade will not accumulate in the GPA.

Combined Earned Unit GPA/ No GPA (combined earned unit for grade point average / not for grade point average) Displays the sum of all enrollment and transfer credit units that are passed with an earned credit grade, including both those that accumulate and do not accumulate in the GPA.

Transfer Credit For Units Only

Displays the sum of transferred units that are passed with an earned credit grade and do not accumulate in the GPA for models where the Include in GPA check box is cleared on the Transfer Course Entry page.

Transfer Credit Units Adjustment

Displays the number of units that were manually removed from the student's overall transfer credit units.

Total Term Units

Displays the sum of all enrollment and transfer credit units that are passed with an earned credit grade, including both those that accumulate and do not accumulate in the GPA, plus transfer credit units that are passed with an earned credit grade that do not accumulate in the GPA for models where the Include in GPA check box is cleared, minus the number of units that were manually removed from the student's overall transfer credit units. Units taken for audit are excluded from this total.

Calculating Term Statistic Values

Use the following table to understand how term statistic values are calculated.

<i>Term Statistics Page Field</i>	<i>Field from STDNT_CAR_TERM</i>	<i>Calculation</i>
ENROLLMENT		
Graded Units - For GPA	UNT_TAKEN_GPA	Sum of UNT_TAKEN from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = Y, INCLUDE_IN_GPA = Y, EARN_CREDIT = n/a
Graded Units - Not For GPA	UNT_TAKEN_NOGPA	Sum of UNT_TAKEN from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = Y, INCLUDE_IN_GPA = N, EARN_CREDIT = n/a
Grade Points - For GPA	GRADE_POINTS	Sum of GRADE_POINTS from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = Y, INCLUDE_IN_GPA = Y, EARN_CREDIT = n/a

Term Statistics Page Field	Field from STDNT_CAR_TERM	Calculation
GPA - For GPA	CUR_GPA	GRADE_POINTS / UNT_TAKEN_GPA
Earned Units - For GPA	UNT_PASSD_GPA	Sum of UNT_EARNED from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = Y, INCLUDE_IN_GPA = Y, EARN_CREDIT = Y
Earned Units - Not For GPA	UNT_PASSD_NOGPA	Sum of UNT_EARNED from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = Y, INCLUDE_IN_GPA = N, EARN_CREDIT = Y
In-Progress Units - For GPA	UNT_INPROG_GPA	Sum of UNT_TAKEN from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = I, INCLUDE_IN_GPA = Y, EARN_CREDIT = n/a
In-Progress Units - Not For GPA	UNT_INPROG_NOGPA	Sum of UNT_TAKEN from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = I, INCLUDE_IN_GPA = N, EARN_CREDIT = n/a
Units Taken Towards Acad Load	UNT_TAKEN_PRGRSS	UNT_TAKEN_GPA + UNT_TAKEN_NOGPA + UNT_INPROG_GPA + UNT_INPROG_NOGPA Sum of UNT_PRGRSS from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = I or Y, INCLUDE_IN_GPA = n/a, EARN_CREDIT = n/a

Term Statistics Page Field	Field from STDNT_CAR_TERM	Calculation
Units Earned Towards Acad Load	UNT_PASSD_PRGRSS	UNT_PASSD_GPA+ UNT_PASSD_NOGPA Sum of UNT_PRGRSS from STDNT_ENRL where AUDIT_GRADE_BASIS = N, UNITS_ATTEMPTED = Y, INCLUDE_IN_GPA = Y, EARN_CREDIT = Y
Units Taken For Audit	UNT_AUDIT	Sum of UNT_PRGRSS from STDNT_ENRL where AUDIT_GRADE_BASIS = Y, UNITS_ATTEMPTED = n/a, INCLUDE_IN_GPA = n/a, EARN_CREDIT = n/a

This page displays running cumulative totals by term.

Enrollments

Units Taken for Audit Displays the total cumulative audit units taken.

Note: All other field definitions are the same as the definitions for the fields in the Enrollments group box on the Term Statistics page.

Note: RESET_CUM_STATS triggers a reset in cumulative computation.

Transfer Credit

All field definitions are the same as the definitions for the fields in the Transfer Credit group box on the Term Statistics page.

Combined (Enrollment + Transfer Credit Units)

Total Cumulative Units Displays the sum of all enrollment and transfer credit units that are passed with an earned credit grade, including both those accumulated and not accumulated in the GPA, plus transfer credit units that are passed with an earned credit grade and do not accumulate in the GPA for models where Include in GPA check box is cleared, minus the number of units that were manually removed from the student's overall transfer credit units. Units taken for audit are excluded from this total.

All other field definitions are the same as the definitions for the fields in the Combined (Enrollment + Transfer Credit Units) group box on the Term Statistics page.

Calculating Cumulative Statistic Values

Use the following table to understand how cumulative statistic values are calculated.

Cumulative Statistics Page Field	Field from STDNT_CAR_TERM	Calculation
ENROLLMENT

Viewing Student Terms

Access the Student Term Search page (Records and Enrollment > Career and Program Information > Student Term Search > Student Term Search).

Academic Career	Every academic career for which the student has been active for a term.
Term	Every term in which the student has been active.
Academic Institution	The academic institution at which the student has been term active.
Eligible To Enroll	The student's eligibility to enroll in the specified academic career and term at an academic institution, according to the value of the corresponding field on the Term Activation page.

Viewing Student Class and Exam Schedules Using Self-Service Pages

If your institution has licensed PeopleSoft Campus Self Service, your students can view their class schedule and scheduled exams over the web.

Class Detail

Click to access the class detail information.

Enrollment Status	<p>Enter the student enrollment status that you want to view for the class. The available values are <i>All</i>, <i>Dropped</i>, <i>Enrolled</i>, and <i>Waitlisted</i>.</p> <p>The roster data determines which values are available. For example, if the class has no students with a dropped status, then the <i>Dropped</i> value is not available. If all the students in the class are enrolled, the only available value is <i>Enrolled</i>.</p>
Start Date	<p>This field is only available for classes scheduled in the Open Entry/Exit (OEE) session. When the field is available, the default value is the term start date.</p> <p>Enter a date in this field to filter the list of students in the class roster for an OEE class so that the only remaining students are those whose class start date is on or after a specific date.</p>
Enrollment Capacity	This value is provided by default from the value that is defined on the Schedule of Classes - Enrollment Cntrl page.
Enrolled	The total number of students enrolled in the class.
Dropped	The total number of students who were enrolled in the class but are now in a dropped status.
Waitlisted	The total number of students currently waitlisted for the class.
Select	<p>Use this check box to select particular students for notification. This check box is available only for students who have an email address defined within the system.</p>
Name	Preferred name appears by default. If no preferred name exists, the primary name appears.
Grade Basis	The grading basis of enrolled students.
Units	The number of units that the student took for the class.
Start Date and End Date	The start and end dates for students in an OEE class.
Program and Plan	The student's primary academic program and any associated academic plans for that program.
Status	<p>The student's current enrollment status in the class.</p> <p>This column appears only when the <i>All</i> value is entered in the Enrollment Status field.</p>
Status Note	This column displays the waitlist position number for students who have a waitlisted status. If a student has a status of enrolled, but has been assigned a drop penalty grade, the notation <i>withdrawn</i> appears in the column.

Select All and Clear All

Click the Select All link to select all students for notification. Only students who have an email address defined in the system are available for selection.

To select particular students for notification, use the Select check box.

Click the Clear All link to clear your selections.

Notify Selected Students

Click this button to access the Class Roster - Send Notification page and send email notifications to selected students.

Printing Class Rosters

This section discusses how to print class rosters.

Page Used to Print Class Rosters

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Print Class Roster	RUNCTL_SRCLASSRSTR	Curriculum Management > Class Roster > Print Class Roster > Print Class Roster	Print class rosters.

Printing Class Rosters

Access the Print Class Roster page (Curriculum Management > Class Roster > Print Class Roster > Print Class Roster).

Academic Institution

Enter the academic institution for which you want to print class rosters.

Term

Enter the term for which you want to print class rosters.

Assignment

Session

Enter the session that contains the class rosters that you want to print. Values for this field are delivered with your system as translate values.

Display Permissions

Select to display permissions on the printed class roster. If the class section has permissions, the Class Roster report displays the name of the student assigned the permission, the date that the student used the permission, and the expiration date of the permission.

Sort Option

Select how you want to sort the student data in the class roster:

Name: Select this option to sort the student data in the class roster by name.

Preferred name appears by default. If no preferred name exists, the primary name appears.

Start Date, Name: Select this option to sort the data for students in an OEE class based on the student's class start date.

Select One of the Following

Academic Organization

If you want to print class rosters for a specific academic organization, enter a value in this field and do not enter a value in the Subject Area and Class Nbr fields.

Subject Area

If you want to print class rosters for a specific subject area, enter a value in this field and do not enter a value in the Academic Organization and Class Nbr fields.

Class Nbr (class number)

If you want to print class rosters for a specific class, enter a value in this field and do not enter a value in the Academic Organization and Subject Area fields. You are prompted by the schedule of classes for the specified term.

Students In The Report

Enrolled Students

Select this check box if you want the class roster to include the students who are enrolled in the class.

Dropped Students

Select this check box if you want the class roster to include the students who have dropped the class.

Waitlisted Students

Select this check box if you want the class roster to include the students who are on the wait list for enrollment in the class.

OEE Start Date Range

From

Enter a date to filter OEE class rosters, so that only students with an OEE start date greater than or equal to this date are included.

To

Enter a maximum OEE start date for this run. Students with an OEE start date that is greater than this date are excluded.

Run the Class Roster Structured Query Report (SQR) process as needed.

Producing Student Study Lists

A student study list is a list of classes in which a student is enrolled for a term.

This section discusses how to generate student study lists.

Page Used to Produce Student Study Lists

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Study List	RUNCTL_SRSTDYLIST	Records and Enrollment > Enrollment Summaries > Student Study List Report > Student Study List	Generate student study lists.

Generating Student Study Lists

Access the Student Study List page (Records and Enrollment > Enrollment Summaries > Student Study List Report > Student Study List).

Institution

Enter the academic institution for which you want to generate student study lists.

Term

Enter the term for which you want to generate student study lists.

Academic Career

Enter a value in this field to generate student study lists for a specific academic career.

Academic Program

Enter a value in this field to generate student study lists for a specific academic program. The Student Group field becomes unavailable for edit.

Student Group

Enter a value in this field to generate student study lists for a specific student group. The Academic Program field becomes unavailable for edit.

Run the Student Class Schedule Report SQR process (SRSTDYLIST). Run the PSJob process only if you are running the process on a server.

Managing Enrollment Verifications

Producing Enrollment Verification Reports

The Enrollment Verification feature enables you to produce enrollment verification reports for students. You can produce these reports for individual students on-demand or through a batch process using PeopleSoft Process Scheduler. This feature also enables you track the production of enrollment verifications for individual students, enter enrollment verification requests for future dates, and prevent production of enrollment verifications for students with specific service indicators.

This section discusses how to:

- Restrict service indicators from enrollment verification.
- Enter enrollment verification requests.
- Enter recipient address for enrollment verifications.
- Add notes to enrollment verifications.
- Process enrollment verifications in batch.

Pages Used to Produce Enrollment Verification Reports

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Enrollment Verification Req (enrollment verification request)	ENRL_VER_REQUEST	Records and Enrollment > Enrollment Verifications > Enrollment Verification > Enrollment Verification Req	Enter the content of a student's enrollment verification request. Also view the history of a student's enrollment verification requests.
Address	ENRL_VER_REQUEST_2	Records and Enrollment > Enrollment Verifications > Enrollment Verification > Address	Enter the destination address of the enrollment verification and the number of copies to be sent. Direct each request to multiple recipients and addresses. For each recipient, either enter a free-form address or select existing address information already stored in the system.

Page Name	Definition Name	Navigation	Usage
Notes	ENRL_VER_REQUEST_3	Records and Enrollment > Enrollment Verifications > Enrollment Verification > Notes	Add an optional free-form message to be included on the student's printed enrollment verification report. The message can be unique to each recipient of the report.
Enrollment Verification Print	RUNCTL_ENRL_VER	Records and Enrollment > Enrollment Verifications > Enrollment Verification Print > Enrollment Verification Print	Process enrollment verification reports for students in batch based on the academic institution, request date, and whether the report has been previously printed.

Restricting Service Indicators from Enrollment Verification

As you can with academic transcripts, you can set up the system to hold the processing of enrollment verification requests when students have certain negative service indicators. In order for the enrollment verification processes to hold these students' requests, you must first associate the delivered service impact ENVER with a service indicator.

Related Links

"Viewing, Assigning, or Removing Service Indicators" (PeopleSoft Campus Solutions 9.2: Campus Community)

Entering Enrollment Verification Requests

Access the Enrollment Verification Req page (Records and Enrollment > Enrollment Verifications > Enrollment Verification > Enrollment Verification Req).

For each request, you can process and print it immediately, process and print it in batch with other requests for a range of days, or hold it for batch processing and printing on a future date. The page displays the student's requests in descending order according to the sequence number of each request, the most recent request appearing on top.

Sequence Number The number assigned to each request that has been entered for the student.

Request Date The date on which the request was entered into the system. If you are entering a new request, the system defaults this date to today's date.

Academic Institution Select the academic institution for which you want to print the request. The system defaults to the academic institution defined for you on the User Defaults component.

Date to be Printed The system defaults to today's date the date this request is to be printed. If you want to print the request on a future date through the batch enrollment verification process (COBOL program SRPCENVB), select a new date. The enrollment verification process does not print the request until the system date matches

this date and the date range of your batch request includes this date.

Date Processed

If the request has already been processed, the system displays the date that the processing occurred.

From Term

To report all terms for which the student has enrollment history, leave this field blank. To print an enrollment verification report for a single term, select the term. To print an enrollment verification report for a range of terms, select the beginning term in the range. The system defaults the value you select to the To Term field.

To Term

This field value defaults from the From Term field value. If you want to print an enrollment verification report for a range of terms, select the latest term in the range.

Current Program

Select to include the student's current academic career, academic program, academic plan, and academic subplan in the printed report. The system selects this option for you by default.

Note: To print the student's current program, academic plan, and academic subplan, the Transcript Level field on the Academic Program page, Academic Plan Table page, and Academic Sub-Plan Table page (respectively) must be set to a value other than *Not Print*.

Earned Degrees

Select to include the student's earned degrees in the printed report. The enrollment verification process prints degrees in degree sequence number order and their associated degree plans in plan sequence number order. If you select this option and the student has no earned degrees, the process excludes this section of information from the printed report.

Cum and Term GPA (cumulative and term grade point average)

Select to include the student's GPA by term and cumulative GPA by academic career on the printed report.

Note: To print the student's cumulative GPA by academic career on the request, you must *also* select the Current Program option.

User ID

If the request has already been processed, then for tracking purposes, the system displays the user ID of the person who entered the request.

Status (not labeled)

The current status of the request, either *On Request* or *Completed*.

Print

Click this button to process the request immediately and send the report directly to your default printer. All of the student's academic careers appear on the same report, listed separately by term. The COBOL program SRPCENVR extracts the student data from the STDNT_CAR_TERM table for all academic

careers and applicable terms. After this is done, the process updates the request Status field to *Completed*.

Also click this button to reprint a request. The system keeps no record of reprinted enrollment verifications. If the student has no enrollment history based on the request parameters, the system prints a report with the enrollment history header and the message *Enrollment History Unavailable*.

If the student has a service indicator with an attached service impact of ENVER, the system displays the Service Indicator page, indicating that enrollment verification has been prevented due to negative service indicators.

Technical Information

The COBOL program SRPCENVR writes data to two tables, and this data is printed by BI Publisher on report SR802---.rpt. One table holds the header data and another table holds the detail data. The COBOL process first outputs the header records—one for each request detail and copy requested. For example, if three copies are requested for address A, three header records are produced with address A. The COBOL process then produces the detail records one time for the whole request. The two tables are joined using the query tool and BI Publisher, producing the right number of copies for each requested address. You can alter the enrollment verification headers by modifying the SRCCENVR Program ID on the Strings Table page (PeopleTools, Utilities, Use Strings Table).

You can also change the date format for the Enrollment Verification Report (SR802). Access the Define Personalizations page (PeopleTools, Personalization, Personalization Options, Format tab, DFRMT option). You can set the date separator options on the same page, under the DTSP option. These settings control the following fields that appear on the SR802 report:

- Enrollment Verification As of date
- Expected Completion Date
- Declare Dt
- Begin Date
- End Date

Entering Recipient Addresses for Enrollment Verifications

Access the Address page (Records and Enrollment > Enrollment Verifications > Enrollment Verification > Address).

Send to Requestor

Select to automatically populate the Send To field with the requestor's name and the address fields with the requestor's home address.

Specify External Org ID

Select to be able to choose an existing external organization. The system makes available the Org ID and Location fields for this purpose.

Org ID (organization ID)	This field becomes available when you select the Specify External Org ID check box. Select the organization to which you are sending the enrollment verification request. The field prompts against the Organization Table record. Define external organizations on the Organization Table page. After you press Tab to move out of the field, the system automatically populates the Send To field with the organization's name.
Location	This field becomes available when you select the Specify External Org ID option. Select the location code of the organization to which you are sending the enrollment verification request. After you press Tab to move out of the field, the system automatically populates the address fields with the location address.
Send to	Enter the name of the recipient to whom you are sending the enrollment verification report. If you select either the Send to Requestor check box or the Specify External Org ID check box, then this value populates automatically according to your selection; however, you can overwrite it. You can also enter multiple recipients.
Number of Copies	Enter the number of enrollment verification reports that you want to produce and send to this recipient and address.
Country	Select the country of the recipient's address. After you press Tab to move out of this field, the system displays the address format associated with that country. Enter all of the necessary address information in the address fields that appear. If you select either the Send to Requestor check box or the Specify External Org ID check box, then these fields populate automatically according to your selection. When you process and print the report, either through the Print button on the Enrollment Verification Req page or through the batch process, the address prints so that it appears properly through the window of a #10 envelope.

"Understanding Organizations" (PeopleSoft Campus Solutions 9.2: Campus Community)

"Creating Organization Records" (PeopleSoft Campus Solutions 9.2: Campus Community)

"Entering Organization Location Data" (PeopleSoft Campus Solutions 9.2: Campus Community)

Adding Notes to Enrollment Verifications

Access the Notes page (Records and Enrollment > Enrollment Verifications > Enrollment Verification > Notes).

Send To and Organization

The system displays the name of the recipient in these fields.

Enrollment Verification Notes

If you want to include a message on the enrollment verification report, enter it in this text box.

Processing Enrollment Verifications in Batch

Access the Enrollment Verification Print page (Records and Enrollment > Enrollment Verifications > Enrollment Verification Print > Enrollment Verification Print).

Image: Enrollment Verification Print page

This example illustrates the fields and controls on the Enrollment Verification Print page. You can find definitions for the fields and controls later on this page.

Academic Institution

Select the academic institution for which you want to print enrollment verification reports.

Unprinted Requests Only

Select if you want the process to print only the request records that have a status of *On Request*, as displayed on the Request process page in the Enrollment Verification Req component. The process excludes all previously printed enrollment verification reports. The system selects this check box by default.

Note: If you clear this check box, the process reprints any request with a status of *Completed*. The new report contains all information as of the run date.

Begin Date and End Date

In the Request Date group box, select a range of dates to process only the request records entered into the system on or within these dates. By default, the system populates the End Date field with today's date. If you want to print the academic institution's request records for all dates, leave these fields blank.

Note: The process does not print request records where the date to be printed value is set to a future date. It prints these records after the date to be printed is on or before the system date and falls within the date range your request for the batch process.

First run the COBOL process SRPCENVB to populate the results tables. PeopleSoft Process Scheduler runs the process at user-defined intervals. The report prints in alphabetical order by the student's name (last name, first name) and displays data according to the criteria selected on the Enrollment Verification Req component. The process extracts the student data from the STDNT_CAR_TERM table for all

academic careers and applicable terms. After this is done, the process updates the request status to *Completed*. Run the PSJob only if you are running the process on a server.

If you have set up negative service indicators with a service impact of ENVER and students have one of these service indicators, the SRCENVB process creates error records for these students.

Technical Information

The COBOL program SRPCENVB writes data to two tables. One table holds the header data and another table holds the detail data. The COBOL process first outputs the header records, one for each request detail and copy requested. For example, if three copies are requested for address A, three header records are produced with address A. The COBOL process then produces the detail records one time for the whole request. The two tables are joined using the query tool, producing the right number of copies for each requested address.

Requesting Enrollment Verifications Through Self Service

If your institution has licensed PeopleSoft Campus Self Service, your students can view enrollment verifications directly by using the web.

Processing Transfer Credit

Understanding Transfer Credit Processing

This section lists common elements and discusses transfer credit processing and converting transfer credit units.

Common Elements Used to Process Transfer Credit

Academic Plan	(Optional) In the Target Information group box, select the academic plan for which the transfer credit in this row of the transfer model will articulate.
Academic Program	In the Target Information group box, select the academic program for which the transfer credit in this row of the model will articulate.
Add Comments	Click to access the Model Comments page, where you can enter comments about this row of the transfer credit model.
Articulation Term	Select the term for which you want to process the individual's transfer credit for this row of the model. Note that you can articulate credits across multiple terms. You would do this, for example, if a student has continually taken credit outside your academic institution and you have posted credit at each point in time.
Calculate	When you articulate course and test credit, click this button to calculate the individual's transfer credit statistics according to the accepted transfer credit on the corresponding row of the model.
Comment	Click to access the Model Comments page, where you can enter comments about this row of the transfer credit model.
Credit Source Type	<p>In the Source Information group box, select the type of source from which you will be modeling transfer credit on this row. Your selection tells the system from which table you will select your source institution. Values are:</p> <p><i>External:</i> The system prompts you with the source IDs of external organizations in your system. The External Org ID (external organization ID) and Data Source fields become available.</p> <p><i>Internal:</i> The system prompts you with source IDs of academic institutions in your system. You select this option, for example,</p>

when a student is transferring from one academic career to another within your academic institution. The Source Career and Source Institution fields become available.

Manual: If you intend to create transfer credit models manually, do not use this component. If you select this option, the system displays a message instructing you to use the corresponding manual component.

Data Source

For an external credit source type, select the data source from which the individual's external transfer credit has been entered into the system. The data source that you specify must match the data source on the individual's external education record. Values for this field are delivered with your system as translate values. You can modify these values.

Equivalent Subject /Catlg Nbr (equivalent subject and catalog number)

After you run the Transfer Credit process for a model, the system displays the subject and catalog number of the internal course that is equivalent to the transfer credit that it evaluated.

The process determines these values for course transfer credit according to the internal equivalent course that is specified for the applicable course transfer equivalency rule on the Subject Area Elements page of the Transfer Subject Area component.

The process also determines these values for test transfer credit according to the internal equivalent course that is specified for the applicable test transfer equivalency rule on the Test Credit Rule/Component page.

When processing transfer credit manually, after you enter the equivalent subject and catalog number on the Equivalent Course Information page for this row of the model, the process displays your selection in this field. You access the Equivalent Course Information page by clicking the Edit Equivalent Course button on the corresponding row of the model.

External Org ID (external organization ID)

For an external credit source type, select the external organization from which the individual is transferring credit.

Define external organizations on the External Organization page. You access this page from the education record of the transfer prospect, applicant, or student as defined on the Education component.

Group

The Transfer Credit process automatically groups incoming transfer credit and its internal equivalent courses together on separate rows within the grid at the bottom of the page. The number in this field identifies the group as unique among other groups on this row of the transfer credit model. You can, after the Transfer Credit process completes the evaluation, move internal equivalent courses from group to group as needed to alter the articulation model before you post the transfer credit to the individual's record. You can move internal equivalent

courses from group to group by using the Move To Group button on the grid row of the course to move.

Include in FA WI Status

Select this check box to indicate that the accepted course must be used to calculate the weeks of instruction component of the student's grade level. By default, the check box is selected for all accepted course credit.

Lock

Select to lock the corresponding group row of the transfer credit model. You might select this check box, for example, if you intend to post or unpost transfer credit for that row at a later date. The groups for which you select this check box are excluded from a rerun of the Transfer Credit process. If you rerun the Transfer Credit process and something about the incoming transfer credit has changed (such as grades or units), then the process displays a red letter *Y* in front of that group. The *Y* alerts you that something about that incoming transfer credit changed after the group was locked. You might, therefore, want to investigate the change before you post or unpost the corresponding transfer credit.

Model Nbr (model number)

The system, by default, sets the first row of the transfer credit model to model number *1*. The system uses this number to store multiple, unique transfer credit models.

Model Status

The system displays the status of the model on the first page and subsequent page of the component. Values are:

Submitted: Indicates that you have run the transfer credit articulation process for this model.

Posted: Indicates that you clicked the Post button on the second page of the component and the system has successfully transferred the articulated transfer credit to the student's career term record (STDNT_CAR_TERM table) for this model.

Completed: Indicates that you have modeled and articulated the student's transfer credit, but that the model could not be posted to the student's career term record because the student is not currently active in either the academic program or articulation term that you selected for the model.

When the student is activated into the academic program and articulation term that you selected, click the Copy TC Units button on the Terms in Residence page. This automatically updates the model status to Posted and writes the data to the STDNT_CAR_TERM table.

Post

Click to post an individual's transfer credit for the corresponding model. Posting automatically saves the page. When you post transfer credit, the system displays the posted transfer credit statistics according to the individual's calculated transfer credit statistics on the page. Posting a transfer credit model also

updates the status of the model from *Submitted* to *Posted* or *Completed*. When you post your transfer credit model, the fields in the Target Information group box on the first page of the component become unavailable. To update target information, you must first unpost your model.

Seq # (sequence number)	For transfer credit in which you manually define equivalencies, the system automatically assigns a sequential number to each incoming row of transfer credit to identify unique rows in the table. These sequence numbers have no programming significance.
Source Career	For an internal credit source type, select the academic career from which the student is transferring credit.
Source Institution	For an internal credit source type, select the internal academic institution from which the student is transferring credit.
Status	After you run the Transfer Credit process for this row of the model, the process displays the transfer status of each transfer credit that it evaluated. Possible statuses are <i>Accepted</i> , <i>Rejected</i> , <i>No Rule</i> , and <i>Contingent</i> .
Study Agreements	Click to access the Student Agreements page, where you can view the details of a student's study agreement.
Total Units - Articulation Term	When you articulate test and other credits, the system calculates the individual's total transfer credit units according to the articulation term and incoming transfer credit on the corresponding of the model.
Total Units - Posted Model	When you articulate test and other credits, use this field to view a summary of the credits that have been transferred to the student's record through this model. You can view changes in this field only after you have posted or unposted the model and saved the transaction. The system displays values for this field in relation to the corresponding value in the Total Units - Articulation Term field that you have calculated for the model.
Transcript Level	Select a transcript level to determine the types of transcripts on which the system will include the transfer credit that articulates through this row of the model, provided that it is posted to the individual's record. Values are <i>Not Print</i> , <i>Official</i> , <i>Unofficial</i> , <i>Stdnt Life</i> (student life), and <i>Degr Prog</i> (degree progress).
Transfer Status	After you run the Transfer Credit process for this row of the model, the process displays the transfer status of each transfer credit that it evaluated. Possible statuses are <i>Accepted</i> , <i>Rejected</i> , <i>No Rule</i> , and <i>Contingent</i> .
Unpost	Click to completely remove the transfer credit that is posted through this model from the student's career term record. View the results for the student on the Term Statistics page.

Click the Transfer Status Detail button to access the Transfer Rule Applied page or the Reject Reason page, where you can either view the transfer equivalency rule that the Transfer Credit process applied to the corresponding external course or, if the transfer credit is rejected, view the reject reason. This field applies only to transfer credit processing with predefined course and test equivalency rules.

Click the Edit Equivalent Course button to access the Equivalent Course Information page, where you can edit equivalent course information prior to posting transfer credit.

Click the Reject External Course button to reject incoming courses before you post transfer credit. Only the incoming course on the corresponding row is rejected. For example, if incoming Math 100 and Math 200 are equivalent to internal Math 104, and you click the reject button on the Math 100 line, the resulting rule is that Math 200 is equivalent to Math 104.

Click the Add Internal Equivalent button to access the Equivalent Course Information page, where you can add internal equivalent course information.

Click the Delete Internal Equivalent button to delete internal equivalent courses for the corresponding group row. This button appears only if multiple internal equivalent courses exist for that row.

Click the Move to Group button to open a field on the page for another group number. Use this field to move transfer credit from one group into another group. For example, assume that a group has a transfer status of *Rejected*. You can use this feature to move the transfer credit to another group that has a transfer status of *Accepted* to ensure that the transfer credit gets posted.

Click the Comment/Override Reason button to access the Course Credit Comments, Test Credit Comments, or Other Credit Comments pages, where you can add an override reason and comment about any adjustments that you made to a group row of a transfer credit model.

Transfer Credit Processing

When you have set up your predefined transfer rules for courses and tests, you can start processing transfer credit. The Transfer Credit process includes retrieving all external transfer credit information; evaluating these external courses, tests, and other credit; then posting the transfer credit. Campus Solutions provides features to enable transfer credit processing by the following methods:

- Using predefined rules.
- Using student-specific agreements.
- Creating manual rules to assign course, test, and other credit.

Our processing design is based on modeling, so you can give individuals options for articulation that depend on the academic program or academic plan that is selected for them.

You can command the system to evaluate transfer credit by using the predefined transfer equivalency rules that you have created and then attached to academic programs and plans. Or you can process transfer credit by creating models manually as you go through processing. For course transfer credit, you can also use student-specific study agreements in conjunction with these predefined course transfer equivalency rules. Whether you are using predefined or manual rules or processing transfer credit manually, the functionality is the same. However, to maximize the use of your time, use only the manual Transfer Credit process to transfer credit for schools from which you rarely receive students.

You should understand some general concepts before you begin processing transfer credit, regardless of which type of transfer credit and method you use. The Transfer Credit process enables you to model as many articulation scenarios for a prospect, applicant, or student as you want. You select the rule for your model (either predefined or manual), command the system to evaluate the scenario on the basis of that rule, revise the results if you want, and save the model or post the credits.

When you have posted credits, the system updates the individual's record. The same is true when you unpost an articulation model—when you have unposted credits, the system updates the individual's academic record. The system removes all the credits that were posted.

Another concept is the grouping of transfer credit. Incoming transfer credit and its internal equivalents are grouped together. The result is known as a *group*. You can, when the Transfer Credit process completes the evaluation, move internal equivalent courses from group to group as needed to alter the articulation before you post the transfer credit to the individual's record. Other features include many buttons that enable you to accept, reject, add, and discard courses from the group. You can also revise details, such as units and grade.

Note: A person does not have to be active in an academic program or academic plan to *create* model-transfer-credit scenarios. However, the student must be active to *post* transfer credit.

Converting Transfer Credit Units

Student Records converts incoming units to the term type of the transfer rule. This enables the system to accurately compare incoming units to the rule. To convert incoming units, the system first determines the number of units taken. Then the system calculates the number of units transferred. At each stage, the system must determine whether it needs to convert the units, and if so, the system converts them.

To calculate the number of units taken, the system:

1. Determines whether the transfer units need to be converted.

The system compares the term type of the course (on the External Courses page) with the term type of the rule (on the Subject Area Elements page). If they are different, the units must be converted. That is, if the student earned four quarter units in MATH 120, and the rule is based on semester units, the system needs to convert the four quarter units to semester units before comparing it to the rule and determining how many units transfer.

2. If yes, the system converts the units.

To convert the units, the system must first determine the correct multiple to use. To find the multiple, the system compares the term type and the external term type of the education record (as shown on the External Data page) with the term type and external term type on the External Term table. You set up external terms with their multiples on the External Term Table page. To convert the units, the system multiplies the number of units earned in the external course (as it appears on the External Courses page) with the multiple.

For example, suppose the system finds that the term type of the external course is quarter and the external term is fall. It would find the corresponding row on the External Term table to find the multiple, which in this case is 0.75. Then it would multiply this by the number of units that the student received, which was 4 in this example. So the equation is 0.75×4 , and the converted value is 3.

3. The system uses the converted value to compare against the rule to determine whether the units meet the requirements of the rule.

The system determines whether the converted value falls within the minimum and maximum unit range set in the rule (Incoming Course Information page). If the converted value falls within the range, the system distributes the units to the internal equivalent and excess unit course as determined by the rule. The system displays the converted units for each incoming course in the Units Taken field on the Equivalent Course Information page.

At this point, the system has determined the number of units taken. It must now determine the number of units transferred according to the transfer credit model.

To calculate the number of units transferred, the system:

1. Determines whether the units must be converted again by comparing the term unit type of the career to the term type of the rule.

You see on the Transfer Course Details page that the transfer credit model has an academic career. The system finds the term unit type for the career that appears on the model. Term unit type for careers appears on the Academic Career Table 2 page. The system then compares the term unit type of the career with the term type of the rule, as found on the Subject Area Elements page. If the term types are the same, the system does not need to convert the units.

2. If the term unit type of the career is different from the term type of the rule, the system converts the units.

The system converts the units just as it does for calculating the units taken, except that instead of using the term unit type of the education record, it uses the term unit type of the transfer credit model's career.

3. The system displays the calculated results for each incoming course in the Units Transferred field on the Incoming Course Information page.

Previously in Student Records, you had to set the unit value of the incoming equivalent course based on the term type of the incoming credit's institution. Now the system converts the incoming units to the term type of the rule, giving you more flexibility in setting up transfer rules.

Note: If you want unit conversion to occur after the units have been awarded to the internal equivalent and excess unit classes, set the term type on the rule to equal that of the incoming course. In this case, the system does not convert the units to match the rule (they will already match), the system converts them only to match the career of the model.

Understanding Internal Transfer Credit and Unit Conversion

When using unit conversion rules with internal transfer modeling, the system uses the multiple from the Unit Conversion table and converts them as illustrated in the following example.

An undergraduate Engineering student (quarter program) takes an undergraduate three-unit class (semester class), Biology 100, and receives a C. The university then models the student in a UGRD program (semester program).

The system converts the units like this:

1. The system automatically changes the Biology 100 class into quarter units (student receives 4.5 units at enrollment).
2. Transfer credit comes in when the university models the student for a career.
3. If the model is in a semester career, the units are converted to 3 units because the student enrollment units are quarter:

Incoming	Conversion factor	Quarter equivalent
3 semester units	x 1.5	= 4.5

4. The system uses the quarter value to determine whether the criteria for transfer are met.
5. The system looks at the rule and finds the unit value of the internal equivalent class, which in this case is 3:

Internal equivalent value	Conversion factor	Semester equivalent
3 semester units	x .6770	= 2.031

Note: If you want to bypass the rule value and just convert the units in student enrollment to the new career, set the transfer rule to *Specify Maximum Units* on the Subject Area Elements page.

Understanding Grading at Articulation

The Transfer Credit Articulation process determines the grade for internal equivalent courses based on the value that is entered in the Default Grade field on the Subject Area Elements page.

See [Defining Subject Area Elements](#).

Recording External Course and Test Information

The first step in processing transfer credit for courses and tests is receiving external course and test information. You enter external course information for individuals in the Education component and external test information in the Test Results component.

Creating Student-Specific Agreements

Student-specific agreements are generally made prior to the student enrolling at your academic institution. Sometimes, however, your course transfer equivalency rules do not satisfy a specific student's situation, or an advisor wants to make a unique transfer agreement with a student.

This section discusses how to:

- Describe student agreements.
- Enter student agreement details.

Pages Used to Create Student-Specific Agreements

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Agreements	STDNT_AGRMNT	Records and Enrollment > Transfer Credit Evaluation > Student Agreements > Student Agreements	Describe specific student agreements, and enter the catalog organization and comments.
Student Agreement Courses	STDNT_AGRMNT_CRSE	Records and Enrollment > Transfer Credit Evaluation > Student Agreements > Student Agreement Courses	Enter the external courses and equivalent internal courses of specific study agreements. These study agreement equivalency rules are separate from the course transfer equivalency rules that you might have created and attached to academic programs and plans.

Describing Student Agreements

Access the Student Agreements page (Records and Enrollment > Transfer Credit Evaluation > Student Agreements > Student Agreements).

Image: Student Agreements page

This example illustrates the fields and controls on the Student Agreements page. You can find definitions for the fields and controls later on this page.

Student Agreements		Student Agreement Courses	
Ana Beck		SR0400

Academic Institution:	PSUNV	PeopleSoft University	
Source ID:	2300022	Santa Barbara City College	
Find View All First 1 of 1 Last			
*Effective Date:	09/30/2004	*Status:	Active
*Description:	Summer courses at SBCC		
*Catalog Org Type:	External		
*Catalog Organization:	2300022 Santa Barbara City College		
Comment:	Ana will enroll in one english course at SBCC over the summer.		
*User ID:	PS		Betty Locherty

Catalog Org Type (catalog organization type)

The information in this field designates the table from which you will select a catalog organization for the external courses of the study agreement. Values are:

External: The system prompts you with external organizations in your system.

Internal: The system prompts you with academic institutions in your system.

Catalog Organization

Select the catalog organization for the external courses of this study agreement. The system prompts you with values based on your selection in the Catalog Org Type field. When you define course equivalencies for this study agreement on the Study Agreement Courses page, the system prompts you with courses based on the catalog organization that you select here.

You can use any external organization or internal academic institution as the catalog organization to define external courses for this study agreement. However, when you define an external course on the Study Agreement Courses page, the Catalog Org Type and Catalog Organization fields become unavailable.

Comment

Enter any comments that are relevant to this study agreement.

User ID

Displays the user identification code of the person who entered the study agreement into the system.

Entering Student Agreement Details

Access the Student Agreement Courses page (Records and Enrollment > Transfer Credit Evaluation > Student Agreements > Student Agreement Courses).

Image: Student Agreement Courses page

This example illustrates the fields and controls on the Student Agreement Courses page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Student Agreement Courses' page for student Ana Beck (SR0400). The page is divided into several sections:

- Student Information:** Ana Beck, SR0400. Academic Career: UGRD (Undergraduate). Academic Institution: PSUNV (PeopleSoft University). Source ID: 2300022 (Santa Barbara City College).
- Effective Date:** 09/30/2004.
- EXTERNAL COURSE:**
 - Subject: ENGL (British Literature)
 - Course Nbr: 17
 - *Units Taken: 4.00
 - Ext Grd Scheme: UGR
 - Ext Grd Basis: GRD
 - Minimum Grade: B
- INTERNAL COURSE:**
 - *Course ID: 003274
 - *Offer Nbr: 1
 - ENGLIT 100
 - *Units Transferred: 3.000
 - Grading Scheme: UGD (Undergrad)
 - Grading Basis: GRD (Graded)
 - Grade: B (Good)

EXTERNAL COURSE

Enter the external course information for the study agreement in the EXTERNAL COURSE group box.

Subject

Select the subject of the course.

Course Nbr (course number)

Select the course number for the external course. If you are using an external organization for the catalog organization (as defined on the Study Agreements page), the system prompts you with courses that you have associated with the external organization on the School Course Classification page. If you are using an internal academic institution for the catalog organization, the system prompts you with courses that are defined for that academic institution in the Course Catalog component.

Units Taken

By default, the system displays the units of the external course according to the course definition. You can override this default value.

Ext Grd Scheme (external grading scheme)

Select the grading scheme from which you can select a valid grading basis for this external course.

Ext Grd Basis (external grading basis)

Select a grading basis to define all of the valid grades from which you can select a minimum grade for this external course.

Minimum Grade

Select a minimum grade that the student must receive in this external course for the course to fulfill the study agreement.

Note: On this page, the minimum grade that is needed is a letter grade, whereas in the Course Credit Transfer Rule component the minimum grade is entered as specific grade points. This is a feature intending that advisors who create student-specific agreements might not always be aware of the grading point scheme.

INTERNAL COURSE

Enter the internal course information for the study agreement in the INTERNAL COURSE group box.

Course ID

Select the internal course that is equivalent to the external course for this study agreement. The system prompts you to select a course from your academic institution's course catalog.

Offer Nbr (offering number)

By default, the system displays the offering number of the course that you selected according to the definition of the course in your academic institution's course catalog. You can override this default value.

Units Transferred

By default, the system displays the units of the course that you selected according to the definition of the course in your academic institution's course catalog. You can override this default value. These units represent the number of units that the student will receive for the internal course if the student fulfills the study agreement.

Grading Scheme

Select a grading scheme from which you can select a valid grading basis for this external course.

Grading Basis

Select a grading basis to define all of the valid grades from which you can select a grade for this internal course.

Grade

Select the grade that the student will receive for the internal course if the student fulfills the study agreement.

Processing Course Transfer Credit

This section provides an overview of course transfer credit processing and discusses how to:

- Process course transfer credit models with predefined rules.
- Calculate and post course transfer credit with predefined rules.
- Process course transfer credit models manually.
- Calculate and post course transfer credit manually.

- View student study agreements.
- View incoming and edit equivalent course information.

Understanding Course Transfer Credit Processing

Two components are available to evaluate course transfer credit, the Course Credits component for predefined rules, and the Course Credits - Manual component for creating manual transfer credit models.

Use the Course Credits component to use predefined course transfer equivalency rules to articulate course transfer credit. Predefined rules can be attached to academic programs, academic plans, and student-specific study agreements. You can create models of articulation based on the source of the transfer credit and the student's academic program and plan. You can create as many models as necessary.

To process course transfer credit using predefined equivalency rules:

1. Set up the source information and target information for the transfer credit model on the Transfer Course Details page.
2. Select the articulation term for the model and command the system to evaluate the courses according to the predefined rules in the Transfer Credit Term group box of the Transfer Course Details page.
3. Calculate transfer credit statistics for the model, post and unpost transfer credit, and view a summary of transfer credit statistics on the Transfer Summary page.
4. View summary student statistics, after you have saved a posted or unposted model, in the Course Credits Summary group box of the Transfer Summary page.

Use the Course Credits - Manual component to manually enter transfer credit. This component is designed to be used for course transfer credit from schools from which you rarely receive students. This saves you from having to go through the rule-defining procedure for a few students.

To process course transfer credit manually:

1. Set up the source information and target information for the transfer credit model on the Transfer Course Entry page.
2. Select the articulation term for the model and enter the incoming course and internal equivalent course information in the Transfer Credit Term group box of the Transfer Course Entry page.

Save the page to run the Transfer Credit process and articulate the course credit.

3. Calculate transfer credit statistics for the model, post and unpost transfer credit, and view a summary of transfer credit statistics on the Course Credits By Term page.
4. View summary student statistics, after you save a posted or unposted model, in the Course Credits Summary group box of the Course Credits By Term page.

The Sort Order of Transfer Credit Articulation Results

The Detail table (TRNS_CRSE_DTL) holds the results of the transfer credit articulation process, and the data is displayed in the Transfer Credit Term group box on the Transfer Course Details page. The results are sorted in the following manner:

1. Incoming courses that have matching student agreement records.

2. Incoming courses that have exact matches—subject and catalog number for external credits, course ID, and course offering number for internal courses—in the Agreement rule set specified in the Program/Source Equivalency Rule for the model's program.

Within this rule set, rules with higher transfer priority are processed first. Within the same transfer priority numbers, rules with the most number of incoming courses—many-to-many or many-to-one—are evaluated first.

3. Incoming courses that have wildcard matches—subject and partial catalog number—in the Agreement rule set that is specified in the Program/Source Equivalency Rule for the model's program.
4. Incoming courses that have exact matches—subject and catalog number for external credits, course ID, and course offering number for internal—in the Override rule set that is specified in the Program/Source Equivalency Rule for the model's program.

Within this rule set, rules with higher transfer priority are processed first. Within the same transfer priority numbers, rules with the most number of incoming courses—many-to-many or many-to-one—are evaluated first.

5. Incoming courses that have wildcard matches—subject and partial catalog number—in the Override rule set that is specified in the Program/Source Equivalency Rule for the model's program.
6. Incoming courses that have exact matches—subject and catalog number for external credits, course ID, and course offering number for internal—in the Default rule set that is specified in the Program/Source Equivalency Rule for the model's program.

Within this rule set, rules with higher transfer priority are processed first. Within the same transfer priority numbers, rules with the most number of incoming courses—many-to-many or many-to-one—are evaluated first.

7. Incoming courses that have wildcard matches—subject and partial catalog number—in the Default rule set that is specified in the Program/Source Equivalency Rule for the model's program.
8. Rejected courses.

Pages Used to Process Course Transfer Credit

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Transfer Course Details	TRNS_CRSE_DTL	Records and Enrollment > Transfer Credit Evaluation > Course Credits - Automated > Transfer Course Details	Create course transfer credit models and run the Transfer Credit process to evaluate the models. For each model, you specify target information, source information, and the articulation term. Then you run the Transfer Credit process to articulate course transfer credit, using predefined equivalency rules. You can revise the results as necessary.

Page Name	Definition Name	Navigation	Usage
Transfer Summary	TRNS_CRSE_TERM	Records and Enrollment > Transfer Credit Evaluation > Course Credits - Automated > Transfer Summary	Calculate an individual's transfer credit statistics, based on the accepted internal equivalent courses of a transfer credit model. After you view the statistics for the transfer credit model, you can post the transfer credit to an individual's record. You can also use this page to unpost transfer credit.
Transfer Course Entry	TRNS_CRSE_ENTRY	Records and Enrollment > Transfer Credit Evaluation > Course Credits - Manual > Transfer Course Entry	Set up course transfer credit models and articulate transfer credit manually as you set up models rather than by using predefined equivalency rules. This page is essentially the same as the Transfer Course Details page of the Course Credits component with the few exceptions that are described in this section.
Course Credits by Term	TRNS_CRSE_TERM	Records and Enrollment > Transfer Credit Evaluation > Course Credits - Manual > Course Credits by Term	Calculate an individual's transfer credit statistics for a model based on the accepted internal equivalent courses of the model. After you view the statistics for the transfer credit model, you can post the transfer credit to an individual's record. You can also use this page to unpost transfer credit. This is the same page as the Transfer Summary page of the course credits component.
Student Agreements	STDNT_AGR_CRSE_SEC	Click the Study Agreements link on the Transfer Course Details page or the Transfer Course Entry page. This link is available only if the student has a Student Agreement in the system.	View the details of a student's study agreement, including the external course and the internal equivalent course.
Student Agreement Header Info (student agreement header information)	STDNT_AGR_SEC	Click the Agreement Data link on the Student Agreements page.	View the description, catalog organization, comments about the agreement, and the name of the user who created the study agreement.

Page Name	Definition Name	Navigation	Usage
Transfer Rule Applied	TRNS_CRSE_RULE_SEC	Click the Transfer Status Detail button on the Transfer Course Details page.	View the course transfer equivalency rule that the Transfer Credit process applied to the corresponding external course. If the course is rejected, the system displays the reject reason. This page applies to transfer credit processing with predefined course equivalency rules.
Reject Reason	TRNS_CRSE_REJR_SEC	Click the Transfer Status Detail button on the Transfer Course Details page.	View the reason why the course transfer equivalency rule was rejected. This page applies only to transfer credit processing with predefined course equivalency rules.
Equivalent Course Information	TRNS_CRSE_INT_SEC	Click the Edit Equivalent Course button on the Transfer Course Details page to edit equivalent course information. Click the Add Internal Equivalent button on the Transfer Course Details page to enter additional equivalent courses.	View incoming course credit information for a specific row of a course transfer credit model, and view and edit equivalent course information.
Equivalent Course Information	TRNS_CRSE_MNL1_SEC	Click the Edit Internal Equivalent button on the Transfer Course Entry page.	View details about incoming course credit and internal equivalent course information for a specific row of a test transfer credit model for which you are manually defining equivalencies.
Course Credit Comments	TRNS_CRSE_DTL_SEC	Click the Comment/Override Reason button on the Transfer Course Details page or the Transfer Course Entry page.	Add an override reason and comment about any adjustments that you have made to a group row of a transfer credit model.
Model Comments	TRNS_CRSE_SCH_SEC	Click the Add/View Comments link on the Transfer Course Details page or the Transfer Course Entry page.	Add comments about this row of the transfer credit model.

Processing Course Transfer Credit Models with Predefined Rules

Access the Transfer Course Details page (Records and Enrollment > Transfer Credit Evaluation > Course Credits - Automated > Transfer Course Details).

Image: Transfer Course Details page

This example illustrates the fields and controls on the Transfer Course Details page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Transfer Course Details' page for user Ana Beck, course SR0400. It is divided into several sections:

- Transfer Credit Model:** Includes fields for Academic Career (UGRD - Undergraduate), Academic Institution (PSUNV - PeopleSoft University), Model Nbr (2), and Transcript Level (Unofficial).
- Target Information:** Includes Academic Program (LAU - Liberal Arts Undergraduate) and Academic Plan, with an 'Apply Agreement' checkbox checked.
- Source Information:** Includes Credit Source Type (External), External Org ID (000010146 - Long Beach City College), and Data Source (Self-Rpted).
- Transfer Credit Term:** Includes Articulation Term (0330 - 1998 Fall) with a 'Fetch' button and 'Submitted' status.
- Equivalency Details Table:**

*Group	Status	External Term	External Subject / Catalog Nbr	Units Taken	Grade Input	Equivalent Subject / Catlg Nbr	Units Accepted	Grade Basis	Grade	Repeat Code	Incl in FA WI
1	Accepted	1990 FALL	MATH 10	4.00	A	MATH 107	2.000	GRD	T		<input type="checkbox"/>

Apply Agreement

Select to have the Transfer Credit process use the *agreement* equivalency rule selected for the specified academic program, plan, and source combination on the Rules Specification page. Clear this check box to ignore the specified agreement equivalency rule. By default, the system selects this check box.

(AUS) Level of Education

This mandatory field appears only if the school type assigned to the credit has a DEST credit basis of *0200 Credit Offered for Prior VET Study*.

School types are defined on the School Type Table page.

This field appears only if the DEST, HECS, Centrelink, TAC check box is selected on the SA Features page.

(AUS) DEST Institution

Note: This field is available only if you select the Australia DEST, HECS, Centrelink, TAC check box on the Academic Institution 6 page.

Enter the DIISRTE institution code from which the transfer credit is coming.

Department of Industry, Innovation, Science, Research and Tertiary Education (DIISRTE) was previously known as DEEWR and before that, as DEST.

Fetch

After you have selected an articulation term for this row of the course transfer credit model, click this button to run the Transfer Credit process.

The Transfer Credit process COBOL program evaluates the individual's course transfer credit according to the valid course transfer equivalency rules. The process determines valid course transfer equivalency rules for the specified source based on whether the rule is active previous to the begin date of the articulation term and based on whether the rule was attached to the individual's academic program or academic plan for the specified source. The process then compares the individual's external course information to the valid rules and calculates the results. The courses that the process evaluates appear in the grid at the bottom of the page.

Define course transfer equivalency rules on the Transfer Subject Area component and attach them to academic programs and academic plans for the source on the Program/Source Equivalency component. Enter an individual's external course information on the External Courses page of the Education component.

External Term

After you run the Transfer Credit process for this row of the model, the process displays the external term of each course that it evaluated. The process determines the external term for the transfer course according to the value that is entered for the course in the corresponding field on the External Courses page of the Education component.

External Subject/Catalog Nbr (external subject/catalog number)

After you run the Transfer Credit process for this row of the model, the process displays the external subject and catalog number of each course that it evaluated. The process determines the external subject and catalog number for the transfer course according to the value that is entered for the course in the corresponding fields on the External Courses page of the Education component.

Note: When you post a model, the Source Information group box for that row becomes unavailable.

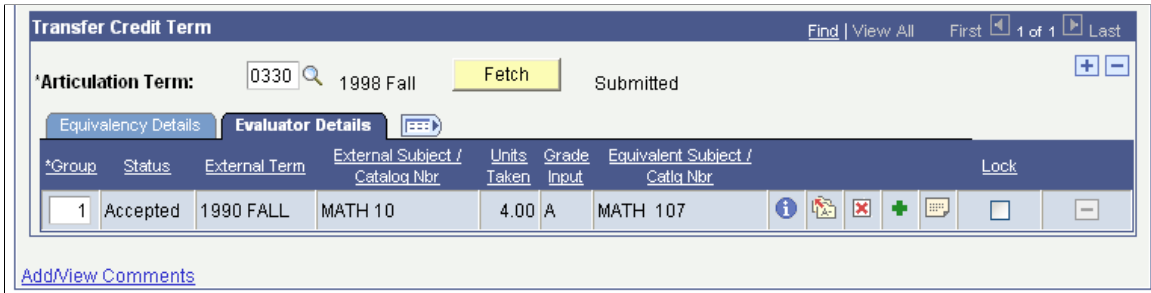

Note: Using the column heading links to sort data on this page may ungroup external and equivalent courses.

Evaluator Details

Select the Evaluator Details tab.

Image: Transfer Course Details page: Evaluator Details tab

This example illustrates the fields and controls on the Transfer Course Details page: Evaluator Details tab. You can find definitions for the fields and controls later on this page.

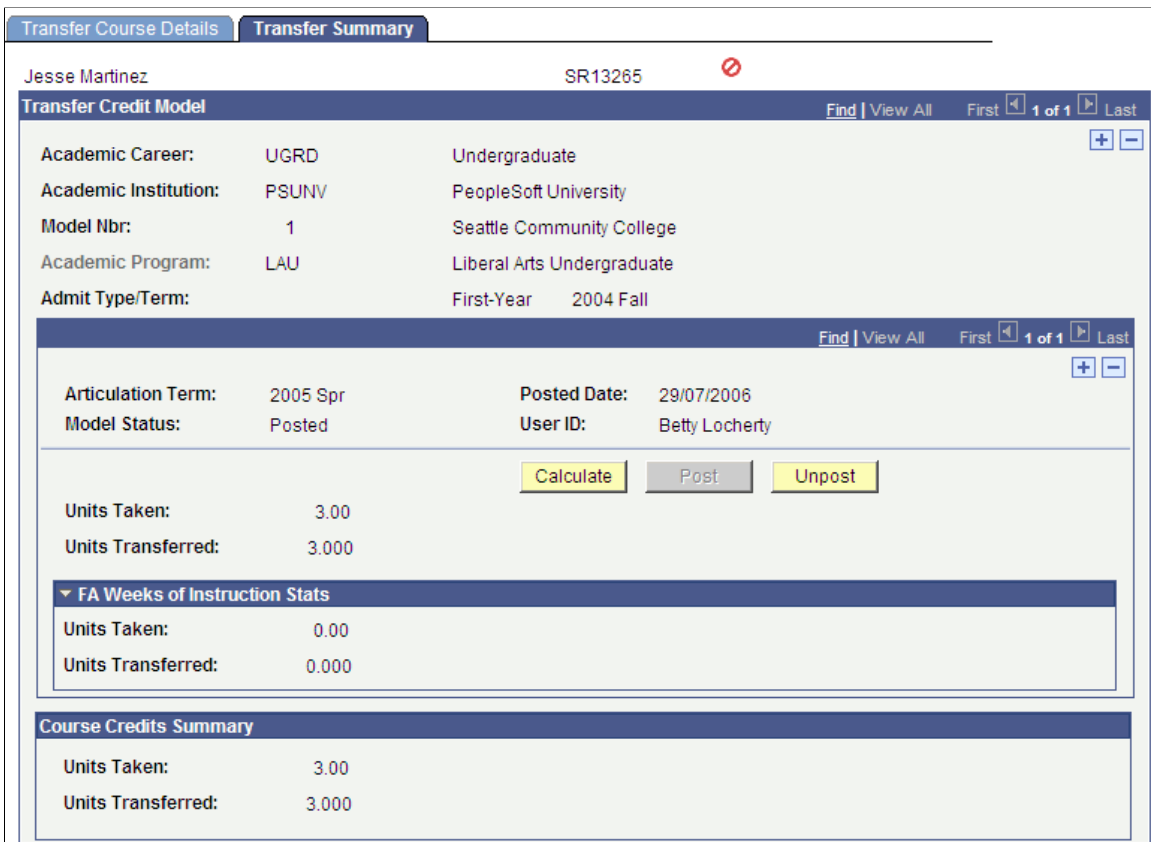

See the previous Common Elements section for information about the icons on this tab.

Calculating and Posting Course Transfer Credit with Predefined Rules

Access the Transfer Summary page (Records and Enrollment > Transfer Credit Evaluation > Course Credits - Automated > Transfer Summary).

Image: Transfer Summary page

This example illustrates the fields and controls on the Transfer Summary page. You can find definitions for the fields and controls later on this page.

Calculate

After you articulate course credit, click this button to calculate the individual's transfer credit statistics according to the accepted transfer credit on the corresponding row of the model.

Note: When you post the transfer credit without clicking the Calculate button, the process still calculates the units.

If you selected to include the accepted equivalent courses of this model in the individual's GPA *and* you have transferred grades that include grade points, the system calculates the transfer taken for GPA, the transfer passed for GPA, the transfer grade points, and the transfer GPA.

If you selected to include the accepted equivalent courses of this model in the individual's GPA *and* you transferred grades that are not included in, for example, F grade points, the system calculates the transfer taken not for GPA and the transfer passed not for GPA.

If you have *not* selected to include the accepted equivalent courses of this model in the individual's GPA, the system calculates the units taken and the units transferred.

You can select to include transfer credit in the GPA for external organizations and internal academic institutions on the Organization Affiliation page.

FA Weeks of Instruction Stats

The group box displays transfer course statistics for courses marked to be included in the Financial Aid weeks of instruction calculations. When articulated transfer work is calculated, these values are calculated and stored in the Include in FA WI Stats area. These values are used by the Financial Aid Term process to then calculate the student's academic level.

Note: The calculation of the FA WI Stats values does not affect the calculation of the current articulated transfer work statistics. In addition, the new values are stored in the transfer credit records and are not moved to PS_STDNT_CAR_TERM.

Units Taken

Displays the units that the individual took for the class being transferred.

Units Transferred

Displays the units of the internal equivalent course.

Course Credits Summary

Use the Course Credits Summary group box to view a summary of the course credits that have been transferred to the student's record through this model. You can view changes in this group box only after you have posted or unposted the model and saved the transaction. The system displays values for the fields in this group box in relation to the corresponding values that you calculated for the model on this page.

Processing Course Transfer Credit Models Manually

Access the Transfer Course Entry page (Records and Enrollment > Transfer Credit Evaluation > Course Credits - Manual > Transfer Course Entry).

Image: Transfer Course Entry page (1 of 2)

This example illustrates the fields and controls on the Transfer Course Entry page (1 of 2). You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Transfer Course Entry' page for user Jesse Martinez. The page is titled 'Transfer Course Entry' and 'Course Credits by Term'. It displays the following information:

- Academic Career:** UGRD (Undergraduate)
- Academic Institution:** PSUNV (PeopleSoft University)
- Model Nbr:** 1
- Transcript Level:** Official
- Target Information:** Academic Program: LAU (Liberal Arts Undergraduate), Academic Plan: (empty), Include in GPA: (checkbox)
- Source Information:** Credit Source Type: Manual, Source Institution: Seattle Community College, School Type: CC (Community College)

Image: Transfer Course Entry page (2 of 2)

This example illustrates the fields and controls on the Transfer Course Entry page (2 of 2). You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Transfer Credit Term' page for articulation term 0540 (2005 Spr). It displays the following information:

- Articulation Term:** 0540 (2005 Spr), Posted
- Incoming Course:**
 - Year: 2005, Ext Term: SPR
 - Subject: ANTH
 - Course Nbr: 101
 - Description: Anthropology Basics
 - Units Taken: 3.00
 - Grade Input: B
- Equivalent Course:**
 - Course ID: 001234 (ANTHRO)
 - Offer Nbr: 1 (101)
 - Units Transferred: 3.000
 - Grading Scheme: UGD (Undergrad)
 - Grading Basis: GRD (Graded)
 - Official Grade: T (Transfer)
 - Repeat Code: (empty)
 - Designation: (empty)
 - Include in FA WI Stats: (checkbox)

Target Information

Include in GPA (include in grade point average)

Select to include eligible courses within this model in students' GPA totals and No GPA totals at your academic institution. Clear this check box to include the eligible courses as units only.

Eligible courses are those courses with the Include in GPA check box selected on the Equivalent Course Information page. Conversely, ineligible courses are those with the Include in GPA check box cleared on the Equivalent Course Information page.

The system renders the Include in GPA field on this page unavailable when the model is posted.

Note: The Include in GPA check box in the Target Information group box has no impact on the Academic Advisement engine.

The Academic Advisement engine looks at the Include in GPA check box on the Equivalent Course Information page to evaluate course grade points for academic requirements and enrollment requisites.

Source Information

(AUS) Level of Education

This mandatory field appears only if the school type assigned to the credit has a DEST credit basis of *0200 Credit Offered for Prior VET Study*.

School types are defined on the School Type Table page.

This field appears only if the DEST, HECS, Centrelink, TAC check box is selected on the SA Features page.

Transfer Credit Term

Details

Click to access the Equivalent Course Information page, where you can edit equivalent course information prior to posting transfer credit.

Comments

Click to access the Course Credit Comments page, where you can add an override reason and comment about any adjustments that you have made to this row of the model.

Incoming Course

Use the Incoming Course group box to define your external course information for this row of the transfer credit model.

Year

Enter the year in which the incoming course was taken.

Ext Term (external term)

Select the external term for each external course that you enter.

Subject	Enter the subject area of the incoming course.
Course Nbr (course number)	Enter the course number for the incoming course.
Description	Enter the description of the incoming course.
Units Taken	Enter the units taken for the incoming course.
Grade Input	Enter the grade received for the incoming course.

Equivalent Course

Use the Equivalent Course group box to define the internal course that is equivalent to the incoming course for this row of the transfer credit model. The system matches classes based on year, external term, subject, course number, units taken, and grade input.

Course ID	Select the course that is equivalent to the incoming course for this row. The system prompts you to select a course from your academic institution's course catalog.
Offer Nbr (offering number)	By default, the system displays the offering number of the course that you selected according to the definition of the course in your academic institution's course catalog. You can override this default value.
Units Transferred	<p>If you select the From Incoming Course option on the Academic Career Table page, the value in this field appears by default from the Units Taken field in the Incoming Course group box for the course that has the same group and sequence number.</p> <p>If you select the From Course Catalog option on the Academic Career Table page, the value in this field appears by default from the Maximum Units field in the Course Catalog (CRSE_CATALOG) component.</p> <p>Regardless of the option that you select on the Academic Career Table page, you can override the default value in this field to transfer a different number of units.</p>
Grading Scheme	Select the grading scheme of the specified internal equivalent course. This grading scheme defines all of the valid grading bases from which you can select an official grade for the specified internal equivalent course.
Grading Basis	Select the grading basis for the specified internal equivalent course. This grading basis defines all of the valid grades from which you can select an official grade for the specified internal equivalent course.
Official Grade	<p>Select the official grade of the specified internal equivalent course. This official grade defines the grade that an individual receives for the specified internal equivalent course.</p> <p>The value entered here is included in the student's cumulative GPA at your academic institution, provided that you selected</p>

the Include in GPA check box on this page and the Equivalent Course Information page.

Repeat Code

Select a repeat code, if applicable.

Repeat codes work in conjunction with repeat rules to determine whether a repeated class violates your repeat policies. When the repeat checking process runs, it searches the student's enrollment history to find class enrollments with matching course IDs. When it finds a match, it determines whether the repeat is legal based on the repeat rules that you define.

When the repeat checking process identifies a course that violates a repeat rule, the process assigns the class enrollment a repeat code. This repeat code determines how the class enrollment is treated in the student's academic statistics, such as whether the grade is used to calculate the student's grade point average. The repeat code that the repeat checking process assigns appears here.

Designation

Use this field to select a requirement designation for the class enrollment.

Save

After you select an articulation term and enter the incoming course and internal equivalent course information for this row of the course transfer credit model, click Save.

Units Taken:	3.00		
Units Transferred:	3.000		
<div style="border: 1px solid black; padding: 2px;"> FA Weeks of Instruction Stats </div>			
Units Taken:	0.00		
Units Transferred:	0.000		
<div style="border: 1px solid black; padding: 2px;"> Course Credits Summary </div>			
Units Taken:	3.00		
Units Transferred:	3.000		

Note: If transfer credit has been posted for a student and then a change is made to his or her record and the data is reposted, an input change flag appears on the page.

FA Weeks of Instruction Stats

The group box displays transfer course statistics for courses marked to be included in the Financial Aid weeks of instruction calculations. When articulated transfer work is calculated, these values are calculated and stored in the Include in FA WI Stats area. These values are used by the Financial Aid Term process to then calculate the student's academic level.

Note: The calculation of the FA WI Stats values does not affect the calculation of the current articulated transfer work statistics. In addition, the new values are stored in the transfer credit records and are not moved to PS_STDNT_CAR_TERM.

Units Taken

Displays the units that the individual took for the class being transferred.

Units Transferred

Displays the units of the internal equivalent course.

Viewing Student Study Agreements

Access the Student Agreements page (click the Study Agreements link on the Transfer Course Details page or the Transfer Course Entry page).

Note: If you enter a course that is a duplicate, the system gives you a warning. You can cancel and fix the duplicate or continue with the post. If you continue with the post and attach the external course to both instances of the class, repeat checking will place repeat codes on the class.

Agreement Data

Click to access the Student Agreement Header Info (student agreement header information) page, where you can view header information about the student-specific study agreement.

Viewing Incoming and Editing Equivalent Course Information

Access the Equivalent Course Information page (click the Edit Equivalent Course button on the Transfer Course Details page to edit equivalent course information).

Image: Equivalent Course Information page

This example illustrates the fields and controls on the Equivalent Course Information page. You can find definitions for the fields and controls later on this page.

Processing Test Transfer Credit

This section provides an overview of test transfer credit processing and discusses how to:

- Process test transfer credit models with predefined rules.
- Calculate and post test transfer credit with predefined rules.
- Process test transfer credit models manually.
- Calculate and post test transfer credit manually.
- Enter incoming test and equivalent course information.

Understanding Test Transfer Credit Processing

Two components are available to evaluate test transfer credit, the Test Credits - Automated component for predefined rules and the Test Credits - Manual component for creating test credit models manually. After you have set up your test codes and test components and you have read the Processing Course Transfer Credit section, the pages for processing test credit will be familiar.

Use the Test Credits - Automated component if you want to use predefined test transfer equivalency rules to articulate test transfer credit. You can attach predefined rules to academic programs and academic plans. You create models of articulation based on the individual's academic program or academic plan. You can create as many models as necessary.

To process test transfer credit using predefined equivalency rules:

1. Set up the target information for the transfer credit model on the Test Credit Details page.
2. Select the articulation term for the model and tell the system to evaluate the test credit according to the predefined rules on the Test Credit Details page.
3. Calculate transfer credit statistics for the model, post and unpost transfer credit, and view a summary of transfer credit statistics on the Test Credits By Term page.
4. View summary student statistics, after you have saved a posted or unposted model, in the Total Units - Posted Model field on the Test Credits by Term page.

Use the Test Credits - Manual component to enter transfer credit manually with equivalencies that you enter as you proceed. This component is designed for test transfer credit from sources from which you rarely receive test results. This saves you from having to go through the rule-defining procedure for a few students.

To process test transfer credit manually:

1. Set up the target information for the transfer credit model on the Test Credit Entry page.
2. Select the articulation term for the model and enter the incoming test and internal equivalent course information on the Test Credit Entry page.

Save the page to run the Transfer Credit process and articulate the test credit.

3. Calculate transfer credit statistics for the model, post and unpost transfer credit, and view a summary of transfer credit statistics on the Test Credits By Term page.
4. View summary student statistics, after you have posted a model, in the Total Units - Posted Model field on the Test Credits By Term page.

Pages Used to Process Test Transfer Credit

Page Name	Definition Name	Navigation	Usage
Test Credit Details	TRNS_TEST_DETAIL	Records and Enrollment > Transfer Credit Evaluation > Test Credits - Automated > Test Credit Details	Create test transfer credit models and run the Transfer Credit process to evaluate the models. For each model, specify a target academic program, the academic plan if applicable, and the articulation term. Then run the Transfer Credit process. You can revise the results as necessary.
Test Credit by Term	TRNS_TEST_TERM	<ul style="list-style-type: none"> • Records and Enrollment > Transfer Credit Evaluation > Test Credits - Automated > Test Credit by Term • Records and Enrollment > Transfer Credit Evaluation > Test Credits - Manual > Test Credit by Term 	Calculate an individual's transfer credit statistics for a model based on the accepted internal equivalent courses of a transfer credit model. After you view the statistics for the transfer credit model, you can post the transfer credit to an individual's record. You can also use this page to unpost transfer credit.

Page Name	Definition Name	Navigation	Usage
Test Credit Entry	TRNS_TEST_ENTRY	Records and Enrollment > Transfer Credit Evaluation > Test Credits - Manual > Test Credit Entry	Set up test transfer credit models and articulate transfer credit by creating test transfer models manually rather than by using predefined equivalency rules. This page is essentially the same as the Test Credit Details page of the Test Credits component, with the few exceptions that are described in this section.
Transfer Rule Applied	TRNS_TEST_RULE_SEC	Click the Transfer Status Detail button on the Test Credit Details page.	View the test transfer equivalency rule that the Transfer Credit process applied to the corresponding external course. If the test is rejected, the Reject Reason page displays the reject reason. The Transfer Rule Applied page applies only to transfer credit processing with predefined test equivalency rules.
Reject Reason	TRNS_TEST_REJR_SEC	Click the Transfer Status Detail button on the Test Credit Details page.	View the reason why the test transfer equivalency rule was rejected. This page applies only to transfer credit processing with predefined test equivalency rules.
Equivalent Course Information	TRNS_TEST_INT_SEC	Click the Edit Equivalent Course button on the Test Credit Details page to edit equivalent course information.	View incoming test credit information for a specific row of a test transfer credit model, view and edit equivalent course information, and enter additional equivalent courses and corresponding information.
Equivalent Course Information	TRNS_TEST_EDIT_SEC	Click the Edit Equivalent Course button on the Test Credit Entry page.	Add incoming test credit information and internal equivalent course information for a specific row of a test transfer credit model for which you are manually defining equivalencies.
Test Credit Comments	TRNS_TEST_DTL_SEC	Click the Comment/Override Reason button on the Test Credit Details page or the Test Credit Entry page.	Add an override reason and comment about any adjustments that you made to a group row of a transfer credit model.
Model Comments	TRNS_TEST_MOD_SEC	Click the Comment link on the Test Credit Details page or the Test Credit Entry page.	Add comments about this test transfer credit model.

Processing Test Transfer Credit Models with Predefined Rules

Access the Test Credit Details page (Records and Enrollment > Transfer Credit Evaluation > Test Credits - Automated > Test Credit Details).

Image: Test Credit Details page

This example illustrates the fields and controls on the Test Credit Details page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Test Credit Details' page for user Marlo Nascimiento (SR0812). The page includes several sections:

- Academic Career:** UGRD (Undergraduate)
- Academic Institution:** PSUNV (PeopleSoft University)
- *Model Nbr:** 1
- *Transcript Level:** Unofficial
- Target Information:**
 - *Academic Program:** LAU (Liberal Arts Undergraduate)
 - Academic Plan:** (Empty field)
 - Include in GPA**
- *Articulation Term:** 0350 (1999 Spring) with a 'Fetch' button and 'Posted' status.
- Table of Test Components:**

*Group	Status	Test ID	Test Component	Equivalent Subject / Catlg Nbr	Lock
1	Posted	AP	ENGC	ENGLIT 100	<input checked="" type="checkbox"/>
2	Posted	AP	FRA	FREN 101	<input checked="" type="checkbox"/>

Fetch

After you select an articulation term for this row of the course transfer credit model, click this button to run the Transfer Credit process. The Transfer Credit process COBOL program evaluates the individual's test transfer credit according to the valid test transfer equivalency rules. The process determines valid course transfer equivalency rules, based on whether the rule is active previous to the begin date of the articulation term and based on whether the rule has been attached to the individual's academic program or academic plan. The process then compares the individual's external test information to the valid rules and calculates the results. The tests that the process evaluates appear in the grid at the bottom of the page.

Define test transfer equivalency rules on the Test Credit Rule / Component page and attached to academic programs and academic plans for the source on the Test Credit Equivalency page. An individual's external test information is entered on the Test Results component.

Test ID

After you run the Transfer Credit process for this row of the model, the process displays the identification code of each test that it evaluated. The process determines the individual's tests

according to the value entered for the test in the corresponding fields on the Test Results component.

Test Component

After you run the Transfer Credit process for this row of the model, the process displays the component of each test that it evaluated. The process determines the individual's test components according to the value that is entered for the test in the corresponding fields on the Test Results component.

Note: Using the column heading links to sort data on this page may ungroup external and equivalent courses.

Calculating and Posting Test Transfer Credit with Predefined Rules

Access the Test Credit by Term page (Records and Enrollment > Transfer Credit Evaluation > Test Credits - Automated > Test Credit by Term).

Image: Test Credit by Term page

This example illustrates the fields and controls on the Test Credit by Term page. You can find definitions for the fields and controls later on this page.

Test Credit Entry		Test Credit by Term	
Jesse Martinez		SR13265

Units Transferred:		3.000	
Test Credits Summary			
Units Transferred:		3.000	

The units of the internal equivalent course appear in the Units Transferred field in the FA Weeks of Instruction Stats (financial aid weeks of instruction statistics) group box.

Processing Test Transfer Credit Models Manually

Access the Test Credit Entry page (Records and Enrollment > Transfer Credit Evaluation > Test Credits - Manual > Test Credit Entry).

Image: Test Credit Entry page

This example illustrates the fields and controls on the Test Credit Entry page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Test Credit Entry' page for student Marlo Nascimiento (SR0812). The page is divided into several sections:

- Student Information:** Marlo Nascimiento, SR0812.
- Academic Career:** UGRD (Undergraduate).
- Academic Institution:** PSUNV (PeopleSoft University).
- *Model Nbr:** 1.
- *Transcript Level:** Unofficial.
- Target Information:**
 - *Academic Program:** LAU (Liberal Arts Undergraduate).
 - Academic Plan:** (Empty field).
 - Include in GPA:** (Unchecked checkbox).
- *Articulation Term:** 0350 (1999 Spring, Posted).
- Table of Articulation Terms:**

*Group	*Seq#	Status	Test ID	Test Component	Equivalent Subject / Catlg Nbr
1	1	Posted	AP	ENGC	ENGLLIT 100
2	1	Posted	AP	FRA	FREN 101

At the bottom of the page, there is a link for [Add/View Comments](#).

Test ID

After you select a test ID on the Equivalent Course Information page for this row of the model, the system displays your selection in this field. You access the Equivalent Course Information page by clicking the Edit Equivalent Course button on the corresponding row of the model.

Test Component

After you select a test component on the Equivalent Course Information page for this row of the model, the system displays your selection in this field. You access the Equivalent Course Information page by clicking the Edit Equivalent Course button on the corresponding row of the model.

Save

After you select an articulation term and enter the incoming test credit and internal equivalent course information for this row of the test transfer credit model, click Save to run the Transfer Credit process. The Transfer Credit process COBOL engine evaluates the individual's test transfer credit according to the test credit and internal equivalent information on the Incoming Course information page.

Calculating and Posting Test Transfer Credit Manually

Access the Test Credit by Term page (Records and Enrollment > Transfer Credit Evaluation > Test Credits - Manual > Test Credit by Term).

The Test Credit by Term page in the Test Credits - Manual component is the same page as the Test Credits By Term page in the Test Credits Component.

Test Credit Input

Use the Test Credit Input group box to enter test information.

Test ID	The identification number of the test for which you are defining a course equivalency.
Component	The component of the test for which you are defining a course equivalency.
Test Date	The date that the test was taken.
Test Score	The individual's test score.

Data Source	The data source.
Percentile	The percentile of the individual's score.

Equivalent Course

Use the Equivalent Course group box to enter internal equivalent course information.

Processing Other Transfer Credit

This section provides an overview of other transfer credit processing and discusses how to:

- Process other transfer credit models.
- Calculate and post other transfer credit.
- Add incoming other credit and equivalent course information.

Understanding Other Transfer Credit Processing

Processing other transfer credit, credit for prior learning, is always a manual process. The pages in the Other Credit component are very similar to those in the Course Credit and Test Credit components. After you have read the Processing Course Transfer Credit section, the pages for processing other credit will be familiar.

The other credit category is appropriate because it requires no external organization information. However, you must assign other credit through a course in your academic institution's course catalog. Therefore, you might set up special summary courses in the course catalog, then grant the student additional transfer credits using these special courses.

To process other transfer credit:

1. Set up the target information for the transfer credit model on the Other Credit Detail page.
2. Select the articulation term for the model and enter the equivalent course information on the Other Credit Detail page.
3. Calculate transfer credit statistics for the model, post and unpost transfer credit, and view a summary of transfer credit statistics on the Other Credit By Term page.
4. View summary student statistics, after you have posted a model, in the Total Units - Posted Model field on the Test Credits By Term page.

Pages Used to Process Other Transfer Credit

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Other Credit Detail	TRNS_OTHR_DETAIL	Records and Enrollment > Transfer Credit Evaluation > Other Credits - Manual > Other Credit Detail	Set up other transfer credit models and articulate transfer credit. For each model, you specify target information, the articulation term, other credit information, and internal equivalent course information.
Other Credit by Term	TRNS_OTHR_TERM	Records and Enrollment > Transfer Credit Evaluation > Other Credits - Manual > Other Credit by Term	Calculate transfer units statistics for a model, post and unpost transfer credit, and view a summary of transfer credit statistics.
Equivalent Course Information	TRNS_OTHR_EDIT_SEC	Click the Edit Equivalent Course button on the Other Credit Detail page.	Add incoming other credit information and internal equivalent course information for a specific model. You can also use this page to edit information that you have previously saved.
Other Credit Comments	TRNS_OTHR_DTL_SEC	Click the Comment/Override Reason button on the Other Credit Detail page.	Add an override reason and comment about any adjustments that you have made to a group row of a transfer credit model.
Model Comments	TRNS_OTHR_MOD_SEC	Click the Comment button on the Other Credit Detail page.	Add comments about this row of the transfer credit model.

Processing Other Transfer Credit Models

Access the Other Credit Detail page (Records and Enrollment > Transfer Credit Evaluation > Other Credits - Manual > Other Credit Detail).

Processing Transfer Credit in Batch

This section provides an overview of batch transfer credit processing and discusses how to:

- Post transfer credit in batch.
- View process results for batch posting of transfer credit.

Understanding Batch Transfer Credit Processing

Processing a student's transfer credit can be a complicated and time-consuming process. Aside from transferring credit from an external organization to your academic institution, you might want to move a student's credit from one academic career to another or from one internal academic institution to another.

To facilitate processing transfer credit, use the Batch Transfer Credit feature. This feature enables you to process transfer credit by batch, simplifying your online data entry and reducing processing time. Provided that you have already entered the student's external education record and defined the transfer credit equivalency rules, you can submit a request to have transfer credit modeled for a group of students who match the parameters that you specify. When you submit your request, the system performs the model setup, transfer articulation, and posting processes for all students in the group.

To process transfer credit by batch:

1. Define the posting process on the Process Definitions page.
2. Define the processing parameters—the group of students to process by batch—on the Transfer Credit Batch page, then run the process through PeopleSoft Process Scheduler.

Pages Used to Process Transfer Credit in Batch

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Transfer Credit Batch	RUNCTL_SR_TRCRBP	Records and Enrollment > Transfer Credit Evaluation > Batch Posting > Transfer Credit Batch	Post transfer credit in batch. Process parameters include the student's identification code and the keys that the system will use in retrieving incoming transfer credit, plus the target academic career, academic program, academic plan (where applicable), and articulation term.
Process Results	RUNCTL_SR_TRCRBPER	Records and Enrollment > Transfer Credit Evaluation > Batch Posting > Process Results	View information that is related to the process that you have run on the Transfer Credit Batch page. To view a student's statistics after you run the process, go to the student's individual transfer credit record on the appropriate component— either external course credit, test credit, or other credit.

Posting Transfer Credit in Batch

Access the Transfer Credit Batch page (Records and Enrollment > Transfer Credit Evaluation > Batch Posting > Transfer Credit Batch).

Image: Transfer Credit Batch page

This example illustrates the fields and controls on the Transfer Credit Batch page. You can find definitions for the fields and controls later on this page.

Group Nbr (group number)

The group number is the numeric counter that distinguishes each row of the process instance from other rows. By default, the system displays the first group as *1* and increases the number by one as you add groups to the process instance.

Description

Enter a description of the group to uniquely identify the group.

Processing Option

Select from the following values the processing option to use for this run of the process. Depending on the option that you select, you can create models in batch, post models in batch, or do both at the same time.

Create Model: Select to create transfer credit models based on the student external education record for external transfers or based on the academic career record for internal transfers.

Post Model: Select to post models that have already been created. If the student is active in the articulation term and academic program that you select, the system posts the transfer credit to each affected student's career term record, sets the transfer model to posted, then automatically runs the Repeat Checking process. If a student is not active in the articulation term and academic program that you select, the system does not post the transfer model. Instead, the system sets the transfer model status to *Completed*. When the student is activated for

the specified academic program and articulation term, you can move the transfer statistics to the student's career term record using the transfer credit copy function on the Terms in Residence page.

Create and Post Model: Select to create the model and then post it in the same run of the process.

Apply Agreement

Select to have the Transfer Credit process use the *agreement* equivalency rule that is selected for the specified academic program, academic plan, and source combination on the Rules Specification page. Clear this check box to ignore the specified agreement equivalency rule. By default, the system selects this check box.

Overlay Unposted Models

Select if you are rerunning the batch and you want to overlay any unposted models.

Transcript Level

Select a specific transcript level. If left blank, the default set at *Academic Career* is used.

Transfer Credit Source

In the Transfer Credit Source group box, select the type of source from which you will be modeling transfer credit for this group. Your selection instructs the system from which table you will be selecting your source.

External

Select to have the system prompt you with the source IDs of external organizations in your system. The External Org ID and Data Source fields appear and are available.

Internal

Select to have the system prompt you with source IDs of academic institutions in your system. You would select this option, for example, when a student is transferring from one academic career to another within your academic institution. The Source Career and Source Institution fields appear and are available.

External Org ID (external organization identification)

For an external transfer credit source, select the external organization from which you are processing transferring credit.

Data Source

For an external transfer credit source, select the data source from which the individual's external transfer credit has been entered into the system. Values for this field are delivered with your system as translate values. You can modify these values.

Source Career

For an internal transfer credit source, select the academic career from which you are processing transfer credit.

Source Institution

For an internal transfer credit source, select the internal academic institution from which you are processing transferring credit.

Transfer Credit Target

Use the grid in the lower portion of the page to enter student ID and target information within your academic institution for each student for whom you want to process transfer credit by batch within the group.

ID	Select the identification code of each student for whom you want to process transfer credit in the group. The system prompts you with IDs from the personal data table (PERSONAL_DATA).
Academic Career	Select the academic career to which the specified student's transfer courses will articulate.
Academic Institution	Select the academic institution to which the specified student's transfer courses will articulate.
Academic Program	Select the academic program to which this student's transfer in this row credit will articulate.
Academic Plan	Select the academic plan to which the specified student's transfer credit in this row will articulate. This field is optional. However, if an academic plan is specified, the individual must be active in that academic plan before the transfer credit is posted.
Articulation Term	Select the term for which you want to process the specified student's transfer credit for this row. Note that you cannot articulate credits across multiple terms by inserting additional rows for the student. You would do this, for example, if a student has continually taken credit outside your academic institution over time and you have posted credit at each point in time.

Run the Transfer Credit Batch Posting job (SRPCTCBJ) as needed. The job consists of two processes—the Transfer Credit Batch Posting process and the Repeat Rule Driver process (SRPCERTD). Both processes are COBOL/SQL.

Depending on the processing options that you select, the Transfer Credit Batch Posting process performs one of the following actions: creates transfer credit models, posts transfer credit, or creates models and posts transfer credit by batch, for the defined group of students. When you initiate the process with the latter option set, the process goes through the records of each student that you have entered and validates your input parameters, creates the transfer credit model, calculates transfer credit articulation, and posts the credits to the student's academic career term. Students can be in multiple groups in the same run control process for which transfer work for multiple institutions exists.

If you need to change the results, you can do so on a student-by-student basis by editing the transfer credit model that the background process creates. You adjust the results the same way that you would adjust them if you were modeling one student at a time. First, unpost the transfer credit. Then adjust one or more courses manually. Finally, repost the transfer credit.

The Repeat Rule Driver process launches the Repeat Checking process, checking the newly posted course credit on each affected student's career term record against existing course credit to identify repeated courses.

Note: The system uses the begin date of the articulation term as the effective date when validating which equivalency rules are valid.

Viewing Process Results for Batch Posting of Transfer Credit

Access the Process Results page (Records and Enrollment > Transfer Credit Evaluation > Batch Posting > Process Results.).

Refresh

Click to display the messages and description of the process instance. If you rerun the process, click this button to view the messages and descriptions from the most recent run. The system populates the page with the most recent message log information.

Viewing and Printing Transfer Credit Information

This section discusses how to:

- View academic test summaries.
- View schools by group.
- Retrieve transfer credit summaries.
- View and print transfer credit summaries.
- Print transfer credit summaries in batch.

Pages Used to View and Print Transfer Credit Information

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Academic Test Summary	STDNT_TEST_SUMMARY	Records and Enrollment > Transfer Credit Evaluation > Academic Test Summary > Academic Test Summary	View a summary of academic test information for prospects and applicants, such as test score and data source.
Organization Groups Summary	ORG_GROUP_SUMM	Records and Enrollment > Transfer Credit Rules > Schools by Group > Organization Groups Summary	View schools, or any type of organization, in groups that you designate. You can display the list in the order that you choose.
Transfer Credit Summary - Selection Criteria	SRTC_RPT_DTL	Records and Enrollment > Transfer Credit Evaluation > Transfer Credit Summary > Selection Criteria	Define the selection criteria to search for transfer credit summaries.

Page Name	Definition Name	Navigation	Usage
Transfer Credit Summary - Selection Result	SRTC_RPT_DTL_RSLT	Records and Enrollment > Transfer Credit Evaluation > Transfer Credit Summary > Selection Result	View and print transfer credit summaries for individuals. The system displays transfer credit summaries based on your selection criteria on the Selection Criteria page.
Evaluation Reports	RUNCTL_SR_TRCR_RPT	Records and Enrollment > Transfer Credit Evaluation > Transfer Evaluation Report > Evaluation Reports	Print transfer credit summary evaluation reports for multiple individuals at the same time.

Viewing Academic Test Summaries

Access the Academic Test Summary page (Records and Enrollment > Transfer Credit Evaluation > Academic Test Summary > Academic Test Summary).

Related Links

"Tracking Test Results for Prospects and Applicants" (PeopleSoft Campus Solutions 9.2: Recruiting and Admissions)

Viewing Schools by Group

Access the Organization Groups Summary page (Records and Enrollment > Transfer Credit Rules > Schools by Group > Organization Groups Summary).

Related Links

"Viewing Organizations by Group Types" (PeopleSoft Campus Solutions 9.2: Campus Community)

Retrieving Transfer Credit Summaries

Access the Transfer Credit Summary - Selection Criteria page (Records and Enrollment > Transfer Credit Evaluation > Transfer Credit Summary > Selection Criteria).

ID	Select the ID of the individual whose transfer credit summary you want to view or print. The system prompts you with IDs from the personal data table (PERSONAL_DATA).
Academic Institution	Select the academic institution for which the specified individual's transfer credit was processed.
All Careers	Select to retrieve transfer credit summaries for all academic careers that are associated with the specified individual.
Career/Program/Plan	Select to retrieve the specified individual's transfer credit summaries within a specific academic career, target academic program, and target academic plan. The Academic Career, Academic Program, and Academic Plan fields become available when you select this option.

Academic Career	Select a specific academic career for which you want to retrieve the specified individual's transfer credit summaries.
Academic Program	Select a specific academic program for which you want to retrieve the specified individual's transfer credit summaries.
Academic Plan	Select a specific academic plan for which you want to retrieve the specified individual's transfer credit summaries.
Posted Status	<p>This filter option enables you to retrieve transfer credit summaries for the specified individual, based on transfer status. Values are:</p> <p><i>All</i>: Enables you to retrieve all transfer credit summaries regardless of transfer status.</p> <p><i>Completed</i>: Enables you to retrieve only transfer credit summaries in which transfer credit has been evaluated and models created but the individual does not yet have an academic program, academic plan, and term activation record for the academic program and articulation term as defined on the transfer credit model.</p> <p><i>Modeled</i>: Enables you to retrieve only transfer credit summaries in which models have been created.</p> <p><i>Posted</i>: Enables you to retrieve transfer credit summaries for transfer credit that have been posted to a student's career term records (STDNT_CAR_TERM table). This differs from the <i>Completed</i> status because the individual has an academic program, academic plan, and term activation record for the academic program and articulation term as defined on the transfer credit model.</p>
Articulation Term	This filter option enables you to select a specific term for which transfer credit has been processed. The system displays only models that have been processed for the articulation term that you specify.
Articulation Term	This sort order option enables you to view and print models based on the begin date of the articulation term. Two options are available: <i>Ascending</i> and <i>Descending</i> . <i>Ascending</i> prints models from the oldest to the newest articulation term. <i>Descending</i> prints models from the newest to the oldest articulation term.
Submit	After you have defined your selection criteria and filtering options, click this button to retrieve the transfer credit summaries for the specified individual according to your selection criteria. When the retrieval process is complete, the system automatically displays the Selection Result page.

Viewing and Printing Transfer Credit Summaries

Access the Transfer Credit Summary - Selection Result page (Records and Enrollment > Transfer Credit Evaluation > Transfer Credit Summary > Selection Result).

Generate Report

Click to run the SQR (Structured Query Report) report (SRTCSTEV). The report contains the same information as the summary page with the addition of a Repeat field for a student who has already completed course work at the institution.

The report is designed in an easy-to-read format intended to be distributed to prospects, applicants, students, recruiters, or advisors. They can see what classes transferred and to which equivalent classes. They can also view their internal and external GPAs.

Important! To print the report, you must first make some changes to your run control definitions.

Articulation Term

The articulation term for which the transfer credit was processed.

Group

The group number within the model that associates incoming transfer credit with its internal equivalent courses. The number in this field identifies the group as unique among other groups.

Model Status

The status of the transfer credit model. Values are: *Submitted*, *Completed*, and *Posted*.

External Subject / Catalog Nbr (external subject/catalog number)

The external subject and catalog number of the class being transferred.

Units Taken

The units that the individual took for the class being transferred.

Grade Input

The grade that the individual received for the class being transferred.

Status

The transfer status of the credit being transferred. Possible transfer status values are *Accepted*, *Contingent*, *Posted*, *No Rule*, and *Rejected*.

Equivalent Subject / Catlg Nbr (equivalent subject/catalog number)

The subject and catalog number of the internal course that is equivalent to the transfer credit.

Units Transferred

The units of the internal equivalent course.

Official Grade

The individual's official grade for the internal equivalent course.

Reject Reason

If the transfer credit was rejected, the system displays the reject reason.

Printing Transfer Credit Summaries in Batch

Access the Evaluation Reports page (Records and Enrollment > Transfer Credit Evaluation > Transfer Evaluation Report > Evaluation Reports).

Academic Institution	Click to select the academic institution for which transfer credit was processed.
Academic Career	Select a specific academic career for which you want to retrieve the transfer credit summaries.
Academic Program	Select a specific academic program for which you want to retrieve the transfer credit summaries.
Academic Plan	Select a specific academic plan for which you want to retrieve transfer credit summaries.
Posted Status	<p>This filter option enables you to retrieve transfer credit summaries based on transfer status. Values are:</p> <p><i>All</i>: Enables you to retrieve all transfer credit summaries regardless of transfer status.</p> <p><i>Completed</i>: Enables you to retrieve only transfer credit summaries in which transfer credit has been evaluated and models created but the individual does not yet have an academic program, academic plan, and term activation record for the academic program and articulation term, as defined on the transfer credit model.</p> <p><i>Modeled</i>: Enables you to retrieve only transfer credit summaries in which models have been created.</p> <p><i>Posted</i>: Enables you to retrieve transfer credit summaries for transfer credit that has been posted to a student's career term records (STDNT_CAR_TERM table). This differs from the <i>Completed</i> status because the individual is a matriculated student who has an academic program, academic plan, and term activation record for the academic program and articulation term, as defined on the transfer credit model.</p>
Articulation Term	This filter option enables you to select a specific term for which transfer credit has been processed. The system displays only models that have been processed for the articulation term that you specify.
Order By	<p>In the Sort Order group box, select the order in which you want the system to sort the transfer credit summaries. Values are:</p> <p><i>Name</i>: The system prints transfer credit summary reports in alphabetical order by last name, first name.</p> <p><i>ID</i>: The system prints transfer credit summary reports in ID order.</p>

Submit

After you have defined selection criteria and filtering options, click this button to run the Student Transfer Credit Evaluation SQR report (SRTCSTEV), using PeopleSoft Process Scheduler, for the specified individual according to your selection criteria.

Viewing Transfer Credit Reports Through Self Service

If your institution has licensed PeopleSoft Campus Self Service, your instructors can view transfer credit reports directly over the web.

Tracking Attendance

Understanding Attendance Tracking

Depending on your business requirements, you might need to track student attendance. Some state agencies require institutions to track student attendance by hours or minutes. Often attendance tracking affects funding decisions. Using the PeopleSoft Campus Solutions Attendance Tracking feature, you can meet these needs. The Attendance Tracking feature enables you to record all of the necessary details about a period of interaction between your students and instructors. You can do the following:

- View attendance records online or print them for manual use.
- Track a wide range of attendance statistics, such as late arrivals and time spent in class.
- Track student attendance in a class section, component, or unit of instruction.
- Generate attendance rosters for individual classes or for multiple classes.
- Track student attendance in any type of course, such as traditional courses, remedial courses, contract courses, extension courses, and courses with nontraditional modes of delivery (such as online instruction, modular instruction, open entry and open exit, distance learning, and so on).
- Create attendance rosters for non-classroom events, such as field trips.

Generating Attendance Rosters

After you schedule classes and enroll students, you can create attendance rosters by using either the Class Attendance page or the Attendance Roster Generator page. Through the Class Attendance page, you can create attendance rosters for one class meeting or for all class meetings within a single scheduled class. Through the Attendance Roster Generator page, you can create attendance rosters for all scheduled classes or for a selection of scheduled classes, within a term.

Each class meeting has its own roster, which comprises the student name and ID, term, session, class section, meeting pattern, attendance date, attendance type, contact hours, and each student's attendance record. The attendance type and the type of student attendance data that you can track are defined on the Course Catalog - Component page. You can use any of these three pages to access the attendance rosters that you generate—each page offers both a different view and a different method of access.

When you generate attendance rosters, the system creates a roster for every scheduled class meeting within your processing parameters and creates a template (a data entry page where you can enter attendance detail for each student) for each class meeting date. You can add new templates, thus adding attendance rosters for class meetings that are not officially scheduled (for example, a field trip to the observatory). For each class meeting, you can view student attendance details. If necessary, you can insert new rows for students who are not formally enrolled in the class (for example, a student who is participating in the class and planning to enroll if space on the waiting list becomes available).

With either attendance roster generation process (batch or online), you can populate your attendance rosters either by downloading from student enrollment (select the Populate from Student Enroll check

box) or by building your attendance rosters from scratch (clear the Populate from Student Enroll check box). If you populate your attendance rosters by downloading from student enrollment, the system populates each roster with student names and IDs. If you choose to build an attendance roster, generate the attendance rosters and the system creates blank templates for each class meeting. Each template has the class attendance date and contact hours, based on the class meeting pattern in the schedule of classes and the class meeting attendance type that your institution uses. You can then use the Class Attendance page to scroll through the class meeting dates, select the specific class meeting dates for which to generate attendance rosters, and populate each of these specific class meeting rosters from student enrollment by clicking the Create button that corresponds to each of these class meetings. You can also enter student IDs by using the Class Attendance page, the Class Attendance By Template page, or the Student Attendance page. Changes that you make on any of these pages are immediately visible in all three components.

After you generate attendance rosters, you can use the Class Attendance page, the Class Attendance By Template page, and the Student Attendance page to track student attendance. Each page provides you with a different view and a different method of access.

Note: You can track events that are not course-related using the Plan Events component in PeopleSoft Campus Community.

Generating Individual Class Attendance Rosters

To generate an attendance roster for a single class:

1. Access the Attendance Roster By Class page and click the Generate button to generate templates for every class meeting within a scheduled class, or click the Create button to generate a template for a single class meeting.
2. Click the View button to access the Class Attendance Detail page and enter attendance for a specific meeting online.
3. (Optional) Print the roster for an individual meeting by clicking the meeting button.

Prerequisites

Schedule the class and assign at least one attendance type on the Schedule of Classes - Basic Data page. The classes for which you generate attendance rosters must have scheduled meeting patterns, and the Generate Class Meeting Attendance check box must be selected on both the Course Catalog - Components page and Schedule of Classes - Basic Data page.

Pages Used to Generate Individual Class Attendance Rosters

Page Name	Definition Name	Navigation	Usage
Attendance Roster By Class	CLASS_ATTENDANCE	Curriculum Management > Attendance Roster > Attendance Roster By Class > Attendance Roster By Class	Generate or update attendance rosters for individual classes and class meetings. You can also use this page to track student attendance and view, update, and print the attendance rosters for each class meeting.
Class Attendance	CLASS_ATTEND_RSTR	Click the View button on the Attendance Roster By Class page.	Track student attendance for a class meeting.

Generating Attendance Rosters for Individual Classes

Access the Attendance Roster By Class page (Curriculum Management > Attendance Roster > Attendance Roster By Class > Attendance Roster By Class).

Image: Attendance Roster By Class page

This example illustrates the fields and controls on the Attendance Roster By Class page. You can find definitions for the fields and controls later on this page.

Attendance Roster By Class

Course ID: 003274	Term: 2003 Fall
Course Name: Surv Brit Lit	Session: Regular Academic Session
Subject / Catalog#: ENGLIT 100	Institution: PeopleSoft University
Class Nbr: 1111	Instructor:
Class Section: 1	

Populate from Student Enroll
 Generate Class Mtg Attendance

[Report Manager](#)

Student Attendance Roster											
Customize Find View All First 1-5 of 45 Last											
				Template Nbr	Type	*Attendance Date	*From Time	*To Time	Contact Minutes	Override	
1	Create	Print	View	1	Class Meeting	08/27/2003	11:00AM	11:50AM	50	<input type="checkbox"/>	+ -
2	Create	Print	View	2	Class Meeting	08/29/2003	11:00AM	11:50AM	50	<input type="checkbox"/>	+ -
3	Create	Print	View	3	Class Meeting	09/03/2003	11:00AM	11:50AM	50	<input type="checkbox"/>	+ -
4	Create	Print	View	4	Class Meeting	09/05/2003	11:00AM	11:50AM	50	<input type="checkbox"/>	+ -
5	Create	Print	View	5	Class Meeting	09/08/2003	11:00AM	11:50AM	50	<input type="checkbox"/>	+ -

When you change attendance rosters using the Attendance Roster By Class page, the system reflects these changes on the Class Attendance By Template page and the Student Attendance page.

Generate

Click to create attendance rosters for all class meetings within this scheduled class. The system populates the grid with templates for each class meeting.

When you click the Generate button, it is important to remember that the system always uses the class meeting attendance type defined on the Academic Institution 3 page.

Report Manager

Click to print generated attendance rosters for all class meetings.

Populate from Student Enroll

Select to have the system populate attendance rosters with the enrolled students for every class meeting within this scheduled class when you generate or create attendance rosters. The system selects this check box by default.

If you clear this check box and click the Generate button, the system creates blank attendance rosters for every class meeting.

You can then scroll through the class meeting dates in the grid located in the lower portion of the page, select the View link for the specific class meeting dates for which to track attendance, and manually enter student IDs.

Processing Options

Select one of the three radio buttons to specify the type of process to run. These work in concert with the Generate button only. These do not work in concert with the Create button.

Values are the following:

Create: Select this option when you want to create new rosters or replace old ones.

Update Attendance/All Students: Select this option when you want to add, but not delete students from the specified group of rosters. Students who have dropped are set to inactive status by having the Present flag set to Off. The system adds new students to the rosters, but only marks these students as present for the class sessions that occur after the add date.

Update Attendance/Active Only: Select this option if you want to add and delete students from the roster based on their current enrollment statuses in the course for the specified group of attendance rosters. The add and drop date on the STDNT_ENRL table determines how rosters are updated. Use this option when a student drops a class and you want to remove the student and leave no attendance history.

Attendance From Date and Attendance To Date

Use the Attendance From Date and the Attendance To Date fields to specify the range of rosters to update. These fields appear only for classes where the Generate Class Meeting Attendance check box is selected on the Components and Basic Data pages. If displayed, the system populates the fields with the class begin and end date, as specified on the schedule of classes. You can change these values. If you manually change the attendance from and to date range, the system creates or updates rosters for meetings that are greater than or equal to the Attendance From Date field and less than or equal to the Attendance To Date field.

Note: A student might appear twice on an attendance roster because enrollment is keyed by academic career. For instance, a student might enroll in a class twice, each time through a different academic career and would thus appear on the attendance record twice.

If students add, drop, or change their personal data in a class after you have generated the attendance roster, you can click the Create button to generate new attendance rosters. Provided that you select the Populate from Student Enroll check box, the system generates new rosters that include these changes.

You can also click the Create button to generate new attendance rosters when the class meeting pattern in the schedule of classes changes. For example, perhaps the class meeting time is rescheduled from 8:00 a.m. to 9:00 a.m., or class meeting dates are changed from *MWF* to *TR*. You can regenerate the class meeting attendance rosters to reflect the new date or time.

Warning! The Generate button always functions as though you are generating attendance rosters from scratch. Therefore, if you have already entered student attendance data into any of the attendance rosters, you should click the Create button associated with each individual attendance roster template. You should *not* click the Generate button or you will lose the attendance data that you have already entered into the rosters.

Generate Class Mtg Attendance
(generate class meeting attendance)

This check box is a display-only check box on this page and is set on the Schedule of Classes - Basic Data page. It determines whether the class can be included in batch roster generation, and it affects which radio buttons and from and to date fields appear.

Create

Click this button on the corresponding meeting row to generate or regenerate an attendance roster for that class meeting row. The system automatically populates the template by downloading data from student enrollment regardless of whether you select the Populate From Student Enroll check box.

You can use the Create button to generate attendance rosters that you enter manually, to generate attendance rosters for additional class meetings that are not formally scheduled, and to update attendance rosters with the latest student enrollment and personal data.

To generate attendance rosters manually, enter the attendance information into a row and click the corresponding Create button. For example, perhaps your institution wants to track attendance for milestone periods within a class such as the 30 percent and 70 percent periods.

To generate attendance rosters for additional class meetings, click the Add button to insert a new row anywhere in the grid, then enter the necessary attendance information, and click the

corresponding Create button. For example, perhaps you have added a field trip to the course.

To update attendance rosters with the latest enrollment data, you first must select the Override check box on a row within the grid. Then, click the Create button for that row. You do not need to select the Populate from Student Enroll check box because it works in conjunction with the Generate button. You might update attendance rosters when students have added or dropped the class or when there has been a change to student personal data, such as their first names or last names. You can also click the Generate button to update enrollment information for all class meetings of the scheduled class rather than changing only one class meeting. However, you should only click the Generate button *before* you manually enter attendance data into your rosters because it creates new rosters, overwriting and replacing existing information.

Print

Click the Print button on a data row to print an attendance roster for a specific class meeting. This automatically creates a web output in portable document format (PDF).

Click the Report Manager link to access and print the roster.

View

Click this button on a data row to view and enter information for an attendance roster.

Template Nbr (template number)

The system generates a template number for each class meeting of the scheduled class. The template number identifies each attendance roster as unique and also denotes the order in which the system prints the attendance rosters. When you change a template number and save the page, the next time that you access the page the system positions the template numbers in numerical order.

Type

Indicates the roster attendance type for the class meeting, such as *Class Meeting*, *Conference*, *Field Trip*, *Instructor Consultation*, or *Study Group*. The attendance type determines which attendance tracking fields the system uses for the attendance roster. When you generate attendance rosters the first time for all class meetings by using the Attendance Roster Generator page or the Class Attendance page, the system populates all attendance rosters with the default attendance type value from the Academic Institution 3 page. If you want to use an attendance type value other than the default, change the value in the Type field for each attendance roster template. When you exit the field, the system makes the change and updates the fields that appear on the roster (according to the selected options for this particular course component and attendance type on the Components page). Values for this field are delivered with your system as translate values. You can modify these values. This is a required field.

To use attendance types, define the attendance types and their associated fields for course components on the Components page.

See [Defining Attendance Type Translate Values](#).

The system displays the *Attendance Date*, *From Time*, *To Time*, and *Contact Minutes* for each class meeting on both the detail and summary rows of a class meeting attendance roster template. When you generate attendance rosters for all class meetings within a scheduled class, either by using the Class Attendance page or the Attendance Roster Generator page, the system assigns each attendance roster these four values based on the class meeting pattern in the schedule of classes. When you generate attendance rosters for individual class meetings (by using the Class Attendance page on a new row), you must assign these values manually.

Attendance Date	Indicates the date of the class meeting. You can change this value. This field is required.
From Time	Designates the start time of the class meeting. This field appears on attendance rosters of this course component only when you select the Use To and From Time check box for the attendance type on the Components page. You can change this value.
To Time	Designates the end time of the class meeting. This field appears on attendance rosters of this course component only when you select the Use To and From Time check box for the Attendance Type on the Components page. You can change this value.
Contact Minutes	Indicates the total length of the class meeting in minutes and is the difference between the to time and from time values. This field appears on attendance rosters of this course component only when you select the Use Contact Minutes check box for the attendance type on the Components page. You can change this value.
Override	Select this check box if you want to update an existing attendance roster with the latest student enrollment information and personal data. Then, when you click the Create button on the same row, the system generates new attendance rosters that contain the latest student enrollment information and personal data and overwrites the previous roster. You can select this check box, for example, if you have already generated class meeting attendance rosters and then students enroll in the course, drop from the course, or change their personal data.

Entering Class Attendance Detail

Access the Class Attendance page (click the View button on the Attendance Roster By Class page).

Image: Class Attendance page

This example illustrates the fields and controls on the Class Attendance page. You can find definitions for the fields and controls later on this page.

*Student ID	Name	Career	Present	Tardy	Left Early	Reason	From Time	*To Time	Contact Minutes		
1	SR13582	Basile, Valerie	Undergraduate	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		11:00AM	11:50AM	50	+ -
2	SR135662	Chavez, Angela	Undergraduate	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		11:00AM	11:50AM	50	+ -

Student ID and Name

The system displays the ID and name of each student enrolled in the class when you generate attendance rosters and opt to have the system populate from data from student enrollment. If you generate rosters and do not select the Populate from Student Enroll check box, you can enter the IDs manually, and the system displays each student's name in the Name field after you exit the Student ID field. Insert rows to add students who are not formally enrolled in the class to the class meeting attendance roster; delete rows to remove students from the class meeting attendance roster. Adding students to the roster does not enroll them in the class. It is for personal tracking only.

Warning! If you entered attendance data into your rosters and you want to add or remove a student from the attendance roster for class meetings (because the student has recently enrolled in or dropped from the class), you can add or remove them from the roster manually, or you can click the Create button on the corresponding class meeting template (with the Override check box selected). This generates a new attendance roster for one class meeting with the latest student enrollment information. Generating attendance rosters by clicking the Generate button in the upper portion of the page creates new attendance rosters for all the class meetings. You would therefore lose any attendance data that you have already entered into the rosters.

Academic Career

The system displays the academic career of the student. This is useful if you track the types of students who enroll in classes, such as how many undergraduate students are in a class compared to how many graduate students.

Present

Select to indicate that the student attended the class meeting.

This field appears on the attendance rosters of this course component only if you select the Use Present check box for this class meeting's attendance type on the Components page.

Tardy	Select to indicate that the student arrived late to the class meeting. This field appears on the attendance rosters of this course component only if you select the Use Tardy check box for this class meeting's attendance type on the Components page.
Left Early	Select to indicate that the student left the class meeting before its scheduled end time. This field appears on the attendance rosters of this course component only if you select the Use Left Early check box for this class meeting's attendance type on the Components page.
Reason	Select a reason to describe a reason for a student's presence, tardiness, or early departure. This field appears on the attendance rosters of this course component if you select the Use Reason check box for this class meeting's attendance type on the Components page. Values for this field are delivered with your system as translate values. You can modify these values.
From Time	Indicates the time that the student arrived at the class meeting. This field appears on attendance rosters of this course component when you select the Use To and From Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can change the from time value on a student-by-student basis. Otherwise, the From Time and To Time fields for the template define the parameters of the From Time and To Time fields on the attendance rosters, and you can change only the from time to a value that falls within the template's time range.
To Time	Indicates the time that the student left the class meeting. This field appears on attendance rosters of this course component if you select the Use To and From Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can change the To Time value on a student-by-student basis. Otherwise, the From Time and To Time fields for the Template define the parameters of the From Time and To Time fields on the attendance roster, and you can change only the to time to a value that falls within the template's time range.
Contact Minutes	Indicates the student's total minutes in attendance. This field appears on attendance rosters of this course component if you select the Use Contact Minutes check box for the attendance type on the Components page. You can change this value.
Attendance Date	Indicates the date on which the student attended the class meeting. This field appears on attendance rosters of this course component if you select the Override Template Date/Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can change the attendance date on a

student-by-student basis. Otherwise, the attendance date for the template defines the value for the Attendance Date field.

Generating Batch Attendance Rosters

This section provides an overview of batch attendance roster generation and discusses how to generate attendance rosters in batch mode.

Understanding Batch Attendance Roster Generation

The following list discusses some of the reasons why you would need to run the batch attendance roster generation process:

- Create new rosters or update existing rosters based on a certain date range.
- Update rosters because students add or drop classes after you generate the initial rosters.
- Update the roster with only newly added students and keep on record those students who have dropped or withdrawn from classes.

To generate attendance rosters in batch:

1. Access the Attendance Roster generator page and specify your run parameters.
2. Click the Roster Options link to access the Roster Generator Options page where you can specify roster options for a specific sequence item in your run control set.
3. Click the Run button on the Attendance Roster generator page.

Prerequisites

Before you can generate attendance rosters in batch, you must:

- Define scheduled meeting patterns for the classes for which you generate attendance rosters.
- Select the Generate Class Meeting Attendance check box on the Course Catalog - Components page.
- Select the Generate Class Meeting Attendance check box on the Schedule of Classes - Basic Data page.

Pages Used to Generate a Batch of Attendance Rosters

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Attendance Roster Generator	RUNCTL_SRPCATNP	Curriculum Management > Attendance Roster > Generate Attendance Roster > Attendance Roster Generator	Create or update attendance rosters for multiple classes within a term, based on the criteria and options that you select.

Page Name	Definition Name	Navigation	Usage
Roster Generator Options	ATT_ROS_GEN_SEC	Click the Roster Options link on the Attendance Roster Generator page.	Narrow your processing parameters.

Running the Attendance Roster Generator Process

Access the Attendance Roster Generator page (Curriculum Management > Attendance Roster > Generate Attendance Roster > Attendance Roster Generator).

Academic Institution

The institution for which to generate rosters. The system populates this field with the value from the User Defaults 1 page, which you can change. This field is required.

Term

Select the term that contains the classes for which to generate attendance rosters. Term values are defined on the Term Table page.

Attendance Create/Update Flag

Use this field to specify a default for the same field on the Roster Generator Options page. This is a default that you can change on a row-by-row basis by clicking the Roster Options link in the grid. Values for the default are the following:

Create Attendance: Select when you want to create new rosters or replace old ones.

Update Attendance/Active Only: Select when you want to add and delete students from the roster, based upon their current enrollment statuses in the course for the specified group of attendance rosters. The add and drop date on the STDNT_ENRL table determines how the system updates rosters. Select this option when a student drops the class and you want to remove the student and leave no attendance history.

Update Attendance/All Students: Select when you want to add, but *not* delete students from the specified group of rosters. Students who have dropped are made inactive when their Present flag is set to *Off*. New students will be added to the rosters, but they can be marked only as present or otherwise for the class sessions that occur after the add date.

Commit Frequency

The system populates the commit frequency field with *1* by default. The lower the commit frequency, the better concurrence of data. While a higher commit frequency enables faster processing of the job, the job could get tied up with another process. You should leave the commit frequency at *1*.

Attendance From Date and Attendance To Date

Use these fields to specify defaults for the grid below them. These values determine which rosters the process updates. If you do not specify a default, the system sets the values in the grid to the length of each class as defined on the schedule of classes, enabling you to update all of the term's rosters (like a

wild card). If you manually specify a separate attendance from date and to date range on the Roster Generator Options page, the process updates class rosters only for those dates that are greater than or equal to the Attendance From Date field and less than or equal to the Attendance To Date field.

Use the fields in the grid, and click the Roster Options link, to indicate specific criteria for each sequence number. The system uses this detail to determine which attendance rosters it generates when you run the process. Select as many selection criteria as necessary. Insert rows as needed.

Sequence	The system sets the sequence number to 1 and increases it by one for each row that you add to the request. The number specifies the order in which the system processes class attendance rosters.
Class Nbr (class number)	Enter the class number for which to generate attendance rosters. The system prompts you with the classes that are defined in the schedule of classes for the term. After you enter the class number, exit the field, and the system populates and hides some of the remaining fields on both the Attendance Roster Generator page and the Roster Generator Options page.
Session	Select the session for which to generate attendance rosters. The system prompts you with the sessions that are defined for the term. Values for this field are delivered with your system as translate values. You can modify these values.
Acad Org (academic organization)	Select the academic organization for which to generate attendance rosters. Academic organization values are defined on the Academic Organization Table page.
Campus	Select the campus for which to generate rosters. Campus values are defined on the Campus Table page.
Subject	Select the subject area for which to generate the rosters. Subject area values are defined on the Academic Subject Table page.
Roster Options	Click to access the Roster Generator Options page, where you can further specify your processing parameters for each sequence number.

Note: Because your institution can define multiple meeting attendance types for a course in the course catalog, the system uses the class meeting attendance type on the Academic Institution 3 page for all attendance rosters that you generate by using the Attendance Roster Generator page. The attendance type indicates the type of attendance roster, such as Class Meeting, Conference, Field Trip, Instructor Consultation, or Study Group. If you want to create attendance rosters with different attendance types from that of the default, change the value for individual class meetings on the Class Attendance page and Class Attendance By Template page, or you can change it for individual students on the Student Attendance page.

Click Run to run this request. PeopleSoft Process Scheduler runs the SRATTEND process at user-defined intervals. After the process finishes, the system makes the row unavailable but continues to display the processing parameters so that you can view a history of what you have done. These rows have no impact on future processing. You can click the Delete button to delete them.

Entering Roster Generator Options

Access the Roster Generator Options page (click the Roster Options link on the Attendance Roster Generator page).

Attendance From Date and **Attendance To Date**

Use these fields to specify the range of rosters to create or update. Only class rosters that are for dates greater than or equal to those in the Attendance From Date field and less than or equal to those in the Attendance To Date field are updated.

If you do not specify a value, the system sets the fields to the values on the Attendance Roster Generator page. If you do not specify from and to dates on either the Attendance Roster Generator page or the Roster Generator Options page, the system sets the values to the length of each class as defined on the schedule of classes. This enables you to update all of the term's rosters.

Catalog Number From and **Catalog Number To**

If you have a specific range of catalog numbers within a subject area for which to generate rosters, enter a value in the Catalog Number From and Catalog Number To fields.

Class Start Date From and **Class Start Date To**

If you have a specific start date range for which to generate attendance rosters, enter a value in the Class Start Date From and Class Start Date To fields. If you enter an individual class number in the grid on the Attendance Roster Generator page, the system hides these fields *and* populates them with the class start date from the Schedule of Classes - Meetings page.

Populate From Student Enroll

Select to have the system populate attendance rosters with the enrolled students for every scheduled class meeting that matches your processing criteria. The system selects this check box by default. If you clear this check box, the system still creates attendance rosters for every class meeting but you will have to manually enter the students and their enrollment data into the rosters.

Note: A student might appear twice on an attendance roster because enrollment is keyed by academic career. For instance, a student might enroll in a class twice, each time through a different academic career, and would thus appear on the attendance record twice.

Generate Class Mtg Attendance (generate class meeting attendance)

Select to have the system generate or regenerate attendance rosters only for classes in which you select the Generate Class Mtg Attendance (generate class meeting attendance) check box on the Schedule of Classes - Basic Data page. The system selects this check box by default on the Roster Generator

Options page. If you clear this check box, the system generates attendance rosters for all scheduled classes matching your processing criteria, regardless of how the Generate Class Mtg Attendance check box is set on the Schedule of Classes - Basic Data page.

Sync Attendance with Class Meeting
(synchronize attendance with class meeting)

When you run the attendance roster generator process, you can update all rosters within your parameters or update only those that have had meeting pattern changes since the original rosters were generated. To update changed rosters, select the Sync Attendance with Class Meeting check box. To update all rosters (even if a roster has had no changes), clear the Sync Attendance with Class Meeting check box.

Attendance Create/Update Flag

Use to specify the type of roster to generate for this sequence number. The system populates this field with the value specified on the Attendance Roster Generator page, but you may change it on a row-by-row basis. Values are:

Create Attendance: Select when you want to create new rosters or replace old ones.

Update Attendance/Active Only: Select when you want to add and delete students from the roster, based on their current enrollment statuses in the course for the specified group of attendance rosters. The add and drop date on the STDNT_ENRL table determines how rosters are updated. Select this option when a student drops the class and you want to remove the student and leave no attendance history.

Update Attendance/All Students: Select when you want to add, but *not* delete students from the specified group of rosters. Students who have dropped are set to inactive status by having the Present flag set to *Off*. The system adds new students to the rosters, but only marks these students as present for the class sessions that occur after the add date.

Printing Attendance Rosters

After you have generate rosters, click the Print button on the Class Attendance page to create and print the Class Attendance report as a PDF file.

[Generating Individual Class Attendance Rosters](#)

Using Attendance Rosters

After you create your attendance rosters, you can access them to track student attendance. This section lists prerequisites and discusses how to:

- Track attendance by class.
- Track attendance by class meeting.
- Select a roster for a student.
- Track attendance by student.

You can indicate for each class meeting whether a particular student is present, tardy, or leaves early. You can even enter the reason. You can also enter the exact time that the student is in attendance, the contact minutes, and the attendance date. The system updates all three previously mentioned pages with the changes. If your institution collects data on paper, or if you prefer to track attendance on paper, you can print your attendance rosters and enter the data into the system later.

Prerequisites

Before you can record attendance, you must generate the attendance roster.

Pages Used to Record Attendance

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Attendance Roster By Class	CLASS_ATTENDANCE	Curriculum Management > Attendance Roster > Attendance Roster By Class > Attendance Roster By Class	Track student attendance by accessing attendance rosters for individual classes. For each class meeting, you can view, enter, update, and print the corresponding attendance roster. You can also generate attendance rosters for classes and class meetings.
Attendance Tracking By Template	ATTEND_TRACKING_1	Curriculum Management > Attendance Roster > Class Attendance By Template > Attendance Tracking By Template	View, enter, and change data on a class meeting basis.
Attendance Roster by Student	STDNT_ATTDNCE1	Curriculum Management > Attendance Roster > Attendance Roster By Student > Attendance Roster by Student	Select a roster for a student.

Page Name	Definition Name	Navigation	Usage
Student Attendance Roster	STDNT_ATTND_SRCH	Click the Class Number link on the Attendance Roster by Student page.	Track an individual student's attendance in a class. You can view, enter, modify, and delete the student's existing attendance data. The student must be enrolled in the class or manually added to the attendance roster.

Tracking Attendance by Class

Access the Attendance Roster By Class page (Curriculum Management > Attendance Roster > Attendance Roster By Class > Attendance Roster By Class).

Related Links

[Generating Individual Class Attendance Rosters](#)

Tracking Attendance by Class Meeting

Access the Attendance Tracking By Template page (Curriculum Management > Attendance Roster > Class Attendance By Template > Attendance Tracking By Template).

Changes made here are immediately visible on the Class Attendance page and the Student Attendance page.

Template Number

The system displays the template number for the class meeting. The template number uniquely identifies each class meeting attendance roster.

Attendance Type

Indicates the attendance type for the class meeting, such as *Class Meeting*, *Conference*, *Field Trip*, *Instructor Consultation*, or *Study Group*. These attendance types determine which fields the system uses for your attendance roster. When you generate attendance rosters for all class meetings by using the Attendance Roster Generator page or the Class Attendance page, the system populates all attendance rosters with the class meeting attendance type value from the Academic Institution 3 page. If you want to use attendance type values other than the default, you can change the Attendance Type field value for an individual attendance roster template. When you exit the field, the system makes the change online and updates the roster fields in accordance with the options for this particular course component and attendance type, as set on the Components page. Values for this field are delivered with your system as translate values. You can modify these values. This is a required field.

To use attendance types, you must first define the attendance types and their associated fields for the course component on the Components page.

When you generate attendance rosters for all class meetings within a scheduled class (either by using the Class Attendance page or the Attendance Roster Generator page), the system assigns each attendance roster with the following four field values (based on the class meeting pattern of the class in the Schedule of Classes). When you generate attendance rosters for individual class meetings (by using the Class Attendance page on a new row), you must manually assign the following four field values:

Attendance Date	Indicates the date of the class meeting. You can change this value.
Attendance From Time	Designates the start time of the class meeting. This field appears on the class meeting attendance roster when you select the Use To and From Time check box for the attendance type on the Components page. You can change this value.
Attendance To Time	Designates the end time of the class meeting. This field appears on the class meeting attendance roster only when you select the Use To and From Time check box for the attendance type on the Components page. You can change this value.
Contact Minutes	Indicates the total length of the class meeting in minutes and is the difference between the to time and from time values. This field appears on the class meeting attendance roster when you select the Use Contact Minutes check box for the attendance type on the Components page. You can change this value.
ID and Name	The system displays the ID and name of each student that is enrolled in the class when you generate attendance rosters and opt to have the system populate the roster from student enrollment. Otherwise, you can enter the IDs manually, and the system displays each student's name in the Name field after you exit the ID field. Insert rows to add to the class meeting attendance roster students who perhaps are not formally enrolled in the class; delete rows to remove students from the class meeting attendance roster. Adding rows does not enroll or drop students. This is for tracking nonenrolled students only.
Present	Select to indicate that the student attended the class meeting. This field appears on the attendance rosters of this course component when you select the Use Present check box for this class meeting's attendance type on the Components page.
Tardy	Select to indicate that the student arrived late to the class meeting. This field appears on the attendance rosters of this course component when you select the Use Tardy check box for this class meeting's attendance type on the Components page.
Left Early	Select to indicate that the student left the class meeting before its scheduled end time. This field appears on the attendance rosters of this course component when you select the Use Left

Early check box for this class meetings attendance type on the Components page.

Reason

Enter a reason to describe a student's presence, tardiness, or early departure. This field appears on the attendance rosters of this course component when you select the Use Reason check box for this class meeting's attendance type on the Components page. Values for this field are delivered with your system as translate values. You can modify these values.

From Time and To Time

Indicates the time that the student arrived and left the class meeting. This field appears on attendance rosters of this course component when you select the Use To and From Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can change the from or to time value on a student-by-student basis. Otherwise, the From Time and To Time fields for the template define the parameters of the From Time and To Time fields on the attendance rosters. You can change the from and to time value to a time that falls only within the template's time range.

Contact Minutes

Indicates the student's total minutes in attendance. This field appears on attendance rosters of this course component when you select the Use Contact Minutes check box for the attendance type on the Components page. You can change this value.

Attendance Date

Indicates the date on which the student attended the class meeting.

Academic Career

The system displays the academic career of the student. This is useful for tracking the types of students who enroll in a class, such as how many undergraduate students are in a class as compared to graduate students.

Note: A student might appear twice on an attendance roster because enrollment is keyed by academic career. For instance, a student might enroll in a class twice, each time through a different academic career and would thus appear on the attendance record twice.

Selecting a Roster for a Student

Access the Attendance Roster by Student page (Curriculum Management > Attendance Roster > Attendance Roster By Student > Attendance Roster by Student).

Click the class number to access the Student Attendance Roster page for that class section.

Tracking Attendance by Student

Access the Student Attendance Roster page (click the Class Number link on the Attendance Roster by Student page).

Attendance Date	Indicates the date on which the student attended the class meeting. This field appears on attendance rosters of this course component only when you select the Override Template Date/Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can edit the Attendance Date field value. Otherwise, the attendance date for the template defines the value for the Attendance Date field on the attendance rosters.
Type	Indicates the attendance type for the class meeting, such as <i>Class Meeting</i> , <i>Conference</i> , <i>Field Trip</i> , <i>Instructor Consultation</i> , or <i>Study Group</i> . These attendance types determine which fields the system uses for your attendance roster. When you generate attendance rosters for all class meetings by using the Attendance Roster Generator page or the Class Attendance page, the system populates all attendance rosters with the class meeting attendance type value from the Academic Institution 3 page. If you want to use attendance type values other than your institution's attendance type value, you can change the attendance Type field value for an individual student. When you exit the field, the system makes the change and updates the fields that appear on the roster according to the selected options for this particular course component and attendance type on the Components page. Values for this field are delivered with your system as translate values. You can modify these values. To use attendance types, define the attendance types and their associated fields for the course component on the Course Component Attendance page.
Description	Describes the attendance type value, such as <i>Class Meeting</i> , <i>Conference</i> , <i>Field Trip</i> , <i>Instructor Consultation</i> , or <i>Study Group</i> .
Present	Select to indicate that the student attended the class meeting. This field appears on the attendance rosters of this course component when you select the Use Present check box for this class meeting's attendance type on the Components page.
Tardy	Select to indicate that the student was late to the class meeting. This field appears on the attendance rosters of this course component when you select the Use Tardy check box for this class meeting's attendance type on the Components page.
Left Early	Select to indicate that the student left the class meeting before its scheduled end time. This field appears on the attendance rosters of this course component when you select the Use Left

Early check box for this class meeting's attendance type on the Components page.

Reason

Enter a reason to describe a student's presence, tardiness, or early departure. This field appears on the attendance rosters of this course component when you select the Use Reason check box for this class meeting's attendance type on the Components page. Values for this field are delivered with your system as translate values. You can modify these values.

The system displays the from time, to time, and contact minutes for the class meeting. When you generate attendance rosters for all class meetings within a scheduled class, either by using the Class Attendance page or the Attendance Roster Generator page, the system assigns each attendance roster these three values based on the class meeting pattern of the class in the schedule of classes. When you generate attendance rosters for individual class meetings (by using the Class Attendance page on a new row), you must manually assign these values.

From Time

Indicates the time that the student arrived at the class meeting. This field appears on attendance rosters of this course component when you select the Use To and From Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can change the from time value on a student-by-student basis. Otherwise, the From Time and To Time fields for the template define the parameters of the From Time and To Time fields on the attendance rosters, and you can only change the from time to a value that falls within the template's time range.

To Time

Indicates the time that the student left the class meeting. This field appears on attendance rosters of this course component when you select the Use To and From Time check box for the attendance type on the Components page. If you select the Override Template Date/Time check box on the Components page, you can change the to time value on a student-by-student basis. Otherwise, the From Time and To Time fields for the Template define the parameters of the From Time and To Time fields on the attendance rosters and you can only change the to time to a value that falls within the template's time range.

Contact Minutes

Indicates the student's total minutes in attendance. This field appears on attendance rosters of this course component when you select the Use Contact Minutes check box for the attendance type on the Components page. You can change this value.

Template Number

The system displays the template number for the class meeting. The template number uniquely identifies each class meeting attendance roster.

Tracking Student Data

Common Element Used in Tracking Student Data

Tran Level (transcript level)

Select the transcript level on which you want the given data to print. Values for this field are delivered with your system as translate values. You can modify these values. The delivered values are *Degr Prog* (degree progress), *Not Print*, *Official*, *Stdnt Life* (student life), and *Unofficial*.

Tracking Academic Standing

This section discusses how to:

- Assign academic standing in batch.
- Track academic standing for individual students.

Pages Used to Track Academic Standing

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Academic Standing/Honors Awards	RUNCTL_SR_ASHA	Records and Enrollment > Term Processing > End of Term Processing > Acad Standing/Honors & Awards > Academic Standing/Honors Awards	Enter parameters for and run the Academic Standing/Honors Awards process (SRPCEASD). The process evaluates students using the rules defined on the Academic Standing Rule page, assigning academic standing to students that pass the rule parameters.
Academic Standing	ACAD_STDNG_ACTN	Records and Enrollment > Student Term Information > Term History > Academic Standing	Track student academic standing. The Academic Standing process populates this page according to the rules you defined on the Academic Standing Rules page. You can also manually enter information on this page.

Assigning Academic Standing in Batch

Access the Academic Standing/Honors and Awards page (Records and Enrollment > Term Processing > End of Term Processing > Acad Standing/Honors & Awards > Academic Standing/Honors Awards).

The Acad Standing/Honors Awards (academic standing/honors awards) COBOL SQL process (SRPCEASD) evaluates students who are active in the academic institution, academic career, term, and academic program that you select. If students meet the parameters of the academic standing rule or honor award rule, the process updates these students' academic standing records or honors and awards records according to the rule. The process does not update students' academic standing for grades that do not count towards GPA, such as pass/no pass grades.

Institution	Select the academic institution that you want the system to use in the Academic Standing process.
Career	Select the academic career that you want the system to use in the Academic Standing process.
Term	Select the term that you want the system to use in the Academic Standing process.
Acad Prog (academic program)	Select the academic program that you want the system to use in the Academic Standing process.
Calculate Academic Standing	Select to calculate academic standing.
Calculate Honors & Awards	Select to calculate honors and awards. You can select both check boxes at the same time.
Date	Enter the date that you want the system to use in the Academic Standing process. The Academic Standing process displays the date that you enter here in the Date Received field on the Academic Standing page.

Related Links

[Tracking Honors and Awards](#)

Tracking Academic Standing for Individual Students

Access the Academic Standing page (Records and Enrollment > Student Term Information > Term History > Academic Standing).

Effective Sequence	<p>When manually entering academic standing, the default for the first academic standing action within a student's academic career and term is 0.</p> <p>If multiple academic standing actions exist within the same academic career and term, you must override the default value by manually incrementing the effective sequence for each additional academic standing action entered for the same effective date.</p>
---------------------------	--

When the Academic Standing process populates this field, it enters effective sequences starting at ten and increments them by ten (such as 10, 20, and 30) when the effective date is the same as an existing row.

Manual Override

Select to indicate that you entered the information on this page manually.

Note: When you run the Academic Standing process, the system does not calculate academic standing for any records in which this check box is selected.

Academic Standing Action

Select an academic standing action.

Academic Program

Select the academic program of the student. The system prompts you for student's record.

Formal Description, Internal Description, and Academic Standing Status

The system displays these values according to corresponding values on the Academic Standing Table page.

Tracking Honors and Awards

This section discusses how to:

- Assign honors and awards in batch.
- Track honors and awards for individual students.

Pages Used to Track Honors and Awards

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Academic Standing/Honors and Awards	RUNCTL_SR_ASHA	Records and Enrollment > Term Processing > End of Term Processing > Acad Standing/Honors & Awards > Academic Standing/Honors and Awards	Enter parameters for and run the Academic Standing/Honors Awards process (SRPCEASD). The process evaluates students using the rules defined on the Honors and Awards Rule page, assigning honors and awards to students that pass the rule parameters.
Honors and Awards	HONORS_AWARDS_CS	Records and Enrollment > Graduation > Honors and Awards > Honors and Awards	Track student honors and awards. The Honors/Awards process populates the page according to the rules you set on the Honors/Awards Rule page. You can also manually enter information on this page.

Assigning Honors and Awards in Batch

Access the Academic Standing/Honors and Awards page (Records and Enrollment > Term Processing > End of Term Processing > Acad Standing/Honors & Awards > Academic Standing/Honors and Awards).

Use this to run the Academic Standing/Honors Awards process (SRPCEASD), which assigns honors and awards to students based on your run parameters and honor award rules.

Related Links

[Tracking Academic Standing](#)

Tracking Honors and Awards for Individual Students

Access the Honors and Awards page (Records and Enrollment > Graduation > Honors and Awards > Honors and Awards).

Internal/External	Indicate whether the student's honor or award relates to an external organization or your internal institution. Your selection here affects the honors and awards that you can choose in the Honor/Award field. The system prompts you with the corresponding honors and awards that you defined on the Honor/Award Table page.
Date Recvd (date received)	Enter the date that the student received the honor or award.
Academic Institution	Select the academic institution for which you are entering the honor or award. Your selection here affects the honors and awards that you can choose in the Honor/Award field. The system prompts you with the corresponding honors and awards that you defined on the Honor/Award Table page for the academic institution that you select. Define academic institution values on the Academic Institution Table component.
Honor/Award	Select the honor and award code that you want to assign to a student's record.
Formal Description and Grantor	The system uses the honor and award code that you enter to populate the formal description and grantor of the honor or award. This information comes from the Honor/Award Table page.
Career	Enter the academic career for which the student is receiving the honor or award. The system prompts you with only the academic careers in which the student has been active.
Term	Enter the term for which the student is receiving the honor or award. The system prompts you with the terms in which the student has been active according to the academic career you select.

Academic Program	Enter the academic program for which the student is receiving the honor or award. The system prompts you with the student's academic programs according to the academic career.
Academic Plan	Enter the academic plan for which the student is receiving the honor or award. The system prompts you with the student's academic plans according to the academic career or program.
System Generated	The system selects this check box if the Honors/Awards process generated this honor and award.

Tracking Special Grade Point Averages

This section provides an overview of how to assign special grade point averages and discusses how to maintain a student's special grade point averages.

[Setting Up Special Grade Point Averages](#)

Understanding How to Assign Special Grade Point Averages

You can assign special grade point averages to students in three ways:

- If you have calculated students' grade point averages through the PeopleSoft Academic Advisement report process using the analysis database report option, your institution can design a process that populates the Student Special GPA page with the results of the calculation, storing them for future analysis.
- You can create and define your own calculation process through the process scheduler.
- You can directly input the special grade point average onto the Student Special GPA page, then use these averages for other applications within PeopleSoft Campus Solutions.

Page Used to Track Special Grade Point Averages

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Special GPA	STDNT_SPCL_GPA	Records and Enrollment > Student Term Information > Term History > Student Special GPA	Assign types of grade point averages to a specific student's term record, indicating whether the student's special grade point average belongs to his or her academic program, academic plan, or academic subplan.

Maintaining a Student's Special Grade Point Averages

Access the Student Special GPA page (Records and Enrollment > Student Term Information > Term History > Student Special GPA).

GPA Type (grade point average type)	Select the grade point average type for the grade point average that you want to enter.
Sequence	The sequence number default is 1. The system increases the number sequentially by one as you add new rows. The system evaluates special grade point average numbers in sequence.
GPA (grade point average)	The default grade point average is 0.000. Enter the student's special grade point average. No programming is tied to this field in the delivered application. Any reporting you choose to perform based on the value entered here must be programmed by your institution.
Entered Online	Select to distinguish this special grade point average from those populated by a configured background process. This flag has no programming tied to it, but you can use it for reporting purposes.
Academic Program	(Optional) Select the student's academic program for which you are creating the special grade point average. The list box displays the student's active academic programs.
Academic Plan	(Optional) Select the student's academic plan for which you are creating the special grade point average. The list box displays the student's active academic plans.
Academic Sub-Plan	(Optional) Select the student's academic subplan for which you are creating the special grade point average. The list box displays the student's active academic subplans.

Tracking Milestones

Milestones are non-course-related events that a student must fulfill for a degree. They include things such as language requirements, qualifying and oral examinations, thesis, and dissertation. Use the Student Milestones component to assign milestones and advisors to individual students, as well as to record completions of milestones and attempts to fulfill them. Use the Process Milestones component to assign or update milestones for multiple students.

This section discusses how to:

- Assign and update milestones for a student.
- Create milestones from templates.
- Assign and updates milestones for multiple students.

Pages Used to Track Milestones

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Milestones	STUDENT_MILESTONE1	Records and Enrollment > Enroll Students > Student Milestones	Assign and update milestones for a student.
Create Student Milestones	STDNT_MLSTN_COPY	Click the Milestone Copy button on the Student Milestone page.	Create milestones from templates by copying milestone information from the milestone template to the student's transcript.
Process Milestones	SSR_RC_MLSTN	Records and Enrollment > Enroll Students > Process Milestones	Assign and update milestones for multiple students.

Assigning and Updating Milestones for a Student

Access the Student Milestones page (Records and Enrollment > Enroll Students > Student Milestones > Student Milestones).

Milestone Copy

Click to copy milestone information from the milestone template to the student's record.

See [Setting Up Milestones](#).

Milestone Detail

Milestone Nbr (milestone number)

The milestone number default is 10. As you insert rows, the system increments this number sequentially. The milestone number is used for sequencing.

Milestone Level

Select the milestone level. Some milestones, such as Comprehensive Exams, can have multiple levels. You can override this value.

Milestone Complete

The system displays the milestone complete status according to the values entered in the Attempts grid.

Academic Plan

Select the academic plan to which the milestone is attached. The system prompts you from the student's academic record.

Milestone Title

Enter a title for the milestone. You can print the title on the student's transcript.

Manage Milestone Documents

Attach documents related to the milestone.

Hide Comment on Stdnt Self-Svc	If you select this check box, comments do not appear on the Student Milestone Details page in Student Self Service.
Term Required and Term Anticipated	Select the term by when the milestone must be completed or by when you anticipate the student will complete the milestone. Depending on the value that is entered in the Calculate Required Date and Calculate Anticipated Date fields on the Milestone Table page – for example, <i>Expected Grad Term Start Date</i> , a value may appear in the Term Required and Term Anticipated fields by default. You can override the value.
Date Required and Anticipated Date	If you select a term, the system populates this date based on the term Ending Date value on the Term Table page. Alternatively, the date appears based on the Milestone Table setup as explained previously. You can override the date.
Print Milestone Detail	Indicates when the milestone is printed on the transcript. The system transfers this value from the Milestone Template page. You can override this value. Values for this field are delivered with your system as translate values. The delivered values are <i>Always</i> , <i>Never</i> , and <i>Satisfied</i> .
Advised by Committee	Select to assign an advisory committee to the student. When you select this check box the Committee field appears.
Advisors	
Advisor/Evaluator	If you do not select the Advised by Committee check box, select individual advisors for the student. The system prompts you with advisors that are within the student's academic career and academic program.
Attempts: Grade Information	
Attempts Allowed	The system displays the attempts allowed according to the values entered on the Milestone Template page. You can override this value.
Attempt Nbr (attempt number)	Enter the number of the student's attempt at this milestone.
Grading Scheme and Grading Basis	The system populates the grading scheme and grading basis from the Milestone Template page. You can override these values.
Grade Input	Enter a grade (if required by the grading scheme and grading basis).
Milestone Complete	Select the status of the milestone. Values for this field are delivered with your system as translate values. You can modify these values. The delivered values are <i>Completed</i> , <i>In Progress</i> , and <i>Not Completed</i> .

How Attempted

Select how the milestone was attempted. Values for this field are delivered with your system as translate values. You can modify these values. The delivered values are *Attended Seminar*, *Exam Taken*, *Filed Petition*, *Native Speaker*, and *Submitted Work*.

Date Attempted

Enter the date that the student attempted the milestone.

Attempts: Enrollment Details

This grid displays the class information if the milestone is assigned to the student when the student enrolls in a course.

See [Linking Milestones to Course Data](#).

Process Action

Select a process action: *Delete, Insert Milestones, Insert/Update Milestones, or Update Milestones.*

You cannot delete milestones which have been completed.

Process Duplicate Milestones

Select this check box to indicate that if duplicate milestones are found they should be inserted/updated.

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool to identify IDs for a specific transaction, you must use it.

See "Understanding the Population Selection Group Box" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Selection Tool Select *External File* or *PS Query*.

Query Name These queries are delivered:

- SSR_MLSTN_PROGPLAN
- SSR_MLSTN_PROGRAM

If you create your own query, you must use the following bind record: SSR_MLSTN_BND - Pop Select Mlstr Report Bind.

Student Select List

Select the Use Student Select check box to select individual EmplIDs to include in the Process Milestones process.

Milestone Detail

The values in the Calculate Required Date and Calculate Anticipated Date fields appear by default from the setup on the Milestone Table page. You can change these values.

For information about other fields on the page, refer to the documentation in the earlier section: Assigning and Updating Milestones for a Student.

Tracking Extracurricular Activities

This section discusses how to record and track an individual's extracurricular activities.

Related Links

[Setting Up Extracurricular Activities](#)

Page Used to Track Extracurricular Activities

Page Name	Definition Name	Navigation	Usage
Extracurricular Activities	STDNT_EXTRA_ACTVTY	Records and Enrollment > Student Background Information > Extracurricular Activity > Extracurricular Activities	Record and track an individual's extracurricular activities. This page is shared with PeopleSoft Recruiting and Admissions and Campus Community.

Tracking an Individual's Extracurricular Activities

Access the Extracurricular Activities page (Records and Enrollment > Student Background Information > Extracurricular Activity > Extracurricular Activities).

Activity	Select an extracurricular activity.
Start Date	The default for the start date is your system date.
End Date	Enter the date that the activity ended.
Academic Institution and Academic Career	The system populates the academic institution and academic career of the student, unless the student has more than one academic career or institution on their record. In that case, you can select the appropriate academic institution and academic career.
Term	Select the academic term in which the activity took place.
Activity Type	The system populates the activity type if it was defined on the Extracurricular Activity Table page. You can change this value.
Office Held	Select the office that the person held (if applicable). Values for this field are delivered with your system as translate values. You can modify these values. The delivered values are <i>Captain</i> , <i>EIC</i> , <i>President</i> , <i>Treasurer</i> , and <i>Vice Pres</i> (vice president).
Time Unit 1 and Time Unit 2	Enter the amount of time the student spent participating in this activity. Time units can represent hours per week, hours per month, and so on. Select the time unit qualifier in the field next to this one. Values for this field are delivered with your system as translate values. You can modify these values.
Additional Info (additional information)	Enter any comments or notes about the student's participation in this extracurricular activity.

Tracking Student Groups

This section lists the page used to track student groups.

Related Links

[Managing Student Groups](#)

Page Used to Track Student Groups

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Groups	STDNT_GROUPS	Records and Enrollment > Career and Program Information > Student Groups > Student Groups	Track student membership in various groups for reporting, fee calculation, or degree progress assessment. You track groups within an academic institution, so students of any program or career can be associated with the same group.

Tracking Student Attributes

This section discusses how to track student attributes.

Related Links

[Setting Up Student Attributes](#)

Page Used to Track Student Attributes

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Attributes	STDNT_ATTRIBUTES	Records and Enrollment > Career and Program Information > Student Program/Plan > Student Attributes	Track student attributes and values for students.

Tracking Student Attributes

Access the Student Attributes page (Records and Enrollment > Career and Program Information > Student Program/Plan > Student Attributes).

Student Attribute

Select the student attribute that you want to attach to the student for cohort tracking and reporting purposes.

The Consolidate Academic Statistics process compares this student attribute to the value existing in the Student Attribute for Cohort field on the Academic Institution 3 page. If the process finds a match, it writes this student attribute to the student's academic statistics record.

Student Attribute Value

Select the student attribute value associated with the student attribute.

Primacy

Enter the primacy number for this student attribute. If you enter the same student attribute more than once, the Consolidate

Academic Statistics process writes the one with the lowest primacy number to the student's consolidated statistics record. This primacy number has no relation to financial aid primacy.

Using Student Records Service Impacts

Use service indicators to provide or limit access to services in your system. Service indicators can be holds to prevent an individual from receiving certain services or positive indicators to designate special services to be provided. Service indicators consist of one or more service impact values identifying the types of specific services that are restricted or provided.

Student Records enables you to attach specific service impacts to negative service indicators, which, when assigned to a student, restricts the student from receiving certain services. These specific service impacts are the following:

CENR	Restricts <i>all</i> enrollment activity (such as adds, drops, swaps, or wait lists) for a student with existing enrollment for the current term.
IENR	Prevents a student from initially enrolling into a class but permits the student to add or drop classes if they already have enrollment activity for the current term.
AENR	Prevents a student from initially enrolling into a class <i>and</i> prevents the student from adding a class, <i>but</i> permits the student to drop classes if they have already have enrollment activity for the current term.
ENVER	Prevents the enrollment verification process from printing a student's enrollment verification request.
GRADE	Restricts a student's access to self-service View My Grades. Also prevents the student grade report process from printing the student's grade report.
DENR	Prevents a student from dropping or swapping a class but permits the student to add classes or make changes to existing enrollments.
WENR	Prevents all enrollment activity other than drops that result from the Student Records withdrawal process or the Student Financials cancellation process.

Assigning Academic Advisors to Students

This section discusses how to assign academic advisors to students.

When the message catalog message set number 14600, message numbers 877 & 878 message severity is set to Warning, the user is able to assign academic advisors or committees to a student whose academic program and plan is inactive for the defined student advisor effective date. To prevent the assigning of an academic advisor or committee to a student whose academic program and plan is inactive, for the defined effective date, the message severity should be set to Error. You can also change the message text and explanation. For example, add the word Error in front of the message text.

The academic program plan look up for the Student Advisor displays the maximum effective dated value corresponding to the defined effective date on the Student Advisor page. When you enter or select an inactive maximum effective dated program or plan value, you receive a warning message, but you can successfully save the transaction. The academic program status appears on the Student Advisor page — for example, LOA.

Access the Look Up Academic Program page from the Academic Program field on the Student Advisor page.

Image: Look Up Academic program

This example illustrates the fields and controls on the Look Up Academic program. You can find definitions for the fields and controls later on this page.

Look Up Academic Program

EmplID: SR12219
 Academic Institution: PSUNV
 Academic Career: Undergraduate
 Academic Program: begins with

[Look Up](#) [Clear](#) [Cancel](#) [Basic Lookup](#)

Search Results

View All First 1 of 1 Last

Academic Program	Description	Program Status
FAU	Fine Arts Undergraduate	Leave of Absence

When the message catalog severity is set to Warning, the user is able to assign an advisor to a student in an inactive program. For example, in the search results of the Look Up Academic Program, the FAU program is listed as Leave of Absence for the January 15, 2001 effective date.

Access the Look Up Academic Plan page from the Academic Plan field on the Student Advisor page.

Image: Look Up Academic Plan page

This example illustrates the fields and controls on the Look Up Academic Plan page. You can find definitions for the fields and controls later on this page.

In the search results of the Look Up Academic Program or Academic Plan, the program status appears. The results also display the maximum effective dated value corresponding to the defined effective date on the Student Advisor page. If the max effective dated program or plan value or status has changed, historical academic advisement rows are not affected unless the user makes a change to the historical record. Users cannot assign and save program or plan values that are not the max effective dated value for the student advisor effective date. For example, if Mary St. James had an academic plan of ETHST-BA in January 1, 2001. Effective January 1, 2006, she had a change to the Honors plan. On the Student Advisor page, with an effective date of April 1, 2006, the user will receive an invalid value message upon entering ETHST-BA as the student's plan.

Page Used to Assign Academic Advisors to Students

Page Name	Definition Name	Navigation	Usage
Student Advisor	STDNT_ADVISOR	Records and Enrollment > Student Background Information > Student Advisor > Student Advisor	Assign individual advisors or a committee of advisors to a student. The student must be active in an academic career and an academic program.
Setup	SSR_STAD_SETUP	Records and Enrollment > Student Background Information > Student Advisor Assignment > Setup	Define the parameters with which to select and match advisors and students.
Advisor	SSR_STAD_ADVISOR	Records and Enrollment > Student Background Information > Student Advisor Assignment > Advisor	View the list of advisors that you can assign to students based on the selection criteria you defined on the Setup page.

Page Name	Definition Name	Navigation	Usage
Student	SSR_STAD_STUDENT	Records and Enrollment > Student Background Information > Student Advisor Assignment > Student	View the list of students based on the selection parameters you defined on the Setup page. From here, you also assign advisors to students.

Assigning Advisors to Students Individually

Access the Student Advisor page (Records and Enrollment > Student Background Information > Student Advisor > Student Advisor).

Image: Student Advisor page

This example illustrates the fields and controls on the Student Advisor page. You can find definitions for the fields and controls later on this page.

Use this page to assign individual advisors or a committee of advisors to a student. The student must be active in an academic career and an academic program.

Academic Institution

Select the academic institution for which you want to assign the student an academic advisor.

Effective Date

Enter the date that the student's advisor or advisory committee becomes effective for the student.

Advisor Role

Select the role that the advisor serves for the student. Values for this field are delivered with your system as translate values. You can modify these values.

Advisor Number

The system, by default, sets the number of the advisor to 1, and it increases the number by one as you add new advisors or committees.

Academic Career

Select the student's academic career for which you want to assign the advisor. The system prompts you with options based on the student's career term record.

Academic Program	Select the student's program for which you want to assign the advisor. The system prompts you with options based on the student's program record.
Academic Plan	Select the student's plan for which you want to assign the advisor. The system prompts you with options based on the student's program record.
Academic Sub-Plan	Select the student's sub-plan for which you want to assign the advisor. The system prompts you with options based on the student's program record.
Academic Advisor	If an individual advises a student, select that individual advisor. The system prompts you with advisors that are within the student's academic career and academic program. If this field is unavailable for entry, you must first clear the Advised by Committee check box.
Advisor Percentage	This field is enabled only when the Advised by Committee check box is not selected. This field allows a numeric value to one decimal place.
Committee	If a committee rather than an individual advises a student, select the committee. If this field is unavailable for entry, you must first select the Advised by Committee check box.
Advised by Committee	If a committee rather than an individual advises a student, select this check box. The Committee field becomes available for entry, and the Academic Advisor field becomes unavailable for entry.
Must Approve Enrollment	Select to indicate that the advisor must approve a student's enrollment into classes. This check box is for information purposes only. No coding is behind it.
Must Approve Graduation	Select to indicate that the advisor or committee must make a degree check before your institution can complete the student's graduation process. The Graduation Approved check box becomes available for entry. Both check boxes are for information purposes only. No coding is behind them.
Graduation Approved	Select to indicate that the advisor or committee has made a degree check and your institution can now complete the student's graduation process. This check box is available for entry only when you select the Must Approve Graduation check box.

Defining the Parameters for Selecting and Matching Advisors and Students

Access the Student Advisor Assignment Setup page (Records and Enrollment > Student Background Information > Student Advisor Assignment > Setup).

Image: Student Advisor Assignment Setup page

This example illustrates the fields and controls on the Student Advisor Assignment Setup page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Student Advisor Assignment Setup' page. At the top, there are three tabs: 'Setup', 'Advisor', and 'Student'. The 'Setup' tab is active. Below the tabs, there are three fields: 'Assignment Code' with the value 'TEST2', 'Academic Institution' with the value 'PSUNV', and 'Academic Career' with the value 'Law'. Below these fields is a section titled 'Details' with a light blue header. This section contains several fields: '*Description' (text input with 'TEST2'), '*Status' (dropdown menu with 'Active'), 'Mode' (dropdown menu with 'Assign'), 'Select Advisors By' (dropdown menu with 'Career/Program/Plan/Subplan'), 'Distribute Advisors By' (dropdown menu with 'Single'), 'Select Students By' (dropdown menu with 'Career / Prog / Plan / SubPlan'), and 'Assign Student Advisors At' (dropdown menu with 'Program / Plan / SubPlan'). Below the 'Details' section is a section titled 'Selection Parameters' with a light blue header. This section contains three fields: 'Academic Program' (text input with 'FAU' and a search icon), 'Academic Plan' (text input with a search icon), and 'Academic Sub-Plan' (text input with a search icon). Below the 'Selection Parameters' section is a section titled 'Additional Parameters' with a light blue header. This section contains one field: 'Admit Term' (text input with a search icon) and a checkbox labeled 'Multiple Academic Career'. Below the 'Additional Parameters' section is a section titled 'Student Advisor Details' with a light blue header. This section contains three fields: '*Advisor Role' (dropdown menu with 'Advisor'), 'Advisor Percentage' (text input), and two checkboxes: 'Must Approve Enrollment' and 'Must Approve Graduation'.

Use this page to define the parameters with which to select and match advisors and students.

To define a set of parameters, click Add New Value, then enter values for:

- Academic Institution
- Academic Career
- Assignment Code. This value uniquely identifies this set of parameters.

Details

Status Select whether this set of parameters is active or inactive.

Mode Select:

- *Assign* to assign a new advisor.

- *Un-assign ALL* to remove advisors from their role for the selected student population.
- *Re-assign ALL* to delete and recreate all of the Student Advisor records to redistribute the students.

Select Advisors By

Identify the method by which the advisor population is selected.

Select:

- *File (All)* to use a file that contains a list of advisors that you want to assign to a select group of students.

Program, Plan, Sub-Plan are ignored by this selection method.

- *File (Matching)* to use a file that contains a list of advisors who are selected if they match the Program, Plan, Sub-Plan you identified.
- *PS Query* to use a PS Query record.

When creating queries, use the bind record SSR_STAD_ADV.

- *PS Query (with Matching)* to use a PS Query record that selects advisors if they match the Program, Plan, Sub-Plan you identified.

When creating queries, use the bind record SSR_STAD_ADV.

- *Committee* to choose a committee as an advisor.
- *Career/Program/Plan/Sub-Plan* to select a program, plan, and sub-plan in the Selection Parameters region.

The details in the Instructor/Advisor Table record are used to select advisors based on the values for career, program, plan, and sub-plan that are matched to the values here. The values here and on the Instructor/Advisor Table are matched exactly, NULL equals NULL. For example, if you don't identify a plan here, all advisor records that don't have plans are selected.

- *Career Only* to select advisors if the career value here matches what's in the Instructor/Advisor Table record.

The Instructor/Advisor Table records are selected only if the program, plan and sub-plan are all null. Otherwise, they aren't selected.

Committee

This field appears only when you select *Committee* in Select Advisors By.

Distribute Advisors By

You can assign only one committee.

Identify how advisors are assigned.

Select:

- *Multiple* to match all advisors to all students.
- *Single* to match an advisor to a student. Each student gets an advisor.

Select Student By

Identify the method by which the student population is selected.

Select:

- *File* to use a file that contains a list of advisors that you want to assign to a select group of students.

This file contains the Employee ID (EMPLID), Program, Plan (optional), and Sub-Plan (optional).

- *PS Query* to use a PS Query record.

When creating queries, use the bind record SSR_STAD_STU.

- *Career/Program/Plan/Sub-Plan* to select a program, plan, sub-plan, admit term, dual career, and academic standing in the Additional Parameters region.

The details in the student program/plan record are used to select students based on the values that are matched to the values here. The values here and on the student record are matched exactly. For example, if you don't identify a plan here, all student records that don't have plans are selected.

- *Career Only* to select students based on the values that match to the student career, admit term, dual career, and academic standing in the Additional Parameters region

When one of the values you define for admit term, dual career, and academic standing is NULL, it matches all values for the student record. For example, if admit term here is NULL, match all student admit terms. Program, plan, sub-plan are ignored.

- *Unassigned* to enable the fields in Selection Parameters and Additional Parameters regions.

The details in the student program/plan record are used to select students based on the values that are matched to the values here. When one of the values you define for admit term, dual career, and academic standing is NULL, it matches all values for the student record. For example, if admit term here is NULL, all student admit terms are matched.

Students are selected only if a Student Advisor Record *doesn't* exist for the student for their program, plan, and sub-plan, that is, the student doesn't have an advisor.

Assign Student Advisors At

Note: This setting is separate from the parameters you use to identify the advisor and student populations. Those parameters don't need to match the level you set in this field.

Select the level at which advisors are assigned:

- Program
- Program and plan
- Program, plan, and sub-plan

For example, you select a student or advisor population for the program 'ARTS' and you want to assign advisors to students at the sub-plan level. Advisors' records should have a program = ARTS and must have values in plan and sub-plan. The system matches advisors to students based on these values and student advisor records are created with the corresponding program, plan, and sub-plan values.

Selection Parameters

This region is enabled only when you select any one of these values in Select Students By to identify your student population:

- Career/Program/Plan/Sub-Plan
- Career Only
- Unassigned

This is also enabled when you select *Career/Program/Plan/Sub-Plan* in Select Advisors By to identify your advisor population.

Additional Parameters

This region is enabled only when you select any one of these values in Select Students By to identify your student population:

- Career/Program/Plan/Sub-Plan
- Career Only
- Unassigned

Student Advisor Details

The information you enter in this region populates the matching fields on the Student Advisor record when it is created.

Viewing the Advisor Population

Access the Advisor page (Records and Enrollment > Student Background Information > Student Advisor Assignment > Advisor).

Image: Advisor page

This example illustrates the fields and controls on the Advisor page. You can find definitions for the fields and controls later on this page.

Display Name	Academic Program	Academic Plan	Academic SubPlan	Count	Advisor
Paul Acosta					0 Y

Here, you can view the list of advisors you can assign to students.

Get Advisors

Note: This button is disabled if Select Advisor By is set to *Committee*.

Click to retrieve a list of advisors based on any one of these methods:

- Defining the parameters by which advisors are selected on the Setup page.
- Uploading a file with a list of advisors.
- Using PS query to identify advisors.

Assigning Advisors to a Student Population

Access the Student page (Records and Enrollment > Student Background Information > Student Advisor Assignment > Student).

Image: Student

This example illustrates the fields and controls on the Student. You can find definitions for the fields and controls later on this page.

Assign Advisors

Here, you can view the list of students that you selected based on the criteria you defined on the Setup page. This is the student population to whom you want to assign advisors, if they don't have one. You also see students who have existing or newly assigned advisors.

Get Students

Click to retrieve a list of students based on any one of these methods:

- Defining the parameters by which students are selected on the Setup page.
- Uploading a file with a list of students.
- Using PS query to identify students.

Assign Advisors

Click to run the Assign Advisors process to match students and advisors.

If you select this mode on the Setup page:

- *Assign*, you're assigning a new advisor.
- *Un-assign ALL*, you're removing advisors from this role for the selected student population.
- *Re-assign ALL*, you're deleting and recreating all of the Student Advisor records to redistribute the students.

Take note of these selections:

- If Select Advisors By = Career Only, advisors are matched to students regardless of students' programs, plans, and sub-plans. Otherwise, students are matched according to the advisors' programs, plans, and sub-plans.
- If Distribute Advisor By = Multiple, all advisors are assigned to all students. Otherwise, advisors are matched to students alternately, one by one.

For example, you select a student or advisor population for the program 'ARTS' and you want to assign advisors to students at the sub-plan level. Advisors' records should have a program = ARTS and must have values in plan and sub-plan. The system matches advisors to students based on these values and student advisor records are created with the corresponding program, plan, and sub-plan values.

Viewing Advisors Through Self Service

If your institution has licensed PeopleSoft Campus Self Service, your students can view their advisors directly over the web.

Managing Interoperability for Learning Management Systems (LMS)

Understanding the LMS Interoperability Batch Extract

The goal of an LMS is to use a common set of interoperability standards that enable the sharing of instructional content and data between learning and administrative environments. Based on instructional management systems (IMS) enterprise system specifications, currently PeopleSoft LMS interoperability batch extract supports one-way file transfer between PeopleSoft Campus Solutions and an external learning management system.

PeopleSoft LMS extract enables institutions to provide a third-party LMS (such as Blackboard CourseInfo) with personal profile data for learners and instructors, enrollment data and maintenance, and limited course scheduling data and maintenance. The LMS batch extract also provides basic integration with PeopleSoft Student Portal. Depending on your extract target, you can format LMS data with a unique file type of XML V1.1, Blackboard CourseInfo 4, or API Input (a WebCT format currently being phased out). WebCT Campus Edition Institutional (version 4.1) and WebCT Vista 2.1 both support XML V1.1

Currently, the feature does not support passing data or information back to PeopleSoft Campus Solutions from another LMS environment; nor does it include a real-time transactional messaging interface based on event processing.

PeopleSoft LMS batch extract supports IMS Enterprise Specification V1.1 XML data binding specifications. It also supports a simple, common, delimited option for API Input format.

File selection criteria are available at runtime for you to specify which type of files to pass. In addition, you can use packaging options to indicate how you want the system to organize the extract files.

The PeopleSoft LMS interoperability extract includes the following extract functions:

- Administrative (properties object) data that describes the contents of an extract file.
- Personal (person object) data about students and instructors that are associated with the LMS classes included in the extract.
- High-level class (group object) data describing each LMS class that is included in the extract.

This includes group term information and group course information.

- Student enrollment and instructor (group membership object) data for each LMS class.

The group is the LMS class and the membership includes the students and instructors that are associated with the LMS class.

High-level definitions for each of these data are provided in the following sections.

Properties Object Data

The properties object data serves as a file header and contains descriptive data about the contents of the file.

Person Object Data

Person object data includes:

- The person source ID wherein 1) the source is the academic institution with which the student or instructor is associated, and 2) the ID is either the individual's employee ID or user ID, depending on which is specified on the Academic Institution 3 page.
- The user ID, which is either the employee ID or user ID, depending on which is specified on the Academic Institution 3 page, of the student or instructor.
- Personal data for all students enrolled or previously enrolled in the selected LMS classes and the instructors teaching the classes.

Group Object Data - Term Information

Group object data - term information includes:

- The source ID wherein 1) the source is the description of the academic institution in which the classes are scheduled, and 2) the ID is the term code.
- The term description information and the term start and end dates.

Group Object Data - Course Information

Group object data - course information includes the source ID, wherein 1) the source is the description of the academic institution in which the class is scheduled, and 2) the ID is a unique identifier for the group. The group identifies the LMS class, which, by default, is TERM-INSTITUTION-SUBJECT-CATALOG NBR-SEC#-CLASS NBR

The ID includes the term code and class number added to the autogenerated LMS extract group ID from the LMS Data page in the schedule of classes.

Group Membership Object Data - Group

Group membership object data - group includes the source ID, which is the same as the source ID for group object data - course information.

Group Membership Object Data - Member

Group membership object data - member includes:

- The source ID, which is the same as the person source ID for person object data.
- The ID type for person or group.
- The role and, for instructors, the subrole, if any.
- The user ID (same as the person user ID for person object data).
- The class start and end dates.

- The enrollment status reason.
- For students only, a mode (grading basis) and result final grade.
- The student's preferred email address, or campus or home email address.
- The datasource, which is set on the run control page.

Understanding Integration with LMS Self-Service User Authentication

PeopleSoft LMS interoperability also provides single sign on authentication within PeopleSoft Campus Self Service, enabling students and instructors to access their learning management system home page and academic content for their LMS classes without having to sign on to the LMS website.

PeopleSoft LMS authentication uses the IMS enterprise system specifications to create a batch XML V1.1 extract file that is imported into the external LMS database. The XML V1.1 LMS extract file type is designated within the schedule of classes and autogenerates an LMS extract group ID that the system supplements with a term code and the class number to create a unique class identifier.

The LMS authentication passes user ID information and, as required, the unique class identifier to the LMS website. The user is authenticated and taken to the designated page within the LMS website, either the user's home page or the academic content for a specific class.

Note: Currently, WebCT Vista 2.1 and WebCT Campus Edition Institutional (version 4.1) are the only external learning management systems using the LMS authentication feature. Prior versions of WebCT are not supported. To determine whether support for other LMS applications has been added since this publication, please contact your PeopleSoft GSC representative.

See “Configuring Self-Service User Authentication for Your Learning Management System Website” in My Oracle Support (ID 702673.1).

Understanding LMS Setup

As you prepare to set up the LMS batch extract feature, consider the following questions:

- What type of batch extract file does your LMS vendor use: XML V1.1 (required for PeopleSoft LMS authentication), Blackboard CourseInfo 4.0, or the API Input format (a WebCT format currently being phased out)?
- If personal data is something that you need to extract, what phone type and address usage do you want to extract for the person objects?

Note: If you use the Blackboard CourseInfo extract file type, all persons whom you extract must have electronic addresses in the system.

- Will all of your classes need to be available for extract to an LMS system?

Each LMS extract file type presents slightly different extract processing requirements. Before you use the LMS Batch Extract component, familiarize yourself with the requirements of the file type that you plan to use.

All of the extract file types use *Update* and *Snapshot* extract modes.

Blackboard CourseInfo 4 creates delimited files that are uploaded through a batch utility in the Blackboard system. Students must have email addresses (preferred, home, or campus) for your PeopleSoft Campus Solutions system to extract and include the student in the people object.

The API Input format creates delimited files that are uploaded in the WebCT system through the use of an API.

Note: The API Input format is currently being phased out. However, the WebCT Campus Edition and Vista formats both support the XML V1.1 LMS extract file type that is required for Campus Solutions.

The following table further describes the requirements:

<i>Item</i>	<i>Enterprise XML V1.1</i>	<i>Blackboard CourseInfo 4</i>	<i>API Input</i>
Extract File Creation Methods	<ul style="list-style-type: none"> Individually. In combination with other files. Combined in a single file. 	<ul style="list-style-type: none"> Individually. In combination with other files. 	<ul style="list-style-type: none"> Individually. In combination with other files. <hr/> <p>Note: You cannot select global files to run individually. They are run automatically every time the student file is selected. This is necessary because the global API has two formats: <i>FileAdd</i> and <i>FileUpdate</i>.</p> <hr/>
Object Output Files	<p>People</p> <ul style="list-style-type: none"> <i>Update:</i> All students and instructors who are members of the classes that meet the runtime criteria. <i>Snapshot:</i> All students and instructors who are members of the classes that meet the runtime criteria. 	<p>User</p> <ul style="list-style-type: none"> <i>Update:</i> All active students in classes that meet the runtime criteria. <i>Snapshot:</i> All active students in classes that meet the runtime criteria. 	<p>Student (the files are loaded through an API in which the course ID is specified on the command line; therefore, one file is created per class.)</p> <ul style="list-style-type: none"> <i>Update:</i> Only active students in classes that meet the runtime criteria who have a STATUS_DT that is greater than or equal to the class enrollment extract datetime new students. <i>Snapshot:</i> All active students in classes that meet the runtime criteria.

Item	Enterprise XML V1.1	Blackboard CourseInfo 4	API Input
	<p>Group</p> <ul style="list-style-type: none"> • <i>Update</i>: Only classes with no extract datetime that meet the runtime criteria and all classes that are designated as combined sections. • <i>Snapshot</i>: All classes that meet the runtime criteria. 	<p>Course</p> <ul style="list-style-type: none"> • <i>Update</i>: Only classes with no extract datetime that meet the runtime criteria. • <i>Snapshot</i>: All classes the meet the runtime criteria. 	<p>Class (Campus Solutions provides this file as informational because WebCT does not use an API to load classes.)</p> <ul style="list-style-type: none"> • <i>Update</i>: Only classes with no extract datetime that meet the runtime criteria. • <i>Snapshot</i>: All classes that meet the runtime criteria.

<i>Item</i>	<i>Enterprise XML V1.1</i>	<i>Blackboard CourseInfo 4</i>	<i>API Input</i>
	<p>Membership</p> <ul style="list-style-type: none"> <i>Update:</i> All instructors of the classes that meet the runtime criteria. <p>All students that meet the runtime criteria who have a STATUS_DT, ENROL_ADD_DT, GRADING_BASIS_DT, ENROL_DROP_DT, or GRADE_DT that is greater than or equal to the class enrollment extract datetime (for example, newly enrolled students or currently enrolled students with a meaningful change).</p> <ul style="list-style-type: none"> <i>Snapshot:</i> All students and instructors of classes that meet the runtime criteria. 	<p>Populate Course</p> <ul style="list-style-type: none"> <i>Update:</i> All instructors of the classes that meet the runtime criteria. <p>Only active students in classes that meet the runtime criteria who have a STATUS_DT that is greater than or equal to the class enrollment extract datetime (for example, new students).</p> <ul style="list-style-type: none"> <i>Snapshot:</i> All instructors and active students of the classes that meet the runtime criteria. 	<p>Global</p> <ul style="list-style-type: none"> <i>Update:</i> <p><i>FileAdd format:</i> Only active students in classes that meet the runtime criteria who have a STATUS_DT that is greater than or equal to the class enrollment extract datetime for all their classes.</p> <ul style="list-style-type: none"> <i>FileUpdate format:</i> Students who have already passed through the extract process at least once before, but have at least one new class in the run. <p>Active students are not included if their status date is less than the class enrollment extract datetime for all of their classes (for example, no new course list information is available to pass).</p> <p>Active students who are in more than one class, and who have a STATUS_DT that is greater than or equal to the class enrollment extract datetime for a class (for example, at least one new course is available to add to a student's list).</p> <ul style="list-style-type: none"> <i>Snapshot FileAdd format only:</i> All active students in classes that meet the runtime criteria.

Note: Students who have dropped the reported class prior to the drop or retain date are not included in any update of the LMS extract. If you run a snapshot, then run an update prior to the drop or retain date. Any students dropped since the snapshot are not updated or deleted from the LMS because their enrollments have been deleted from PeopleSoft Campus Solutions. Plan your production refresh schedule with this in mind.

Setting Up LMS Values and Default Options

Now that you have considered the extract file type that you plan to use, you can set up values and options for PeopleSoft interoperability LMS batch extract and LMS authentication.

To set up LMS values and options:

1. If you plan to use the XML V1.1 extract file type, you must set up LMS datasource codes and descriptions, LMS target codes and descriptions, and LMS type codes and descriptions.

You must create a data source code and a description for every possible extract source (for example, Undergraduate School of Business Administration, or PeopleSoft University). You must consider how you want to name your extract source information, and whether you typically extract from one small department or school at a time or extract a large group of data for a term at a time.

You must create target codes and descriptions for all of your targets (for example, the PSUNV/LMS shared server, or the School of Law server). Also, you need to create codes and descriptions for all of the different types of extract processes that you may run. These naming conventions are used as part of each XML V1.1 extract and are useful tracking tools.

2. If you plan to use PeopleSoft LMS self-service user authentication, you must set up LMS authentication profiles.

Currently, WebCT is the only LMS that uses LMS authentication. If you plan to use the LMS single sign on authentication, you must assign the LMS extract file type of XML for the LMS classes on the Schedule of Classes - LMS Data page.

3. If you plan to use PeopleSoft LMS self-service user authentication, you must set up LMS providers.

LMS providers are assigned to classes on the Schedule of Classes - LMS Data page and the Schedule New Course - LMS Data page in the Providers for Authentication field. LMS providers can also be assigned as default values on the Academic Institution 3 page and the Course Catalog - Components page.

4. (Optional) If you want to automatically include all newly scheduled classes in a particular LMS extract file type, you can specify the desired LMS extract file type on the Academic Institution 3 page.

If you are using LMS authentication, you can also assign a default LMS provider for authentication on the Academic Institution 3 page.

Every time that you schedule a new class, the system uses the values on the Academic Institution 3 page as default values on the Schedule of Classes - LMS Data page.

5. (Optional) If you want to automatically include only some of your newly scheduled classes in the LMS extract file type, you can specify the desired LMS extract file type, and if required, the LMS provider for authentication, on each course's respective Course Catalog - Components pages.

When you schedule classes, the system uses the values that you specify on the Course Catalog - Components page as default values on the Schedule of Classes - LMS Data page instead of using the values from the Academic Institution 3 page.

Note: You can set up default values at the institution level or at the catalog level to populate the schedule of classes. However, the extract uses only the values that are set at the class level.

- You can add or modify LMS options on the Schedule of Classes - LMS Data page or on the Schedule New Course - LMS Data page.

The LMS extract file type that is specified on the LMS Data page autogenerates an LMS extract group ID. The batch extract uses these LMS values, as does the self-service authentication process, when linking a student or instructor from a self-service page to the academic content for the class on the LMS website.

For each class that does *not* require authentication to use an LMS or other website, enter the target URL on the Schedule of Classes - LMS Data page. The URL address must be complete (for example, include "http://").

Note: Do *not* enter URLs for classes that require authentication. The system autogenerates the required URLs from the Student Center, My Class Schedule, Faculty Center - My Teaching Schedule, and Learning Management Systems self-service pages.

Pages Used to Set Up LMS Values and Default Options

Page Name	Definition Name	Navigation	Usage
LMS Datasource	LMS_DATASOURCE	Curriculum Management > Learning Management Systems > LMS System Setup > LMS Datasource	Set up codes and descriptions for potential XML batch extract sources.
LMS Target	LMS_TARGET	Curriculum Management > Learning Management Systems > LMS System Setup > LMS Target	Set up codes and descriptions for potential XML batch extract targets.
LMS Type	LMS_TYPE	Curriculum Management > Learning Management Systems > LMS System Setup > LMS Type	Set up codes and descriptions for potential XML batch extract types.
Learning Management System Authentication Profile	ESA_PROFILE_PG	Curriculum Management > Learning Management Systems > LMS Authentication Profile > Learning Management System Profile	Set up authentication profiles to communicate with your external LMS websites and to synchronize keys between your Campus Solutions site and the LMS site.
LMS Provider	LMS_INT_SETUP	Curriculum Management > Learning Management Systems > LMS Provider Setup > LMS Provider	Set up codes, descriptions, and LMS authentication profiles to enable authentication for students and instructors to access their LMS home page and LMS academic content pages. Using this page, define all LMS providers to be used with LMS authentication at your institution.

Page Name	Definition Name	Navigation	Usage
Academic Institution 3	INSTITUTION_TABLE3	Set Up SACR > Foundation Tables > Academic Structure > Academic Institution Table > Academic Institution 3	Define a default provider for authentication and the LMS extract file type to use when scheduling new classes. Define remaining LMS options for the LMS batch extract to use.
Components	CRSE_CATALOG_CMPNT	Curriculum Management > Course Catalog > Course Catalog > Components	Enter default provider for authentication and LMS extract file type values on a course-by-course basis to use when scheduling new classes.
LMS Data	CLASS_LMS_SETUP	<ul style="list-style-type: none"> Curriculum Management > Schedule of Classes > Schedule New Course > LMS Data Curriculum Management > Schedule of Classes > Maintain Schedule of Classes > LMS Data 	Enter or modify LMS values to use when generating the LMS batch extract and when clicking a class's LMS link on the self-service pages.

Setting Up LMS Datasource Values

Access the LMS Datasource page (Curriculum Management > Learning Management Systems > LMS System Setup > LMS Datasource).

Image: LMS Datasource page

This example illustrates the fields and controls on the LMS Datasource page. You can find definitions for the fields and controls later on this page.

LMS datasource codes and descriptions are required on the LMS Batch Extract page as part of your run control parameters if you run the batch extract process with an LMS batch extract file type of XML V1.1. If you run the batch extract process with an LMS extract file type of Blackboard CourseInfo 4 or API Input format, this setup is not required.

LMS Datasource Code and LMS Datasource Description

Enter an LMS datasource code and corresponding LMS datasource description for all valid data sources. The data source is an identifier for the site generating the XML file and is used in the properties object (header record).

For XML file types, the LMS datasource code must be entered at runtime on the LMS Batch Extract - Setup page.

Setting Up LMS Target Values

Access the LMS Target page (Curriculum Management > Learning Management Systems > LMS System Setup > LMS Target).

Image: LMS Target page

This example illustrates the fields and controls on the LMS Target page. You can find definitions for the fields and controls later on this page.

LMS Datasource LMS Target LMS Type		
*LMS Target Code	*LMS Target Description	
BUADSRVR	School of Business LMS Server	+ -
LAWSRVR	School of Law LMS Server	+ -
LBARTSSVR	Liberal Arts LMS Server	+ -
PSUNVSRVR	PSUNV Shared LMS Server	+ -

LMS target code and description information is required on the LMS Batch Extract - Setup page as part of your run control parameters if you run the batch extract process with an LMS type of XML V1.1. If you run the batch extract process with an LMS extract file type of Blackboard CourseInfo 4 or API Input format, this setup is not required.

LMS Target Code and LMS Target Description

Enter an LMS target code and corresponding LMS target description for all valid recipients of the XML files. The target code is an identifier for the site receiving the XML file and is used in the properties object (header record).

For XML file types, the LMS target code is entered at runtime on the LMS Batch Extract - Setup page.

Setting Up LMS Type Values

Access the LMS Type page (Curriculum Management > Learning Management Systems > LMS System Setup > LMS Type).

Image: LMS Type page

This example illustrates the fields and controls on the LMS Type page. You can find definitions for the fields and controls later on this page.

*LMS Type Code	*LMS Type Description		
BUSADCLASS	Business Administration Classes	+	-
EXTDCCLASS	Extended Ed Classes	+	-
GRADCLASS	Graduate Classes	+	-
LAWCLASS	Law Classes	+	-
LBARTCLASS	Liberal Arts Classes	+	-
UGRDCCLASS	Undergraduate Classes	+	-

LMS type and description information is required on the LMS Batch Extract - Setup page as part of your run control parameters if you run the batch extract process with an LMS type of XML V1.1. If you run the batch extract process with an LMS extract file type of Blackboard CourseInfo 4 or API Input format, this setup is not required.

LMS Type Code and LMS Type Description

Enter an LMS type code and a corresponding LMS type description to specify the nature of any extract that you may perform with this type. The type code is used in the properties object (header record).

For XML types, the LMS type code is entered at runtime on the LMS Extract - Setup page.

Setting Up LMS Authentication Profiles

If you plan to use PeopleSoft LMS authentication, you must configure your system to communicate with external LMS sites by creating an LMS authentication profile and synchronizing the keys between your Campus Solutions site and the external LMS site. Keys enable the two sites to recognize the requests that are passed between them and to authenticate your self-service users to the LMS site.

Using LMS authentication, end-users sign on one time to enter the PeopleSoft Campus Self Service.

When using the self-service Learning Management Systems page, users can click an LMS provider link, which takes them to their home page within the LMS system such as WebCT. For classes, you can assign LMS providers for authentication at the Academic Institution and Course Catalog Component level. The system then uses the provider as a default value when adding a class to the schedule of classes. You can also assign or update providers at the class level.

If an LMS provider is assigned to a class, the system displays an LMS button next to the class within the self-service Student Center, My Class Schedule page, and Faculty Center - My Teaching Schedule page. When students or instructors click the button, the system quickly performs the authentication and moves the user to the academic class content on the LMS website. The authentication happens without users explicitly signing on to the other site, without their having any sense of moving out of the Campus

Solutions application, and without having to add another user ID or password to their ever-growing list of IDs and passwords.

You can also assign LMS providers without using LMS authentication for use on the Learning Management Systems self-service page. In this case, you assign a target URL, such as an institution or division website that has links to instructor web pages.

You can also use the LMS provider as a run control parameter within the LMS batch extract process.

See “Configuring Self-Service User Authentication for Your Learning Management System Website” in My Oracle Support (ID 702673.1).

"Using LMS Authentication" (PeopleSoft Campus Solutions 9.2: Self Service)

Defining LMS Providers

Access the LMS Provider page (Curriculum Management > Learning Management Systems > LMS Provider Setup > LMS Provider).

Image: LMS Provider page

This example illustrates the fields and controls on the LMS Provider page. You can find definitions for the fields and controls later on this page.

- Effective Date** Enter the date when the status of this LMS provider becomes effective. Use a new effective date each time that you make a change to a provider. Insert new rows as needed, and modify the record.
- Description** Enter the description to display to students and instructors from the self-service Learning Management System page.
- LMS Authentication Profile** If the provider uses the LMS authentication feature, select the LMS authentication profile to use for that provider.
- Default URL** The system hides and clears the Default URL field when you enter an LMS authentication profile. If you do not enter an LMS

authentication profile, the Default URL field is available so that you can specify the default URL to use for a provider who does not use LMS authentication. You might want to use the URL that takes the user to an institution or division website from the Learning Management Systems page. Be sure to enter the complete URL (including http://).

Display as LMS Link

Select this check box to display the LMS provider as a link on the self-service Learning Management System page. The link enables users to access their LMS site homepage by way of PeopleSoft LMS authentication.

Comments

Enter comments to further describe or identify the LMS provider.

Defining LMS Default and Extract Options for Your Institution

Use the LMS Options group box on the Academic Institution Table 3 page to specify the LMS extract file type default values if all your classes need to be available to extract to a learning management system. If you plan to use PeopleSoft LMS authentication, you must also specify the provider for authentication.

The system uses the values that are defined on the Academic Institution Table 3 page as default values when adding a class to the schedule of classes.

The LMS batch extract uses the personal data extract parameters of phone type and address usage. The user ID extract option identifies whether the extract should use the student or instructor's employee ID or user ID. User IDs are created on the User Profile page.

Note: The user ID value is of particular importance for LMS authentication. For the user's authentication to work properly, the selected user ID extract option must be the same as the LMS authentication profile - authentication user ID value. If you set the user ID extract option to user ID on the Academic Institution Table 3 page, then authentication user ID must also be set to user ID on the LMS Authentication Profile page.

See “Configuring Self-Service User Authentication for Your Learning Management System Website” in My Oracle Support (ID 702673.1).

Related Links

"Setting Additional Institution Defaults and Options" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Defining LMS Default Options for Course Components

Use the Course Catalog - Components page to enter LMS values on a course-by-course basis if you have not specified a default LMS extract file type and a default provider for authentication (if you plan to use PeopleSoft LMS authentication) on the Academic Institution 3 page. When you enter LMS values on the Course Catalog - Components page, the system overrides the values that are set on the Academic Institution 3 page and uses the Course Catalog - Components page values as defaults.

Related Links

[Defining Course Components](#)

Defining LMS Options for Classes

If you have not specified, on either the Academic Institution 3 page or the Course Catalog - Components page, a default LMS extract file type and a default provider for authentication (if you plan to use PeopleSoft LMS authentication), you must enter your LMS values on the Schedule of Classes - LMS Data page.

All LMS classes must have an LMS extract file type and an LMS extract group ID defined on the Schedule of Classes - LMS data page. You can also modify the LMS that comes in from the Academic Institution 3 page or the Course Catalog - Components page.

Note: You must assign an extract file type to use. To use PeopleSoft LMS authentication, you must use the XML LMS extract file type and you must identify a provider for authentication.

The LMS authentication is designed to work with the IMS enterprise system specifications that are used to create the batch XML V1.1 extract file. When the XML V1.1 LMS extract file type is designated within the Schedule of Classes, the system autogenerates the LMS extract group ID. During the extract process and LMS authentication from self-service pages, the system creates a unique class identifier by supplementing the LMS group ID with a term code and the class number.

If you do not want to use LMS authentication, but want to link students who are enrolled in a class to a designated URL such as an instructor's website, you can specify the website in the LMS URL field. The website URL must be preceded by the http:// designation.

Note: Do not specify URLs for classes that require authentication to the LMS site. When using PeopleSoft LMS authentication, the system autogenerates the required URLs from the Student Center, My Class Schedule, and Faculty Center - My Teaching Schedule self-service pages.

[Defining LMS Options for Classes](#)

Running the LMS Batch Extract Process

Use the PeopleSoft LMS Batch Extract process to create extract files of object properties data in the appropriate format for your target LMS. If you use PeopleSoft LMS authentication, you must use the XML LMS extract file type and select the appropriate provider for authentication.

You can specify all of your runtime parameters on the LMS Batch Extract - Setup and LMS Extract - Criteria pages, and designate the appropriate file path for your extract files on the LMS Batch Extract - Output page. After the process finishes, you can locate your extract files in the file directory that you specify. You can run the extract process in either snapshot or update mode.

Prerequisites

Before you can perform an extract for XML V1.1, you must create LMS datasource, LMS target, and LMS type values in the LMS Setup component.

Pages Used to Extract LMS Data

Page Name	Definition Name	Navigation	Usage
LMS Batch Extract Process - Setup	RUNCTL_SRLMSEX1	Curriculum Management > Learning Management Systems > LMS Batch Extract Process > Setup	Specify properties and parameters for the extract process and header properties object.
LMS Batch Extract Process - Criteria	RUNCTL_SRLMSEX2	Curriculum Management > Learning Management Systems > LMS Batch Extract Process > Criteria	Further narrow your specifications for the extract process.
LMS Batch Extract Process - Output	RUNCTL_SRLMSEX3	Curriculum Management > Learning Management Systems > LMS Batch Extract Process > Output	Specify the extract file path and storage conventions for the extract process.

Defining LMS Run Control Parameters

Access the LMS Batch Extract Process - Setup page (Curriculum Management > Learning Management Systems > LMS Batch Extract Process > Setup).

Image: LMS Batch Extract Process - Setup page

This example illustrates the fields and controls on the LMS Batch Extract Process - Setup page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Setup' tab of the LMS Batch Extract Process configuration page. At the top, there are three tabs: 'Setup', 'Criteria', and 'Output'. Below the tabs, the 'Run Control ID' is set to 1. To the right, there are links for 'Report Manager' and 'Process Monitor', and a yellow 'Run' button. The main configuration area includes:

- *Institution:** A search field containing 'PSUNV' with a magnifying glass icon, and the text 'PeopleSoft University'.
- *Term:** A search field containing '0530' with a magnifying glass icon, and the text '2004 Fall'.
- File Properties section:**
 - Provider for Authentication:** A dropdown menu with 'WEBCT' selected.
 - *LMS Extract File Type:** A dropdown menu with 'XML V1.1 (req to authenticate)' selected.
 - Datasource:** A dropdown menu with 'College of Liberal Arts' selected.
 - Target:** A dropdown menu with 'Liberal Arts LMS Server' selected.
 - Type:** A dropdown menu with 'Liberal Arts Classes' selected.
 - *Extract Mode:** A dropdown menu with 'Snapshot' selected.
 - Language:** A text field containing 'EN'.

Institution	Enter the institution that specifies the source of the extract data.
Term	Enter the term that specifies the source of the extract data.
Provider for Authentication	Specify the authentication provider to use within the extract. Single signon providers are defined on the LMS Provider Setup page and are assigned to classes on the Schedule of Classes - LMS Data page.
LMS Extract File Type	Specify the file type, or extract format, to use within the extract. Values are: <i>XML V1.1</i> (required for PeopleSoft LMS authentication), <i>Blackboard CourseInfo 4</i> , and <i>API Input</i> (the WebCT format that is currently being phased out; however, WebCT Campus Edition and Vista both support XML V1.1). Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort. The LMS extract file type that you specify here must be the same as the LMS extract file type that is assigned to the LMS classes on the Schedule of Classes - LMS Data page.
	<hr/> Note: If you select a file type of <i>Blackboard CourseInfo4</i> or <i>API Input</i> , the Datasource, Target and Type fields become unavailable. <hr/>
Datasource and Target	Enter the datasource and target that serve as identifiers for the site generating the XML file. For example, you might have a datasource of <i>College of Liberal Arts</i> and a target of <i>Liberal Arts LMS Server</i> .
Type	Enter the extract type that describes the classes that you want to extract. For example, keeping with the datasource and target examples, you might enter <i>Liberal Arts Classes</i> .
Extract Mode	Specify an extract mode. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort. The current set of values include: <i>Snapshot:</i> Full set of data for purposes of initial group creation or reloads. <i>Update:</i> Partial set of changes that applies to enrollment, group, and group membership. The effectiveness of the LMS extract mode of <i>Update</i> on the run control page depends on the LMS extract file type on the Schedule of Classes - LMS Data page. This is because Blackboard CourseInfo 4.0 standard edition and API Input (the WebCT format that is currently being phased out) both have limiting specifications on what data they can currently accept

in update form. When you run Blackboard CourseInfo 4 in *Update* mode, only new user and new course data since the last time the process ran is accepted. When you run API Input in *Update* mode, only new user and new course data, since the last time the process ran, and new enrollment and new course list information, is accepted.

In addition, students who dropped prior to the drop or retain date are not included in any update of the LMS extract. In other words, if you run a snapshot, then run an update prior to the drop or retain date, any students dropped since the snapshot are not updated or deleted from the LMS because their enrollments have been deleted from Campus Solutions. Plan your refresh schedule with this in mind.

Language

Enter a two-character language value that serves as an attribute of the properties object, for example, <PROPERTIES lang="en">,ISO 639 format. This field is optional.

After you enter all necessary data on the LMS Batch Extract - Setup, LMS Batch Extract - Criteria, and LMS Batch Extract - Output pages, click Run to run this request. PeopleSoft Process Scheduler runs the LMS Batch Extract process at user-defined intervals.

Defining LMS Run Control Criteria

Access the LMS Batch Extract Process - Criteria page (Curriculum Management > Learning Management Systems > LMS Batch Extract Process > Criteria).

Image: LMS Batch Extract Process - Criteria page

This example illustrates the fields and controls on the LMS Batch Extract Process - Criteria page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Criteria' tab of the LMS Batch Extract Process configuration page. At the top, there are three tabs: 'Setup', 'Criteria' (which is active), and 'Output'. Below the tabs, the 'Run Control ID' is set to '1'. To the right of this are two links: 'Report Manager' and 'Process Monitor', and a yellow 'Run' button. A section titled 'Selection Criteria' contains three radio buttons: 'None', 'Filter' (which is selected), and 'Class Number'. Below this section, several fields are listed with their current values and corresponding descriptions: 'Career' is 'UGRD' (Undergraduate), 'Session' is '1' (Regular Academic Session), 'Campus' is 'MAIN' (Main Hacienda Campus), 'Academic Group' is empty, 'Subject Area' is 'MATH' (Mathematics), and 'Catalog Nbr' is empty. At the bottom of the page, there is a 'Class Nbr' field which is also empty.

The fields on this page prompt against the institution and term that you specify on the LMS Batch Extract - Setup page. If you do not enter any narrowing parameter information on the LMS Batch Extract Process - Criteria page, the process runs for the institution and term that are specified on the LMS Batch Extract Process - Setup page.

Selection Criteria

Select an option to indicate the level of filtering to apply in addition to the parameters on the LMS Batch Extract Process - Setup page.

None	Select to disable all fields.
Filter	Select to enable the field filters.
Class Number	Select to disable the field filters and enable the Class Nbr (class number) field.

Additional Elements

Career	Enter a career if you want to isolate only those courses that are offered under a particular academic career.
Session	Enter a session to isolate classes within the term that are specified on the LMS Batch Extract Process - Setup page and within a particular session.
Campus	Enter a campus to filter those classes that are offered by a particular campus.
Academic Group	Enter an academic group to filter classes that are associated with a particular group.
Subject Area	Enter a subject area to filter those classes with a particular subject.
Catalog Nbr (catalog number)	Enter a catalog number to isolate a particular course.
Class Nbr (class number)	Enter a class number to specify a particular class offering. This field is available when the Class Number option is selected.

After you enter all necessary data on the LMS Batch Extract Process - Setup, LMS Batch Extract Process - Criteria, and LMS Batch Extract Process - Output pages, click Run to run this request. PeopleSoft Process Scheduler runs the LMS Batch Extract process at user-defined intervals.

Note: The system treats cleared fields as wild cards and returns all values.

Defining LMS Output Parameters

Access the LMS Batch Extract Process - Output page (Curriculum Management > Learning Management Systems > LMS Batch Extract Process > Output).

Image: LMS Batch Extract Process - Output page

This example illustrates the fields and controls on the LMS Batch Extract Process - Output page. You can find definitions for the fields and controls later on this page.

Note: The LMS Batch Extract Process - Output page appears differently depending on the file type (*XML*, *Blackboard*, or *API*) that you select.

File Path

Enter a file path to indicate the extract file location. This is where your extracted people, classes, and enrollment files are located. In addition to sending report output for this process to a file (through setting preferences in the PeopleSoft Process Monitor), you can also send any additional output files that are created by this process to a file directory. To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.

Combine Output

This check box is available if you select a file type of *XML VI*. *I* on the LMS Batch Extract Process - Setup page. Select this check box to combine person, group, and membership objects into one file.

When this check box is cleared, you can further specify the level and location of objects to extract. In doing so, you must also create individual file names for each object.

Note: You must always include the file type (such as XML) in the output name.

People

Select this check box to include person object data in the extract for all students and instructors who are associated with the selected LMS classes. Enter a corresponding file name for this

data. This check box is unavailable if you select a file type of *API Input* (the WebCT format that is currently being phased out) on the LMS Batch Extract Process - Setup page.

Group

Select this check box to include group object data in the extract for all selected LMS classes. Enter a corresponding file name for this data.

Membership

Select this check box to include membership object data in the extract, which identifies each LMS class and the students and instructors who are associated with the class. Enter a corresponding file name for this data.

After you enter all necessary data on the LMS Batch Extract Process - Setup, LMS Batch Extract Process - Criteria, and LMS Batch Extract Process - Output pages, click Run to run this request. The LMS Batch Extract process:

- Collects and stores the appropriate data in an extract file (or files) with the name and file path that you specify.
- Creates an SQR .log file that provides detail about the process itself.
- Creates a detailed LMS Batch Extract report (SRLMSEX.<file extension>) that highlights the parameters, messages, and total record count for the process.

PeopleSoft Process Scheduler runs the LMS Batch Extract Report process at user-defined intervals.

Click the Process Monitor link to access the Process Detail page, where you can view the status of submitted process requests. From the Process Detail page, click the View Log/Trace link to access the SQR .log and LMS Batch Extract report (SRLMSEX.<file extension>).

Using Self-Service Pages and LMS Authentication

If your institution has licensed PeopleSoft Campus Self Service, students and instructors can access LMS websites from your system.

Chapter 50

Grading Students

Understanding Grading

After you set up your grading schemes and grade bases, define mapping rules, and generate grade rosters, you are ready to enter grades.

You can enter grades in one of three ways:

- System administrators or power users can enter grades directly on the Grade Roster page for each class.
- Instructors can define class assignments, percentages, and even electronically communicate with students by entering grades directly through PeopleSoft Gradebook, a separately licensed PeopleSoft application.
- Instructors or other authorized self-service users can enter midterm and final grades through PeopleSoft Campus Self Service, a separately licensed PeopleSoft application.

Prerequisites

Before you can enter and post grades, you must:

- Set up your grading schemes and grade bases.
- Define mapping rules.
- Generate grade rosters.

Printing Grade Rosters

This section provides an overview of printing a grade roster and discusses how to run the Grade Roster report.

Understanding Printing a Grade Roster

Some organizations have business processes that use grade rosters in printed form. This section discusses how to print grade rosters in batch or for a specific class.

Complete these steps to print grade rosters:

1. Access the Grade Roster Print page.
2. Enter your run control parameters.
3. Click the Run button.
4. Locate your printed rosters through the Report Manager link, and print them as needed.

Page Used to Print Grade Rosters

Page Name	Definition Name	Navigation	Usage
Grade Roster Print	RUNCTL_SRGRDROSTER	Curriculum Management > Grading > Print Grade Roster > Grade Roster Print	Print generated rosters.

Running the Grade Roster Report

Access the Grade Roster Print page (Curriculum Management > Grading > Print Grade Roster > Grade Roster Print).

Image: Grade Roster Print page

This example illustrates the fields and controls on the Grade Roster Print page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Grade Roster Print' page with the following fields and controls:

- Run Control ID:** 1
- Report Manager** and **Process Monitor** links, and a **Run** button.
- *Academic Institution:** PSUNV (dropdown), PeopleSoft University
- *Term:** 0550 (text input with search icon), 2005 Fall
- Grade Roster Type:** Final (dropdown)
- Print Note Area** (checked checkbox)
- Print Incomplete Area** (unchecked checkbox)
- Sequence Number:** 1
- Academic Organization:** MATH (text input with search icon), Mathematics
- Session:** Regular (dropdown)
- Class End Date From:** 05/07/2005 (calendar icon)
- Class End Date To:** 05/28/2005 (calendar icon)
- Campus:** MAIN (text input with search icon)
- Specific Class** (unchecked checkbox)
- Print Options** (pop-up window):
 - Grdng Auth (dropdown)
 - *Instructor Print Option (checked checkbox)
 - Print Course Administrator (unchecked checkbox)
 - Print Blind Grading ID (checked checkbox)

Academic Institution

Select the institution for which to print rosters.

Term

Select a term for the roster. Term values are defined on the Term Table page.

Grade Roster Type

Select the grade roster type to print. The default is *Final*. Grade roster type values are delivered with your system as translate

values. While you should not change the *Final Grade* value, you can add as many nonfinal grade values as you want.

Print Note Area	Select to provide extra space on the roster for instructors to write notes.
Print Incomplete Area	Select to provide extra space on the roster for instructors to make note of incomplete information.
Specific Class	Select to print a roster for one class.
Class Nbr (class number)	If you select the Specific Class check box, the Class Nbr field becomes available. Select the class number for the roster to print.
Academic Organization	If you do not select the Specific Class check box, select an academic organization. Academic organization values are defined on the Academic Organization Table page.
Session	Select the session for which to print rosters.
Class End Date From and Class End Date To	Select the class end date from and to dates. The system selects rosters to print for classes with an end date that is greater than or equal to the value in the Class End Date From field and less than or equal to the value in the Class End Date To field.
Campus	Select the campus that is associated with the grade rosters. Attach campus values to courses in the course catalog and to classes in the schedule of classes.
Instructor Print Option	Select the type of instructor information to print on the grade roster for the graded component. Attach instructor values to classes on the Schedule of Classes - Basic Data page. Values are: <i>All</i> : Prints the names of all instructors. <i>Grdng Auth</i> : Prints only the name of the instructor who is authorized to grade. <i>None</i> : Prints no instructor names.
Print Course Administrator	Select to print the course administrator's name on the grade roster. Attach course administrator values to classes on the Schedule of Classes - Basic Data page.
Print Blind Grading ID	Select to print the blind grading IDs of students. Student names do not appear on the roster.

Entering Grades Online

This section provides an overview of entering grades online and discusses how to:

- Use the Grade Roster page to enter grades.
- Review student enrollment detail.
- Review transcript notes.
- Review student incomplete information.

Understanding Entering Grades Online

System administrators and power users can enter grades directly to the Grade Roster page for each class. Complete these steps to enter grades online:

1. Enter grades and transcript notes on the Grade Roster page.
2. (Optional) Review student enrollment detail on the Student Enrollment Detail page.
3. (Optional) Enter or review a transcript note for the student on the Transcript Note page.
4. (Optional) Enter student incomplete information on the Student Incomplete page.
5. Save the grade roster.

Pages Used to Enter Grades Online

Page Name	Definition Name	Navigation	Usage
Grade Roster	GRADE_ROSTER1	Curriculum Management > Grading > Grade Roster > Grade Roster	Enter official grades and requirement designation grades, view enrollment summary information, and add transcript notes.
Enrollment Detail	GRADE_ROSTER_ENRL	Click the Detail link on the Grade Roster page.	Review detailed information about a student's enrollment, including their primary academic program, grading basis, units taken, and so on.
Transcript Note	GRADE_ROSTER_NOTEA	Click the Note link on the Grade Roster page.	Enter or view a transcript note that is related to the student's enrollment record. The system displays this note on transcript types for which the Print Transcript Notes check box is selected on the Enrollment/Statistics page.
Student Incomplete	GRADE_ROSTER_INCA	Click the Incomplete Detail button on the Transcript Note page.	Enter a lapse deadline, lapse to grade, or comment for students who have no grade or a grade that is equivalent to a grade of <i>Incomplete</i> .
Student Milestone Grade	SSR_MLSTN_GRD	Curriculum Management > Grading > Grade Roster > Student Milestone Grade	Enter a student's milestone grade.

Page Name	Definition Name	Navigation	Usage
Milestone	SSR_CRSE_MLSTN_GRD	Click the Milestone link on the Grade Roster page.	View a student's milestone grade.

Using the Grade Roster Page to Enter Grades

Access the Grade Roster page (Curriculum Management > Grading > Grade Roster > Grade Roster).

Image: Grade Roster page

This example illustrates the fields and controls on the Grade Roster page. You can find definitions for the fields and controls later on this page.

The screenshot shows the Grade Roster page with the following details:

- Term:** 2005 Sum
- Class Nbr:** 1254 Perspectives on the Present
- Section:** 1
- Session:** Twelve Wk
- Catalog:** HISTORY 100
- Seq Nbr:** 2

Roster Type: Final Grade

Approval Status: Not Reviewed

Display Unassigned Roster Grade Only

ID	Name	Roster Grade	Converted Roster Grade	Official Grade	Career	Grading Basis	Final Roster Status	Detail	Note
1 SR12206	Kalombo,Chantal				Undergrad	P/NP	Pending	Detail	Note
2 SR12201	Keshishi,Khanom	A+	A	A	Undergrad	Graded	Posted	Detail	Note
3 SR12202	Lancet,Amit	B		B	Undergrad	Graded	Posted	Detail	Note
4 SR12210	Omar,Raad				Undergrad	Graded	Pending	Detail	Note
5 SR12212	Pople,John				Graduate	Graded	Pending	Detail	Note
6 SR12031	Ruiz,Robert			WF	Undergrad	Graded	Graded	Detail	Note

If you use blind grading IDs, the roster lists students in random order. If you do not use blind grading IDs, the roster lists students in ID order.

Sort Option

This option is available on Open Entry/Exit class rosters. You can sort IDs in one of two ways. Values are:

Last,First: Sorts IDs by last name.

Date,Last: Sorts IDs by fully graded date, and then by last name within the start date. This view is particularly useful for classes that are offered in open entry and open exit format, where students can have fully graded dates that differ.

Display Unassigned Roster Grade Only

Select to view only those students with unassigned grades. This option is particularly useful for open entry and open exit classes for which you might grade students at different intervals based on their various end dates.

Name

Preferred name appears by default. If no preferred name exists, the primary name appears.

Preferred name also appears by default on the Enrollment Detail, Transcript Note, Student Milestone Grade, and Milestone pages.

Roster Grade

Enter the student's grade for the course. This field displays only grades assigned on the grade roster; it does not display grades assigned in enrollment. After grades are posted, this field displays the grade but is unavailable for updating.

All active Grade Input values from the Grading Scheme Table page are available in the Roster Grade field, regardless of whether the Include in Self Service check box on the Grading Scheme Table page is selected.

Converted Roster Grade

This field appears when at least one roster grade has a value defined in the Convert to Grade field on the Grading Scheme Table page.

The Converted Roster Grade field continues to appear when grades are posted.

Official Grade

This field displays posted grades and grades that have been assigned on a student enrollment page.

Roster RD Grade (roster requirement designation grade)

This field becomes available if the class has a requirement designation that requires a separate grade. Values are:

Satisfied: A basic credit.

Not Satisfied: No credit type of grade.

If the requirement designation requires a separate grade, then it is assumed that the requirement designation is satisfied when a passing grade is posted for the student.

See [Defining Requirement Designations](#).

Detail

Click to access the Student Enrollment Detail page, where you can view detailed information about each enrollment.

Note

Click to access the Transcript Note page, where you can view a transcript note that is related to the student enrollment record.

After a student's grade is posted or assigned and saved on an enrollment page, the student's final roster grade field becomes unavailable for update. The system displays the roster's approval status on the Grade Roster page, as well as a status of *Posted* when the roster is posted.

Reviewing Student Enrollment Detail

Access the Enrollment Detail page (click the Detail link on the Grade Roster page).

Use this page to view detailed information about a student's enrollment. You can view the student's enrollment status, grading basis, units taken, and primary academic program. If you have already entered a grade for the student, you can also view the grade in and official grade.

Reviewing Transcript Notes

Access the Transcript Note page (click the Note link on the Grade Roster page).

Note ID	Enter a value. Note ID values are defined on the Transcript Note Table page.
Transcript Note	Enter free-form text. The system displays this text in addition to the predetermined transcript note ID text.
Transcript Note Sequence Nbr (transcript note sequence number)	The system increments the transcript note sequence number for each row of free-form text. The sequence number determines the order in which the free-form transcript notes appear on the transcript (if they appear).
Incomplete Detail	If you enter a grade of <i>Incomplete</i> on the Grade Roster page, the Incomplete Detail link is available. Click this link to enter data related to an <i>Incomplete</i> grade.

Note: Users cannot add, change, or remove transcript notes from the grade roster after grades are posted. After grades are posted, users can add, change, and remove transcription notes from any one of the administrative enrollment pages and then regenerate the grade roster:

Enrollment: On Student Enrollment 3 page, enter a new note, modify an existing note, or delete a current note.

Enrollment Request: Select the action of *Normal Maintenance* for the class and enter a new note, modify an existing not, or delete a current note. Be sure to submit the transaction.

Quick Enroll: Select the action of *Normal Maintenance* for the class and then, on the Other Class Info page, click Create Transcript Note. Enter a new note, modify an existing note, or delete a current note. Be sure to submit the transaction.

To update the grade roster with the changes to the transcript notes, navigate to the Grade Roster Type page, select Override, and click the Create button to regenerate the grade roster.

Reviewing Student Incomplete Information

Access the Student Incomplete page (click the Incomplete Detail button on the Transcript Note page).

Lapse Deadline and Lapse To Grade	The system populates these fields when you enter a grade of <i>Incomplete</i> . The system creates a student incomplete record when you post the <i>Incomplete</i> grade. However, you can manually enter these values. If the student has an <i>Incomplete</i> grade, you can specify the date for this grade to lapse to another grade. The Grade Lapse process does not overwrite values that are entered manually.
Comment	Enter any comments about the lapse grade. These comments do not appear on the transcript.

[Defining Grade Lapse Rules](#)

Entering Grades Through Self Service

If your institution has licensed PeopleSoft Campus Self Service, your instructors can access grade rosters and enter midterm and final grades directly over the web.

Related Links

"Entering Grades Through Self-Service" (PeopleSoft Campus Solutions 9.2: Self Service)

Entering Grades Through the Self-Service Gradebook

In addition to the grade methods mentioned in the previous section, instructors can use PeopleSoft Gradebook to enter grades for individual assignments, quizzes, and tests, midterm grades, and final grades. PeopleSoft Gradebook is a separately licensed application.

Related Links

"Entering Grades" (PeopleSoft Campus Solutions 9.2: Gradebook)

Posting the Grade Roster

Posting the grade rosters is an important step because it officially assigns final class grades to the students' career term records.

This section provides an overview of posting grades, lists prerequisites, and discusses how to:

- Post grades for a single class.
- Post grades for multiple classes.

Understanding How to Post Grades

You can post grades in these ways:

- Post grades for a single class on the Grade Roster page.
- Post grades for a single class on the Self Service Grade Roster page.
- Post grades for multiple classes on the Grade Post page.

Post Grades for a Single Class

Complete these steps to post grades for a single class:

1. (Optional) To perform a partial post of grades, select the Partial Post check box and click the Post button on the Grade Roster page.

2. To post the entire grade roster, clear the Partial Post check box and click the Post button on the Grade Roster page.

Post Grades on the Self-Service Grade Roster Page

Complete these steps to post grades on the self-service Grade Roster page:

Note: The instructor must have post access to be able to post from Campus Self Service.

1. Assign grades on the Self Service Grade Roster page.
2. Set approval status to approved and save.
3. Click Post.

Post Grades for Multiple Classes

Complete these steps to post grades for multiple classes:

1. Access the Grade Post page and specify the institution, term, and partial post option for which you want to post grades.
2. (Optional) Narrow the batch for which you want to post grade rosters by entering any of the following values:
 - a. *Session*
 - b. *End date*
 - c. *Academic Organization*
 - d. *Subject Area*
3. (Optional) Add rows as needed.
4. Click the Run button.

Prerequisites

Before you can post grades, you must:

- Generate the grade rosters.
- Enter grades on the Grade Roster page or enter grades through the PeopleSoft Gradebook application.

Pages Used to Post Grade Rosters

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Grade Roster Type	GRADE_ROSTER_TYPE	Curriculum Management > Grading > Grade Roster > Grade Roster Type	Click the Post button on the Grade Roster Type page to post grades on a course-by-course basis. For partial posting, select the Partial Post check box before you click the Post button.
Grade Post	RUNCTL_GRD_POST	Curriculum Management > Grading > Grade Post > Grade Post	Post grades for multiple classes. You can post grades for multiple classes within an academic organization or subject area.

Posting Grades for a Single Class

Access the Grade Roster Type page (Curriculum Management > Grading > Grade Roster > Grade Roster Type).

Click the Post button to post grades on a course-by-course basis. For partial posting, select the Partial Post check box before you click the Post button.

Related Links

[Creating Grade Rosters for a Single Class](#)

Posting Grades for Multiple Classes

Access the Grade Post page (Curriculum Management > Grading > Grade Post > Grade Post).

Academic Institution	Select the academic institution for the grade posting. This value determines which terms, sessions, and other field values are available.
Term	Select the term for the grade posting. Term values are defined on the Term Table page.
Session	Select the session for the grade posting. Session is an optional field. Session values are defined on the Session Table page.
Class End Date From and Class End Date To	Select the class end date from and to dates. The system selects rosters to create for classes with an end date that is greater than or equal to the value in the Class End Date From field and less than or equal to the value in the Class End Date To field. Both fields are optional and one may be entered without the other.
Academic Organization	Select either an academic organization or a subject area in which to post grades. Academic organization values are defined on the Academic Organization Table page.

Subject Area

Select either an academic organization or a subject area in which to post grades. Subject area values are defined on the Academic Subject Table page.

Partial Post Option

Select to post only those grades that you enter and save on the roster. Later, you can enter the remaining grades and post those. Values are:

Yes: Select to partially post all rosters in your parameters, regardless of whether or not the rosters are missing grades. The batch grade post process performs a partial post on all grade rosters, regardless of whether you selected the Partial Post check box on the Grade Roster Type page.

No: Select to post only rosters that have a status of *Approved*. This option does not permit reposting of the same roster type.

Note: After the system posts the grades, all statistics accumulate. If any revisions are needed on individual records, you must make these on a student-by-student basis on an enrollment page or on the self-service Grade Roster page, request grade change.

Note: For information about setting up notifications for grade post via Campus Mobile:
 See "Getting Started With Campus Mobile" (PeopleSoft Campus Solutions 9.2: Self Service)
 See "Setting Up Campus Mobile Within Campus Solutions" (PeopleSoft Campus Solutions 9.2: Self Service)
 See "Accessing Campus Mobile Functionality" (PeopleSoft Campus Solutions 9.2: Self Service)
 See "Understanding Notifications" (PeopleSoft Campus Solutions 9.2: Self Service)

Generating Midterm Deficiency Reports and Communications

Important! Letter Generation (Letter Gen) is a deprecated product. Support will be maintained for this product, but no new development will be produced for Letter Gen. It is strongly recommended that you use Communication Generation (Comm Gen) instead. For more information on Comm Gen, see "Using the Communication Generation Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

This section provides an overview of midterm deficiency reporting and discusses how to:

- Generate the midterm deficiency report.
- Generate midterm deficiency letters.

Understanding Midterm Deficiency Reporting

The Mid-Term Deficiency process generates a report that lists students with deficient midterm grades. Deficient grades are those grades with a grade input value that is equal to the value in the Grade Input field on the Mid-Term Deficiency Report page.

Page Used to Monitor Midterm Deficiencies

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Mid-Term Deficiency Report	RUNCTL_SRTRMDEFCNY	Curriculum Management > Grading > Mid-Term Deficiency Report > Mid-Term Deficiency Report	Produce a summary report of all students whose grades are deficient during the midterm for each class.

Generating the Midterm Deficiency Report

Access the Mid-Term Deficiency Report page ((Curriculum Management > Grading > Mid-Term Deficiency Report > Mid-Term Deficiency Report).

The system inserts the IDs of all students with deficient grades into the Communication table so that you can easily identify them and create individual warning letters.

Academic Institution	Select an academic institution for which to evaluate students.
Term	Select a term for the system to use as it searches for student enrollment records. Term values are defined on the Term Table page.
Academic Organization	Select an academic organization for the system to use as it searches for records. Academic organization values are defined on the Academic Organization Table page.
Session	Select a session for the system to use as it searches for records. Session values are defined on the Session Table page.
Class End Date From and Class End Date To	Select the class end date from and to values. The values in these fields further narrow your processing parameters. The system evaluates enrollment records for classes that are active between these dates and within all other parameters you specify.
Campus	Select a campus for the system to use as it searches for records. Campus values are defined on the Campus Table page.
Grading Scheme	Select a grading scheme to prompt for appropriate grades in the Grade Input field. Grading scheme values are defined on the Grading Scheme Table page.
Grade Input	Select the grade that the system should seek to identify whether a student is midterm deficient.

Click Run to run the report using PeopleSoft Process Scheduler. The process populates the Communication table with IDs for students with deficient grades. Later, you can produce a letter to inform them of their status.

Generating Midterm Deficiency Letters

Complete these steps to generate midterm deficiency letters:

1. Set up midterm deficiency keys on the Communication Speed Keys page.

After you set these parameters, you do not have to set them each time you run the report. Select the Administrative Function of *STRM*, which is a delivered value. When defining your communication speed key for midterm deficiency reports, select the method of *letter*; the direction of *out*, and the letter code of *MAD* (Midterm Academic Deficiency).

2. Generate midterm deficiency reports on the Mid-Term Deficiency page.

In addition to generating a report of midterm deficiencies, the report places students with deficiencies into the Communication table so that you can generate a letter informing them of their deficient grades.

The Mid-Term Deficiency report creates one midterm deficiency communication record per student who fits the criteria for having deficiencies. After you run letter generation for letter code *MAD*, the system inserts a row in the corresponding comma delimited (.CSV) extract file for each deficient class for the term. Using Microsoft Word Merge, the system creates a single letter for a student with midterm deficient grades. The letter includes up to 10 classes in which the student is deficient.

If you run the Mid-Term Deficiency report and letter generation again at a later date, Microsoft Word Merge produces student letters that include all previously deficient classes for the term, as well as any newly selected deficient classes.

3. Generate letters on the Letter Generation - General Parameters page.

To generate midterm deficiency report letters, select the letter code of *MAD*.

Running the Grade Lapse Process

This section provides an overview of the grade lapse process and discusses how to:

- Define grade lapse rules.
- Run the grade lapse process.
- View the lapse report results online.

Understanding the Grade Lapse Process

Use the Grade Lapse process to convert posted *In-progress* or *Incomplete* grades to some other grade that you specify. You can define grades as *In-progress* on the Grade Scheme table.

Typically, you run the Grade Lapse process two to three weeks after all grades are entered and posted. Your lapse deadline can be before the processing date.

Complete these steps to run the Grade Lapse process:

1. Define grade lapse rules for your academic programs on the Incomplete page.
2. Enter and post grades for a given time period.
3. Run the Grade Lapse process on the Grade Lapse page.

4. View new, lapsed grades on the Incomplete page.

After you set up your grade lapse rules, you can run the Grade Lapse process at any time. The Grade Lapse process uses the lapse grade that you indicate to populate the Student Incomplete page. Later, you can post the new grade.

Pages Used to Run the Grade Lapse Process

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Repeat/Incomplete	INCOMPLETE_GRADE	Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Repeat/Incomplete	Define grade lapse rules for academic programs. Each rule defines the grade that your incomplete grades lapse to when you run the report and what related transcript notes (if any) appear on a student's transcript.
Grade Lapse	RUNCTL_SR_GRD_LPS	Curriculum Management > Grading > Grade Lapse > Grade Lapse	Enter processing parameters for the Grade Lapse process and to run the process.
Student Incomplete	STDNT_INCOMPLETE	Records and Enrollment > Student Term Information > Student Incomplete > Student Incomplete	Review the Grade Lapse process results for an individual student.

Defining Grade Lapse Rules

Access the Repeat/Incomplete page (Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Repeat/Incomplete).

Image: Repeat/Incomplete page

This example illustrates the fields and controls on the Repeat/Incomplete page. You can find definitions for the fields and controls later on this page.

Incomplete Grade

Enter a value that you define as an incomplete grade for students who are active in this program. This grade lapses to the value in the Lapse To Grade field as a result of the Grade Lapse process *only* if you select the Lapse Grade check box. If you neither select the Lapse Grade check box nor enter a Lapse To Grade value, then the system never lapses the incomplete grade. Grade values are defined on the Grading Scheme Table page.

Lapse Grade

Select to use the lapse grade rules for this incomplete grade. Some incomplete grades may not have lapse rules attached to them (in which case you would leave the Lapse To Grade field blank.) If you do not select this check box, the system does not change incomplete grades to any lapse grade value for classes taken in this academic program, and the lapse transcript note ID does not appear.

Lapse To Grade

Select the lapse to grade value. Grade values are defined on the Grading Scheme Table page.

Lapse Days

Enter the number of days past the fully-graded date that an incomplete grade can stay on a student's record. This value is provided by default from the Term Calendar 3 page to the student career term record during term activation. Lapse days function as a grace period.

For example, assume that at PSUNV the fully-graded date for the undergraduate academic career (*UGRD*), term 0330, regular session (1) is 12/01/01.

If the institutional policy at PSUNV for the LAU academic program allows a student to make up incomplete grades for one month past the term's end, you would enter *30* in the Lapse Days field. When you run the Grade Lapse process, use 1/10/02 as the lapse deadline. This way, you can be sure that all students who might make up an incomplete have done so and that the grades have been entered and posted. The additional 10 days provide you with time to post grades.

Note: Run the grade lapse report after all grades are entered and posted, which can be after your lapse day's deadline.

Lapse Transcript Note ID

Select the transcript note ID for the lapse grade. Transcript note IDs are defined on the Transcript Note Table page.

Print Lapse Date

Select to display the lapse date on the student's transcript. The system uses the lapse days value to generate the lapse date. It does *not* use the lapse process date.

Completed Transcript Note ID

Select the transcript note ID that appears after the student's final grade is posted. Transcript note IDs are defined on the Transcript Note Table page.

Print Completed Date

Select to display the completed date on the student's transcript.

Related Links

"Defining Academic Programs" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Running the Grade Lapse Process

Access the Grade Lapse page (Curriculum Management > Grading > Grade Lapse > Grade Lapse).

The Grade Lapse process converts the original *Incomplete* grade to the lapse grade. In addition, the process creates a report that lists all enrollment request numbers for grades that it lapses.

You should run this process two to three weeks *after* all grades are entered and posted. Your lapse deadline should be before the date you run the process.

Institution

Select the institution that the system uses to limit the scope of the process. The selected value defines which careers are valid.

Career	Select the academic career that the system uses to limit the scope of the process. The system evaluates students with enrollment records for this career.
Term	Select the term that the system should use to limit the scope of the process. The system evaluates students with enrollment records for this career and term.
Lapse Deadline	<p>Select the lapse date deadline to specify the date for grades to lapse (change from their original grade to the <i>lapse to</i> grade). The lapse deadline must be greater than or equal to the fully-graded date plus the lapse days. The fully-graded date is set up on the Term Calendar 3 page, and the system populates this value by default to the student career term record during term activation or during the term activation update process. It is the date that the institution expects to have all grades posted for a particular career, term, and session. Lapse days are defined for an academic program and grade on the Incomplete page in the Academic Program Table component.</p> <p>The Grade Lapse process looks at all of the student incomplete records that meet your processing parameters. It then uses the lapse deadline to determine which students have <i>Incomplete</i> grades on their records and converts those students' grades to the lapse grade value that you define on the Incomplete page in the Academic Program Table component.</p> <p>Subsequent processes pick up any new <i>Incomplete</i> grades that you enter. You can run this process as many times as you need for a specific term and career.</p> <hr/> <p>Warning! The Grade Lapse process does not convert <i>Incomplete</i> grades that you enter on the Student Enrollment 1 page. <i>Incomplete</i> grades that you enter on this page do not have a corresponding row in the incomplete table.</p> <hr/>
Academic Program	Because different programs can have different lapse rules, select the academic program that the system uses to limit the scope of the population to process. Academic Program is an optional field.

Click Run to run this request. PeopleSoft Process Scheduler runs the Grade Lapse process at user-defined intervals.

Running the PSJob on the server generates the Grade Lapse report and automatically posts the transaction.

Viewing the Lapse Report Results Online

Access the Student Incomplete page (Records and Enrollment > Student Term Information > Student Incomplete > Student Incomplete).

Lapse Deadline and Lapse To Grade	The grade post process populates the Lapse Deadline and Lapse To Grade fields. However, you can manually enter these values. If the student has an incomplete grade, you can specify the date for this incomplete grade to lapse to another grade. The process does not overwrite values that you enter manually.
Comment	Enter any comments about the lapse grade. The comments do not appear on the transcript.

Viewing Student Grades and Statistics

When you post grades, the system calculates term statistics. Use the Student Grade Inquiry component to view a student's grades and statistics for the term.

Related Links

[Viewing Term Statistics](#)

Prerequisite

Before you can review term statistics, you must post grades for the term.

Pages Used to View Student Grades and Statistics

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Grade Inquiry	STDNT_GRADE_INQ	Records and Enrollment > Student Term Information > Student Grades > Student Grade Inquiry	Review grades for a student within a term.
Term Statistics	TERM_STATISTICS	Records and Enrollment > Student Term Information > Student Grades > Term Statistics	Review a student's current term statistics.

Auditing Grade Changes

This section provides an overview of grade change audits and discusses how to enter grade change audit search parameters.

Understanding Grade Change Audits

PeopleSoft Campus Solutions provides grade change audit functionality that captures and displays detailed information about grade changes made through online pages, batch processes, and SQL. Specifically, the system tracks and writes an audit record to the grade change audit table for each of these changes:

- Online and self-service changes to the GRADE_INPUT field.
- Batch changes to the GRADE_INPUT field on the Grade Lapse Process page.
- SQL changes to the Grade Input field.

The grade change audit table captures the entire PS_STDNT_ENRL record and stores an image of the record before and after any changes. The system dates and time stamps and also marks each record in the audit table as a before or after image.

Complete these steps to audit grade changes:

1. Enter the parameters that define your audit group on the Grade Change Audit page.
2. Select the View Changes Only check box to see only changes to original grades.
Clear the View Changes Only check box to see both original grades and subsequent grade changes.
3. Click the Search button to retrieve your results.
4. Review the results of your search on the Change Detail, Units and GPA, and Miscellaneous Details tabs.

Prerequisites

To record the grade changes that the Grade Change Audit functionality audits, your IT team must first install and execute delivered SQL trigger files.

"Understanding CS-to-HCM Integration" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Page Used to Audit Grade Changes

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Grade Change Audit	GRADE_AUDIT	Curriculum Management > Grading > Grade Change Audit > Grade Change Audit	Specify grade change audit search parameters and review detailed information about grade changes that match the selection criteria.

Entering Grade Change Audit Search Parameters

Access the Grade Change Audit page (Curriculum Management > Grading > Grade Change Audit > Grade Change Audit).

Note: Multiple views of this page are available by clicking the tabs in the scroll area. We document fields that are common to all views first.

ID

The ID of the student to audit. Leave this field blank to have the system retrieve all values for this field (wildcard).

User ID	The ID of the user to audit. Leave this field blank to have the system retrieve all values for this field (wildcard).
Start Date	Enter the earliest date to audit. Leave this field blank to have the system retrieve all values for this field (wildcard).
End Date	Enter the latest date to audit. Leave this field blank to have the system retrieve all values for this field (wildcard).
View Changes Only	Select this check box to have the system return only those records with an action of <i>After</i> . Clear this check box to have the system return records with an action of <i>Before</i> and <i>After</i> .
Search	Click to retrieve audit data. To refresh the data that the system returns, update the selection criteria and click the button again.

Note: After you click the Search button, the retrieval process begins. If the system finds records in the GRADE_AUDIT table within your search criteria, the system refreshes the data on the Change Detail tab. If the process returns no changes, the fields on the Change Detail tab remain blank.

User ID	Displays the ID of the individual who made changes to the PS_STDNT_ENRL record.
ID	Displays the ID of the student whose grade changed.
Date/Time	Displays when a user made changes to the PS_STDNT_ENRL record.
Action	Displays the state of the change record. Values are: <i>Before:</i> The image of the record before it was updated. <i>After:</i> The image of the record after it was updated.

All remaining columns on the Units and GPA tab and the Miscellaneous Detail tab display a subset of columns from the Grade Audit table, which stores a snapshot of the student's record in the PS_STDNT_ENRL table.

Graduating Students

Tracking Graduation Progress

This section discusses how to:

- Track individual candidate progress.
- Review graduation status history.
- Update academic program for a group of students.
- Track candidate group progress.

Pages Used to Track Graduation Progress

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Graduation Tracking	SSR_STDNT_GRAD	Records and Enrollment > Graduation > Graduation Tracking	Determine if a student has completed all the requirements necessary to receive his or her degree.
Graduation Status History	SSR_STDGRD_HIST_SP	Click the View Status History button on the Graduation Tracking page.	View an audit trail of all graduation status changes to a student record.
Graduation Processing	SSR_RUNCTL_GRADRPT	Records and Enrollment > Graduation > Graduation Processing	Manage the degree checkout process for a group of students.
Graduation Tracking Batch	SSR_RUNCTL_GRADTRK	Records and Enrollment > Graduation > Graduation Tracking Batch	Create and update graduation tracking data for a group of students.

Track Individual Candidate Progress

Access the Graduation Tracking page (Records and Enrollment > Graduation > Graduation Tracking).

Image: Graduation Tracking page: Cumulative Units tab

This example illustrates the fields and controls on the Graduation Tracking page: Cumulative Units tab. You can find definitions for the fields and controls later on this page.

Graduation Tracking

Mary Fernwood SRGR0001

Statistics: Personalize | Find | View All | First 1 of 1 Last

Term	Acad Level Projected	Taken for Progress	Passed for Progress	Taken Toward GPA	Passed Toward GPA	Taken Not Toward GPA	Passed Not Toward GPA	In Progress GPA	In Progress Not for GPA
0700	Senior	114.000	99.000	99.000	99.000			15.000	

The sections that appear on this page are configured on the Institution Table page. The Academic Plan group box displays all plans for the student's career/student career number identified at the top of the page. If the student has more than one degree in the career/student career number, all plans appear under each degree.

The information displayed in the statistics section are from the student career term record that is less than or equal to the expected graduation term. The Cumulative Units tab displays a summary of the status of all units taken by the student in a term.

Update Graduation Status Select this check box to open a new Graduation Review Status field for entry of a new status.

View Status History Click this button to access the Graduation Status History page.

The Cumulative GPAs tab displays all GPAs for a student.

The Transfer Credit tab displays posted units for transfer, test and other credit.

The Class Information tab displays classes that do not have a grade or have a grade that is set up as an incomplete grade for which the student is enrolled. If a class needs to be tracked during the graduation review process, enter a Grad Note on that class. If the class is dropped (after the drop retain date) or once the class is graded, it still appears in this section, due to the Grad Note.

Select Display Option Select *Show All* to display all enrollments, or select *Limited View* to display only ungraded ones.

Enter any free-form text" - add this "In the Milestones, Graduation Notes, Honors, Special GPA section of the page, enter any free-form text in the Comment field for the graduation reviewer. If the student is eligible for any honors at graduation, enter an Honors Code.

Reviewing Graduation Status History

Access the Graduation Status History page (click the View Status History button on the Graduation Tracking page).

Updating Academic Program for a Group of Students

Access the Graduation Processing page (Records and Enrollment > Graduation > Graduation Processing).

Image: Graduation Processing page (1 of 2)

This example illustrates the fields and controls on the Graduation Processing page (1 of 2). You can find definitions for the fields and controls later on this page.

This example illustrates the fields and controls on the Graduation Processing page (2 of 2). You can find definitions for the fields and controls later on this page.

The screenshot displays a web form titled "Program/Degree Update Options". It contains several sections:

- Program/Degree Update Options:**
 - New Degree Checkout Status: Degree Awarded (dropdown)
 - Action Reason: Successful Completion (dropdown)
 - Completion Term: 0650 (input) 2010 Fall (input)
 - Program Effective Date: User Date (dropdown)
 - User Defined Date: 02/15/2011 (calendar icon)
 - Confer Date Option: User Date (dropdown)
 - Confer Date: 02/15/2011 (calendar icon)
- Update Degree Values:**
 - Degree GPA: No GPA (dropdown) [Update Degree Values button]
 - Degree Honors 1: (dropdown)
 - Degree Honors 2: (dropdown)
- Report Options:**
 - Create Transcript Request
 - Create Academic Advisement Req

This page enables you to update academic program information for multiple students; you can either click the Add Students link to enter student IDs or create a list using the Population Selection process.

Select the Population Selection option to use flexible methods to load audience data into the system. This group box expands when the Population Selection process is selected.

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool (such as PS Query) to identify IDs for a specific transaction, you must use it.

See "Understanding the Population Selection Group Box" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Load Selection Results

Select this link to populate the Selection Results section with the student list created during the Population Selection process. At this point, you can exclude a student. When you are ready to award the degree, you can update the Degree GPA and the Honors 1 and Honors 2 fields using the Update Degree Values. The fields can also be manually updated.

Graduation Process Action	Select an action: <i>Degree Checkout Status</i> , <i>Expected Graduation Status</i> , <i>Reports Only - Transcripts/AA</i> , or <i>Update All</i> . These are delivered values.
New Degree Checkout Status	Select a status to be applied to the IDs: <i>Applied for Graduation</i> , <i>Approved</i> , <i>Denied</i> , <i>Needs to Finish Pending Work</i> , <i>Program in Review</i> , <i>Review in Progress</i> , <i>Withdrawn</i> , <i>Degree Awarded</i> , and <i>Eligible for Graduation</i> . When the degree checkout status is <i>Degree Awarded</i> , the <i>Action Reason</i> , <i>Completion Term</i> , <i>Program Effective Date</i> , and <i>Confer Date Option</i> fields become available. For all other degree checkout status values, the <i>Action Reason</i> , <i>New Expected Grad Term</i> , and <i>Expected Grad Term Option</i> fields become available.
Program Effective Date, Confer Date Option	Values for these fields are: <i>Confer Dt</i> (Confer Date), <i>Today</i> , or <i>User Date</i> . The <i>Confer Dt</i> is the date defined in the Academic Calendar.
Create Transcript Request	Select this check box to create transcript requests for the population defined. You must also select the transcript type.
Create Academic Advisement Req	Select this check box to create an academic advisement report for the population selected. You must also select a report identifier, report date, as of date and advisement report type.

When you click the Run button, the system takes the student group created using Population Selection and inserts a new row into the Academic Program table for each student; depending on the degree checkout status, either a new data row is inserted or a completion row (Degree Awarded) and the action reason selected on this page.

Tracking Candidate Group Progress

Access the Graduation Tracking Batch page (Records and Enrollment > Graduation > Graduation Tracking Batch).

Use the Population Selection process to create a graduation tracking row for a student or update an existing row. Graduation Review Status values are defined by your institution.

To add graduation review notes to students' graduation tracking, select a Graduation Review Note and a text note.

Posting Degrees

The process of posting degrees requires that you update student program records and, if necessary, report and audit degree changes. This section provides an overview of the degree posting process, lists prerequisites, and discusses how to:

- Complete the student's program.

- Verify and update student degree data.
- View and modify degree data.
- View and modify degree honors data.
- View and modify degree plan data.
- View and modify degree subplan data.

Understanding the Degree Posting Process

To post a degree:

1. Insert a new row and enter a program action of *Completion of Program* on the Student Program page.
This sets the Degree Checkout Stat (degree checkout status) field on the Student Degrees page to *Approved*.
2. (Optional) On the Student Degrees page, verify the completion term, specify degree honors, and enter a degree grade point average (GPA).
3. Click the Update Degrees button on the Student Program page to post the degree.
This sets the Degree Checkout Stat field to *Awarded*.
4. (Optional) When the process finishes, you can view and edit posted degrees through the Student Degrees component.
 - a. View and modify degree honors information on the Degree Honors page.
 - b. View and modify degree plan information on the Degree Plan page.
 - c. View and modify subplan information on the Degree Sub-Plan page.
5. (Optional) Use the Degree Change Audit component to audit any degree status changes.
See [Auditing Degree Changes](#).

Prerequisites

Before you can post a student's degree, you must:

- Define degrees and degree honors.
- Assign degrees to academic plans.
- Matriculate the student, or confirm that the student has a history of matriculation.

Pages Used to Post Degrees

Page Name	Definition Name	Navigation	Usage
Student Program	STDNT_PROG	Records and Enrollment > Career and Program Information > Student Program/Plan > Student Program	Insert a new row and update the Program Action field value to a status of <i>Completion of Program</i> .
Student Degrees	STDNT_DEGR	Records and Enrollment > Career and Program Information > Student Program/Plan > Student Degrees	Verify and update a student's completion term, degree honors, degree GPA, and degree checkout status.
Degree	ACAD_DEGREE	Records and Enrollment > Graduation > Student Degrees > Degree	View and modify posted degree data.
Degree Honors	ACAD_DEGREE_HONORS	Records and Enrollment > Graduation > Student Degrees > Degree Honors	View and modify degree honors information, which is particularly useful when you want to award more than two honors code values to a student (there is a limit of two honors codes on the Student Degrees page).
Degree Plan	ACAD_DEGREE_PLAN	Records and Enrollment > Graduation > Student Degrees > Degree Plan	View and modify degree plan information.
Degree Sub-Plan	ACAD_DEGREE_SUBPLN	Records and Enrollment > Graduation > Student Degrees > Degree Sub-Plan	View and modify subplan information.

Completing the Student's Program

Access the Student Program page (Records and Enrollment > Career and Program Information > Student Program/Plan > Student Program).

Program Action

Insert a new row in this field, and select a value of *Completion of Program*.

Note: If you must revoke a degree after it has been awarded, insert a row and enter a program action of *Revoke Degree*. The system automatically updates the degree tables.

Related Links

[Pages Used to Manage Student Program Stacks](#)

Verifying and Updating Student Degree Data

Access the Student Degrees page (Records and Enrollment > Career and Program Information > Student Program/Plan > Student Degrees).

Degree Checkout Stat (degree checkout status)

Throughout a student's degree history, you can progressively update the values in this field. Values are: *Applied*, *Approved*, *Awarded*, *Denied*, *In review*, *Pending*, and *Withdrawn*.

When you select the status of *Completion of Program* in the Program Action field on the Student Program page, the system populates the Degree Checkout Stat field here to *Approved*; you cannot modify this value. The system changes this status from *Approved* to *Awarded* when you click the Update Degrees button. When you click this button, all fields on this page become unavailable. You must complete future edits on the Degree page, or you can revoke the degree altogether by inserting a new row in the Program Action field on the Student Program page and selecting a value of *Revoke Degree*.

Completion Term

Enter the term in which the degree is awarded.

Degree Honors 1 and Degree Honors 2

If applicable, select a value from the list of values that you defined on the Degree Honors Table page.

Degree GPA (degree grade point average)

Enter the degree GPA. When you click the Update Degrees button, the GPA and degree honors are stored on the student's degree records.

Although the system does not calculate this value, you can create an academic advising report to assist you with calculating the value.

Viewing and Modifying Degree Data

Access the Degree page (Records and Enrollment > Graduation > Student Degrees > Degree).

Degree Number

The system generates the degree number, which is unique for each degree that you assign to a student.

Degree and Institution

These values appear by default from the Student Degrees page. You cannot override these values after degree posting is complete. The degree appears on the transcript if you specify a *Local Degrees* print area on the Transcript Type - Degrees/Program page.

Primary Career, Completion Term, Confer Date, Degree Status and Degree GPA

These values appear by default from the Student Degree page. The Confer Date defaults to the Confer Date for student's completion term. You can override the values.

Degree Status Date

This date appears by default from the effective date for the *Completion* row on the Student Program page.

Prefix and Suffix

Select from those prefixes and suffixes that you defined on the Degree Honors Table page. Only those honors with a type of *Degree Prefix* and *Degree Suffix*, respectively, are available.

The prefix and suffix appears with the degree description on the transcript if you specify a *Local Degrees* print area on the Transcript Type - Degrees/Program page.

Class Rank and Of

Enter class rank values for the student's degree. The class rank information appears with the degree description on the transcript if you specify a *Local Degrees* print area and select the Print Degree Rank check box on the Transcript Type - Degrees/Program page.

Viewing and Modifying Degree Honors Data

Access the Degree Honors page (Records and Enrollment > Graduation > Student Degrees > Degree Honors).

Honors Number

The system generates the honors number and uses this value for sequencing honors on the transcript.

Honors Code

If available, this value appears by default from the Student Degrees page. Add rows to select additional honors for the degree. Honors values are defined on the Degree Honors Table page.

Award Date

This value appears by default from the Confer Date field on the Degree page.

See "Setting Up Term Landmark Dates" (PeopleSoft Campus Solutions 9.2: Application Fundamentals).

Print on Diploma

No programming is tied to this check box.

Print on Transcript

Select this check box to display the honors value on the student's transcript. For the degree honors information to appear on the transcript, you must also specify a *Local Degrees* print area and select the Print Degree Honors check box on the Transcript Type- Degrees/Program page.

Warning! Changes to this page do not post to a student's record. You must post honors to the student's record by running the posting process using the Academic Standing/Honors and Awards page. When you run the process, select the Calculate Honors & Awards check box to calculate honors and awards.

Viewing and Modifying Degree Plan Data

Access the Degree Plan page (Records and Enrollment > Graduation > Student Degrees > Degree Plan).

Plan Seq (plan sequence)

This value defines the primacy of the plan within the program.

Career	The career to which the degree is assigned.
Career Nbr (career number)	The specific career number to which the degree is assigned. The system increments this number for each active program in the same career.
Acad Plan (academic plan)	The academic plan to which the degree is assigned.
Degr Stat (degree status)	The status of the degree: <i>Awarded</i> and <i>Revoked</i> . You can override the degree status. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort.
Degr Dt (degree date)	The effective date from the Student Program page, where the program action is <i>Completion of Program</i> .
Plan Type	The type of plan, as defined on the Academic Plan Table page.
Override	Select this check box to revise the transcript description and the diploma description.
Transcript Description	The description of the plan degree to appear on the transcript. The plan transcript description appears on transcripts where you specify a <i>Local Degrees</i> print area on the Transcript Type - Degrees/Program page.
Diploma Description	No programming is tied to this field.
Honors Prefix	Specify an honors prefix for this plan degree, if any. Honors prefix values are defined with a type of <i>Degree Plan Prefix</i> on the Degree Honors Table page. The plan honors prefix appears next to the plan degree on transcripts where you specify a <i>Local Degrees</i> print area on the Transcript Type - Degrees/Program page.
Honors Suffix	Specify an honors suffix for this plan degree, if any. Honors suffix values are defined with a type of <i>Degree Plan Suffix</i> on the Degree Honors Table page. The plan honors suffix appears next to the plan degree on transcripts where you specify a <i>Local Degrees</i> print area on the Transcript Type - Degrees/Program page.
Plan GPA (plan grade point average)	The system does not calculate the plan GPA value, although you can create an academic advising report to assist you with the calculation. The plan GPA appears with the plan degree on transcripts where you specify a <i>Local Degrees</i> print area and select the Print Degree Plan GPA check box on the Transcript Type - Degrees/Program page.
Plan Rank and Of	Enter plan rank values for the student's plan. The plan rank information appears with the plan degree description on the transcript if you specify a <i>Local Degrees</i> print area and select

the Print Degree Plan Rank check box on the Transcript Type - Degrees/Program page.

Viewing and Modifying Degree Subplan Data

Access the Degree Sub-Plan page (Records and Enrollment > Graduation > Student Degrees > Degree Sub-Plan).

Academic Sub-Plan	The academic subplan associated with the plan degree.
Sub-Plan Seq (subplan sequence)	The sequence number for the subplan. This value defines the primacy of the subplan within the plan.
Override	Select this check box to revise the transcript description and the diploma description.
Transcript Description	The subplan transcript description appears on transcripts where you specify a <i>Local Degrees</i> print area and select the Print Degree Sub-Plan check box on the Transcript Type - Degrees/Program page.
Diploma Description	No programming is tied to this field.
Honors Prefix	Specify an honors prefix for this subplan degree, if any. Honors prefix values are defined with a type of <i>Degree Sub-Plan Prefix</i> on the Degree Honors Table page. The subplan honors prefix appears next to the subplan degree on transcripts where you specify a <i>Local Degrees</i> print area and select the Print Sub-Plan check box on the Transcript Type - Degrees/Program page.
Honors Suffix	Specify an honors prefix for this subplan degree, if any. Honors suffix values are defined with a type of <i>Degree Sub-Plan Suffix</i> on the Degree Honors Table page. The subplan honors suffix appears next to the subplan degree on transcripts where you specify a <i>Local Degrees</i> print area and select the Print Sub-Plan check box on the Transcript Type - Degrees/Program page.

Automating Graduation Processing and Reporting

The Graduation Processing and Reporting feature, which is run through the Graduation Reporting component, facilitates the degree checkout process. The feature works as a part of core functionality, and it works as an integrated complement to the PeopleSoft Campus Self Service application (through which students can use self-service pages to apply for graduation).

Using the Graduation Processing and Reporting feature, you can dynamically define a student population, and for this population you can:

- Update degree checkout status values (from a valid status that you specify to another status that you specify).

- Create requests for transcripts, degree audits, and special advisement reports.
- Generate a graduation report.

This section provides an overview of the graduation reporting process, lists prerequisites, and discusses how to:

- Enter graduation report parameters.
- Retrieve the student population.

Understanding the Graduation Reporting Process

To run the graduation reporting process:

1. Select the Student Population check box, and enter your student population selection criteria on the Graduation Reporting page.
2. Click the Run button to run the Graduation Reporting process.
3. Click the Fetch button on the Selection Results page in order to populate the page with your resultant student population.
4. Delete rows to remove students that you do not want to process.

Insert rows to add students that did not match your parameters, but whom you want to process.

5. Navigate to the Graduation Reporting page and clear the Student Population check box.
6. Select the run option check boxes and their respective data.

For example, select the Update Program and Degrees check box, and provide the information required in the Program/Degree Update Options group box, including the new degree checkout status, completion term, and program effective date.

7. Click the Run button and run the Graduation Reporting process.

If you run a report, you should use a type of *Web* and a format of *PDF*.

8. After the process finishes, you can do the following:
 - a. Navigate to the Transcript Generation page to generate transcripts (use the transcript request number on the Graduation Reporting page).
 - b. Navigate to the Student Degrees page or the Degrees page to view updated degree checkout status values.
 - c. Review the Graduation report.

Prerequisites

If you plan to create transcript requests, you must first define transcript types in the Define Transcript Type component.

[Defining Transcript Types](#)

Pages Used to Automate Graduation Processing and Reporting

Page Name	Definition Name	Navigation	Usage
Graduation Report	RUNCTL_GRAD_RPT	Records and Enrollment > Graduation > Graduation Report > Graduation Report	<p>Enter graduation report parameters: define a population of students for which you can update degree checkout status values, create transcript requests, and generate graduation reports.</p> <p>For example, when a student applies for graduation through the self-service Apply for Graduation feature, the system sets that student's degree checkout status to <i>Applied</i>. You can use the Graduation Reporting component to set all students with a status of <i>Applied</i> to <i>In Review</i>.</p>
Selection Results	RUNCTL_GRAD_RPT2	Records and Enrollment > Graduation > Graduation Report > Selection Results	Retrieve the results of your population query, add or delete students, and edit the degree GPA and degree honors for each student.

Entering Graduation Report Parameters

Access the Graduation Report page (Records and Enrollment > Graduation > Graduation Report > Graduation Report).

Run Options

Select Population

The first step to using the Graduation Reporting component is entering selection criteria and fetching a student population.

Select this check box to enable the fields that define your student population in the Selection Criteria group box. After you enter all of your parameters, click the Run button to run the Graduation Reporting process. View your student population on the Selection Results page, where you can add or delete students.

Note: The process does not select students with a current program action of Admission Revocation, Defer Enrollment, Discontinuation, Suspension, or Administrative Withdrawal.

Update Programs and Degrees

After you enter your selection criteria and fetch your population, select this check box to enable the fields in the Program/Degrees Update Options group box and enter your update data.

After you specify your update data, click the Run button to run the Graduation Reporting process to update program and degree information for the students in your population. Specifically, this process updates for all students in your population the student career term records with the values from:

- The Program/Degree Update Options group box on this page.
- The Degree GPA and Degree Honors fields on the Selection Results page.

Create Transcript Request

After you enter your selection criteria and fetch your population, select this check box to enable the fields in the Transcript Request Options group box and to enter your transcript type data. After you specify your data, run the Graduation Reporting process to create a batch transcript request for the students in your population. Next, generate the transcripts on the Transcript Generation page.

Generate Report

After you enter your selection criteria and fetch your population, select this check box and run the process to create a report that highlights all of the graduation data for the students in your population.

Selection Criteria**Academic Institution**

The academic institution of the students you want to fetch.

Academic Career

The academic career of the students you want to fetch.

Degree Checkout Status

The current degree checkout status of the students to fetch: *Applied, Approved, Denied, In Review, Pending, or Withdrawn.*

Academic Program 1, Academic Program 2, and Academic Program 3

You can enter up to three academic programs within the career you specify to identify the students you want to fetch. If any fields are left blank, the system fetches all students in the career you specify.

Expected Graduation Term

The expected graduation term of the students to fetch. The system verifies this value against the value in the Expected Grad Term (expected graduation term) field on the Student Program page. This field is optional.

Program/Degree Update Options**New Degree Checkout Status**

When you select the Update Programs and Degrees check box, the New Degree Checkout Status field becomes available.

Specify the degree checkout status that you want to assign to all students in your population: *Approved*, *Awarded*, *Denied*, *In review*, *Pending*, or *Withdrawn*. For a new checkout status of *Awarded*, the system inserts a new effective-dated row on the Student Program page with a program action of *Completion of Program*. For all other checkout status values, the system inserts a new effective-dated row on the Student Program page with a program action of *Data Change*. The system does not specify a program action reason.

Completion Term

When you select a New Degree Checkout Status field value of *Awarded*, you must specify the completion term that you want the system to assign to students in your population.

Program Effective Date

The field becomes available when you select the New Degree Checkout Status field value of *Awarded*. Select the value that you want assigned as the effective date for the student's academic program upon awarding the student's degree (that is, upon setting the program action to *Completed* and the Degree Checkout Status to *Awarded*.)

Values are:

Confer Date: Select to use the confer date (defined on the academic calendar) as the student's program completion effective date.

If, however, the confer date is prior to the current program effective date, the process assigns today's date as the program effective date, not the confer date. For example, the student applied for graduation on September 1, 2009 and you are trying to confer the degree for a prior term (such as Spring 2009); the process then assigns today's date (the system date) as the student's academic program effective date.

Today's Date: This is the default value whereby the process assigns today's date (the system date) as the program effective date. If the current program effective date is also today's date, then the process assigns a new effective sequence number with today's date. For example, if the student applies for graduation today, and you run the process to award the degree with today's date, the program effective date remains today's date and the process inserts an incremental effective sequence with the number of "2."

User Defined: Select this value if you want to define the date that should be used as the program effective date. Then select a date in the User Defined Date field.

User Defined Date

If you select the Program Effective Date field value of *User Defined*, select a date.

Note: If the user-defined date is prior to the current program effective date, the process assigns today's date as the program effective date, not the user-defined date.

Transcript Request Options

Elements in this group box are available when you select the Create Transcript Request check box.

Transcript Request Nbr (transcript request number)	The system generates and displays the number of your transcript request after you specify your transcript options and run the Graduation Reporting process. Use this number to generate transcripts on the Transcript Generation page.
Transcript Type	Specify the type of transcript to create for all students in your population.
Transcript default as of date	When you select a transcript type that is also an advising report (special or standard), this field becomes available. A value appears by default from the Transcript Default Date field on the Installation Student Administration page. You can override it.
Database Report	When you select a transcript type that is also an advising report (special or standard), this check box becomes available. Select this check box to create a transcript request where the results of the advising report populate the analysis database tables.

Retrieving the Student Population

Access the Selection Results page (Records and Enrollment > Graduation > Graduation Report > Selection Results).

Fetch	Click to populate the page with your student population. If no students appear, either no students match your selection criteria, or you did not run the Graduation Reporting process.
Add a Student	Click to access the Add Student page where you can search for other student IDs within the career that you have specified. Only students that are active in their program are available.
Student ID	The ID of the student in the population.
Name	The name of the student in the population.
Academic Program	The academic program of the student in the population. If a student is active in more than one program in the career you

	specify, the selection returns all instances. You can delete program instances as necessary.
Primary Academic Plan	The primary academic plan of the student.
Degree	The degree that is associated with the program and primary plan of the student.
Degree Checkout Status	The student's degree checkout status prior to the update degree checkout status process. The system reads this value from the Student Degrees page.
New Degree Checkout Status	The student's degree checkout status of the student after the update degree checkout status process. The system reads this value from the Student Degrees page.
Degree GPA (degree grade point average)	Enter a degree GPA on one of three pages: the Selection Results page (prior to program completion/degree checkout status of <i>Awarded</i>), the Student Degrees page (prior to program completion or degree checkout status of <i>Awarded</i>), or the Degrees page (after program completion).
Degree Honors 1 and Degree Honors 2	The student's degree honors for this degree. The values appears from the Student Degrees page. Enter degree honors on one of three pages: the Selection Results page (prior to program completion/degree checkout status of <i>Awarded</i>), the Student Degrees page (prior to program completion/degree checkout status of <i>Awarded</i>), or the Degrees page (after program completion).

Auditing Degree Changes

This section provides an overview of degree change audits, lists prerequisites, and discusses how to:

- Enter degree change audit search parameters.
- View degree change audit results.
- View degree honors change audit results.
- View degree plan change audit results.
- View degree subplan change audit results.

Understanding Degree Change Audits

Degrees are among the most sensitive data within the Student Records application. As such, Campus Solutions offers Degree Change Audit functionality that captures and displays detailed information about student degree postings or changes to postings. Changes include online changes to the Student Degrees page that occur when you click the Update Degrees button on the Student Degrees page and

changes to any of the pages in the Student Degrees component. Inserts, updates, or deletions on these pages cause the system to write an audit record to the degree change audit table. The degree change audit table captures the entire record for ACAD_DEGR, ACAD_DEGR_HONS, ACAD_DEGR_PLAN, and ACAD_DEGR_SPLN, storing an image of each record before and after any change. The system date/time stamps and marks each record in the audit table as an "insert" or "delete," or as a "before" or "after" in the case of updates.

Use the Degree Change Audit component to search your database for details about degree changes. An option on the Search Criteria page enables you to filter out the "before" image.

Prerequisites

To record the degree changes that the Degree Change Audit functionality audits, your IT team must first install and execute delivered SQL trigger files.

To view degree changes, you must first click the Search button on the Search Criteria page.

Pages Used to Audit Degree Changes

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Degree Change Audit - Search Criteria	DEGREE_AUDIT	Records and Enrollment > Graduation > Degree Change Audit > Search Criteria	Define your degree change audit search parameters. All of the fields on this page are optional.
Degree	AUD_ACAD_DEGR	Records and Enrollment > Graduation > Degree Change Audit > Degree	Review detailed information about degree changes that match the selection criteria specified on the Search Criteria page. The elements on this page are the same as those found on the Degree page.
Degree Honors	AUD_ACAD_DEGR_H	Records and Enrollment > Graduation > Degree Change Audit > Degree Honors	Review detailed information about changes to degree honors that match the selection criteria specified on the Search Criteria page.
Degree Plan	AUD_ACAD_DEGR_P	Records and Enrollment > Graduation > Degree Change Audit > Degree Plan	Review detailed information about degree plan changes that match the selection criteria specified on the Search Criteria page.

Page Name	Definition Name	Navigation	Usage
Degree Subplan	AUD_ACAD_DEGR_S	Records and Enrollment > Graduation > Degree Change Audit > Degree Subplan	Review detailed information about degree subplan changes that match the selection criteria specified on the Search Criteria page. The elements of all four tabs on this page are the same as those found on the Degree Sub-Plan page.

Entering Degree Change Audit Search Parameters

Access the Degree Change Audit - Search Criteria page (Records and Enrollment > Graduation > Degree Change Audit > Search Criteria).

ID	The ID for the student who you want to audit. Leave this field blank to have the system retrieve all values for this field (wild card).
User ID	The ID for the user who you want to audit. Leave this field blank to have the system retrieve all values for this field (wild card).
Start Date	The earliest date to audit. Leave this field blank to have the system retrieve all values for this field (wild card).
End Date	The latest date to audit. Leave this field blank to have the system retrieve all values for this field (wild card).
View Changes Only	If cleared, the system returns all records with an action of <i>Insert</i> , <i>Before</i> , <i>After</i> , or <i>Delete</i> . If selected, the system does not return records with an action of <i>Before</i> and returns only records with an action of <i>Insert</i> , <i>After</i> , or <i>Delete</i> .
Search	After you enter your search parameters, click this button to return audit data to the Degree page. To change the data that the system returns, update the selection criteria and search for data again.

Note: When you click the Search button, the retrieval process begins. If the system finds changes to any of the records within your search criteria, the system automatically takes you to the first page where changes exist. If no changes are found, the system remains on the Search Criteria page.

Viewing Degree Change Audit Results

Access the Degree page (Records and Enrollment > Graduation > Degree Change Audit > Degree).

Note: Multiple views of this page are available by clicking the tabs in the scroll area. We document fields common to all views first.

User ID The ID of the individual who made changes to the ACAD_DEGR record. For rows where the action is *Delete*, no user ID appears. This is because when a record is deleted from the database, although the trigger can track that the record has been deleted, it cannot track the user ID of the person who deleted it. When deletes occur, the character string "*****" appears in the User ID field.

Date/Time When changes to the ACAD_DEGR record were made.

Action Action types include the following:

Insert: User inserted a new row (a row was added to the database).

Delete: User deleted a row out of the database. For rows where the action is *Delete*, no user ID appears. This is because when a record is deleted from the database, although the trigger can track that the record has been deleted, it cannot track the user ID of the person who deleted it. When deletes occur, the character string "*****" appears in the User ID field.

Before: Image of the record before it was updated.

After: Image of the record after it was updated.

ID The ID of the student whose degree was changed.

Degree Nbr (degree number) Students can have more than one degree, and each degree is assigned a degree number.

Degree The student's degree.

Institution The academic institution associated with the degree.

Completion Info Tab

Select the Completion Info tab.

Career The career under which the student earns the degree.

Completion Term The completion term of the degree.

Confer Date The date the degree was conferred. This is the date when the degree is official.

Degr Stat (degree status) The status of the degree. Choices are *A* (active) and *R* (revoked).

Degr Dt (degree date) The date the degree is updated to a status of awarded or revoked. This date may differ from the actual confer date.

Honors/Rank Tab

Select the Honors/Rank tab.

Hon Prefix (honors prefix)	The degree honors prefix for the degree.
Hon Suffix (honors suffix)	The degree honors suffix for the degree.
Degree GPA (degree grade point average)	The degree grade point average.
Class Rank Of	The student's class rank and class size.

Viewing Degree Honors Change Audit Results

Access the Degree Honors page (Records and Enrollment > Graduation > Degree Change Audit > Degree Honors).

Note: Multiple views of this page are available by clicking the tabs in the scroll area. We document fields common to all views first.

User ID	The ID of the individual who made changes to the ACAD_DEGR_HONS record. For rows where the action is <i>Delete</i> , no user ID appears. This is because when a record is deleted from the database, although the trigger can track that the record has been deleted, it cannot track the user ID of the person who deleted it. When deletes occur, the character string "*****" appears in the User ID field.
Date/Time	When changes to the ACAD_DEGR_HONS record were made.
Action	Action types include the following: <i>Insert:</i> User inserted a new row (a row was added to the database). <i>Delete:</i> User deleted a row out of the database. For rows where the action is <i>Delete</i> , no user ID appears. This is because when a record is deleted from the database, although the trigger can track that the record has been deleted, it cannot track the user ID of the person who deleted it. When deletes occur, the character string "*****" appears in the User ID field. <i>Before:</i> Image of the record before it was updated. <i>After:</i> Image of the record after it was updated.
ID	The ID of the student whose degree was changed.
Degree Nbr (degree number)	Students can have more than one degree, and each degree is assigned a degree number.

Honors Info Tab

Select the Honors Info tab.

Honors Nbr (honors number)	Students can have multiple honors for each degree. Each honors value has a unique number.
Hon Code (honors code)	The honors code associated with the degree.
Award Date	The date the honor was awarded.
Diploma	The setting of the Print on Diploma check box on the Degree Honors page. The check box status values are <i>Y</i> for selected, and <i>N</i> for cleared.
Transcript	The setting of the Print on Transcript check box on the Degree Honors page. The check box status values are <i>Y</i> for selected, and <i>N</i> for cleared.

Viewing Degree Plan Change Audit Results

Access the Degree Plan page (Records and Enrollment > Graduation > Degree Change Audit > Degree Plan).

User ID	The user ID of the individual who made changes to the ACAD_DEGR_PLAN record. For rows where the action is <i>Delete</i> , no user ID appears. This is because when a record is deleted from the database, although the trigger can track that the record has been deleted, it cannot track the user ID of the person who deleted it. When deletes occur, the character string "*****" appears in the User ID field.
Date/Time	When changes to the ACAD_DEGR_PLAN record were made.
Action	Action types include the following: <i>Insert:</i> User inserted a new row (a row was added to the database). <i>Delete:</i> User deleted a row out of the database. For rows where the action is <i>Delete</i> , no user ID appears. Degree Nbr (degree number)	Students can have more than one degree, and each degree is assigned a degree number.

Acad Plan (academic plan)

All plans associated with the degree.

Career/Degree Tab

Select the Career/Degree tab.

Career

The career under which the student earns the degree.

Career Nbr (career number)

The number of the career associated with the degree. For students with more than one program in a single career, this number increments from zero.

Degr Stat (degree status)

The status of the degree. Choices are *A* (active) and *R* (revoked).

Degr Dt (degree date)

The date the degree is updated to a status of awarded or revoked. This date may differ from the actual confer date.

Override

This represents the setting of the Override check box on the Degree Plan page.

Descriptions Tab

Select the Descriptions tab.

Dipl Descr (diploma description)

The academic plan diploma description, if different from the default.

Trns Descr (transcript description)

The academic plan transcript description, if different from the default.

Honors/Rank Tab

Select the Honors/Rank tab.

Hon Prefix (honors prefix)

The degree honors prefix for the plan.

Hon Suffix (honors suffix)

The degree honors suffix for the plan.

Degree GPA (degree grade point average)

The plan grade point average.

Class Rank Of

The student's class rank and class size.

Plan Seq (plan sequence)

The number of the plan within the program.

Producing Transcripts

Understanding Transcript-Related Processes

Important! The COBOL transcript process is a deprecated product. Support will be maintained for this product, but no new development will be produced for the COBOL transcript process. It is strongly recommended that you use the Application Engine transcript process instead. For more information on the Application Engine transcript process.

Two distinct processes are available to create transcripts. One transcript process uses COBOL to generate the transcript and Crystal reports to print the transcript. The other transcript process generates transcripts using Application Engine, creates detailed results tables, and uses XML to produce the report in PDF format. The processes have separate and distinct transcript type setup and processing pages. These transcript processes were not designed to be in production concurrently. The control of which process creates transcripts is determined by the security granted to the components.

After you have set up transcript notes, transcript types, and transcript type security, you're ready to create transcript requests and process transcripts. The PeopleSoft Transcript feature enables you to define multiple types of transcripts at varying levels of security, formality, appearance, and function. You can produce transcripts for individual students or for dynamically created groups of students that meet criteria you specify. You can process transcripts online or in the background at scheduled intervals, and you can send the results to a file, a window, or a printer. Finally, the Transcript feature includes a purge process that enables you to delete transcript results and requests. Purging transcripts periodically is a maintenance practice that enhances system performance.

If you are using the COBOL process to create transcripts, the choices you have for producing transcripts are the same as those that you have for producing advising reports. In the Application Engine transcript process, the advisement reports are created by using a different component. We briefly discuss advising reports in this section, but you are encouraged to review the Academic Advisement product documentation for more information.

The COBOL transcript process provides you with five components that you can use to create, process, print, and purge transcript requests. This table lists and describes how to use those components:

Component	Usage
Transcript Request component	Request, process, and print small numbers of transcripts (recommended for fewer than 20).
Batch Transcript Request	Define group parameters and create request for large group (more than 20) of students.
Batch Transcript Generation component	Process and generate transcripts for a previously created online request. Generate transcripts for a previously created batch request.

Component	Usage
Batch Transcript Print component	Print transcripts that were previously generated through either the Transcript Request inquiry component or the Batch Transcript Generation process component.
Transcript Purge component	Purge transcript requests and transcript results based on parameters that you specify.

The Application Engine transcript process provides three components that you can use to create, process, print, and purge transcript requests. This table lists and describes how to use those components:

Component	Usage
Request Transcript Report component	Request, process, and print small numbers of transcripts (recommended for fewer than 20).
Process Transcripts component	This component combines the functionality of both the Batch Transcript Request and the Generate and Print Transcripts component.
Purge Transcript Reports component	Purge transcript requests and transcript results based on parameters that you specify.

Processing Transcripts for Individuals or Small Groups of Students

Important! The COBOL transcript process is a deprecated product. Support will be maintained for this product, but no new development will be produced for the COBOL transcript process. It is strongly recommended that you use the Application Engine transcript process instead. For more information on the Application Engine transcript process, see [Understanding Transcript-Related Processes](#).

This section provides an overview of the Request Transcript Report component, lists prerequisites, and discusses how to:

- Create transcript request headers.
- Specify students for evaluation.
- Enter transcript recipient information.
- View process messages for transcript requests.

Use the Request Transcript Report component to process application engine based transcripts for individuals or small groups of students.

Note: The pages of the Transcript Request component (TSCRPT_RQST) still exist in the system: SA_REQUEST_HEADER, SA_REQUEST_DETAIL, SA_REPORT_RESULTS, and SA_REQ_REPORT_ERR.

Use this component to process the COBOL based transcripts.

Understanding the Request Transcript Report Component

Use the Request Transcript Report component (application engine) to create and update transcript requests for an individual student or a small group of students. A small group of students is defined as a group of fewer than 20. Process the request, and you can view the transcripts online and print them. You can also use the Request Transcript Report component to create transcript requests for processing on future dates or events. For example, a student can request that a transcript be processed after they are awarded a degree, after their grades are posted for a term, or when a specific date arrives. When the future transcript request is saved, the system generates a report request number. You can then use a single report request number, a range of report request numbers, or requested print dates to process these requests.

Complete these steps to create a transcript request by student ID:

1. Select the transcript type and enter other general parameters on the Transcript Request Header page.
2. Enter IDs for students requesting transcripts, as well as recipient information, on the Transcript Request Detail page.
3. Submit your request by clicking the Process Request button on the Request Detail page.
4. View results in .PDF format by clicking the View Report link that appears for each student.
5. If no link appears, view any process errors on the Report Errors page.
6. Print all results by clicking the Print button.

Prerequisite

Before you can create an online transcript request, you must create a transcript type.

Pages Used to Create an Online Transcript Request

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Transcript Request Header	SSR_TSRQST_HDR	Records and Enrollment > Transcripts > Request Transcript Report > Transcript Request Header	Select the type of transcript you want to process and set general parameters for the request.
Transcript Request Detail	SSR_TSRQST_DTL	Records and Enrollment > Transcripts > Request Transcript Report > Transcript Request Detail	Enter the IDs that you want to process and the number of copies you want to create. Run the Flexible Transcript generation process.
Send To Information	SA_REQUEST_DTL_SEC	Click the Send To button on the Transcript Request Detail page.	Specify an address to which to send a student's transcript.
Report Messages	SA_REQ_REPORT_ERR	Records and Enrollment > Transcripts > Request Transcript Report > Report Messages	Review messages about any problems the system encounters while processing the transcript request.

Creating Transcript Request Headers

Access the Transcript Request Header page (Records and Enrollment > Transcripts > Request Transcript Report > Transcript Request Header).

Image: Transcript Request Header page

This example illustrates the fields and controls on the Transcript Request Header page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Transcript Request Header' page with the following fields and controls:

- Report Request Nbr:** 000000000
- Request Date:** 10/02/2006
- User ID:** PS
- Request Attributes:**
 - *Institution:** PSUNV (PeopleSoft University)
 - *Transcript Type:** ALLOF (Official Transcripts - All)
 - Freeze Record
 - Override Service Indicator
- Number of Copies:** 1
- Future Release:** Immediate Processing
- Academic Career:** [Searchable text field]
- Term:** [Searchable text field]
- Print Date:** 10/02/2006
- Request Reason:** [Dropdown menu]
- Cancel Request

Institution

The system populates this field by default. You can change this value before you enter a transcript type.

Transcript Type

Select a transcript type with the correct detail organization that you want to appear on the transcripts. The system populates this field by user default, but you can change this value. Transcript type values are defined on the Define Transcript Type - Basic Data page, and the Transcript Type default is defined on the User Defaults 4 page.

Freeze Record

Select to protect the request from being purged during the transcript purge process. Because requests build up quickly in your system, the application provides a purge process to delete them. If you select this check box, the purge process does not delete the request.

Override Service Indicator

Select this check box to have the system process transcripts for all students, regardless of whether their service indicators match those specified for this transcript type on the Basic Data page.

For instance, some service impacts—if listed on the Basic Data page and attached to the student through a service indicator—might prevent a student from receiving a transcript.

See [Defining Transcript Type Basic Data](#).

See [Using Student Records Service Impacts](#).

See "Viewing, Assigning, or Removing Service Indicators" (PeopleSoft Campus Solutions 9.2: Campus Community)

If you do not select this check box, the system enforces the service indicator rules and does not generate transcripts for students with negative service indicators that match the service impacts on the Basic Data page for this transcript type.

Future Release

Select a value to indicate that you want the system to print the transcript at a later date. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort. Values are:

- *Degree Confer Date*: The Career and Term fields become available for entry.
- *Grades Post*: The Career and Term fields become available for entry.
- *Specific Date*: The Print Date field is populated by default to the current date and is available for entry.
- *Hold*: The Print Date field is populated by default to the current date and is available for entry. This option indicates that you are going to process the request at a later and as yet undetermined time. The system saves this request until you change the future release value and enter a specific print date.
- *Immediate Processing*: The Print Date field is populated by default to the system date. This value is used as the online default, as well as by self service.
- *Transfer Credit Post*: The Print Date field is populated by default to the current date and becomes available for entry. You can issue a transcript after the system has articulated transfer credit to the student's academic record. This process is not automatic.

Academic Career and Term

If available for entry, select the appropriate academic career and term values. Later, you can issue a transcript on the fully graded date (future release value of *Grades Post*) or after you award degrees for the students (future release value of *Degree Confer Date*). The system populates the Print Date field with either the fully graded date from the Academic Term Calendar 3 page

or the degree confer date from the Academic Term Calendar 3 page. Term values are defined on the Term Table page.

To create transcripts for future release, enter the request parameters and save the request without processing it. To later process and print the future release request, enter a single or range of report request numbers or requested print dates on the Transcript Generation page (if running COBOL transcripts) or Process Transcripts (if running application engine transcripts).

The system processes requests for all transcripts due to print within the range you specify. After you process a transcript request, the system marks the report request ID as complete and excludes it from further processing.

This table lists how the Future Release field values affect the Academic Career, Term, and Print Date fields:

Field Value	Academic Career	Term	Print Date
<i>Degree</i>	Available for entry	Available for entry	Unavailable for entry (default is <i>Degree Confer Date</i> for Term).
<i>Grades</i>	Available for entry	Available for entry	Unavailable for entry (default is <i>Fully Graded Date</i> for Term).
<i>Hard Date</i>	Unavailable for entry	Unavailable for entry	Available for entry (default is the system date).
<i>Hold</i>	Unavailable for entry	Unavailable for entry	Available for entry (default is the system date).
<i>Imed Proc</i> (immediate processing) (default)	Unavailable for entry	Unavailable for entry	Unavailable for entry (default is the system date).
<i>Transfr Cr</i> (transfer credit)	Unavailable for entry	Unavailable for entry	Available for entry (default is the system date).

Request Reason

Select a request reason. The reason appears on the transcript if the transcript type is set to display request reason information.

Values for this field are delivered with your system as translate values. You can modify these values.

Cancel Request

Select this check box to cancel a future-dated transcript request before it is processed.

Using the Request Header Page (COBOL Based Transcripts Only)

These additional fields appear on the Request Header page (Records and Enrollment, Transcripts, Transcript Request, Request Header):

Output Destination

Select the output destination of the transcript. This determines where the system electronically sends the results of the

process. Values for this field are delivered with your system as translate values. Do not modify these values in any way.

Any modifications to these values will require a substantial programming effort. Values are:

Page: Sends the transcripts to the Report Results page to be viewed online before printing. You can then click the Print button to initialize Crystal, viewing and printing transcripts through a new window.

Printer: Like the Page option, sends the transcripts to the Report Results page to be viewed online before printing. You can then click the Print button to initialize Crystal, viewing and printing transcripts through a new window.

Report Format

With a transcript type that includes an advising report, the Report Format field becomes available for entry. A single report request can have multiple report formats. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values will require a substantial programming effort. Values are:

Standard Report Format: Indicates that the report is delivered to a page or printer.

Analysis Database: Indicates that the results of the report are written to the analysis database. The results are stored in computer-readable format so application programs can be written against the tables to create user configurable reports. (This is the only field value that refreshes the database tables.)

Completed Only: Indicates that the report contains only those requirement groups that have been wholly completed. (Usually, the advising report bolds incomplete requirement groups and requirements while completed requirement groups are not bold.)

Incompleted Only: Indicates that the report contains only those requirement groups that have not been wholly completed. (This field value can help a counselor determine exactly what a student needs to satisfy in order to graduate.)

Specifying Students for Evaluation

Access the Transcript Request Detail page (Records and Enrollment > Transcripts > Request Transcript Report > Transcript Request Detail).

Seq Nbr (sequence number)

The system determines the sequence number, and the number is the order in which the transcripts are processed.

ID

Enter IDs of students for whom you want to process transcripts. The system populates the name by default after you enter the ID and tab out of the field.

Number of Copies	Although you can indicate the overall number of copies on the Transfer Request Header page, you can override the number on a student-by-student basis by changing the value in this field.
Send To	Before you process the transcript request, click to enter recipient information for each ID.
Process Request	<p>Click when you are ready to submit the request for processing. An Application Engine process commences. When the process is complete, the system displays the View Report link next to the student's ID.</p> <p>If no View Report link appears, access the Report Errors page to investigate what went wrong during the process.</p>
View Report	Click this link to view the transcript as a PDF file. Each student ID has a link to view its report.
Print	After you successfully complete the transcript request process, the Print button becomes available. Click the button to submit all of the transcripts on this request to the printer.

Using the Request Detail Page (COBOL Based Transcripts Only)

Here is some information about the Request Detail page (Records and Enrollment, Transcripts, Transcript Request, Request Detail):

Process Request	Click when you are ready to submit the request for processing. A COBOL/SQL process commences and, when complete, the system displays the results on the Report Results page and automatically opens that page.
Print	After you have successfully completed the transcript request process, the Print button on the Request Detail page becomes available. Click the button to submit the Crystal to the Report manager. Use the Report Manager link to view and print the Crystal output, which the system sorts by Student Name within Transcript Request ID. Click the Print button on the Crystal window and choose whether you want to print all pages or a range of pages. When you have large groups of transcripts to print, clicking the Print All button significantly reduces the time it takes you to print them. You can also print transcripts by individual student ID by clicking the Print button on the Report Results page.

Entering Transcript Recipient Information

Access the Send To Information page (click the Send To button on the Transcript Request Detail page).

Send To	Enter the name of the addressee.
----------------	----------------------------------

Specify External Org ID (specify external organization ID)	Select to send the transcript to an external organization that you already have in your database.
Org ID (organization ID)	Select the appropriate external organization ID number. If you do not select the Specify External Organization ID check box, enter the name and address of the recipient in the available address fields.
OK	Click to save and exit the page.
Cancel	Click to exit the page.
Edit Address	Click this link to enter or update the address where the transcript is to be sent.

Viewing Process Messages for Transcript Requests

Access the Report Messages page (Records and Enrollment > Transcripts > Request Transcript Report > Report Messages).

Sequence	After you run the process, the system displays the sequence number in the Sequence column.
Message Text	The message text explains the message or error, if any.

Using the Report Results Page (COBOL)

Here is some information about the Report Results page (Records and Enrollment, Transcripts, Transcript Request, Report Results):

Print	<p>Click to submit the Crystal to the Report manager. Use the Report Manager link to view and print the Crystal output. Click the Print button on the Crystal window and choose whether you want to print all pages or a range of pages. When you have large groups of transcripts to print, clicking the Print All button significantly reduces the time it takes you to print them. You can also print transcripts by individual student ID by clicking the Print button on the Report Results page.</p> <p>To print transcripts for multiple students whose transcripts you have processed within this report request number, click the Print button on the Request Detail page then click Print All from the Crystal window. If necessary, you can save the transcript request and both process and print the request at a later time.</p>
--------------	--

To view messages about any problems that the system encounters while processing the transcript request (COBOL), use the Report Errors page (Records and Enrollment, Transcripts, Transcript Request, Report Errors).

Processing Batch Transcripts (Application Engine)

This section discusses how to process Application Engine based batch transcripts.

The Process Transcripts process enables you to process transcripts in multiple ways for a large group of students at one time. Based on a specific academic institution or transcript type, you can select the appropriate process action to: create a transcript request; generate or generate and print transcripts; only print transcripts; or request, generate, and print transcripts in a single step.

Complete these steps to process batch transcripts:

1. Specify the parameters for which you want to process transcripts on the Process Transcripts page.
2. Click the Run button on the Process Transcripts page to request, generate, or print your transcript.
3. After the process finishes, select View Log and Trace and select the PDF file.

Note: To process transcript requests for individual student IDs, use the Request Transcript Report component.

Page Used to Process Batch Transcripts

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Process Transcripts	SSR_RUNCTL_TSRPT	Records and Enrollment > Transcripts > Batch Transcripts > Process Transcripts	Select the institution and type of transcript that you want to process, and the appropriate processing action and student criteria for the group of students.

Defining Transcript Processing Options

Access the Process Transcripts page (Records and Enrollment > Transcripts > Batch Transcripts > Process Transcripts).

Image: Process Transcripts page

This example illustrates the fields and controls on the Process Transcripts page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Process Transcripts' page with the following elements:

- Run Control ID:** PS
- Navigation:** [Report Manager](#) [Process Monitor](#) [Run](#) (button)
- *Academic Institution:** PeopleSoft University (dropdown)
- *Transcript Type:** Unofficial Transcript -- All (dropdown)
- Process Action:** Create Transcript Request (dropdown)
- Request Options:** Override Service Indicator
- Population Selection:** Population Selection
- Student Select List:**
 - Use Student Select [Clear List](#) (button)
- Table:**

EmpID	Name		
1 SR12201	Keshishi,Khanom		+ -

Note: The fields on this page change based on the Process Action that you select.

Academic Institution

Select the institution for which the transcript type is associated. When you run the process, the system creates a transcript request number for each row within the process instance. Institution values are defined on the Academic Institution Table page.

Transcript Type

Select the transcript type. Be sure you select a transcript type with the correct detail organization that you want to appear on the transcripts. You can organize by academic career or chronology. Transcript type values are defined on the Define Transcript Type - Basic Data page.

Process Action

Select one of these options: *Create Transcript Request*, *Generate Transcript*, *Generate and Print Transcript*, *Print Transcript*, or *Request, Generate and Print*.

If you select a Process Action of *Generate Transcript* or *Generate and Print Transcript*, the system finds all transcripts that have an On Request status (requested only).

If you select a Process Action of *Print Transcript*, the system finds all transcripts that have a Completed status (generated), but have not yet printed.

To reprint a previously printed transcript, select the Reprint check box. This check box is available only when you select a Process Action of *Print Transcript*.

Note: If you select the Allow XML Output File check box on the Define Transcript Type - Basic Data page, the Output XML File and Output File Path fields appear on this page when you select a value of *Generate and Print Transcript*, *Print Transcript*, or *Request, Generate and Print* in the Process Action field.

Override Service Indicator

Select this check box to override any service indicators attached to student records that may prevent a transcript from being generated.

Population Selection

This group box appears if you select the *Create Transcript Request* or *Request, Generate and Print* process action.

Population selection is a method for selecting the IDs to process for a specific transaction. The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes.

If your institution uses a specific delivered selection tool (PS Query, Equation Engine equation, or external file) to identify IDs for a specific transaction, you must use it.

See "Understanding the Population Selection Group Box" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Query Name

If you selected *PS Query*, select an existing query in the system. The application delivers these predefined queries:

- SSR_TS_ACADLEVEL: Transcript Query by Acad Level (transcript query by academic level)
- SSR_TS_ADVISOR: Transcript Query by Advisor
- SSR_TS_CAREER: Transcript Query by Career
- SSR_TS_PROGPLAN: Transcript Query by Prog Plan (transcript query by program/plan)
- SSR_TS_PROGRAM: Transcript Query by Program
- SSR_TS_STUDENT_GRP: Transcript Query by Stdnt Grp (transcript query by student group)

Note: You should not modify the delivered queries. Instead, create new queries using the Save-As feature so that the integrity of the delivered queries is not compromised.

Student Select List

This group box appears if you select the *Create Transcript Request* or *Request, Generate and Print* process action. Select the Use Student Select check box to add individual student IDs to your batch transcript process request. You can use this method alone or in combination with the Population Selection process to create the batch request.

EmplID (employee ID)	Enter individual student IDs that you want to include in the batch transcript request. The student's name appears to the right of this field.
Clear List	Click this button to remove all entered names from the student list.

Generate and Print Options

This group box appears if you select the *Generate Transcript*, *Generate and Print Transcript*, or *Print Transcript* process option.

Generate Transcripts By	Select whether to generate transcripts by <i>Request Date</i> or <i>Request Nbr</i> (request number).
Request Date	To generate transcripts by date, enter a single date or date range for the previously created transcript requests.
Request Number	To generate transcripts by number, enter one or more previously created transcript request numbers.

Additional Options

If you selected the *Generate and Print Transcript*, *Print Transcript*, or *Request, Generate and Print* process option, this group box appears.

Print Sort Option	Select whether to sort the transcripts for printing by <i>Last Name</i> , <i>Student ID</i> , or <i>Zip/Postal Code</i> .
--------------------------	---

Using the XML Transcript Template

This section discusses how to use the XML transcript template.

Understanding the XML Transcript Template

When a transcript is processed, an XML file is also created, with data for testing.

The XML file is uploaded to the Data Source page (Reporting Tools, XML Publisher, Data Source, Data Source).

To use the XML transcript template:

1. Select Reporting Tools > XML Publisher > Report Definition and search by SSR.

2. Select *SSR_TSRPT* and access the Template page.
3. Click the Download button to select the template (it is an .rtf file).

Note: Two rows exist: Landscape and Portrait.

4. To access the sub template, select Reporting Tools > XML Publisher > Content Library.
5. Search using SSR and select *SSR_TSRPT_STMPLT*.
6. To use the Word Plug-In during testing of the template design, you must make some changes to the template so that the Word Plug-In knows where to find the sub template: click Download to view the instructions, which are at the top of the sub template.
7. To access the Plug-In, select Reporting Tools > XML Publisher > Setup > Design Helper.

PeopleTools: BI Publisher for PeopleSoft

Personalizing XML Transcript Dates

The system date format is set up on the Define Personalizations page in PeopleTools (PeopleTools > Personalization > Personalization Options > Define Personalizations > Format). Individual users can also set the date format by using the My Personalizations menu link. A local variable exists on the XML Transcript template, *date_mask*, to represent the date mask as the date format that was set up using personalizations. This variable is then added to each date field in the template, as the academic plan date. The Print Date and Plan Date fields on the transcript use this date formatting, as this example illustrates.

Image: Example of personalized date formatting on XML Transcript

This example illustrates personalized date formatting on an XML transcript.

Name:	Sevilla Flores
Student ID:	SRTS0003
Institution Info:	PeopleSoft University 4301 Hacienda Boulevard Pleasanton, CA 94588

Sub-Plan:	Voice
Requestor:	Betty Locherty

Creating Batch Transcript Requests (COBOL)

Important! The COBOL transcript process is a deprecated product. Support will be maintained for this product, but no new development will be produced for the COBOL transcript process. It is strongly recommended that you use the Application Engine transcript process instead. For more information on the Application Engine transcript process, see:

[Understanding Transcript-Related Processes](#)

[Processing Batch Transcripts \(Application Engine\)](#)

The Transcript Request process (COBOL) component enables you to create transcript requests for a large group of students at one time based on a specific academic institution and transcript type, and based on additional selection criteria and key values that you specify to define the group. For example, you can use this component to create transcript requests for all senior-level undergraduates for the fall term.

Note: The pages of the Transcript Request process (RUNCTL_SR_TSBATCH) and the Batch Transcript Generation (RUNCTL_SR_TSBATCH) components still exist in the system: RUNCTL_SRTSCRPT and RUNCTL_SRTSBGEN.

Use these components to process the COBOL based transcripts.

To create a batch transcript request (COBOL):

1. Specify the parameters for which you want to create transcript requests on the Batch Transcript Request page.
2. Click the Run button on the Batch Transcript Request page to create your request.
3. After the Transcript Request process finishes, view the Message Log and note the Transcript Request Number. You can enter the Transcript Request Number on the Transcript Generation page to generate the transcripts.

This section lists prerequisites and discusses how to run the Batch Transcript Requests process.

Prerequisites

Before you can process a batch transcript request, you must:

- Define your run control ID.
- Define transcript types and any of the key values that you want to use as search criteria.

Page Used to Create Batch Transcript Requests

Page Name	Definition Name	Navigation	Usage
Batch Transcript Request	RUNCTL_SRTSCRPT	Records and Enrollment > Transcripts > Batch Transcripts > Batch Transcript Request	Select the institution and type of transcript that you want to process, select the criteria for the group of students, and create the transcript requests for all students who meet your selection criteria. This process only creates a request; it does not generate a transcript. To generate transcripts, use the Transcript Generation component.

Running the Batch Transcript Request Process

Access the Batch Transcript Request page ((Records and Enrollment > Transcripts > Batch Transcripts > Batch Transcript Request).

Image: Batch Transcript Request page

This example illustrates the fields and controls on the Batch Transcript Request page. You can find definitions for the fields and controls later on this page.

Batch Transcript Request

Run Control ID: PS [Report Manager](#) [Process Monitor](#) Run

User ID: PS Run Control ID: PS

Request No: 1 Product: SA Application: SRTSRQST When: Always

Instance: Status: Pending

*Institution	*Transcript Type	*Transcript Request Criteria	Group Name			
PSUNV	ALLOF	Student Group	ATHL	<input type="text" value="Athlete"/>	<input type="button" value="+"/>	<input type="button" value="-"/>

Institution

Select the institution for which the transcript type is associated. Add rows as necessary. When you run the process, the system creates a transcript request number for each row within the process instance. Institution values are defined on the Academic Institution Table page.

Transcript Type

Select the transcript type. Be sure you select a transcript type with the correct detail organization that you want to appear on the transcripts. You can organize by academic career or chronology. Academic advising reports can include both an advising report and a regular transcript. When transcript types have the Advising Report check box or the Special Advising Report check box selected on the Basic Data page, the transcript includes an audit of academic requirement groups. Transcript

type values are defined on the Transcript Type - Basic Data page.

If you select an advising transcript type, the Use Stored What-If, Database Report, and As of Date fields become available for entry.

Use Stored What-If

Select to process the batch of advisement reports based on stored what-if information for each student (as opposed to actual student academic career, academic program, academic plan and academic subplan information). For example, a student may have a stored what-if scenario set up for them that has an alternate combination of academic program, academic plan, academic subplan, requirement term, and so on. If the Use Stored What-If check box is selected, the system uses the hypothetical what-if data rather than the student's actual data from the Student Program/Plan component.

Database Report

Select this check box to update the academic advisement analysis database with the results of the transcript request (at the time of the Transcript Generation process). Specific data for each student based on each student's respective requirements is then available for query and reporting. For example, you may run an advisement report with the Student Group and Athlete options selected, thereby populating the analysis database with advising results for student athletes. You may then query those tables to create user configurable reports for all athletes at a later date.

As of Date

Set the As of Date field as appropriate to include or exclude future-dated academic programs, academic plans, academic subplans, conditions, and entity groups when you process any type of academic advising report.

At the start of the advising report process (on the Transcript Generation page), the system references the value in the As of Date field to determine which STUDENT_CAR_TERM records are active for each student. Active records are defined as rows on the Track Student Careers component, with an effective date that is equal to or less than the as-of date and with a program action of activate, data change, plan change, program change, or readmit. After the system identifies the active rows, it compares the student's career, program, plan, subplan, and requirement term information against the appropriate academic requirement groups. Appropriate academic requirement groups are defined as those with effective dates that are equal to or less than the start date of the student's requirement term. Regardless of the As of Date field value, the system evaluates all courses on a student's transcript, future-dated or otherwise.

Note: As delivered, the system populates the As of Date field by default to 01/01/3000, but you can modify the date each time you run the process. To set the As of Date field default to the current date, go to the Installation Student Administration page and clear the Transcript Default As of Date field.

Transcript Request Criteria

Select batch processing criteria and further describe the group. Select one of these values:

Academic Level: If you select this option, the Career, Term, and Level fields become available for entry. The values in all three of these fields intersect to form a single criterion set.

Advisor: If you select this option, the Advisor field becomes available for entry.

Career/Program/Plan: If you select this option, the Career, Acad Program (academic program), and Acad Plan (academic plan) fields become available for entry.

Student Group: If you select this option, the Group Name field becomes available for entry.

Career

Creates transcript requests for all students within the academic career you specify. Academic career values are defined on the Academic Career Table page. This field is required.

Acad Program (academic program)

Creates transcript requests for all students within the academic career and academic program that you specify. Academic program values are defined in the Academic Program Table component.

Acad Plan (academic plan)

Creates transcript requests for all students within the academic career, academic program, and academic plan that you specify. Academic plan values are defined on the Academic Plan Table page.

Term

Creates transcript requests for all students that are term activated in the academic career and academic level as of the term you specify. Term values are defined on the Term Table page. This field is required.

Academic Level

Creates transcript requests for all students within the academic career and academic level as of the term you specify. Academic level values are defined on the Academic Level Table page. This field is required.

Advisor

Creates transcript requests for all active students who are assigned to this advisor on the Student Advisor page. This field is required.

Group Name

Creates transcript requests for all students who are active within the group that you specify. Student group names are defined on

the Student Group Table page and assigned to students on the Student Groups page.

Click the Run button to run this request. When you click the OK button, an Application Engine process scans the database and creates transcript requests for the students who match your selection criteria. When the Run Status for SRTSRQST process is Success, you can generate the transcripts on the Transcript Generation page. Be sure to click the Message Log link on the Process Detail page to note the system-generated transcript request numbers. You need these numbers to generate transcripts on the Transcript Generation page and to print transcripts on the Transcript Print page.

Using the Grade Review Transcript Release Process

Using the Grade Review Transcript Release process, you can update your students' fully graded date and grade review status in batch mode, and then process transcripts or degree audits for students who meet your specific run control parameters. Essentially, this process releases transcripts or degree audits only if a student's classes are fully graded for the term. If some required grades are missing, the process does not generate a transcript. Instead, it assigns a special grade review value to the student so that they can be easily identified for future processing.

Complete these steps to use the Grade Review process:

1. Set up grade review values on the Grade Review Table page.
2. Set specific grade bases as *required* on the Grading Scheme Table page.
3. Process grade reviews.
4. View the grade review information on the Student Grade Review page.
5. View fully graded date information on the Term Control Dates page.
6. View the transcripts through the Transcript Request component.

Pages Used to Run the Grade Review Process

Page Name	Definition Name	Navigation	Usage
Grade Review Table	GRD_REVIEW_TABLE	Set Up SACR > Product Related > Student Records > Grading > Grade Review > Grade Review Table	Define different values that you want to assign to students as a result of the grade review process. For example, <i>MISS</i> for missing grades, <i>PEND</i> for pending grade review, and <i>COMP</i> for completed all grades. The system assigns these values to students on the Term History - Student Grade Review page based on the status of the students' grades for the term you specify.

Page Name	Definition Name	Navigation	Usage
Grading Scheme Table	GRADING_SCHEME_TBL	Set Up SACR > Foundation Tables > Academic Structure > Grading Scheme Table > Grading Scheme Table	Define the grade bases that you want to require. The system references the Grade Required check box setting to determine if a student's transcript can be released or not. Students who are enrolled in classes with a grade basis that is set to Grade Required must have all of their grades entered and posted for a specific term in order for the system to release their transcript through the Grade Review process.
Grade Review	RUNCTL_SRGRDREV	Curriculum Management > Grading > Grade Review > Grade Review	Specify the group of students that you want to evaluate for fully graded data. Also, define other processing parameters and enter the values that you want to assign to the students' records. Run the Grade Review (SRPCGRDR) process.
Student Grade Review	STDNT_GRD_REVIEW	Records and Enrollment > Student Term Information > Term History	View or change the grade review value that the Grade Review process assigned, or enter a grade review value. Define grade review values on the Grade Review Table page.

Setting Up Grade Review Values

Access the Grade Review Table page (Set Up SACR > Product Related > Student Records > Grading > Grade Review > Grade Review Table).

Image: Grade Review Table page

This example illustrates the fields and controls on the Grade Review Table page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Grade Review Table' page. At the top, there are three rows of information: 'Academic Institution: PSUNV PeopleSoft University', 'Academic Career: UGRD Undergraduate', and 'Grade Review: MISS'. Below this is a table with a blue header bar containing 'Find | View All | First 1 of 1 Last'. The table has three rows: '*Effective Date: 01/01/1900' with a calendar icon, '*Status: Active' with a dropdown arrow, '+ -' buttons, '*Description: Missing Grades' in a text box, and 'Short Description: Missing' in a text box.

Effective Date

Enter an effective date for this grade review status. The effective date defines when the status that you select is valid.

Status

Select a status for this grade review. Select *Active* when adding a new grade review status. The *Inactive* option should only be used if your institution will no longer use this grade review status.

Description

Enter a description for the status. The description appears on the Student Grade Review page.

Short Description

Enter a short description for the status.

Specifying Required Grade Bases

Access the Grading Scheme Table page (Set Up SACR > Foundation Tables > Academic Structure > Grading Scheme Table > Grading Scheme Table).

This example illustrates the fields and controls on the Grade Review page (2 of 2). You can find definitions for the fields and controls later on this page.

The screenshot shows a web form titled "Student Selection Criteria". It contains several input fields and dropdown menus:

- Academic Program:** Text input with "LAU" and a magnifying glass icon. To the right, the text "Liberal Arts Undergraduate" is displayed.
- Academic Plan:** Empty text input with a magnifying glass icon.
- Academic Sub-Plan:** Empty text input with a magnifying glass icon.
- Academic Load:** Dropdown menu.
- Academic Level:** Dropdown menu.
- Degree Checkout Status:** Dropdown menu.
- Expected Graduation Term:** Empty text input with a magnifying glass icon.
- Student Group:** Text input with "ATHL" and a magnifying glass icon. To the right, the text "Athlete" is displayed.

Below these fields is a section titled "Exclude Following Academic Standings" with a "Find" button and navigation controls: "First", "1 of 1", and "Last". At the bottom of this section is a field labeled "*Academic Standing:" with an empty text input and a magnifying glass icon, and two buttons: a plus sign (+) and a minus sign (-).

Academic Institution

Select the institution for which you want to run the grade review process. The system populates this field by default to the setting on the User Defaults 1 page.

Academic Career

Select the academic career of students for which you want to run the grade review process. The system populates this field by default to the setting on the User Defaults 1 page.

Term

Select the term for which you want to run the grade review process. The system populates this field by default to the setting on the User Defaults 1 page.

System Date

The process assigns this date to the student records when it assigns new grade review values. For example, if a student is fully graded and meets all other processing parameters, the student's grade review status is set to *COMP* on the Student Grade Review page, with an effective date equal to the system date. In addition, if you select the Set Fully Graded Date check box, the system sets the student's fully graded date to the system date on the Term Control Dates page.

Grade Review Status

Select a status to assign to a student on the Student Grade Review page if the system finds him to be fully graded for the term.

Grade Review Missing Grades

Select a status to assign to a student on the Student Grade Review page if the system finds the student to be in acceptable academic standing but lacking fully graded enrollment records for the term. If a student is neither fully graded nor in acceptable standing, the system assigns the value in the Grade Review Excl

<p>Grade Review Excl Acad Stand (grade review excluded due to academic standing)</p>	<p>Acad Stand field to the student on the Student Grade Review page.</p> <p>Select a status to assign to a student on the Student Grade Review page if the system finds him to be fully graded but his academic standing for the term is equal to the value in the Academic Standing field. If a student is neither fully graded nor in acceptable standing, the system assigns the value in the Grade Review Excl Acad Stand field to the student on the Student Grade Review page.</p>
<p>Generate Transcript</p>	<p>Select to process transcripts for the students in your selected population.</p> <hr/> <p>Warning! If you select the Generate Transcript check box and run the Grade Review process, the system immediately generates transcripts (not just transcript request numbers) for all students in your population. Depending on the size of your population and the transcript type you select, this process could take a substantial amount of time to complete.</p> <hr/>
<p>Transcript Type</p>	<p>Select the type of transcript that you want to generate.</p>
<p>Report Format</p>	<p>If you select a transcript type that is an advising report, the Report Format field is available for entry. Select from these values:</p> <p><i>Standard Report Format:</i> Indicates that the report is delivered to a page or a printer.</p> <p><i>Analysis Database:</i> Indicates that the results of the report are written to the analysis database. The results are stored in computer-readable format so application programs can be written against the tables to create user configurable reports. (This is the only field value that refreshes the database tables.)</p> <p><i>Completed Only:</i> Indicates that the report contains only those requirements that have been wholly completed. (Normally, the advising report marks incomplete requirement groups and requirements in bold, while completed requirement groups and requirements are not in bold.)</p> <p><i>Incompleted Only:</i> Indicates that the report contains only those requirements that have not been wholly completed. (This field value can help a counselor determine exactly what a student needs to satisfy in order to graduate.)</p>
<p>Set Fully Graded Date</p>	<p>Select to set a student's fully graded date (on the Term Control Dates page) to the system date you specify in the System Date field. The system sets the fully graded date only if the process assigns a new grade review status to the student. If no grade review status is assigned, the fully graded date field does not</p>

update. Clear this check box if you never want to update the fully graded date.

Grades Required

Select to have the system use the Grade Required check box setting on the Grade Scheme Table page to determine if grades are missing. If you select this check box, the system only evaluates courses taken with grade bases for which the Grade Required check box is selected. If you clear this check box, students in the population will be set regardless of whether their grades are in.

Process Blank Grade Review

Select to include in your student selection students with no grade review value.

Grade Review Status

Enter the current grade review status of students that you want to process. Add rows to specify more than one valid grade review status value.

Academic Program

Select the academic program of the students you want to review.

Academic Plan

Select the academic plan of the students you want to review.

Academic Sub-Plan

Select the academic subplan of the students you want to review.

Academic Load

Select the academic load of the students you want to review for the term you specify.

Academic Level

Select the academic level (term begin) of the students you want to review for the term you specify.

Degree Checkout Status

Select the degree checkout status of the students you want to review.

Expected Graduation Term

Select the expected graduation term of the students you want to review.

Student Group

Select the student group of the students you want to review.

Academic Standing

Select the academic standing of students (on the Term History page for the term you specify) that you want to *exclude* from the grade review. Add rows to specify more than one type of academic standing value that you want to exclude from the review.

Click Run to run this request. PeopleSoft Process Scheduler runs the Grade Review Process Driver process at user-defined intervals. If you selected the Generate Transcripts check box, you can view the transcripts online or print them when the process finishes.

Producing Electronic Transcripts

After you have set up the TS130 controls and mapped your internal values within the EDI Manager, you can create electronic transcript requests and process outbound files. This section discusses how to:

- Enter electronic transcript request information.
- Enter the recipient's address information.
- Enter send options.
- View electronic transcript request history for a student.

Related Links

[Setting Up Electronic Transcript Processing](#)

Pages Used to Produce Electronic Transcripts

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Transcript Request	TSCRPT_REQUEST	Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Transcript Request	Enter general information about this transcript request.
Address	TSCRPT_ADDRESS	Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Address	Enter address information for the organization to which you are sending the electronic transcript.
Send Options	TSCRPT_EMAIL_SEND	Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Send Options	Specify the send method and the recipient's email information.
Request History	TSCRPT_HISTORY	Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Request History	View the electronic transcript request history for this student.

Entering Electronic Transcript Request Information

Access the Transcript Request page (Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Transcript Request).

Image: Transcript Request page

This example illustrates the fields and controls on the Transcript Request page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Transcript Request' page with the following fields and values:

- Transcript Seq No:** 1
- Request Date:** 07/16/2004
- *Academic Institution:** PSUNV (PeopleSoft University)
- *Transcript Type:** Official Transcripts - All
- Request Reason:** Graduation
- Request Reason:** (Empty text field)
- Override Service Indicator:**
- *Future Release:** Immediate Processing
- Academic Career:** (Empty)
- Term:** (Empty)
- Date to be Processed:** 07/16/2004
- Date Processed:** (Empty)
- User ID:** Locherty, Betty

Navigation tabs at the top include: Transcript Request, Address, Send Options, Request History. A 'Process' button is visible next to the Transcript Seq No field.

Transcript Seq No (transcript sequence number)

The system assigns a sequential number to each request that you enter for the student.

Request Date

The system displays the date on which you enter the request.

When you enter a new request, the system uses the current date by default.

Academic Institution

Select the academic institution for which you want to print the request. By default, the system selects the academic institution defined in the User Defaults component.

Transcript Type

Select a transcript type with the correct detail that you want to report electronically. Only transcript types for which you have user security and that have valid careers for this student are available. Transcript type values are defined on the Transcript Type - Basic Data page.

Request Reason

Select the request reason. Request reason values are delivered with your system as translate values. You can modify these values.

You can enter free-form text to further clarify the request reason in this field.

Override Service Indicator

Select this check box to have the system process the transcript for this student, regardless of whether the student has a service indicator with service impacts that match those specified for

this transcript type on the Basic Data page. Service impacts that are listed on the Basic Data page and are attached to the student prevent a student from receiving a transcript. If you do not select this check box, the system enforces the service indicator rules and does not generate transcripts for a student with service impacts that match those on the Basic Data page for this transcript type.

See "Viewing, Assigning, or Removing Service Indicators" (PeopleSoft Campus Solutions 9.2: Campus Community)

Future Release

Select a future release to indicate that you want the system to generate the transcript at a later date. Future release values are delivered with your system as translate values. These translate values should not be modified in any way. Any modifications to these values require a substantial programming effort. Values are:

Degree Confer Date: The Career and Term fields become available for entry.

Grades Post: The Career and Term fields become available for entry.

Hold: The system sets the Date to be Processed field to the current date and is available for entry. This option indicates that you are going to process the request at a later and undetermined time. The system saves this request until you change the future release value and enter a specific print date.

Immediate Processing: The system sets the Date to be Processed field to the system date.

Specific Date: The system sets the Date to be Processed field to the current date and it is available for entry. You can enter a specific date for the transcript request to be processed through the Generate Electronic Transcript page.

Transfer Credit Post: The system sets the Date to be Processed field to the current date and it becomes available for entry. You can issue a transcript through the Generate Electronic Transcript page after the system articulates transfer credit to the student's academic record. Because this process is not automatic, you must still generate the electronic transcript on the Generate Electronic Transcript page.

Academic Career and Term

If available for entry, select the appropriate academic career and term values. You can issue a transcript later through the Generate Electronic Transcript page on the fully graded date—future release value of *Grades Post*—or when the degree confer date arrives for the student—future release value of *Degree Confer Date*. The system populates the Date to be Processed field with either the fully graded date from the Term

Control Dates page in the Term Activation component, or the degree confer date from the Degree page in the Student Degrees component. Term values are defined on the Term Table page.

To create transcripts for future release, enter the request parameters and save the request without processing it. To process and send the future release request later, enter into the Generate Electronic Transcript page a range of dates based on the Dates to be Processed field. The system processes requests for all electronic transcripts that have not yet been generated within the range you specify. After you process a transcript request, the system marks the report request ID as *Generated*, and the system excludes it from further batch processing.

Entered By

The system displays the user ID and name of the person who entered the request.

Process

Click to process the request immediately and send the report as indicated on the Send Options page. The system takes you to the Request History page.

The Process button calls an Application Engine program that processes the request and creates the flat file. PeopleSoft PeopleCode, using Workflow, will send the resulting file as an email attachment if so requested on the Send Options page.

The process updates the request status to be generated. If you also send the file by email, the process updates the request status to complete.

If the student has a service indicator with an attached service impact that is defined on the transcript type setup, the system displays the Service Indicator page and indicates that it prevented the transcript due to negative service indicators.

Entering the Recipient's Address Information

Access the Address page (Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Address).

Send to Student

Select to automatically populate the Send to field with the student's name. The Address Type field becomes available.

Address Type

Select the address type for the student to which you want to send this transcript. The system populates the address fields based on the address type you select. This field is available when you select the Send to Student check box.

Specify External Org ID (specify external organization ID)

Select to choose an existing external organization. The system makes the Org ID and Location Nbr fields available.

Org ID (organization ID)

This field becomes available when you select the Specify External Org ID check box. Select the organization to which

you are sending the electronic transcript. Define external organizations on the Organization Table page. When you exit this field, the system automatically populates the Send to field with the organization's name.

Location Nbr (location number)	This field becomes available when you select the Specify External Org ID check box. Select the location number of the organization to which you are sending the electronic transcript. Define location numbers for external organizations on the Organization Location page. When you exit this field, the system automatically populates the address fields with the location address.
Send to	Enter the name of the recipient to whom you are sending the electronic transcript. If you select either the Send to Student check box or the Specify External Org ID check box, then this value populates automatically according to your selection. This value can be overwritten.
Country	Select the country of the recipient's address. When you exit this field, the system displays the address format associated with that country.
Edit Address	Click to enter a different address to which you want to send this transcript.

Entering Send Options

Access the Send Options page (Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Send Options).

Send Options	Select the method that you want to use to send the TS130 file. Select <i>E-Mail</i> if you want to send the electronic transcript by email. The system sends the output file as soon as you run the Transcript Request process. Select <i>Place File in Directory</i> to enable you to transfer the file at a later time by using a file transfer protocol, such as the FTP.
E-Mail Address	Enter a valid email address to which the system sends the transcript.
File Name	The generated file name appears after processing. The naming convention is defined on the TS130 Setup page. The system inserts the control number before the file extension to identify unique files.
Output File Path	Insert the file path to which the system writes the TS130 file at the time it is generated. The system displays this value by default from the TS130 Setup page (or the Organization TS130 Setup page if the send to address is an organization with information in the Org TS130 Setup page). Users must have

write permission for this specified directory to prevent runtime errors.

Note: Regardless of your send option, you need to specify a directory to store the TS130 file because the email process picks the file up as an attachment and sends it by email from this directory. For example, you could use `c:\temp\`.

E-Mail Message

Enter free-form text that will appear in the body of the email.

Note: You can set up defaults for the Send Options, E-Mail Address, and Output File Path fields on the Organization TS130 Setup page.

Viewing Electronic Transcript Request History for a Student

Access the Request History page (Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Request > Request History).

DateTime	Displays the date and time of the action performed on this request.
Name	Displays the user name of the user performing the action.
File Name	Displays the unique file name.
Action	Displays the various actions performed on this request. Values include <i>Generate</i> , <i>Batch Generate</i> , <i>E-Mail</i> , and <i>Batch E-Mail</i> .
TS131 Status	Displays the status of any incoming TS131 acknowledgements that have been processed for this request. Values include <i>Confirm</i> and <i>Reissue</i> .
TS131 Processed	Displays the date on which the sender processed the TS131 inbound file.

Producing Electronic Transcripts in Batch

This section provides an overview of producing electronic transcripts in batch and discusses how to:

- Generate electronic transcripts in batch.
- Send electronic transcripts in batch by email.
- Enter a text message on the request.

Understanding Producing Electronic Transcripts in Batch

The Generate Electronic Transcript page enables you to generate previously created TS130 requests that you saved through the Electronic Transcript Request page. The process combines transcripts from

multiple requests when the requests specify the same recipient. This component is ideal for generating electronic transcripts requested for release on future dates or following specific events.

For example, students can request future release of their transcripts based on degree confer date, term grade posting date, transfer credit posting date, or a date you specify. When the future date arrives, you can access the Generate Electronic Transcript page, enter the transcript type that you want the system to process, enter a single date or a range of process dates, and generate the TS130 files. For example, if a student knows in March that he or she needs a transcript sent electronically to a specific institution on June 15, the date of graduation, he or she can enter this request and save it online in March with a future date of June 15 on the Transcript Request page. On June 15, they system can process this request through the Generate Electronic Transcript page and can generate this student's transcript electronically, along with all other requests scheduled for processing on this date.

After you run the process through the Generate Electronic Transcript page, you can access the TS130 files in the output directory indicated on the request, and you can send these files by email, in batch, through the E-Mail Electronic Transcript page. On the E-Mail Electronic Transcript page, enter the same run control that you used in the Generate Electronic Transcript process. Only those requests with a send option of email will appear. The batch generation process groups requests by email address and directory, thus forming virtual envelopes that can include several students' transcripts.

Pages Used to Produce Electronic Transcripts in Batch

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Generate Electronic Transcript	RUNCTL_E_SRTSCPRT	Records and Enrollment > Transcripts > Electronic Transcripts > Generate Electronic Transcript > Generate Electronic Transcript	Generate previously created TS130 transcript requests that you saved through the Electronic Transcript Request page.
E-Mail Electronic Transcript	EMAIL_TS130	Records and Enrollment > Transcripts > Electronic Transcripts > EMail Electronic Transcript > EMail Electronic Transcript	Email TS130 requests in batch.
Transcript E-Mail Detail	EMAIL_TS130_SBP	Click the Notes and Details link on the Email Electronic Transcript page.	Enter a message to be delivered in the body of the email. This message overwrites the email messages for each individual request within this file.

Generating Electronic Transcripts in Batch

Access the Generate Electronic Transcript page (Records and Enrollment > Transcripts > Electronic Transcripts > Generate Electronic Transcript > Generate Electronic Transcript).

Academic Institution

Select the institution that the system should use in the process. Institution values are defined on the Academic Institution Table page.

Transcript Type

Select the transcript type. Transcript type values are defined on the Transcript Type - Basic Data page. Be sure you select a

transcript type that matches the pending requests that you want to generate.

From and Through

Enter the range of dates for which you want to generate electronic transcripts. To generate electronic transcripts for one day, enter the same date in both fields.

Sending Electronic Transcripts in Batch by Email

Access the EMail Electronic Transcript page (Records and Enrollment > Transcripts > Electronic Transcripts > EMail Electronic Transcript > EMail Electronic Transcript).

EMail

Select this check box if you want the process to send this file. Clear this check box for any row that has a file that should not be sent at this time.

TS130 Control

Enter the date the TS130 was generated.

E-Mail Address

Enter the email address of the recipient.

File Name

Enter the generated file name of the TS130.

File Path

Enter the file path where the file is located and will be picked up as an attachment in the email.

Notes and Details

Click to access the Transcript E-Mail Detail page, where you can view the requests that are included in each flat file and the history of each request. You can also enter text that will be delivered in the body of the email.

Note: The email text entered here overwrites email message text on the request.

Entering a Text Message on the Request

Access the Transcript E-Mail Detail page (click the Notes and Details link on the Email Electronic Transcript page).

Message

Enter a message to be delivered in the body of the email. This message overwrites the email message for each individual request within this file.

Note: If you rerun the Generate Electronic Transcript process, the system deletes all email records under that run control value and creates new records.

Reviewing TS130 Outbound Transactions

The Electronic Transcript Query enables you to see the status of various electronic transcript requests based on the user who entered the request, student ID, request date, process date, or request status.

This section discusses how to review transcript request data.

Page Used to Review TS130 Outbound Transactions

Page Name	Definition Name	Navigation	Usage
Electronic Transcript Query	TRANSCRIPT_QUERY	Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Query > Electronic Transcript Query	View the status of various electronic transcript requests.

Reviewing Transcript Request Data

Access the Electronic Transcript Query page (Records and Enrollment > Transcripts > Electronic Transcripts > Electronic Transcript Query > Electronic Transcript Query).

User ID	Enter the user ID of the person who completed the request if you want to view requests created by a single user.
Student ID	Enter the student ID if you want to view requests for a specific student.
Date From	Enter dates in the From and Through fields to view electronic transcript requests with request date values within a certain date range. These two fields can contain the same date.
Process Date Range	Enter dates in the From and Through fields to view electronic transcript requests with process date values within a certain date range. Process date values are specified in the Date Processed field on the Transcript Request page.
Request Status	Select a request status to filter the status of requests you want to view. Values include: <i>Acknowledgement Received</i> , <i>Completed</i> , <i>Generated</i> , <i>On Request</i> , and <i>Reissue Requested</i> .
Fetch	Click to retrieve the results of your inquiry.
Go to Request	Click to go to the Electronic Transcript Request component for this request.

Processing TS131 Inbound Files

This section provides an overview of TS131 inbound files and discusses how to download TS131 files.

Understanding TS131 Inbound Files

Institutions that receive TS130 Electronic Transcripts from you should send back to you a Student Educational Record (Transcript) Acknowledgement, or TS131, file. This file confirms that the recipient received the record, and it ensures that the recipient received certain key elements as they were sent.

This process reconciles TS131 inbound files with individual electronic transcript requests. The process updates the Request History page in the Electronic Transcript Request component to indicate that it was successfully received or that the request needs to be reissued. You can query on which requests must be reissued through the Electronic Transcript Query page. Additionally, the Generate Electronic Transcript process also regenerates requests marked as Reissue.

Page Used to Process TS131 Inbound Files

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Download TS131	RUNCTL_TS131_DWNLD	Records and Enrollment > Transcripts > Electronic Transcripts > Download TS131 > Download TS131	Download TS131 files.

Downloading TS131 Files

Access the Download TS131 page (Records and Enrollment > Transcripts > Electronic Transcripts > Download TS131 > Download TS131).

Single File	Select this option to process a single file. The File Name field appears.
File List Driven	Select this option to process a list of files. Enter the name of the file that contains a list of files that you want to process in the File Name field.
Directory	Enter the name of the file if you selected the Single File or File List Driven option.
File Pattern	Enter the pattern of the file names that you want to process. For example, enter <i>*.txt</i> to process all text files in the directory that you specified. This field appears if you selected the Directory option.
Input/Output file	Enter the path to the file or files that you want to process.

Note: You must enter the final slash in the file path.

Reviewing Student Transcript Request History

This section lists a prerequisite and discusses how to run a transcript request query.

Prerequisite

Before you can search for a transcript request history, you must first have made at least one transcript request for a student.

Page Used to Review Student Transcript Request History

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Transcript Request Inquiry	SSR_TSRQST_INQ	Records and Enrollment > Transcripts > Transcript Request Inquiry > Transcript Request Inquiry	List all of the transcript requests for a specific student.

Running a Transcript Request Query

Access the Transcript Request Inquiry page (Records and Enrollment > Transcripts > Transcript Request Inquiry > Transcript Request Inquiry).

Academic Institution	Select the institution for which the transcript was generated. Institution values are defined on the Academic Institution Table page.
Transcript Type	Select the transcript type. Transcript type values are defined on the Transcript Type - Basic Data Page.
Student ID	Enter the ID for the student whose transcript request history you want to review.
Flexible Transcript	Select this check box to search for dynamically created transcripts only.
Search	When you click this button, the system displays transcript requests that meet the selection criteria you selected.

Purging Transcripts

Important! The COBOL transcript process is a deprecated product. Support will be maintained for this product, but no new development will be produced for the COBOL transcript process. It is strongly recommended that you use the Application Engine transcript process instead. For more information on the Application Engine transcript process, see [Understanding Transcript-Related Processes](#).

This section lists a prerequisite and discusses how to purge transcript reports.

To purge transcripts, use the Purge Transcript Reports component.

Note: The Transcript Purge (RUNCTL_SRTRPURG) component still exists in the system. Use this component to purge COBOL based transcripts.

Prerequisite

Before you can purge transcript requests and transcripts, you must create transcript requests.

Page Used to Purge Transcripts

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Purge Transcript Reports	SSR_RC_TSRPT_PURGE	Records and Enrollment > Transcripts > Purge Transcript Reports > Purge Transcript Reports	Purge transcript requests, including transcript results, if any. The system purges all transcript reports within the parameters that you specify.

Purging Transcript Reports

Access the Purge Transcript Reports page (Records and Enrollment > Transcripts > Purge Transcript Reports > Purge Transcript Reports).

Note: You can enter any or all of the parameters on the page to select the appropriate transcript reports to purge.

Purge All Results

Select this option to purge all results.

Warning! Selecting the Purge All Results option will override the Freeze Record flag set on the report request record and will delete all data from the results tables.

If you also select the Purge Report Requests and Logs option, all associated request records will also be purged, even if the Freeze Record flag is set.

Select Results to Purge

Select this option to purge by transcript type parameter, date range, or user ID selection.

Purge Report Requests and Logs

When this option is selected, the transcript requests that all information associated with the request will be deleted.

Requests will not appear on the Transcript Request Inquiry after the process runs.

Academic Institution

Enter the institution for which you want to purge transcripts. This value determines the availability of transcript types in the Transcript Type field.

Transcript Type

Enter the transcript type for which you want to purge transcripts.

Request Date From and Request Date To

Enter values that specify purge parameters. The system purges transcript requests created on and including these dates. The request date is the date that the transcript request number is created.

Request Print Date From and Request Print Date To

Enter values that specify purge parameters. The system purges transcript requests printed on and including these dates. The request print date is not a literal definition. The request print date refers to the date on which the transcript is generated and available for printing. For online transcript requests, this value is provided by the value in the Print Date field on the Transcript Request Header page. For batch transcript requests, this date is the date that the transcript is generated.

Request User ID

Select an ID from your user ID list. The system purges transcript requests and print requests initiated by this user.

Click Run to run this request. PeopleSoft Process Scheduler runs the Purge Transcript Reports process at user-defined intervals.

Using Self-Service Transcripts

If your institution has licensed PeopleSoft Campus Self Service, your students can request official and unofficial transcripts through self-service pages. See "Understanding Self-Service Student Center" (PeopleSoft Campus Solutions 9.2: Self Service)

Consolidating and Reporting Academic Statistics

Understanding Consolidating and Reporting Academic Statistics

With the Consolidate Academic Statistics process (SRPCCONP), you can capture demographic and statistical information about your students, reporting these students under one primary academic career and program for a statistical period of time. If a student is active in multiple academic careers or programs within one or more terms of an academic statistics period, the process combines the student's academic career, program, level, and load information, based on the student's academic career and program that have the lowest primacy number. Your institution can report each student under one academic career and program for a statistical period of time and have the multiple academic level, load, and other statistics consolidated. You can then use these consolidated academic statistics to meet reporting requirements—such as Integrated Postsecondary Education Data System (IPEDS) and National Student Clearinghouse (NSC).

After your institution completes the prerequisite setup for consolidating and reporting academic statistics, you are ready to capture and consolidate academic statistics for students who are active in terms at the academic institution for a given academic statistics period. You can, through the Consolidated Statistics page, run three COBOL/SQL processes:

- Take Term Statistics Snapshot (SRPCCONA).
- Recurring Term Snapshot (SRPCCONU).
- Consolidate Academic Statistics (SRPCCONP).

Important! To gather statistics that reflect different times of the year, you must run the Recurring Term Snapshot process (SRPCCONU) and the Consolidate Academic Statistics process (SRPCCONP) on a regular basis because the statistics themselves are based on the run date, not on the snapshot date. The processes use the snapshot date to locate the valid academic career and term combinations to include in the calculations.

After you have run the Consolidate Academic Statistics process (SRPCCONP) and are satisfied with the statistical results, you can then create reports based on the calculations found in the consolidated statistics table. Campus Solutions provides reporting features—such as NSC—that use the Consolidate Academic Statistics process results. Or you can create other reports to meet the needs of your institution. This documentation discusses the delivered reporting features.

Related Links

[Understanding Consolidate Academic Statistics Process Calculations](#)
[Performing Academic Statistics Consolidation](#)

Understanding Consolidated Statistics Processes

Before you run any of the consolidated statistics processes, it is important to understand when to use each process and how each process functions. This section summarizes each process, describes the common functionality shared between the processes, and outlines how each application process functions.

Take Term Statistics Snapshot Process

The Take Term Statistics Snapshot process (SRPCCONA) takes a term snapshot of every academic career and term combination listed in the grid in the lower portion of the Consolidated Statistics process page, where the snapshot date is less than or equal to the system date. The process considers as valid only the academic career and term combinations listed on the Academic Statistics Period page for the academic statistics period for which you run the process.

Run the process only when the consolidation trigger for the given academic statistics period is set to *Consolidation Date*. With such a consolidation trigger, this process is a precursor to running the Consolidate Academic Statistics process (SRPCCONP).

The process stores results in a temporary holding table (PS_STDNT_CARTRM_PD) for future use. This table has no corresponding page in which to view the stored data. There may be several rows of information in this table for one student per academic statistics period, depending on the academic career, term, and snapshot date combination. For example, on the Academic Statistics Period page, you might have set the following snapshot dates:

<i>Academic Career</i>	<i>Term</i>	<i>Snapshot Date</i>
BUSN	0505 (fall semester 2003)	09/20/03
BUSN	0518 (spring semester 2004)	02/01/04
LAW	0507 (fall quarter 2003)	09/15/03
LAW	0512 (spring quarter 2004)	01/30/04

Suppose that student A is in both the BUSN and LAW academic careers. In this scenario, after all term snapshots have been run, there will be four rows for student A in the temporary holding table PS_STDNT_CARTRM_PD.

Whenever you select *Consolidation Date* as your consolidation trigger for the academic statistics period, you must run two processes—the Term Snapshot process and the Consolidate Academic Statistics process. With such a consolidation trigger, the Consolidate Academic Statistics process consolidates all of a student's data that is found in the temporary holding table for a specific academic statistics period, calculating only one row of data for each student within an academic statistics period. The Consolidate Academic Statistics process writes these results to the consolidated statistics table (PS_STDNT_CONS_STAT). You can view many of the results from the Consolidate Academic Statistics process in the Student Consolidated Statistics component.

Note: You must use the Consolidation Date consolidation trigger for statistics periods that you create for NSC reporting. The term snapshot data provided by the SRCCONA process is also used to derive NSC program level data (this is written to the PS_SSR_STD_CON_ST2 table). See "Consolidate Academic Statistics Process: Deriving Program Level Data for NSC Reporting."

Consolidate Academic Statistics Process

The Consolidate Academic Statistics process (SRPCCONP) combines all of a student's valid academic statistics into one consolidated record.

You must run the Consolidate Academic Statistics process for every academic statistics period, regardless of the consolidation trigger for the academic statistics period. For academic statistics periods where the consolidation trigger is set to *Consolidation Date*, you must first run either the Take Term Statistics Snapshot process (SRPCCONA) or the Recurring Term Snapshot process (SRPCCONU) for all academic career, term, and snapshot date combinations of an academic statistics period before running the Consolidate Academic Statistics process. For academic statistics periods where the consolidate trigger is set to *As of Date* or *As of Today*, you need run only the Consolidate Academic Statistics process. The Consolidate Academic Statistics process uses the SRPCCONS program to calculate results, which the system then stores in the PS_STDNT_CONS_STAT table.

Regardless of the consolidation trigger for your academic statistics period, when a student is active in more than one academic career and academic program during the same academic statistics period, the Consolidate Academic Statistics process locates the student's primary academic career and program in two ways: by the academic careers and programs in which the student is active, and by the primacy number on the academic career and program. Because many federal and state reports require that you count students under one academic career and program even if the student is actively enrolled in more than one, the process combines all of the academic level, load, career, and program information for each student, based upon the primacy number you give to the academic career and program. The process reports the student based upon the student's academic career and program that has the lowest primacy number at the institution.

For information about NSC program level reporting, see "Consolidate Academic Statistics Process: Deriving Program Level Data for NSC Reporting."

Important! You should run the Consolidate Academic Statistics process at night, during the weekend, or at any other time with reduced demands on the system.

Consolidate Academic Statistics Process: Deriving Program Level Data for NSC Reporting

To meet NSC reporting requirements, institutions must report *program level* data for each student where the program level indicator (SSR_NSC_PRG_IND) is set to *Yes*. If a student is pursuing multiple programs, an institution must report enrollment data by program in addition to overall (per student) enrollment status related data. NSC program level data is equivalent to Campus Solutions Academic Plan data.

See [Setting Up For NSC Program Level Reporting](#)

The Consolidated Academic Statistics process derives program level data for students selected in an academic statistics period for which the NSC Report check box is selected on the Academic Statistics Type page and the Consolidation Trigger value is equal to *Consolidation Date* on the Academic Statistics Period page.

See [Setting Up Statistic Period Types](#)

See [Setting Up Academic Statistics Periods](#)

Program level data is written to the SSR_STD_CON_ST2 table and provides the source for the NSC extract program data. The table can capture a maximum of six sets of program level data. How many sets of program data are reported depends on the number of careers that have been consolidated for the statistics period and the number of eligible academic plans within those careers.

See [Understanding Consolidate Academic Statistics Process Calculations](#)

Consolidate Academic Statistics Process: Excluding Grades from Academic Load Calculation for NSC Reporting

The following information discusses how academic load is calculated if you use grade exclusions for NSC Reporting.

You can exclude units that are counted towards STDNT_CAR_TERM progress, based on grade definition, from the NSC load calculation.

The grade exclusions, which are defined on the Academic Statistics Type page, are used by the Consolidated Academic Statistics (SRPRCONP) process to exclude units from the total units used to calculate a student's academic load for a statistics period.

See [Setting Up Statistic Period Types](#).

This exclusion feature is specific to load calculations performed as part of the Consolidated Academic Statistics process.

Note: If you use exclusions, it is likely that some students—those with units excluded from calculation based on a grade (or grades)—will have a different academic load reported in Consolidated Statistics than the load calculated for the same term in STDNT_CAR_TERM. You should be aware that a higher or lower load might be reported to the NSC based on grade definition and the grade exclusion rules that you create.

Here is an example:

- On the Academic Statistics Type page, for Statistics Period Type of N, the Exclude Withdrawal Grades grid indicates that grades of WF are to be excluded when calculating academic load for a statistics period.

Image: Enrollment Data Example

A student has this enrollment data for the Spring 2011 term:

Level / Load	
Academic Level - Projected:	Freshman
Academic Level - Term Start:	Freshman
Academic Level - Term End:	Freshman
Approved Academic Load:	Full-Time
Academic Load:	Enrolled Full-Time

Classes					
 Enrolled  Dropped  Wait Listed					
Class	Description	Units	Grading	Grade	Status
ART 112-1 (1006)	History of World Art (Lecture)	3.00	Graded	WF	
ECON 1-1 (1554)	Introduction to Economics (Lecture)	3.00	Graded		
PHILO 150-1 (1526)	Intro to Logic (Lecture)	3.00	Graded	WF	
PHILO 205-1 (1030)	Elementary Logic (Lecture)	3.00	Graded	WF	
SOC 104-FA2 (2173)	American Race Relations (Lecture)	4.00	Graded		

- There are 16 units and 9 of these units have been dropped for penalty grades of WF. At PSUNV, the WF grade is included in a student's progress units, for load calculation and GPA purposes.
- Although the student's term load (as calculated in STDNT_CAR_TERM) is *full-time* (based on 16 units), if this student's record was evaluated by the Consolidated Academic Statistics process (with the grade exclusion rules defined as outlined above), the load would be calculated in the following way:
 - Number of enrolled units for reporting period is 16.00.
 - Number of units to be excluded based on Academic Statistics Type exclusion rule is 9.00 (3 x 3 units with grade of WF).

- Total units for Load Calculation is 7.00. This is the number of units that is passed from SRPCCONP into SRPCCALC.cbl for getting the NSC load.
- Academic Load (according to Load rule) is *half-time*.

The following information discusses how the NSC Enrollment Status Change Date is calculated when the academic load changes as a result of grade exclusion.

In order to report an accurate NSC Enrollment Status Change Date, the Consolidated Statistics process evaluates the drop date based on a student's enrollment record (STDNT_ENRL.DROP.ENRL_DROP_DT) when processing grade exclusions.

This allows the reporting of a date on which the student's term record (STDNT_CAR_TERM.UNTPRG_CHG_NSLC_DT) might not necessarily reflect a change in load.

Here is an example:

- In the scenario described above, the student has dropped 3 classes, with each drop resulting in penalty grade of WF. Because the units associated with this grade are counted towards the student's progress units, there is no change in the student's progress units, and therefore the STDNT_CAR_TERM.UNTPRG_CHG_NSLC_DT value for the term remains null.
- Although the units value does not change, a drop date is captured on the student's enrollment record.
- Because the WF grades are excluded from NSC load calculation, the process reports a reduced load for the student (half-time in this case) and therefore has to report a status change date.
- The process evaluates the classes with the *excluded* grades and uses the latest drop date as the Enrollment Status Change Date (STDNT_CONS_STAT.ENRL_STAT_CHG_DT).

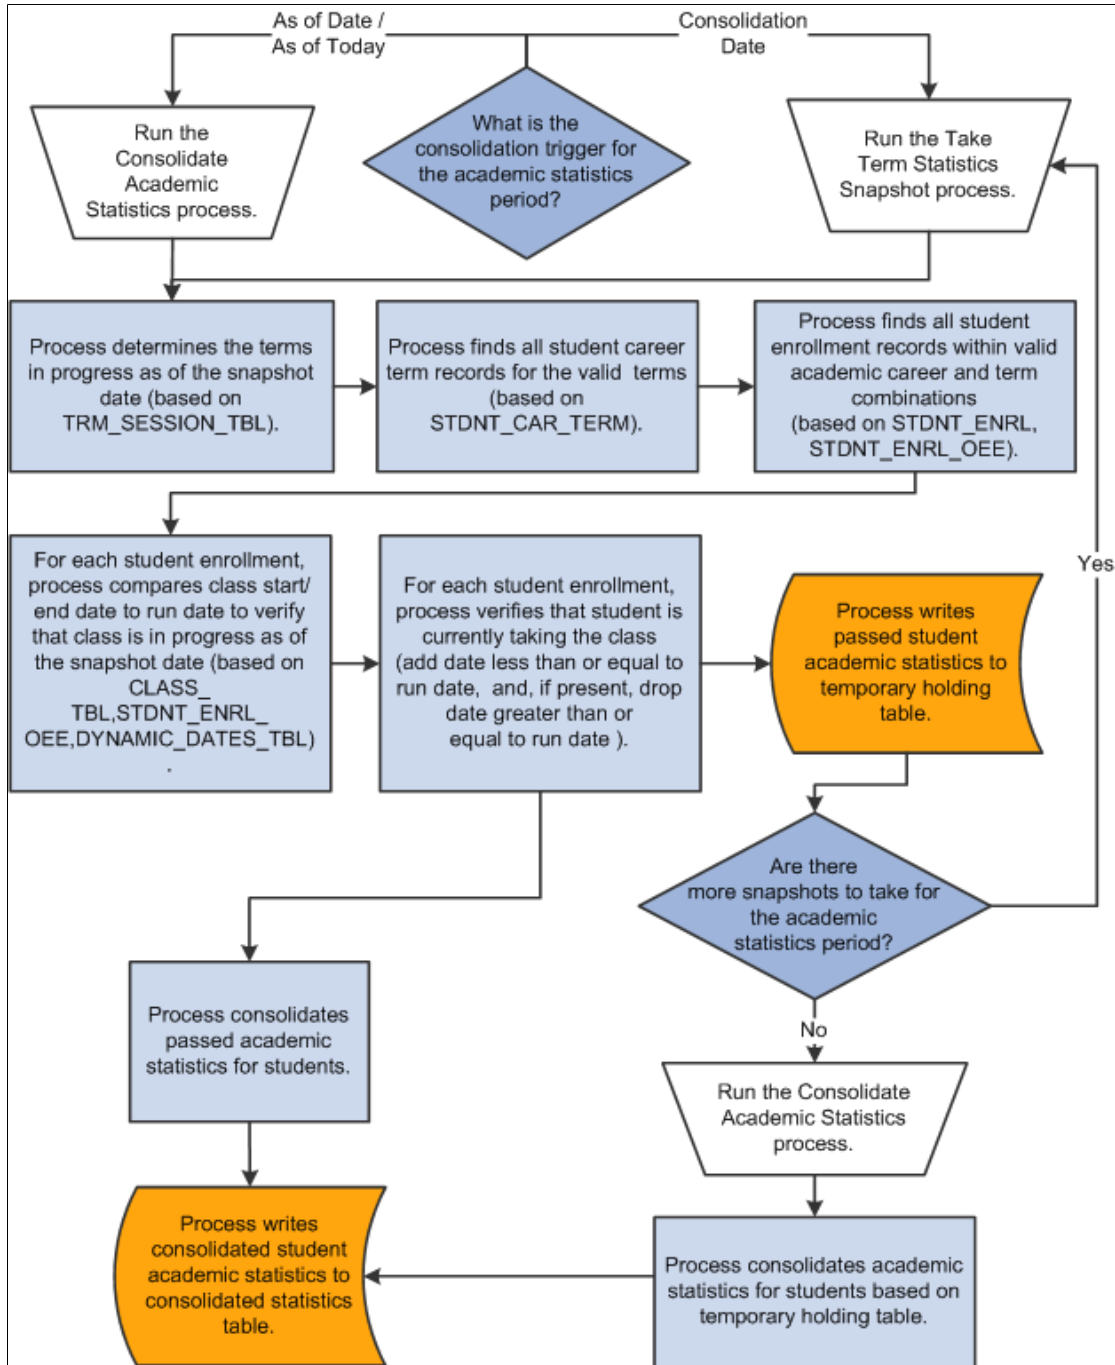

Common Functionality Shared Between Processes

Before you run any of the consolidated statistics processes, it is important to understand how the processes locate which student data to include in their results. First, the processes locate the valid academic career and term combinations that are in progress as of the snapshot date. After the processes locate the valid academic career and term combinations, they gather all of the career-term records for students active in these academic career and term combinations, excluding any student who has completed their degree, except within the student's degree completion term. After the processes gather the applicable student career-term records, they further gather these students' enrollment records and compare the start and end dates for all classes in which the student is actively enrolled to the snapshot date to determine if a student's class units should count towards her or his academic level and load calculation. For example, the process excludes a student's class units if the student has enrolled in the class for a future session. This structure assists nonterm-based institutions in identifying a student's status at any given point in time, such as a student's primary academic program, primary academic career, term, academic level, academic load, and current and cumulative career-term statistics.

Flow Chart of Consolidated Statistics Processes

Image: Example flows of consolidated academic statistics processes

The following diagram illustrates when to run the Consolidate Academic Statistics process (SRPCCONP) and the Take Term Statistics Snapshot process (SRPCCONA) and, when initiated, how these processes function:

Understanding Consolidate Academic Statistics Process Calculations

After you run the Consolidate Academic Statistics process (SRPCCONP), the system stores the results (except for NSC program level data) in the Consolidated Statistics table (PS_STDNT_CONS_STAT). NSC program level data is stored in the SSR_STD_CON_ST2 table. See [Understanding Consolidated Statistics Processes](#)

You can access the statistics stored in the stored in the PS_STDNT_CONS_STAT table: for a specific student through the Student Consolidated Stats component, for a group of students through the Mass Consolidated Statistics component, or through SQL select statements when you query the database.

The PS_STDNT_CONS_STAT table contains over a hundred data elements and only the most vital are available for inquiry online (which statistics are available is decided based on the guidelines of federal reports such as NSC, IPEDS and IRS, and feedback from clients).

Use the following table to view the logic behind how the SRPCCONS program, which is part of the Consolidate Academic Statistics process (SRPCCONP), calculates each student's consolidated academic statistics. The table lists the fields found in the PS_STDNT_CONS_STAT table, in the order in which they appear in the record definition, and explains the related logic.

Field	Logic
EMPLID (EmplID)	Populated from the corresponding field on the STDNT_CAR_TERM record for the student's primary academic program.
INSTITUTION (Academic Institution)	Originated from input through the Consolidated Statistics process page.
ACAD_STATS_PERIOD (Academic Statistics Period)	Originated from input through the Consolidated Statistics process page.
CONS_STATUS (Consolidation Status)	Result of the Consolidate Academic Statistics process (SRPCCONS). If successful, then the program logic sets the status to <i>S</i> (success).

Field	Logic
ACAD_CAREER (Academic Career)	<p>Populated from the corresponding field on the STDNT_CAR_TERM record.</p> <p>If the academic statistics period has <i>As of Date</i> or <i>As of Today</i> (system date) for its trigger, then that date triggers the cut-off for the admit term.</p> <p>If the academic statistics period has <i>Consolidation Date</i> for its trigger, then that date triggers the cut off for the admit term (same as the <i>As of Date</i> or <i>As of Today</i> trigger).</p> <p>If more than one academic career passes these criteria, then the program logic locates the active academic career.</p> <p>If two academic careers are active on the same date, then the program logic looks at the primacy number. The lowest number takes precedence.</p> <p>If the academic careers have the same primacy number, then the program logic will compare the effective dates (EFFDT). The later date takes precedence.</p>
STRM (Term)	<p>Populated with values from the corresponding field on the STDNT_CAR_TERM record.</p> <p>If the academic statistics period has <i>As of Date</i> or <i>As of Today</i> for its trigger, then the program logic reports the term from the student's primary academic program.</p> <p>If the academic statistics period has <i>Consolidation Date</i> for its trigger, then the program logic reports the term from the student's primary academic program in relation to the consolidation as of date. For example, if you take snapshots for terms 0330, 0350, and 0370 but your consolidation as of date falls within term 0350, then the program logic reports term 0350.</p>
WITHDRAW_CODE (Withdrawal/Cancel)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program.
WITHDRAW_REASON (Withdrawal/Cancel Reason)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program.
WITHDRAW_DATE (Withdrawal/Cancel Date)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program.
LAST_DATE_ATTENDED (Last Date of Attendance)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program.
STDNT_CAR_NBR (Student Career Number)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program.

Field	Logic
ACAD_PROG_PRIMARY (Primary Academic Program)	Calculated from the corresponding field on the STDNT_CAR_TERM record. If a student has two or more active academic programs, the program logic calculates the primary academic program according to the primacy value of the academic programs. It is the calculated academic program that will be reported.
ACAD_LOAD_APPR (Approved Academic Load)	Populated from the corresponding field on the STDNT_CAR_TERM record.
ACADEMIC_LOAD (Academic Load)	<p>Computed by the SRPCRULE/SRPCLOAD process based on units in progress and using academic load rules according to the academic statistics period.</p> <p>See the logic description for the OVRD_ACADEMIC_LOAD field.</p> <hr/> <p>Note: If you use grade exclusions for NSC Reporting, the SRPCCONP process excludes units from the total units used to calculate a student's academic load for a statistics period, based on the grade exclusions defined at the Statistics Type level.</p> <hr/> <p>See Understanding Consolidated Statistics Processes.</p>
OVRD_ACADEMIC_LOAD (Override Academic Load)	The system sets this field value to <i>N</i> , indicating that the Academic Load field (ACADEMIC_LOAD) contains the value of the calculated academic load (ACADEMIC_LOAD_CL). You can override the calculated academic load (ACADEMIC_LOAD_CL) by selecting the Override Academic Load check box (OVRD_ACADEMIC_LOAD) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for the Academic Load field (ACADEMIC_LOAD). Selecting this check box sets the OVRD_ACADEMIC_LOAD field value to <i>Y</i> .
ACADEMIC_LOAD_CL (Academic Load Calculated)	<p>Computed by the SRPCRULE/SRPCLOAD process, based on units in progress and using academic load rules according to the academic statistics period.</p> <p>See the logic description for the OVRD_ACADEMIC_LOAD field.</p> <hr/> <p>Note: If you use grade exclusions for NSC Reporting, the SRPCCONP process excludes units from the total units used to calculate a student's academic load for a statistics period, based on the grade exclusions defined at the Statistics Type level.</p> <hr/> <p>See Understanding Consolidated Statistics Processes.</p>
FA_LOAD (Financial Aid Load)	Computed by SRPCRULE/SRPCLOAD.

Field	Logic
ACADEMIC_LOAD_NSLC (NSC Academic Load)	<p>Calculated from units in progress and using NSC academic load rules (PS_ACAD_LOAD2_TBL) according to the academic statistics period. You can override the calculated result by selecting the Override Academic Load check box in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for this field.</p> <hr/> <p>Note: If you use grade exclusions for NSC Reporting, the SRPCCONP process excludes units from the total units used to calculate a student's academic load for a statistics period, based on the grade exclusions defined at the Statistics Type level.</p> <hr/> <p>See Understanding Consolidated Statistics Processes.</p>
ACAD_LOAD_NSLC_CL (NSC Academic Load Calculated)	<p>Calculated from units in progress and using NSC academic load rules (PS_ACAD_LOAD2_TBL) according to the academic statistics period.</p> <hr/> <p>Note: If you use grade exclusions for NSC Reporting, the SRPCCONP process excludes units from the total units used to calculate a student's academic load for a statistics period, based on the grade exclusions defined at the Statistics Type level.</p> <hr/> <p>See Understanding Consolidated Statistics Processes.</p>
ACAD_LEVEL_PROJ (Academic Level - Projected)	Computed by SRPCRULE/SRPCLVL.
ACAD_LEVEL_PROJ_CL (Academic Level Proj Calculated)	Computed by SRPCRULE/SRPCLVL.
ACAD_LEVEL_BOT (Academic Level - Term Start)	Computed by the SRPCRULE/SRPCLVL process based on cumulative units and using the academic level rules according to the Academic Level Table page.
ACAD_LEVEL_BOT_CL (Academic Level BOT Calculated)	Computed by the SRPCRULE/SRPCLVL process based on cumulative units and using the academic level rules according to the Academic Level Table page.
ACAD_LEVEL_EOT (Academic Level - Term End)	<p>Computed by SRPCRULE/SRPCLVL.</p> <p>See the logic description for the OVRD_ACAD_LVL_ALL field.</p>
ACAD_LEVEL_EOT_CL (Academic Level EOT Calculated)	<p>Computed by SRPCRULE/SRPCLVL.</p> <p>See the logic description for the OVRD_ACAD_LVL_ALL field.</p>

Field	Logic
ACAD_LEVEL_IPEDS (IPEDS Academic Level)	Calculated from cumulative units at the end of the term or using academic level and IPEDS academic level mapping according to the Level/Load Rules Table page. You can override the calculated result by selecting the Override All Academic Levels check box in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for this field. See the logic description for the OVRD_ACAD_LVL_ALL field.
ACAD_LEVEL_IPED_CL (IPEDS Academic Level Calculated)	Calculated from cumulative units and using academic level and IPEDS academic level mapping according to the Level/Load Rules Table page. See the logic description for the OVRD_ACAD_LVL_ALL field.
SSR_NSC_CRD_LVL (NSC Class Credential Level)	Consolidate Academic Statistics reports the NSC Classification from the Academic Plan Table. If the process finds a NSC Classification value of Bachelor's Degree in the Academic Plan Table component, then, based on the calculated academic level, it retrieves the appropriate NSC Level Category value.
SSR_NSC_CRD_LVL_CL Calculated NSC Class Credential Level	See the logic description for SSR_NSC_CRD_LVL
SSR_OVRD_NSC_CRLVL (Override Calculated NSC Class Credential Level)	The system sets this field value to N, indicating that the NSC Class Credential Level field (SSR_NSC_CRD_LVL) contains the value of the calculated class credential level (SSR_NSC_CRD_LVL_CL). To override the calculated class credential level, select the Override NSC Class Credential Level check box (SSR_OVRD_NSC_CRLVL) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then select a new value for the NSC Class Credential Level field. Selecting the check box sets the SSR_NSC_CRD_LVL_CL field value to Y.
NSLDS_LOAN_YEAR (NSLDS Loan Year)	Computed by SRPCRULE/SRPCVLV.
OVRD_ACAD_LVL_PROJ (Override Projected Level)	Populated from the corresponding field on the STDNT_CAR_TERM record.

Field	Logic
OVRD_ACAD_LVL_ALL (Override All Academic Levels)	<p>Populated from the corresponding field on the STDNT_CAR_TERM record.</p> <p>The system sets this field value to <i>N</i>, indicating that the IPEDS Academic Level field (ACAD_LEVEL_IPEDS) and the Academic Level - Term End field (ACAD_LEVEL_EOT) contain the value of the respective calculated academic levels (ACAD_LEVEL_IPED_CL and ACAD_LEVEL_EOT_CL).</p> <p>You can override the calculated academic levels (ACAD_LEVEL_IPED_CL) and (ACAD_LEVEL_EOT_CL) by selecting the Override Units For Progress check box (OVRD_ACAD_LVL_ALL) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for the IPEDS Academic Level field (ACAD_LEVEL_IPEDS) and Academic Level - Term End field (ACAD_LEVEL_EOT).</p> <p>Selecting this check box sets the OVRD_ACAD_LVL_ALL field value to <i>Y</i>.</p>
ELIG_TO_ENROLL (Eligible to Enroll)	<p>Populated from the corresponding field on the STDNT_CAR_TERM record.</p>
UNT_TAKEN_PRGRSS (Units Taken for Progress)	<p>Computed by the Consolidate Academic Statistics process (SRPCCONS).</p> <p>See the logic description for the OVRD_UNT_TAKEN_PRG field.</p>
UNT_TAKEN_PRGRS_CL (Calculated Progress Units)	<p>Computed by the Consolidate Academic Statistics process (SRPCCONS).</p> <p>See the logic description for the OVRD_UNT_TAKEN_PRG field.</p>
OVRD_UNT_TAKEN_PRG (Override Units for Progress)	<p>The system sets this field value to <i>N</i>, indicating that the Units Taken For Progress field (UNT_TAKEN_PRGRSS) contains the value of the calculated progress units (UNT_TAKEN_PRGRS_CL). You can override the calculated progress units (UNT_TAKEN_PRGRS_CL) by selecting the Override Units For Progress check box (OVRD_UNT_TAKEN_PRG) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for the Units Taken for Progress field (UNT_TAKEN_PRGRSS). Selecting this check box sets the OVRD_UNT_TAKEN_PRG field value to <i>Y</i>.</p>
UNT_PASSD_PRGRSS (Units Passed for Progress)	<p>Computed by the Consolidate Academic Statistics process (SRPCCONS).</p>
UNT_TAKEN_GPA (Units Taken Toward GPA)	<p>Computed by the Consolidate Academic Statistics process (SRPCCONS).</p>

Field	Logic
UNT_PASSD_GPA (Units Passed Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_TAKEN_NOGPA (Units Taken Not Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_PASSD_NOGPA (Units Passed Not Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_INPROG_GPA (Units In Progress - GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_INPROG_NOGPA (Units In Progress - Not for GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
GRADE_POINTS (Grade Points)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_AUDIT (Units Audited)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_TRNSFR (Units Transferred)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TRF_TAKEN_GPA (Transfer Taken for GPA)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TRF_TAKEN_NOGPA (Transfer Taken Not for GPA)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TRF_PASSED_GPA (Transfer Passed for GPA)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TRF_PASSED_NOGPA (Transfer Passed Not for GPA)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TRF_GRADE_POINTS (Transfer Grade Points)	Populated from the corresponding field on the STDNT_CAR_TERM record.
UNT_TEST_CREDIT (Units From Test Credit)	Populated from the corresponding field on the STDNT_CAR_TERM record.

Field	Logic
UNT_OTHER (Units From Other Credit)	Populated from the corresponding field on the STDNT_CAR_TERM record.
UNT_TAKEN_FA (Fin Aid Progress Units Taken)	Populated from the corresponding field on the STDNT_CAR_TERM record.
UNT_PASSD_FA (Fin Aid Progress Units Passed)	Populated from the corresponding field on the STDNT_CAR_TERM record.
UNT_TAKEN_FA_GPA (FA Units Taken Toward GPA)	Populated from the corresponding field on the STDNT_CAR_TERM record.
GRADE_POINTS_FA (Financial Aid Grade Points)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
UNT_TERM_TOT (Total Term Units)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
RESET_CUM_STATS (Reset Cum Stats at Term Start)	Currently not in use.
TOT_TAKEN_PRGRSS (Total Taken for Progress)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_PASSD_PRGRSS (Total Passed for Progress)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_TAKEN_GPA (Total Taken Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_PASSD_GPA (Total Passed Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_TAKEN_NOGPA (Total Taken Not Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_PASSD_NOGPA (Total Passed Not Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_INPROG_GPA (Total In Progress - GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).

Field	Logic
TOT_INPROG_NOGPA (Total In Progress - Not for GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_AUDIT (Total Audited)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_TRNSFR (Total Transferred)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_TEST_CREDIT (Total From Test Credit)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_OTHER (Total From Other Credit)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_CUMULATIVE (Total Cumulative Units)	Computed by the Consolidate Academic Statistics process (SRPCCONS). See the logic description for the OVRD_TOT_CUM field.
TOT_CUMULATIVE_CL (Total Cumulative Units Calculated)	Computed by the Consolidate Academic Statistics process (SRPCCONS). See the logic description for the OVRD_TOT_CUM field.
OVRD_TOT_CUM (Override Total Cumulative Unit)	The system sets this field value to <i>N</i> , indicating that the Total Cumulative Units field (TOT_CUMULATIVE) contains the value of the calculated total cumulative units (TOT_CUMULATIVE_CL). You can override the calculated total cumulative units (TOT_CUMULATIVE_CL) by selecting the Override Total Cumulative Unit check box (OVRD_TOT_CUM) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for the Total Cumulative Units field (TOT_CUMULATIVE). Selecting this check box sets the OVRD_TOT_CUM field value to <i>Y</i> .
TOT_GRADE_POINTS (Total Grade Points)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_TAKEN_FA (Total Fin Aid Units Taken)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_PASSD_FA (Total Fin Aid Units Passed)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
TOT_TAKEN_FA_GPA (Total Fin Aid Taken Toward GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS).

Field	Logic
TOT_GRD_POINTS_FA (Total Fin Aid Grade Points)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
FORM_OF_STUDY (Form of Study)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. See the logic description for the OVRD_FORM_OF_STUDY field.
FORM_OF_STUDY_PD (Form of Study for Period)	Used in the United States, specifically for IRS reporting in a delivered report in the database. When you have an academic statistics period that consolidates several terms: If the latest term form of study equals <i>Enrollment</i> and units equals <i>0</i> , then the program logic populates FORM_OF_STUDY_PD with the <i>prior</i> term's form of study value. If the latest term form of study equals <i>Enrollment</i> and units are greater than <i>0</i> , then the program logic populates FORM_OF_STUDY_PD with the <i>latest</i> term's form of study value.
FORM_OF_STUDY_CL (Form of Study Calculated)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. See the logic description for the OVRD_FORM_OF_STUDY field.
OVRD_FORM_OF_STUDY (Override Form of Study)	The system sets this field value to <i>N</i> , indicating that the Form of Study field (FORM_OF_STUDY) contains the value of the calculated form of study (FORM_OF_STUDY_CL). You can override the calculated form of study (FORM_OF_STUDY_CL) by selecting the Override Form of Study check box (OVRD_FORM_OF_STUDY) in the Mass Consolidated Statistics component or the Basic Data page in the Student Consolidated Stats component, then selecting a new value for Form of Study field (FORM_OF_STUDY). Selecting this check box sets the OVRD_FORM_OF_STUDY field value to <i>Y</i> .
TERM_TYPE (Term Type)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic career.
CLASS_RANK_NBR (Class Rank Nbr)	Populated from the corresponding field on the STDNT_CAR_TERM record.
CLASS_RANK_TOT (Class Rank Total)	Populated from the corresponding field on the STDNT_CAR_TERM record.
SEL_GROUP (Tuition Group)	Populated from the corresponding field on the STDNT_CAR_TERM record.

Field	Logic
BILLING_CAREER (Billing Career)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic career and primary academic program.
UNIT_MULTIPLIER (Unit Multiplier)	Populated from the corresponding field on the STDNT_CAR_TERM record.
ACAD_YEAR (Academic Year)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic career and primary academic program.
CUR_RESIDENT_TERMS (Current In Residence Terms)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TRF_RESIDENT_TERMS (Transfer In Residence Terms)	Populated from the corresponding field on the STDNT_CAR_TERM record.
CUM_RESIDENT_TERMS (Cumulative In Residence Terms)	Computed by the Consolidate Academic Statistics process (SRPCCONS).
REFUND_PCT (Refund Percentage)	Populated from the corresponding field on the STDNT_CAR_TERM record.
REFUND_SCHEME (Refund Scheme)	Populated from the corresponding field on the STDNT_CAR_TERM record.
PRO_RATA_ELIGIBLE (Pro-rata Eligible)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic career and primary academic program.
FULLY_ENRL_DT (Fully Enrolled Date)	Populated from the corresponding field on the STDNT_CAR_TERM record.
FULLY_GRADED_DT (Fully Graded Date)	Populated from the corresponding field on the STDNT_CAR_TERM record.
EXT_ORG_ID (External Org ID)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. Relates to external study only, as entered through the External Study page in the Term Activation component.
COUNTRY (Country)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. Relates to external study only, as entered through the External Study page in the Term Activation component.

Field	Logic
STUDY_AGREEMENT (Study Agreement)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. Relates to external study only, as entered through the External Study page in the Term Activation component.
START_DATE (Start Date)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. Relates to external study only, as entered through the External Study page in the Term Activation component.
END_DATE (End Date)	Populated with values from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic program. Relates to external study only, as entered through the External Study page in the Term Activation component.
CUR_GPA (Current GPA)	<p>Computed by the Consolidate Academic Statistics process (SRPCCONS).</p> <p>If the academic statistics period has <i>As of Date</i> or <i>As of Today</i> for its trigger, then the program logic uses the current GPA.</p> <p>If the academic statistics period has <i>Consolidation Date</i> for its trigger, the program logic uses the current term GPA.</p> <p>If a student is active in multiple programs and careers with different grading bases (for example, a 100-point scale and a 4-point scale), then the program logic reports only the student's primary career and program GPA.</p> <p>See the logic description for the OVRD_GPA field.</p>
GPA_CL (GPA Calculated)	<p>Computed by the Consolidate Academic Statistics process (SRPCCONS).</p> <p>If the academic statistics period has <i>As of Date</i> or <i>As of Today</i> for its trigger, then the program logic uses the current GPA.</p> <p>If the academic statistics period has <i>Consolidation Date</i> for its trigger, the program logic uses the current term GPA.</p> <p>If a student is active in multiple programs and careers with different grading bases (for example, a 100-point scale and a 4-point scale), then the program logic reports only the student's primary career and program GPA.</p> <p>See the logic description for the OVRD_GPA field.</p>
OVRD_GPA (Override GPA)	The system sets this field value to <i>N</i> , indicating that the Current GPA field (CUR_GPA) contains the value of the calculated GPA (GPA_CL). You can override the calculated GPA (GPA_CL) by selecting the Override GPA check box (OVRD_GPA) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for the Current GPA field (CUR_GPA). Selecting this check box sets the OVRD_GPA field value to <i>Y</i> .

Field	Logic
CUM_GPA (Cumulative GPA)	Computed by the Consolidate Academic Statistics process (SRPCCONS). Total grade points divided by total units. If the student is active in multiple programs and careers with different grading bases (for example, 100-point scale and 4-point scale), then the program logic reports only the student's primary career and program GPA. See the logic description for the OVRD_CUM_GPA field.
CUM_GPA_CL (Cumulative GPA Calculated)	Computed by the Consolidate Academic Statistics process (SRPCCONS). Total grade points divided by total units. If the student is active in multiple programs and careers with different grading bases (for example, 100-point scale and 4-point scale), then the program logic reports only the student's primary career and program GPA. See the logic description for the OVRD_CUM_GPA field.
OVRD_CUM_GPA (Override Cum GPA)	The system sets this field value to <i>N</i> , indicating that the Cumulative GPA field (CUM_GPA) contains the value of the calculated GPA (CUM_GPA_CL). You can override the calculated cumulative GPA (CUM_GPA_CL) by selecting the Override Cum GPA check box (OVRD_CUM_GPA) in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component, then selecting a new value for the Cumulative GPA field (CUM_GPA). Selecting this check box sets the OVRD_CUM_GPA field value to <i>Y</i> .
OVRD_TUIT_GROUP (Override Tuition Group)	Populated from the corresponding field on the STDNT_CAR_TERM record.
OVRD_WDRW_SCHED (Override Withdrawal Schedule)	Populated from the corresponding field on the STDNT_CAR_TERM record based on the student's primary academic career and primary academic program.
TUITION_RES_TERMS (Tuition Residency)	Populated from the corresponding field on the STDNT_CAR_TERM record.
TC_UNITS_ADJUST (TC Units Adjustment)	Populated from the corresponding field on the STDNT_CAR_TERM record.
STDNT_COHORT_PRIM (Primary Student Cohort)	The Consolidate Academic Statistics process (SRPCCONS) reports one student attribute only for cohort processing. Define student attributes and their valid values on the Student Attributes Table page. Define the student attribute for cohort reporting at your institution on the Institution 3 page. When you run the process, it calls, for each student, a routine to retrieve the student's most primary student attribute value for the specific student attribute for cohort value that you define on the Institution 3 page. Assign student attributes and values to students on the Student Attributes page of the Student Program/Plan component.

Field	Logic
ETHNIC_GROUP_SR (Ethnic Group)	<p>Populated from joining the ETHNICITY_DTL record which contains the ETHNIC_GRP_CD against the ETHNIC_GRP_TBL which contains ETHNIC_GROUP, which is reported.</p> <hr/> <p>Note: The field value is derived according to IPEDS reporting requirements if the academic statistics type is identified as IPEDS.</p> <hr/> <p>See Setting Up Statistic Period Types.</p>
AGE_CATEGORY_SR (Age Category)	<p>Populated from the corresponding field on the PERSON record. Age categories are defined per IPEDS rules. The program logic calculates age by using a student's birth date from personal data (based on system date) and comparing their birth date to the as of date, as of today date (system date), or consolidation as of date.</p>
DEGREE (Degree)	<p>Populated from the ACAD_DEGR record if the ACAD_PLAN for the ACAD_PROG being reported matches the ACAD_PLAN in the ACAD_DEGR_PLAN record.</p>
EXP_GRAD_TERM (Expected Graduation Term)	<p>Populated from corresponding field on the ACAD_PROG record based on the student's primary academic program.</p>
COMPLETION_TERM (Completion Term)	<p>Populated from the corresponding field on the ACAD_PROG record based on the student's primary academic program.</p> <p>If the statistics type includes the academic program status <i>Completed</i>, the process selects those students who have a completion term that is greater than or equal to the consolidated statistics term (STRM), and those whose effective date of the student's completion row is greater than or equal to the term start date and less than or equal to the term end date.</p>
DEGR_CONFER_DT (Confer Date)	<p>Populated from the ACAD_DEGR record if the ACAD_PLAN for the ACAD_PROG being reported matches the ACAD_PLAN in the ACAD_DEGR_PLAN record.</p>
ENRL_STAT_CHG_DT (Enrollment Status Change Date)	<p>Populated based on the program action on the ACAD_PROG record. If the program status is CM and the program action is COMP, the DEGR_CONFER_DT is reported. If the program status is CM and the program action is not COMP, the EFFDT of the ACAD_PROG record is reported. If the program status is active or waitlisted, and during the term a program or NSC reporting unit change has occurred, the date of the change is reported. Otherwise, no date is reported. If any other program status is reported, the EFFDT of the ACAD_PROG record is reported.</p> <hr/> <p>Note: If you use grade exclusions for NSC Reporting, the SRPCCONP process evaluates the drop date based on a student's enrollment record (STDNT_ENRL.DROP.ENRL_DROP_DT) to accurately report the ENRL_STAT_CHG_DT.</p> <hr/> <p>See Understanding Consolidated Statistics Processes.</p>

Field	Logic
ACAD_PROG_MAIN (Academic Program)	Populated with the student's primary academic program (ACAD_PROG) within the student's primary academic career based on the STDNT_CAR_TERM record.
STDNT_CAR_NBR_MAIN (Student Career Number)	Populated with the student career number (STDNT_CAR_NBR) based on the student's primary academic career and primary academic program as found on the STDNT_CAR_TERM record.
ACAD_PLAN (Academic Plan)	Calculated from the corresponding field on the ACAD_PLAN record based on the student's calculated primary academic program.
ACAD_SUB_PLAN (Academic Subplan)	Populated from the corresponding field on the ACAD_SUBPLAN record based on the student's primary academic program.
EXTRA_ACTIVITY (Extracurricular Activity)	Populated from the corresponding field on the EXTRACUR_ACTIVITY record. Primacy is taken into consideration by joining PS_EXTR_ACTIVITY_TBL on common keys.
SF_1098_GRAD_FLG (1098 Grad Flag)	Currently not in use, reported as N.
SF_1098_HLFTME_FLG (1098 Half Time Flag)	Currently not in use, reported as N.
CORRECTION_STATUS (Correction Status)	Currently not in use, reported as 1.
SF_CORRECTION_DTTM (Correction Date Time)	Currently not in use, reported as NULL.
SF_OVERRIDE_GRAD (Override Grad Flag)	Currently not in use, reported as N.
SF_OVERRIDE_HALF (Override Half Flag)	Currently not in use, reported as N.
SF_ORIGINAL_SENTDT (Original Sent Date)	Currently not in use, reported as NULL.
SF_ORIGINAL_PRT_DT (Original Print Date)	Currently not in use, reported as NULL.

Field	Logic
ATHLETIC_AID (Athletic Aid)	Populated from FIN_AID_TYPE field found on the financial aid record ITEM_TYPE_FA. If the FIN_AID_TYPE value equals A (athletic), then the program sets the ATHLETIC_AID flag for consolidated statistics to Y (yes). You can override this value with the Athletic Aid check box in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component.
PROG_STATUS (Program Status)	This is the student's status within her or his primary academic program.
MULTI_ACAD_CAREER (Multiple Academic Career)	The program logic sets this flag to Y (yes) if the program is consolidating multiple careers and programs for a student regardless of a student's enrollment status. You can override this value with the Multiple Academic Career check box in the Mass Consolidated Statistics component or on the Basic Data page in the Student Consolidated Stats component.
FA_UNIT_WARNING (Excluded FA eligible Term Warn)	SRPCCONS currently does not calculate the value for the FA_UNIT_WARNING flag. The program logic sets this field value to N (no).
CAMPUS (Campus)	Populated from the corresponding field on the ACAD_PROG record based on the student's primary academic program.
LEVEL_LOAD_RULE (Level Load Rule)	The academic level and load rule that the SRPCCONS process uses to calculate the student's academic level and academic load.
OPRID (Operator ID)	Populated from the corresponding field on the run control table PS_RUN_CNTL_CONS, based on the user who saved the Consolidated Statistics process page.
LASTNAME_RPTD_NSLC (Last name Reported NSLC)	<p>Populated from input through the Consolidated Statistics process page provided that a value was entered into the Prev Stat NSC (previous statistics NSC) field on the page.</p> <p>The program will use the EMPLID, INSTITUTION, and ACAD_STATS_PERIOD to pull up the STDNT_CONS_STAT record from the previous NSC run and pull the data from the record. STDNT_CONS_STAT record will have the Last Name field populated when SRNSLCEX.SQR is run (<i>Manage Academic Records, Reports, NSC</i>).</p>
SSN_RPTD_NSLC (SSN Reported NSLC)	<p>Populated from input through the Consolidated Statistics process page provided that a value was entered into the Prev Stat NSC field on the page.</p> <p>The program will use the EMPLID, INSTITUTION, and ACAD_STATS_PERIOD to pull up the STDNT_CONS_STAT record from the previous NSC run and pull the data from the record. STDNT_CONS_STAT record will have the SSN field populated when SRNSLCEX.SQR is run (<i>Manage Academic Records, Reports, NSC</i>).</p>

Field	Logic
PREV_STATSPER_NSLC (Prev Acad Stats Period NSLC)	Originated from data on the Consolidated Statistics process page when the process is run.

The Consolidated Academic Statistics process writes NSC program level data to the SSR_STD_CON_ST2 table and the NSC extract uses this data. The table can capture a maximum of six sets of program level data.

NSC program level data is reported when the Program Indicator field value is *Yes*.

The following table lists the fields found in the SSR_STD_CON_ST2 table, in the order in which they appear in the record definition, and explains the related logic.

The table includes descriptions for the first set of program fields (PRG1). The same logic is used for all six sets of program fields.

Fields	Logic
SSR_NSC_PRG_IND (Program Indicator)	If a student has at least one valid academic plan(for the reporting period) that has been identified on the Academic Plan table as a plan that should be reported as an "NSC Program" (ACAD_PLAN_TBL.SSR_NSC_INCL_PLAN = Y), then this value is set to <i>Yes</i> .
SSR_NSC_PRG1_CIPCD (Program CIP Code)	The Consolidated Statistics process reports the CIP code for the academic plan. The value is retrieved from the table ACAD_PLAN_TBL and the column CIP_CODE. See "Setting Up Taxonomy" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)
SSR_NSC_PRG1_CIPYR (CIP Year)	The year in which the CIP code being reported was published. Because this value can change over time, the value is attached to the Statistics Type definition. The data is retrieved from the table ACD_STAT_TP_TBL and the column SSR_NSC_PRG_CIPYR. See <u>Setting Up Statistic Period Types</u>

Fields	Logic
SSR_NSC_PRG1_CRLVL (Program Credential Level)	<p>The credential level of the program required by the NSC. The Code and Description values are:</p> <ul style="list-style-type: none"> • 01: Undergraduate Certificate of Diploma Program • 02: Associate's Degree • 03: Bachelor's Degree • 04: Post Baccalaureate Certificate • 05: Master's Degree • 06: Doctoral Degree • 07: First Professional Degree • 08: Graduate / Professional Certificate • 99: Non Credential Program (Preparatory Coursework / Teacher Certification) <p>These values are mapped from the NSC Credential Level values attached to the student's academic plan. The values are defined by Aid Year on the Financial Aid Credential Level Cross Reference page. The Consolidated Statistics process retrieves this value from the table SFA_CRDLVL_XREF and the column SFA_COD_CRED_LVL.</p> <p>See "Setting Up Taxonomy" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)</p> <p>See "Setting Up 150 Percent Direct Subsidized Loan Limit (SULA)" (PeopleSoft Campus Solutions 9.2: Financial Aid)</p>
SSR_NSC_PRG1_LNGTH (Published Program Length)	<p>The length of the instructional program in weeks, months, or years. The value in the extract is represented by six digits, with a decimal implied between the third and fourth digit. For example, an NSC report value of 036000 is 36 and 000500 is 0.5.</p> <p>The value is retrieved from the table ACAD_PLAN_TBL and the column is SSR_PROG_LENGTH.</p> <p>See "Setting Up Taxonomy" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)</p>

Fields	Logic
<p>SSR_NSC_PRG1_LENCD (Published Length Measurement)</p>	<p>The code that defines the length of measurement for the Published Program Length. The Code and Description values are:</p> <ul style="list-style-type: none"> • Y: Year • M: Month • W: Week <p>The value is retrieved from the table ACAD_PLAN_TBL and the column is SSR_PROG_LEN_TYPE.</p> <p>See "Setting Up Taxonomy" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)</p>
<p>SSR_NSC_PRG1_TT4YR (Weeks Program Title IV Academic Year)</p>	<p>The number of weeks of instruction in the program's academic year. This value is reported only if the Published Program Length is reported as either Months or Weeks. Because the value can be overridden at the student level, the Consolidated Statistics process uses the following logic to report this data:</p> <ul style="list-style-type: none"> • If the student's academic program overrides the default value, it is reported. The value is retrieved from the table STDNT_PELL_RULE and the column is BASE_WEEKS_ACAD. See "Reviewing the Student's Packaging Status" (PeopleSoft Campus Solutions 9.2: Financial Aid) • If the default program value is not overridden, the value is used from the Aid Processing Rule setup defined for the academic program for the current aid year. The value is retrieved from the table FA_DFLT_RUL_SET and the column is BASE_WEEKS_ACAD. See "Creating Aid Processing Rule Sets" (PeopleSoft Campus Solutions 9.2: Financial Aid) • If neither value is found, the default value from the FA installation table is used. The value is retrieved from the table INSTALLATION_FA and the column is ACAD_WEEKS_BASE. See "Defining Installation Level Defaults" (PeopleSoft Campus Solutions 9.2: Financial Aid)
<p>SSR_NSC_PRG1_BGNDT (Program Begin Date)</p>	<p>The date on which the student began the program. This value is calculated based on when the student became active in the current academic program from the EFFDT of the ACAD_PROG table. The valid academic program statuses used for reporting are defined on the Academic Statistics Type page. The value is retrieved from the table ACAD_PROG and the column is EFFDT.</p> <p>See Setting Up Statistic Period Types</p>

Fields	Logic
SSR_NSC_PRG1_SPIND (Special Program Indicator)	<p>This code is used to identify whether the program belongs to one of a select special group. The Code and Description values are:</p> <ul style="list-style-type: none"> • A: Special Admission Associate Degree Program • B: Bachelor's Degree Completion Program • N: Not Applicable • P: Preparatory Coursework Graduate/Professional • T: Non Credential Teacher Certification • U: Preparatory Coursework Undergraduate <p>The value is retrieved from the table ACAD_PLAN_TBL and the column is SFA_SPEC_PROG_FLG.</p> <p>See "Setting Up Taxonomy" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)</p>

Fields	Logic
<p>SSR_NSC_PRG1_ENRST (Program Enrollment Status)</p>	<p>The student's enrollment status for this program in the reporting period. The Code and Description values are:</p> <ul style="list-style-type: none"> • F: Full Time • Q: Three Quarter Time • H: Half Time • L: Less Than Half Time • A: Leave of Absence • G: Graduated • W: Withdrawn • D: Deceased <p>Different calculation methods are used, depending on the status:</p> <ul style="list-style-type: none"> • For actively enrolled students: use the number of units enrolled for the current program and get the NSC academic load. The value is retrieved from the table ACAD_LOAD_TBL and the column is ACADEMIC_LOAD_NSLC. • Leave of Absence is reported if the academic program has a program status of LA. • Graduated is reported if the academic program has a program status of CM. • Deceased is reported if the academic program has a program status of DE. • Withdrawn is reported if the: <ul style="list-style-type: none"> • Current STDNT_CAR_TERM record has a WITHDRAW_CODE not equal to NWD and the LAST_DATE_ATTENDED is populated, <i>or</i> • Student changes plan during the reporting period. When this is the case, the student is reported in Withdrawn status for the change from plan.

Fields	Logic
<p>SSR_NSC_PRG1_ENRDT</p> <p>Program Enrollment Status Effective Date</p>	<p>The effective date of the current program enrollment status. The value reported here can change depending on whether enrollment status has changed since the last reporting period.</p> <ul style="list-style-type: none"> • If this is the first NSC submission of the term or there has been no change in the students enrollment status, the date is equal to the term begin date. • If the Enrollment Status has changed since the previous statistics period the date is calculated as follows: <p>If the status changes to F, Q, H or L, then the date reported is the enrollment status change date from STDNT_CAR_TERM, column UNTPRG_CHG_NSLC_DT.</p> <p>If the status changes to W, then the date will be sourced differently depending on whether the student has withdrawn completely or if they have changed (or removed) a plan:</p> <ul style="list-style-type: none"> • <i>Withdrawal</i> (STDNT_CAR_TERM record has a WITHDRAW_CODE not equal to NWD) <p>The date reported is the LAST_DATE_ATTENDED value from the STDNT_CAR_TERM row.</p> • <i>Plan Change</i> (student changed plans during the reporting period) <p>The date reported is the date the student changed from the plan, that is, the effective date of the change row on the student's program stack (ACAD_PROG.EFFDT).</p> <p>If the status changes to G, then the date reported is the effective date from the program stack Completed row (ACAD_PROG.EFFDT).</p>

NSC Program Level Reporting: Academic Plan Usage

For NSC program level reporting purposes, the Consolidated Statistics process selects all of a student's eligible academic plans. This requires that users identify academic plans for NSC program reporting purposes. See "Setting Up Taxonomy" (PeopleSoft Campus Solutions 9.2: Application Fundamentals).

The process reports all eligible plans, that is, Plan values where the ACAD_PLAN_TBL.SSR_NSC_INCL_PLAN value = Y, across careers, up to the current NSC maximum of six.

Consider the following examples:

For an undergraduate student with three plans, Plan A, B, and C, and with their Report as NSC Program check boxes set to Y, N, and Y, respectively, the process reports the student with a Program Indicator value = Y. At the program level, the process will report Plan A (and associated data) as NSC Program 1 and Plan C for NSC Program 2.

For a non-degree student, that is, a student who does not have any plans set for NSC, the process reports the student with a Program Indicator value = N. This means no program data is reported.

In a case where a student has multiple careers, such as Law and Graduate Business, the process will report all eligible plans for each career. If the student had one Law Plan (LAWPLANA) and 2 Business Plans (MBAPLANA, MBAPLANB) and all 3 plans were identified as NSC Programs, the process reports the student with a Program Indicator value = Y. At the program level, LAWPLANA (and associated data) is reported for NSC Program 1, MBAPLANA for NSC Program 2, and MBAPLANB for NSC Program 3.

Reporting NSC Program Changes

Program changes are reported as they occur during the reporting period. In the event that a student changes programs (academic plan) during the term, the new program will be reported in an *Enrolled* status, and the effective date of the Plan change will be used for the program begin date and enrollment status values. In addition, the original program will be reported with a *Withdrawn* status, and an enrollment status date equal to the date of the Plan change.

Consider the following examples.

Student with a Single Plan or NSC Program

A student was admitted to Plan A for Fall 2014 term on 8/1/14 and is enrolled full-time. The Fall term begins 8/30/2014. In the first NSC submission of the Fall 2014 term (consolidation date: 09/05/2014), the student is reported with the following data:

Data	Value
Program 1	Plan A CIP Code
Program 1 Begin Date	08/01/2014
Program 1 Enroll Status	F
Program 1 Enroll Status Date	08/30/2014

Subsequently, the student changes from Plan A to Plan B, with an effective date of 09/07/2014. On the subsequent NSC submission (consolidation date: 09/15/2014), the following data would be reported for the student:

Program 1 Data	Value	Program 2 Data	Value
Program 1	Plan B CIP Code	Program 2	Plan A CIP Code
Program 1 Begin Date	09/07/2014	Program 2 Begin Date	08/01/2014
Program 1 Enroll Status	F	Program 2 Enroll Status	W
Program 1 Enroll Status Date	09/07/2014	Program 2 Enroll Status Date	09/07/2014

The withdrawn (W) program entry will continue to be reported for any subsequent submissions in the same reporting period, but will not be included for later reporting periods. In this example, the withdrawn Plan A would not be reported in the Spring 2015 term submissions.

Student with Two Plans or NSC Programs

A student was admitted to Plan A and Plan B for the Fall 2014 term on 8/1/14 and is enrolled full-time. The Fall term begins 8/30/2014. In the first NSC submission of the fall 2014 term (consolidation date: 09/05/2014), the student is reported with the following data:

Program 1 Data	Value	Program 2 Data	Value
Program 1	Plan A CIP Code	Program 2	Plan B CIP Code
Program 1 Begin Date	08/01/2014	Program 2 Begin Date	08/01/2014
Program 1 Enroll Status	F	Program 2 Enroll Status	F
Program 1 Enroll Status Date	08/30/2014	Program 2 Enroll Status Date	08/30/2014

Subsequently, the student changes Plan A to Plan C, with an effective date of 09/07/2014. On the next NSC submission (consolidation date: 09/15/2014), the following data would be reported for the student:

Program 1 Data	Value	Program 2 Data	Value	Program 3 Data	Value
Program 1	Plan B CIP Code	Program 2	Plan C CIP Code	Program 3	Plan A CIP Code
Program 1 Begin Date	08/01/2014	Program 2 Begin Date	09/07/2014	Program 3 Begin Date	08/01/2014
Program 1 Enroll Status	F	Program 2 Enroll Status	F	Program 3 Enroll Status	W
Program 1 Enroll Status Date	08/30/2014	Program 2 Enroll Status Date	09/07/2014	Program 3 Enroll Status Date	09/07/2014

The withdrawn (W) program entry will continue to be reported for any subsequent submissions in the same term reporting periods, but will not be included for later term submissions. In this example, the withdrawn Plan A would not be reported in the Spring 2015 term submissions.

Academic Load Calculation at the NSC Program Level

During academic load calculation, the process will report the same academic load value across NSC programs using the academic load rule for the student's consolidated career. Given the examples used in [Reporting NSC Program Changes](#), the following academic loads are calculated:

- For an undergraduate student with three plans, the consolidated or campus level academic load is *F*.

NSC Programs	Academic Load
Prog1: PLANA	F

NSC Programs	Academic Load
Prog2: PLANB	F
Prog3: PLANC	F

- For a non-degree student, that is, a student that does not have an NSC program, the consolidated or campus level academic load is *L*

NSC Programs	Academic Load
No data	No data

- For a law student (career = LAW) who is also an MBA (career = Business) student with two plans within the MBA program, the consolidated or campus level academic load is *H*.

NSC Programs	Academic Load
Prog1: LAWPLANA	H
Prog2: MBAPLANA	H
Prog3: MBAPLANB	H

Performing Academic Statistics Consolidation

This section discusses how to consolidate academic statistics.

Page Used to Perform Academic Statistics Consolidation

Page Name	Definition Name	Navigation	Usage
Consolidated Statistics	RUNCTL_CONS_STATS	Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Process Consolidate Statistics > Consolidated Statistics	Consolidate students' academic statistics for an academic statistics period.

Consolidating Academic Statistics

Access the Consolidated Statistics page (Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Process Consolidate Statistics > Consolidated Statistics).

If the academic statistics period has *Consolidation Date* for its consolidation trigger, you must first run either the Take Term Statistics Snapshot process (SRPCCONA) or the Recurring Term Snapshot process (SRPCCONU) for all academic career and term combinations defined within the academic statistics period. Then you must run the Consolidate Academic Statistics process (SRPCCONP). If the

academic statistics period has *As of Date* or *As of Today* as its consolidation trigger, you need run only the Consolidate Academic Statistics process.

Academic Institution

Select the academic institution that contains the academic statistics period for which you want to run the process.

Academic Statistics Period

Select the academic statistics period for which you want to run the process.

Prev Stats NSC (previous statistics National Student Clearinghouse)

Select the academic statistics period used as the source for the previous NSC Extract report that your institution submitted to the NSC within the current reporting period.

The Prev Stats NSC field enables your institution to report enrollment status changes to the NSC throughout a reporting period so that student loan lenders know when a student's enrollment status declines. The field enables the Consolidate Academic Statistics process to perform a comparison of a student's current enrollment status to that which was previously reported to the NSC within the same reporting period. The current report thus includes only the key differences between it and the previous report.

Use the Prev Stats NSC field *only if* you have previously reported to the NSC for the current reporting period or term. *Do not* use this field for a *first of term* submission to the NSC.

Consolidation Mode

Select the consolidation mode to indicate how the process that you are running writes its results to the applicable table.

The Take Term Statistics Snapshot and the Recurring Term Snapshot processes write results to a temporary holding table (PS_STDNT_CARTRM_PD). Each student has only one row for an academic career, term, and snapshot date combination.

The Consolidate Academic Statistics process writes results to the consolidated statistics table (PS_STDNT_CONS_STAT).

Each student has only one row for each academic institution and academic statistics period combination. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort. Select from the following choices.

Insert: Select this option to have the Take Term Statistics Snapshot process and the Recurring Term Snapshot process insert only new rows into the temporary holding table and leave untouched the rows in the table where students already have data for the academic career, term, and snapshot date combination. Or, select this option to have the Consolidate Academic Statistics process insert only new rows into the consolidated statistics table and leave untouched the rows in the table where students already have data for the academic institution and the academic statistics period combination specified for this run of the process.

Overwrite: Select this option to have the Take Term Statistics Snapshot process and the Recurring Term Snapshot process delete all existing rows from the temporary holding table where students already have data for the academic career, term, and snapshot date combination, *then* insert new rows into the table for students that have data for the academic career, term, and snapshot date combination. Or, select this option to have the Consolidate Academic Statistics process delete all existing rows from the consolidated statistics table where students already have data for the academic institution and academic statistics period combination specified on this page, *then* insert new rows into the table for students that have data for the academic institution and academic statistics period combination.

Commit Frequency

The system sets the commit frequency to *1*. For other processes this is generally the best option. However, for these processes, you should set the commit frequency higher, such as *300*, for faster processing of the job due to the potentially large volume of records.

Academic Career

The system displays a grid on the lower portion of the page only if the *Academic Statistics Period* that you select has *Consolidation Date* as its consolidation trigger. To populate the temporary holding table when you run the Take Term Statistics Snapshot process and the Recurring Term Snapshot process, enter the academic career, term, and snapshot date combinations for which you want the process to create student records in the temporary holding table. The combinations must be valid ones that your institution has defined for this academic statistics period on the Academic Statistics Period page.

In this field, select the academic career for which you want the Take Term Statistics Snapshot process or the Recurring Term Snapshot process to create student records in the temporary holding table.

Term

Select the term within the academic career for which you want the Take Term Statistics Snapshot process or the Recurring Term Snapshot process to create student records in the temporary holding table.

Overwrite

Select to have the Take Term Statistics Snapshot process or the Recurring Term Snapshot process delete all existing rows from the temporary holding table (STDNT_CARTRM_PD), where students already have data for the academic career, term, and snapshot date combination, *then* insert new rows into the table for students that have data for the academic career, term, and snapshot date combination. Selecting this check box enables you to rerun the Take Term Statistics Snapshot process without retaining the values in the temporary holding table that were generated from a previous run of the process.

If you set the Consolidation Mode field for the academic statistics period to *Insert*, then select the Overwrite check box for an individual row, the process deletes and replaces data records in the temporary holding table that match the academic institution, academic statistics period, academic career, and term for that individual row.

Viewing Consolidated Academic Statistics for Individual Students

This section discusses how to use the Student Consolidated Stats component to view the results of the Consolidate Academic Statistics process (SRPCCONP) on a student-by-student basis for a specific academic statistics period. For example, perhaps a student has just enrolled in another class and you want to adjust this student's statistics to more accurately report them. The component divides the results into the following four categories:

- Basic data.
- Statistics.
- Withdrawal and external study information.
- Demographic data.

Pages Used to View Consolidated Academic Statistics for Individual Students

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Student Consolidated Stats - Basic Data (student consolidated statistics - basic data)	STDNT_CONS_STATS0	Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Basic Data	View basic data about a student's consolidated academic statistics for an academic statistics period, such as the student's primary academic career, term, primary academic program, academic level and load determination, and academic program status. Also use this page to view the calculated results of the Consolidate Academic Statistics process (SRPCCONP) for the student's academic load, academic level, units, form of study, and GPA. If necessary, override the calculated results.

Page Name	Definition Name	Navigation	Usage
Student Consolidated Stats - Statistics (student consolidated statistics - statistics)	STDNT_CONS_STATS1	Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Statistics	View a student's consolidated term statistics and cumulative statistics for an academic statistics period.
Withdrawal/External Study	STDNT_CONS_STATS3	Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Withdrawal/External Study	View withdrawals and cancellations on a student-by-student basis for an academic statistics period. Also use this page to view consolidated external study programs that apply towards a student's academic career, such as study abroad.
Demographics/Last Action	STDNT_CONS_STATS6	Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Demographics/Last Action	View a student's age category, ethnic group, primary cohort, and latest consolidation status for the academic statistics period.

Viewing Basic Data

Access the Student Consolidated Stats - Basic Data page (Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Basic Data).

Image: Student Consolidated Stats - Basic Data page

This example illustrates the fields and controls on the Student Consolidated Stats - Basic Data page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Basic Data' tab for a student's consolidated statistics. At the top, navigation tabs include 'Basic Data', 'Statistics', 'Withdrawal/External Study', and 'Demographics/Last Action'. The student's name 'Phillip Beard' and ID 'SR14021' are shown. Below this is a search bar with 'Find | View All' and pagination 'First 1 of 1 Last'. The main section contains several fields:

- *Academic Institution:** PSUNV (PeopleSoft University)
- Academic Statistics Period:** 2012FALL-1 (2012 Fall - First Run)
- Academic Career:** GRAD (Graduate)
- Term:** 0690 2012 Fall (Semester)
- Academic Program:** GLAU (Graduate Liberal Arts Programs)
- Academic Plan:** ENGL-MA (English (MA))
- Academic Sub-Plan:**
- Level Determination:** Manual (Academic Year: 2013)
- Load Determination:** Units (Billing Career: GRAD)
- Academic Program Status:** Active in Program

Below these fields is a section titled 'Prev Stats NSC:' and a collapsed group box 'Calculated Values and Overrides'. This group box is expanded to show a table of overrideable statistics:

Override	Value	Calculated
<input type="checkbox"/> Academic Load:	Full-Time	Full-Time
NSC Academic Load:	Full-Time	Full-Time
<input type="checkbox"/> Academic Level:		
IPEDS Academic Level:		
<input type="checkbox"/> NSC Class Credential Level:	Master's	Master's
<input type="checkbox"/> Units Taken for Progress:	9.000	9.000
<input type="checkbox"/> Total Cumulative Units:	16.000	16.000
<input type="checkbox"/> *Form of Study:	Enrollment	Enrollment
<input type="checkbox"/> Current GPA:		0.000
<input type="checkbox"/> Cumulative GPA:	3.625	3.625

Academic Institution Select the academic institution that contains the consolidated academic statistics of the student.

Academic Statistics Period The page displays the student's consolidated academic statistics for each applicable academic statistics period that you have run.

Calculated Values and Overrides

Click the arrow on the left of the Calculated Values and Overrides group box title bar to display the calculated statistical results of the Consolidate Academic Statistics process (SRPCCONP) for various types of statistics. Select the Override check box next to each type of statistic to change the calculated results. The corresponding field becomes available. Enter the new value. The calculated results of the process itself always appear, unaltered on this page so that you can compare the original process calculation to your changes.

Calculate

If the academic statistics period for which you have calculated the student's consolidated academic statistics has *As of Date* or *As of Today* for its consolidation trigger, you can recalculate the student's consolidated statistics. Click this button to have the system rerun the Consolidate Academic Statistics process for this student's academic record in the academic institution and academic statistics period that you specify. If the academic statistics period has *Consolidate Date* for its consolidation trigger, then rerunning the Consolidate Academic Statistics process with the Calculate button has no bearing on the student's calculated results. This is because the process is retrieving statistics from the temporary holding table populated by either the Take Term Statistics Snapshot process (SRPCCONA) or the Recurring Term Snapshot process (SRPCCONU) rather than retrieving data from the student's records. The only way to recalculate a student's academic statistics in such a case is to first retake the term snapshots through the Term Statistics Snapshot process or the Recurring Term Snapshot process.

Note: For NSC Reporting, using grade exclusions impacts how the Consolidate Academic Statistics process calculates `ACADEMIC_LOAD`. It is likely that some students—those with units excluded from calculation based on a grade (or grades)—will have a different academic load reported in Consolidated Statistics than the load calculated for the same term in `STDNT_CAR_TERM`.

See [Understanding Consolidated Statistics Processes](#).

See [Setting Up Statistic Period Types](#).

Viewing Statistics

Access the Student Consolidated Stats - Statistics page (Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Statistics).

Reset Cum Stats at Term Start (reset If this check box is selected, all statistics have been reset to cumulative statistics at term start) zero at the start of the given term. If this check box is cleared, statistics have been accumulated from previous terms and added to the given term. This check box is set on the Cumulative Statistics page of the Term History component.

Viewing Withdrawal and External Study Information

Access the Withdrawal/External Study page (Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Student Consolidated Stats > Withdrawal/External Study).

The system displays the student's withdrawal and external study statistics for an academic statistics period based on the student's primary academic career, primary academic program, and last term within the academic statistics period.

Viewing Consolidated Academic Statistics for Groups of Students

This section discusses how to view mass consolidated academic statistics.

Related Links

[Understanding Consolidate Academic Statistics Process Calculations](#)

Page Used to View Consolidated Academic Statistics for Groups of Students

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Mass Consolidated Statistics	STDNT_CONS_MASS0	Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Mass Consolidated Statistics > Mass Consolidated Statistics	Search for and view groups of students and update their consolidated academic statistics.

Viewing Mass Consolidated Academic Statistics

Access the Mass Consolidated Statistics page (Records and Enrollment > Enrollment Reporting > Consolidated Statistics > Mass Consolidated Statistics > Mass Consolidated Statistics).

By searching for statistics on groups of students within an academic statistics period, you can easily override the results of the Consolidate Academic Statistics process for every student in the group. The system retrieves the consolidated academic statistics for the students that meet your selection criteria and displays these statistics in the grid in the lower portion of the component. For example, perhaps your institution had consolidated academic statistics yesterday for a particular academic statistics period but discovers today that a group of law students need to enroll in a new class. This changes their academic load. To correct the inconsistency in their academic statistics, you can use the Mass Consolidated Statistics component to override the academic load that the Consolidate Academic Statistics process calculated for the law students.

Searching for Statistics on Groups of Students

Select the search criteria to find and display consolidated academic statistics for a student or group of students within an academic statistics period.

Multiple Academic Career

Select to have the system retrieve only those students who have multiple academic careers and also meet your search criteria.

Excluded Eligible Term Warn

Select to have the system retrieve only those students who meet your search criteria and also have been excluded from financial aid eligibility due to an insufficient number of units.

Search

Click to have the system retrieve and display the results meeting your selection criteria. The system pulls the statistics from the consolidated statistics table (PS_STDNT_CONS_STAT) and displays the results in the grid in the lower portion of the

component. Select the tabs to move from one set of statistics to the next.

Viewing Statistics for Groups of Students

The system retrieves the statistics that meet your criteria from the consolidated statistics table (PS_STDNT_CONS_STAT) and displays the search results in the grid in the lower portion of the component. The system displays each student's consolidated academic statistics on a separate row. Use the horizontal tabs to move from one set of statistics to the next.

To override a student's calculated results, select the Overrides tab, select the check boxes that pertain to the statistics to override, then move to the applicable tab to change the statistics to override. The system always displays the unaltered process results on the various tabs of this component so that you can compare the process calculation to your changes.

After you update the consolidated academic statistics, click the Save button and the system stores your changes. The changes also appear in the Student Consolidated Stats component.

Note: For NSC Reporting, using grade exclusions impacts how the Consolidate Academic Statistics process calculates ACADEMIC_LOAD. It is likely that some students—those with units excluded from calculation based on a grade (or grades)—will have a different academic load reported in Consolidated Statistics than the load calculated for the same term in STDNT_CAR_TERM.

See [Understanding Consolidated Statistics Processes](#).

See [Setting Up Statistic Period Types](#).

Producing NSC Extracts

This section discusses how to run the National Student Clearinghouse (NSC) Report process (SRNSLCEX.SQR) to produce an NSC extract.

Page Used to Produce an NSC Extract

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
NSC Report	RUNCTL_SRNSLC	Records and Enrollment > Enrollment Reporting > NSC Report > NSC Report	Run the NSC Report process to generate a flat file extract of students enrolled during a specific period of time that you can then send electronically to the NSC.

Running the NSC Report Process

Access the NSC Report page (Records and Enrollment > Enrollment Reporting > NSC Report > NSC Report).

Image: NSC Report page

This example illustrates the fields and controls on the NSC Report page. You can find definitions for the fields and controls later on this page.

NSC Report

Run Control ID: PS [Report Manager](#) [Process Monitor](#) Run

*Academic Institution: PeopleSoft University

*Academic Statistics Period: Spring 2005 Report 1

SSN Exclusions:

*Branch Code:

*Report Type:

*Address Usage: Home, Mailing, Permanent, Work

*FICE Code:

*Output File:

Note: For information about the impact of grade exclusions on Academic Load calculation and Enrollment Status Change Date in NSC Reporting:

See [Understanding Consolidated Statistics Processes](#).

See [Setting Up Statistic Period Types](#).

The NSC Extract report lists all students who have been enrolled at your academic institution during an academic statistics period. The NSC Extract process compiles the students' enrollment statuses based on the statistics that the system saves in the consolidated statistics table (PS_STDNT_CONS_STAT) *and* in the SSR_STD_CON_ST2 table (for program level data) when you run the Consolidate Academic Statistics process. A single row of data per student is reported.

See [Setting Up For NSC Program Level Reporting](#)

See [Understanding Consolidate Academic Statistics Process Calculations](#)

If a student has been withdrawn from an academic career (through the Term History - Withdrawal page), the system sets the WITHDRAWAL_CODE field on the student's career term record (STDNT_CAR_TERM) to WDR. Because the consolidated statistics processes gather students' career term data, the processes are able to include this withdrawal information in the consolidated statistics table. The NSC Extract process is thus able to include the academic career data for these withdrawn students in the extract. The NSC Extract process uses the status date of the withdrawal from the Last Date of Attendance field on the Term History - Withdrawal page.

In addition to the extract, the NSC Extract process produces a report (in pdf format). The report includes a header record identifying the institution (Federal Interagency Committee on Education code and branch code), date of file, term of reporting, and whether the report is standard, nonstandard, or graduate only; a detail record (by student ID) listing informational messages describing any error or warning conditions that may need to be corrected. The trailer record includes the total number of student records in the extract

file, a list of the students not included in the extract file, and messages stating why the process has not included these students (such as missing addresses, blank or invalid Social Security numbers, and invalid enrollment status). You can then fix the errors at the source.

Run the NSC Report process (SRNSLCEX.SQR) on a timeline that your institution determines in agreement with NSC.

Academic Institution	Select the academic institution for which you are producing the report.
Academic Statistics Period	Select the academic statistics period for which you are producing the report.
SSN Exclusions (social security number exclusions)	Use these fields to exclude school-generated Social Security numbers and identification numbers from the NSC Extract report, as required by the NSC. Enter into each field the first three digits of the series you want to exclude, such as the 000 series and the 999 series. The NSC Extract process excludes all Social Security numbers within the series. You can list anywhere from zero to five series.
Branch Code	Select the branch code for the NSC extract.
Report Type	Select from the following choices the report type for the NSC extract. Values for this field are delivered with your system as translate values. Do not modify these values in any way. Any modifications to these values require a substantial programming effort. <i>Graduates Only:</i> The process includes only graduated students. <i>Non-Standard Report:</i> The process includes only academic sessions not considered <i>regular</i> academic sessions, such as summer session. <i>Standard Report:</i> The process includes only <i>regular</i> academic sessions.
Address Usage	Select the address usage that the NSC Extract process should follow. Address usage is how the process locates the address of students included in the extract.
FICE Code (Federal Interagency Committee on Education code)	Enter the FICE code to appear in the NSC extract for this academic institution. This value appears by default from the Academic Institution 3 page.
Output File	In addition to sending report output for this process to a file (through setting preferences in the Process Monitor), you can also send any additional output files created by this process to a file directory. To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read and write permission. If you cannot locate such a folder, consult your system administrator.

Setting Up and Managing Veterans Benefit Reporting

Setting Up Veterans Benefit Reporting

This section discusses how to set up:

- Instruction mode mapping.
- Payment mapping.
- Net tuition and fees calculation.

Pages Used to Set Up Veterans Benefit Reporting

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Instruction Mode Mapping	SSR_VB_INSTR_MAP	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Setup > Veterans Instruction Mode Map > Instruction Mode Mapping	Map class instruction modes with Veterans Instruction modes of Distance Learning and Residential.
Payment Mapping	SSR_VB_PAY_MAP	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Setup > Payment Mapping	Identify Veterans Benefit payment item type groups for Federal, State and Yellow Ribbon funding.
Net Tuition and Fees Setup	SSR_VB_TF_SETUP	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Setup > Net Tuition and Fees Setup	Identify eligible tuition, fees, financial aid and waivers for the Veterans Net Tuition and Fees calculation.

Setting Up Instruction Mode Mapping

Access the Instruction Mode Mapping page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Setup > Veterans Instruction Mode Map > Instruction Mode Mapping).

Image: Instruction Mode Mapping page

This example illustrates the fields and controls on the Instruction Mode Mapping page . You can find definitions for the fields and controls later on this page.

Instruction Mode Mapping						
Academic Institution PSUNV PeopleSoft University						
Personalize Find First 1-8 of 8 Last						
	Instruction Mode			Veterans Instruction Mode		
1	CO		Correspondence	Distance Learning		
2	CT		Closed Circuit TV	Residential		
3	IN		Internet	Distance Learning		
4	IS		Independent Studies	Distance Learning		
5	P		In Person	Residential		
6	TV		Television	Residential		
7	VT		Videotape	Distance Learning		
8	WWW		World Wide Web	Distance Learning		

Use this page to map the instruction mode of a class to a veterans instruction mode.

The Enrollment Certification page uses this mapping to categorize class units taken as Residential or Distance Learning.

See [Certifying Student Enrollment](#)

Instruction Mode

Select an instruction mode. Values are inherited from the Instruction Mode field on the Components page (Curriculum Management > Course Catalog > Course Catalog > Components).

See [Defining Course Components](#)

Veterans Instruction Mode

Map a class instruction mode to a veterans instruction mode of either *Residential* or *Distance Learning*, but not both.

Setting Up Payment Mapping

Access the Payment Mapping page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Setup > Payment Mapping).

Image: Payment Mapping page

This example illustrates the fields and controls on the Payment Mapping page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Payment Mapping' page for institution 'PSUNV PeopleSoft University'. It features a table with the following data:

Item Type Group	Description	*Source	Yellow Ribbon
1 FINAID	Financial Aid	Federal	<input type="checkbox"/>
2 GRANTS	Scholarships and Grants	Federal	<input type="checkbox"/>
3 PAYMENTS	Payments	Federal	<input type="checkbox"/>

Use this component to map veterans payments with their source of funds.

Item Type Group

Select an item type group to map with its funding source. Item type groups are defined on the Item Types Group page and in the Tree Manager.

See "Defining Item Type Groups" (PeopleSoft Campus Solutions 9.2: Student Financials)

See *PeopleTools: Tree Manager*

Source

Select a funding source to correspond with the particular item type group. Select either *Federal* or *State* as the source.

Yellow Ribbon

Select the Yellow Ribbon check box if the particular item type group is funded through the Yellow Ribbon program. The check box is available only if the source is Federal.

The setup on this page defines the Source and Yellow Ribbon data that appear on the Payment History page.

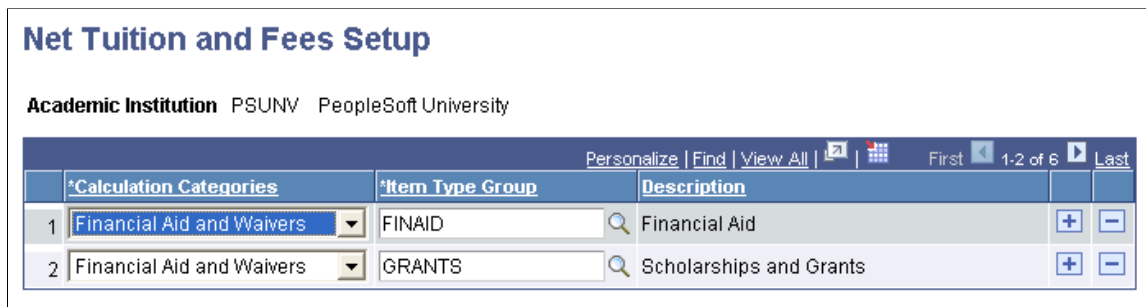

See [Viewing Veterans Payment History](#)

Setting up Net Tuition and Fees

Access the Net Tuition and Fees Setup page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Setup > Net Tuition and Fees Setup).

Image: Net Tuition and Fees Setup page

This example illustrates the fields and controls on the Net Tuition and Fees Setup page. You can find definitions for the fields and controls later on this page.

Use this component to define eligible item type groups to be used to calculate the Veterans' Net Tuition and Fees as tuition, fees, financial aid and waivers. The Veterans Tuition Worksheet page inherits item type groups for calculation from this page.

See [Calculating Net Tuition and Fees](#)

Calculation Categories Select a calculation category from the list to map it with a particular item type group. You can select either *Tuition and Fees* or *Financial Aid and Waivers*.

Item Type Group Select an item type group to map it with a calculation category.

Managing a Student's Veterans Benefit Information

This section discusses how to define and maintain Veterans Benefit information for a student.

Pages Used to Manage a Student's Veterans Benefit Information

Page Name	Definition Name	Navigation	Usage
Veterans Benefit Summary	SSR_VB_DATA	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Summary	Define and maintain a summary of a student's Veterans Benefit.
Attachments	SSR_VB_ATTACH	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Summary > Attachments	Attach Veterans Benefit-related documents.

Defining and Maintaining Veterans Benefit Information for a Student

Access the Veterans Benefit Summary page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Benefit Summary).

Image: Veterans Benefit Summary page (1 of 2)

This example illustrates the fields and controls on the Veterans Benefit Summary page (1 of 2). You can find definitions for the fields and controls later on this page.

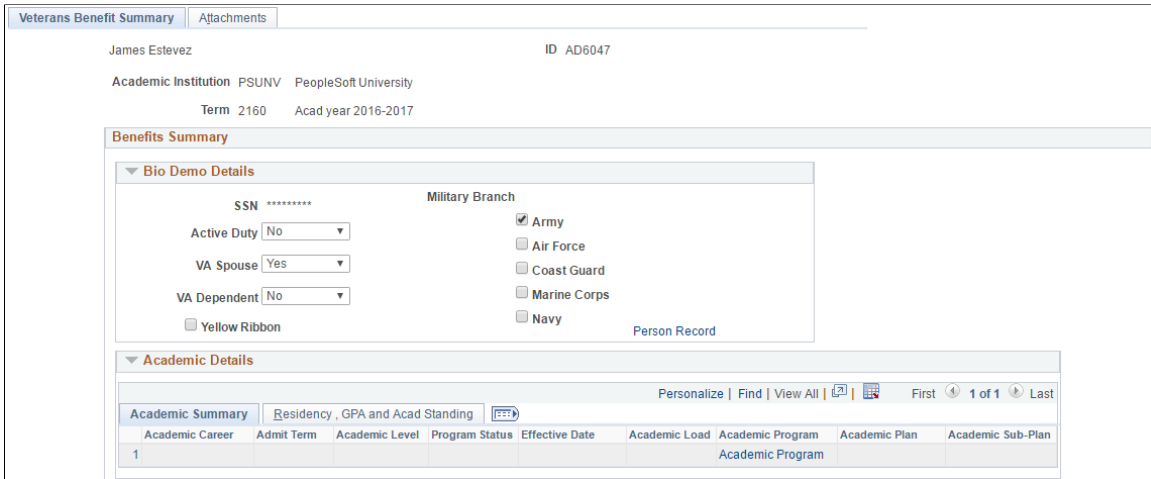

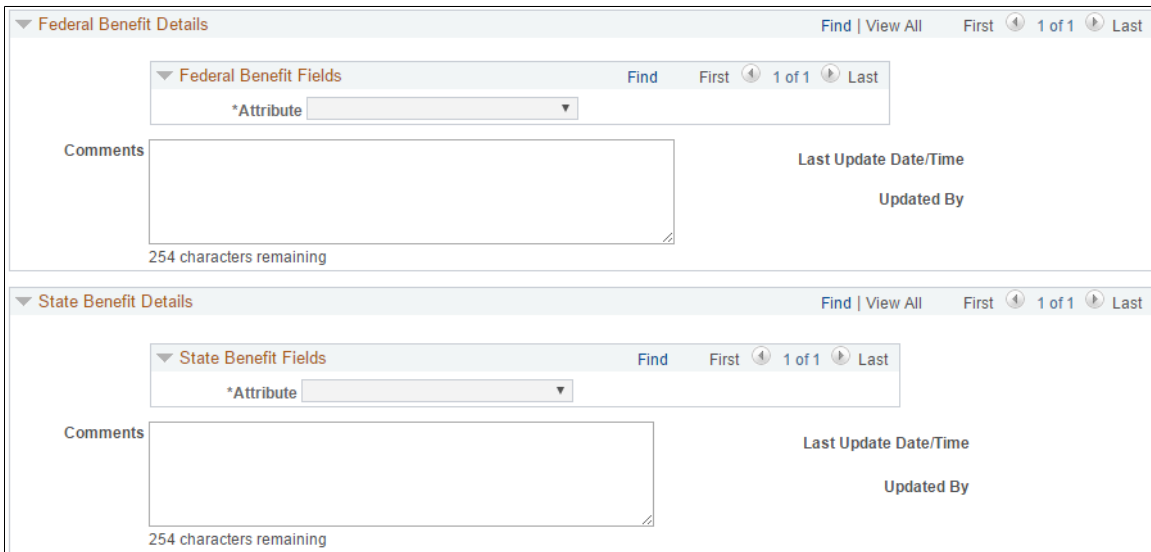

Image: Veterans Benefit Summary page (2 of 2)

This example illustrates the fields and controls on the Veterans Benefit Summary page (2 of 2). You can find definitions for the fields and controls later on this page.

Bio Demo Details

Enter or update the student's biographical details.

For information on how to mask the social security number:

See "Applying Demographic Data Access Security" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

For information about service indicators:

See "Setting Up Service Indicator Codes and Reasons" (PeopleSoft Campus Solutions 9.2: Campus Community)

Yellow Ribbon

Select this check box if the student is enrolled in the Yellow Ribbon program. If the check box is selected, the system displays the Yellow Ribbon section on the Tuition Worksheet.

Person Record

Select this link to access the student's biographical and demographic data.

Use the Addresses page to indicate the address to which the Veterans Benefit check is to be sent. The Veterans Administration verifies that the recipient's address they have matches the address that your institution indicates.

Federal Benefit Details and State Benefit Details

The attributes available here are those that you define on the Common Attribute page (Set Up SACR, Common Definitions, Common Attributes Setup, Common Attribute).

After you define attributes, associate attributes with a record context on the Record Context page (Set Up SACR, Common Definitions, Common Attributes Setup, Record Context).

The delivered record contexts are SSR_VB_FED_AUD and SSR_VB_STA_AUD.

See "Understanding Common Attribute Framework" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Defining a Common Attribute" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Associating a Common Attribute to a Record" (PeopleSoft Campus Solutions 9.2: Campus Community)

Creating and Updating Terms

This section discusses how to create and update terms.

Page Used to Create or Update Terms

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Create/Update Term Process	SSR_VB_RC_UPDTRM	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Create/Update Term Process	Create the Net Tuition and Fees page and the Enrollment Certification page; and update records.

Creating and Updating Terms

Access the Create/Update Term Process page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Create/Update Term Process).

Image: Create/Update Term Process page

This example illustrates the fields and controls on the Create/Update Term Process page. You can find definitions for the fields and controls later on this page.

Create/Update Term Process

Run Control ID: PS [Report Manager](#) [Process Monitor](#) Run

*Academic Institution: PSUNV PeopleSoft University

*Term: 0730 2014 Fall

*Mode: Update Tuition Worksheet

Include Federal

Include State

Include Both Federal and State

Population Selection

Population Selection

Selection Tool: PS Query

Query Name: SSR_VB_POP_UPDTERM

[Launch Query Manager](#) [Preview Selection Results](#)

Update Enrollment Mode

Depending on the status of the record, the system performs various tasks when you run the Create/Update Term process:

- **New Records:** If no enrollment certification record exists for the student and the term, the system creates a record. For a student's enrolled units and academic history, it populates fields on the Enrollment Certification page. The new record is set to *In review* status and is listed in the log as a new record with the student name and EMPLID. If the class status is *Dropped*, the system populates the Drop Date field; and if the attendance roster is used, the Last Date Attended field. The system also calculates the number of units taken for *Residential* and *Distance Learning* classes.
- **In Review Records:** For records with an *In review* status, the system overrides any manual changes made to the record and updates the term Enrollment Information.
- **Reported Records:** For records with a *Reported* status, the system versions the existing record and creates a new record for the student with the *In review* status. The system logs all records sequenced by this process with the Student Name and EMPLID information.

Update Tuition Worksheet Mode

When you select this mode, the following options become available on the page:

- Include Federal
- Include State
- Include Both Federal and State

Depending on the status of the record and the option selected, the system performs various tasks when you run the Create/Update Term process:

- **New Records:** If no Tuition Worksheet exists for the student for the term, the system creates a record.
- **In Review Records:** If a record exists with an *In review* status, the Tuition Worksheet replaces the In Review record, assigning it an *In review* status. The system logs all records created by this process with the Student Name and EMPLID information.

If Both Federal and State is selected, both State and Federal Tuition Worksheets are updated. If the Benefit Summary page contains information related to the State, then the system creates a State Tuition Worksheet with an *In review* status.

- **Reported Records:** If a record exists with the *Reported* status and you run the Create/Update Term Process, the system creates a new incremental record for the student with an *In review* status.

The system updates both Federal and State Tuition Worksheets if Both State and Federal is selected. If a State Tuition Worksheet does not exist, the system creates it if the Benefit Summary page has any fields defined for the term. The system logs all records sequenced by this process with the Student Name and EMPLID information.

Population Selection

The Population Selection group box is a standard group box that appears on run control pages when the Population Selection process is available or required for the transaction. Selection tools are available based on the selection tools that your institution selected in the setup of the Population Selection process for the application process and on your user security. Fields in the group box appear based on the selection tool that you select. The fields behave the same way from within the group box on all run control pages and application processes. If your institution uses a specific delivered selection tool to identify IDs for a specific transaction, you must use it.

Selection Tool Select *PS Query*.

Query Name The *SSR_VB_POP_UPDTERM* query is delivered.

If you create your own query, you must use the following bind record: *SSR_VB_UPDT_BND*.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Certifying Student Enrollment

This section discusses how to certify a student's enrollment for a reporting period.

Page Used to Certify Student Enrollment

Page Name	Definition Name	Navigation	Usage
Enrollment Certification	SSR_VB_ENRL_CERT	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Enrollment Certification	Review and certify student enrollment.

Certifying Student Enrollment For a Reporting Period

Access the Enrollment Certification page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Enrollment Certification).

Image: Enrollment Certification page

This example illustrates the fields and controls on the Enrollment Certification page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Enrollment Certification' page for student ID SFRP0001, Name Cole Powell, at PSUNV PeopleSoft University, Term 0700 2013 Spring. The status is 'In Review' and the sequence is 1. The page is divided into several sections:

- Term Enrollment Certification Table:**

Class Nbr	Subject Area	Catalog Nbr	Section	Location	Zip Code	Career	Primary Academic Program	Federal Cert	Federal Review Date	Federal Review By	State Cert	State Review Date	State Review By
1210	ART	112	1			Undergraduate	LAU						
1293	ENGLCOMP	10	1			Undergraduate	LAU						
1342	BIOLOGY	140	1			Undergraduate	LAU						
1396	BIOLOGY	140	1A			Undergraduate	LAU						
- Federal Certified Units:**

Total Units			
Residential Units	Distance Learning Units	Remedial Units	Clock Hrs/Week
- State Certified Units:**

Total Units	
-------------	--

Status

In Review: The page can be updated by the Create/Update Term process.

Reported: The page is display only. Any updates that result from the Create/Update Term process create another page with an *In Review* status for the term.

Term Enrollment Certification

Select the Class Certification tab.

Certify the eligible classes where the student has enrollment. Some fields in this group box inherit their values from the Enrollment Summary page. Select the certification of the class—Federal or State— if applicable. You may leave State Cert blank if there is no State-level Veterans Administration for the institution; in which case, the corresponding units do not reflect in the total State Certified Units. On save, the Review Date and Review By fields are updated and totals displayed.

Select the Class Detail tab:

View details about the student's class activity during the term. If a class is dropped, the Drop Date field is populated. If the attendance roster is being used, the Last Date Attended is calculated. You can override or manually enter the date.

Select the Unit Detail tab:

View details about residential, distance learning units, and remedial clock hours and units, if applicable. If the class is Remedial, and the indicator is set to *Yes*, then the Remedial Units field is populated. If applicable, enter the number of clock hours per week for the student in the Clock Hrs/Week field.

Calculating Certified Units

Review information about Federal Certified Units and State Certified Units. Based on information entered in the Class Certification fields, the system calculates the total of Federal-certified and State-certified units. It provides details of residential, distance learning and remedial units, and the total number of clock hours, if applicable, for Federal-certified classes.

Calculating Net Tuition and Fees

This section discusses how use the Tuition Worksheet to calculate net tuition and fees for a student. It discusses:

- Calculating Federal Net Tuition and Fees
- Calculating State Net Tuition and Fees

Pages Used to Calculate Net Tuition and Fees

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Federal Benefit Details	SSR_VB_TUI_WRK_FED	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Tuition Worksheet > Federal Benefit Details	Calculate net tuition and fees for Federal reporting.
State Benefit Details	SSR_VB_TUI_WRK_STA	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Tuition Worksheet > State Benefit Details	Calculate net tuition and fees for State reporting.

Calculating Federal Net Tuition and Fees

Access the Federal Benefit Details page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Tuition Worksheet > Federal Benefit Details).

Use this page to calculate net tuition and fees eligible for Federal benefit from the Veterans Administration.

Summary

Use Actual

Select this calculation method to view the Actual Tuition and Fees section details.

Use Rate Per Unit

Select this calculation method to view the Rate Per Unit Tuition and Fees section details. Based on the Benefit Type selected

—*Federal or State*—the Certified Units field displays the sum of certified units.

Use Equation

Select this calculation method to view the Tuition and Fees Equation section details.

Anticipated Payment

Enter the benefit amount anticipated from the Veterans Administration, if any. The maximum value is 99,999.99.

Actual Tuition and Fees

Item Type

This field derives its values from the Tuition and Fees item type groups defined in the Net Tuition and Fees Setup page, with the amount assessed on the student's account for that term.

Override

Enter the amount to be overridden. Click Update to revise totals.

Rate Per Unit Tuition and Fees

Enter the rate per unit and click Update for the system to calculate the total tuition and fees.

Tuition and Fees Equation

Select an available Tuition and Fees equation to calculate the total tuition and fees. Click Calculate to return the Total Tuition and Fees. Click Update to revise Net Tuition and Fees.

See "Understanding Equation Engine" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

See "Defining an Equation" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Financial Aid and Waivers

This displays the Financial Aid and Waivers actually disbursed on to the student accounts for the term. Eligible item type groups are defined on the Net Tuition and Fees Calculation Setup page. You can override an actual amount, add or delete an item type.

Yellow Ribbon

This section is visible only if the Yellow Ribbon option was selected on the Benefit Summary Page. Enter Out of State and In State tuition and fees and click Update to return the Unmet Tuition and Fees and Veterans Payment. You can store a predetermined amount from the Yellow Ribbon program for a student.

See [Setting Up Veterans Benefit Reporting](#)

Calculating State Net Tuition and Fees

Access the State Benefit Details page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Tuition Worksheet > State Benefit Details).

For information about the State Benefit Details page, refer to the section on Federal Benefit Details. It contains all the information required for this page.

Viewing Veterans Payment History

This section discusses how to view a student's Veterans payments.

Pages Used to View Veterans Payment History

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Veterans Payment History	SSR_VB_PAY_HIST	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Payment History	View a student's veterans payment history.

Viewing a Student's Veterans Payments

Access the Veterans Payment History page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Veterans Payment History).

Use the Veterans Payment History page to view the actual veterans payments applied to a student account and adjustments to the payments, if any. Click Save and reenter the page to view payments within the defined term range.

The Yellow Ribbon section appears only if the Yellow Ribbon check box is selected for an item type group in the Payment Mapping page.

Comments Use this field to save information relevant to the veterans benefit payments received.

Rolling Over a Student's Benefit Summary Information

This section discusses how to roll over a benefit summary.

Page Used to Roll Over a Student's Benefit Summary

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Rollover Benefit Summary	SSR_VB_RUN_SUMM	Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Rollover Benefit Summary.	Transfer a student's benefit information from one term to another.

Rolling Over a Benefit Summary

Access the Rollover Benefit Summary page (Records and Enrollment > Enrollment Reporting > Veterans Benefit Reporting > Rollover Benefit Summary).

Selection Tool

Select *PS Query*.

Query Name

The *SSR_VB_POP_ROLL_BNSUMM* query is delivered.

If you create your own query, you must use the following bind record: *SSR_VB_ROLL_BND*.

See "Using the Population Selection Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Viewing Student Records Process Messages

Viewing System Messages for Student Records COBOL Processes

You can view system messages for certain COBOL processes within Student Records that are specifically coded to use this message log. These processes log all messages to the student records message log table whenever you run them. The messages include successful completions of the process and errors that the process encounters. When you run one of these processes, the system displays a message indicating that you can view messages for the process on the Message Log page. Depending on the commit frequency of the process, you can usually view messages in this catalog only after the process finishes.

This section discusses how to view system messages.

Page Used to View System Messages for Student Records COBOL Processes

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Message Log	MESSAGE_LOG_SR	Curriculum Management > Schedule of Classes > Review Message Log > Message Log	View system messages.

Viewing System Messages

Access the Message Log page (Curriculum Management > Schedule of Classes > Review Message Log > Message Log).

Process Instance

A number that uniquely identifies each process request and its position in the queue. The system automatically increments and assigns a process instance value to each process request.

Job ID

Multiple process definitions can be logically linked to a job request to process each request serially or in parallel, and optionally to initiate subsequent processes based on the return code from each prior request. If applicable, the system displays the identification code for the PSJob.

Program Name

If applicable, the system displays the name of the program within the PSJob to which the messages relate.

Message Sequence	Each individual message has a sequence in relation to the others, revealing the order in which the process wrote the messages to the log.
Severity	The system displays the severity of the message, such as <i>Error</i> .
Last Update Date Time	The date and time that the system last updated the message appears here.
Message Text	Information about the process status appears here. Typically, this field displays messages that describe the status of the program that you are running.
Explanation	A more detailed explanation of the message text appears here.

(AUS) Managing Enrollment Feedback

Understanding Enrollment Feedback

Each state in Australia has access to a Tertiary Admissions Centre (TAC) that makes offers of admission on behalf of participating institutions. After TAC makes the offers, each institution becomes responsible for recording all acceptances of offers and all subsequent enrollments.

The four TACs in Australia that make offers are the University Admissions Centre-NSW & ACT (UAC), South Australian Tertiary Admissions Centre (SATAC), Victorian Tertiary Admissions Centre (VTAC), and Queensland Tertiary Admissions Centre (QTAC).

The final phase of the main TAC admissions period is known generically as enrollment feedback and involves the return of statistical information about applicants to the relevant TAC. In this phase, it is verified whether or not those applicants who accepted offers are in fact enrolled at the institution as of the census date of 31 March.

The principal purpose of the Enrollment Feedback file is to collect enrollment information about applicants who have been made an offer of admission through a TAC. The information is used by the TACs, participating institutions, Department of Industry, Innovation, Science, Research and Tertiary Education (DIISRTE), New South Wales Vice Chancellors Committee (NSWVCC), Australian Vice Chancellors Committee (AVCC), and other organizations for statistical purposes and future TAC application processing.

Each TAC has an enrollment feedback file that differs in format and field type; however, three of the TACs just require a file to be created in their own specified format. These files all get processed through different software. The other TAC (QTAC) delivers two files that must have fields appended.

Note: Only students loaded into your system using the TAC Load process (SAD_TACLDANZ) appear on the Enrollment Feedback reports.

Common Elements Used to Manage Enrollment Feedback

Admit Term	Enter the admit term for which you are reporting your students. The process captures and reports on any student loaded through the TAC Load process whose admit term matches the term you specify.
File Output	Enter the directory location and name for the enrollment feedback output files. The system displays one or more file output fields based on the TAC that you process.
Input File Path	For QTAC and VTAC, enter the file name and directory location where your institution has put the files received from the TAC. The file name is determined as delivered by the TAC.

- Institution** Enter the academic institution for which you want to generate an enrollment feedback report.
- Run Date** Enter the date you want to use for the run date on the enrollment feedback report. The run date is usually 31 March each year. The system populates this field with today's date by default.

Processing Enrollment Feedback for QTAC

This section provides an overview of QTAC enrollment feedback processing and discusses how to report enrollment for QTAC.

Understanding QTAC Enrollment Feedback Processing

The final phase of the main QTAC admissions period involves a verification of whether applicants who accepted offers are in fact enrolled as of the census date of 31 March.

Two files are placed in the institution's account on the QTAC FTP server. The account name is identical to that used for the offer files.

As of 31 March, the following information is returned to QTAC:

- Names of individuals who are enrolled or not enrolled.
- Names of individuals who are enrolled in the same QTAC programs or a different QTAC program.
- Names of individuals who are now deferred.
- Names of individuals who are not on the acceptance list.

These individuals have lapsed offers that have been reinstated by the institution.

- Mode of attendance of each enrolled student.
- Type of attendance of each enrolled student.
- Student identification number of each enrolled student.

The institution may report this information to QTAC in one of two ways—as a bulk update or through the online system.

Reviewing Data Mapping for the QTAC Output File

This table lists the data mapping for the QTAC Enrollment Feedback files:

QTAC Field	PeopleSoft Field
QTAC Reference Number	ADM_APPL_DATA.Ext_adm_appl_nbr
Family_Name	NAMES.LAST_NAME

QTAC Field	PeopleSoft Field
Given_Name_1	NAMES.FIRST_NAME
Given_Name_2	NAMES.MIDDLE_NAME
Date_of_Birth	PERSONAL_DATA.BIRTHDATE
Course_Code	ACAD_PROG_TBL.Program_cd
Final_Response	A,D,I,K
Final_Enrolment_Status	Y,N,Z
Inst_Student_Num	ADM_APPL_DATA.Emplid
Attendance Type	F,P, or blk
Attendance Mode	I,E,M or blk

Page Used to Create a QTAC Enrollment Feedback Report

Page Name	Definition Name	Navigation	Usage
Enrollment Feedback QTAC	SSR_RUN_QTACENRFLD	Records and Enrollment > Enrollment Reporting > Enrollment Feedback QTAC AUS > Enrollment Feedback QTAC	Generate enrollment feedback reports for QTAC.

Processing Enrollment Feedback for SATAC

This section provides an overview of SATAC enrollment feedback processing and discusses how to report enrollment for SATAC.

Understanding SATAC Enrollment Feedback Processing

Your reconciliation should ensure that the enrollment record and the SATAC acceptance record (response codes A & AB) are identical for all students new to each of your programs offered through SATAC.

The basic codes are shown in the following table:

SATAC Response Code	Definition
A or AB	Enrolled
F or FB	Deferred

SATAC Response Code	Definition
K or KB	Withdrawn

The four distinct phases of the reconciliation process are:

1. SATAC data extract.

SATAC extracts the most up-to-date applicant information from its database and forwards it to its member institutions around the 31 March census date. Offer data can be then used by the member institution to add or update its information about SATAC applicants.

2. Reconciliation file prepared by institution.

Each member institution extracts information from its own enrollment records and creates a file of reconciliation data to return to SATAC. This file should contain data about all new course students whose application should be processed by SATAC.

3. SATAC edit, edit correction, and update process.

SATAC processes the reconciliation file returned from the member institutions in an iterative process. The process begins by running the edit program and reporting any validation errors in the data, then analyzing and correcting those errors (if possible). The next step is rerunning the edit program, reporting any errors, analyzing and correcting errors until all differences in the SATAC database and institutional files can be reconciled, and updating the SATAC database with the correct institutional data.

4. Reconciliation reporting.

Reports that summarize the results are prepared by SATAC for the member institutions. Any issues that need addressing are highlighted.

Reviewing Data Mapping for the SATAC Output File

The following table lists the data mapping for the SATAC Enrollment Feedback files:

SATAC Field	PeopleSoft Field
INST_Ref_Num	ADM_APPL_DATA.Ext_adm_appl_nbr
INST_Family_Name	NAMES.LAST_NAME
INST_Given_Name_1	NAMES.FIRST_NAME
INST_Given_Name_2	NAMES.MIDDLE_NAME
INST_Student_Number	ADM_APPL_DATA.Emplid
INST_Gender	PERSONAL_DATA.SEX
INST_Date_of_Birth	PERSONAL_DATA.BIRTHDATE

SATAC Field	PeopleSoft Field
INST_Offer_Course_Code	ACAD_PROG_TBL.Program_cd
INST_Enrolment_Status	'A','F','K'
Filler	spaces

Page Used to Produce a SATAC Enrollment Feedback Report

Page Name	Definition Name	Navigation	Usage
Enrollment Feedback SATAC	SSR_RUN_ENROLFEED	Records and Enrollment > Enrollment Reporting > Enrollment Feedback SATAC AUS > Enrollment Feedback SATAC	Generate enrollment feedback reports for SATAC.

Processing Enrollment Feedback for UAC

This section provides an overview of UAC enrollment feedback processing and discusses how to report enrollment for UAC.

Understanding UAC Enrollment Feedback Processing

During UAC enrollment feedback processing, the system produces a data set for each offer extended through UAC. Each data set contains the following:

- Enrollment code.
- Student number.
- Attendance type.
- Attendance mode.

Each institution has its own connection to the UAC system and generates its own data set. This data set can be updated in two ways, either through a file upload or manual update. This data set contains all offers for a given institution and also provides several empty columns as placeholders to receive information supplied by the institution.

Reviewing Data Mapping for the UAC Output File

The following table lists the data mapping for the UAC Enrollment Feedback files. The file created is a comma delimited file. Numeric fields should be zero justified.

UAC Field	PeopleSoft Field
UAC Reference Number	ADM_APPL_DATA.Ext_adm_appl_nbr

UAC Field	PeopleSoft Field
UAC Course	ACAD_PROG_TBL.Program_cd
Emplid	ADM_APPL_DATA.Emplid
Enrolment	E,D,N
Attendance Type	F,P, or blk
Attendance Mode	I,E,M or blk

Page Used to Create a UAC Enrollment Feedback Report

Page Name	Definition Name	Navigation	Usage
Enrollment Feedback UAC	SSR_RUN_ENROLFEED	Records and Enrollment > Enrollment Reporting > Enrollment Feedback UAC AUS > Enrollment Feedback UAC	Generate enrollment feedback reports for UAC.

Processing Enrollment Feedback for VTAC

This section provides an overview of VTAC enrollment feedback processing and discusses how to report enrollment for VTAC.

Understanding VTAC Enrollment Feedback Processing

Enrollment feedback is also generated for the Victorian Tertiary Admissions Centre (VTAC).

Reviewing Data Mapping for the VTAC Output File

This table lists the data mapping for the VTAC Enrollment Feedback files:

VTAC Field	PeopleSoft Field
VTAC Application number	ADM_APPL_DATA.Ext_adm_appl_nbr
Surname	NAMES.LAST_NAME
First Given Name	NAMES.FIRST_NAME
Second Given Name	NAMES.MIDDLE_NAME
Category	TAC_SPS_VIC_ANZ.VIC_CATEGORY

VTAC Field	PeopleSoft Field
Offered Course	ACAD_PROG_TBL.PROGRAM_CD
Street Name	ADDRESSES.ADDRESS1
Suburb	ADDRESSES.CITY
State	ADDRESSES.STATE
Postcode	ADDRESSES.POSTAL
Country	ADDRESSES.COUNTRY
Overseas Zip/Postcode	TAC_SPS_ANZ.OVERSEAS_ZIP
Enrolment Indicator	Derived from PS_ADM_APPL_PROG.PROG_ACTION or PS_ACAD_PROG.PROG_ACTION depending if the student has been matriculated
Round number	TAC_SPS_ANZ.OFFER_ROUND_NUM
Acceptance Indicator	Provided by VTAC
Date of Birth	PERSONAL_DATA.BIRTHDATE

Page Used to Create a VTAC Enrollment Feedback Report

Page Name	Definition Name	Navigation	Usage
Enrollment Feedback VTAC	SSR_RUN_VTACENRLFD	Records and Enrollment > Enrollment Reporting > Enrollment Feedback VTAC AUS > Enrollment Feedback VTAC	Generate enrollment feedback reports for VTAC.

(AUS) Managing the Automated Results Transfer System

Understanding ARTS

ARTS is a national system that electronically distributes academic record information for current and former students who have applied for admission to an institution through a Tertiary Admissions Centre (TAC). The ARTS system enables the TAC to obtain academic records quickly and securely, in order to support the applications for students applying to programs of study at other institutions.

The ARTS process is initiated by the target institution's TAC, which sends a request for academic information to the target institution. The institution acknowledges the TAC request through an acknowledgment file and creates a result file with the student's academic record information. The institution then sends the result file to the TAC. When the TAC receives the results file, they send an acknowledgment file to the institution. The request file, the result file, and the acknowledgment file, are all transferred electronically between the TAC and the institution. The details of how this works are:

1. A TAC initiates a request for academic record information about a current or past student of an institution by creating a request file containing identifying information supplied by the student.
2. The admissions center encrypts the request file using a standard encryption process.
3. The admissions center transfers the encrypted request file to a target directory on the institution's system.
4. The institution renames and copies the request file to a working directory, decrypts and validates the request, and places an encrypted request acknowledgment file on the target directory.
5. The institution retrieves the academic record information and constructs and encrypts a result file.
6. The institution copies the encrypted result file back to the target directory.
7. The admissions center continually checks the institution target directory to determine the state of requests.

The admissions center retrieves the result file and deletes the request and acknowledgment files from the target directory.

8. The admission center decrypts and validates the result file and places an encrypted result acknowledgment file on the target directory.

If the result file does not validate, the system places a copy of the original encrypted request file on the target directory.

9. The institution continually monitors the target directory for the existence of result acknowledgment files.

- a. If no error records are reported, the acknowledgment file is deleted by the institution.
- b. If error records are reported, the institution takes action to rectify the cause of the invalid data or result file format before deleting the acknowledgment file.

PeopleSoft Campus Solutions is designed to perform the following tasks for ARTS processing:

- Read all ARTS request files in a target directory, after the file is decrypted.
- Create acknowledgment files for each request file.
- Retrieve academic information for a student in a request file, including notes.
- Produce a result file for each individual request.

Note: The system does not process students who have their results blocked by user-defined service indicators.

Additional detail about specific requirements for ARTS processing, file formats, data reporting guidelines, and technical information for ARTS is available.

See Automated Results Transfer System Users Guide published by the Australasian Conference of Tertiary Admissions Centres.

Understanding ARTS File Naming Conventions

PeopleSoft Campus Solutions creates all acknowledgement and results files and names them in accordance with a specific file naming convention, which is also used by all TACs.

The naming convention for ARTS files is *XAAAAAAA.YYY*, where each of the alphanumeric characters is defined as:

X

The Admissions Centre code:

- *Q*: Queensland Tertiary Admissions Centre.
- *S*: South Australian Tertiary Admissions Centre.
- *T*: Tertiary Institutions Service Centre (Western Australia).
- *U*: Universities Admissions Centre (New South Wales).
- *V*: Victorian Tertiary Admissions Centre.

AAAAAAA

A unique seven digit alphanumeric code identifying either the applicant or the transaction.

YYY

The file extension that identifies the type of the file:

- *REQ*: Request file.
- *ACK*: Request Acknowledgment file.

- *RLT*: Result file.
- *ACS*: Result Acknowledgment file.
- *CPD*: Request file after processing.

Note: The file name must be in upper case and contain no special (nonalphanumeric) characters.

File Naming Examples

For example, a request file generated by South Australia TAC for applicant 12BC567 would be named S12BC567.REQ.

The request acknowledgment file generated by Campus Solutions corresponding to the request file would be named S12BC567.ACK.

The result file generated by Campus Solutions corresponding to the request file would be named S12BC567.RLT.

The acknowledgment file generated by South Australia TAC for applicant 12BC567 corresponding to the request file would be named S12BC567.ACS.

Preparing for ARTS Processing

To prepare for ARTS processing, use these components: Academic Program Table (ACADEMIC_PROG_TBL), ARTS Institution Mapping AUS (SSR_ARTS_INST_MAP), Service Indicator Data (SERVICE_IND_PERS), ARTS Student Program Notes AUS (SSR_PROG_NOTES), Honors and Awards (HNR_AWD_EXT_PERS), Person Comment Entry (CMNT_ENTRY), and Communication Management (COMM_MANAGEMENT).

This section provides an overview of ARTS processing and discusses how to:

- Enter field of study values.
- Enter data mapping specifications.
- Assign service indicators.
- Enter student program notes.
- Enter honors and awards.
- Enter comments.
- Enter communications.

Understanding ARTS Processing

To prepare for ARTS processing, ensure that:

- Fields of study have been populated on the Acad Prog AUS (Academic Program AUS) page.

- Data mapping specifications have been completed on the ARTS Institution Mapping page.
- Service indicators are assigned to students that you want the system to exclude from ARTS processing on the Service Indicator Data page.

In addition to reporting traditional personal data and course data that resides in your system for students, the ARTS process can also report:

- Honors and awards information.
- Program notes.
- Comments.
- Communications.

Therefore, prior to running the ARTS process, add:

- Program notes to student records.
- Honors and awards information to student records.
- Comments to student records.
- Communications to student records.

Pages Used to Prepare for ARTS Processing

Page Name	Definition Name	Navigation	Usage
Acad Prog AUS (academic program Australia)	SSR_ACAD_PROG_AUS	Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Acad Prog AUS	Assign a field of study value for each program that can be processed by ARTS.
ARTS Institution Mapping	SSR_ARTS_INST_MAP	Set Up SACR > Product Related > Student Records > Transcript > ARTS Institution Mapping AUS > ARTS Institution Mapping	Map PeopleSoft campus codes to the Department of Industry, Innovation, Science, Research and Tertiary Education (DIISRTE) institution codes, which the system uses in the ARTS transcripts.
Manage Service Indicators	SRVC_IND_SUMRY	Campus Community > Service Indicators (Student) > Manage Service Indicators > Manage Service Indicators	Assign or release a service indicator. Students with service indicators that match one or both of the service indicators entered on the Arts Parameters 1 page at runtime will be excluded from ARTS processing.

Page Name	Definition Name	Navigation	Usage
ARTS Student Program Notes	SSR_PROG_NOTES	Records and Enrollment > Transcripts > ARTS Student Program Notes AUS > ARTS Student Program Notes	Add notes to a student's program in order for notes to appear on the ARTS transcript.
Honors and Awards	HONORS_AWARDS_CS	Records and Enrollment > Graduation > Honors and Awards > Honors and Awards	Track student honors and awards. The Honors/Awards process populates the page according to the rules you set on the Honors/Awards Rule page. You can also manually enter information on this page.
Person Comment Entry	CMNT_ENTRY1	Campus Community > Comments > Comments - Person > Person Comment Entry > Person Comment Entry	Enter comments about an individual.
Person Communication	COMM_MGMT1	Campus Community > Communications > Person Communications > Communication Management > Person Communication	Assign a communication to an individual.

Entering Field of Study Values

Access the Acad Prog AUS page (Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Acad Prog AUS).

Image: Acad Prog AUS page (1 of 2)

This example illustrates the fields and controls on the Acad Prog AUS page (1 of 2).

The screenshot shows the 'Acad Prog AUS' page with the following details:

- Navigation:** Enrollment | Course | Dynamic Date | **Acad Prog AUS** | Acad Prog NZL | Home Campus NLD
- Academic Institution:** PSUNV PeopleSoft University
- Academic Program:** LAU Liberal Arts Undergraduate
- Effective Date:** 01/01/1900
- Status:** Active
- *Field of Study:** 030101 Arts, Humanities, Social Sc.
- Field of Education Code:** 091523 Literature
- Program Type Code:** 10 Bachelor's Pass
- Special Program Type:** 00 Not Course of Special Interest
- Aggregated EFTSL:** 30 3 Years
- Minimum Units:** 360.00
- Program Eligibility:** PELS Elig
- CRICOS Code:** [Empty]
- Combined Course Indicator**
- Supplementary FOS:** 000000 Non-Award
- Supplementary FOE:** 010101 Mathematics
- DEST Related Programs Table:**

Related Academic Program	*Status
1 [Search]	Active [Dropdown] [+ -]

Image: Acad Prog AUS page (2 of 2)

This example illustrates the fields and controls on the Acad Prog AUS page (2 of 2). You can find definitions for the fields and controls later on this page.

The screenshot shows the 'TAC Program Mapping' page with the following fields:

- Program Code:** [Text Input] [Search] [+ -]
- TAC Stream Code:** [Text Input]
- Academic Load:** [Dropdown]
- Academic Plan:** [Text Input] [Search]
- Mode of Attendance:** [Dropdown]
- Campus:** [Text Input] [Search]

Enter a field of study value for each program that you process as part of ARTS.

Related Links

"Defining Academic Programs" (PeopleSoft Campus Solutions 9.2: Application Fundamentals)

Entering Data Mapping Specifications

Access the ARTS Institution Mapping page (Set Up SACR > Product Related > Student Records > Transcript > ARTS Institution Mapping AUS > ARTS Institution Mapping).

Image: ARTS Institution Mapping page

This example illustrates the fields and controls on the ARTS Institution Mapping page. You can find definitions for the fields and controls later on this page.

*Campus	Code	Description	Version ID	Main	IP Address
MAIN	9998	Peoplesoft Aus University	2.7	<input checked="" type="checkbox"/>	

Version ID

Enter the Version ID. The ARTS version number represents the specification number applicable to the request/return. The system includes this number on the Request file header record, Result file header record, Request acknowledgement file header record and Result acknowledgement file header record.

Except for a short period of time during change over from one version to the next, this number will be the same for all request/results records—the current version. However during changeover periods and for testing, multiple versions may coexist for short periods.

Main

Select this check box to indicate the main campus for the institution.

IP Address

An IP address can be assigned to the campus for which you select the Main check box. The system includes this on the ARTS transcript header record.

Assigning Service Indicators

Access the Manage Service Indicators page (Campus Community > Service Indicators (Student) > Manage Service Indicators > Manage Service Indicators).

Assign service indicators to students that you want to exclude from ARTS processing. At runtime, you can specify up to two (2) service indicators which, if assigned to a student, will exclude the student from ARTS processing.

See [Performing ARTS Processing](#).

Related Links

"Viewing, Assigning, or Removing Service Indicators" (PeopleSoft Campus Solutions 9.2: Campus Community)

Entering Student Program Notes

Access the ARTS Student Program Notes page (Records and Enrollment > Transcripts > ARTS Student Program Notes AUS > ARTS Student Program Notes).

Enter any notes that you want to include in the ARTS process.

Sequence Nbr (sequence number)	If you have multiple notes per program, enter a sequence value to control the order of the notes.
Include Program Description	Select to include the program description in the report.
ARTS Program Notes	Enter notes for the student's program.

Entering Honors and Awards

Access the Honors and Awards page (Records and Enrollment > Graduation > Honors and Awards > Honors and Awards).

Enter any honors and awards information that you want to include in the ARTS process. You specify the honors and awards that you want to report during ARTS processing on the Honors/Awards page.

See [Entering ARTS Honors and Awards Parameters](#).

Related Links

"Entering Honors and Awards Data" (PeopleSoft Campus Solutions 9.2: Campus Community)

Entering Comments

Access the Person Comment Entry page (Campus Community > Comments > Comments - Person > Person Comment Entry > Person Comment Entry).

Enter any comments that you want to include in the ARTS process. You specify the comments that you want to report during ARTS processing on the Comments/Communications page.

See [Entering Comment and Communication Parameters](#).

Related Links

"Entering Comments About an Individual" (PeopleSoft Campus Solutions 9.2: Campus Community)

Entering Communications

Access the Communication Management 1 page (Campus Community > Communications > Person Communications > Communication Management > Person Communication).

Enter any communications that you want to include in the ARTS process. You specify the communications that you want to report during ARTS processing on the Comments/Communications page.

See [Entering Comment and Communication Parameters](#).

Related Links

"Assigning Communications" (PeopleSoft Campus Solutions 9.2: Campus Community)

Performing ARTS Processing

You can schedule ARTS processing to run routinely using the Process Scheduler. After you set up the process pages in this section and specify a processing frequency, you need only monitor the system.

The processing program operates under the assumption that the request files have been decrypted and placed into the appropriate directory, which the institution specifies in the Input File Path field.

This section discusses how to:

- Enter ARTS processing parameters.
- Enter ARTS honors and awards parameters.
- Enter comment and communication parameters.

Pages Used to Run the ARTS Process

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Arts Parameters 1	SSR_RUN_SRARTS	Records and Enrollment > Transcripts > ARTS Results AUS > Arts Parameters 1	Provide parameters for ARTS processing. Specify where the system shall retrieve and place the ARTS files, and indicate what service indicators (if present for a student) prevent a student's academic record from being released.
Honors/Awards	SSR_RUN_SRARTS2	Records and Enrollment > Transcripts > ARTS Results AUS > Honors/Awards	Enter the codes you have set up in your system for the various types of honors and awards that you want to report in the results file. Honors categories are used to determine the honors flag in the course attempt record. Careers are used to select honor details in the result file.

Page Name	Definition Name	Navigation	Usage
Comments/Communications	SSR_RUN_SRARTS3	Records and Enrollment > Transcripts > ARTS Results AUS > Comments/Communications	Enter the codes that you set up in your system for the various types of comments and communications that you want to report as notes in the result file.

Entering ARTS Processing Parameters

Access the ARTS Parameters 1 page (Records and Enrollment > Transcripts > ARTS Results AUS > Arts Parameters 1).

Input File Path

Enter the complete file path to the ARTS request files.

Output File Path

Enter the complete file path to where you want to post the ARTS results and request acknowledgment files.

Academic Institution

Enter the academic institution that you want to process. If you have more than one institution, you may need to set up multiple run control IDs.

Service Indicator - Fees and Service Indicator Reason - Fees

Select a service indicator code and reason in order to identify students whose academic records should not be released due to unpaid fees. You can leave these fields blank.

Service Indicator - Other and Service Indicator Reason - Other

Select a service indicator code and reason in order to identify students whose academic records should not be released due to other reasons. You can leave these fields blank.

Entering ARTS Honors and Awards Parameters

Access the Honors/Awards page (Records and Enrollment > Transcripts > ARTS Results AUS > Honors/Awards).

Image: Honors/Awards page

This example illustrates the fields and controls on the Honors/Awards page. You can find definitions for the fields and controls later on this page.

The Course Attempt record is written out in the ARTS Results File extract. The Result File Course Attempt record is a type of record in the output file. The Honours flag is a field in this record.

In the Honors Award Categories group box, select the honors categories that you want to include in students' academic records for ARTS. Any honors or awards in a student's record that have an honors category listed on this page will cause the Honours Flag field to be set in the Result Output File produced for the Course Attempt record. The input parameters include up to five honors code categories that may be used when building the Honours Flag field value in the Result File Course Attempt record. For example, if a student has *NHS* as an award code, then the system will code the Honours flag as 3, which specifies Lvl IIA.

Use the Career field to identify the careers to which honors details should be associated. Add rows to include additional careers.

The ARTS Honour Flag is described in the ARTS user guide.

See Automated Results Transfer System Users Guide published by the Australasian Conference of Tertiary Admissions Centres.

Entering Comment and Communication Parameters

Access the Comments/Communications page (Records and Enrollment > Transcripts > ARTS Results AUS > Comments/Communications).

Image: Comments/Communications page

This example illustrates the fields and controls on the Comments/Communications page. You can find definitions for the fields and controls later on this page.

Comments/Notes Categories			
Comment Category 1:	<input type="text" value="ALEVNT"/>		Alumni Events
Comment Category 2:	<input type="text" value="AWRDGS"/>		Awarding General Secured
Comment Category 3:	<input type="text"/>		
Comment Category 4:	<input type="text"/>		
Comment Category 5:	<input type="text"/>		

Communication/Notes Categories			
Communication Category 1:	<input type="text" value="ADMORG"/>		Admissions Organization Comm
Communication Category 2:	<input type="text" value="AWARD"/>		Financial Aid Award Notificatn
Communication Category 3:	<input type="text"/>		
Communication Category 4:	<input type="text"/>		
Communication Category 5:	<input type="text"/>		

In the Comments/Notes Categories group box, select the comment categories that you want to include in the student's academic records for ARTS. Any comment in a student's record that has a comment category listed on this page is included in the results file as part of the student note record. The input parameters include up to five categories of comments to look for when building the relevant student note records.

In the Communication/Notes Categories group box select the communication categories that you want to be included in student's academic records for ARTS. Any communication in the student's record that has a communication category listed on this panel is included on the Results files part of the student note record. The input parameters include up to five communication categories to look for when building the relevant student note records.

Click Run to run the ARTS (SRARTS) process. PeopleSoft Process Scheduler runs the ARTS process at user-defined intervals.

Note: You should schedule the ARTS process to run at intervals that enable the system to promptly respond to ARTS requests.

(AUS) Generating Government Reports

Understanding the DIISRTE File Generation Process

To understand the business process requirements to generate and submit the various DIISRTE files, it is important to understand the relationships between processes and file output.

This section discusses:

- Student Data files with multiple reporting periods per year and revision requirements.
- Past Course Completions—annual reporting and revision requirements.
- Unit of Study Completions file—annual reporting.
- Course of Study file.

Student Data Files with Multiple Reporting Periods Per Year and Revision Requirements

Most files in Student Data Collection (EN, LL, DU, SS, SA, OS) rely on a prerequisite work process to extract the data to be reported. This process populates work data records with the base data for reporting, and in the case of enrollment data, key information that is common to multiple file extracts. Each of these data tables contains a submission date field. The processes to generate the flat file extracts report data only from the work records with a blank submission date.

When the flat files are submitted to DIISRTE, the work data records are 'stamped' with a submission date. This process populates the submission date field to acknowledge that the data was submitted. These records are no longer reported in the flat file extracts for the related files if they are run again for the same reporting period. You can run the prerequisite process to load the work data records as many times as necessary prior to submission to 'refresh' the population for reporting.

When the process is re-run, any existing work data records for the submission year and period that have a blank submission date are deleted and replaced with records that have not previously been submitted for that reporting period. Any work data records with a non-blank submission date are retained and no longer reported. This mechanism allows institutions to adhere to the incremental reporting requirements of DIISRTE and ensures that previously reported data is not included in subsequent files for the same period. Any data records that are found to be incorrect or require remission after submission must be added as revision records.

These steps summarize the process:

1. Process Work Records – run the prerequisite process to create the work data records.
2. Run the DIISRTE Student Data files.
3. Load the file(s) into HEPCAT, review and validate data.

4. If validation errors exist and data must be corrected, correct the data and repeat from step 1.
5. If data is preliminary and not ready for submission, repeat from step 1.
6. Submit valid data by the required submission date.
7. Run the Submission Processing process to date stamp the work data records for the file(s) submitted.
8. Repeat steps 1 to 7 for further reporting periods or sets of data in the reference year.

Past Course Completions - Annual Reporting and Revision Requirements

The Past Course Completions file does not require a prerequisite work data process. The process to generate the Past Course Completion file extract both creates the data records to retain a history of the completions data reported and generates the file.

These steps summarize the process:

1. If required, enter Student Completion Percentage details for students studying joint degrees with partner institutions.
2. Run the DIISRTE Past Course Completion file.
3. Load the file into HEPCAT, review and validate data.
4. If validation errors exist and data must be corrected, correct the data and repeat from step 1.
5. If data is preliminary and not ready for submission, repeat from step 1.
6. Submit valid data by the required submission date.
7. Run the Submission Processing process to date stamp the work data records for Past Course Completions.

Unit of Study Completions File – Annual Reporting

No DIISRTE revision requirements exist for Unit of Study Completions reporting and consequently, no work data records exist for this extract. Only those enrollment records previously submitted in the Load/Liability File for the corresponding reporting year are included in the flat file extract.

These steps summarize the process:

1. Run the DIISRTE Unit of Study Completions file.
2. Load the file into HEPCAT, review and validate data.
3. If validation errors exist and data must be corrected, correct the data and repeat from step 1.
4. If data is preliminary and not ready for submission, repeat from step 1.
5. Submit valid data by the required submission date.

Course of Study File

You can generate the Course of Study file as often as required for a given reference year. Any changes or additions that must be reported to DIISRTE are treated as a replacement file and no work data records are retained.

These steps summarize the process:

1. Run the DIISRTE Course of Study file.
2. Load the file into HEPCAT, review and validate data.
3. If validation errors exist and data must be corrected, correct the data and repeat from step 1.
4. If data is preliminary and not ready for submission, repeat from step 1.
5. Submit valid data by the required submission date.

Recording a Commonwealth Scholarship

This section discusses how to record a Commonwealth Scholarship.

Page Used to Record a Commonwealth Scholarship

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Commonwealth Scholarships	SSR_CLS_STATUS	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Commonwealth Scholarships > Commonwealth Scholarships	Add or update details about the Commonwealth Scholarships. Your institution allocates the scholarships to students.

Recording a Commonwealth Scholarship

Access the Commonwealth Scholarship page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Commonwealth Scholarships > Commonwealth Scholarships).

Image: Commonwealth Scholarships page

This example illustrates the fields and controls on the Commonwealth Scholarships page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Commonwealth Scholarships' page for student ID SRAUS010, Smythe, Stewart. The CS Type is E545 (Indigenous Accommodation). The 'Details' section includes fields for Effective Date (01/11/2019), CS Status Code E526 (Current Scholarship), Allocate Date, Accept Date, CS End Date, and a Comments field. Below this is a 'Scholarship Amounts' table with columns for Reporting Year, Period, Award Date, and Scholarship Amount E598.

	*Reporting Year	*Period	*Award Date	Scholarship Amount E598		
1	2019	2	01/11/2019	5000.00	+	-
2	2020	1	21/01/2020	6000.00	+	-
3	2020	2	01/11/2020	2000.00	+	-

CS Code (Commonwealth Scholarship Code) Select the Commonwealth Scholarship code applicable to the student. The values available for selection are the Commonwealth Scholarships Type codes.

The institution reports the Commonwealth Scholarships Type codes to DIISRTE as an element 545 value.

CS Status Code (Commonwealth Scholarship Status Code)

Select the Commonwealth Scholarship Status code applicable to the student.

The institution reports this value to DIISRTE as an element 526 value. To ensure accurate reporting, you need to select the correct combination of CS code and CS Status code.

For CAS Indigenous Payments that the student accepts before the census date, you must select the status code in the CS Status Code field to indicate acceptance. Additionally, you must report the related record to DIISRTE and stamp the record as submitted.

When you report the CAS Indigenous Payments that the student accepts before the census date for the second time, insert a row.

In the new row, indicate whether the institution has confirmed or denied the scholarship after the first census date or at a time when your institution failed to confirm the scholarship.

Allocate Date

Enter the date on which the institution allocated the scholarship to the student.

The system does not use this date to select students for reporting purposes.

Institutions can use the Allocate Date values for internal reporting and information sharing.

Accept Date

Enter the date on which the student accepts the scholarship.

The Process Work Records process uses this date to select students with CAS Indigenous Payments.

You can record the Accept Date for all students who have accepted scholarships. Institutions can use the Accept Date values for internal reporting.

Scholarship Amounts

Use this region to record information about the scholarship amount, its reporting year and award date.

Generating the Student Data Files that Allow Revision

This section discusses how to:

- Load the DIISRTE work records.
- View the DIISRTE work records.
- Generate the DIISRTE Student Data files.
- Define completion percentage in joint degree programs for past course completions.
- Generate the Annual File extracts.
- View Past Course Completion records.
- Date-Stamp records as submitted.
- Extract TFN data.
- Report programs on campus.

Pages Used to Generate the Student Data Files that Allow Revision

Page Name	Definition Name	Navigation	Usage
Process Work Records	SSR_RC_DEST_WT	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Process Work Records > Process Work Records	Generate the DIISRTE work records for Enrollment, OS-HELP, SA-HELP, and Scholarships reporting.
View Enrollment Records	SSR_DEST_WRK_HDR	<ul style="list-style-type: none"> • Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by Period > View Enrollment Records • Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by EMPLID > View Enrollment Records 	View the Enrollment work records that the system used to generate the DIISRTE reporting extracts.
View Units of Study	SSR_DESTWRK_UNT	Click the Units of Study link on the View Enrollment Records page.	View units of study data.
View OS-HELP Records	SSR_DEST_WRK_OS	<ul style="list-style-type: none"> • Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by Period > View OS-HELP Records • Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by EMPLID > View OS-HELP Records 	View the OS_HELP work records that the system used to generate the DIISRTE reporting extracts.

Page Name	Definition Name	Navigation	Usage
View SA-HELP Records	SSR_DEST_WRK_SA	<ul style="list-style-type: none"> Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by Period > View SA-HELP Records Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by EMPLID > View SA-HELP Records 	View the SA_HELP work records that the system used to generate the DIISRTE reporting extracts.
View Scholarship Records	SSR_DEST_WRK_SS	<ul style="list-style-type: none"> Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by Period > View Scholarship Records Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by EMPLID > View Scholarship Records 	View the Scholarship work records that the system used to generate the DIISRTE reporting extracts.
Process Run History	SSR_DEST_WRK_HST	<ul style="list-style-type: none"> Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by Period > Process Run History Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by EMPLID > Process Run History 	Confirm work records processing.

Page Name	Definition Name	Navigation	Usage
Run Student Data Files	SSR_RC_DEST1	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run Student Data Files > Run Student Data Files	Generate the Student Data files - Enrollment Load/ Liability, Commonwealth Assisted Students, Scholarships, OS-HELP, SA-HELP - for submission to DIISRTE.
Student Completion Percentage	SSR_DEST_COMPL	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Student Completion Percentage	Define the completion percentage for past course completion for DIISRTE reporting.
Run Annual File Extracts	SSR_RC_DEST2	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run Annual File Extracts > Run Annual File Extracts	Generate the DIISRTE Course of Study, Past Course Completions, and Unit of Study Completions files.
View PS Records	SSR_DEST_PS_HDR	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Course Completion Records > View PS Records	View records extracted for the Past Course Completions file.
View Completion Data	SSR_PSWRK_UNT	Click the Completion Details link on the View PS Records page.	View data extracted for the Past Course Completions file.
Process Run History	SSR_DESTPS_WRK_HST	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Course Completion Records > Process Run History	Confirm the processing for the Past Course Completions extract.
Submission Processing	SSR_DEST_RC_ST	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Submission Processing > Submission Processing	Enter the parameters to run the Submission Processing process. This process assigns a submission date to the work records submitted to DIISRTE.
Run TFN Extract	SSR_RC_TFN_EXTRACT_GBL	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run TFN Extract	Extract TFN data in the TR or TL file format for selected groups of students. Run the report by parameters, population selection or student.

Page Name	Definition Name	Navigation	Usage
HEIMS Program on Campus	SSR_HEIMS_CRSE_CAM	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > HEIMS Program on Campus	Report which courses are delivered from which campuses.

Loading the DIISRTE Work Records

Access the Process Work Records page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Process Work Records > Process Work Records).

Reference Year

Select the year for which you are running the report.

Note: You can select only the years that you have set up on the Reporting Set Up page.

See [Setting Up DIISRTE Reporting Codes](#)

First or Second Half Year

Select which half of the year you are reporting.

Census Start Date and Census End Date

The system enters the census start and end dates based on the reference year.

CAS Indicator (Commonwealth Assisted Students indicator)

When using the CAS Indicator to distinguish between Commonwealth and Non-Commonwealth assisted students, the Process Work Records process references the Commonwealth Assisted check box on the Liability Status page:

Commonwlth Asstd Students Only (Commonwealth assisted students only): The process finds records for which the check box is selected.

Non Cmwltth Asstd Stdnts Only (non-Commonwealth assisted students only): The process finds records for which the check box is not selected.

All Students: The process finds all records that meet the other parameter selections regardless of whether the check box is selected or cleared.

Scholarship Group

Select the scholarship group value to indicate the scholarship records that you want to report to DIISRTE.

The Scholarship Group field allows you to cater to the different reporting deadlines for continuing and commencing scholarship holders. For example, if you want to report new scholarship holders first, then use the Scholarship Group field to select *Commencing Only* students.

Values for this field are *Commencing Only* and *Commencing and Continuing*. To exclude scholarships from processing, do not select any value.

Scholarship From Date and Scholarship To Date

Use the Scholarship From Date and Scholarship To Date fields to specify a date range applicable to the selection of commencing scholarship holders.

For CAS Indigenous Payments, the accept date on the Commonwealth Scholarship Page is relevant to this date range.

Students commencing a commonwealth scholarship other than CAS indigenous payments must have an enrollment record in Student Records with a census date within the range of the scholarship from and to dates.

See [Setting Up DIISRTE Reporting Codes](#).

Viewing the DIISRTE Work Records

Access the Work Records by Period or View Work Records by EMPLID components to view DIISRTE work records.

Viewing Enrollment Records

Access the View Enrollment Records page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Work Records by Period > View Enrollment Records).

Click the Units of Study link to access the View Units of Study page and view class and financial data.

Viewing Units of Study

Access the View Units of Study page (click the Units of Study link on the View Enrollment Records page).

Each type of record to be reported (Class Enrollment, OS-HELP, SA-HELP, Scholarships) includes a submitted column. If the Submitted field is blank, the DIISRTE Submission process has not been run for this work data and the student and related data will be output to the corresponding flat file extract if the process is run. If a date value exists in the Submitted field, the record is available for revision. Only submitted data can be revised.

Generating the DIISRTE Student Data Files

Access the Run Student Data Files page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run Student Data Files > Run Student Data Files).

Use this page to generate the Enrollment, Load/Liability, Commonwealth Assisted Students, Scholarships, OS-HELP, SA-HELP, and Commonwealth Scholarships flat file extracts.

Most of the fields on this page are the same as the fields on the Process Work Records page—refer to the documentation about that page.

File Path

Enter the path where you want the system to save the file.

The file path must end with a backslash (\).

Defining Completion Percentage in Joint Degree Programs for Past Course Completions

Access the Student Completion Percentage page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Student Completion Percentage).

Use this page to set up the Completion Percentage (E578) and Joint Degree Partner Higher Education Provider Code (E579) elements for an academic program or plan to be used in DIISRTE reports. This page gives you the option to create a record to identify the institution code and completion percentage for students studying joint degrees with partner institutions.

Institution Code

This field indicates the four-digit institution code that identifies the joint degree partner institution. If you use the value *0000*, this indicates the degree is not a joint degree.

Percent

This field indicates the percentage of course completion in a joint degree program that is recognized by a provider. The default value is *100*, which indicates that the student is not studying a joint degree.

Generating the Annual File Extracts

Access the Run Annual File Extracts page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run Annual File Extracts > Run Annual File Extracts).

Use this page to generate the Past Course Completion extract: when you click Run, select the DEEWR Past Course Completion process. You also run the DEEWR Course of Study File process and the DEEWR Unit of Study Completion process from this page.

Only Past Course Completion reporting has DIISRTE revision requirements.

Viewing Past Course Completion Records

Use the View Past Course Completion Records (SSR_DEST_PS_WRK) component to view records and data extracted for the Past Course Completions file.

Viewing Completion Records

Access the View PS Records page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Course Completion Records > View PS Records).

Click the Completion Details link to access the View Completion Data page and confirm the data elements returned in the extract.

Viewing Completion Data

Access the View Completion Data page (click the Completion Details link on the View PS Records page).

Joint Degree Partner

This field displays the four-digit institution code of the joint degree partner institution recognized by the provider. Records will only exist for students that have a joint degree. For students with no joint degree, the default value *0000* is displayed.

Completion Percent

This field displays a code that indicates the percentage of course completion in a joint degree program recognized by the provider. Records will only exist for students that have a joint degree. If multiple records exist for the Student Program and Joint Degree Partner (institution code), the Completion Percent field displays the sum of the percentages. For students with no joint degree, the value *100* is displayed.

See [Defining Completion Percentage in Joint Degree Programs for Past Course Completions](#).

This table describes the DIISRTE data elements that populate the fields on this tab.

Field	DIISRTE Data Element
Course Code	307
CHESSN	488
Commencement Date	328
Attendance Mode	329
Attendance Type	330
Specialisation Code	463
Exemption Granted	385
Scholarship Type	487
Joint Degree Partner	579
Completion Percent	578

Select the Student Data tab:

The DIISRTE Submission process populates the date in the Submitted field.

This table describes the DIISRTE data elements that populate the fields on this tab.

Field	DIISRTE Data Element
Birthdate	314

Field	DIISRTE Data Element
Birth Country	346
Year Arrival	347
Gender	315
Language	348
ATSI Code	316
Citizenship	358
Disability	386
Submitted	Indicates the date the completion record was submitted to DIISRTE, populated by the Submission process. A blank value indicates data has not yet been confirmed as submitted.

Viewing Process Run History

Access the Process Run History page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > View Course Completion Records > Process Run History).

This page confirms the processing for the Past Course Completions extract by indicating the number of records reported and or stamped by the Submission process. The Records Processed field includes any past course completion revisions reported.

Date-Stamping Records as Submitted

Access the Submission Processing page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Submission Processing > Submission Processing).

Records Submitted

In the Records Submitted group box select the check box applicable to the records that you have submitted. You can select multiple check boxes.

Enrollments

If you select this check box and run the process, the system changes the submitted date from blank to the current system date for the unit of study and academic organization (AOU) records relevant to the Load Liability, Enrollment, and Commonwealth Assisted Students files.

Scholarships

If you select this check box and run the process, the system changes the submitted date from blank to the current system date for the scholarship work records that belong to the reference year and reporting period. The system also stamps as submitted any scholarship revision records for the same

reference year and half-year period that are not stamped as submitted.

OS-HELP

If you select this check box and run the process, the system changes the submitted date from blank to the current system date for the OS-HELP work records that belong to the reference year and reporting period.

SA-HELP

If you select this check box and run the process, the system changes the submitted date from blank to the current system date for the work records that belong to the reference year and reporting period identified.

Past Course Completion

Select this check box to allow date-stamping of Past Course Completion records that have been submitted to DIISRTE.

The First or Second Half Year run parameter is not applicable to past course completions; the system updates records with a submitted date based on the reference year parameter only for this annual extract.

The process date-stamps originally reported completion records for the reference year indicated and revised completion records less than or equal to the reference year indicated.

Extracting TFN Data

Use this page to extract student Tax File Number (TFN) data using parameters, population selection or by students, to verify student TFN information before submitting periodic report data. This process does not populate the work tables.

Access the Run TFN Extract page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run TFN Extract).

Image: Run TFN Extract page

Extract student TFN data using parameters, population selection or student IDs.

The screenshot shows the 'Run TFN Extract' interface. At the top, it displays 'Run Control ID: TFN_EXT' and a 'Run' button. Below this are several configuration fields:

- *Academic Institution: PSAUS (with a search icon) and 'PeopleSoft Australia Uni'.
- *Select Option: A dropdown menu set to 'By Parameters'.
- *File Type: A dropdown menu set to 'TFN Revision'.
- *File Path: An empty text input field.
- An unchecked checkbox for 'Increment Revision Number'.

 A section titled 'Parameters' contains:

- Reference year: 2017 (with a search icon).
- First or Second Half Year: A dropdown menu set to 'First Half Year'.
- Census Start Date: 01/01/2017 (with a calendar icon).
- Census End Date: 05/06/2017 (with a calendar icon).
- CAS Indicator: A dropdown menu set to 'All Students'.
- An unchecked checkbox for 'Unverified TFN'.

Select Option

Select an option by which to extract the TFN data—parameters, population selection, or student ID. Based on the selected option, the system prompts you for further details.

- *Parameters:* Use parameters similar to those used by other reporting functionality such as Process Work records—Reference Year, First or Second Half Year, Census Start and End Dates, CAS Indicator. See [Loading the DIISRTE Work Records](#) for information on parameter values.
- *Population Selection:* Select students based on your own query.
- *Student:* Generate a report for individual Student IDs.

File Type

Select whether to generate a TFN Revision (TR) or TFN Lookup (TL) file.

File Path

Enter a location to save the generated TFN file.

Increment Revision Number

Select to increment the Revisions Submission Number on the Reporting Setup page after the process completes successfully.

Unverified TFN

Select the check box to extract information only for unverified TFN numbers.

Reporting Programs on Campus

Access the HEIMS Program on Campus page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > HEIMS Program on Campus).

Image: HEIMS Program on Campus page

This example illustrates the fields and controls on the HEIMS Program on Campus page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'HEIMS Program on Campus' page with the following details:

- Academic Institution:** PSAUS (PeopleSoft Australia Uni)
- Academic Program:** BCOM
- Academic Plan:** ACCOUNTING (Accounting)
- Location:** GEELONG (Geelong Campus)

Buttons: Rollover, Copy, Import

Details Section:

- *Effective Date: 01/01/2020
- *Status: Active
- CRICOS Code E597: 2378623
- Type of Campus E569: Stand-alone arrangement
- Offshore Course Mode E570: Multi-modal
- Offshore Delivery Code E571: Delivered fully offshore

TAC Offers Section:

TAC Offer E557	Find	1-3 of 3
QTAC	+	-
SATAC	+	-
VTAC	+	-

Course Fees Section:

- Course Fee Effective Date: 01/01/2020
- Course Fee Type E536: CSP Only
- Indicative CSP Amount E495: 12000.00
- Indicative Tuition Fee E496: 18000.00
- International Indicative Tuition Fee:

Use this page to report which courses are delivered from a certain location (TCSI campus). On this page, you can provide information on the program (TCSI course) features as delivered in each campus. Each program on campus must be associated to a location and a program.

Rollover

Click to specify rollover values and copy the active course on campus data to the target effective date.

Import

Click to import a file with course on campus data.

Copy

Click to select the institution, program, plan, and location (campus) you want to use to populate the TAC Offers and Course Fees regions with values from the record you chose.

CRICOS Code E597

Enter the seven-digit CRICOS code that you want to associate with this program.

By default, the value that appears here is the one the Acad Prog AUS page, if it exists.

Processing DIISRTE Revisions

This section provides an overview of adding revision records for Load/Liability, OS-HELP, SA-HELP, and Commonwealth Scholarships, and discusses how to:

- Record revision records for half yearly submissions.
- Record revision records for past course completions.
- Generate the revision files and date stamp the revision records as submitted to DIISRTE.

Adding Revision Records for Load/Liability, OS-HELP, SA-HELP, and Commonwealth Scholarships

Records are entered in the Revisions Processing component for:

- Previously submitted data that is subsequently found to be incorrectly reported.
- Remissions.
- Additional records for a previously reported student/course/unit of study census date.

Institutions are required to self-identify records that require revision.

Note: Only records that have a non-blank submission date in the associated work data record can be revised. By definition, a revision must have previously submitted data for the reporting period. You can not enter revision records until you have run the Submission process to date stamp the corresponding data. For example, you cannot enter a remission for a unit of study if that enrollment record has not been recorded in the work data records and acknowledged as submitted to DEEWR with a submission date stamp.

Pages Used to Process DIISRTE Revisions

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Revision - LL	SSR_DEST_REV_LL	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - LL	Record LL revisions.
DEST Revisions Select a Class	SSR_DREV_SEL_CLASS	Click the Select a Class/AOU button on the Revision - LL page.	Select the class enrollment record that requires revision.
Retrieve LL Revisions	SSR_DREV_RETRV_LL	Click the Retrieve Revisions button on the Revision - LL page.	Retrieve the LL revision records that were previously recorded for the reporting period.

Page Name	Definition Name	Navigation	Usage
Revision - LL Data	SSR_DEST_REV_LL2	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - LL Data	Change the AOU, EFTSL, Census Date, or Work Experience Indicators.
Revision - LL Financial	SSR_DEST_REV_LL3	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - LL Financial	Change any of the key financial attributes that were reported.
Revision - OS	SSR_DEST_REV_OS	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - OS	Record OS revisions.
DEST Revisions Select OS	SSR_DREV_SEL_OS	Click the Select an OS Record button on the Revision - OS page.	Select the OS-HELP Record that requires revision.
Retrieve OS Revisions	SSR_DREV_RETRV_OS	Click the Retrieve Revisions button on the Revisions - OS page.	Retrieve the OS revision records that were previously recorded for the reporting period.
Revision – SA	SSR_DEST_REV_SA	Records and Enrollment, Enrollment Reporting, AUS Regulatory Reporting, Student Data Collection, Revisions Processing	Record SA revisions.
Retrieve SA Revisions	SSR_DREV_RETRV_OS	Click the Retrieve Revisions button on the Revisions - SA page.	Retrieve the SA revision records that were previously recorded for the reporting period.
DEST Revisions Select SA	SSR_DREV_SEL_SA	Click the Select an SA Record button on the Revision - SA page.	Select the SA-HELP Record that requires revision.
Revision - SS	SSR_DEST_REV_SS	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - SS	Record SS revisions.
DEST Revisions Select SS	SSR_DREV_SEL_SS	Click the Select a CS Record button on the Revision - SS page.	Select the Commonwealth Scholarship record for the student.

Page Name	Definition Name	Navigation	Usage
Retrieve SS Revisions	SSR_DREV_RETRV_SS	Click the Retrieve Revisions button on the Revision - SS page.	Retrieve the scholarship revision records previously recorded for the reporting period
Process History	SSR_DEST_REV_HST	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Process History	Confirm revisions processing.
Revision PS	SSR_DEST_REV_PS	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Course Completion Revisions > Revision PS	View revision records.
DEEWR Revisions Select PS	SSR_DREV_SEL_PS	Click the Select a PS Record button on the Revision PS page.	Select revision data.
Retrieve Past Course Completion	SSR_DREV_RETRV_PS	Click the Retrieve Revisions button on the Revision PS page.	Retrieve submitted past course completions for revision entry.
Revision PS Academic	SSR_DEST_REV_PS2	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Course Completion Revisions > Revision PS Academic	View academic record data elements for the revision.
Revision PS Personal	SSR_DEST_REV_PS3	Records and Enrollment, Enrollment Reporting, AUS Regulatory Reporting, Student Data Collection, Course Completion Revisions, Revision PS Personal	View personal record data elements for the revision.
Run Revisions Extracts	SSR_RC_DEST_REV	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run Revisions Extracts > Run Revisions Extracts	Generate and date stamp the revisions files for submission to DIISRTE.

Recording Revision Records for Half Yearly Submissions

Use the Revisions Processing (SSR_DEST_REV_INPUT) component to record revision records for half yearly submissions.

Recording Load/Liability Revisions

Revisions for Load/Liability data can also result in a requirement to submit a Revised Commonwealth Assisted Students File. If the financial data attributes for the LL record indicate the student is Commonwealth Assisted, the revision record is automatically flagged for inclusion in the additional revisions file.

Revision - LL

Access the Revision - LL page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - LL).

Select a Class/AOU

Click to access the DEST Revisions Select a Class page and select the class enrollment record that requires revision. You can select only those records from the original submission that the system has stamped as submitted to DIISRTE.

Revision Type

Select the type of revision.

Values are: *Addition*, *Revision*, *Deletion*, and *Remission*.

Retrieve Revisions

Click to access the Retrieve LL Revisions page and retrieve the Load/Liability revision records that were previously recorded for the reporting period.

Revision - LL Data

Access the Revision - LL Data page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - LL Data).

Use this page to change the values in the AOU CodeCensus Date, EFTSL, or Work Exp Ind fields.

The fields are populated with data that was previously reported. If the EFTSL value that was reported was incorrect, enter the correct value in the Revised EFTSL field.

Recording OS-HELP Revisions

Access the Revision - OS page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision - OS).

Select an OS Record

Click to access the DEST Revisions Select OS page and select the OS-HELP Record that requires revision. You can select only those records from the original submission that the system has stamped as submitted to DIISRTE.

Revision Type

Select the type of revision.

Values are: *Revision* and *Deletion*.

If the record selected is of type *Revision*, you can change any of the enabled fields on the page.

Retrieve Revisions

Click to retrieve the OS revision records that were previously recorded for the reporting period.

See "Creating and Updating OS-HELP Loans" (PeopleSoft Campus Solutions 9.2: Student Financials)

Recording Revision – SA Revisions

Access the Revision - SA page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing).

Retrieve Revisions

Click to access the Retrieve SA Revisions page to retrieve SA revision records that were previously recorded for the reporting period.

Select an SA Record

Click to access the Revisions Select SA page and select the SA-HELP record that requires revision. You can select only those records from the original submission that the system has stamped as submitted to DIISRTE.

Revision Type

Select the type of revision.

Values are: *Revision* and *Deletion*.

If the record selected is of type *Revision*, you can change any of the enabled fields on the page.

Recording Scholarship Revisions

Access the Revision – SS page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Revisions Processing > Revision — SS).

ID

Enter or select the Student ID for whom you want to revise a previously reported scholarship record.

Revision Type

Select the type of revision. Values for this field are *Revision*, *Addition*, and *Deletion*.

Select a CS Record (Select a Commonwealth Scholarship Record)

Click to access the Revision Select Scholarship page, where you can select the Commonwealth Scholarship record for the student. You can select only those records, from the original submission, that the system has stamped as submitted to DIISRTE.

If the revision type is *Revision* or *Deletion*, the Revision - SS page displays the previously reported values for a selected record.

CS Code (Commonwealth Scholarship code)

Displays the Commonwealth Scholarship code for the stamped scholarship record.

CS Status Code (Commonwealth Scholarship Status Code)

Displays the status code for the stamped scholarship record.

CS Termination Code (Commonwealth Scholarship Termination Code)

Displays the termination code for the stamped scholarship record.

Revised CS Code (Revised Commonwealth Scholarship Code)	Select the scholarship code that requires a revision addition. The system enables this field only for the revision type of <i>addition</i> .
Revised CS Status Code (Revised Commonwealth Scholarship Status Code)	The value reported in the original submission appears by default. If the revision type is <i>Revision</i> , you can enter a value that differs from the value reported in the original submission.
Revised CS Termination Code (Revised Commonwealth Scholarship Termination Code)	This field is available for entry only if the Revised CS Status Code is <i>Terminated Scholarship</i> .
Retrieve Revisions	Click to retrieve the scholarship revision records previously recorded for the reporting period.

Record Revision Records for Past Course Completions

This section discusses how to:

- View revision records.
- Select DIISRTE revision data.
- View academic record data elements for the revision.
- View personal record data elements for the revision.

Viewing Revision Records

Access the Revision PS page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Course Completion Revisions > Revision PS).

ID This prompt returns students with submitted past course completion records for the institution and reference year that you select.

Revision Type Select a revision type. Values are:

- *Revision*: Select to revise the value of an element previously reported incorrectly. A revision does not allow updates to elements classified as unique identifiers.
- *Deletion*: Select to delete a record that was previously reported. Revisions of this type do not allow updates to any elements reported.
- *Addition*: Select to report an additional record for a student. Revisions of this type allow updates to unique identifiers Course Code, Specialisation, and CHESSN.

Note: You do not have to enter a revision type of *Addition* to reflect incorrect reporting of a unique identifier if the source data is changed for the reference year. The past course completions extract acknowledges changes to key identifiers for previously reported data and extract the record. A warning message appears when the Past Course Completions process is generated if additional data is extracted for a student with submitted records for the program. The warning indicates that deletion records may be necessary. Consequently, a change to a unique identifier only requires the revision deletion to be entered if the source data is changed for the incorrect element.

Academic Career, Academic Program, and Student Career Nbr

Displays the data applicable to the completion record that was submitted.

Course Code E307, Specialization E463, and CHESSN E488

Displays the values reported for Elements 307, 463, and 488. These fields are enabled only for a revision type of addition because they are unique identifiers.

Retrieve Revisions

Click this button to access the Retrieve Past Course Completion page and retrieve previously saved revision records for institution and reference year on the Retrieve Past Course Completion page.

Select a PS Record

Click this button to access the DEEWR Revisions Select PS page, where you can select the record to populate the fields on the Revision PS page.

All revision types must be initiated by selecting a previously reported record. The data displayed on the DEEWR Revisions Select PS page reflects the elements that are already reported.

Selecting DIISRTE Revision Data

Access the DEEWR Revisions Select PS page (click the Select a PS Record button on the Revision PS page).

Select Completion

Select the check box for the completion data that requires revision.

Viewing Academic Record Data Elements for the Revision

Access the Revision PS Academic page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Course Completion Revisions > Revision PS Academic).

Image: Revision PS Academic page

This example illustrates the fields and controls on the Revision PS Academic page. You can find definitions for the fields and controls later on this page.

Revision PS		Revision PS Academic		Revision PS Personal	
Academic Institution:	PSAUS	PeopleSoft Australia Uni			
Reference year:	2012				
Course Completion Updatable Elements Find View All First 1 of 1 Last					
ID:	SRAUS020	Oprey, Karen			
Revised Elements					
Commencement Date E328:	25/02/2008	Commencement Date E328:	<input type="text" value="25/02/2008"/>		
Mode of Attendance E329:	Internal	*Mode of Attendance E329:	<input type="text" value="Internal"/>		
Type of Attendance E330:	Full-Time	*Type of Attendance E330:	<input type="text" value="Dual"/>		
Exemption Granted E385:	0	Exemption Granted E385:	<input type="text" value="0"/>		
Scholarship Type E487:	None	*Scholarship Type E487:	<input type="text" value="None"/>		
Joint Degree Partner E579:		Joint Degree Partner E579:	<input type="text" value="4999"/>		
Completion Percent E578:	50	Completion Percent E578:	<input type="text" value="90"/>		

This page displays originally reported data on the left side, and revised elements on the right side. All revised elements on this page are available to be updated for revision types of revision and addition. The value for the Revised Elements field defaults to the value as originally reported. No revised elements appear for a revision type of deletion.

Viewing Personal Data Record Elements for the Revision

Access the Revision PS Personal page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Course Completion Revisions > Revision PS Personal).

This page displays data on the same basis as the Revision PS Academic page.

Generating the Revision Files and Date–Stamping the Revision Records as Submitted

Access the Run Revisions Extracts page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Run Revisions Extracts).

When you click Run, select the DEEWR Revisions Files process to generate the flat file extracts for the Revised Load Liability, Revised Commonwealth Assisted Students, and Revisions files.

Select the Stamp DEST Revision Records process to date-stamp the revision records as submitted to DEEWR.

Processing the DIISRTE Applications and Offers Files

This section discusses how to:

- Generate the Applications and Offers files.
- Purge Applications and Offers data.

Pages Used to Process the Applications and Offers Files

Page Name	Definition Name	Navigation	Usage
Applications and Offers Files	SSR_DEEWR_AO_RNC	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Applications & Offers Files > Applications & Offers Files	Specify parameters to generate the files in the Applications & Offers Collection for submission to DIISRTE.
Applications and Offers Purge	SSR_DEEWR_AO_PRG	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Applications & Offers Purge > Applications & Offers Purge	Purge Applications and Offers data.

Generating the Applications and Offers Files

Access the Applications and Offers Files page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Applications & Offers Files > Applications & Offers Files).

The Reference Year and Reporting Period values are used in the file naming convention.

The reference date is relevant to the effective date logic for many elements.

Profile

Select a profile from the values that you set up in the Applications and Offers Profile (SSR_DEEWR_AO_PRFL) component, to define the scope of data for this reporting requirement.

Current Year 12 Year

Select a year value that is equivalent to the most recent year in which Australian State and Territory school-leavers are completing or have just completed year 12.

This run parameter is used to report values for elements that are only appropriate to current year 12: Elements 369, 710, and 702.

See [Setting Up for Collecting Applications and Offers Data](#).

Purging Applications and Offers Data

Access the Applications and Offers Purge page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Student Data Collection > Applications & Offers Purge > Applications & Offers Purge).

The Applications and Offers Purge (SSR_DEEWR_PR) process deletes rows from the following data records based on the parameters that you enter:

- SSR_DEEWR_AOAPP
- SSR_DEEWR_AOPRE
- SSR_DEEWR_AOOFF

If you do not select a value in the Reporting Period From optional field, the process uses all reporting periods for the institution, reference year range, profile, and reference date range that you specify.

The process performs similarly when you do not enter a value in other optional fields.

Reference Year To	The year that you select in the Reference Year From field appears by default. You can select a different year.
Reporting Period To	The reporting period that you select in the Reporting Period From field appears by default. You can select a different reporting period.
Profile	Select a profile from the values that you set up in the Applications and Offers Profile (SSR_DEEWR_AO_PRFL) component.
Reference Date To	The reference date that you select in the Reference Date From field appears by default. You can select a different reference date.

See [Setting Up for Collecting Applications and Offers Data](#).

Generating Centrelink Reports

This section provides an overview of Centrelink reporting and discusses how to:

- Load the XML Request file.
- Confirm the Search/Match parameters.
- Review the suspense data status.
- Review the Request file suspense data.
- Generate the XML Response file.
- Review the Response file data.

- Purge the suspense data.

Understanding Centrelink Reporting

The Centrelink Academic Reassessment Transformation (CART) system allows for electronic exchange of information between Centrelink and academic institutions.

The following is an overview of the process to load a CART Request file and generate an associated Response file for return to Centrelink.

1. Download the request file from the Centrelink Business Contact site. This XML request file contains information about students who are attending your institution and have received Centrelink payment.
2. Use the CART Load process to load the request file and match the data to students in your database. For the records in the request file that have a Student ID, the system validates the first and last name, date of birth, and gender. For the records without a Student ID or where the ID is not valid, the system uses the search/match parameters to verify the data.
3. Use the CART Suspense component to review data in the request file and filter for match exceptions. This component also confirms the student's enrollment data when the response file is generated.
4. Use the CART Response File page to create an XML response file that confirms a student's study workload. The response file confirms workload information for those students whose data has been loaded through the CART Request File Processing page.
5. Log in to the Centrelink Business Contact site and upload the response file.
6. Use the CART Purge page to delete the suspense data when the response file has been returned to Centrelink and the information is no longer required.

Centrelink conducts enrollment checks of students in receipt of student assistance from the Commonwealth in order to independently verify information that has been provided to Centrelink by customers, detect incorrect payments resulting from incorrect or incomplete information provided by recipients, and to assist in the timely detection of discontinuation of study or a reduction in workload. The enrollment checks are conducted by matching Centrelink data against data provided by the institution to determine a student's enrollment status and workload where applicable.

Pages Used to Generate Centrelink Reports

Page Name	Definition Name	Navigation	Usage
CART Load	SSR_CART_LOAD	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Load > CART Load	Designate the directory location of the request file that you are loading.
Search Params	SSR_CART_LOAD	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Load > Search Params	Set the search parameter to find records in the request file that do not have a student ID or have an invalid student ID

Page Name	Definition Name	Navigation	Usage
CART Suspense	SSR_CART_SUS	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Suspense > CART Suspense	This page confirms the results of search/match or whether a Student ID is matched. Search/match messages reflect the inconsistencies in data – for example, cases where the Student ID in the request file is invalid and where the personal data in the request file is inconsistent with the student data in the database.
CART Request	SSR_CART_SUS	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Suspense > CART Request	Review the student's personal information as provided in the request file. The system sets a Matched ID field value if a definitive match was confirmed during the CART Load process. Alternatively, you can enter a Matched ID field value. If no match was found, the field will be blank but editable.
CART Response File	SR_CART_RESPONSE	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Response File > CART Response File	Generate the XML response file for submission to Centrelink.
CART Response	SSR_CART_RESPONSE	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Suspense > CART Response	Review the response file data for submission to Centrelink.
CART Purge	SSR_CART_PURGE	Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Purge > CART Purge	Purge request file data, any related processing messages, and response file data from the suspense tables.

Loading the XML Request File

Access the CART Load page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Load > CART Load).

File Path and Name

The file name must have an .xml file extension.

The CART Request File process loads the request file data into the suspense tables. Additionally, the process matches the student data that the request file contains with the student data in your database.

Confirming the Search/Match Parameters

Access the Search Params page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Load > Search Params).

Image: Search Params page

This example illustrates the fields and controls on the Search Params page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Search Params' page with the following elements:

- Navigation tabs: 'CART Load' and 'Search Params'.
- Run Control ID: CA01
- Links: 'Report Manager' and 'Process Monitor'.
- 'Run' button.
- *Search Parameter: Input field containing 'CS_CART' and a search icon.
- Match status: 'CART'.
- 'No Match Found' section with radio buttons for 'New', 'No Match', 'Verified Suspend', and 'Ignore'. 'New' is selected.
- 'Match(es) Found' section with a pagination control showing '1-2 of 2'.
- Match 1: 'Order Nbr: 10 CART 1'. Radio buttons for 'One Match' (selected), 'Multiple Matches', 'Verified Suspend', and 'Ignore'. A message '*****Parameters Refreshed*****' is displayed.
- Match 2: 'Order Nbr: 20 CART 2'. Radio buttons for 'One Match', 'Multiple Matches' (selected), 'Verified Suspend', and 'Ignore'.

The system uses the Search/Match parameters to find records in the request file that do not have a student ID or have an invalid student ID.

Search Parameter

Select the search parameter code that includes the search fields that you need to use to perform the search.

No Match Found

New

Select No Match for records in the request file that cannot be matched to students in the database. The system does not assign a matched ID to these records.

Suspend and Ignore are not relevant for No Match.

Matches Found

One Match and Multiple Matches

Select No Match for records in the request file that cannot be matched to students in the database. The system does not assign a matched ID to these records.

Select Verified to set the Matched ID mapped to the Student ID found in the search/match processing. This value is typically set for One Match.

Select Suspend when the results cannot be reliably matched to a student in the database. This value is typically set for the multiple matches result. The system does not enter any value for the Matched ID field. Additionally, the response file returns the value *NMF*(no match found) for the enrollment match result unless you have manually updated the record for the Matched ID.

Select Ignore to force the processing result to No Match. The system does not enter any value for the Matched ID field.

Additionally, the response file returns the value *NMF* for the enrollment match result unless you have manually updated the record for the Matched ID.

Reviewing the Suspense Data Status

Access the CART Suspense page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Suspense > CART Suspense).

The CART suspense page provides the status of a suspense record about the loading, search/match, and the response file creation processes.

The Request ID field displays the unique identifier for a request file. The CART Request File process uses the Last CART Request ID counter on the SA Features page to assign a Request ID to a request file.

Processing Options

Edit

Displays the status of the record in relation to the load process.

Values are:

Complete: The program processed the record without any error.

Error: The program encountered problems when processing the record.

Perform: You set this value manually. Use this value for informational purposes.

Search

Displays the status of the record in relation to the search/match process.

Values are:

Complete: The search/match process ran without any error.

Error: The search/match process encountered errors.

Perform: You set this value manually. Use this value for informational purposes.

Result

Displays the status of the record in relation to the load process.

Details are confirmed in the following table.

The following table describes the Result values.

Result Value	Meaning	How the Value is Set
Awaiting	The system sets this value automatically if a record loaded from the request file had a Matched ID recorded which was subsequently removed. The value will automatically change from <i>Verified</i> to <i>Awaiting</i> in this case.	Set if a record with a matched ID has that ID removed and saved.
Inconsist	<p>The system sets this value if the student ID in the request file and the student personal data in your database does not match. If a value of <i>Inconsistent</i> is set, a message(s) appears to verify the discrepancy. The following issues result in a inconsistent value:</p> <ul style="list-style-type: none"> • Date of Birth does not correspond to Date of Birth for the Student ID in the request file. • Primary or preferred names of the student do not match with any of the name occurrences for the Student ID in the request file. • Student gender is inconsistent with the request file data. <p>A message also appears on the Messages tab if the Student ID in the request file does not exist in the database. If the student ID does not exist, the system again uses search/match to match the student. Even if the search/match process finds a matched ID, the message appears because the process initially failed to find a matched ID.</p>	Refer to the information in the Meaning column of this table.
Multiple	The system sets this value if the request file data matches multiple students in the database and the search/match option is set to suspend for multiple matches.	Set by the CART Request load and search/match processes.

Result Value	Meaning	How the Value is Set
No Match	The system sets this value if data was not matched for a record in the request file.	Set by the system during the search/match process if no match was found in your database.
Verified	The system sets this value if the matching process confirmed the ID in the request file with the personal data in the database or if the search/match process found a definitive match for the student. The system also sets the value of verified automatically if you enter and save a Matched ID for a record that the load/search/match program was unable to match.	Set by the CART Request load and search/match processes if a record with a student ID in the request file matches with primary or preferred name, date of birth and gender, or the search/match process resulted in a definitive match.

Reviewing the Request File Suspense Data

Access the CART Request page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Suspense > CART Request).

Generating the XML Response File

Access the CART Response File page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Response File > CART Response File).

The CART Response File process generates a response file for all records in the request file. The response file includes the value No Match Found (NMF) for records without a Matched ID (when the processing option result is not verified).

You can generate the response file for a single request as many times as required before submission to Centrelink.

Academic Institution

Select the institution applicable to the enrollment data to be reported in the response file. Only those institutions that are recorded on the Centrelink Setup page are available for selection.

Request ID

Select the request ID for which you want to generate the response data.

Census Start Date and Census End Date

The census start and end dates control the enrollment data that is reflected in the reported workload. The response file includes the enrollment records that fall within the specified census date range.

Phone Type

Enter a phone type if you need to report optional student contact details in the response file. The response file includes phone numbers of only those students that have a blank match result.

You can leave this field blank.

Email Type

Enter an email type if you need to report optional student contact details in the response file. The response file includes email addresses of only those students that have a blank match result.

You can leave this field blank.

File Output

Enter the file path for which the process should create the XML file in and the name of the XML file. The file extension must be .xml.

Reviewing the Response File Data

Access the CART Response page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Suspense > CART Response).

Note: The Course End Date and Year Based Subject fields do not display any value. This is because the CART Response File process does not enter values for these fields.

Purging the Suspense Data

Access the CART Purge page (Records and Enrollment > Enrollment Reporting > AUS Regulatory Reporting > Centrelink > CART Purge > CART Purge).

Request ID From and **Request ID To** Select the request ID range for which you want the data to be purged. The system assigns a request ID when you run the CART Request File process.

Chapter 59

(CAN) Generating Canadian Government Reports

Understanding Canadian Government Report Generation

Generating Canadian government reports is a multiple step process. An overview of the process is as follows:

1. Set up all of your government reporting data and populate the Student List table.
2. (Optional) Generate a report of students.
3. (Optional) Freeze the student list.
4. Run the extract process.
5. Review the report data.
6. (Optional) Correct the source pages or online pages and rerun the extract process.
Or, correct the data directly in the extract table.
7. Generate the flat file.
8. Deliver the flat file to the federal or provincial government.
9. Archive the extract data table file.

These steps are discussed in the following sections.

Prerequisites for Generating Canadian Government Reports

Before you can generate extract reports and flat files you must:

- Set up your system for Canadian Government reporting.
- Populate the Student List.

Related Links

[Understanding the Canadian Government Reporting Process](#)

[Loading the Student ID Table](#)

(Optional) Generating a Report of Selected Students

The Student Selection report contains a list of students that correspond to those on the Student List page. You can generate the report before you run the reports extract program.

Page Used to Generate the Student Selection Report

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Selected Student Report	RUNCTL_CAN_SRSTSEL	Records and Enrollment > Government Reporting Canada > Reports > Selected Student Report > Selected Student Report	Define run parameters for the Student Selection report (SRSTSEL).

Generating a Student List Report

Access the Selected Student Report page (Records and Enrollment > Government Reporting Canada > Reports > Selected Student Report > Selected Student Report).

Academic Institution

Enter the institution for which you want to generate a student selection report.

Report Type

Select the report type for which you want to generate a student selection report.

Report Period

Enter the report period for which you want to generate a student selection report. This field prompts against the report period table.

Click Run to run this request. PeopleSoft Process Scheduler runs the SRSTSEL process at user-defined intervals.

(Optional) Freezing a Student List

Campus Solutions provides you with the ability to "freeze" the student list.

Running the freeze process is optional. As a result of running the freeze process, the system prevents you from making changes or additions to the CAN_STDNT_LST table after the freeze date you specify. You can change key information after you run the freeze process. The business processes of your institution determine the timing of this process.

Page Used to Freeze a Student List

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Freeze Student List	RUNCTL_CAN_FRZE	Records and Enrollment > Government Reporting Canada > Processes > Freeze Student List > Freeze Student List	Define run parameters for the Student ID Freeze report (SRFREEZE).

Running the Student List Freeze Process

Access the Freeze Student List page (Records and Enrollment > Government Reporting Canada > Processes > Freeze Student List > Freeze Student List).

Academic Institution	Enter the institution for which you want to freeze a student list.
Report Type	Select the report type for which you want to freeze a student list.
Report Period	Enter the report period for which you want to freeze a student list. This field prompts against the report period table.
Student ID Freeze Date	Enter the date on which you want to freeze student list records.

Click Run to run this request. PeopleSoft Process Scheduler runs the SRFREEZE process at user-defined intervals.

Running the PSIS Extract Process

This section discusses how to:

- Run the PSIS Institution process.
- Run the PSIS Student process.

Pages Used to Run the PSIS Extract Process

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
PSIS Institution Process	RUNCTL_CAN_ESIS_I	Records and Enrollment > Government Reporting Canada > Processes > PSIS Institution Process > PSIS Institution Process	Define run parameters for the Create Extract for PSIS Inst process (SRXTRESI) and the Create Flat file for PSIS Inst process (SRCRFESI).
PSIS Student Process	RUNCTL_CAN_ESIS_S	Records and Enrollment > Government Reporting Canada > Processes > PSIS Student Process > PSIS Student Process	Define run parameters for the Create Extract for PSIS Stdnt process (SRXTRESS) and the Create Flat file for PSIS Std process (SRCRFESS).

Running the PSIS Institution Process

Access the PSIS Institution Process page (Records and Enrollment > Government Reporting Canada > Processes > PSIS Institution Process > PSIS Institution Process).

The PSIS Institution flat file process generates the following three flat files:

- The PSIS ID (institution description) file lists all unique terms and sessions in the term group table.
- The PSIS IP (institution program) file lists all the plans and programs mapped in the Canadian Program and Plan mapping tables.
- The PSIS IC (institution course) file lists all the courses for which classes have been scheduled during the terms and sessions included in the term group table, for the selected reporting period.

Academic Institution

Enter the institution for which you are running the process.

Report Period

Select the period for which you are running the process. This field prompts against the report period table.

File Path

To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.

Note: The file path must have a "\" (backslash symbol) at the end of the path (for example, c:\temp\).

Click Run to run this request and select Create Extract for PSIS Instit. Click OK. After the extract process finishes, return to the Process Scheduler Request page and select Create Flat file for PSIS Inst. Click OK.

Running the PSIS Student Process

Access the PSIS Student Process page (Records and Enrollment > Government Reporting Canada > Processes > PSIS Student Process > PSIS Student Process).

Academic Institution

Enter the institution for which you are running the process.

Report Period

Select the period for which you are running the process. This field prompts against the report period table.

File Path

To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.

Note: The file path must have a "/" (slash symbol) at the end of the path (for example, c:\temp\).

Student Selection

To define the group of students that you want to process, select one of the following options:

Process All Students: Select to generate the extract and flat file for all students in the student list table.

Process Selected Students: Select this option in conjunction with using the Select check box on the Student List Table page. The reports extract process adds data for a new student or replaces reporting data for an existing student. The reporting information for the students who do not have the Select check box selected remains unchanged by the process.

Click Run to run this request and select Create Extract for PSIS Std. Click OK. After the extract process finishes, return to the Process Scheduler Request page and select Create Flat file for PSIS Stdnt. Click OK.

Running the USISE Extract Process

This section discusses how to run the USISE extract process and generate a corresponding flat file. Run the USISE extract process if you submit your reporting file directly to the federal government.

Follow these steps to run the USISE extract process and flat file generation for all provinces except Ontario:

1. Access the USISE Extract Process page and run the USISE extract process.
2. Access the USISE Extract Process page and run the USISE flat file process.

Note: For Ontario Fall USISE reporting, where the FALL USIS Enrollment reporting submission includes the OUAC elements, running the extract process is a two-step process.

Follow these steps to run the USISE extract process for Ontario *Fall* USISE reporting:

1. Access the MET Extract Process page and run the MET extract process.
2. Access the OUAC Extract Process page and run the OUAC extract process.
3. Access the OUAC Extract Process page and run the OUAC flat file process.

When you run the OUAC flat file generation process, the system generates two files. One file contains only OUAC elements. The second file is a combined file that contains the USISE, MET, and OUAC elements.

To run the USISE extract process for Ontario USISE reporting *not* in Fall:

1. Access the MET Extract Process page and run the MET extract process.
2. Access the MET Extract Process page and run the MET flat file process.

Related Links

[Running the MET Extract Process](#)

[Running the OUAC Extract Process](#)

Page Used to Run the USISE Extract Process

Page Name	Definition Name	Navigation	Usage
USISE Extract Process	RUNCTL_CAN_USE	Records and Enrollment > Government Reporting Canada > Processes > USISE Report Process > USISE Report Process	Define run parameters for the Create Extract for USISE process (SRXTRUSE) and the Create Flat file for USISE process (SRCRFUSE).

Entering USISE Extract Process Parameters

Access the USISE Extract Process page (Records and Enrollment > Government Reporting Canada > Processes > USISE Report Process > USISE Report Process).

Academic Institution

Enter the institution for which you are running the process.

Report Period

Select the period for which you are running the process. This field prompts against the report period table.

File Path

To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.

Note: The file path must have a "\" (slash symbol) at the end of the path (for example, c:\temp\).

Student Selection

To define the group of students that you want to process, select one of the following options:

Process All Students: Select to generate the extract and flat file for all students in the student list table.

Process Selected Students: Select this option in conjunction with using the Select check box on the Student List Table page. The reports extract process adds data for a new student or replaces reporting data for an existing student. The reporting information for the students who do not have the Select check box selected remains unchanged by the process.

Data Type

Enter the DATYPE element.

Reporting Type

Enter the INSTYP element.

Click Run to run this request and select Create Extract for USISE. Click OK. After the extract process finishes, return to the Process Scheduler Request page and select Create Flat file for USISE. Click OK.

Running the CIS Extract Process

This section discusses how to run the CIS extract process and generate a corresponding flat file. Run the CIS extract process if you submit your reporting file directly to the federal government.

Page Used to Run the CIS Extract Process

Page Name	Definition Name	Navigation	Usage
CIS Extract Process	RUNCTL_CAN_CIS	Records and Enrollment > Government Reporting Canada > Processes > CIS Report Process > CIS Extract Process	Define run parameters for the Create Extract for CIS process (SRXTRCIS) and the Create Flat file for CIS process (SRCRFCIS).

Entering CIS Extract Process Parameters

Access the CIS Extract Process page (Records and Enrollment > Government Reporting Canada > Processes > CIS Report Process > CIS Extract Process).

Academic Institution

Enter the institution for which you are running the process.

Report Period

Select the period for which you are running the process. This field prompts against the report period table.

File Path

To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.

Note: The file path must have a "\" (slash symbol) at the end of the path (for example, c:\temp\).

Student Selection

To define the group of students that you want to process, select one of the following options:

Process All Students: Select to generate the extract and flat file for all students in the student list table.

Process Selected Students: Select this option in conjunction with using the Select check box on the Student List Table page. The reports extract process adds data for a new student or replaces reporting data for an existing student. The reporting information for the students who do not have the Select check box selected remains unchanged by the process.

Click Run to run this request and select Create Extract for CIS. Click OK. After the extract process finishes, return to the Process Scheduler Request page and select Create Flat file for CIS. Click OK.

Running the MET Extract Process

This section discusses how to run the MET extract process and generate a corresponding flat file.

Page Used to Run the MET Extract Process

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
MET Extract Process	RUNCTL_CAN_MET	Records and Enrollment > Government Reporting Canada > Processes > MET Report Process > MET Extract Process	Define run parameters for the Create Extract for MET process (SRXTRMET) and the Create Flat file for MET process (SRCRFMET).

Entering MET Extract Process Parameters

Access the MET Extract Process page (Records and Enrollment > Government Reporting Canada > Processes > MET Report Process > MET Extract Process).

Academic Institution	Enter the institution for which you are running the process.
Report Period	Select the period for which you are running the process. This field prompts against the report period table.
File Path	To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.
	<hr/> Note: The file path must have a "\" (slash symbol) at the end of the path (for example, c:\temp\). <hr/>
Student Selection	To define the group of students that you want to process, select one of the following options: <i>Process All Students:</i> Select to generate the extract and flat file for all students in the student list table. <i>Process Selected Students:</i> Select this option in conjunction with using the Select check box on the Student List Table page. The reports extract process adds data for a new student or replaces reporting data for an existing student. The reporting information for the students who do not have the Select check box selected remains unchanged by the process.
Data Type	Enter the DATYPE element.
Reporting Type	Enter the INSTYP element.

Click Run to run this request and select Create Extract for MET. Click OK. After the extract process finishes, return to the Process Scheduler Request page and select Create Flat file for MET. Click OK.

Running the OUAC Extract Process

In Ontario, running the MET extract process and generating the MET flat file will satisfy most of your reporting.

However, in Ontario, where the FALL USIS Enrollment reporting submission includes the OUAC elements, the process is more complex.

Follow these steps to generate the OUAC report for Ontario Fall USIS Enrollment reporting:

1. Run the MET extract process.
2. Run the OUAC extract process.
3. Run the OUAC flat file generation process.

When you run the flat file process for OUAC, it generates two files. One file contains just the OUAC elements, and the second file is a combined file that contains the USISE, MET, and OUAC elements.

[Running the MET Extract Process](#)

Page Used to Run the OUAC Extract Process

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
OUAC Extract Process	RUNCTL_CAN_OUAC	Records and Enrollment > Government Reporting Canada > Processes > OUAC Report Process > OUAC Extract Process	Define run parameters for the Create Extract for OUAC process (SRXTROUC) and the Create Flat file for OUAC process (SRCRFOUC).

Entering OUAC Extract Process Parameters

Access the OUAC Extract Process page (Records and Enrollment > Government Reporting Canada > Processes > OUAC Report Process > OUAC Extract Process).

Academic Institution

Enter the institution for which you are running the process.

Report Period

Select the period for which you are running the process. This field prompts against the report period table.

File Path

To send the extract output to a file directory, enter a valid directory path that maps to a folder with appropriate read/write permission. If you cannot locate such a folder, consult your system administrator.

Note: The file path must have a "\" (slash symbol) at the end of the path (for example, c:\temp\).

Student Selection

To define the group of students that you want to process, select one of the following options:

Process All Students: Select to generate the extract and flat file for all students in the student list table.

Process Selected Students: Select this option in conjunction with using the Select check box on the Student List Table page. The reports extract process adds data for a new student or replaces reporting data for an existing student. The reporting information for the students who do not have the Select check box selected remains unchanged by the process.

Click Run to run this request and select Create Extract for OUAC. Click OK. After the extract process finishes, return to the Process Scheduler Request page and select Create Flat file for OUAC. Click OK.

Verifying Report Results and Viewing the Audit Reports

After you run the extract process, you can run a number of audit reports to verify that the system generated reporting data for all students in the student list table. This section discusses how to:

- Run the Student Description Audit.
- Run the Student Program Audit.
- Run the Student Course Audit.

Pages Used to Verify Report Results

Page Name	Definition Name	Navigation	Usage
Student Description Audit	RUNCTL_CAN_SDAUD	Records and Enrollment > Government Reporting Canada > Reports > Student Description Audit > Student Description Audit	PSIS: Verify that the system reported all students in the student list table. This report compares the students reported in the SD file to each unique student ID in the CAN_STDNT_LST table and reports the differences.

Page Name	Definition Name	Navigation	Usage
Student Program Audit	RUNCTL_CAN_SPAUD	Records and Enrollment > Government Reporting Canada > Reports > Student Program Audit > Student Program Audit	<p>PSIS: Verify that there is a corresponding record in the CAN_RPT_ESIS_SP table for all entries in the CAN_STDNT_LST table. Specifically, verify that the career, program, and plan entered for the student in the student list table are valid. If they are not, then the extract program does not produce a record on the SP, SC, and ST files. Invalid students will also be included in the report if the career, program, or plan entered for the student is not valid.</p> <p>CIS, MET, OUAC, USISE: Verify report discrepancies such as an invalid EMPLID, career, program, or plan.</p>
Student Course Audit	RUNCTL_CAN_SCAUD	Records and Enrollment > Government Reporting Canada > Reports > Student Course Audit > Student Course Audit	<p>PSIS: Identify students who are enrolled in duplicate course IDs during the reporting period. If you find duplicate course IDs, you must manually delete one of the classes from the Student Course 1 page, as this condition will fail the Stats Canada audit.</p> <p>See Reviewing Report Data.</p>

Running the Student Description Audit

Access the Student Description Audit page (Records and Enrollment > Government Reporting Canada > Reports > Student Description Audit > Student Description Audit).

Academic Institution Enter the institution for which you want to audit.

Report Period Select the report period for which you want to audit.

Click Run to run the SRSDAUD report using PeopleSoft Process Scheduler.

Running the Student Program Audit

Access the Student Program Audit page (Records and Enrollment > Government Reporting Canada > Reports > Student Program Audit > Student Program Audit).

Academic Institution Enter the institution that you want to audit.

Report Type Select the report type that you want to audit.

Report Period Select the report period that you want to audit.

Click Run to run the SRSPAUD report using PeopleSoft Process Scheduler.

Running the Student Course Audit

Access the Student Course Audit page (Records and Enrollment > Government Reporting Canada > Reports > Student Course Audit > Student Course Audit).

Academic Institution Enter the institution that you want to audit.

Report Period Select the report period that you want to audit.

Click Run to run the SRSCAUD report using PeopleSoft Process Scheduler.

Reviewing Report Data

After you run the extract process, you can view and edit the results by navigating to online pages that display the extract report results. However, you cannot add a new row of information for a student. If you need to add a row of data, you must add another line in the CAN_STDNT_LST table with its associated key field values and rerun the extract report.

Pages Used to Review Report Data

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>

(Optional) Correcting Report Data

Before you send your report to the government, you may want to correct the reporting data. You can correct reporting data in one of two ways:

1. Campus Solutions source pages (student data or setup data).
2. Report data pages (for example, the Student Course 1 page).

When you rerun the report, the system reprocesses any changes that you make using method one, as long as the effective date of the change is less than or equal to the value in the Report Due Date field on the Can Report Period page. This implies that you must rerun the extract program. If you do not enter a date in the Report Due Date field, the system references the system date to determine what to include in the report.

Note: You will make most corrections using method number one. You should correct data using method two only if you are certain that you will not be required to rerun the reports extract program. The extract program will overwrite any corrections you make in method two when you rerun the process. Changes made through method two are best used for updating the flat file.

Archiving Extract Table Data

After you submit the flat files to the government, you can archive the data in the reports extract archive tables. This process takes the data in the extract tables and saves it to archive tables. The report date acts as an effective date; so you can store multiple report periods in the applicable archive tables. After you run the archive process for a particular report and report period, you cannot run the archive process again. If you attempt to do so, the archive program writes a message in the log file.

The system archives your data in the following tables:

- CAN_ARC_ESIS_IC
- CAN_ARC_ESIS_ID
- CAN_ARC_ESIS_IP
- CAN_ARC_ESIS_SC
- CAN_ARC_ESIS_SD
- CAN_ARC_ESIS_SP
- CAN_ARC_ESIS_ST
- CAN_ARCH_USISE
- CAN_ARCH_USMET
- CAN_ARCH_CIS
- CAN_ARCH_OUAC

Page Used to Archive Extract Data

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Archive Extract File	RUNCTL_CAN_ARCHIVE	Records and Enrollment > Government Reporting Canada > Processes > Archive Extract File > Archive Extract File	All: Define run parameters for the Canada Report Archive process (SRARCH).

Running the Archive Process

Access the Archive Extract File page (Records and Enrollment > Government Reporting Canada > Processes > Archive Extract File > Archive Extract File).

- Academic Institution** Enter the institution that you want to archive.
- Report Type** Enter the report type that you want to archive.
- Report Period** Enter the report period that you want to archive.

Click Run to run the SRARCH report using PeopleSoft Process Scheduler.

(GBR) Managing HESA Returns

Understanding HESA Returns

Government-funded academic institutions in the United Kingdom (UK) must submit student related returns of data to HESA. Institutions must submit the returns as an Extensible Markup Language (XML) file that conforms to the HESA schema definition.

A return is composed of various data fields. Specifications for each return and its data fields are available from the [HESA website](#). HESA periodically amends the return specifications.

PeopleSoft Campus Solutions enables you to generate the Student, Aggregate Offshore, and Initial Teacher Training (ITT) returns for the 2008–09 reporting period onwards. In addition, you can generate a Destinations of Leavers from Higher Education (DLHE) return from the 2009–10 reporting period onwards and the Unistats (formerly Key Information Set – KIS) return for 2013–14 onwards.

To generate returns for submission:

1. Select the HESA, UCAS check box on the SA Features page.
2. Select the HESA, UCAS check box on the Academic Institution 6 page to enable the UK-specific regions in the system for an institution.
3. Set up the valid HESA field codes.
4. Enter HESA-specific data into your system.
5. Generate the HESA extract data.
6. Generate the XML file for the returns.
7. Validate the XML file for any schema errors.

Plan how you want the system to derive the return field values. Oracle recommends that you review the return type specification that is available from the HESA website to review the field descriptions, validations, and the valid field values. To understand how the system derives the fields, see [Understanding HESA Derivation Steps](#).

Fields not included in Unistats/KIS

The system includes all the entities and fields for the Unistats/KIS return in the return except for the following:

- Fields specific to institutions in Wales:
 - Location.ACCOMURLW
 - Location.LOCNAMEW

- KISCourse.ASSURLW
 - KISCourse.CRSEURLW
 - KISCourse.EMPLOYERURLW
 - KISCourse.LTURLW
 - KISCourse.SUPPORTURLW
 - KISCourse.TITLEW
 - Accreditation.ACCDEPENDURLW
-
- Field specific to Further Education colleges (FEC): KISCourse.LDCS
 - Field specific to 4 joint medical and pharmaceutical schools: HESACourse.JOINTUKPRN

Importing and Mapping HESA Codes

First, you import HESA field codes into your system. These codes are the valid values that the system can assign to a field in a return. For example, the Student.NATION field has HESA codes such as *DE* for Germany and *AU* for Australia.

To import HESA codes:

1. Place the HESA code list XSD file in a local directory before you access the Import HESA Codes page.
2. Use the Import HESA Codes page to load the HESA codes from the XSD file to your system.

After importing the codes, you can use the Codes page to search and view the imported codes. Also, you can use the Codes page to manually add new codes for fields.

In some cases, you must use the Code Mapping pages to map the HESA codes with the Campus Solutions codes. For example, you must map Campus Solutions marital status codes to the HESA marital status codes. You can delete a mapping by clicking the Delete Row button or inactivate a mapping by clearing the Active check box in all the Code Mapping pages.

On all the Mapping pages, such as the Ethnicity page, the drop-down fields display both the inactive and active Campus Solutions codes. For example, if you use the Ethnic Groups page (Set Up Common Objects >Product Related >Workforce Administration >Ethnic Groups) to set the *ABC* ethnic group as inactive, the system continues to display *ABC* as the drop-down value for the Ethnic Group field on the Ethnicity page.

This section discusses how to:

- Import HESA codes.
- Search for the imported HESA codes.
- Map ethnic codes.

- Map campus codes.
- Map marital status codes.
- Map religion codes.
- Map qualification codes.
- Map nationality codes.
- Map fee eligibility codes.
- Map mode of study codes.
- Map classification codes.
- Map disability codes.
- Map module outcome codes.
- Map orientation codes.
- Map title codes.
- Map entry qualifications.

Note: For Aggregate Offshore return, the mapping for campus codes is required. For ITT return, the mappings for ethnicity, nationality, mode of study, and disability codes are required.

Note for Unistats/KIS

Some codes are not provided in Cnn061CodeLists.xsd and you need to manually add them via the Codes page. The codes that you need to manually add are:

- ACCTYPE
- ILRAIMID
- KISAIM

Pages Used to Import and Map HESA Codes

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Import HESA Codes	SSR_HE_RUNCNTL	Records and Enrollment > HESA Reporting > Codes and Mappings > Import HESA Codes	Import HESA codes from the XML Schema Definition (XSD) file. The code list XSD file is available from the HESA website.
Codes	SSR_HE_CODES	Records and Enrollment > HESA Reporting > Codes and Mappings > Codes	View the codes that you have imported from the code list XSD file. If required, add new codes for fields.

Page Name	Definition Name	Navigation	Usage
Ethnicity	SCC_HE_ETHNIC	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Ethnicity	Map Campus Solutions regulatory region and ethnic group codes to the HESA ethnicity codes.
Campus	SSR_HE_CAMPUS	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Campus	Map Campus Solutions campus codes to the HESA campus and Institution's Own Campus codes.
Marital Status	SCC_HE_MARITAL	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Marital Status	Map Campus Solutions marital status codes to the HESA marital status codes.
Religion	SCC_HE_RELIGION	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Religion	Map Campus Solutions religious preference codes to the HESA belief and religion codes.
Qualification	SSR_HE_QUALIFIC	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Qualification	Map Campus Solutions degree codes to the HESA qualification codes.
Nationality	SCC_HE_NATIONALITY	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Nationality	Map Campus Solutions country codes to the HESA nationality codes.
Fee Eligibility	SSR_HE_FEE_ELIG	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Fee Eligibility	Map Campus Solutions residency codes to the HESA fee eligibility codes.
Mode of Study	SSR_HE_MODE_STD	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Mode of Study	Map Campus Solutions academic load codes to the HESA mode of study codes.
Classification	SSR_HE_CLASSIFI	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Classification	Map Campus Solutions honors type and honors codes to the HESA classification codes.

Page Name	Definition Name	Navigation	Usage
Disability	SCC_HE_DISABILITY	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Disability	<p>Map Campus Solutions type of impairment and support services request codes to the HESA disability codes.</p> <p>Note that the system creates disability records as part of Universities & Colleges Admissions Service (UCAS) processing.</p> <p>For information on how to assign impairment codes to students and specify whether or not support services have been requested, refer to "Identifying Regional Impairment and Support Services" (PeopleSoft Campus Solutions 9.2: Campus Community)</p>
Module Outcome	SSR_HE_MODULE	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Module Outcome	Map Campus Solutions grading scheme, grading basis, grade input, and grade category codes to the HESA module outcome codes.
Gender	SCC_HE_GENDER	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Gender	Map Campus Solutions gender values to HESA gender identifiers.
Orientation	SSR_HE_ORIENT	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Orientation	Map Campus Solutions orientation values to HESA orientation identifiers.
Title	SSR_HE_TITLE	Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Title	Map Campus Solutions title values to HESA title identifiers.
Entry Qualification Mapping	SSR_HE_QOE_MAP	Records and Enrollment > HESA Reporting > Codes and Mappings > Entry Qualification Mapping	Map a qualification type to a list of valid grades for that qualification. If grades are not mapped to a particular qualification type, then all the grades are available for a qualification type on the Entry Profile page. If you do this mapping, the Entry Profile page displays only the mapped grades for a type.

Importing HESA Codes

Access the Import HESA Codes page (Records and Enrollment > HESA Reporting > Codes and Mappings > Import HESA Codes).

Add Attachment

Click to browse to the CodeLists.xsd file that HESA delivers, and click Upload. You can browse your local drive and select a file.

Note: The upload process creates a files subdirectory to store and process the XSD file. This subdirectory is created in the server directory location that is specified in the PS_SERVDIR system parameter in the Application Server/Process Scheduler configuration file psappsrv.cfg/psprcs.cfg. Ensure that PS_SERVDIR is set up with an appropriate value in the configuration file and that users have the correct permission to access the files subdirectory.

XSD File Path

Enter the path and file name of the HESA codes XSD file. You must store this XSD file on an application server that the import process can access.

Warning! For the import process to run properly, the CodeLists.xsd file should not be renamed. The import process uses the CodeLists xsd file name to determine the return type. For example, in C08053CodeLists.xsd, 053 indicates that the file is the xsd for the ITT return. If the file is renamed, the position of substring "053" might be changed or deleted. If it is not present in the filename, then it will not be correctly decoded as the ITT return. In addition, if the institution imports the Codelists for both the ITT and the Student returns, then import the ITT Codelist file first and then import the Student Codelist.

Note that institutions need to handle the deletion of processed files from the application server. Therefore, after using a CodeLists.xsd file, you will need to handle the deletion of this file from the application server.

For Unistats/KIS return, the process imports:

- LEVEL values to the LEVELK field rather than the LEVEL field which is for the Aggregate Offshore return.
- JACS values to the JACSA field rather than the JACS field which is for the DLHE return.

Notes

The import process does not import codes for fields that are not required by the system, for example EMPFEES. The log file for the process includes messages for codes that are not imported.

When there are multiple fields with the same HESA data type, the process will create the codes for each of the fields. For example, when importing codes for MOBTYPE, the process imports the same codes and descriptions for MOBTYPE2 and MOBTYPE3.

The codes for some fields in the ITT return are either identical to, or a subset of, the codes in the Student return. For such fields, the process does not import the codes for the ITT return. The process does not import the following codes for an ITT code list (Cnn053CodeLists.xsd):

- DISABLE
- DISALL
- ENTRYRTE
- ETHNIC
- FUNDCODE
- ITTPHSC
- ITTSCHMS
- MODE
- MSTUFEE
- PGCECLSS
- PGCESBJ
- RSNEND
- SBJCA
- SEXID
- TTCID
- UNITLGTH

From a Unistats/KIS code list file (Cnn061CodeLists.xsd), codes for this field are not imported: TTCID (same codes as Student return).

If any of the codes that the process does not import for ITT or Unistats/KIS are required by your institution before the code list for the Student return is imported, then you can add such codes manually through the Codes page.

Searching for the Imported HESA Codes

Access the Codes search page (Records and Enrollment > HESA Reporting > Codes and Mappings > Codes).

Image: Codes search page

This example illustrates the fields and controls on the Codes search page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Codes' search page. At the top, there is a title 'Codes' and a subtitle 'Enter any information you have and click Search. Leave fields blank for a list of all values.' Below this are two tabs: 'Find an Existing Value' (selected) and 'Add a New Value'. The search form includes a 'Field:' dropdown set to 'begins with' and a text input containing 'ACCESS'. Below it is a 'Code:' dropdown also set to 'begins with' and an empty text input. A 'Case Sensitive' checkbox is present and unchecked. Action buttons include 'Search' (highlighted in yellow), 'Clear' (highlighted in yellow), 'Basic Search' (with a magnifying glass icon), and 'Save Search Criteria' (with a document icon). Below the search form is a 'Search Results' section with a table. The table has columns 'Field', 'Code', and 'Description'. It shows two results: 'ACCESS 1' with description 'Entered HE via the SWAP' and 'ACCESS 2' with description 'Entered HE via other access pr'. Navigation controls for the results include 'View All', 'First', '1-2 of 2', and 'Last'.

Use the Codes search page to search for all the codes of a specific field. If required, click the Add a New Value link to manually add a code for a field.

Click the Add a New Value link or click a link in the Search Results group box to access the Codes page.

Image: Codes page

This example illustrates the fields and controls on the Codes page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Codes' page for editing a specific code. It displays the 'Field:' as 'ACCESS' with the description 'Access programmes' and the 'Code:' as '1'. Below this is a 'Code' section with a dark blue header. It contains a 'Description:' field with the text 'Entered HE via the SWAP' and a 'Long Description:' field with the same text. At the bottom of the code section are two checkboxes: 'Imported' (checked) and 'Active' (checked).

The text in the Description field can accept a maximum of 30 characters. Note that when you select a code on a data capture page, the page displays the text from the Description field. If the Import HESA Codes Application Engine (SSR_HE_IMPCD) process has cut a description text that extends beyond

30 characters, you can modify the description text so that a meaningful description appears on the data capture pages.

The "Setting Up and Entering Data for HESA Reporting" section discusses the data capture pages.

Mapping Ethnic Codes

Access the Ethnicity page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Ethnicity).

Image: Ethnicity page

This example illustrates the fields and controls on the Ethnicity page. You can find definitions for the fields and controls later on this page.

*Regulatory Region	*Ethnic Group	Description	*HESA Ethnicity	Description	Active
GBR	ASNIND	Asian British/Indian	31	Asian or Asian British - India	<input checked="" type="checkbox"/>
GBR	ASNPKN	Asian British/Pakistani	32	Asian or Asian British - Pakis	<input checked="" type="checkbox"/>
GBR	BLKAFR	Black British/African	22	Black or Black British - Afric	<input checked="" type="checkbox"/>
GBR	BLKCAR	Black British/Caribbean	21	Black or Black British - Carib	<input checked="" type="checkbox"/>
GBR	CHINESE	Chinese	34	Chinese	<input checked="" type="checkbox"/>
GBR	REFUSE	Information Refused	98	Information refused	<input checked="" type="checkbox"/>
GBR	WHITE	White	10	White	<input checked="" type="checkbox"/>

Map Campus Solutions regulatory region and ethnic group codes to the HESA ethnicity codes. The system uses this mapping to derive the Student.ETHNIC field values (for both Student and ITT returns).

Mapping Campus Codes

Access the Campus page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Campus).

Image: Campus page

This example illustrates the fields and controls on the Campus page. You can find definitions for the fields and controls later on this page.

*Campus	Description	Venue ID	Venue Name	Campus ID	Own Campus ID	Active
LEEDS	Leeds Campus			L	L	<input checked="" type="checkbox"/>
MAIN	Main Campus	A	Main City Campus	M	M	<input checked="" type="checkbox"/>

Map the Campus Solutions campus codes to the (HESA) Venue ID, Campus ID and (HESA) Own Campus ID codes. The system uses this mapping to derive the Instance.CAMPID, Instance.INSTCAMP, and Provision.INSTCAMP field values.

Mapping Marital Status Codes

Access the Marital Status page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Marital Status).

Image: Marital Status page

This example illustrates the fields and controls on the Marital Status page. You can find definitions for the fields and controls later on this page.

Academic Institution PSUNV PeopleSoft University							
Mappings							
*Marital Status	*HESA Marital Status	Description	Active				
Divorced	04	Divorced	<input checked="" type="checkbox"/>			+	-
Separated	03	Separated (but still legally m	<input checked="" type="checkbox"/>			+	-
Married	02	Married	<input checked="" type="checkbox"/>			+	-
Single	01	Single (never married)	<input checked="" type="checkbox"/>			+	-
Unknown	01	Single (never married)	<input checked="" type="checkbox"/>			+	-
Widowed	05	Widowed	<input checked="" type="checkbox"/>			+	-

Map the Campus Solutions marital status codes to the HESA marital status codes. The system uses this mapping to derive the EntryProfile.MARSTAT field value.

Mapping Religion Codes

Access the Religion page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Religion).

Image: Religion page

This example illustrates the fields and controls on the Religion page. You can find definitions for the fields and controls later on this page.

Academic Institution: PSUNV PeopleSoft University							
Mappings							
*Religious Preference	Description	*HESA Belief	Description	HESA Religion	Description	Active	
BDHS	Buddhist	09	Christian - Other	3	Other	<input checked="" type="checkbox"/>	
CHRS	Christian			1	Protestant	<input checked="" type="checkbox"/>	
CTLC	Catholic			2	Roman Catholic	<input checked="" type="checkbox"/>	
HNDU	Hindu			3	Other	<input checked="" type="checkbox"/>	
ISLM	Islamic	01	No religion			<input checked="" type="checkbox"/>	
JWSH	Jewish	02	Buddhist	3	Other	<input checked="" type="checkbox"/>	

Map the Campus Solutions religious preference codes to the HESA belief and religion codes. The system uses this mapping to derive the Student.RELBLF and EntryProfile.RELIGION field values.

Mapping Qualification Codes

Access the Qualification page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Qualification).

Image: Qualification page

This example illustrates the fields and controls on the Qualification page. You can find definitions for the fields and controls later on this page.

The system uses this mapping to derive the Entry Qualification Award entities from External Degrees.

Mapping Nationality Codes

Access the Nationality page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Nationality).

Image: Nationality page

This example illustrates the fields and controls on the Nationality page. You can find definitions for the fields and controls later on this page.

Map the Campus Solutions country codes to the HESA nationality codes. The system uses this mapping to derive the Student return's Student.NATION and EntryProfile.DOMICILE field values and ITT return's Student.DEGCTRY field value.

You map only certain Campus Solutions country codes to the HESA codes for Nationality. In most cases, the system can use the two-character Campus Solutions country code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL).

HESA Nationality

Enter a value only if the two-character Campus Solutions country code is not a valid value for Student.NATION and Student.DEGCTRY. For example, the French territory of Reunion Island has its own country code *RE* but the academic institution must report the value as France *FR* in Student.NATION and Student.DEGCTRY.

If you do not select a value, the system uses the default two-character country code.

HESA Domicile

Enter a value only if the two-character Campus Solutions country code is not a valid value for EntryProfile.DOMICILE.

If you do not select a value, the system uses the default two-character country code.

In the above exhibit example, the institution has mapped both Nationality and Domicile to *XA* for Cyprus. Therefore, if a student's record in Campus Solutions has a country code of *CYP*, the system uses the *XA* value for Student.NATION and Student.DEGCTRY, and uses the same value *XA* for EntryProfile.DOMICILE. Also, in the second row of the exhibit example, the setup indicates that if the student's record in Campus Solutions has a country code of *REU* (Reunion Island), then the system uses the value of *FR* for Student.NATION and Student.DEGCTRY. In such a case, because the HESA Domicile field has been left blank, the system uses the default two-character country code of *RE* for reporting EntryProfile.DOMICILE of the student.

See [Nationality \(NATION\)](#)

See [Domicile \(DOMICILE\)](#)

Mapping Fee Eligibility Codes

Access the Fee Eligibility page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Fee Eligibility).

Image: Fee Eligibility page

This example illustrates the fields and controls on the Fee Eligibility page. You can find definitions for the fields and controls later on this page.

*Residency	Description	Fee Eligibility	Description	Fee Status	Description	Active	
AUS	Australian Resident	2	Not eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
EU	Home/European Union	1	Eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
HOME	Home/United Kingdom	1	Eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
IC	In City	1	Eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
ID	In District	1	Eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
IND	India	2	Not eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
INTL	International Student	2	Not eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
IS	In State	1	Eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
NZL	New Zealand Resident	2	Not eligible to pay home fees			<input checked="" type="checkbox"/>	+ -
NZP	New Zealand Permanent Resident	2	Not eligible to pay home fees			<input checked="" type="checkbox"/>	+ -

Map Campus Solutions residency codes to the HESA fee eligibility codes. The system uses this mapping to derive the Instance.FEEELIG field value.

Mapping Mode of Study Codes

Access the Mode of Study page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Mode of Study).

Image: Mode of Study page

This example illustrates the fields and controls on the Mode of Study page. You can find definitions for the fields and controls later on this page.

*Academic Load	Delivery Mode	Session Mode	Description	Session Status	Description	Mode of Study	Active	
Full-Time	01	01	Full time			01	<input checked="" type="checkbox"/>	+ -
Part-Time	31	31	Part time			31	<input checked="" type="checkbox"/>	+ -

Map the Campus Solutions academic load codes to the (HESA) Session and (HESA) Mode of Study codes. The system uses this mapping to derive the Student return's Instance.MODE ITT return's Student.MODE field values, and the Data Futures return's StudentCourseSessionMode.SCSMODETYPE.

Mapping Classification Codes

Access the Classification page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Classification).

Image: Classification page

This example illustrates the fields and controls on the Classification page. You can find definitions for the fields and controls later on this page.

*Honors Type	Description	*Honors Code	Description	*HESA Classification	Description	Active
DH	Degree Honors	HON	Honors	01	First class honours	<input checked="" type="checkbox"/>

Map the Campus Solutions honors code and type codes to the HESA classification codes. The system uses this mapping to derive the QualificationAwarded.QUALRESULT field value.

Mapping Disability Codes

Access the Disability page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Disability).

Image: Disability page

This example illustrates the fields and controls on the Disability page. You can find definitions for the fields and controls later on this page.

*Type of Impairment	*HESA Disability	Description	Active
Hearing Disability	03		<input checked="" type="checkbox"/>
Learning Disability	11		<input checked="" type="checkbox"/>
Mobility Disability	04		<input checked="" type="checkbox"/>
Vision Disability	02		<input checked="" type="checkbox"/>
Medical Disability	07		<input checked="" type="checkbox"/>
Other Disability	96		<input checked="" type="checkbox"/>

*Support Services Request	*HESA Disability Allowance	Description	Active
			<input checked="" type="checkbox"/>

Disability Mappings

Use this region to map the Campus Solutions type of Impairment codes to the HESA disability codes. The system uses this mapping to derive the Student.DISABLE field value (for both Student and ITT returns).

Disability Allowance Mappings

Use this region to map the Campus Solutions support services request codes to the HESA disability allowance codes. The system uses this mapping to derive the DISALL field value (for both Student and ITT returns).

Mapping Module Outcome Codes

Access the Module Outcome page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Module Outcome).

Image: Module Outcome page

This example illustrates the fields and controls on the Module Outcome page. You can find definitions for the fields and controls later on this page.

Map the Campus Solutions grade input and grade category codes to the HESA module outcome codes. The system uses this mapping to derive the Student On Module.MODOUT field value.

Mapping Gender Codes

Access the Gender page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Gender).

Image: Gender page

This example illustrates the fields and controls on the Gender page. You can find definitions for the fields and controls later on this page.

The system uses this mapping to derive the Student.SEXID field values for the Student and ITT returns.

Mapping Orientation Codes

Access the Orientation page (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Orientation).

Image: Orientation page

This example illustrates the fields and controls on the Orientation page. You can find definitions for the fields and controls later on this page.

*Sexual Orientation	*HESA Identifier	Description	Active
Other	05	Other	<input checked="" type="checkbox"/>
Prefer not to say	98	Information refused	<input checked="" type="checkbox"/>

The system uses this mapping to derive the Student.SEXORT field values for the Student and ITT returns.

Note: This page is available only in Campus Solutions 9.2 and is used to derive values from the Person Biographic record.

Mapping Title Codes

Access the Title page (Records and Enrollment > HESA Reporting > Codes and Mappings > Title).

Image: Title page

This example illustrates the fields and controls on the Title page. You can find definitions for the fields and controls later on this page.

*Name Prefix	*HESA Identifier	Description	Active
Miss			<input checked="" type="checkbox"/>

The system uses this mapping to derive the Student.TITLEID field values from the Name Prefix table.

Name Prefix

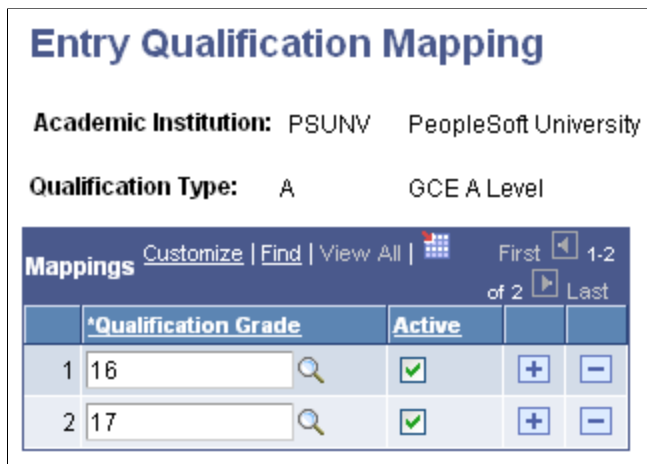

This value must be unique for your institution.

Mapping Entry Qualification

Access the Entry Qualification Mapping page (Records and Enrollment > HESA Reporting > Codes and Mappings > Entry Qualification Mapping).

Image: Entry Qualification Mapping page

This example illustrates the fields and controls on the Entry Qualification Mapping page. You can find definitions for the fields and controls later on this page.

An institution can only return specific Grades (QUALGRADE) for a Qualification Type to HESA. If an invalid Grade is returned, then validation errors will occur at HESA. Use the Entry Qualification Mapping page to define which Grade values are appropriate for a particular Qualification Type. The system then uses this mapping to ensure that only valid Grade values are entered for the selected Qualification Type on the Entry Profile page. The Import Applicant Data process also uses this mapping when importing ivStarJ records to report invalid grade values.

Setting Up a HESA Return

This section discusses how to:

- Set up a HESA return.
- Set up HESA fields.
- Set up HESA types.
- Set up HESA action reasons.
- Configure HESA.
- Generating student identifiers (SIDs or HUSIDs) during registration or enrollment.

Pages Used to Set Up a HESA Return

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
Reporting Periods	SSR_HE_REP_PERIODS	Records and Enrollment > HESA Reporting > HESA Returns Setup > Reporting Periods	View or create a reporting period. Reporting periods from 2000 onwards are delivered with your system.

Page Name	Definition Name	Navigation	Usage
Returns	SSR_HE_RETURNS	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns	View or create a return type. The STUDENT, OFFSHORE, DLHE, GRADOUT, Unistats/KIS, Data Futures, and ITT return types are delivered with your system.
Entities	SSR_HE_ENTITIES	Records and Enrollment > HESA Reporting > HESA Returns Setup > Entities	View or create an entity for a return type. The entities for Student, Offshore, DLHE, GRADOUT, Unistats/KIS, Data Futures, and ITT returns are delivered with your system.
Fields	SSR_HE_FIELDS	Records and Enrollment > HESA Reporting > HESA Returns Setup > Fields	View or create return fields. For Student, Offshore, DLHE, GRADOUT, Unistats/KIS, Data Futures, and ITT returns, the HESA fields are delivered with your system.
HESA Returns	SSR_HE_HESA_RETURN	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Returns	Create a return for a reporting period. To create a return, you can copy return setup data (such as the return fields) from another return you previously created.
HESA Fields	SSR_HE_HESA_FIELDS	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Fields	Add, edit, or view HESA fields in a return. If required, specify default and constant values for the HESA return fields.
HESA Types	SSR_HE_HESA_TYPES	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Types	For the Student return, map HESA fields to the Campus Solutions name, address and external ID types. The system uses this mapping to derive HESA return field values. Also, define the program statuses that the system uses to determine which Instances records to include in the return.
HESA Action Reasons	SSR_HE_HESA_ACTN	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Action Reasons	For the Student return, map HESA field codes to the Campus Solutions Program Action and Action Reason values. The system uses this mapping to derive HESA return field values.

Page Name	Definition Name	Navigation	Usage
HESA Configuration	SSR_HE_CONFIG	Records and Enrollment > HESA Reporting > HESA Returns Setup > Configuration > HESA Configuration	Configure the system for Create Extract and Create HUSID processing. Control validation for DLHE survey.
Create Student Identifiers	SSR_HE_CRTHUSID	Records and Enrollment > HESA Reporting > HESA Returns Setup > Create Student Identifiers	Create SID or HUSID for students during the registration or enrollment period.

Setting Up a HESA Return

Access the HESA Returns page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Returns).

When adding a new return, you have to enter an academic institution and a return name. You must enter a unique return name for an academic institution.

Note: To test the Create Extract Application Engine (SSR_HE_DATA) process, you can define multiple returns for the same institution, return type, and reporting period.

Note: For the Data Futures return, the field derivation logic uses the Rules Engine. Rules are delivered for each field, and to activate the rules for the return you must run the Build Rules process for HESA DF Field Derivation Rules and HESA Derivation Steps Rule Categories. Make sure you have the appropriate security access to both categories. To run the process, go to Set Up SACR >System Administration >Rules Engine >Setup >Build Rules.

When you access the HESA Returns page in add mode, the Copy Return Setup Data From group box appears.

To create a return using the Copy Return Setup Data From group box:

1. Select a previously defined return name from which you want to copy the setup data.
2. Select a reporting period for which you want to create the return.
3. Click Copy.

The other tabs in the page appear when you copy a return or click the Skip Copy button. If you want to manually create a return, if you are creating a return for the first time, or if no appropriate records are available to copy from, click the Skip Copy button.

The Create Fields button is available only when you click the Skip Copy button.

After selecting a return type, you can click the Create Fields button to have the system automatically create all the entities and the associated fields for the return. The system displays the created fields on the HESA Fields page.

Return Type

Select any one of the following: *STUDENT*, *OFFSHORE*, *DLHE*, *GRADOUT*, *ITT* or *KIS (Unistats)*.

You can also select a return type that you have defined in the Returns page.

Note: The system displays the HESA Types tab only for the Student and ITT returns.

The system displays the HESA Action Reasons tab only for the Student, ITT and DLHE returns.

Reporting Period

Select the reporting period for which you want to create the return.

Country

Select a country code that the system uses to determine which fields to include in the return. Values for this field are delivered with your system as translate values. Values are *England*, *Northern Ireland*, *Scotland*, and *Wales*. This field is not applicable for the Aggregate Offshore return.

INSTAPP

Enter a value that you want the system to return in the Institution.INSTAPP field of the return. This field is not applicable for the Aggregate Offshore, DLHE, GRADOUT, Unistats/KIS and ITT, and Data Futures returns.

Specification Code

Enter the code you want to use to set the specification attribute in the XML. For example, enter *HDPStudent1*. This value is required for Data Futures return. This field is hidden for other return types.

Version Number

Enter the number you want to use to set the specification version number attribute in the XML. For example, enter *1.6.0*. This value is required for Data Futures return. This field is hidden for other return types.

Enable Sub-Plan Reporting

Select if you want to enter the reporting data in the Sub-Plan HESA and the Sub-Plan Offering/Year HESA pages. Selecting this check box enables the system to use the entered subplan level data to generate the HESA return.

This is not enabled for Graduate Outcomes (GRADOUT) return.

Include FE (Include further education)

Select to have the system derive fields relevant to further education (FE) students. This check box is not applicable for the Aggregate Offshore, DLHE, and GRADOUT returns.

Active

Clear this check box if you want to prevent old test returns from being displayed in the search results.

For more information about the HUSID, INSTAPP, and UKPRN fields, refer to the HESA Student Record specification available from the HESA website. Specification for the HUSID digit structure can also be found on the HESA website.

Program Statuses

Select program statuses that the system can use for creating Instance entities.

See [Student Record Return: Instance Entity](#)

See [ITT Return: Student Entity](#)

Survey Details

The system enables the Survey Details region when you select the DLHE return type. Use this region to define the details of the two surveys (April and January) for each DLHE reporting period.

Survey

For DLHE, select the survey translate values: *1* for the April survey or *2* for the January survey.

For Graduate Outcomes, select the survey translate values:

- *A* for December.
- *B* for March.
- *C* for June.
- *D* for September.

Note: Because the CENSUS value is returned at the Provider rather than the Graduate level, it is expected that separate returns are defined for each of the survey populations. This allows the extracted data to be retained and not overwritten when the extract is run for a subsequent survey. The setup also allows a single return to be defined for multiple surveys where an institution does not want to retain the extract data.

Qualifying Start Date

- For DLHE, select the start date to be used when identifying students who qualify for the survey. If the Survey value is April, the value defaults to the reporting period start date. If the Survey value is January, the value defaults to 01-JAN-YYYY where the year value is the year value of the reporting period end date.
- For Graduate Outcomes, students who belong to cohort:
 - *A*, the value defaults to 01-AUG-YYYY, where the year value is the record year.
 - *B*, the value defaults to 01-NOV-YYYY, where the year value is the record year.
 - *C*, the value defaults to 01-FEB-YYYY, where the year value is the record year plus 1.
 - *D*, the value defaults to 01-MAY-YYYY, where the year value is the record year plus 1.

Qualifying End Date

- For DLHE, select the end date to be used when identifying students who qualify for the survey. If the Survey value is April, the value defaults to 31-Dec-YYYY, where the

YYYY value is the year of the reporting period start date.

If the Survey value is January, the value defaults to the reporting period end date.

- For Graduate Outcomes, students who belong to cohort:
 - A, the value defaults to 31-OCT-YYYY, where the year value is the record year.
 - B, the value defaults to 31-JAN-YYYY, where the year value is the record year plus 1.
 - C, the value defaults to 30-APR-YYYY, where the year value is the record year plus 1.
 - D, the value defaults to 31-JUL-YYYY, where the year value is the record year plus 1.

Census Date

Select the census date for the survey. This system also displays the date to the student on the Survey questionnaire

For Graduate Outcomes, this field is optional.

Survey Start Date

Select the date when the survey is available for completion by the student.

For Graduate Outcomes, this field is optional. But if you define a start date, then you must also define an end date.

Survey End Date

Select the date when the survey is no longer available for completion by the student.

For Graduate Outcomes, this field is optional.

Survey Statuses

The system enables the Survey Statuses region when you select the DLHE and GRADOUT return type. Use this region to define which surveys, based on the survey status, should be included by the Create Extract process.

Note: Unless other survey status values are set in Survey Management that should be included in the extract, you should define only *New* for a GRADOUT return.

Survey Status

Select the translate values of the statuses to be included in the HESA extract.

Account Types

The system enables the Account Types region when you select the Student return type. Use this region to specify the account types that your institution uses for tuition and waiver charges. The system uses the values that you enter in this region to derive Instance.GROSSFEE and Instance.NETFEE.

Research Options

This region appears only when the Return Type is STUDENT.

Primary Advisor Only

By default, this check box is not selected.

Use this check box to determine which student advisor records are used to create REF Data entities.

Primary Supervisor Only

By default, this check box is not selected.

Use this check box to determine which supervisor records are used to create REF Data entities.

Advisor Roles

Select the advisor role.

Supervisor Roles

Optional. Use this field to define one or more roles to determine which supervisor records are used to create REF Data entities.

If you do not define a role, supervisor records with any role value will be considered.

Supervisor Statuses

Use the Status field to define one or more status values to determine which supervisor records are used to create REF Data entities.

See [Student Record Return: REF Data Entity](#).

Research Attributes

Use this grid to map research fields to Common Attributes. This grid is hidden for Data Futures returns.

Field

Select a Research field (ORCID, RCSTDID, RCSTDNT) to map to a single Common Attribute.

Common Attribute

Select a Common Attribute for mapping. Common Attributes are limited to the attributes defined for the Research Consumption record (SSR_RS_CONSMPTN).

Common Attributes

Use this grid to map a field to a combination of record and Common Attributes for the Data Futures return. This grid is hidden for other HESA Return types.

Field

Select a field to map to a record and attribute:

- COURSESTARTDATE — A date attribute for start of attendance can be defined for CourseDelivery.
- EXPECTEDENDDATE — A date attribute for end of assessment (as distinct from end of teaching or end of term) can be defined for CourseDelivery.
- MODENDDATE — A date attribute for end of assessment (as distinct from end of teaching or end of term) can be defined for ModuleDelivery for dummy modules.

- **MODSTARTDATE** — A date attribute for start of attendance can be defined for ModuleDelivery for dummy modules.
- **QUALAWARDDATE** — A date attribute for QualificationAwarded.
- **SESSIONENDDATE** — A date attribute for end of assessment (as distinct from end of teaching or end of term) can be defined for CourseSession.
- **SESSIONSTARTDATE** — A date attribute for start of attendance can be defined for CourseSession.

Record Name

Select the Record (table) that includes the Common Attribute field to which you wish to map.

Common Attribute

Select a Common Attribute for mapping. Available Common Attributes are limited to the Record Name (table) selected.

Setting Up HESA Fields

Access the HESA Fields page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Fields).

Image: HESA Fields page

This example illustrates the fields and controls on the HESA Fields page. You can find definitions for the fields and controls later on this page.

The screenshot shows the HESA Fields page with the following configuration:

- Academic Institution: PSUNV PeopleSoft University
- Return Name: AT Return
- Return Type: STUDENT

The 'Entities' section shows a table for 'MODULE' with the following fields:

Field	Description	Constant Value	Default Value		
CRDTPTS	Credit value of module		999	+	-
CRDTSCM	Credit transfer scheme	9		+	-
FTE	Module FTE			+	-
LANGPCNT	Percentage of module taught in			+	-
LEVLPTS	Level of credit points			+	-
MODID	Module identifier			+	-
MODLANG	Module available in a Celtic I			+	-
MTITLE	Module title			+	-
PCOLAB	Percentage not taught by this			+	-
TINST	Other institution providing te			+	-

Use a field constant when your institution wants to return the same value for an entity. For example, if you want the system to derive the Credit transfer scheme as No Scheme for all modules in the Student return 2008/09, set the Module.CRDTSCM constant value to 9.

Use the field default to reduce the amount of data entry by defining a default value to be used when no value is derived for a mandatory field. For example, if a default value of 999 is defined for the Module.CRDTPTS field, and no data is found for a module, then 999 is used.

Note that you must enter the value *NULL* if you want to define a null constant or default.

Note: The Constant Value field or the Default Value field can accept a maximum of 30 characters. Therefore, the system does not use these two fields in the derivation of the Unistats/KIS fields that exceed 30 characters (for example, the URL fields).

Note: For Unistats/KIS: The LEVELK field has K appended to distinguish it from the LEVEL field in the Aggregate Offshore return. The TITLEK field has K appended to distinguish it from the TITLE field in the ITT return. JACSA, JACSB and JACSC fields have A, B and C appended to allow three values to be returned and to distinguish the fields from the JACS field in the DLHE return.

Setting Up HESA Types

Access the HESA Types page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Types).

Image: HESA Types page

This example illustrates the fields and controls on the HESA Types page. You can find definitions for the fields and controls later on this page.

HESA Returns
HESA Fields

<input type="text" value="RCSTDID"/>	Research council student ident	<input type="text" value="RCS"/>	Research Council ID (RCSTDID)					

Name Types

The system uses the Name Types mapping to derive Student.SNAME16 for ITT, Data Futures, and Student returns.

This region does not appear for Graduate Outcomes return. Name details are derived from Primary name records as per Student return.

Address Types

The system uses the Address Types mapping to derive the following fields:

- EntryProfile.POSTCODE
- Student.TTPCODE

For Graduate Outcomes, only the COUNTRY field is available. Users can define one or more address types that are considered when deriving the COUNTRY field and the Postal Address entity. If users do not define a type, all active address are considered during derivation.

Note: The Address Types region is not applicable for the ITT return.

Contact Address Types

Use this region to define one or more address types for the Data Futures return. The system uses the Contact Address Type to derive ContactPurpose.CONTACTTYPEID.

Contact Type

Select either:

- 01 — Permanent home address
- 02 — Term time address

External ID Types

The system uses the External ID Types mapping to derive the following fields for the Student return:

- Instance.DHREGREF
- Student.HUSID
- Instance.RCSTDID
- Student.SCN
- Instance.TREFNO
- Student.UCASPERID
- Student.ULN

The system uses the External ID Types mapping to derive the following fields for the ITT return:

- Student.HUSID
- Student ISANUM
- Student.NIN
- Student.SKILLTEST
- Student.TREFNO
- Student.ULN

For information about defining external systems and entering external system IDs for a person or an organization, see:

- "Defining External Systems" (PeopleSoft Campus Solutions 9.2: Campus Community)
- "Entering External System IDs" (PeopleSoft Campus Solutions 9.2: Campus Community)

Contact Email Types

Use this region to define one or more email types for Data Futures return EMAIL field.

Email Types

Use this region to define one or more email types for the Graduate Outcomes return EMAIL field. If you do not define a type, all emails are considered during derivation. The system uses Email Types to derive the following fields for Graduate Outcomes return:

- GRADUATE.EMAIL
- GRADUATE.EMAIL2
- GRADUATE.EMAIL3

Person ID Type

Use this region to define one or more ID types for the Data Futures return. The system uses the Person ID Type to derive PersonIdentifier.IDTYPECODE.

Phone Types

Use this region to define one or more phone types for the Graduate Outcomes return INTTEL, UKMOB, and UKTEL fields. If you do not define a type, all phone numbers are considered during derivation. The system uses Phone Types to derive the following fields for Graduate Outcomes return:

- GRADUATE.INTTEL
- GRADUATE.INTTEL2
- GRADUATE.INTTEL3
- GRADUATE.UKMOB
- GRADUATE.UKMOB2
- GRADUATE.UKMOB3
- GRADUATE.UKTEL
- GRADUATE.UKTEL2
- GRADUATE.UKTEL3

Setting Up HESA Action Reasons

Access the HESA Action Reasons page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Action Reasons).

Image: HESA (Higher Education Statistics Agency) Action Reasons page

This example illustrates the fields and controls on the HESA (Higher Education Statistics Agency) Action Reasons page. You can find definitions for the fields and controls later on this page.

HESA Returns				HESA Fields				HESA Types				HESA Action Reasons											
Academic Institution								PSGBR								PeopleSoft University UK							
Return Name																ST1718							
PhD Submission Mapping																Personalize Find View All [grid] [refresh]				First 1 of 1 Last			
*Program Action				Action Reason				Description				Active											
Data Change				PHDS				PHDS Submission				<input checked="" type="checkbox"/>											
Reason for Ending Instance Mapping																Personalize Find View All [grid] [refresh]				First 1-3 of 6 Last			
Program Action				Reason for Ending Instance																			
*Program Action				Action Reason				Description															
Completion of Program				RSUN				Result Unknown				<input type="checkbox"/>											
Completion of Program				SUCC				Successful Completion				<input type="checkbox"/>											
Completion of Program				TRCS				Transfer Collab Supervision				<input type="checkbox"/>											
Change of Mode Mapping																Personalize Find View All [grid] [refresh]				First 1 of 1 Last			
Program Action				Mode of Study																			
*Program Action				Action Reason				Description															
Data Change				DMFT				Dormant to Full Time				<input type="checkbox"/>											
Suspension of Active Studies Mapping																Personalize Find View All [grid] [refresh]				First 1 of 1 Last			
Program Action				Suspension of Studies																			
*Program Action				Action Reason				Description															
Leave of Absence				SUSP				Suspended Studies				<input type="checkbox"/>											
Award Only Mapping																Personalize Find View All [grid] [refresh]				First 1-2 of 2 Last			
*Program Action				Action Reason				Description				Active											
Completion of Program				SUCC				Successful Completion				<input checked="" type="checkbox"/>											
Program Change				AWDP				Award Only Program Change				<input checked="" type="checkbox"/>											

Use this page to define the combinations of program action and action reason that the system uses to indicate PHD submission for research students, reason for ending studies, mode change, suspension of active studies, and award-only mapping.

For each region, if you edit the Program Action values the corresponding Action Reason fields are cleared to prevent an invalid combination from being saved.

Note: The Phd Submission Mapping and Suspension of Active Studies Mapping regions are not applicable for the ITT return.

Phd Submission Mapping

The system uses this mapping to derive the Instance.PHDSUB and StudentCourseSession.PHDSUB fields.

Reason for Ending Mapping

Select the Reason for Ending tab to enter the HESA codes. Map the program action and action reason values to the (HESA) Session Reason, Leaver Reason, and Instance Reason codes.

The system uses this mapping to derive Student return's Instance.ENDDATE and Instance.RSNEND fields, ITT return's Student.ENDDATE and Student.RSNEND fields, and Data Futures return Leaver.RSNREGEN field and StudentCourseSession.RSNSENSEND.

Change of Mode Mapping

Map the program action and action reason values to the HESA Mode of Study and HESA Mode Direction codes. Click the Mode of Study tab to enter the HESA mode of study and direction codes.

The system uses this mapping to derive the Student return's Instance.MODE field and ITT return's Student.MODE field.

Suspension of Active Studies Mapping

Map the program action and action reason values to the HESA Suspension of Studies codes. Click the Suspension of Studies tab to enter the HESA Suspension of Studies codes.

The system uses this mapping to derive the Instance.NOTACT field.

Award Only Mapping

The mapping in this grid is used in cases where the student's program or plan is changed in order to make an intermediate award. When this happens, you must define the combinations of program action and reason that are used to make the change and complete the program. For example, Program Change/AWDP followed by Completion of Program/SUCC and those rows in Student Program/Plan are not considered when determining the COURSEID for the instance. This ensures continuity with what has been previously reported to HESA for that instance. The new program or plan is considered for the derivation of Qualifications Awarded. If you do not set a mapping as active, the program action and reason mapping continues to be considered.

This grid appears only for Student and ITT returns.

Action Reason	(Optional) If you do not define a value, all action reasons (including blanks) are considered for the Program Action.
Active	By default, this check box is selected. You can deselect this check box to indicate that the mapping row is considered.

Configuring HESA

Access the HESA Configuration page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Configuration > HESA Configuration).

Institution Details

UKPRN	Enter a value that you want the system to return in the Institution.UKPRN field of the return.
Show Further Education page	Select to enable the Further Education page on the HESA Instance Details component (SSR_HE_INSTANCE). If this check box is deselected, you cannot access the Further Education page.

Note: The fields on the Further Education page are relevant only to institutions in England and Wales.

Show Financial Support region	Select to enable the Financial Support region in HESA Instance Details component. Institutions in England can select this check box and institutions in Scotland, Northern Ireland and Wales can deselect this check box.
Show ITT Placement region	Select to enable the ITT Placement records in the HESA Instance Details component.

Student Identifier Generation

Use this region to configure HUSID before running the Create HUSID process or the Create Extract process.

Note: For students without HUSIDs, the system creates HUSIDs when you run the Create Extract process for the Student return. However, if you want to create these IDs at the point of registration or enrollment for new students and before running the Create Extract process, run the Create HUSID process.

For information about defining external systems and entering external system IDs for a person or an organization, see:

- "Defining External Systems" (PeopleSoft Campus Solutions 9.2: Campus Community)
- "Entering External System IDs" (PeopleSoft Campus Solutions 9.2: Campus Community)

HESA Institution Identifier (Optional) Set the institution identifier. This value is used to generate part of the HUSID.

Sequence Number Enter the starting number for the system-assigned six-digit number included in the 13-digit HUSID number. For each student without an existing HUSID, the Create HUSID process or the Create Extract process assigns a unique 13-digit HUSID value in the return.

HUSID External System (Optional) Select the ID type that the Create HUSID or Create Extract process uses for HUSID value.

SID External System (Optional) Select the ID you want to use to generate SID records for the Data Futures return.

Grading Basis Inclusion and Repeat Code Exclusion

These regions enable you to specify which Grading Basis values to include and which Repeat Codes to exclude in the Create Extract, Calculate Full-Time Equivalence, and Calculate Year of Student processes.

In the Grading Basis Inclusion region, when you select a Grading Basis and select a check box for the Extract, FTE, or the Year of Student process, the selected Grading Basis is considered by the selected process. In the Repeat Code Exclusion region, when you select a Repeat Code and select a check box for the Extract, FTE or Year of Student process, the selected process excludes class enrollments for the selected Repeat Code.

See [Setting Up Your System for Grading](#)

See [Understanding Repeat Checking Functionality](#)

Drop Reason Exclusion

Use this region to define one or more reasons for dropping an enrollment. The Create Extract process for the Data Futures return, Calculate Full-Time Equivalence (FTE), and Calculate Year of Student processes utilizes the reasons you select to determine which records are excluded.

DLHE Survey

Allow incomplete submission

Select to allow incomplete submission of the Enter Survey self-service page data.

If this check box is:

- Not selected and the student clicks the Submit button on Section F of the Enter Survey self-service page, then:
 - if there are any questions in the Incomplete Questions section then a message (*In order to submit your survey all questions must be complete. Please update any incomplete questions and then select Submit*) appears and the system saves the survey record but does not submit it. The student can then navigate back to other sections and enter the answers.
 - If all the questions are answered, the system submits the survey.
- Selected and the student clicks the Submit button, then:
 - if Q1 appears in the Incomplete Questions section, then a message (*In order to submit your survey Section A must be complete. Please update any incomplete questions and then select Submit*) appears and the system saves the survey record but does not submit it. The student can then navigate back to Section A to enter the answers.
 - if Q1 is answered, the system submits the survey.

This check box is applicable only for students accessing the Enter Survey self-service page. If you are accessing the Enter Survey self-service page by clicking the Enter Survey button on the Survey Management page, then this check box does not impact you.

Hide Qualified Teacher Status

If you select this check box, the system does not display the following on both student and administrator versions of the survey:

- Your Education Summary region in Section A.
- Help text and the Newly Qualified Teacher Status check box in Section C (however, admin users can still update the

Newly Qualified Teacher Status check box on the Survey Details page).

Hide Save and Return

If you select this check box, the system does *not* display the Save and Return button and the Cancel button on each section of the student version of the survey (but the system will display the Save button on the administrator version of the survey).

Require mandatory questions

If you select the Allow incomplete submission check box, this check box becomes available.

If the Allow incomplete submission is selected and the Require mandatory questions is not selected, then the students can submit the survey as long as Section A is complete (regardless of whether or not the Incomplete Questions list in section F contains optional or required fields).

If both the Allow incomplete submission and Require mandatory questions check boxes are selected, then the students will not be able to submit if there are any required questions listed in the Incomplete Questions list; students will be able to submit if only optional questions or no questions are included in the Incomplete Questions list.

This check box is applicable only for students accessing the Enter Survey self-service page. If you are accessing the Enter Survey self-service page by clicking the Enter Survey button on the Survey Management page, then this check box does not impact you.

Generating Student Identifiers During Registration or Enrollment

Access the Create Student Identifiers page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Create HUSID).

Use this page if you want to create Student identifiers (SIDs) or HUSIDs when registering or enrolling new students and before running the Create Extract process.

To create a HUSID, the process selects a student's earliest MATR Student Program record . If the MATR record is not available, then it selects the student's earliest ACTV record. If a record is found, the process uses the record's effective date for the entry year element. Then, the Create HUSID process uses the following logic to generate the HUSID value for a student who does not have a HUSID:

- The first two digits of HUSID represent the year the student entered the Institution (for example, 08 for 2008). The entry year is determined as the final two digits of the year element of the effective date of the selected Student Program record.
- The next four digits represent the institution identifier.
 - The process calculates the institution identifier as Institution Code plus 1000 (for example, 0184 is calculated as 1184)
 - Note that the process picks the Institution Code value from the HESA Configuration page.

- The next six digits represent the system assigned sequence number.
- Note that the starting number is defined in the HESA Configuration page. The process assigns this number for the first student for whom calculation is done.
- The system automatically increases the starting number by one when it assigns a new sequence number.
- The final digit is a check digit based on the existing ten digits. See the HESA website for details on check digit calculation.

ID Type

Select:

- HUSID external system, if you are creating a HUSID.
- SID external system, if you are creating a student identifier (SID) for Data Futures return.

If you select an SID external system, the Create from HUSID and Create New check boxes appear.

Create from HUSID

Select this check box to create SID records for students who don't have SIDs by using their existing HUSID records. Students must also have an active Student Program record for the institution.

By default, this check box is deselected.

Create New

Select this check box to create new SID records. By default, this check box is selected.

To create an SID, the system uses a similar logic when creating a HUSID. However, the system formats the SID according to the UKPRN and SID external system values from the HESA configuration instead of the institution identifier and HUSID external system. For SIDs, the:

- first two digits are the last two digits of the year of entry into the institution
- next eight digits are the institution's UKPRN
- next six digits represent the six-digit reference number internally allocated by the institution
- last digit is a check digit, which provides a way to detect errors in transcription. This is calculated using the first 16 digits of the SID.

Note: If you select this check box *and* the Create from HUSID check box, the system first creates SIDs from existing HUSIDs before creating new SIDs.

Start Date

Specify a date if you want the process to only examine Student Program records that are active or matriculated on or after the specified date. For example, if you enter January 5, 2009, the process creates HUSIDS or SIDs for students who have records that have a program action of MATR or ACTV with an effective date of January 5, 2009 or later.

Setting Up and Entering Data for HESA Reporting

This section provides an overview of setting up and entering data for HESA reporting and discusses how to:

- Set up data capture rules.
- Enter HESA Data for an institution.
- Enter HESA data for an academic program.
- Enter HESA data for a program offering and program year.
- Enter HESA data for an academic plan.
- Enter HESA data for a plan offering and plan year.
- Enter HESA data for a subplan.
- Enter HESA data for a subplan offering and subplan year.
- Create HESA modules.
- Enter HESA data for a module.
- Enter HESA data for a dummy module.
- Create HESA Instance and Person HESA Data Records for students.
- Restrict access to person HESA data fields.
- Enter HESA data for a person.
- Enter restricted HESA data for a person.
- Enter HESA Instance data for a student.
- Entering mobility data for a student.
- Enter HESA Entry Profile data for a student.
- Calculate Year of Student values for students.
- Calculate Full-Time Equivalence for students.
- Enter HESA advisor data for a student.

- Enter HESA Data for an external organization.
- Enter DEGTYPE value.

Understanding Setting Up and Entering Data for HESA Reporting

To derive a field, the system checks each data capture level to find out whether a field value has been defined. Each level is associated with a Campus Solution page or a group box. For example, to derive the Instance.EXCHANGE field, after checking if a constant value exists for a field, the system first looks at the Instance level to see if the field value has been defined on the HESA Instance page. If it does not find a value at the Instance level, then it checks whether a value has been defined on the following pages and group boxes:

1. Sub-Plan Year HESA Data group box in the Sub-Plan Offering/Year HESA page (Subplan Year level).

You can define field values at this level when different values are required for different years of program and the subplan is being reported to HESA. For example, if students in year three of a full-time offering undertake an exchange year away from the home institution, then the appropriate Instance.EXCHANGE value can be defined for that offering year at the Subplan Year level.

2. Sub-Plan HESA Data page (Subplan level)

The system looks at this level only if the Course entity is based on a subplan.

3. Plan Year HESA Data group box in the Plan Offering/Year HESA page (Plan Year level)
4. Plan HESA Data page (Plan level)
5. Program Year HESA Data group box in the Program Offering/Year HESA page (Program Year level)
6. Program HESA Data page (Program level)

Although the system derives Course records from either plans or subplans, you can define values at the program level if required. Typically, you would define a field value at the program level when you want the system to derive the same HESA field value for all the child plans, subplans, or both child plans and subplans of a program. For example, if a program exists specifically for incoming exchange students, define the appropriate Instance.EXCHANGE value only at the program level. The system includes this program level field value in the return for all the Instances associated with the plans or subplans of the program.

The system looks at the Subplan Year and Subplan levels only if the course entity is based on a subplan. For Subplan Year and Plan Year levels, the system uses the field values defined for the combination of Academic Load and Year of Program of the student instance.

The pages and group boxes for other levels include:

- Program Offering HESA Data group box in the Program Offering/Year HESA page (Program Offering level)
- Plan Offering HESA Data group box in the Plan Offering/Year HESA page (Plan Offering level)

You can define field values at the Plan Offering level when you want to report different field values for different offerings. For example, the expected length of study (Instance.SPLENGTH) for students

studying a full-time offering will typically be different from that of a part-time offering. In this case, you can define different values at plan offering level for each offering.

- Sub-Plan Offering HESA Data group box in the Sub-Plan Offering/Year HESA page (Subplan offering level)
- Module HESA Data and HESA Dummy Module Data pages (Module level). Module level is equivalent to the Course Offering level. The system uses the field values entered at the Module level to create the Module, Module Subject, and Student On Module entities.
- HESA Student Data page (Student level).

The system uses the field values entered at the Student level to create the Student entity.

- Advisor HESA Data page (Advisor level)

Use this page to define research units of assessment for an instructor or an advisor. The system uses the values entered at this level to create the RAE Data entity.

- Institution HESA Data page (Institution level)

Use this page to capture data for Unistats/KIS fields and Unistats/KIS location data for the academic institution.

After you import the HESA codes and define the data capture rules in the Institution Data Capture page, you can:

- Enter return field values at the institution and academic program, plan, and subplan levels.
- Enter return field values at the program, plan and subplan offering levels. An *offering* is a program, plan, or subplan associated with an academic load.
- Enter return field values at the program, plan, and subplan program year levels. A *program year* is a program associated with an academic load and year of program.
- Enter return field values for modules and module subjects for course offerings.
- Review and edit return field values for student personal attributes such as nationality and ethnicity. Some of the data that the system uses for HESA reporting, such as addresses, will already be in your database.
- Use the Create HESA Instance Application Engine (SSR_HE_CRTHE) process to specify the student data you want to report.
- Review and enter Instance-specific return field values, such as entry qualifications, year of program, and qualifications awarded.

You can decide at which levels the system should capture data for HESA reporting. For example, you can decide not to enter a Course.CLSDCRS value in the Program HESA Data page but enter it in the Plan HESA Data page. You can decide to enter the Instance.FEEELIG value in the HESA Instance page for each student rather than storing the Instance.FEEELIG data in the Program HESA Data page.

The system can create Course entities from either plans or subplans, depending on your academic structure setup. For example, you can either select the Biology plan for reporting to HESA or select its subplans, such as Molecular Biology and Marine Biology, for reporting to HESA, but you cannot select both.

The pages you use for entering HESA data at various levels are available only if you select the HESA, UCAS check boxes on the SA Features and the Academic Institution 6 pages.

Note: For information about the delivered functionality for deriving the HESA return fields, see [Understanding HESA Derivation Steps](#).

You can use the Institution Data Capture page to determine at which level the system should derive the fields.

Other than the various data capture levels, the system may use a constant or a default value set up on the HESA Fields page based on the derivation logic.

Deriving FTE Calculation Type and FTE Load

On each data capture page (which corresponds to a data capture level), optional Full-Time Equivalence (FTE) Calculation Type and FTE Load fields are available. The Calculate Full-Time Equivalence process uses the field values to determine which FTE calculation type to use for each student. If you select *Derive load from Program* as the calculation type, the process uses the FTE Load value for calculation.

Pages Used to Set Up and Enter Data for HESA Reporting

Page Name	Definition Name	Navigation	Usage
Institution Data Capture	SSR_HE_INST_DATA	Records and Enrollment > HESA Reporting > HESA Returns Setup > Data Capture Setup	<p>Create and maintain the rules to capture HESA data in the system.</p> <p>Use this page to control which fields are available on the various HESA data capture pages.</p> <p>Use this page to make any new fields (that are delivered with a Campus Solutions update) available on the HESA data capture pages.</p>
Institution HESA Data	SSR_HE_INST_HEDATA	Records and Enrollment > HESA Reporting > HESA Returns Setup > Institution Data	Enter or modify values that the system can use for creating Unistats/KIS return's Institution and Location entity data at the institution level.
Qualification Setup	SSR_HE_QUAL_SETUP	Records and Enrollment > HESA Reporting > Codes and Mappings > Qualification Setup	Enter or modify Qualifications for inclusion in the Data Futures return.

Page Name	Definition Name	Navigation	Usage
Program HESA Data	SSR_HE_PROG	Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Program HESA Data	<p>Enter or modify values that the system can use for creating Student return's Course, Course Subject, and Instance entity data at the program level.</p> <p>Indicate the HESA subjects that the system can use for creating ITT return's Course Subject entity data (SBJCA field) at the program level.</p> <p>Enter values for Unistats/KIS entities (KISCourse, CourseStage and Accreditation entities).</p>
Program Offering/Year HESA	SSR_HE_PROG_OFFRYR	Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Program Offering/Year HESA	Enter or modify values that the system can use for creating Student return's Instance entity data at the program offering and program year levels.
Plan HESA Data	SSR_HE_PLAN	Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan HESA Data	<p>Enter or modify values that the system can use for creating the following at the plan level:</p> <p>Student return's Course, Course Subject, and Instance entity data.</p> <p>Aggregate Offshore return's Provision entity data.</p> <p>ITT return's Course Subject entity data (SBJCA field).</p> <p>Unistats/KIS return's KISCourse, CourseStage, Accreditation, HESACourse and ILRAims entities.</p>
Plan Offering/Year HESA	SSR_HE_PLAN_OFFRYR	Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan Offering/Year HESA	Enter or modify values that the system can use for creating Student return's Instance entity data at the plan offering and plan year levels.

Page Name	Definition Name	Navigation	Usage
Sub-Plan HESA	SSR_HE_SUBPLAN	Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan HESA	<p>Enter or modify values that the system can use for creating the following at the subplan level:</p> <p>Student return's Course, Course Subject, and Instance entity data.</p> <p>Aggregate Offshore return's Provision entity data.</p> <p>ITT return's Course Subject entity data (SBJCA field).</p> <p>Unistats/KIS return's KISCourse, CourseStage, Accreditation, HESACourse and ILRAims entities.</p>
Sub-Plan Offering/Year HESA	SSR_HE_SPLN_OFFRYR	Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan Offering/Year HESA	Enter or modify values that the system can use for creating Student return's Instance entity data at the subplan offering and subplan year levels.
Create HESA Module Data	SSR_HE_CREATECRSE	Records and Enrollment > HESA Reporting > HESA Returns Setup > Create Module	Create HESA module data records for an academic institution.
HESA Module Data	SSR_HE_CRSE	Curriculum Management > Course Catalog > HESA Module Details	Update a HESA module data record that the Create HESA Module Data created or manually create a HESA Module Data record. Enter or modify values that the system can use for creating Student return's Module, ModuleSubject, and Student on Module entity data at the module level.
HESA Dummy Module Data	SSR_HE_CRSE_DUMMY	Curriculum Management > Course Catalog > HESA Dummy Module Details	Manually create a HESA dummy module data record. Enter HESA field and Module Subject values for the dummy Module record.

Page Name	Definition Name	Navigation	Usage
Create HESA Instance	SSR_HE_CREATEHESA	Records and Enrollment > HESA Reporting > HESA Returns Setup > Create Instance	Run the process to create HESA instance and Person HESA Data records for new matriculated students. You can specify whether you want to create records for matriculated students of a particular academic institution, program, plan, or subplan. In addition, you can specify a date to have the process generate records of students who matriculated on or after the specified date.
Fields	SSR_HE_FIELDS	Records and Enrollment > HESA Reporting > HESA Returns Setup > Fields	Restrict access to Person HESA Data fields on the HESA Student Data page. The system uses the values for the Person HESA Data fields to create Student entity.
HESA Student Data	SCC_HE_PERSON	Campus Community > Personal Information > Add/Update a Person > HESA Student Data	Update a Person HESA Data record that the Create HESA Instance created or manually create a Person HESA Data record. View, enter or modify values for a person that the system can use for creating Student entity data at the student level (for the Student and ITT returns).
HESA Restricted Data	SCC_HE_PERSON_RES	Campus Community > Personal Information > Add/Update a Person > HESA Restricted Data	View, enter or modify Person HESA Data record values for fields that are restricted through the Fields page. The system can use these values for creating Student entity data at the student level (for the Student and ITT returns).

Page Name	Definition Name	Navigation	Usage
HESA Instance	SSR_HE_INSTANCE	<p>Records and Enrollment > Career and Program Information > HESA Instance Details > HESA Instance</p> <p>Alternatively, access Records and Enrollment > Career and Program Information > Student Program/Plan > Student Program and click the HESA Instance link.</p>	<p>Update a HESA instance record that the Create HESA Instance created or manually create a HESA instance record.</p> <p>Enter or modify values that the system can use for creating Instance, Qualifications Awarded, and RAE entity data at the instance level (for the Student return).</p> <p>Enter or modify values that the system can use for creating Student entity data (for the ITT return)</p> <p>View or edit the Year of Student value that the Calculate Year of Student process has calculated.</p> <p>View or override the FTE value that the Calculate Full-Time Equivalence process has calculated.</p>
Mobility	SSR_HE_INST_MOB	Records and Enrollment > Career and Program Information > HESA Instance Details > Mobility	Enter or modify values that the system can use to create Mobility entity data.
Entry Profile	SSR_HE_ENTRPROFL	Records and Enrollment > Career and Program Information > HESA Instance Details > Entry Profile	Enter or modify values that the system can use for creating Student return's Entry Profile and Qualifications entity data.
Further Education	SSR_HE_FUR_EDU	Records and Enrollment > Career and Program Information > HESA Instance Details > Further Education	Enter or modify values that the system can use for creating FE-specific entities and fields.
Calculate Year of Student	SSR_HE_CALC_YRSTU	Records and Enrollment > HESA Reporting > Extract Processing > Calculate Year of Student	Calculate the Year of Student values of all the active HESA instance records for a particular reporting period. The system uses the calculated value to derive the Instance.YEARSTU field.

Page Name	Definition Name	Navigation	Usage
Calculate Full-Time Equivalence	SSR_HE_CALC_FTE	Records and Enrollment > HESA Reporting > Extract Processing > Calculate FTE	Calculate the FTE value that represents the student's academic load for the reporting period. The system uses the calculated value to derive the Instance. STULOAD field.
Advisor HESA Data	SSR_HE_INST_ADV	Curriculum Management > Instructor/Advisor Information > Instructor/Advisor Table > Advisor HESA Data	For an advisor, enter or modify values that the system can use for creating the Student return's RAE Data entity.
Regional	EXT_ORG_TBL_REG	Campus Community > Organization > Create/Maintain Organizations > Organization Table > Regional	Enter or modify the value that the system can use to derive the Student.DEGEST value (ITT return).
Degree Table	SA_DEGREE_TABLE	Set Up SACR > Foundation Tables > Academic Structure > Degree Table	Enter or modify the value that the system can use to derive the Student.DEGTYPE value (ITT return).

Setting Up Data Capture Rules

Access the Institution Data Capture page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Data Capture Setup).

Image: Institution Data Capture page

This example illustrates the fields and controls on the Institution Data Capture page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Institution Data Capture' page. At the top, it displays 'Academic Institution: PSGBR PeopleSoft University UK' and a yellow 'Create Fields' button. Below this is a navigation bar with 'Find | View 100', 'First', '166 of 369', and 'Last'. The main content area shows a field configuration for 'LATITUDE'. The 'Field:' is 'LATITUDE', the 'Description:' is 'Location latitude', and the 'Long Description:' is 'Location latitude'. Below this is a section for 'Fixed' and 'Available at' with a list of 'Include at' options. The 'Include at' options are: Institution (checked), Student, Instance, Advisor, Program, Program Offering, Program Offering Year, Plan, Plan Offering, Plan Offering Year, Subplan, Sub-Plan Offering, Sub-Plan Offering Year, and Module.

Create Fields

Click to create a data capture record from the delivered data. When you click this button, the system creates all the fields and, for each field, selects the check boxes to indicate at which level the system captures data to derive the field.

After you have created a data capture record, use the Create Fields button to add new fields that you have created using the Fields page. For example, you have clicked the Create Fields button to create a data capture record. After creating the data capture record, you create a new field using the Fields page. To add this new field to the data capture record, click the Create Fields button.

Note: You must click the Create Fields button to add any new fields that have been added as part of a Campus Solutions update to make them available in data capture.

Fixed	<p>Indicates whether you can configure the data capture levels or if the levels are non-configurable (fixed).</p> <p>You cannot select or clear the Fixed check box. If the system has not selected the Fixed check box, you can clear or select the Include At check boxes.</p>
Available At	<p>Indicates the level at which the system can derive the field value. You cannot select or clear the Available At check boxes.</p>
Include At	<p>Select or clear to indicate the level at which you want the system to capture the field value.</p> <p>As an initial default, the Include At check box appears selected for each level where the field value can be captured. You can clear the Include At check box to ensure that the field value cannot be entered at the corresponding page of that level.</p> <p>You can select or clear an Include At check box only if the corresponding Available At check box is selected by the system. However, if the system has selected the Fixed check box, you cannot select or clear the Include At check boxes for the field.</p>

Entering HESA Data for an Institution

Access the Institution HESA Data page (Records and Enrollment >HESA Reporting >HESA Returns Setup >Institution Data).

Image: Institution HESA Data page

This example illustrates the fields and controls on the Institution HESA Data page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Institution HESA Data' page for 'PSGBR PeopleSoft University UK'. It is divided into several sections:

- Institution Data:** Includes fields for 'Effective Date' (01/01/1900) and 'Student Union URL' (www.psgbr.ac.uk/suurl).
- Key Information Set:** A table with columns for Field, Description, Code, and Description. It lists 'NSP' (National Scholarship Programme) with code '1' and 'OTHERINST' (Franchise UKPRN) with code '12347000'.
- Locations:** Includes fields for 'Location ID' (1), 'Location Name' (Main Campus), 'Accommodation Cost URL' (www.psgbr.ac.uk/main/accomcost), and 'Student Union URL'.
- Location Data:** A table with columns for Field, Description, Code, and Description. It lists various location-related fields such as 'INSTBEDS' (Institution Bed Number), 'INSTLOWER' (Inst beds lower quartile cost), 'INSTUPPER' (Inst beds upper quartile cost), 'LATITUDE' (Location latitude), 'LOCUKPRN' (Location UKPRN), 'LONGITUDE' (Location longitude), 'PRIVATELOWER' (Priv beds lower quartile cost), and 'PRIVATEUPPER' (Priv beds upper quartile cost).

The following table describes the type of data that you can enter in each group box of this page:

Group Box	Used for Entering
Unistats Fields	Institution entity fields and their associated values for the Unistats return.
Locations	KIS location records for the institution for the Unistats return. A maximum of 50 records can be entered.
Location Data	Location entity fields and their associated values for each KIS location record for the Unistats return.
Venues	Venue entity fields and their associated values for the Data Futures return.
Financial Support	Financial support scheme for the Data Futures return.

The Field prompt values in these group boxes are restricted to fields that are defined in the Institution Data Capture page as *Include at Institution level*.

Entering HESA Data for Qualifications

Access the Qualification Setup page (Records and Enrollment >HESA Reporting >Codes and Mappings > Qualification Setup).

Image: Qualification Setup

This example illustrates the fields and controls on the Qualification Setup page. You can find definitions for the fields and controls later on this page.

Qualification Setup

Institution PSGBR PeopleSoft University UK
Degree PGCERT Postgraduate Certificate
Primary Plan EGEOG Geography
Secondary Plan

Details Find | View All First 1 of 1 Last

Effective Date 01/01/1900 **Status** Active

***Title** PG Certificate in Education

***Category** M0016 Postgraduate Certificate in Ed

***Qualification ID** PGCERTEGEOG

HECoS Subjects Personalize | Find | View All First 1 of 1 Last

*Subject	Description	*Percentage	ITT	Subject
100459	Education studies	100.0	<input type="checkbox"/>	

Awarding Body

Award Accreditation Personalize | Find First 1 of 1 Last

*Accreditation ID	Description
99801	Teacher training qualification

Use this page to define Qualifications for inclusion in the Data Futures return. The Qualification ID values are available for selection in the Program, Plan and Sub-Plan HESA pages.

HECoS Subjects

Subject Select a value that the system will use to derive the QualificationSubject.QUALSUBJECT field.

Percentage Enter a value that the system will use to derive the QualificationSubject.QUALPROPORTION field.

Awarding Body

Awarding Body Select a value that the system will use to derive the AwardingBodyRole.AWARDINGBODYID field.

Relationship Select a value that the system will use to derive the AwardingBodyRole.RELATIONSHIP field.

Award Accreditation

Accreditation ID

Select a value that the system will use to derive the QualificationAwardAccreditation.ACCREDITATIONIDQAA field.

Entering HESA Data for an Academic Program

Access the Program HESA Data page (Set Up SACR >HESA Reporting Foundation Tables > Academic Structure > Academic Program Table > Program HESA Data).

Image: Program HESA Data page (1 of 2)

This example illustrates the fields and controls on the Program HESA Data page (1 of 2). You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Program HESA Data' page for an Academic Institution (PSGBR PeopleSoft University UK) and Academic Program (BA Bachelor of Arts). The page includes a navigation bar at the top with tabs for Home Campus NLD, Program HESA Data, Program Offering/Year HESA, PBI Data, Graduation, Program Enrollment & Mapping, Research Processing Options, and Advisement. The main content area is divided into several sections:

- Details:** Shows Effective Date (01/01/1900), Status (Active), FTE Calculation Type (dropdown), and FTE Load (0).
- Program HESA Data:** A table with columns for *Field, Description, *Code, and Description. Rows include COURSEAIM (Course Qualification Aim), REDUCEDC (Reduced course return indicato), and TTCID (Teacher training course).
- Program HESA Subjects:** A table with columns for *Subject, Description, JACS2, Description, *Percentage, and ITT Subject. Rows include C900 (Others in biological sciences) and J310 (Ceramics).
- Program HECoS Subjects:** A table with columns for *Subject, Description, *Percentage, and ITT Subject. Rows include 100061 (Graphic design), 100070 (Music), 100074 (Advertising), and 100998 (Sustainable agriculture and landscape development).
- Program HESA Instance Data:** A table with columns for *Field, Description, *Code, and Description. Rows include EXCHANGE (Exchange programmes) and TYPEYR (Type of instance year).

Image: Program HESA Data page (2 of 2)

This example illustrates the fields and controls on the Program HESA Data page (2 of 2). You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Program HESA Data page (2 of 2)' interface. It is divided into several sections:

- KIS Course Data:** Includes search fields for '*Field' and '*Code', each with a 'Description' label and a search icon. There are also '+' and '-' buttons.
- KIS Course Links:** Contains five text input fields, each with a label and a '254 characters remaining' indicator:
 - Assessment Methods URL
 - Course Page URL
 - Employment Details URL
 - Learning/Teaching Methods URL
 - Support Details URL
- Accreditation:** Features a search field for '*Accreditation Type' and a checkbox for 'Dependency'.
- Stage Modules:** A table with columns: *Stage, *Course ID, Description, *Offer Nbr, FTE Load, Coursework, Written Exam, Practical Exam, Scheduled Study, Independent Study, Placement Study. The values for Offer Nbr, FTE Load, Coursework, Written Exam, Practical Exam, Scheduled Study, Independent Study, and Placement Study are all 0.
- Course Stages:** A table with columns: *Stage, *Assessment Method, Coursework, Written Exam, Practical Exam, *Learning/Teaching Method, Scheduled Study, Independent Study, Placement Study. The values for Coursework, Written Exam, Practical Exam, Scheduled Study, Independent Study, and Placement Study are all 0.

Qualification ID

Use this field to indicate the ID that links Course Delivery and Qualification.

The following table describes the type of data that you can enter in each group box:

Group Box	Used for Entering
Program HESA Data	Student return's Course entity fields and their associated values. Unistats/KIS return's KISCourse entity fields and their associated values.
Program HESA Subjects	Student return's CourseSubject entity field values. KISCourse entity's JACSA, JACSB and JACSC fields and their associated values.
Program HECoS Subjects	Data Futures return's CourseSubject entity field values
Program HESA Instance Data	Instance entity fields and their associated values.

Group Box	Used for Entering
KIS Course Data	KISCourse entity fields and their associated values.
KIS Course Links	Values for URL fields of KISCourse entity, such as the CRSEURL field.
Stage Modules and Course Stages	Unistats/KIS CourseStage entity fields and their associated values.
Accreditation	Unistats/KIS Accreditation entity fields and their associated values.

Program HESA Subjects

You can define a maximum of three subjects. The total percentage for the three subjects must equal 100.

Subject

Enter a value that the system will use to derive the CourseSubject.SBJCA field.

JACS2

Enter a value only if the JACS3 value entered in the Subject field is not valid in JACS2 (that is, the value entered in the Subject field is a JACS3 code that does not appear in JACS2 prompt).

Percentage

Enter a value that the system will use to derive the CourseSubject.SBJCNT field.

ITT Subject (Initial Teacher Training subject)

Select to indicate that the subject is an ITT subject. The system uses this check box setting to derive the CourseSubject.ITTSUBJECT field.

The system enables the check box only if the HESA Subject is valid for the ITT return. The valid SBJCA values for ITT return are available on the HESA web site.

Program HECos Subjects

You can define a maximum of five subjects for the Data Futures return. The total percentage for all five subjects must equal 100.

Subject

Enter a value that the system will use to derive the CourseSubject.SBJCA field.

Percentage

Enter a value that the system will use to derive the CourseSubject.SBJCNT field.

ITT Subject (Initial Teacher Training subject)

Select to indicate that the subject is an ITT subject. The system uses this check box setting to derive the CourseSubject.ITTSUBJECT field.

Accreditation

Accreditation Type

(Optional) Enter a value that the system will use to derive the Accreditation.ACCTYPE field.

Each row on the Accreditation group box must have a unique accreditation type. If codes are not provided in the Cnn061CodeLists.xsd file, then you manually add the codes for this field through the Codes page.

Accreditation ID

(Optional) Select an accreditation ID. This ID is used to determine which records are considered for the Curriculum Accreditation entity in the Data Futures return.

Dependency

If you select this check box, the system derives the Accreditation.ACCDEPEND as *I*.

When you select this check box, the Accreditation Dependency URL field appears.

This field is applicable only to Unistats.

Accreditation Dependency URL

Enter a value that the system uses to derive the Accreditation.ACCDEPENDURL field.

This field is applicable only to Unistats.

Stage Modules

Note: This data is no longer required because the Course Stages entity has been removed from the Unistats return.

This group box enables you to define the course offerings associated with each stage of the course and displays the FTE and assessment and teaching/learning values defined for each course offering in the HESA Module Data record.

Course Stages

Note: This data is no longer required because the Course Stages entity has been removed from the Unistats return.

The read-only row in this group box displays the weighted averages (by FTE) for the six % percentage fields based on any records added to the Stage Modules group box.

For example, based on the modules defined in the Stage Modules group box of the example graphic, the row for Stage 1 in the Course Stages grid would include read-only percentage fields below the updatable fields for Coursework, Written Exam, Practical Exam, Scheduled Study, Independent Study and Placement Study.

Each of the fields contains the average weighted by FTE for that element to 2 decimal places, for example, the weighted average value for Coursework from the records shown below would be FTE of each module multiplied by the Coursework value for each module. The total for all the modules would then be divided by the total FTE to get the average:

FTE for 666683 * Cwk = 20* 70 = 1400

+

FTE for 666684 * Cwk = 15 * 20 = 300

+

FTE for 666685 * Cwk = 25 *40 = 1000

+

Total = 2700

The total 2700 would then be divided by the total FTE of all the modules, that is 65.

= 2700/60 = 45

The same applies to each of the six fields to give the totals shown above.

You could then decide to (a) add percentage integer values in the updatable fields using the module averages as a guide, example, for Stage 1 add values 43, 39, 18 for Scheduled Study, Independent Study and Placement Study as the module averages rounded to make 100 total, and those values would be derived in the extract or (b) leave all the updatable fields as zero, in which case, if Stage Modules records had been defined, then the values would be derived based on the weighted averages from the modules rounded to the nearest integer with some adjustment to ensure that the total of each group of three fields equals 100. If the updatable fields were all zero and no Stage Modules were defined then each of the fields would be derived as zero.

Entering HESA Data for a Program Offering and Program Year

Access the Program Offering/Year HESA page (Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Program Offering/Year HESA).

Image: Program Offering/Year HESA page

This example illustrates the fields and controls on the Program Offering/Year HESA page . You can find definitions for the fields and controls later on this page.

The screenshot shows a web application interface with several sections:

- Navigation:** Enrollment, Course, Dynamic Date, Program HESA Data, Program Offering/Year HESA.
- Academic Information:**
 - Academic Institution: PSUNV PeopleSoft University
 - Academic Program: FAU Fine Arts
- Program Offering HESA Data:**
 - Effective Date: 03/09/2009
 - Status: Active
 - *Academic Load: Full-Time
 - FTE Calculation Type: Derive load from Program
 - FTE Load: 100

*Field	Description	*Code	Description
FEEELIG	Fee eligibility	1	Eligible to pay home fees
IMPRATE	Implied rate of council partia	20	
- Program Year HESA Data:**
 - *Academic Load: Full-Time
 - FTE Calculation Type: Derive load from Program
 - FTE Load: 100
 - *Year of Program: 1

*Field	Description	*Code	Description
DESTOCM	Destination of outward credit	AD	Andorra
FUNDLEV	Level applicable to funding co	10	Undergraduate

You can enter Instance entity field values in the Program Offering HESA Data and Program Year HESA Data group boxes.

Entering HESA Data for an Academic Plan

Access the Plan HESA Data page (Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan HESA Data).

Group boxes on this page are similar to the group boxes on the Program HESA Data page (except that the Offshore Provision, HESA Course and ILR Aims group boxes do not appear on the Program HESA Data page).

You can use this page to enter return fields and corresponding values which you have not defined at the program level. For example, you can use the Plan Subject HESA Data group box to define course subjects at the Biology plan level instead of at the BS program level.

Qualification ID Use this field to indicate the ID that links Course Delivery and Qualification.

Course Title Optionally, enter a value that the system uses to derive the Course.CTITLE field for the Student return and the KISCourse.TITLEK field for the Unistats/KIS return. If you do not enter

a value, the system derives the Course.CTITLE value from the plan description.

KIS Title

Enter a value if the KISCourse.TITLEK value should be different from the value required for the Student return's Course.CTITLE. If both KIS Title and Course Title fields are left blank, the system derives the KISCourse.TITLEK value from the plan description.

The system enables this KIS Title field only if KIS Type has a value or at least one of the child subplans has a KIS Type value.

Report to HESA

Select to include the plan in the Course or Provision entity. If you select this check box for a plan, you cannot report data for its subplans.

The system enables this check box only if the Report to HESA check boxes of all the subplans associated with the plan are deselected.

Offshore Plan

Select to display the Offshore Provision group box. If you select this check box, the system includes the plan in the Aggregate Offshore return but does not include the plan in the Student return.

KIS Type

The system enables this field only if KIS Type values of all the subplans associated with the plan are blank. This KIS Type field value is used to determine whether the plan should be included in the KISCourse entity. Blank indicates that the plan is not included in the Unistats/KIS return.

The system enables the KIS Course Data, KIS Course Links, Stage Modules, Course Stages, Accreditation, HESA Course and ILR Aims group boxes and the KIS Title field only if KIS Type has a value or at least one of the child subplans has a KIS Type value.

The system enables the ITT Subject check box only if the HESA Subject is valid for the ITT return. The valid SBJCA values for ITT return are available on the HESA web site.

Offshore Provision

Use the Offshore Provision group box to enter field values for the Provision entity (Aggregate Offshore return).

HESA Course

The system uses the values that you enter in this group box to derive the field values for the Unistats/KIS HESACourse entity.

You can add any number of rows but the HESA Year and Course ID combination must be unique for each row in this group box.

ILR Aims

The system uses the values that you enter in this group box to derive the field values for the Unistats/KIS ILRAims entity.

You can add a maximum of 25 records. The ILR Year and ILR Aim combination for each row must be unique.

Entering HESA Data for a Plan Offering and Plan Year

Access the Plan Offering/Year HESA page (Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan Offering/Year HESA).

Image: Plan Offering/Year HESA page 1 of 2

This example illustrates the fields and controls on the Plan Offering/Year HESA page 1 of 2.

The screenshot displays the 'Plan Offering/Year HESA' page with the following details:

- Navigation:** Academic Plan Table | Print Options | Taxonomy | Owner | Plan HESA Data | **Plan Offering/Year HESA** | PBI Data | Research Processing Options | Advyisement
- Academic Institution:** PSGBR | PeopleSoft University UK
- Academic Plan:** HIST | History
- Details:** Effective Date 01/01/1900 | Status Active | Find | View All | First | 1 of 1 | Last
- Plan Offering HESA Data:** Find | View All | First | 1 of 2 | Last
 - *Academic Load: Full-Time
 - Offering Start Term: 2190 | 2019-20 Academic Year
 - Offering Start Session: [Empty]
 - Campus: MAIN | Main Campus
 - Offering End Term: 2200 | 2020-21 Academic Year
 - Offering End Session: [Empty]
 - Qualification ID: BAHIST | BA (Hons) History Full-Time
 - Offering Title: [Empty]
 - Course Delivery ID: HISTF2190MAIN
 - FTE Calculation Type: Derive load from Modules
- Field Details:** Find | First | 1-2 of 2 | Last

*Field	Description	*Code	Description
DISTANCELEARNING	Distance learning	01	Distance learning
EXPECTEDENDDATE	Expected end date	2021-03-06	
- Accreditation:** Personalize | Find | 1 of 1 | Last

Accreditation ID	Description
1 06603	Accredited by the General Teaching Council for Scotland (GTCS): Secondary

Image: Plan Offering/Year HESA page 2 of 2

This example illustrates the fields and controls on the Plan Offering/Year HESA page 2of 2.

The screenshot shows the 'Plan Year HESA Data' form with the following fields and values:

- *Academic Load: Full-Time
- Offering Start Term: 2190 (2019-20 Academic Year)
- Offering Start Session: (empty)
- Campus: MAIN (Main Campus)
- *Year of Program: 1
- Year Term: 2190 (2019-20 Academic Year)
- Year Session: (empty)
- Cohort: (empty)
- Course Session ID: HISTF2190MAIN12190
- Year Type: (empty)
- FTE Calculation Type: Derive load from Modules

The 'Field Details' table is as follows:

*Field	Description	*Code	Description
FOUNDEYEAR	Foundation year	01	This course session does not r

Group boxes on this page are similar to the group boxes on the Program Offering/Year HESA page.

Use the Plan Offering/Year HESA page to enter fields and corresponding values that you did not define at the subplan offering/year or program offering/year levels.

Plan Offering/Year HESA Data

Offering Start Term

Select an offering start term. This value is used to derive CourseDelivery.COURSESTARTDATE. You can override this value if you define a value for COURSESTARTDATE in the Field Details region.

Offering Start Session

(Optional) Use this field to define a session start date if you have different starting points within the academic year or term.

Campus

(Optional) Use this field if you have multiple offerings of a course on different campuses and each course must be returned as separate course deliveries.

Year Term

Select the term when the year of program starts.

Offering End Term

Select an the offering end term. This field is used to derive CourseDelivery.EXPECTEDENDDATE. You can override this value if you specify a term end date in the Field Details region.

Offering End Session

(Optional) Use this field to specify an end date if you have different end dates for sessions within the academic year or term.

Qualification ID

Use this field to indicate the ID that links Course Delivery and Qualification.

Offering Title

(Optional) Specify an offering-specific title that is different from what is reported in Course.COURSENAME. This value is derived for COURSEDELIVERYTITLE.

Cohort	(Optional) Enter a cohort tag for a year of program to allow students to be associated with the course session by cohort.
Course Delivery ID	Enter the Course Delivery ID. The system automatically generates this value to identify the course delivery, but it can also be entered manually.
Accreditation ID	Select an Accreditation ID for this offering.
Year Type	(Optional) Select <i>Final</i> to indicate this is the final year of the offering.

Entering HESA Data for a Subplan

Access the Sub-Plan HESA page (Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan HESA).

The fields on this page are similar to the fields on the Plan HESA Data page. Like the Plan HESA Data page, the Unistats/KIS group boxes on the Sub-Plan HESA page (KIS Course Data, KIS Course Links, Stage Modules, Course Stages, Accreditation, HESA Course and ILR Aims) appear only if KIS Type field has a value.

The system disables the Report to HESA check box on the Sub-Plan HESA page if you selected the Report to HESA check box for the parent plan on the Plan HESA Data page. Similarly, the system disables the KIS Type field on the Sub-Plan HESA page if you selected a value for the KIS Type field for the parent plan on the Plan HESA Data page. That is, the system enables the KIS Type field on the Sub-Plan HESA page only if the KIS Type value of the parent plan is blank. The KIS Type field value on the Sub-Plan HESA page is used to determine whether the subplan should be included in the KIS Course entity. Blank indicates that the subplan is not included in the Unistats/KIS return.

If you want to report values from the subplan level, use the Sub-Plan HESA page to enter the fields and their corresponding values. For example, you can use the Sub-Plan HESA Data group box to define the Course.COURSEAIM value at the Molecular Biology subplan level rather than defining the Course.COURSEAIM value at the Biology plan level or the BS program level.

Select the Offshore Sub-Plan check box to display the Offshore Provision group box. If you select this check box, the system includes the subplan in the Aggregate Offshore return but does not include the subplan in the Student return.

The system enables the ITT Subject Flag check box only if the HESA Subject is valid for the ITT return. The valid SBJCA values for ITT return are available on the HESA web site.

Entering HESA Data for a Subplan Offering and Subplan Year

Access the Sub-Plan Offering/Year HESA page (Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan Offering/Year HESA).

Image: Sub-Plan Offering/Year HESA page 1 of 2

This example illustrates the fields and controls on the Sub-Plan Offering/Year HESA page 1 of 2. You can find definitions for the fields and controls later on this page.

Image: Sub-Plan Offering/Year HESA page 2 of 2

This example illustrates the fields and controls on the Sub-Plan Offering/Year HESA page 2 of 2. You can find definitions for the fields and controls later on this page.

Group boxes on this page are similar to the group boxes on the Plan Offering/Year HESA page and Program Offering/Year HESA page.

Use the Sub-Plan Offering/Year HESA page to enter fields and corresponding values that you did not define at the plan offering/year or program offering/year levels.

Creating HESA Modules

Access the Create HESA Module Data page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Create Module).

The Create HESA Module Data process creates HESA Module Data records for active course offerings. The HESA Module Data record is created with an effective date equal to the latest effective date of the course offering record and the Report to HESA column set to *Yes*.

The process ignores course offerings that already have a corresponding HESA Module Data record.

Note: The Create HESA Module Data process does not allow you to create dummy module data records. Use the HESA Dummy Module Data page to manually create a dummy module data record.

Processing Steps

The Create HESA Module Data process examines each distinct course offering record of the institution.

If you do not select a Reporting Period parameter, the process creates HESA Module Data records as described in the following steps:

1. The process selects the current effective dated record of the course offering (that is, the process selects the most recent effective dated record on or before system date). This is to check whether the course offering is active at the time the process is run. For example, let us suppose two effective dated records exist for a course offering CALCULUS 1. One is dated August 01, 2008 and the other is dated August 01, 2009. If you run the Create HESA Module Data process on August 03, 2009, the process selects the CALCULUS 1 course offering record dated August 01, 2009.
2. If the selected course offering record status is inactive, the process does not create HESA Module Data records.
3. If the selected course offering record is active:
 - a. The process selects the earliest active effective dated record for the course offering. For example, in step 1 the process had selected a course offering record dated 02, August, 2009. If we assume that the course offering CALCULUS 1 has also got effective dated records dated 01 July, 2008 and 01, July 2009, the process selects the record dated 01 July, 2008.
 - b. If a HESA Module Data record does not exist for the selected record, the process creates a new record using the selected record. The process sets the Report to HESA value to *Y*.
 - c. If a HESA Module Data record exists, the process stops processing that course offering record.

If you select a Reporting Period parameter, the process creates new HESA Module Data records and new effective dated rows for the reporting period as described in the following steps:

1. The process selects the earliest effective dated record relevant to the reporting period for the course offering (that is, the process selects the earliest effective dated record between the reporting period start and end dates). For example, let us suppose that the reporting period is 2008-09 and for a course offering General Accounting, two effective dated records exist. One is August 01, 2008 and the other is November 01, 2008. In this case, the process selects the course offering record dated August 01, 2008.

If an effective dated course offering record does not exist in the reporting period, then the process does not process the record.

2. If the selected course offering record is active and:
 - a. If an existing HESA Module Data record does not exist, the process creates a new record using the effective date of the selected course offering record. The process sets the Report To HESA value to *Y*.
 - b. If a HESA Module Data record exists with an effective date in the reporting period, the process stops processing that record.
 - c. If a HESA Module Data record with an effective date after the reporting period exists, the process updates the effective date of that record and any child field records using the effective date of the selected course offering record.
 - d. If a HESA Module Data record with an effective date before the reporting period exists, the process creates a new effective dated row using the HESA Module Data record and the effective date of the selected course offering record. The process also copies any existing child Module field records of the HESA Module Data record to the new effective dated HESA Module Data record.
3. If the selected course offering record is inactive, the process stops processing. Note that the process derives the active and inactive status value from the parent Course Catalog record of the course offering.

Entering HESA Data for a Module

Access the HESA Module Data page (Curriculum Management > Course Catalog > HESA Module Details).

Image: HESA Module Data page

This example illustrates the fields and controls on the HESA Module Data page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'HESA Module Data' page with the following sections:

- Course Information:** Course ID 667476, Academic Skills for English; Long Course Title Academic Skills for English; Course Offering Nbr 1; Academic Institution PSGBR, PeopleSoft University UK.
- Module Details:** Includes an 'Effective Date' field (01/01/1900) and a checked 'Report to HESA flag'.
- Module Data:** A table with columns for Field, Description, Code, and Description.
- HESA Subjects:** A table with columns for Cost Centre, Description, Subject, Description, and Percentage.
- HECoS Subjects:** A table with columns for Cost Centre, Description, Subject, Description, and Percentage.
- Roles:** A table with columns for Type, Description, Identifier, Venue ID, Venue Name, and Percentage.
- Venues:** A table with columns for Venue ID, Venue Name, and Percentage.

In the HESA Module Data page:

- For each course stage, use the Module Details group box to enter weighted averages (by FTE) in the six percentage fields. These KIS Course Stage fields also exist in the Course Stages region of the Program, Plan and Sub-Plan HESA data pages. For more information, refer to the ‘Entering HESA Data for an Academic Program’ topic in this section.

Note: These values are no longer required because the Course Stage entity has been removed from the Unistats return.

- Use the Module Data group box to enter Module and Student on Module entity fields and their associated values.
- Use the HESA Subjects group box to enter values that the system uses for deriving HESA Subject entity fields. You can enter a maximum of 16 subjects. The Subject/Cost Centre Percentage for all module subject records must equal 100.

You can manually add a HESA Module Data record for a course offering using the HESA Module Data page in add mode. However, if you want to create multiple HESA module data records for course offerings, use the Create HESA Module Data process.

HECoS Subjects

This group box is the same as the group box in Plan HESA Data page, except it does not have the ITT Subject field.

You can define a maximum of three subjects.

Entering HESA Data for a Dummy Module

Access the HESA Dummy Module Data page ((Curriculum Management > Course Catalog > HESA Dummy Module Details).

Image: HESA Dummy Module Data page

This example illustrates the fields and controls on the HESA Dummy Module Data page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'HESA Dummy Module Data' page. At the top, it shows the 'Academic Plan' as 'BIO' (Biology) and 'Year' as '0'. The 'Academic Institution' is listed as 'PSGBR' (PeopleSoft University UK). The page is divided into several sections:

- Module Details:** Includes a date field for '*Effective Date' set to 11/10/2017, and two checkboxes: 'Report to HESA flag' and 'Always Include'.
- Module Data:** A table with columns for '*Field', 'Description', '*Code', and 'Description'.
- HESA Subjects:** A table with columns for '*Cost Centre', 'Description', '*Subject', 'Description', and '*Percentage'.
- HECoS Subjects:** A table with columns for '*Subject', 'Description', and '*Percentage'.

You can manually add a HESA dummy module data record using the HESA Dummy Module Data page in add mode. The system uses the HESA dummy module data record to create a dummy module in the Student On Module entity. This dummy module represents the year of program for active Research and Placement students who do not have any class enrollments

Always Include

Select this check box to report the dummy module in the Student on Module entity together with any eligible class enrollments for the students.

If this check box is not selected, the dummy module is reported *only* if the student does not have any class enrollments being reported in the Student on Module entity.

HECoS Subjects

This group box is the same as the group box in HESA Module Data. You can define a maximum of three subjects.

Creating HESA Instance and Person HESA Data Records for Students

Access the Create HESA Instance page (Records and Enrollment > HESA Reporting > HESA Returns Setup > Create Instance).

The Create HESA Instance process examines student program/plan records and determines whether there is a related HESA Instance record for a student. If a student does not have an Instance record, the process creates a new HESA Instance record using the Effective Date of the MATR or ACTV row in the Student Program/Plan stack record and sets the Report to HESA internal setting to *Yes* for the student. The process first selects the MATR row and creates a HESA record with that effective date. If a MATR row does not exist, the process selects the row with program action ACTV and creates a HESA record with that effective date.

The process automatically populates the Instance Identifier field value to the HESA Instance record. The NUMHUS derivation logic considers the Instance Identifier value. The process also creates the Person HESA Data record if it does not already exist for the student.

The process generates the Instance Identifier based on the Academic Career, Student Career Number, and Entry Year of the student. The system determines the Entry Year based on the reporting period and the effective date that is used to create the HESA Instance record. The system selects the Reporting Year value of the HESA reporting period that the effective date falls within and uses the year value for Entry Year. For example, an effective date of September 20, 2008 falls within the 2008/09 reporting period, which has a reporting year value of 2008, so Entry Year would be 2008. If the student's career details are Career = UGRD, Career Number = 0, and effective date = September 20, 2008, then the process creates an Instance Identifier of UGRD02008.

Year of Student (YEARSTU) defaults to 1, and Year of Program is set to either the Year of Program value in the same Student Program/Plan record used for Effective Date or a default value of 1.

Academic Career, Academic Program, Academic Plan, Academic Sub-Plan

Select values as needed to generate the HESA Instance records for students with the selected career, program, plan, or subplan.

Start Date

Enter a date so that only students who matriculated on and after this date are included by the process.

If the Update Registration Number check box is selected, you must enter a Start Date.

Update Registration Number

Select to update existing HESA instance records where the Registration Number is zero and the earliest effective-dated row is on or after the Start Date. The system updates the registration number to 1 for the most recent effective-dated record.

Student Override

Student Override

Select if you want to generate HESA Instance records for the IDs selected in the EmplID field.

If you select the Student Override check box, the process ignores any values entered in the Academic Career, Academic Program, Academic Plan, Academic Sub-Plan, and Start Date fields.

EmplID (employee ID)

Enter the IDs of one or more students for whom the process must create the Instance data.

Restricting Access to Person HESA Data Fields

Access the Fields page (Records and Enrollment, >HESA Reporting >HESA Returns Setup >Fields).

Image: Fields page

This example illustrates the fields and controls on the Fields page. You can find definitions for the fields and controls later on this page.

Fields

Field: RELBLF

Description: Religion or belief

Long Description: Religion or belief

HESA Data Type: RELBLFCodeType

Field Type: Text Text Data Type

Field Length: 2.0

Source: Seeded

***Display Region:** Restricted Active

Fixed

Available at

Instance

Advisor

Program

Program Offering

Program Offering Year

Plan

Plan Offering

Plan Offering Year

Subplan

Sub-Plan Offering

Sub-Plan Offering Year

Module

To restrict access, select a value for the Display Region field if the system has selected the Available at check box for Student. The Display Region field remains read-only for all other fields.

Display Region

This field is available for edit only if the system has selected the Available at check box for Student level data capture. Three values are delivered: *Restricted*, *Other* and *Not Displayed*.

If you select *Other*, the field will be available only on the HESA Student Data page where you can capture the field’s value.

If you select *Restricted*, the field will be available only on the HESA Restricted Data page where you can capture the field’s value.

If you select *Not Displayed*, you cannot capture any new values for the field on the HESA Student Data page but the page will continue to display any existing values for the field.

You can restrict the following delivered fields: DISABLE, ETHNIC, GENDERID, NATION, NATIOND, RELBLF, SDEPEND, SEXORT, TTACCOM, TTPCODE and WELSP.

Entering HESA Data for a Person

Access the HESA Student Data page (Campus Community > Personal Information > Add/Update a Person > HESA Student Data).

Image: HESA Student Data page

This example illustrates the fields and controls on the HESA Student Data page. You can find definitions for the fields and controls later on this page.

Field	Description	Code	Description
DISABLE	Disability	00	No known disability
NATION	Nationality	GB	United Kingdom
NATIOND	National identity	E	English
SDEPEND	Dependants in reporting year	03	No dependents
TTACCOM	Term-time accommodation	8	Other rented accommodation
WELSSP	Welsh speaker indicator	3	Not Welsh speaker

Use the HESA Student Data page to enter fields and their corresponding values at the student level.

You can manually add a Person HESA Data record using the HESA Student Data page in add mode. However, if you want to create multiple Person HESA Data records with instance records, use the Create HESA Instance process.

Note: On this page, you can select only those fields for which the Display Region is set up as *Other* on the Fields page. The fields that have Display Region as blank will be displayed on this page if they have any values but you cannot select those fields.

Entering Restricted HESA Data for a Person

Access the HESA Restricted Data page (Campus Community >Personal Information >Add/Update a Person >HESA Restricted Data).

Image: HESA Restricted Data page

This example illustrates the fields and controls on the HESA Restricted Data. You can find definitions for the fields and controls later on this page.

The screenshot shows the HESA Restricted Data page for James Barret (SRGBR001). The page has several tabs: Biographical Details, Addresses, Regional, HESA Student Data, and HESA Restricted Data. The HESA Restricted Data tab is active. Below the tabs, there is a header with the person's name, ID, and a star icon. Below the header, there is a search bar and a list of fields. The fields are:

Field	Description	Code	Description
GENDERID	Gender identity	01	Yes
RELBLF	Religion or belief	03	Christian
SEXORT	Sexual orientation	04	Heterosexual

On this page, you can select only those fields for which the Display Region is set up as *Restricted* on the Fields page.

Access to the HESA Restricted Data page can be controlled through the PeopleTools Permission List setup:

- Menu Name: CC_BIO_DEMO_DATA – Bio/Demographic Data
- Component Name: SCC_BIO_DEMO – Add/Update a Person

Entering HESA Instance Data for a Student

Access the HESA Instance page (Records and Enrollment > Career and Program Information > HESA Instance Details > HESA Instance).

Image: HESA Instance page

This example illustrates the fields and controls on the HESA Instance page . You can find definitions for the fields and controls later on this page.

The screenshot shows the 'HESA Instance' page for a student named James Barret. The page is divided into several sections:

- Student Information:** Name (James Barret), ID (SRGBR001), Academic Career (Undergraduate), Career Number (0), Academic Institution (PeopleSoft University UK), Status (Active), Academic Program (Bachelor of Arts), Academic Plan (History), Admit Term (2006-2007 Academic Year), Academic Load (Full-Time), and Student Identifier (AAAA01022341A).
- Instance HESA Data:** A form with fields for Effective Date (08/01/2017), Reported Plan, Linked Career, Linked Career Number, HIN Population Year (2016), Instance Load, Start Session, Expected End Date, Current Term, Instance Identifier (UGRD02006), Registration Number, Start Date of Instance (09/18/2006), Year of Student (3), Year of Program (4), and a checked 'Report to HESA' checkbox.
- Instance Details:** A table with columns for Field, Description, Code, and Description. One entry is shown: Field 'MSTUFEE' (Major source of tuition fees) with Code '01' (No award or financial backing).
- Financial Support, Qualifications Awarded, and Research Data:** These sections are currently collapsed.
- FTE Details:** A table with columns for Reporting Period, Calculated FTE, Override FTE, and Report Zero. Data for 2016/17 shows Calculated FTE of 50.0 and Override FTE of 100.0. Data for 2017/18 is currently blank.

This page is available for a student if you have created a HESA Instance record for the student. Use the Create HESA Instance page to create HESA Instance records for a group of students. You can also manually create a HESA Instance record for a student using the HESA Instance page in add mode.

Student Identifier

This is a read-only field that displays either the student’s current SID or HUSID.

The combination of this value and Instance Identifier (NUMHUS) is used as the unique key for the Engagement entity.

Instance HESA Data

Instance Identifier

Displays the value generated by the Create HESA Instance process when it creates a HESA Instance record. You can manually enter or modify this value. The system uses this value to derive NUMHUS.

Reported Plan

Select the primary plan to be used for HESA reporting if the student has more than one active plan.

Registration Number	This field displays 1 for new instance records. The system uses the value in this field and Instance Identifier to ensure the combination is a unique ID for the institution.
Start Date of Instance	<p>Displays the date generated by the Create HESA Instance process. You can manually enter or modify this value.</p> <p>The system uses this value to derive the Instance.COMDATE (Student return) and Student.COMDATE (ITT return).</p>
Year of Student	Displays the value generated by the Calculate Year of Student process. You can manually enter or modify this value. The system uses this value to derive the Instance.YEARSTU field (Student return) and Student.YEARSTU field (ITT return).
Year Of Program	Enter a value that the system uses to derive the Instance.YEARPRG field (Student return) and Student.YEARPRG field (ITT return).
Linked Career and Linked Career Number	Select a career to link this Instance to previous careers. The system treats all the linked careers for a student as a single Instance for HESA reporting.
HIN Population Year	<p>Displays the value entered by the Import HIN Target List process. You can edit the value, if required.</p> <p>The Create Extract process uses the HIN Population Year value to determine which Instance entities to include in the return. If the HIN Population Year matches the reporting year of the reporting period, then the process automatically includes the Instance entity of the student regardless of other criteria (such as whether the Report To HESA is selected).</p> <p>Examples of valid HIN Population Year values include <i>2008</i> (for 2008/09 reporting) and <i>2009</i> (for 2009/10 reporting).</p>
Instance Load	<p>(Optional) Use this field to override the academic load value from Student Program.</p> <p>For example, if the student a repeating part-time student but is still on a full-time program <i>and</i> the Academic Load in Student Program is set to part-time, the Instance Load field can be set to full-time to ensure the student is still associated with a full-time Course Delivery.</p>
Start Session	(Optional) Use this field to override the earliest start session that is selected from the student enrollment records. You can also use this field to define non-standard start sessions where there are no related enrollment records.
Expected End Date	(Optional) Use this field to allow a specific end date to be defined where the date is different from the expected end date that is reported for the student's Course Delivery.

Current Term (Optional) Use this field to override the current term that is selected from the term activation records.

Report To HESA Select to report the Instance to HESA. If the check box is cleared, the Create Extract process does not create a return extract for the instance.

Fees

Use this region to define fee invoice amount entities for a student course session. Fee Amount and Fee Collector are used to derive the Student Fee entity.

Financial Support

The page displays the Financial Support region if you have selected the Show Financial Support region check box on the HESA Configuration page. The system uses the values that you enter in this region to create the Financial Support entity.

ITT Placement

This region appears if you select the Show ITT Placement region check box on the HESA Configuration page. You can define a maximum of five records. The School and Start Date combination must be unique.

Collaborative Provision

Optionally, add partner details for research collaboration.

Research Data

In the Research Data group box, the combination of REF Unit, RAE Unit, and Collaborating Provider must be unique and at least one value must be defined (either REF Unit or RAE Unit) along with Percentage to save a record.

Collaborating Provider To record the same REF Unit for your institution as well as a collaborating provider, leave this field blank for your institution's records, and enter a value for the collaborating provider's records.

FTE Details

Calculated FTE Displays the value calculated by the Calculate Full-Time Equivalence process.

Override FTE Enter a value to override the Calculated FTE.

Report Zero Select to report zero in STULOAD rather than the Calculated FTE or Override FTE values

Entering Mobility Data for a Student

Access the Mobility page (Records and Enrollment >Career and Program Information >HESA Instance Details >Mobility).

Image: Mobility page

This example illustrates the fields and controls on the Mobility page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Mobility' page for a student. At the top, there are tabs for 'HESA Instance', 'Mobility', 'Entry Profile', and 'Further Education'. The student's details are as follows:

Name:	Fredrich Jones	ID:	SRGBR002
Academic Career:	Undergraduate	Student Career Nbr:	0
Academic Institution:	PeopleSoft University UK	Car Req Term:	Acad year 2007-2008
Academic Program:	Bachelor of Science	Status:	Active

Below the student details is a form for entering mobility data. The 'Effective Date' is set to 17/09/2007. The 'Mobility' section contains the following fields:

- *Location: EU (European Union not otherwise s)
- External Org ID: 000010029 (Florida Keys Community College)
- *Scheme: 03 (ERASMUS)
- *Start Date: 05/05/2014
- *End Date: 09/05/2014
- *Type 1: 02 (Work abroad)
- Type 2: (empty)
- Type 3: (empty)

Mobility

The combination of Location, Scheme and Start Date must be unique.

External Org ID

You can enter an External Organization ID if you want to record the exact location of the student.

Type 1

Select a MOBTYP1 code.

Type 2

Select a MOBTYP2 code.

This field becomes available only if you have selected a value for the Type 1 field. The Type 2 and Type 1 values cannot be the same.

Type 3

Select a MOBTYP3 code.

This field becomes available only if you have selected a value for the Type 2 field. The Type 3, Type 2 and Type 1 values cannot be the same.

Off Venue Activity

The combination of Activity Type, Mobility Scheme, External Org ID, Host Name, Host ID Type, Host ID, and Start Date must be unique.

If there are multiple records with the same Activity Type, Scheme, and Host, then you must specify a Start Date.

External Org ID

(Optional) The values that appear on the list are organizations that have one of the following values defined in Regional: UKPRN, Unique Reference Number, Companies House Number, National Health Service ID, Host ID.

If you select an external organization, then these fields are disabled:

- Host Name
- Host ID Type
- Host ID
- Country
- Postcode
- Lead School

Entering HESA Entry Profile Data for a Student

Access the Entry Profile page (Records and Enrollment > Career and Program Information > HESA Instance Details > Entry Profile).

Image: Entry Profile page

This example illustrates the fields and controls on the Entry Profile page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Entry Profile' tab selected in a navigation bar. Below the tabs, student information is displayed: Name: James Barret, ID: SRGBR001, Academic Career: Undergraduate, Student Career Nbr: 0, Academic Institution: PeopleSoft University UK, Status: Completed, Academic Program: Bachelor of Arts, and Car Req Term: Acad year 2006-2007. An 'Effective Date' of 01/08/2011 is shown with an 'Include Entry Profile' checkbox. Below this is an 'Entry Profile' table with one row: Field 'DOMICILE', Description 'Domicile', Code 'BE', and Description 'Belgium'. At the bottom is an 'Entry Qualifications' table with columns for Type, Description, Subject, Description, Year, Sitting, Grade, Imported, and Report to HESA. The 'Sitting' dropdown is set to 'Not know'.

Include Entry Profile

Select if want an entry profile to be created when the Start Date of Instance is before the start of the reporting period.

If the Start Date of Instance is in the reporting period, you need not select this check box. The Extract process automatically creates an entry profile when the Start Date of Instance is equal to or after the start date of the reporting period, regardless of whether you select or clear this check box.

Note: The Create HESA Instance process clears the Include Entry Profile check box, when it creates a new HESA instance record.

Imported

Indicates whether the data was imported from UCAS.

Report To HESA

Select to include the record in the Qualifications On Entry entity.

Note: If grades are not mapped to a particular qualification type on the Entry Qualification Mapping page, then all the grades are available for a qualification type. If you have done a Entry Qualification mapping, the lookup for the Grade field displays only the mapped grades for a type.

Entering Further Education Data for a Student

Access the Further Education page (Records and Enrollment >Career and Program Information >HESA Instance Details >Further Education).

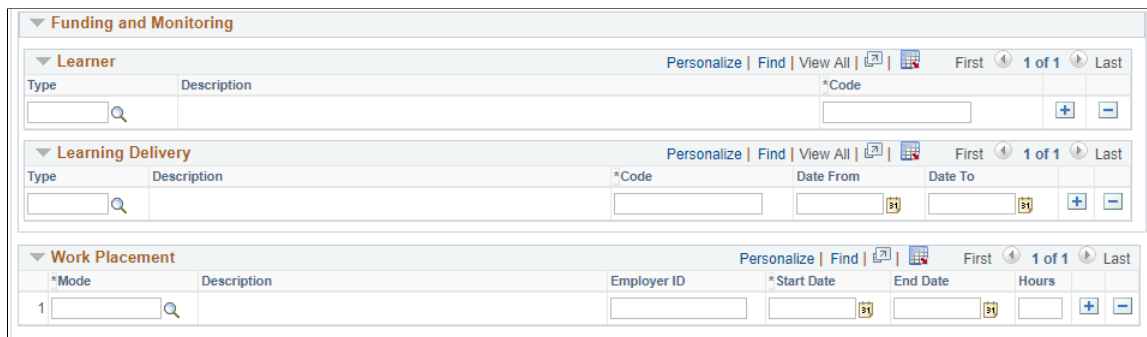

Image: Further Education page (1 of 2)

This example illustrates the fields and controls on the Further Education page (1 of 2). You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Further Education' page for a student named James Barret. At the top, there are tabs for 'HESA Instance', 'Mobility', 'Entry Profile', and 'Further Education'. The student's details are shown: Name (James Barret), ID (SRGBR001), Academic Career (Undergraduate), Student Career Nbr (0), Academic Institution (PeopleSoft University UK), Status (Active), and Academic Program (Bachelor of Arts). Below this, there are sections for 'Details', 'Instance Details', 'Employment Status', and 'Employment Monitoring'. Each section contains various input fields and search controls. The 'Instance Details' section has a table with columns for Field, Description, Code, and Description. The 'Employment Status' section includes fields for Record Number (1), Employment Status, Status Date, and Workplace Postcode. The 'Employment Monitoring' section has a table with columns for Record Number, Type, Description, and Code.

Image: Further Education page (2 of 2)

This example illustrates the fields and controls on the Further Education page (2 of 2). You can find definitions for the fields and controls later on this page.

The system displays this page only if you have selected the Enable Further Education page check box on the HESA Configuration page.

Work Placement

The values in this region are used to derive the Learning Delivery Work Placement entity in the Student Return.

Mode Select the type of work placement.

Employer ID Optional. The value is derived from the Employer ID field in the Employment Status region. Alternatively, you can use this field to record the employer number from the Employer Data Service (EDS).

Start Date Select the date that the work placement started.

End Date Select the date that the work placement ended.

Note: The combination of Mode, Employer ID, and Start Date must be unique. Employer ID can be blank.

Calculating Year of Student Values for Students

Access the Calculate Year of Student page (Records and Enrollment > HESA Reporting > Extract Processing > Calculate Year of Student).

Increment Year of Program Select to increment the Year of Program value by one when the Calculate Year of Student process creates a new effective dated HESA Instance record for the reporting period.

Student Override Select to specify single or multiple students for whom the process should calculate YEARSTU.

Copy Instance Details Select to have the process copy instance records from the previous effective-dated HESA Instance record.

Copy Qualifications Awarded	Select to have the process copy qualifications awarded records from the previous effective-dated HESA Instance record.
Copy Research Data	Select to have the process copy research records from the previous effective-dated HESA Instance record.
Copy FTE Details	Select to have the process copy FTE records from the previous effective-dated HESA Instance record.

The process calculates the value that the system uses to derive the Instance.YEARSTU (Year of student on this instance) field in the Student Return. The Instance.YEARSTU value is the number of reporting periods that the student has been active in the instance (including linked previous instances).

The process examines student class enrollments and calculates the number of distinct reporting periods covered by the enrollments. The process creates new effective dated HESA Instance records for the specified reporting period. For example, if a student has a HESA Instance record with an effective date of August 1, 2007 and the process runs for the 2008/09 reporting period, then the system creates a row with a new calculated YEARSTU value and an effective date of August 1, 2008. This enables you to roll forward the HESA Instance records to a new reporting period. If the student already has an effective dated record in the reporting period, then the process updates the YEARSTU value of that record.

Note: The HESA Instance page displays the value that the Calculate Year of Student process has calculated.

Calculation Steps

The following steps describe how the Calculate Year of Student process selects records and calculates YEARSTU from the selected records:

Step 1: Initial Selection of Records

The process selects HESA Instance records that match the run parameters. For each distinct student career in the HESA Instance records, it selects the latest record with an effective date on or before the reporting period end date only if the Report to HESA setting = Y. If the selected record has Report to HESA setting = N, then the process does not include the record in the calculation even if there are previous effective dated records with the Report To HESA setting = Y. This means, the process selects HESA Instance records that either (a) started prior to the reporting period and there is no effective dated row starting in the reporting period, or (b) started in the reporting period. Depending on the calculated YEARSTU value, it treats the records differently for update in the following steps.

If the latest student program record has a status of COMP and the effective date of that record is before the beginning of the reporting period, then the process assumes that the career has been completed before the reporting period (and has not been reactivated since completion) and the calculation of the YEARSTU for the selected HESA Instance record is skipped.

The process logs a message for each record that is selected.

Step 2: Filter for Active Students

The Calculate Year of Student process calculates and stores a YEARSTU value only if the student has been active in the current reporting period.

To determine the student has been active in the current reporting period, the process performs the following steps:

- The process selects all activated terms for the student career.
- The process determines that the student is active in the current reporting period if there is at least one class for any of the selected terms that satisfies the following conditions:
 - Class Start Date is within the reporting period, or Class End Date is within the reporting period, or Class Start Date is prior to the reporting period and Class End Date is after the reporting period.
 - Status = *Enrolled* or *Dropped*.
 - Units Taken value is greater than zero.
 - Grading basis value matches one of the values defined in the Grading Basis Inclusion region with the Year of Student check box selected on the HESA Configuration page.
 - Repeat Code value is null or does not match a value defined in the Repeat Code Exclusion region with the Year of Student check box selected on the HESA Configuration page.
 - If the student has multiple careers with the same Academic Career value as the career being processed (that is, the same career value with different career numbers), then the process applies a further filter to the class enrollments. In that case, the process selects the class only if the program value of the enrollment record matches one of the program values in the Student Program records for that career and career number.

When the process considers class start and end dates for class enrollments where the Session = *OEE* (open entry/exit), rather than selecting the class start/end dates, the process selects the values from the Student OEE Enrollment Data record for the class enrollment. If the end date is not defined in Student OEE Enrollment Data then the process uses the class end date. The start date is mandatory for a Student OEE Enrollment Data record. Note that the process uses this same OEE logic when it examines class enrollments in the next step (the next step is Step 3, Calculate YEARSTU).

The process does not consider previous linked careers because it assumes that linked careers will only have been active prior to the current reporting period.

In cases where the student has multiple careers, the process does not consider class enrollments that occur before the effective date of the HESA Instance record unless the Instance is linked to a previous career. The selection of activated terms considers only those terms that overlap the Instance, that is where the term begin date is greater than the earliest effective date of the HESA Instance record. The only exception to this rule is where a Linked Career and Career Number are defined for the HESA Instance record in which case the process also considers terms related to that other career.

For each Instance where the student has not been active for the reporting period, the process logs a message and the process skips to the next selected record.

For each active Instance, the process logs a message and calculates the total YEARSTU.

Note that this method of selection does not include active students who do not have any class enrollments (for example, research students).

Step 3: Calculate YEARSTU

For each student who is active in the reporting period, the Calculate Year of Student process uses the following selection method to calculate the year of student value: The process selects distinct activated terms for the Student Career. If the Instance has been linked to a prior Student Career using the Linked

Career and Linked Career Number fields in the HESA Instance record, then the process also selects activated terms for the previous career with enrollments.

From the selected terms, the student must have at least one class enrollment that satisfies the following conditions:

- Class Start Date is within the reporting period, or Class End Date is within the reporting period, or Class Start Date is prior to the reporting period and Class End Date is after the reporting period.
- Status = *Enrolled* or *Dropped*.
- Units Taken value is greater than zero.
- Grading basis value matches one of the values defined in the Grading Basis Inclusion region with the Year of Student check box selected on the HESA Configuration page.
- Repeat Code value is null or does not match a value defined in the Repeat Code Exclusion region with the Year of Student check box selected on the HESA Configuration page.
- If the student has multiple careers with the same Academic Career value as the career being processed (that is, the same career value with different career numbers), then the process applies a further filter to the class enrollments. In that case, the process selects the class only if the program value of the enrollment record matches one of the program values in the Student Program records for that career and career number.

The process then finds out the distinct reporting periods where the class enrollment overlaps (the process considers all delivered active or inactive reporting periods but does not consider any manually added reporting periods). The count of these reporting periods is the year of student value. The process ignores any future reporting periods, that is periods subsequent to the period selected as the run parameter. For example, if the student has only been active in the current (that is, the period selected as the parameter) reporting period then the YEARSTU value is 1, if the student has been active in 2 distinct reporting periods the YEARSTU value is 2.

Step 4: Store the Calculated YEARSTU

The Calculate Year of Student process stores the calculated YEARSTU value in the HESA Instance record as follows.

If the most recent effective dated HESA Instance record has an effective date before the reporting period start date:

1. The process creates a new effective dated record using the reporting period start date. It copies all the data from the following records to the new effective dated record: Header record (SSR_HE_INSTANCE), Entry Profile fields (SSR_HE_INST_FLD where SSR_HE_ENTR_FLAG = Y), Entry Qualifications (SSR_HE_QUAL_ENT), Employment Status (SSR_HE_INST_EST), Employment Monitoring (SSR_HE_INST_MON), Learner (SSR_HE_INST_LRN) and Learning Delivery (SSR_HE_INST_LDL). The Instance Details fields (SSR_HE_INST_FLD where SSR_HE_ENTR_FLAG = N), including the Further Education Instance fields, are copied only if you have selected the Copy Instance Details check box. The Qualifications Awarded (SSR_HE_QUAL_AWD) records are copied only if you have selected the Copy Qualifications Awarded check box. The Research Data (SSR_HE_INST_RES) records are copied only if you have selected the Copy Research Data check box. The FTE Details (SSR_HE_INST_FTE) records are copied only if you have selected the Copy FTE Details check box.
2. The process sets the YEARSTU value to the calculated value.

3. If the Increment Year of Program parameter check box is selected and the existing record has a Year of Program value greater than zero, the process increments the value by one in the new record.

If the HESA Instance record starts within the reporting period, the process inserts the calculated YEARSTU value to the existing record.

The process logs a message to confirm the value has been calculated and stored.

Calculating Full-Time Equivalence for Students

Access the Calculate Full-Time Equivalence page (Records and Enrollment > HESA Reporting > Extract Processing > Calculate FTE).

Student return's Instance.STULOAD is expressed as a percentage of FTE. A student who has been studying full-time for the reporting period has an FTE of 100. A student studying part-time has a value of less than 100 to represent the proportion of full-time study they have undertaken. For example, a student with half the load of a full-time student has a FTE of 50.

An institution can calculate the FTE based on either class enrollments or program load depending on its requirements.

An institution can define a calculation type of either *Derive load from Modules* (that is, calculation based on the student's class enrollments) or *Derive load from Program* (that is, calculation based on the FTE load defined for the year or for the program, plan, and subplan) at each data capture level (for example, the Plan HESA Data page for plan level). A default calculation type run parameter is also available to enable institutions to apply the same calculation type to all students of a particular institution, career, or program without the need for defining the calculation type against each program, plan, or subplan.

Academic Career

Select a value to run the calculation process individually for each academic career. This enables your institution to apply a different FTE calculation type, academic calendars and full-time load to each distinct career.

Required to select an academic calendar or academic program.

Note: Do not select a value if you want to run the process for all academic careers in an institution. You should run the process for all academic careers only when the FTE Calculation Type is *Derive load from Modules* for all records.

If the FTE Calculation Type is *Derive load from Program* for any record, then you must select both academic career and academic calendar as the run parameters.

Academic Calendar

Select a value that the process uses for program calculation to determine the start and end dates of terms associated with the calendar that fall within the reporting period. The process uses these dates to apportion load for discontinued students.

Required if the Default Calculation Type is *Derive load from Program*.

Default FTE Calculation Type

Select a default value that the process uses if a calculation type is not defined for the program, plan, or subplan related to

the HESA Instance record. Values include *Derive load from Modules* and *Derive load from Program*.

Maximum Calculated Value

Enter the maximum FTE value that the process can calculate. This field enables you to cap the calculated value to a maximum value, typically 100 for full-time students.

Consider Sub-Plans

Select to have the process consider subplan HESA records to determine FTE calculation type and FTE load. You can select a calculation type and enter an FTE load in the Sub-Plan HESA Data page or the Sub-Plan Offering/Year HESA page.

Include Dropped Classes

Select to have the process consider class enrollments with a status of *Dropped* along with class enrollments with a status of *Enrolled*.

Increment Year of Program

Select to have the existing Year of Program value increase by one when the Calculate Full-Time Equivalence process creates a new effective dated HESA Instance record for the reporting period.

Apportion Module Load

Select to have the process reduce the load of class enrollments for students who have discontinued, left, or cancelled.

The process considers the selection or de-selection of this check box only when the derived calculation type is *Derive Load from Modules*. The process always reduces the load for discontinuation if the calculation type is *Derive load from Program*.

Student Override

Select to specify single or multiple students for whom the process should calculate FTE.

Note: If you want to use calculation type or FTE load values at *Offering* or *Year* levels, then you must ensure that the Year of Program values in HESA Instance records are verified and updated before the FTE calculation process is run.

The process determines the calculation type from the student's year, program, plan, or subplan. If no values exist in the data capture pages, it uses the default calculation type run parameter. After the process determines the calculation type, the calculation is done based on either the FTE Load defined in the data capture pages or class enrollments. For calculation based on program load, an adjustment is made if the student has discontinued before the end of the academic calendar.

The process initially selects each HESA Instance record that matches the process parameters. It selects the latest effective dated record with an Effective Date on or before the reporting period end date only if the Report to HESA setting = Y. If the selected record has Report to HESA setting = N, then the process does not include the record in the calculation even if previous effective dated records exist with the Report To HESA setting = Y. For each selected Instance, the process determines if the related Academic Career has at least one activated term overlapping the reporting period or at least one class enrollment overlapping the reporting period. If the relevant activated term or class enrollment does not exist for the student, then the process logs a message and skips processing the instance.

While determining if any classes overlap the reporting period, if the class enrollment has a Session = *OEE* (open entry/exit), rather than selecting the class start/end dates, the process selects the values from the Student OEE Enrollment Data record for the class enrollment. If the end date is not defined in Student OEE Enrollment Data then the process uses the class end date. The start date is mandatory for a Student OEE Enrollment Data record. Note that the process uses this same OEE logic when it examines class enrollments in the following step 3, *If the FTE calculation type is Derive load from Modules*.

Calculation Steps

The following steps describe how for each selected instance the Calculate Full-Time Equivalence process calculates the FTE for the specified reporting period run parameter:

Step 1: Determine the Academic Career details

The process selects the following values from the associated academic career by selecting the most recent effective dated Student Program/Plan records that start on or before the reporting period end date:

- Academic Program
- Academic Load (Approved Academic Load)
- Academic Plan
- Academic Subplan

If multiple plans exist, then the process refers to the HESA Instance record to determine which plan to use. If plan is not defined, then it uses the plan with the lowest Plan Sequence value.

If multiple subplans exist with the Report to HESA setting = Y, then the process selects the subplan with the most recent Declare Date within the reporting period. If multiple records exist with the same Declare Date, then the process selects the record with the lowest subplan code ordered alphabetically.

Step 2: Determine the FTE Calculation Type and FTE Load

After selecting the program, academic load, plan and subplan, the Calculate Full-Time Equivalence process selects the Year of Program (YEARPRG) value from the HESA Instance record . The process determines the FTE Calculation Type and FTE Load in the following sequence:

1. If Consider Sub-Plans run parameter is selected and the HESA Sub-Plan Offering Year contains the selected subplan, academic load, and year of program, then the process selects the FTE values from the HESA Sub-Plan Offering Year. Only records in SSR_HE_SPLNOYR where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
2. If Consider Sub-Plans run parameter is selected and the HESA Sub-Plan Offering contains the selected subplan and academic load, then the process selects the FTE values from the HESA Sub-Plan Offering. Only records in SSR_HE_SPLNOFR where Offering Start Term, Offering Start Session and Campus are all blank are considered.
3. If Consider Sub-Plans run parameter is selected and the HESA Sub-Plan contains the selected subplan, then the process selects FTE values from the HESA Sub-Plan.
4. If the HESA Plan Offering Year contains the selected plan, academic load and year of program, then the process selects the FTE values from the HESA Plan Offering Year. Only records in SSR_HE_PLNOFRYR where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.

5. If the HESA Plan Offering contains the selected plan and academic load, then the process selects FTE values from the HESA Plan Offering. Only records in SSR_HE_PLNOFR where Offering Start Term, Offering Start Session and Campus are all blank are considered.
6. If the HESA Plan contains the selected plan, then the process selects FTE values from the HESA Plan.
7. If the HESA Program Offering Year contains the selected program, academic load, and year of program, then the process selects FTE values from the HESA Program Offering Year.
8. If the HESA Program Offering contains the selected program and academic load, then the process selects FTE values from the HESA Program Offering.
9. If the HESA Program contains the selected program, then the process selects the FTE values from the HESA Program.
10. The process selects the Default Calculation Type run parameter value and sets the FTE Load to either 100 (if the calculation type is *Derive load from Program*) or zero (if calculation type is *Derive load from Modules*).

The following validations apply to the sequence of steps:

- If the process finds the FTE Calculation Type in any of the steps, it stops processing the subsequent steps. If the FTE Load is not defined, then the process retrieves the Calculation Type from that step, and load is set to zero. For example, in step 3, if the process finds out that the FTE Calculation Type value exists but the FTE Load value does not exist on the HESA Sub-Plan page, then it sets the FTE Load value as zero.
- If YEARPG value is zero or null in the HESA Instance record, then the process does not perform steps that match to Offering Years (Steps 1, 4, and 7).
- The FTE Load value is only required if the calculation type is *Derive load from Program*. If you selected the calculation type as *Derive load from Modules* on the data capture page, then the process automatically sets the FTE Load value as zero.

For each record, the process logs a message indicating the derived FTE Calculation Type and the step that derived the value. .

Step 3: If the FTE calculation type is Derive load from Modules

The Calculate Full-Time Equivalence process selects class enrollments for the student as described in the following steps:

1. The process selects activated terms for the Student Career.
2. From each selected term, it selects classes that satisfy the following conditions:
 - Class Start Date is within the reporting period, or Class End Date is within the reporting period, or Class Start Date is prior to the reporting period and Class End Date is after the reporting period.
 - Status = Enrolled or Status = Dropped (if the Include Dropped Modules check box is selected on the Calculate Full-Time Equivalence page).
 - Units Taken value is greater than zero.
 - Grading basis value matches one of the values defined in the Grading Basis Inclusion region with the FTE check box selected on the HESA Configuration page.

- Repeat Code value is null or does not match a value defined in the Repeat Code Exclusion region with the FTE check box selected on the HESA Configuration page.
- If the student has multiple careers with the same Academic Career value as the career being processed (that is, the same career value with different career numbers), then the process applies a further filter to the class enrollments. In that case, the process selects the class only if the program value of the enrollment record matches one of the program values in the Student Program records for that career and career number.

For each class enrollment, the process finds the associated Module HESA Data record that contains the relevant Course ID/Course Offering Number. The process considers the most recent effective dated record where the effective date is not after the reporting period end date.

The process determines the FTE field value for the Module (from Module HESA Data). This value is the class FTE value (that is, Module FTE = Class FTE). If the FTE field value for the Module is not defined, then the process determines the value as zero (that is, Class FTE = 0).

If the Class Start Date is before the Reporting Period Start Date or if the Class End Date is after the Reporting Period End Date (that is, class overlaps more than one reporting period):

1. Determine the total class days from Class Start Date to Class End Date.
2. Determine the total student days for the reporting period as the number of days from the Class Start Date or Reporting Period Start Date (whichever is the latest) until the Class End Date or Reporting Period End Date (whichever is the earliest).
3. Updated Class FTE = (student days in reporting period / total class days) * Class FTE
4. If the load has been reduced (that is, total student days is less than total class days), log a message indicating that the load for that Course Offering has been reduced.

If the class enrollment status = Enrolled, then the process reduces module load where the student has discontinued or withdrawn, as described in the following steps:

1. The process selects the most recent effective dated row in the Student Program record with effective date on or before the reporting period end date.
2. If the Apportion Module Load run parameter is selected and the Student Program status is Discontinued (DC) or Leave of Absence (LA) or Cancelled (CN), then the process reduces the module FTE as described in the following steps to reflect an early leaving date:
 - a. The process determines the Student Leave Date as the effective date of the selected Student Program plan record.
 - b. The process determines the Term End Date of the class enrollment.
 - c. If the Student Leave Date is null or on or after the Term End Date, then the process does not reduce the load. The process includes the full load in the total calculation.
 - d. If the Student Leave Date is before the Class End Date, the process reduces the load described as follows:

- Determine the total student days in the reporting period from Class Start Date or Reporting Period Start Date (whichever is the latest) until the Student Leave Date (not including the day of the leave date in the total).
- Determine the total class days in the reporting period from the Class Start Date or the reporting period start date (whichever is the latest) to Class End Date or Reporting Period End Date (whichever is the earliest) .
- Determine the Class FTE = (student days / class days) * Class FTE.
- If the load has been reduced (that is, total student days is less than total class days), then log a message to indicate that the load for that Course Offering has been reduced.

If the parameter Apportion Module Load is not selected or status is not DC, LA, or CN, adjustment to the load for the class enrollment is not required.

If the class enrollment status = Dropped, then the process reduces module load for dropped classes based on drop date as described in the following steps:

1. The process determines the Class Drop Date from the class enrollment record.
2. If the Class Drop Date is in the reporting period and before the Class End Date, the process reduces the load described as follows:
 - a. Determine the total student days from Class Start Date or Reporting Period Start Date (whichever is the latest) until the Class Drop Date (not including the day of the drop date in the total).
 - b. Determine the total class days from Class Start Date or Reporting Period Start Date (whichever is the latest) to Class End Date or Reporting Period End Date (whichever is the earliest)
 - c. Determine the Class FTE = (student days / class days) * Class FTE

If the Class Drop Date is not in the reporting period and before the Class End Date, no reduction is required. Note that the process reduces the load for dropped classes regardless of whether the Apportion Module Load run parameter is selected or cleared. If the Class Drop Date is before the reporting period start date, update Class FTE to zero.

Calculated FTE = total of the individual module FTE values for each class enrollment (that is, FTE for each Module HESA Data record) with adjustments for discontinuation as mentioned above.

The process logs a message confirming the calculated FTE values.

Step 4: If FTE Calculation Type is Derive load from Program

The Calculate Full-Time Equivalence process uses the derived FTE Load as described in the following steps:

1. The process selects the most recent effective dated row in the Student Program record with effective date on or before the reporting period end date.
2. If the status is not Discontinued (DC), Leave of Absence (LA) or Cancelled (CN), then the Calculated FTE = FTE Load.

3. If the status is Discontinued (DC), Leave of Absence (LA), or Cancelled (CN), the process apportions the load according to date of discontinuation/leave/withdrawal as described in the following steps:
 - a. The process determines the full teaching period for the Academic Calendar with reference to each of the terms associated with the calendar and the reporting period (that is the term is associated with Academic Calendar run parameter and the Term Begin Date falls in the reporting period). Then, the process sets Teaching Start Date = the earliest Term Begin Date and Teaching End Date = the latest Term End Date.
 - b. The process determines the Student Days as being from the Teaching Start Date until the Effective Date of the discontinuation, leave of absence or withdrawal.
 - c. The process determines the Teaching Days as being from the Teaching Start Date to the Teaching End Date
 - d. Calculated FTE = FTE Load * (Student Days / Teaching Days)
 - e. The process logs a message indicating the calculated FTE value after discontinuation or leave of absence.

Step 5: Store the Calculated FTE

The Calculate Full-Time Equivalence process stores the calculated FTE in the HESA Instance record as described in the following steps:

1. If the Maximum Calculated Value run parameter value is specified and the Calculated FTE value is greater than the parameter value, then the process replaces the Calculated FTE value with the Maximum Calculated Value when the value is stored in the HESA Instance record.
2. If the most recent effective dated HESA Instance record has an effective date before the reporting period start date, the process performs the following steps:
 - a. The process creates a new effective dated record using the Reporting Period Start Date.
 - b. If the Increment Year of Program run parameter is selected and the existing record has a Year of Program value, then the process increments the Year of Program value by one in the new record.
3. The process selects the most recent effective dated HESA Instance record that starts on or before the reporting period end date (that is, the process selects either the newly created record above or the existing record that starts within the reporting period).
4. If there is an existing FTE record for the reporting period (in PS_SSR_HE_INST_FTE), the process updates the Calculated FTE value of the existing record. The process retains any existing Override FTE and Report Zero setting values.
5. If FTE record does not exist for the reporting period, the process creates a new FTE record using the Reporting Period and Calculated FTE values. It sets the Override FTE value to zero and the Report Zero setting is not selected. The process uses the Override FTE value only if the value is greater than zero. The Report Zero check box is provided in the HESA Instance page to allow a zero override to be applied to the extract. If the calculated FTE values is greater than 100 and the institution wants the return STULOAD as 100, then you can use the HESA Instance page to manually add an Override FTE value of 100.

Entering HESA Advisor Data for a Student

Access the Advisor HESA Data page (Curriculum Management > Instructor/Advisor Information > Instructor/Advisor Table > Advisor HESA Data).

Image: Advisor HESA Data page

This example illustrates the fields and controls on the Advisor HESA Data page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Advisor HESA Data' page for Julie Kompany (PSGBR001). It features two main sections: 'Instructor Details' and 'Research HESA Data'.

Instructor Details:

- Academic Institution: PSGBR PeopleSoft University UK
- Effective Date: 26/12/2013
- Status: Active

Research HESA Data:

REF Unit	Description	RAE Unit	Description	Percentage
01A	Clinical Medicine - A	01	Cardiovascular medicine	40.0
		03	Infection & immunology	30.0
		02	Cancer studies	30.0

You can enter a maximum of six units. The total percentage for the six subjects must equal 100.

The combination of REF Unit and RAE Unit must be unique and at least one value must be defined along with Percentage to save a record.

Collaborating Provider

This field is optional. Use this field to record a UKPRN value or one of the generic codes provided by HESA. For example, 4002, 4003, or 4004.

Note: HESA does not provide the UKPRN code in the CodeLists.xsd so a prompt is not available for this field.

Entering HESA Data for an External Organization

Access the Regional page (Campus Community > Organization > Create/Maintain Organizations > Organization Table > Regional).

Previous Degree Establishment

Enter a value that the system can use to derive the Student. DEGEST value for ITT Return

Entering DEGTYPE Value

Access the Degree Table page (Set Up SACR > Foundation Tables > Academic Structure > Degree Table).

Previous Degree Type

Enter a value that the system can use to derive the Student. DEGTYPE value for ITT return.

Preparing for Generating DLHE Return

This section provides an overview of processing DLHE return and discusses how to:

- Identify the DLHE target population
- Import the target population
- Import DLHE survey data into staging table
- Review and update imported survey data in staging table
- Use the Survey Link pagelet
- Add, view, and update surveys

Understanding Preparing for Generating DLHE Return

For Student, Offshore, and ITT returns, an academic institution collects most of the data from the data capture pages. For DLHE returns, an institution collects most of the return data by conducting a survey of the students.

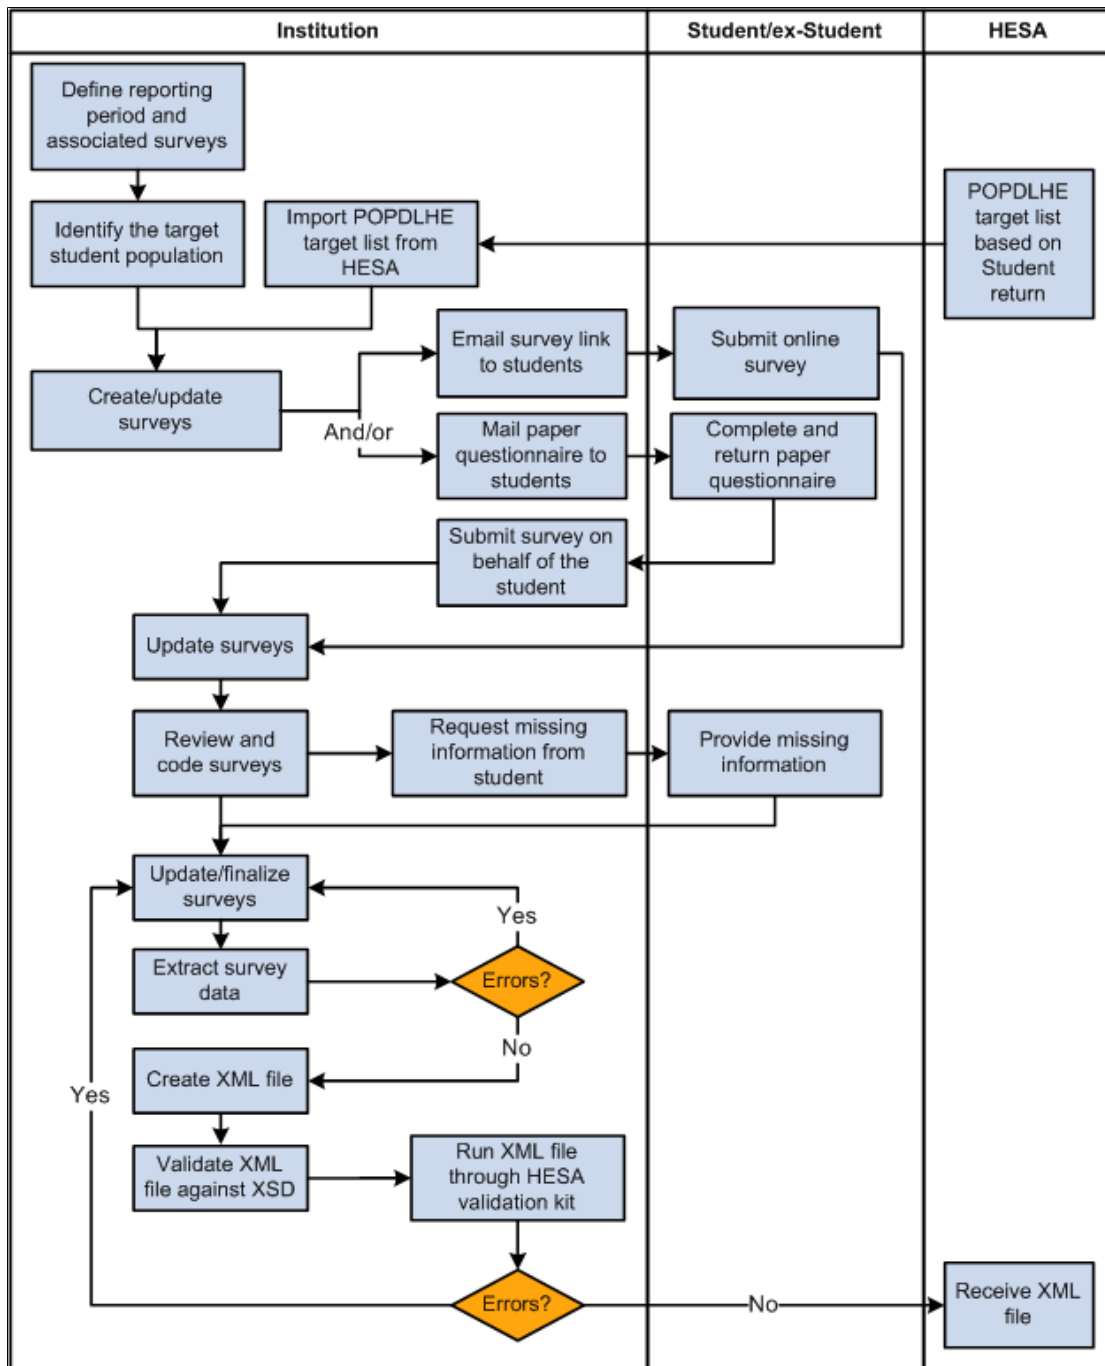

An academic institution can create a DLHE survey return either from their student data or by importing the POPDLHE file. There are numerous ways through which an institution can collect survey data from students, for example:

- By asking the student to complete the online survey.
- By conducting a telephone survey and entering the survey details on behalf of the student.
- By asking the student to complete and return a paper questionnaire and then enter the survey details on behalf of the student.

Also, participants can enter the survey data on the HESA website and HESA provides an XML file that contains this data. An institution can import the survey records from this XML file into a staging table. The institution can then review and edit the imported data before posting to the database.

Image: Example for processing the DLHE survey

The following diagram illustrates how an institution can process the DLHE survey:

Pages Used to Prepare for Generating DLHE Return

Page Name	Definition Name	Navigation	Usage
Identify DLHE Target Population	SSR_HE_TARPOP	Records and Enrollment > HESA Reporting > Destination of Leavers > Identify Target Population	Run the process to create/update survey records from students' records in your system.
Import Survey Target Population	SSR_HE_IMP_TPOP	Records and Enrollment > HESA Reporting > Destination of Leavers > Import Target Population	Run the process to import the target population.
Import Survey Data	SSR_HE_IMPDLHE_RC	Records and Enrollment > HESA Reporting > Destination of Leavers > Import Survey Data	Run the process to import DLHE survey records from the XML file that HESA provides. The process imports the records into a staging table.
Survey Staging Data	SSR_HE_SURV_STG	Records and Enrollment > HESA Reporting > Destination of Leavers > Survey Staging Data	Review and edit the imported survey data in the staging table.
Survey Management	SSR_HE_SURV_MGMT	Records and Enrollment > HESA Reporting > Destination of Leavers > Survey Management	Allows users to retrieve existing survey records, update the record, navigate to further detailed survey pages, navigate to the self-service survey pages or navigate to add a new survey.
Add a Survey	SSR_HE_SURV_ADD	Click the Add Survey button on the Survey Management page.	Supplementary page to allow users to manually add a new survey record.
Survey Details	SSR_HE_SURV_DTLS	Click the Details button on the Survey Management page.	Supplementary page to view further details of a survey and to add or update coded values required for the HESA extract.

Identifying DLHE Target Population

Access the Identify DLHE Target Population page (Records and Enrollment > HESA Reporting > Destination of Leavers > Identify Target Population).

Survey

Select the DLHE Survey translate values of April or January.

Use the Student Override region to specify single or multiple students for whom the process determines eligibility for including in the DLHE survey.

Processing Steps

The process selects student careers whose latest HESA Instance record has Report to HESA = Y.

For each distinct student career for the institution, the process derives the following fields and includes the student in the survey if all of the following criteria are met.

Field	Derivation Criteria for the Student
End Date of Instance (Instance.ENDDATE)	The derived value should fall on or between the Qualifying Start Date and the Qualifying End Date for the survey. For the April Survey, the Instance.ENDDATE is between 01-AUG-YYYY and 31-DEC-YYYY, where YYYY is the year element from the start date of the reporting period. For the January Survey, the Instance.ENDDATE is between 01-JAN-YYYY and 31-JUL-YYYY, where YYYY is the year element from the end date of the reporting period.
Mode of Study (Instance.MODE)	The derived value should not equal 63 or 64 or MODE is 63 or 64 and QUAL begins with D or L.
Location of Study (Instance.LOCSDY)	The derived value is null or not S (The value S means that the student is studying abroad and is included in the Student record because the student has spent or will spend more than 8 weeks in UK).
Exchange Programmes (Instance.EXCHANGE)	The derived value is null or is not one of the following incoming exchange student codes: <ul style="list-style-type: none"> • 4 (Other incoming exchange or visiting student) • G (Incoming ERASMUS student)
Intercalation (Instance.INTERCALATE)	The derived value is null or is not 01.
Qualification Awarded (QUAL)	There must be at least one derived QUAL value that has a code that is not null or <i>NULL ERROR</i> and is not one of the following: L91, M91, H91, I91, M76, H76, I76, J76, M72, H72, I72, C90, D90, E90, H90, I90, J90, L90, M90, or any value beginning P, Q, R, S or X
Reason for Ending Instance (Instance.RSNEND)	The derived value is not 5 or 12.

The following table describes how the process derives the fields listed in the preceding table.

Field	Derivation Logic
End Date of Instance (Instance.ENDDATE)	Values are derived for this field as per the Student return.
Mode of Study (Instance.MODE)	Values are derived for this field as per the Student return.

Field	Derivation Logic
Year of Program (Instance.YEARPRG)	A value for this field is derived to derive Instance.LOCSDY and Instance.EXCHANGE. Value is derived for YEARPRG as per the Student return, except the field derivation rules (relating to REDUCEDI and Country) and the use of default and null error steps.
Course Identifier (Instance.COURSEID)	To derive Instance.LOCSDY and Instance.EXCHANGE, the system needs to determine whether the Instance.COURSEID is based upon a subplan or plan.
Location of Study (Instance.LOCSDY)	Values are derived for this field as per the Student Return, except the field derivation rule (relating to REDUCEDI) and the constant, default and null error steps.
Exchange Programmes (Instance.EXCHANGE)	Values are derived for this field as per the Student Return, except the field derivation rule (relating to REDUCEDI, COURSEAIM and Country) and without the constant, default and null error steps.
Qualification Awarded (QualificationsAwarded.QUAL)	Values are derived for this field as per the Student Return, except that this value is derived for all records.
Reason for Ending Instance (Instance.RSNEND)	Values are derived for this field as per the Student Return, except the Student Program record selected in Step 1 is where the Effective Date is on or before the reporting period end date and a value is derived irrespective of the REDUCEDI value.

Survey Creation

If all the selection criteria are met, then the process either creates a new survey record for the student or, if a record already exists, updates the record. The Survey Source is set to *I*. If the student has multiple career records then potentially the student may be picked up more than once by the selection logic for inclusion. In that case, the process creates multiple survey records for the distinct careers and logs a message. You must review the survey records and exclude any unwanted survey records by setting the survey status to *Duplicate*.

Importing the Target Population

Access the Import Survey Target Population page (Records and Enrollment >HESA Reporting >Destination of Leavers >Import Target Population).

Return Name Select a return.

Survey For DLHE, select the DLHE Survey translate values of April or January.

(Optional) For Graduate Outcomes, select any one of the following:

- December Survey
- March Survey
- June Survey
- September Survey

XML Path/File Name

Enter the file path and file name that you want the system to import.

Add Attachment

Click to browse to the XML file that HESA provides, and click Upload. You can browse your local drive and select a file.

Note: The upload process creates a files subdirectory to store and process the XML file. This subdirectory is created in the server directory location that is specified in the PS_SERVDIR system parameter in the Application Server/Process Scheduler configuration file psappsrv.cfg/psprcs.cfg. Ensure that PS_SERVDIR is set up with an appropriate value in the configuration file and that users have the correct permission to access the files subdirectory.

Create New Surveys

Select if you want the import process to create blank survey records for students in the population file who do not currently have a survey record.

For Graduate Outcomes return, this check box is selected by default.

Exclude Surveys

Select if you want the process, at the end of processing the incoming population file, to set the Survey Status to *Excluded* for any existing survey records where the student is not included in the population.

For Graduate Outcomes return, this check box is selected by default.

Overwrite Values

Select if you want the process to overwrite key values in the survey with the incoming values when the incoming student is matched to an existing survey record. These key values are HUSID, NUMHUS, COURSEID, MODE and TTCID.

For Graduate Outcomes return, this check box is selected by default.

Use the Student Override region to specify single or multiple students for whom the process imports the record and creates a survey.

Processing Steps

The import process creates or updates records for a single survey selected as a parameter. If the POPDLHE file provided by HESA contains records for multiple surveys (for example, APR and JAN), then the process should be run twice for the same XML. It should be run once for each survey.

The process clears existing staging table records, opens the XML file and imports records into the staging table.

For DLHE survey, only records with the CENSUS value that matches the survey parameter value of APR or JAN are loaded.

If you provide the Student Override parameter value, then the process imports into the staging table only the records where the OWNSTU value matches one of the specified EMPLID (person ID) values.

For Graduate Outcomes, if the Survey field is blank, all the records in the XML file are imported to the staging record. Otherwise, records where the CENSUS value matches the Survey parameter are imported into the staging record.

For each staging record, the process matches to a single HESA Instance record based upon the following values:

- Academic Institution
- EMPLID: from OWNSTU in the target list record.
- Instance Identifier: from NUMHUS in the target list record.

If the process finds multiple HESA instance records, it selects the most recent effective dated record. For each HESA instance record, it selects the most recent effective dated record on or before the reporting period end date. If there is no existing survey for the combination of Institution, EMPLID, Academic Career, Student Career Number, Return Name and DLHE Survey, then the process creates a new record. The process then sets the Survey Source to *P*. If there is an existing survey, it updates the record. If any of the values for HUSID, NUMHUS, COURSEID, MODE and TTCID are different in the staging record from the existing survey record then if the Overwrite Values check box is selected, the process updates those values in the survey record.

Create New Surveys check box processing: If there is no existing survey for the combination of Institution, EMPLID, Academic Career, Student Career Number, Return Name and DLHE Survey, then the process creates a new survey record for the student using the values described in the following table:

Column Name	Value
INSTITUTION	Academic institution from the HESA instance record.
EMPLID	EMPLID from imported OWNSTU value.
ACAD_CAREER	Academic Career from the HESA Instance record.
STDNT_CAR_NBR	Student Career Number from the HESA Instance record.
SSR_HE_RET_NAME	HESA return name from the process parameter.

Column Name	Value
SSR_HE_APRJAN	<p>For DLHE, Survey parameter (1 = APR or 2 = JAN).</p> <p>For GRADOUT, imported CENSUS values are converted to translate field value by matching the translate short name:</p> <ul style="list-style-type: none"> • Dec = A • Mar = B • Jun = C • Sep = D <p>If a translate does not match with a short translate value, the default value becomes X. If multiple translate values are set up with the same short translate value, one is randomly selected.</p>
SSR_HE_SURV_STATUS	Set to <i>N</i> for new survey records.
SSR_HE_SOURCE	Set to <i>P</i> for Import Survey Target Population process.
SSR_HE_HUSID	HUSID value from the import file.
SSR_HE_NUMHUS	NUMHUS value from the import file.
SSR_HE_COURSEID	COURSEID value from the import file.
SSR_HE_MODE	MODE value from the import file.
SSR_HE_PT_FLAG	<p>Blank</p> <hr/> <p>Note: The mode values for DLHE are 1 or 2 to indicate full or part-time. For Graduate Outcomes, the actual MODE value is provided so the flag is left blank.</p> <hr/>
SSR_HE_TTCID	TTCID value from the import file.
SSR_HE_QTS_FLAG	If the imported TTCID = 1, 8, or G, then set to <i>Y</i> , else set to <i>N</i> .
SSR_HE_GRADSTATUS	<p>For DLHE, blank.</p> <p>For GRADOUT, if Date of Death is populated for the EEMPLID (PERSON.DT_OF_DEATH), the field is set to 01, else set to blank.</p>
SSR_HE_FNAMES	FNAMES value from the import file.
SSR_HE_SURNAME	SURNAME value from the import file.
SSR_HE_METHOD	Set to blank.

Column Name	Value
All other surveys fields	Set to blank or zero.

If the Create New Surveys check box is not selected, then the process does not create a new survey and logs a *survey not created* message.

Exclude Surveys check box processing: For each survey record for the Academic Institution, Return Name and Survey where Source (SSR_HE_SOURCE) is *I* or *M* (Identify DLHE Target Population or manually added) and Survey Status is not *E* or *D* (excluded or duplicate) and EMPLID does not appear in the staging records for the institution/survey, the process updates the Survey status to *E* (excluded) and logs an excluded survey message.

For Graduate Outcomes, because the Survey parameter can be blank and the staging table can include records for different surveys, the exclude processing is done for each distinct survey value that appears at least once in the staging record. For example, if the staging records contain just surveys for “Dec” and APRJAN = A, then only existing surveys for APRJAN = A that don’t also appear in the staging record with APRJAN = A are excluded. Processing is not done for existing survey records with any other APRJAN value. If the staging records contain surveys for “Mar” and “Jun,” then the exclude processing is done for existing survey records with APRJAN = B and C, but not for existing survey records for APRJAN = A or D and so on.

Note: The exclude survey processing ignores surveys that have already been created or updated by the Import Survey Target Population process where the source has been set to *P* and surveys that have been created by the Import Survey Data process where source has been set to *H*. The check on the EMPLID in the staging records is included to ensure surveys are not excluded where there is a pending staging record and the source has not yet been updated to *P* (for example, when the HESA Instance record is not found).

Importing DLHE Survey Data into the Staging Table

Access the Import Survey Data page (Records and Enrollment >HESA Reporting >Destination of Leavers >Import Survey Data).

The fields are similar to the existing Import Survey Target Population page. The XML Path/File Name field is optional and you can set it to blank to clear the existing imported staging records.

Note: Before running the Import Survey Data process, create blank survey records (that is, records with survey status = *New*) in Campus Solutions using either the Identify DLHE Target Population process or the Import HIN Target Population process. The Import Survey Data process matches the incoming survey data to the existing survey record and add the student’s responses. The Import Survey Data process then sets the survey record to *Submitted* or *Saved* depending on whether or not the incoming survey is complete. If there is no matching survey record, then the incoming survey will be saved as a pending staging record and you can use the staging page to add the required Student Program data to create a new survey record.

Processing steps

The process performs the following steps:

1. Deletes existing staging records

The process deletes any existing staging records for the institution where import status is *I* (imported) or *O* (obsolete). Existing non-imported staging records can be updated to staging status = *O* (obsolete) through the DLHE staging data page.

2. Creates staging records

The process creates staging records based on the records in the XML or CSV file. The OWNSTU value is used as the EMPLID. If the OWNSTU element is not found, the record is not processed.

For each record found in the XML or CSV file, if the Survey parameter is *April*, the process checks for the APRJAN value. If the APRJAN value of the incoming record is *1*, the processing for the record is continued. Otherwise, the process skips the record and moves to the next record.

If the Survey parameter is *January* and if the APRJAN value of the incoming record is *2*, the processing for the record is continued. Otherwise, the process skips the record and moves to the next record.

If EMPLID values have been defined for the Student Override parameter, only records with a matching OWNSTU are imported.

If there is an existing staging record for the combination of EMPLID, Institution, Return Name and Survey (APRJAN), the process deletes the existing staging record and creates a new staging record. If staging record does not exist for the incoming record, the process creates a new staging record with import status = *N* (new).

If an XML element is not present in the XML file or there are blank fields in the CSV file, then the process sets the staging field to blank (character fields) or zero (number fields).

The SSR_HE_HUSID staging field defaults to the most recent effective dated HUSID external system ID for the EMPLID. The External System ID type for HUSID is defined for the institution in the HESA Configuration record. If no HUSID is found then the field is saved as blank and a value can be added via the staging data page once a HUSID external system ID has been added.

The process always sets the SSR_HE_METHOD to *04* (electronic reply) and SSR_HE_SOURCE to *H* (HESA survey).

Values of *X* or *x* are not imported for SSR_HE_MIMPACT.

SSR_HE_FOLLOWUP is set to *N* if the imported value is *1* and set to *Y* if the imported value is *0*.

3. Processes staging records

For each staging record:

The process matches to existing survey records in the database for the combination of Institution, EMPLID, Return Name and Survey (APRJAN) value. If there is a single existing student survey record with survey status (SSR_HE_SURV_STATUS) = *N* (new), it updates that survey record with the values from the staging record and sets staging status to *I* (imported).

If there are multiple existing survey records with survey status = *N* (i.e. new surveys for different Careers/Numbers), the process makes no update, more information is required to identify the correct survey to update for the ID. It sets the staging status to *P* (pending) for the records.

If there is one or more existing student survey records with survey status other than *N*, the process makes no update and sets the staging status to *P* (pending).

If there is no existing survey record and if all the following required values are defined for the staging record, the process creates a new survey record with Survey Status of either *Submitted* or *Saved*:

- Institution (INSTITUTION)
- ID (EMPLID)
- Return Name (SSR_HE_RET_NAME)
- Survey (SSR_APR_JAN)
- Academic Career (ACAD_CAREER)
- Student Career Nbr (STDNT_CAR_NBR)
- HUSID (SSR_HE_HUSID)
- Instance Identifier (SSR_HE_NUMHUS)

After creation of a survey record, it sets the import status to *I* (imported).

If there are missing required values to create a new survey and if the existing import status is *N*, it sets the status to *P* (pending). If there are missing required values to create a new survey and the existing import status is not *N*, then the record is pending from a previous run.

The Survey Status is set to *Submitted* if the imported completion status is *04* (complete), otherwise the status is set to *Saved*.

The Part-Time flag is set based on any Mode Of Study value added for the staging record in the same way as for the Import HIN Target Population process.

The QTS flag is set if a Teacher Training Course (TTCID) value of *I* is added for the staging record or if any of the Section C teaching questions has a value.

The administrative coding fields are all set to blank as these values are not provided in the XML file.

Reviewing and Updating Imported Survey Data in Staging Table

Access the Survey Staging Data page (Records and Enrollment >HESA Reporting >Destination of Leavers >Survey Staging Data).

Image: Survey Staging Data page

This example illustrates the fields and controls on the Survey Staging Data page. You can find definitions for the fields and controls later on this page.

DLHE Survey Staging Data			
Academic Institution	PSGBR PeopleSoft University UK		
Return Name	DLHE1415	Survey	April
ID	SRGBR001	Surname	Barret
Staging Status	<input type="text" value="Pending"/>	Forenames	James
Timestamp	2015-06-02 12:11:11 UTC	PIN Number	1234567890
Completion Status	4		
Course Studied	Course description		
Contact Details			
Telephone	01241 999 999	Email Address	email@emailaddress.com
Address 1	Address Line 1	Town/City	Town or City
Address 2	Address Line 2	Postcode	GL51 1HZ
Address 3	Address Line 3	County	County description
Country	Country description		
Survey Details			
Academic Career	<input type="text"/>	Student Program/Plan	
Student Career Nbr	<input type="text" value="0"/>		
HUSID	<input type="text" value="0611841000043"/>		
Instance Identifier	<input type="text"/>		
Course ID	<input type="text"/>		
Teacher Training Course	<input type="text"/>		
Mode Of Study	<input type="text"/>		
Survey Method	<input type="text" value="04"/>	Electronic reply (email/web)	

Staging Status

This field is available for edit if the status is not *Imported*.

The following statuses are available:

Pending: Record has not yet been added to the database. For pending records, you can add the required values to create a new survey record. Refer to the previous topic *Importing DLHE Survey Data* for the required values.

Imported: Record has been added to the database. All fields on the page are read-only if the staging status is *Imported*. These records will be deleted on the new run of the *Import Survey Data* process.

Obsolete: Record is not needed.

The Staging Status field can be set to *Obsolete* to allow the record to be deleted on the next run of the *Import Survey Data* process.

HUSID

The HUSID for the student is defaulted for new staging records so in most cases the value should already be populated in this field. If the HUSID has been added or changed after the staging record was created, the value can be added or changed here.

Refer to the previous topic “Importing DLHE Survey Data into Staging Table” for information on how the system adds the defaults value to this field.

Instance Identifier	The system populates the value by default from the HESA Instance record for the selected Career/Career Number. Change the value if the default does not exist.
Course ID	Optional to create a new survey record.
Teacher Training Course	Optional to create a new survey record. The system uses this value to set the QTS flag.
Mode Of Study	Optional to create a new survey record. The system uses this value to set the Part-Time flag.
Survey Method	The system enters the default value of <i>04</i> for new staging records. Update the value, if required.

Using the Survey Link Pagelet

The Enter DLHE Survey link for students to complete the survey appears in the Academics region of the Student Center. A DLHE Survey pagelet is available that academic institutions can deploy on a dashboard or portal as appropriate.

To add the pagelet to a dashboard, access the pagelet setup for the dashboard (PeopleTools >Portal >Dashboard >Manage Dashboard Pages >Pagelets). In the Campus Solutions region on the Content tab select the check box for Destination of Leavers Survey.

The Enter Survey link appears on this new pagelet only if the survey status is *New* or *Saved* (that is, the status is not *Submitted*, *Coded*, *Duplicate* or *Excluded*) and the current date falls within the survey start and end dates defined in HESA Returns setup.

If multiple open surveys are available, the system displays each survey record to allow selection of one survey.

The instruction text is displayed from the description of PeopleTools Message Catalog’s message number 476 from message set 14720 and can be updated if required.

When the student accesses the survey from the new pagelet and then selects the Cancel button, Save and Return button or Submit button on the survey pages, the system displays the pagelet rather than the Student Center.

Adding, Viewing, and Updating Surveys

Access the Survey Management page (Records and Enrollment > HESA Reporting > Destination of Leavers > Survey Management).

The Survey Management page enables users to retrieve existing survey records and either update the record on the page, navigate to a further detailed survey update page, navigate to the self-service DLHE Survey pages, or navigate to add a new survey. You can also use this page to view records created from the Graduate Outcomes population file as well as excluding records from the extract by setting the field Survey Status to *Excluded*.

Survey Status	Select the current status value of the survey from the possible translate values defined as Coded, Duplicate, Excluded, New, Saved or Submitted.
Survey Method	(Optional) Select a survey method. This field does not appear for Graduate Outcomes return.
Graduate Status	(Optional) Select a status. This field does not appear for DLHE return.
Add Survey	Click to access the Add a Survey page where you can add a new survey record.
Details	Click to access the Survey Details page where you can review further details of the survey and add codes where required.
Enter Survey	Click to access the self-service Enter DLHE Survey page of the student where you can update the survey on behalf of the student. For Graduate Outcomes return, this button does not appear.

You can use the Survey Management page to edit the surveys created by the processes (Import Survey Target Population or Identify DLHE Target Population) or manually created.

Self-service Enter DLHE Survey page

Note that students can access this self-service page from the Student Center page. See "Entering and Submitting the DLHE Survey" (PeopleSoft Campus Solutions 9.2: Self Service).

When a student accesses this page from the Student Center page, the I do not wish to give this information check box is not available for salary information (Section B). However, when you as an administrative user access the page using the Enter Survey button, the same check box is available. Other differences are:

- Many of the radio button options (for example, the Question 1 options labelled as Most Important) and, in particular, the Question 17 check boxes are numbered for the administrative users. But for students, the numbers do not appear.
- The Clear buttons are available for only administrative users and not for students. This button is for only the radio button options, except for the radio button options in Section C. In Section C, if you clear the Newly Qualified Teacher Status check box, the system clears the values for all the radio button options in that section.
- The Occupational Classification field and the Post Doctoral Research Contract field for Question 4 and the JACS subject fields for Question 26 are available only for administrative users and not for students.
- The page displays telephone numbers and email addresses of the student to only administrative users and not to students.
- Notes region is available only for administrative users and not for students.

- Allow incomplete submission and Require mandatory fields check boxes on the HESA Configuration page are applicable for only students. If an administrative user clicks Submit and if there are any questions in the Incomplete Questions list of Section F that are marked as required (*), then the page displays a warning message with the option of continuing to submit the survey or cancelling the submission with no update of survey status.

Adding a Survey

Access the Add a Survey page (Click the Add Survey button on the Survey Management page).

Survey	Select the survey translate value for Graduate Outcomes: <ul style="list-style-type: none"> • December Survey • March Survey • June Survey • September Survey
ID	Select person ID of the student for which the survey should be created.
Academic Career	Select the career for the selected person ID.
Mode of Study	Select an Instance.MODE code.

You can use this page to create a new survey rather than using the Import Survey Target Population or Identify DLHE Target Population processes. The student must have a HUSID external system ID before you can add a survey. A HUSID ID type must be entered in the External System field of the HESA Configuration page.

Viewing or Updating Survey Details

Access the Survey Details page (Click the Details button on the Survey Management page).

You can use the Survey Details page to view further details of a particular survey record and to add or update coded values required for the HESA extract of survey data.

Part-Time Study	Indicates whether the mode of study is full-time or part-time. When a survey record is entered (by Import Survey Target Population or Identify DLHE Target Population processes or manually through the Add a Survey page), the system sets this field to <i>N</i> when the Mode of Study value entered is one of the full-time codes: 01, 02, 23, 24 or 25, otherwise the system sets the field to <i>Y</i> (including when the Mode of Study value is not entered). This field does not appear for Graduate Outcomes return.
Survey Status	Select the current status value of the survey from the possible translate values defined as <i>Coded</i> , <i>Duplicate</i> , <i>Excluded</i> , <i>New</i> , <i>Saved</i> or <i>Submitted</i> .

Survey Method

Select the method of data collection.

This field does not appear for Graduate Outcomes return.

Graduate Status

By default, this field is blank or set to *01*. You can add or update the value for the extract. If a graduate does not have any email or phone records in Contact details, you can set this field to *02*.

Newly Qualified Teacher Status

The system selects or clears this check box based on the derived or imported Course.TTCID value. If the Course.TTCID value is *1*, then the system automatically selects this check box.

If required, you can manually select or clear this check box.

This field does not appear for Graduate Outcomes return.

Delete

Click to delete the survey.

The system enables this button only if the Survey Status is *New*. If the status is not *New* and you want to delete a survey record: change the status to *New*, save the record, return to the Survey Management page, click the Details button to access the same record, and then click the Delete button.

When you delete a survey, the Survey Management page appears with the search results. The deleted survey will remain in these search results until you click the Search Surveys button again.

Supplied Fields

This region displays the imported values from the Graduate Outcomes survey record. You can edit this region to add missing values for survey records that are manually added.

Contact Details

This region displays email addresses, telephone, and address records from the Graduate Outcomes survey record. Use this region to review data that may be extracted. This view is not filtered so all current records for the graduate appear.

Employment Circumstances

The Employment Circumstances region displays the DLHE survey responses provided for key employment questions that are then used in coding of the survey prior to submission to HESA. The system enables this region if the student has selected either check box 1 (Working full-time) or check box 2 (Working part-time) under Activities for Q1 in the survey, that is SSR_HE_ALLACT1 = 1 or SSR_HE_ALLACT2 = 2. If neither check box is selected, then the system disables the Employment Circumstances region.

Q3 – Job Title

Displays the answer provided by the student to Question 3 (JOBTITLE) on the survey. If required, you can manually edit the value.

Q4 – Job Duties	Displays the answer provided by the student to Question 4 (JOBDDUTIES) on the survey. If required, you can manually edit the value.
Occupational Classification	Select the SOCDLHE coded value based upon the answers provided in Questions 3 and 4 on the survey.
Postdoctoral Research Contract	Select the POSTDOC coded value based upon the answers provided in Questions 3 and 4 on the survey.
Q9 – Organisation Name	Displays the answer provided by the student to Question 9 on the survey. If required, you can manually edit the value.
Q11 - Town/City/Area	Displays the answer provided by the student to Question 11 on the survey (LOCEMP_AREA) relating to the town/area/country of his or her employment. If required, you can manually edit the value.
Q11 - Postcode (UK Only)	Displays the answer provided by the student to Question 11 on the survey relating to the postcode of his or her UK employment. If required, you can manually edit the value.
Q11 - Country	Displays the answer provided by the student to Question 11 on the survey relating to the country code of his or her UK employment.
Employment Country	Select the coded country value if no UK postcode has been provided by the student in Question 11 on the survey.

Further Study

The Further Study region displays the DLHE survey responses provided for key further study questions that are used in the coding of the survey prior to submission to HESA. The system enables this region if the student has selected either check box 5 (Engaged in full-time further study...) or check box 6 (Engaged in part-time further study...) under Activities for Q1 in the survey, that is SSR_HE_ALLACT5 = 5 or SSR_HE_ALLACT6 = 6. If neither check box is selected, then the system disables the Further Study region.

Q27 - Course Name	Displays the answer provided by the student to Question 27 (CRSENAME) on the survey. If required, you can manually edit the value.
Q28 - Subject	Displays the answer provided by the student to Question 28 (CRSESBJ) on the survey. If required, you can manually edit the value.
JACS Subject	Select the JACS coded value based on the answers provided in Question 27 and 28 on the survey.
JACS Subject 2 and JACS Subject 3	The system enables these two fields only if you select a value for the JACS Subject field.
Q29 - Institution Name	Displays the answer provided by the student to Question 29 (UCNAME) on the survey.

Institution Providing Study	Select the UC PROV coded value based on the answer provided in Question 29 on the survey.
Number of Courses	This field is relevant only for pre-2013/14 survey records.

Generating a HESA Return and Creating a Return File

This section provides an overview of generating a HESA return and creating a return file and discusses how to:

- Import the HIN Target List.
- Generate a HESA extract.
- Review the extract data.
- Create a XML return file.
- Validate a XML return file.

Understanding Generating a HESA Return and Creating a Return File

After entering the data that you want to report to HESA at the various data capture levels, use the Create Extract process to generate the HESA return data. The return data is composed of extracts of various entities.

Before you generate the return data file, you can use the Extract Data pages to review and edit the HESA extracts that the Create Extract process generates.

After reviewing the data for the Student, Offshore, ITT, Unistats/KIS, or DLHE return, use the Create XML Application Engine (SSR_HE_GXML) process to generate the XML file for the return. After the process generates the XML file, validate the file against the schema (not including the HESA business rules) using the Validate XML Application Engine (SSR_HE_VXML) process. You can review the errors reported by the Validate XML process, correct the errors, and rerun the extract process using the same or revised extract criteria.

You can validate the XML files both against the schema and the HESA business rules using the HESA Validation Kit. The HESA Validation Kit generates an error file that you can import into a Campus Solutions staging table. Once the records are imported, re-run the Create Extract process just for those records with validation errors. You can review these error records using the Extract Data pages, correct the errors, and rerun the extract process using the same or revised extract criteria.

When the full return passes the HESA validation, submit the XML file to HESA.

Note: You must run the Create HESA Instance process before running the Create Extract process.

After the academic institution has submitted the Student return, HESA provides a target list for the next reporting period. This target list includes all instances that are incomplete or not reported as dormant in the current reporting period. HESA requires that an Instance entity be reported for all these students in the next reporting period. Use the Import HIN Target List Application Engine (SSR_HE_IMPFI) process

to import the target list and select the HESA Instance records that must be included in the next year's Student return.

Pages Used to Generate a HESA Return and Create a Return File

Page Name	Definition Name	Navigation	Usage
Import HIN Target List	SR_HE_HIN_RC	Records and Enrollment > HESA Reporting > Extract Processing > Import HIN Target List	Import the target list and select the HESA Instance records that the institution must include in the next year's Student return.
Create Extract Data	SSR_HE_EXT_PRC_RC	Records and Enrollment > HESA Reporting > Extract Processing > Create Extract	Generate return data. See Understanding HESA Derivation Steps
Institution Extract Data	SSR_HE_INSTITU_EXT	Records and Enrollment > HESA Reporting > Extract Data > Institution Extract Data	Review the Institution entity data that the Create Extract process generates. You can review the Institution entity data for Aggregate Offshore, Student, DLHE, Unistats/KIS and ITT returns.
DLHE Extract Data	SSR_HE_DLHE_EXT	Records and Enrollment > HESA Reporting > Extract Data > DLHE Survey Data	Review the Survey entity data that the Create Extract process generates.
Module Extract Data	SSR_HE_MOD_EXT	Records and Enrollment > HESA Reporting > Extract Data > Module Extract Data	Review the Module and Module Subject entity data that the Create Extract process generates.
Course Extract Data	SSR_HE_CRS_EXT	Records and Enrollment > HESA Reporting > Extract Data > Course Extract Data	Review the Course and Course Subject entity data and the KISCourse entity data that the Create Extract process generates.
Student Extract Data	SSR_HE_STUD_EXT	Records and Enrollment > HESA Reporting > Extract Data > Student Extract Data	Review the data that the Create Extract process generates for a student.
Instance Extract Data	SSR_HE_INST_EXT	Records and Enrollment > HESA Reporting > Extract Data > Student Extract Data > Instance Extract Data	Review the Instance, Student On Module, Entry Profile, Qualifications On Entry, Qualifications Awarded, and RAE entity data that the Create Extract process generates for a student.
Provision Extract Data	SSR_HE_PROV_EXT	Records and Enrollment > HESA Reporting > Extract Data > Provision Extract Data	Review the Provision entity data that the Create Extract process generates for a student's Aggregate Offshore return.

Page Name	Definition Name	Navigation	Usage
ITT Extract Data	SR_HE_ISTUD_EX	Records and Enrollment > HESA Reporting > Extract Data > ITT Extract Data	Review the Student and Course Subject entity data that the Create Extract process generates for a student's ITT return.
Create XML	SSR_HE_GXML_RC	Records and Enrollment > HESA Reporting > Extract Processing > Create XML	Create the XML file for HESA submission.
HESA Validate XML	SSR_HE_VXML_RC	Records and Enrollment > HESA Reporting > Extract Processing > Validate XML	Validate the XML file generated by the Create XML process.

Importing the HIN Target List

Access the Import HIN Target List page (Records and Enrollment > HESA Reporting > Extract Processing > Import HIN Target List).

Before you run the process, ensure the following exist:

- HESA Instance records. These record contain the HIN Population Year field to store the reporting year value.
- Instance Identifier values in the HESA Instance records must match the NUMHUS values in the target list file.
- EMPLID values must match the OWNSTU values in the target list.

Increment Year of Program

Select to increment the Year of Program value by one when the Import HIN Target List process creates a new effective dated HESA Instance record for the reporting period.

The Add Attachment button and XML Path/File Name field are similar to the same button and field on the Import Survey Target Population page.

See “Importing POPDLHE Survey Target List” subsection in the Understanding Preparing for Generating DLHE Return section.

The four check boxes (other than the Increment Year of Program check box) are similar to the check boxes on the Calculate Year of Student page.

See “Calculating Year of Student Values for Students” subsection of the Setting Up and Entering Data for HESA Reporting section.

The Import HIN Target List process sets the HIN Population Year of the instance records to the reporting year value of the reporting period parameter. This enables the Create Extract process to identify the instance records for the next reporting year. For example, when you run the Import HIN Target List process with a reporting period parameter set to *2009/10*, the process sets a student's HIN Population Year to *2009*. Subsequently, when you run the Create Extract process for the reporting period *2009/10*, the HIN Population Year of the student matches the reporting year of the reporting period, and therefore the Create Extract process automatically includes the Instance entity of the student regardless of other criteria.

The following steps describe the Import HIN Target List process:

1. The Import HIN Target List process imports the target list into the staging tables.
2. For each staging record, the process finds HESA Instance records in Campus Solutions database by matching the academic institution (provided as the run parameter), EMPLID (provided as OWNSTU in the target list record), and Instance Identifier (provided as NUMHUS in the target list record). This may mean multiple records are picked up for the same Instance Identifier.
3. The process logs messages for those records that do not have a matching HESA Instance record. The process retains the unmatched record in the staging table.
4. If the most recent effective dated HESA Instance record has an effective date before the reporting period start date:
 - a. The Import HIN Target List process creates a new effective dated record using the reporting period start date. It copies all the data from the following records to the new effective dated record: Header record (SSR_HE_INSTANCE), Entry Profile fields (SSR_HE_INST_FLD where SSR_HE_ENTR_FLAG = Y), Entry Qualifications (SSR_HE_QUAL_ENT), Employment Status (SSR_HE_INST_EST), Employment Monitoring (SSR_HE_INST_MON), Learner (SSR_HE_INST_LRN), and Learning Delivery (SSR_HE_INST_LDL).

The Instance Details fields (SSR_HE_INST_FLD where SSR_HE_ENTR_FLAG = N), including the Further Education Instance fields, are copied only if you have selected the Copy Instance Details check box.

The Qualifications Awarded (SSR_HE_QUAL_AWD) records are copied only if you have selected the Copy Qualifications Awarded check box.

The Research Data (SSR_HE_INST_RES) records are copied only if you have selected the Copy Research Data check box.

The FTE Details (SSR_HE_INST_FTE) records are copied only if you have selected the Copy FTE Details check box.
 - b. The process sets the HIN Population Year to the reporting year value of the reporting period parameter.
 - c. If the Increment Year of Program run parameter is selected and the existing record has a Year of Program value greater than zero, then the process increments the year of program by one in the new record.
5. If a HESA Instance record starts within the reporting period, the process sets the HIN Population Year of the existing record to the reporting year value of the reporting period parameter.

Generating a HESA Extract

Access the Create Extract Data page (Records and Enrollment > HESA Reporting > Extract Processing > Create Extract).

Image: Create Extract Data page

This example illustrates the fields and controls on the Create Extract Data page. You can find definitions for the fields and controls later on this page.

Return Type Enter a return type to filter the list of available returns in the Return Name field.

Return Name Enter the return for which the process should generate the reporting data.

You set up a return using the Returns Setup component.

Retain Data from Previous Run Select to have the Create Extract process delete the existing inactive data, update the existing active data to inactive, and to extract new data. If the check box is deselected, then the process deletes all the existing data (both active and inactive) records and extracts the new data.

The fields on this page are available for entry depending on the return you select. For example, the system disables the Course/Module, Student, and Student Override regions for an Aggregate Offshore return. If the return is DLHE, only the Null Errors Only and Validation Errors Only check boxes in the Student region and the Student Override region are available.

Survey Details

Use this region to select which survey records are included in the extract. Each check box is enabled only if the corresponding Survey value is defined for the return. You can run the extract process for only one Graduate Outcomes survey at a time.

If only one survey is defined for the return, that survey check box is selected by default and the other check boxes are disabled. If more than one survey is defined, then all the check boxes are enabled and default to the deselected state. You must select at least one check box to run the process. When you select a check box, other check boxes that are currently selected are automatically deselected.

Course/Module

Use this region to include or exclude the Course and Module entity data in the Student return. Also, you can use the region to restrict the Course and Module entity data in the Student return. For example, you can specify that the process should create Course data for all the courses in the undergraduate career and Module data for a Biochemistry course offering in the undergraduate career.

Also, use this region to include or exclude the KISCourse entity data in the Unistats/KIS return.

You can use this region only for Student and Unistats/KIS returns. This region is not applicable for ITT, Offshore, DLHE, and Graduate Outcomes returns.

Academic Career

Select to restrict the Course and Module extracts of the Student return to a particular career.

This check box is not applicable for Unistats/KIS return.

Note: If you select an academic career, the process will restrict the Instance extract in the Student return based on the selected career because the process creates Instance records only if the plan or subplan is already included in the Course extract.

The system enables the Academic Career field only if you select either the Include Course Entities check box or the Include Module Entities check box. However, if you select either the Null Errors Only check box or the Validation Errors Only check box, the system disables this field.

Include Course Entities

Select to include the Course and Course Subject extracts in the Student return.

Select to include KISCourse extract in the Unistats/KIS return.

Null Errors Only

Select to restrict the Course or KISCourse extract to those records where a *NULL ERROR* value has been derived in the previous run of the process.

You cannot select both the Null Errors Only and Validation Errors Only check boxes for the Course entity.

Validation Errors Only

Select to restrict the Course or KISCourse extract to those records where the HESA Validation Kit has identified a validation error and the error details have been imported to the validation staging table.

Academic Plan

Select to restrict Course or KISCourse extract to a particular plan.

The system enables this field only if the Include Course Entities check box is selected and both the Null Errors Only and Validation Errors Only check boxes are cleared.

All active academic plans are available for selection. Ensure that the Report to HESA check box is selected on the Plan HESA Data page for the plan you have selected.

Academic Sub-Plan

Select to restrict Course or KISCourse extract to a particular subplan.

The system enables this field only if the Include Course Entities check box is selected and both the Null Errors Only and Validation Errors Only check boxes are cleared.

All active academic subplans are available for selection. Ensure that the Report to HESA check box is selected on the Sub-Plan HESA Data page for the subplan you have selected. Also, select the Enable Sub-Plan Reporting check box on the HESA Returns page if you want to report subplan data.

Include Module Entities

Select to include the Module and Module Subject extracts.

This check box is not applicable for Unistats/KIS return.

Null Errors Only

Select to restrict the Module extract to those records where a *NULL ERROR* value has been derived in the previous run of the process.

You cannot select both the Null Errors Only and Validation Errors Only check boxes for the Module entity.

Validation Errors Only

Select to restrict the Module extract to those records where the HESA Validation Kit has identified a validation error and the error details have been imported to the validation staging table.

Course ID and Course Offering Nbr

Select to restrict the Course entity data to a particular course.

If you select a Course ID or Course Offering Number, the process creates Module and StudentOnModule data for only the selected values.

All active courses are available for selection. Ensure that the Report to HESA check box is selected on the HESA Module Data page for the course ID and course offering number you have selected.

The system enables this field only if the Include Module Entities check box is selected and both the Null Errors Only and Validation Errors Only check boxes are cleared.

Student

Use this region to include or exclude the student-related entity data in the return. Also, you can use the region to restrict the student-related entity data. Examples of student-related entities include Instance, Student, and Entry Profile entities.

This region is not applicable for Unistats/KIS return.

Include Student Entities

Select to include the student-related extracts.

The system enables this check box for only Student returns. For DLHE and ITT, the Create Extract process automatically includes the student-related entity data.

HIN Population Only

Select to restrict the Instance extract to only those continuing students whose HIN Population Year value in the HESA Instance record matches the Reporting Period Year.

The system enables this check box for only Student returns.

Note that this check box affects only continuing students and does not affect new students.

Null Errors Only

Select to restrict returns to those students where a *NULL ERROR* value has been derived in one of the student-related entities during a previous run of the process.

You cannot select all three check boxes — Null Errors Only, Validation Errors Only, and Student Overrides — for the student-related entities. Only one check box can be selected.

The system enables this check box for only Student, ITT, and DLHE returns.

Validation Errors Only

Select to restrict the student-related entities in the extract to those records where the HESA Validation Kit has identified a validation error and the error details have been imported to the validation staging table.

You cannot select all three check boxes — Null Errors Only, Validation Errors Only, and Student Overrides — for the student-related entities. Only one check box can be selected.

The system enables this check box for only Student and ITT returns.

Student Override

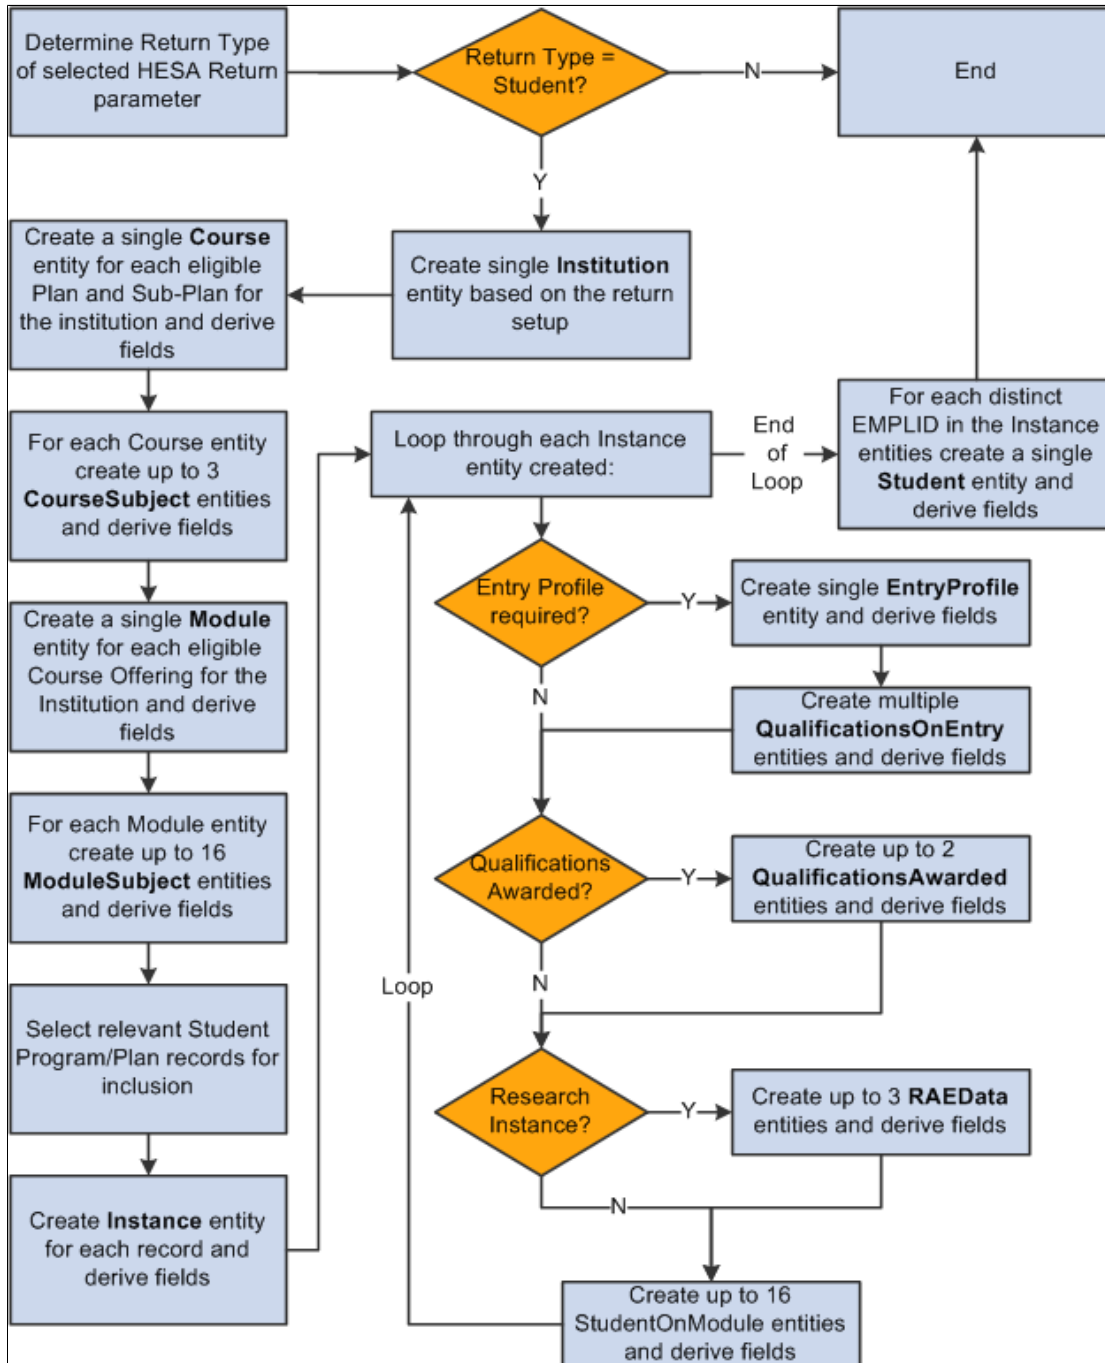

Use this region to specify a single or multiple students for whom the process should generate the return data.

The system enables the Student Override check box for only Student, ITT, and DLHE returns.

Processing Diagram

Image: Process for Creating Student Return Entities

The following diagram describes how the Create Extract process creates the entities for a student return:

When the process creates an entity record, it sets the record to *active*. The records it created previously are set to *inactive* or deleted depending on whether or not the Retain Data from Previous Run check box is selected. The process deletes the records it created before the previous run.

Refer to the documentation sections of each entity (for example, the “Student Record Return: Course Entity” section), for information about how the system includes records for each entity.

Also, specifically, refer to the following documentation sections for information about how the entities are processed when you select the validation only and null only check boxes:

- [Student Record Return: Course Entity](#)
- [Student Record Return: Module Entity](#)
- [Student Record Return: Instance Entity](#)
- [ITT Return: Student Entity](#)
- [DLHE Return: Study Entity](#)

HESA Validation Errors

To run the Create Extract process for records with validation errors:

1. Use the File Parser utility to import the errors, reported by the HESA Validation Kit, into a staging table (PS_SSR_HE_VAL_STG)
2. Run the Create Extract process just for those records with validation errors. You must select at least one of the Validation Errors Only check boxes for the process to select error records from the PS_SSR_HE_VAL_STG table.
3. Use the Extract Data page to review the extract records with errors.

Note: You should ensure that all previous validation error records, including the header record, have been processed and deleted from the validation staging table before importing a new validation errors file to the staging table using the File Parser process.

Using File Parser to import HESA Validation Kit errors

When you use the HESA Validation Kit to process an XML file, the kit reports errors with an option to save the error details as a text (.txt) file. To import the records from the text file into the PS_SSR_HE_VAL_STG staging table, you can use File Parser process. For more information about setting up and running the File Parser process, refer to the File Parser documentation:

See "Understanding the File Parser Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

See "Running the File Parser Process" (PeopleSoft Campus Solutions 9.2: Campus Community)

Note that the Field Conversion Definition setup is required only if the file data needs to be converted before inserting into the staging table. Therefore, this setup is not required for HESA validation error processing.

The following is an example of the context definition setup for HESA Validation error processing:

Image: Context Definition setup for HESA error processing (1 of 2)

This example illustrates Context Definition setup for HESA error processing (1 of 2). You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Context Definition' setup. At the top, the 'Context Name' is 'HESA Validation Import' and the 'Conversion Definition' is a dropdown menu. Below this, the 'Staging Table Records' section shows a search for '*Record' with the value 'SSR_HE_VAL_STG' and a 'Synchronize Record Fields' button. The 'Staging Table Fields' section is a table with the following data:

	Field Name	Field Type	*Mapping Action	Visible for Mapping
1	SSR_HE_LEVEL	Char	No Default	<input checked="" type="checkbox"/>
2	SSR_HE_RULE_NUM	Char	No Default	<input checked="" type="checkbox"/>
3	SSR_HE_RULE_DESC	Char	No Default	<input checked="" type="checkbox"/>
4	SSR_HE_COLUMN1	Char	No Default	<input checked="" type="checkbox"/>
5	SSR_HE_COLUMN2	Char	No Default	<input checked="" type="checkbox"/>
6	SSR_HE_COLUMN3	Char	No Default	<input checked="" type="checkbox"/>
7	SSR_HE_COLUMN4	Char	No Default	<input checked="" type="checkbox"/>
8	SSR_HE_COLUMN5	Char	No Default	<input checked="" type="checkbox"/>
9	SSR_HE_COLUMN6	Char	No Default	<input checked="" type="checkbox"/>
10	SSR_HE_COLUMN7	Char	No Default	<input checked="" type="checkbox"/>
11	SSR_HE_COLUMN8	Char	No Default	<input checked="" type="checkbox"/>

Image: Context Definition setup for HESA error processing (2 of 2)

This example illustrates Context Definition setup for HESA error processing (2 of 2). You can find definitions for the fields and controls later on this page.

12	SSR_HE_COLUMN9	Char	No Default	<input checked="" type="checkbox"/>
13	SSR_HE_COLUMN10	Char	No Default	<input checked="" type="checkbox"/>
14	SSR_HE_COLUMN11	Char	No Default	<input checked="" type="checkbox"/>
15	SSR_HE_COLUMN12	Char	No Default	<input checked="" type="checkbox"/>
16	SSR_HE_COLUMN13	Char	No Default	<input checked="" type="checkbox"/>
17	SSR_HE_COLUMN14	Char	No Default	<input checked="" type="checkbox"/>
18	SSR_HE_LINE_NUM	Char	No Default	<input checked="" type="checkbox"/>

Click the Refresh Layout Tree link on the Record Tree page to view the staging table (SSR_HE_VAL_STG) that holds the imported validation errors.

Image: Record Tree page for SSR_HE_VAL_STG

The following is an example of the Record Tree page for SSR_HE_VAL_STG:

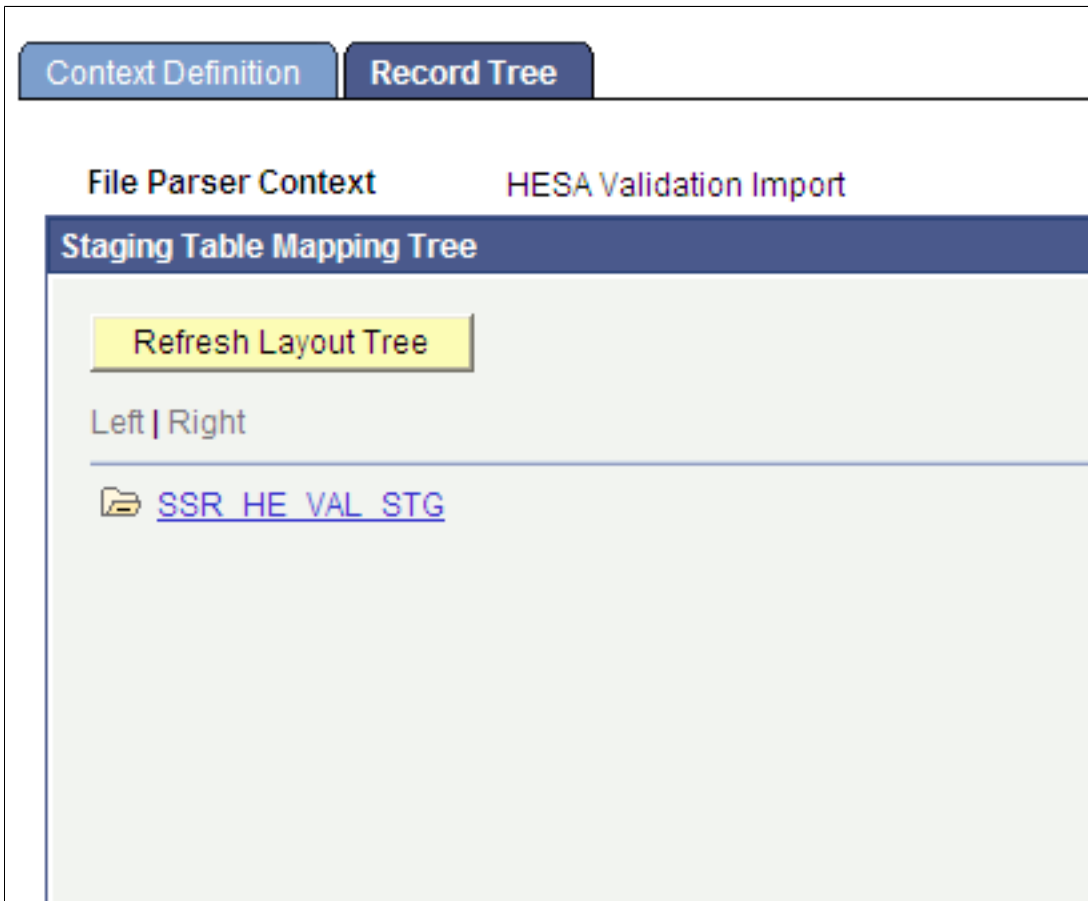

Image: Example of a File Definition page

Campus Solutions delivers an example definition that includes the possible validation error values that you can import:

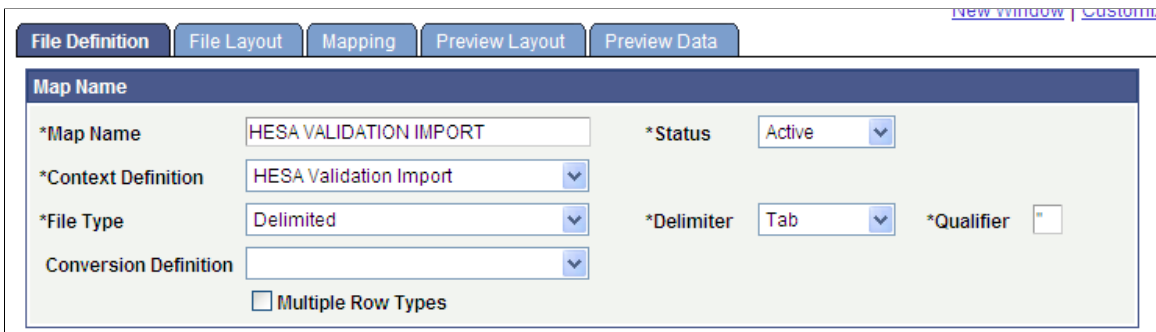

Image: An example of the error file structure set up on the File Layout page

The delivered definition is based on an assumed error file structure:

The header row for the file would contain the field names, indicated in the preceding example, without the Line Number.

You can copy an existing File Mapping Definition (Set Up SACR, System Administration, Utilities, File Parser, Copy File Map Definition) and then edit the copied version to create different mappings that match the fields in the error file.

Map the key fields of COURSEID, MODID, and OWNSTU to a staging table column if the values for the fields are provided in the errors file. Also, map the Level, Rule Number, and Rule Description values.

Image: Mapping for the minimum fields (1 of 2)

The following is an example of the Mapping page with the mappings for these fields:

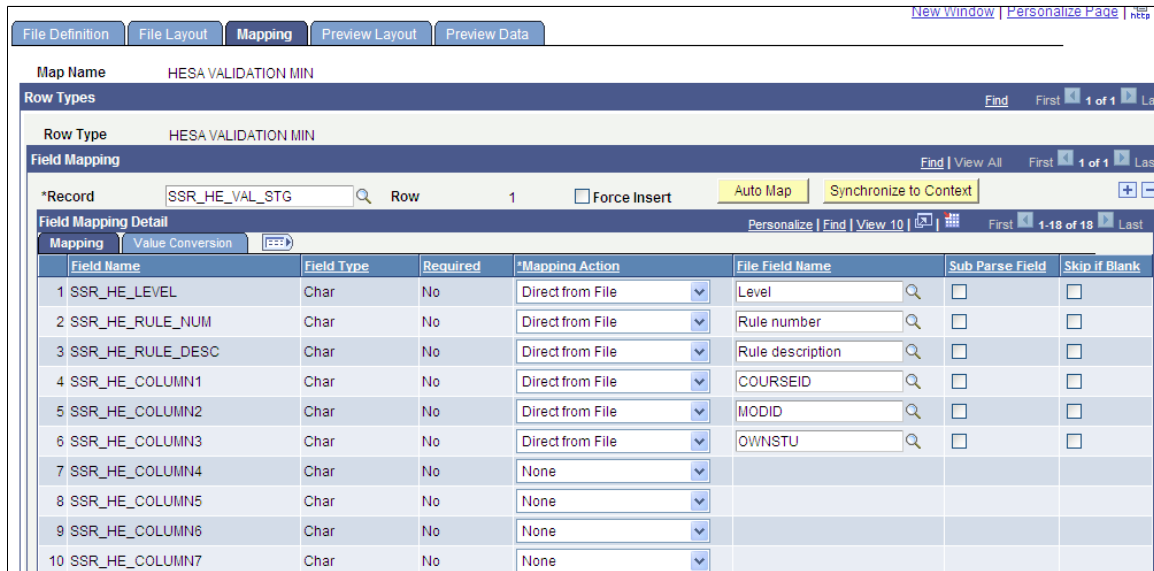

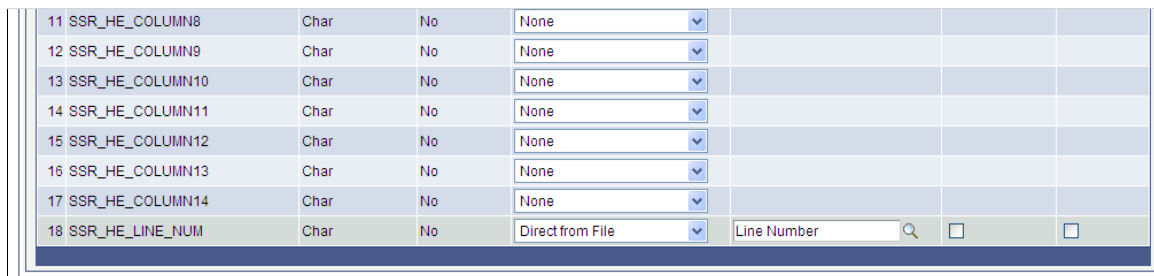

Image: Mapping for the minimum fields (2 of 2)

Example of mapping for the minimum fields (continued):

To process the staging table records, the Create Extract process does not rely on values existing in a particular column but the process will select the key COURSEID, MODID and OWNSTU values based on the header row value for the column in the error file. Therefore, you must include the header row in the error file being imported.

Other than the key and Level, Rule Number and Rule Description values, you can map the remaining fields to import the full details of the errors into the staging table record. This step is optional because the non-key values are not required for the subsequent processing of the staging table records by the Create Extract process.

Image: Mapping for the full error file (1 of 2)

This is the mapping for the full Student return error file:

Field Name	Field Type	Required	*Mapping Action	File Field Name	Sub Parse Field	Skip if Blank
1 SSR_HE_LEVEL	Char	No	Direct from File	Level	<input type="checkbox"/>	<input type="checkbox"/>
2 SSR_HE_RULE_NUM	Char	No	Direct from File	Rule number	<input type="checkbox"/>	<input type="checkbox"/>
3 SSR_HE_RULE_DESC	Char	No	Direct from File	Rule description	<input type="checkbox"/>	<input type="checkbox"/>
4 SSR_HE_COLUMN1	Char	No	Direct from File	COURSEID	<input type="checkbox"/>	<input type="checkbox"/>
5 SSR_HE_COLUMN2	Char	No	Direct from File	SBJCA	<input type="checkbox"/>	<input type="checkbox"/>
6 SSR_HE_COLUMN3	Char	No	Direct from File	MODID	<input type="checkbox"/>	<input type="checkbox"/>
7 SSR_HE_COLUMN4	Char	No	Direct from File	MODSBJ	<input type="checkbox"/>	<input type="checkbox"/>
8 SSR_HE_COLUMN5	Char	No	Direct from File	COSTCN	<input type="checkbox"/>	<input type="checkbox"/>
9 SSR_HE_COLUMN6	Char	No	Direct from File	OWNSTU	<input type="checkbox"/>	<input type="checkbox"/>
10 SSR_HE_COLUMN7	Char	No	Direct from File	HUSID	<input type="checkbox"/>	<input type="checkbox"/>

Image: Mapping for the full error file (2 of 2)

Mapping for the full Student return error file (continued):

11 SSR_HE_COLUMN8	Char	No	Direct from File	OWNINST	<input type="checkbox"/>	<input type="checkbox"/>
12 SSR_HE_COLUMN9	Char	No	Direct from File	NUMHUS	<input type="checkbox"/>	<input type="checkbox"/>
13 SSR_HE_COLUMN10	Char	No	Direct from File	QUALSBJ	<input type="checkbox"/>	<input type="checkbox"/>
14 SSR_HE_COLUMN11	Char	No	Direct from File	QUALTYPE	<input type="checkbox"/>	<input type="checkbox"/>
15 SSR_HE_COLUMN12	Char	No	Direct from File	QUAL	<input type="checkbox"/>	<input type="checkbox"/>
16 SSR_HE_COLUMN13	Char	No	Direct from File	UOA2008	<input type="checkbox"/>	<input type="checkbox"/>
17 SSR_HE_COLUMN14	Char	No	None			
18 SSR_HE_LINE_NUM	Char	No	Direct from File	Line Number	<input type="checkbox"/>	<input type="checkbox"/>

As with the Student return, for the ITT return, you must map the Level, Rule Number and Rule Description values along with the key OWNSTU value. The File Parser process uses these mappings to identify the extract records that are to be re-processed by the Create Extract process.

Image: Mapping for the minimum fields — ITT (1 of 2)

This example illustrates the mapping for the minimum fields — ITT.

Field Name	Field Type	Required	*Mapping Action	File Field Name	Sub Parse Field	Skip if Blank
1 SSR_HE_LEVEL	Char	No	Direct from File	Level	<input type="checkbox"/>	<input type="checkbox"/>
2 SSR_HE_RULE_NUM	Char	No	Direct from File	Rule number	<input type="checkbox"/>	<input type="checkbox"/>
3 SSR_HE_RULE_DESC	Char	No	Direct from File	Rule description	<input type="checkbox"/>	<input type="checkbox"/>
4 SSR_HE_COLUMN1	Char	No	Direct from File	OWNSTU	<input type="checkbox"/>	<input type="checkbox"/>
5 SSR_HE_COLUMN2	Char	No	None			
6 SSR_HE_COLUMN3	Char	No	None			
7 SSR_HE_COLUMN4	Char	No	None			
8 SSR_HE_COLUMN5	Char	No	None			
9 SSR_HE_COLUMN6	Char	No	None			
10 SSR_HE_COLUMN7	Char	No	None			

Image: Mapping for the minimum fields — ITT (2 of 2)

Mapping for the minimum fields — ITT (continued).

11 SSR_HE_COLUMN8	Char	No	None			
12 SSR_HE_COLUMN9	Char	No	None			
13 SSR_HE_COLUMN10	Char	No	None			
14 SSR_HE_COLUMN11	Char	No	None			
15 SSR_HE_COLUMN12	Char	No	None			
16 SSR_HE_COLUMN13	Char	No	None			
17 SSR_HE_COLUMN14	Char	No	None			
18 SSR_HE_LINE_NUM	Char	No	Direct from File	Line Number	<input type="checkbox"/>	<input type="checkbox"/>

This is the mapping for the full ITT error file:

Image: Mapping for the full error file — ITT (1 of 2)

This example illustrates the mapping for the full error file — ITT.

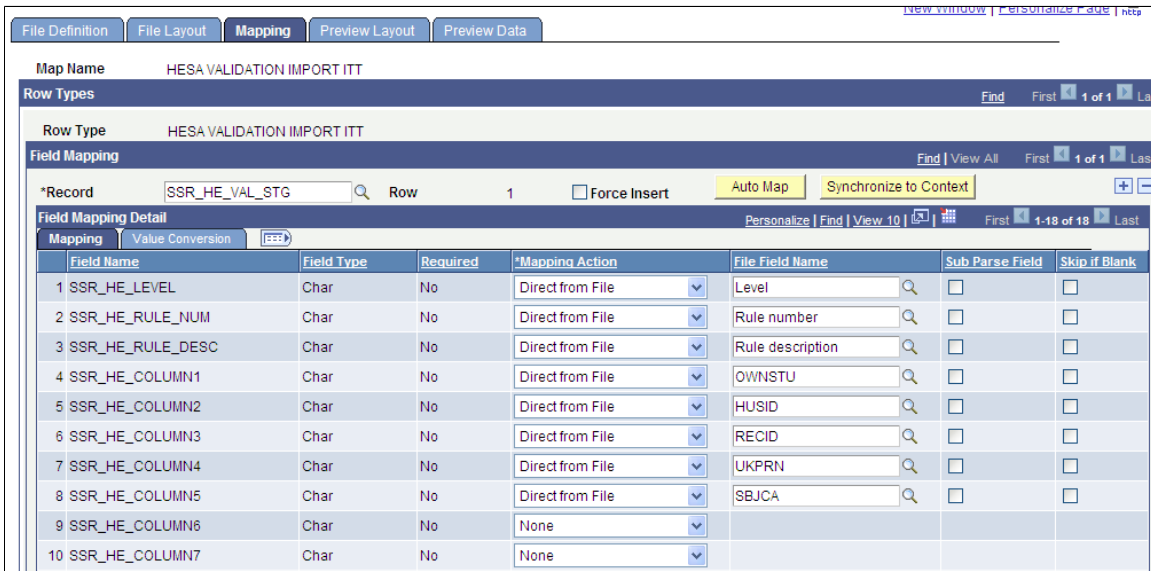

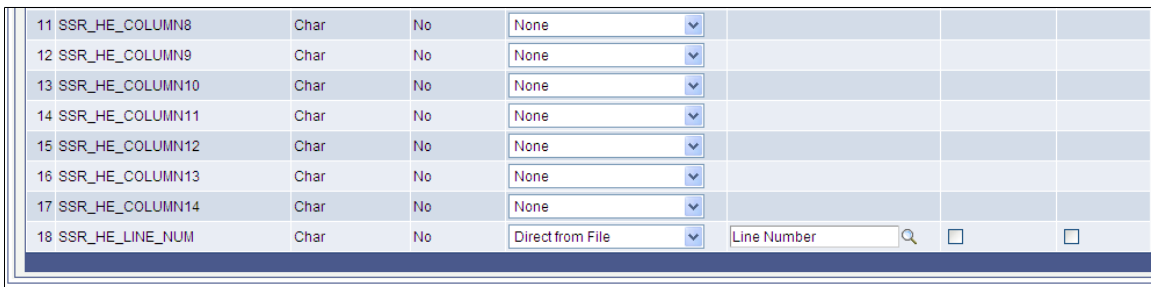

Image: Mapping for the full error file — ITT (2 of 2)

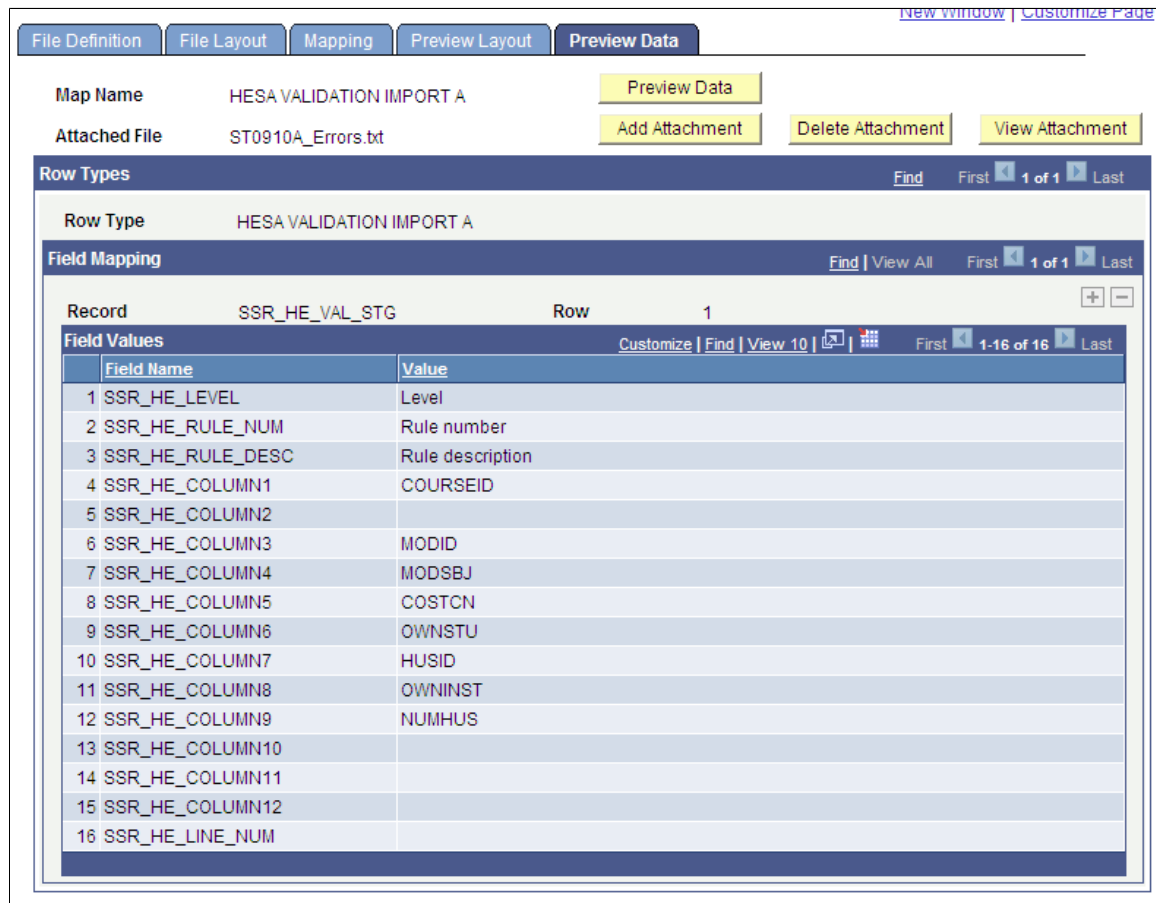

Mapping for the full error file — ITT (continued).

On the Preview Data page, you can attach an error file and generate a preview based on the first row in the error file. This lets you check whether the values will populate the correct columns in the staging table.

Image: Example of the Preview Data page

The following is an example of the Preview Data page:

In the preceding example, note that because the header row does not included a label for Line Number that value is blank in the preview.

Reviewing the Extract Data

Access the extract data pages (Records and Enrollment >HESA Reporting >Extract Data).

Use the Institution Extract, Module Extract Data, Course Extract Data, Student Extract Data, and Instance Extract Data pages to review the Student return extract data.

Use the Institution Extract and Provision Extract Data pages to review the Aggregate Offshore return data.

Use the Institution Extract and ITT Extract Data pages to review the ITT return data.

Use the Graduate Outcomes Extract Data page to review the Graduate Outcomes return data.

For the Unistats/KIS return, use the Institution Extract page to review institution level fields and fields of Location entities. Use the Course Extract Data page to review the KIS Course records.

You can review only the most recent data for a particular return. When you run the Create Extract process, the system automatically deletes any data previously generated for a return.

Null Error check box on the Instance Extract Data page

The Create Extract process selects this check box if any field in the student's extract data has a *NULL ERROR* value. The Null Error check box is applicable for only Student return.

Creating an XML Return File

Access the Create XML page (Records and Enrollment > HESA Reporting > Extract Processing > Create XML).

After you review the return data using the Extract Data pages, use the Create XML page to run the Create XML File process.

Return Name	Enter the return that you want to process.
XML Path/File Name	Enter the file path and file name that you want the system to use to save the XML file. You must enter a valid directory path that maps to a folder with appropriate Read/Write permission. If you cannot locate such a folder, consult your system administrator.
Exclude Null Error tags	Select this check box if you want the process to exclude fields with a Reported Value of <i>NULL ERROR</i> from the XML file. If you do not select this check box, then the process includes the fields with Reported Value of <i>NULL ERROR</i> .

The Create XML process automatically excludes from the XML file:

- A field that does not have a value (null).
- An entity in which all fields have no values.

After running the process, you can use the View Log/Trace page to download the generated XML file to your local machine.

Note for Data Futures Return

Entities are included if the Entity Status is New, Amended, Identify, or Delete. Fields are included for each entity if:

- the Field Status is *New* or *Amended* OR
- the Field Type in Entity/Fields is *Key* OR
- the *Entity Status* is *New* or *Amended* and the Field Type is *Required* in Entity Fields.

Each field element is populated with the Reported Value. If the Reported Value is null an empty element is included in the XML. Note: Typically required fields without a value will be derived as *NULL ERROR* and the corresponding Entity Status will be set to *Error* so the entity will not be included in the XML.

There are some non-unique identifier fields that are required in the schema when any of the other fields in the sequence are being returned. Those fields are always included where the action is upsert.

Note for Student Return

The Create XML File process includes the RAEData element as <REFData> in the XML file. The MOBTYPE2 and MOBTYPE3 fields are included in the XML as <MOBTYPE>. NATIOND2 is included as <NATIOND>, REGBODY2 as <REGBODY>, and TQGSUB2 and TQGSUB3 as <TQGSUB>.

Note for ITT Return

- Blank NQTEMAIL values are included as empty tags, that is, <NQTEMAIL/>
- PGCECLSS – included in the XML as <DEGCLSS>
- PGCESBJ – included in the XML as <DEGSBJ>
- PGCESBJ2 – included in the XML as <DEGSBJ>
- PGCESBJ3 – included in the XML as <DEGSBJ>

Note for Unistats/KIS Return

The Create XML File process converts the tags for the following field names:

- OTHERINST2 to OTHERINST9 converted to <OTHERINST>
- SSR_HE_COURSEID converted to <KISCOURSEID>
- SSR_HE_CTITLE is converted to <TITLE>
- JACSA, JACSB and JACSC converted to <JACS>
- TEACHUKPRN2 and TEACHUKPRN3 converted to <TEACHUKPRN>

Note for DLHE Return

The Create XML File process includes the PREVEMP field as <PREVEM> in the XML file.

Validating an XML Return File

Access the HESA Validate XML page (Records and Enrollment > HESA Reporting > Extract Processing > Validate XML).

Run the HESA Validate XML process to validate the XML file generated by the Create XML File process. The HESA Validate XML process validates against the schema, it does not validate against the HESA business rules. You can validate the XML file against both the schema and the HESA business rules by using the HESA Validation Kit. After you run the HESA Validate XML process, refer to the log file to check for any validation errors.

XML Path/File Name

Enter the path and file name of the XML file that you want to validate.

Add Attachment

Click to browse to the XML file that you want to validate. You can browse your local drive and select a file.

Note: The upload process creates a files subdirectory to store and process the XML file. This subdirectory is created in the server directory location that is specified in the PS_SERVDIR system parameter in the Application Server/Process Scheduler configuration file psappsrv.cfg/psprcs.cfg. Ensure that PS_SERVDIR is set up with an appropriate value in the configuration file and that users have the correct permission to access the files subdirectory.

XSD Path/File Name

Enter the complete path and file name of the XSD file. The process uses the XSD file to validate your XML file.

The XSD file is available from the HESA website.

Note: You must place the two related XSD files for CodeLists and DataTypes in the same directory as the XSD file being used for the XML validation. For example, if C08051.xsd is being used to validate the XML file and you have stored the C08051.xsd in /bur/hesa/psoft/shared/, then you must place C08051DataTypes.xsd and C08051CodeLists.xsd in the same directory /bur/hesa/psoft/shared/ because C08051.xsd references these two files.

Add Attachment

Click to browse to the XSD file. You can browse your local drive and select a file.

Note: The upload process creates a files subdirectory to store and process the XSD file. This subdirectory is created in the server directory location that is specified in the PS_SERVDIR system parameter in the Application Server/Process Scheduler configuration file psappsrv.cfg/psprcs.cfg. Ensure that PS_SERVDIR is set up with an appropriate value in the configuration file and that users have the correct permission to access the files subdirectory.

Note: If you are adding an XSD file using the Add Attachment button you must also ensure that any related XSD files (for example, Code Lists and Data Types) have also been added to the same location using the Add Attachment button.

Chapter 61

(GBR) HESA Field Derivation

Understanding HESA Derivation Steps

Academic institutions submit the student-based statistical returns to HESA as an XML file. The XML file is composed of entities. Each entity, in turn, is composed of data fields. For example, the Institution entity in the student return has three data fields: INSTAPP, RECID, and UKPRN. The specifications for HESA returns are available from the HESA website. The specifications on the HESA website also include field validations and the valid field values for the various returns.

See also [Understanding HESA Returns](#)

This documentation discusses the:

- Campus Solution pages that the Create Extract Application Engine (SSR_HE_DATA) process uses to derive each field.
- Steps that the Create Extract process performs to derive each field.

This documentation does not list the Constant and Default fields on the HESA Fields page that the Create Extract process uses for derivation. However, it does note the step where the Create Extract process uses a constant and default value for derivation. For information about the HESA Fields page, see [Setting Up a HESA Return](#)

The Create Extract process performs a sequence of steps to derive a field. If the process finds a value in a certain step, it does not perform the next step. For example, the process performs the following steps to derive the Course.BITTM field value:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

If a constant value exists for Course.BITTM, then the process uses the constant value in the return and does not perform Step 2 and the remaining steps. If a constant value does not exist, the process performs the next step in the sequence, which Step 2. If the process is not able to derive the value after performing Steps 1 through 5, it performs the last step and sets the Course.BITTM value to *NULL ERROR* in the HESA return.

The last derivation step for most fields is to either assign the value as *NULL ERROR* or not to derive a value and leave the field as blank. If HESA requires a value for a field, the last derivation step is to

assign the field a value of *NULL ERROR*. Conversely, if HESA does not require a value for a field, the last derivation step is to not derive a value and leave the field value as blank. For example, if the Create Extract process cannot derive a Course.FEQAIMC value, it leaves the Course.FEQAIMC value as blank because HESA does not require a value for Course.FEQAIMC for a Course entity.

In some cases, before executing the derivation steps, the Create Extract process checks the Field Derivation Rule to determine whether a value should be derived. If a value should not be derived, the process leaves the field value as blank. For example, before performing the derivation steps for Course.BITTM, the process first checks whether:

- Country = Wales, Scotland, or Northern Ireland
- Course.REDUCEDC = 00, 01, or 04
- Course.TTCID = 1 or 2

The process starts performing the derivation steps for Course.BITTM only if all three conditions are met. If all three conditions are not met, the process leaves the field value as blank.

Important! Oracle recommends that you use the Extract Data pages to review and correct all the values that are derived as *NULL ERROR* before submission to HESA. .

For information about the Extract Data pages, see [Understanding Generating a HESA Return and Creating a Return File](#)

Note: To derive a field value, the Create Extract process uses the most recent effective-dated record that falls on or before the end of the reporting period. Exceptions to this rule are noted in this HESA field derivation documentation.

The following table lists the navigation paths for the pages mentioned throughout the HESA field derivation documentation:

Page	Navigation
Program HESA Data	Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Program HESA Data
Program Offering/Year HESA	Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Program Offering/Year HESA
Plan HESA Data	Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan HESA Data
Plan Offering/Year HESA	Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan Offering/Year HESA
Sub-Plan HESA	Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan HESA
Sub-Plan Offering/Year HESA	Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan Offering/Year HESA
HESA Module Data	Curriculum Management > Course Catalog > HESA Module Details

Page	Navigation
HESA Returns	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Returns
Student Program	Records and Enrollment > Career and Program Information > Student Program/Plan
HESA Instance	Records and Enrollment > Career and Program Information > HESA Instance Details > HESA Instance
Entry Profile	Records and Enrollment > Career and Program Information > HESA Instance Details > Entry Profile
HESA Action Reasons	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Action Reasons
HESA Types	Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns Setup > HESA Types
External System ID	Campus Community > Personal Information (Student) > Identification (Student) > External System ID
Person HESA Data	Campus Community > Personal Information > Add/Update a Person > Person HESA Data
Enter DLHE Survey (self-service)	Click the Enter Survey button on the Survey Management page (Records and Enrollment > HESA Reporting > Destination of Leavers > Survey Management). Click the Enter DLHE Survey link on the Student Center page (Self Service, Student Center).
Survey Details	Click the Details button on the Survey Management page.

For information about these pages and how to generate HESA Returns, see

- [Setting Up a HESA Return](#)
- [Setting Up and Entering Data for HESA Reporting](#)
- [Preparing for Generating DLHE Return](#)
- [Generating a HESA Return and Creating a Return File](#)

Note: This documentation about HESA field derivation describes the delivered functionality for deriving the HESA return fields. You can use the Institution Data Capture page to determine at which level you can enter data for field derivation. For more information about the Institution Data Capture page see: [Setting Up and Entering Data for HESA Reporting](#)

Oracle recommends that you review the return type specification that is available from the HESA website for field descriptions, validations, and valid field values.

See <http://www.hesa.ac.uk>.

Student Record Return: Institution Entity

The Create Extract process creates a single Institution entity. The Institution entity is composed of three fields.

Indicator for HEFCE Funding Approximations (INSTAPP)

Return: Student Record

Entity: Institution

Page Used:

Page	Page Element
HESA Returns	INSTAPP

Field Derivation Rule: If the country is England or Northern Ireland, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the HESA Returns page.
2. Derive as *NULL ERROR*.

Record Type Indicator (RECID)

Return: Student Record

Entity: Institution

Pages Used:

Page	Page Element
Reporting Periods (Records and Enrollment > HESA Reporting > HESA Returns Setup > Reporting Periods)	Record Year
Returns (Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns)	Record ID

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive as YYNNN, where *YY* is the final two digits of the Record Year (for example, 09 for 2009) and *NNN* is the 3-digit Record ID for the seeded return.
2. Derive as *NULL ERROR*.

For Student Return 2009/10, the Record ID must be 051 and the Record Year for the Reporting Period must be 2009. The correct Record ID and Record Year for Student Return 2009/10 are delivered with your system.

UK Provider Reference Number (UKPRN)

Return: Student Record

Entity: Institution

Page Used:

Page	Page Element
HESA Configuration	UKPRN

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the HESA Returns page.
2. Derive as *NULL ERROR*.

Student Record Return: Course Entity

If you select the Include Course Entities check box on the Create Extract Data page, the Create Extract process creates Course entities based on the academic plans and academic subplans of the institution that are active and have been set up as eligible for reporting to HESA on the Plan HESA Data or the Sub-Plan HESA page.

If you select the Enable Sub-Plan Reporting check box on the HESA Returns page, the Create Extract process looks at both subplans and plans with the Report to HESA check box selected. If you did not select the Enable Sub-Plan Reporting check box on the HESA Returns page or if no subplan records are marked for reporting to HESA, then the extract process looks at only plan records for deriving the Course fields.

Note: You can specify an academic subplan, academic plan, or both on the Create Extract Data page to test the Create Extract process for a single plan or subplan. The process then uses the specified subplan or plan to create the Course entities. You must select the Enable Sub-Plan Reporting check box on the HESA Returns page if you want to specify a subplan on the Create Extract Data page.

If you have specified an academic career on the Create Extract Data page and no plan, the process includes only those plans that are related to the specified academic career either by looking at the Academic Career field on the Academic Plan Table page or by looking at the parent Academic Program settings (Academic Program field on the Academic Plan Table page and then Academic Career field on the Academic Program Table page).

If you have specified an academic career on the Create Extract Data page and no subplan, the process includes only those subplans whose parent Academic Plan is related to the Academic Career either directly (Academic Career field on the Academic Plan Table page) or by looking at the parent Academic

Program settings (Academic Program field on the Academic Plan Table page, and then the Academic Career field on the Academic Program Table page).

If you have specified an academic plan on the Create Extract Data page and no subplan, the process includes only those subplans that are related to the specified plan by looking at the Academic Plan field on the Academic Sub-Plan Table page.

If you have selected the Null Errors Only check box for the Include Course Entities on the Create Extract Data page, the process selects distinct COURSEID values from the existing active Course extract data, where at least one field in the Course or Course Subject extract data has a Derived Value of *NULL ERROR*. The process then selects Course entity records for these COURSEIDs.

If you have selected the Validation Errors Only check box for the Include Course Entities, the process first deletes any Validation Error staging records where all of the COURSEID, MODID and EMPLID fields are blank. Then, it selects distinct COURSEID values from the Validation Error staging table for rows where COURSEID is not blank and EMPLID is blank. The process selects Course entity records for these COURSEIDs. Finally, it deletes records from the Validation Error staging table where COURSEID is populated and EMPLID is blank.

Awarding Body 1 (AWARDBOD)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	AWARDBOD
Plan HESA Data	AWARDBOD
Sub-Plan HESA	AWARDBOD

Field Derivation Rule: Derive a value if the following conditions are met:

- Course.COURSEAIM begins with D, E, L, M, H, I, J or C.
- Course.COURSEAIM does not end with 99 (that is, H99, L99, M99, I99, J99, C99).

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Default to the derived Institution.UKPRN value.

Awarding Body 2 to 8 (AWARDBOD2 to 8)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	AWARDBOD2 to 8
Plan HESA Data	AWARDBOD2 to 8
Sub-Plan HESA	AWARDBOD2 to 8

Field Derivation Rule: Derive a value if the following conditions are met:

- Course.COURSEAIM begins with D, E, L, M, H, I, J or C.
- Course.COURSEAIM does not end with 99 (that is, H99, L99, M99, I99, J99, C99).

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If Course.AWARDBOD was derived from a subplan (derivation step 2 in the previous subsection), derive from the Sub-Plan HESA page.
2. If Course.AWARDBOD was derived from a plan (derivation step 3 in the previous subsection), derive from the Plan HESA Data page.
3. If Course.AWARDBOD was derived from a program (derivation step 4 in the previous subsection), derive from the Program HESA Data page.
4. Do not derive a value and leave the field blank.

Bilingual ITT Marker (BITTM)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	BITTM
Plan HESA Data	BITTM
Sub-Plan HESA	BITTM

Field Derivation Rule: Derive a value only if the following conditions are met:

- Country = Wales, Scotland, or Northern Ireland
- Course.REDUCEDC = 00, 01, or 04
- Course.TTCID = 1 or 2

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Closed Course (CLSDCRS)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	CLSDCRS
Plan HESA Data	CLSDCRS
Sub-Plan HESA	CLSDCRS

Field Derivation Rule: Derive a value only if the following conditions are met:

- Country = England
- Course.REDUCEDC = 00
- Course.COURSEAIM is not Z99

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.

4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *0*.

Collaborating Organization (COLLORG)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	COLLORG
Plan HESA Data	COLLORG
Sub-Plan HESA	COLLORG

Field Derivation Rule: Derive a value only if the following conditions are met:

- Country = England
- Course.REDUCEDC = 00
- Course.COURSEAIM does not equal D00, D01, D90, L00, L80, L90, L91, L99, or Z99

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

General Qualification Aim of Course (COURSEAIM)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	COURSEAIM
Plan HESA Data	COURSEAIM
Sub-Plan HESA	COURSEAIM

Field Derivation Rule: Include for all Course entities.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Course Identifier (COURSEID)

Return: Student Record

Entity: Course

Pages Used: None

Field Derivation Rule: Include for all Course entities.

Derivation Steps:

1. If the Course entity is based on a subplan, derive from the Academic Sub-Plan Table record.
2. Derive from the Academic Plan Table record.

Course Title (CTITLE)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Plan HESA Data	Course Title
Sub-Plan HESA	HESA Course Title

Page	Page Element
Academic Plan Table (Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table)	Academic Plan
Academic Sub-Plan Table (Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table)	Academic Subplan

Field Derivation Rule: Include for all Course entities.

Derivation Steps:

1. If the Course entity is based on a subplan, derive from the Sub-Plan HESA page.

If the Course Title field does not have a value, use a combination of the plan and subplan descriptions from the Academic Plan Table and Academic Sub-Plan Table pages.

2. Derive from the Plan HESA Data page.

If the Course Title field does not have a value, use the plan description from the Academic Plan Table page.

FE General Qualification Aim (FEQAIMC)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	FEQAIMC
Plan HESA Data	FEQAIMC
Sub-Plan HESA	FEQAIMC

Field Derivation Rule: Include for all Course entities.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Do not derive a value and leave the field blank.

Major Source of Funding (MSFUND)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	MSFUND
Plan HESA Data	MSFUND
Sub-Plan HESA	MSFUND

Field Derivation Rule: Derive a value if Course.REDUCEDC = 00, 01 or 04. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. If Country = Scotland, Northern Ireland or Wales, derive as *NULL ERROR*.
7. Do not derive a value and leave the field blank.

NHS Bursaries (NHSBURSARY)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	NHSBURSARY
Plan HESA Data	NHSBURSARY
Sub-Plan HESA	NHSBURSARY

Field Derivation Rule: Derive a value if Country = Northern Ireland, England or Wales and REDUCEDC = 00

Derivation Steps:

1. Use Constant.
2. If the Course entity is based on a sub-plan, derive from the Sub-Plan HESA page.
3. Derive from Plan HESA Data.
4. Derive from Program HESA Data
5. Use default.
6. Derive as *NULL ERROR*.

Own Course Identifier (OWNCOURSEID)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Plan HESA Data	OWNCOURSEID
Sub-Plan HESA Data	OWNCOURSEID

Field Derivation Rule: Include for all Course entities.

Derivation Steps:

1. If Course entity is based on a subplan, derive from the Sub-Plan HESA Data page.
2. Derive from the Plan HESA Data page.
3. Do not derive a value and leave the field blank.

Reduced Course Return Indicator (REDUCEDC)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	REDUCEDC
Plan HESA Data	REDUCEDC
Sub-Plan HESA	REDUCEDC

Field Derivation Rule: Include for all Course entities.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Regulatory Body for Health and Social Care Students (REGBODY)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	REGBODY
Plan HESA Data	REGBODY
Sub-Plan HESA	REGBODY

Field Derivation Rule: Derive a value if the following conditions are met:

- Course.COURSEAIM = M16, M26, M76, M86, H16, H62, H76, I16, I76, J26, or J76
- Course.REDUCEDC = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Regulatory Body for Health and Social Care Students 2 (REGBODY2)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	REGBODY
Plan HESA Data	REGBODY
Sub-Plan HESA	REGBODY

Field Derivation Rule: Derive a value if the following conditions are met:

- Course.COURSEAIM = M16, M26, M76, M86, H16, H62, H76, I16, I76, J26, or J76
- Course.REDUCEDC = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL*.

Subject Knowledge Enhancement Units (SKEUNITS)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	SKEUNITS
Plan HESA Data	SKEUNITS
Sub-Plan HESA	SKEUNITS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England

- Course.REDUCEDC = 07 (SKE) or Course.TTCID = F (SKE)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use Constant.
2. If the Course entity is based on a sub-plan, derive from the Sub-Plan HESA page.
3. Derive from Plan HESA Data.
4. Derive from Program HESA Data
5. Use default.
6. Derive as *NULL ERROR*.

Subject Knowledge Enhancement Placement (SKEOS)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	SKEOS
Plan HESA Data	SKEOS
Sub-Plan HESA	SKEOS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Course.REDUCEDC = 07 (SKE) or Course.TTCID = F (SKE)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use Constant.
2. If the Course entity is based on a sub-plan, derive from the Sub-Plan HESA page.
3. Derive from Plan HESA Data.
4. Derive from Program HESA Data
5. Use default.
6. Derive as *NULL ERROR*.

Teaching Qualification Sought Sector (TQSSEC)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	TQSSEC
Plan HESA Data	TQSSEC
Sub-Plan HESA	TQSSEC

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland or Northern Ireland
- Course.REDUCEDC = 00
- Course.TTCID = 1 or 2

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Teaching Qualification Sought Subject (TQSSUB)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	TQSSUB, TQSSUB2, TQSSUB3
Plan HESA Data	TQSSUB, TQSSUB2, TQSSUB3
Sub-Plan HESA	TQSSUB, TQSSUB2, TQSSUB3

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- Course.REDUCEDC = 00
- Course.TQSSEC = 2

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant to create a single TQSSUB field.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default to create a single TQSSUB field.
6. Derive a single TQSSUB field as *NULL ERROR*.

Note: The system can derive up to three values. Each of the values is included as a separate TQSSUB field in the XML file.

Teacher Training Course (TTCID)

Return: Student Record

Entity: Course

Pages Used:

Page	Page Element
Program HESA Data	TTCID
Plan HESA Data	TTCID
Sub-Plan HESA	TTCID

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland or Scotland AND Course.REDUCEDC = 00, 01, 04, 07 or 09 AND Course.COURSEAIM is not Z99
- Country = Wales AND Course.COURSEAIM does not begin with P, Q, R, S or X and is not Z99 AND Course.REDUCEDC = 00, 01, 04, 07 or 09.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Student Record Return: Course Subject Entity

If you select the Include Course Entities check box on the Create Extract Data page, the Create Extract process creates Course Subject entity records for each Course entity. The process can create a maximum of three Course Subject entity records for each Course entity.

The derivation of Course Subject fields may vary depending on whether the parent Course entity is based on a subplan or plan record.

Subject of ITT Specialism Indicator (ITTSUBJECT)

Return: Student Record

Entity: Course Subject

Pages Used:

<i>Page</i>	<i>Page Element</i>
Program HESA Data — HECoS Subjects	ITT Subject
Plan HESA Data — HECoS Subjects	ITT Subject
Sub-Plan HESA — HECoS Subjects	ITT Subject

Note: The system identifies a HESA subject as an ITT subject only if the ITT Subject Flag check box is selected for the HESA subject.

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Course.TTCID = 1

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If Course entity is based on a subplan, derive from the Sub-Plan HESA — HECoS Subjects page.

2. Derive from the Plan HESA Data page — HECoS Subjects.
3. Derive from the Program HESA Data page — HECoS Subjects.

Subject of Course (SBJCA)

Return: Student Record

Entity: Course Subject

Pages Used:

Page	Page Element
Program HESA Data — HECoS Subjects	Subject
Plan HESA Data — HECoS Subjects	Subject
Sub-Plan HESA — HECoS Subjects	Subject

Field Derivation Rule: Include for all Course Subject entities.

Derivation Steps:

1. If Course entity is based on a subplan, derive from the Sub-Plan HESA — HECoS Subjects page.
2. Derive from the Plan HESA Data — HECoS Subjects page.
3. Derive from the Program HESA Data — HECoS Subjects page.

Subject Percentage (SBJPCNT)

Return: Student Record

Entity: Course Subject

Pages Used:

Page	Page Element
Program HESA Data — HECoS Subjects	Percentage
Plan HESA Data — HECoS Subjects	Percentage
Sub-Plan HESA — HECoS Subjects	Percentage

Field Derivation Rule: Include for all Course Subject entities.

Derivation Steps:

1. If Course entity is based on a subplan, derive from the Sub-Plan HESA — HECoS Subjects page.
2. Derive from the Plan HESA Data — HECoS Subjects page.

3. Derive from the Program HESA Data — HECoS Subjects page.

Student Record Return: Module Entity

If you select the Include Module Entities check box on the Create Extract Data page, the Create Extract process creates the Module entities. To create Module entities, the process uses the institution's Course Offering records that are active and have been set up as eligible for reporting to HESA. You must select the Report to HESA check box on the HESA Module Data page to make a course offering record eligible for HESA reporting.

If HESA Module Data records do not exist, the process does not include the course offerings in the Module entity. The process includes dummy modules in the module entity.

Note: When you run the Create Extract process, you can choose to enter the course ID or course offering number as a run parameter for testing purposes. The Create Extract process then uses the specified course ID or course offering number to create the Module entities.

If you have selected an academic career and no course offering on the Create Extract Data page, then the process selects only those course offerings that are related to the selected career.

If you have selected the Null Errors Only check box for the Include Module Entities on the Create Extract Data page, the Create Extract process selects distinct MODID values from the existing active Module extract data, where at least one field in the Module or Module Subject extract data has a Derived Value of *NULL ERROR*. The process then selects Module entity records for these MODIDs.

If you have selected the Validation Errors Only check box for the Include Module Entities, the Create Extract process first deletes any Validation Error staging records where all of the COURSEID, MODID and EMPLID fields are blank. Then, it selects distinct MODID values from the Validation Error staging table for rows where MODID is not blank and EMPLID is blank. The process selects Module entity records for these MODIDs. Note that the File Parser process removes the leading zeroes from MODID, therefore, the comparison of MODID with Course ID and Course Offering Number includes the logic to correctly match the values. The system makes an assumption that the Course Offering Number is a single digit. Finally, the Create Extract process deletes records from the Validation Error staging table where MODID is populated and EMPLID is blank.

Credit Value of Module (CRDTPTS)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	CRDTPTS
Catalog Data (Curriculum Management, Course Catalog, Catalog Data)	Maximum Units, Academic Progress Units, Enrollment Unit Load Calc Type

Field Derivation Rule: Include for all Module entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Select the Course Catalog record for the Course ID. If the Enrollment Unit Load Calc Type value is *Academic Progress Units*, derive from the Academic Progress Units value. If the Enrollment Unit Load Calc Type value is any other value, derive from the Maximum Units value. Round off the fractional values to the nearest whole number. This step is not performed for dummy modules.
4. Use default.
5. Derive as *NULL ERROR*.

Credit Transfer Scheme (CRDTSCM)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	CRDTSCM

Field Derivation Rule: Include for all Module entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Module Franchise Indicator (FRANIND)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	FRANIND

Field Derivation Rule: If Country = Wales, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Do not derive a value and leave the field blank.

Note: The HESA specification indicates that the Module.FRANIND coverage also includes Course.COURSEAIM that begins with D, E, L, M, H, I, J or C, however, the extract process cannot check this as there is no direct link to the Course entity.

Module FTE (FTE)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	FTE

Field Derivation Rule: Include for all Module entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Level of Credit Points (LEVLPTS)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	LEVLPTS

Field Derivation Rule: If Module.CRDTPTS does not equal 999, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Module Identifier (MODID)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	Course ID Course Offering Nbr

Field Derivation Rule: Include for all Module entities.

Derivation Steps:

1. Derive as combination of Course ID plus Course Offering Number (CRSE_ID and CRSE_OFFER_NBR column values from PS_CRSE_OFFER). For example, if Course ID = 001248 and Offering Number = 2, then MODID = 0012482.

Module Taught in a Celtic Language (MODLANG)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	MODLANG

Field Derivation Rule: If Country = Northern Ireland, Scotland, or Wales, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.

4. Derive as *NULL ERROR*.

Module Title (MTITLE)

Return: Student Record

Entity: Module

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Data	Short description that appears on the right of Course ID page element
HESA Dummy Module Data	Year

Field Derivation Rule: Include for all Module entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page for standard modules. If short description is unavailable on the HESA Module Data page, derive as the description of the parent Course Catalog record.

For dummy modules, the MTITLE is derived as a combination of the Plan description, the text *Year*, and the year value of the dummy module record separated by spaces. For example, for Academic Plan = BA ENG with description BA English and Year = 2, MTITLE is derived as *BA English Year 2*.

3. Use default.
4. Derive as *NULL ERROR*.

Percentage Not Taught By This Institution (PCOLAB)

Return: Student Record

Entity: Module

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Data	PCOLAB

Field Derivation Rule: Include for all Module entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.

- 3. Use default.
- 4. Derive as *NULL ERROR*.

Other Institution Providing Teaching (TINST)

Return: Student Record

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	TINST

Field Derivation Rule: If Module.PCOLAB is greater than zero, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

- 1. Use constant.
- 2. Derive from the HESA Module Data page.
- 3. Use default.
- 4. Derive as *NULL ERROR*.

Student Record Return: Module Subject Entity

If you select the Include Module Entities check box on the Create Extract Data page, the Create Extract process creates a maximum of 16 Module Subject entity records for each Module entity. To create the Module Subject entity records, the process uses the subject records for each Module record. Each module subject is a combination of Cost Center and Subject. The Module HESA Data page ensures that each combination of Cost Center and Subject is unique and the total percentage equals 100.

If you have not defined subjects on the Module Subjects region of the HESA Module Data page, then the process creates a single Module Subject entity record. The process derives the values for each field within the entity using the constant or default value defined on the HESA Fields page (Records and Enrollment, HESA Reporting, HESA Returns Setup, Returns Setup, HESA Fields). If a constant or default is not available, the process derives the value as *NULL ERROR*. Note that if you have defined a constant, the process does not examine any subjects defined on the HESA Module Data page (that is, the process does not execute derivation step 2 for the Module Subject fields).

Cost Centre (COSTCN)

Return: Student Record

Entity: Module Subject

Page Used:

Page	Page Element
HESA Module Data — HECoS Subjects	Cost Centre
HESA Dummy Module Data — HECoS Subjects	

Field Derivation Rule: Include for all Module Subject entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data — HECoS Subjects page.
3. Use Default.
4. Derive as *NULL ERROR*.

Subject of Module (MODSBJ)

Return: Student Record

Entity: Module Subject

Page Used:

Page	Page Element
HESA Module Data — HECoS Subjects	Subject
HESA Dummy Module Data — HECoS Subjects	

Field Derivation Rule: Include for all Module Subject entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data — HECoS Subjects page.
3. Use default.
4. If Country = Scotland or Northern Ireland, derive as *NULL ERROR*.
5. Derive as null.

Subject/Cost Centre Percentage (MODSBJP)

Return: Student Record

Entity: Module Subject

Page Used:

Page	Page Element
HESA Module Data — HECoS Subjects	Percentage
HESA Dummy Module Data — HECoS Subjects	

Field Derivation Rule: Include for all Module Subject entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data — HECoS Subjects page.
3. Use default.
4. Derive as *NULL ERROR*.

Student Record Return: Student Entity

The Create Extract process creates a single Student entity for each student included in the Instance entity. However, it is possible for a student to have multiple distinct Instances for a particular return. In this case, only one Student entity will be created.

The process creates the Student entities only if the Include Student Entities check box is selected on the Create Extract Data page.

The process uses each distinct HESA unique student identifier (HUSID) to create a Student entity. The process also uses the student's EMPLID to link the HUSID with the person data to derive fields within the Student entity. The process creates the Student entity after creating all the other entities because of the dependency on values derived for the Course, Instance, and Entry Profile fields.

Date of Birth (BIRTHDTE)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Biographical Details (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details)	Date of Birth

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Biographical Details page in the format YYYY-DD-MM.

2. Derive as null.

Carer (CARER)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	CARER

Field Derivation Rule: If all the following conditions are met, a value is derived:

- Country = Scotland
- Student has any one of the following:
 - An EntryProfile in the extract with DOMICILE = XH
 - Any HESA Entry Profile record with DOMICILE = XH. Consider all records for the student (based on EMPLID), regardless of effective date or career or instance.
 - A Residency Self-Report record where the mapped two-character country code is XH. All student records are considered, based on EMPLID, regardless of effective date.

Derivation Steps:

1. Derive from Person HESA Data.
2. Use default.
3. Derive as NULL ERROR.

Disability (DISABLE)

Return: Student Record

Entity: Student

Pages Used:

Page	Page Element
Person HESA Data	DISABLE
Impairment AUS (Campus Community > Personal Information > Health Information > Impairment AUS)	Type of Impairment
Disability (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Disability)	HESA Disability Code

Field Derivation Rule: If the student has at least one Instance with REDUCEDI = 00, 01 or 07, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. If the student has a single impairment record, use the HESA Disability code from the mapping between the impairment type and the HESA disability code.
3. If the student has multiple mapped impairment records and all the records are mapped to a single HESA disability code, derive the HESA code.
4. If the student has multiple mapped impairment records and the records are mapped to more than one HESA disability code other than 00, 97, 98, or 99, then derive '08' (multiple disabilities).
5. If the student has multiple mapped impairment records and only one record is mapped to a HESA disability code other than 00, 97, 98, or 99, then derive as *NULL ERROR*.
6. If the student has multiple mapped impairment records and the records are all mapped to HESA disability codes 00, 97, 98, or 99, then derive the lowest mapped HESA code.

Note: Note: If all records are mapped to the same code, it is derived in step 3.

7. Use default.
8. Derive as *NULL ERROR*.

You can define a default as either *00* (no known disability) or *99* (not known).

Ethnicity (ETHNIC)

Return: Student Record

Entity: Student

Pages Used:

Page	Page Element
Person HESA Data	ETHNIC
Ethnicity (Campus Community > Personal Information (Student) > Biographical (Student) > Personal Attributes > Ethnicity)	Regulatory Region, Ethnic Group
Ethnicity (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Ethnicity)	HESA Ethnic Code

Page	Page Element
Country Description (Set Up Common Objects >Install >Country Table >Country Description) See: <ul style="list-style-type: none"> • "Administering Country Codes" (PeopleSoft Campus Solutions 9.2: Campus Community) • "Understanding CS-to-HCM Integration" (PeopleSoft Campus Solutions 9.2: Application Fundamentals) 	2-Char Country Code

Field Derivation Rule: Derive a value if the following conditions are met:

- Student has at least one Instance with REDUCED = 00, 01, 07 or 08.
- One of the following is true (a, b, c or d):
 - a. Student has a related Entry Profile in the extract with DOMICILE = XF, XG, XH, XI, XK, XL, GG, JE, or IM.
 - b. Student has a HESA Entry Profile record with DOMICILE = XF, XG, XH, XI, XK, XL, GG, JE, or IM. All student records are considered, based on EMPLID, irrespective of effective date or career/instance.
 - c. Student has a Residency Self-Report record where Country = GBR or the mapped 2-character country code is XF, XG, XH, XI, XK, XL, GG, JE, or IM. All student records are considered, based on EMPLID, irrespective of effective date.
 - d. Country = England and Course.TTCID is 1

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Select Person Ethnicity records as follows:
 - If a single record exists, use that record.
 - If multiple records exist and one is marked as Primary on the Campus Community Ethnicity page, use that record.
 - If multiple records exist and none are marked as Primary, select the record with the highest Percentage defined in the Ethnicity Detail page.
 - If multiple records are indistinguishable, select the the most recent record based on last updated date (LASTUPDDTTM from ETHNICITY_DTL).
 - For the selected record, use the HESA Ethnic code from the mapping between the Ethnic Group, Regulatory Region, and the HESA Ethnic code. If no mapping exists, log an error message and skip to next step.

3. Use default.
4. Derive as *NULL ERROR*.

Forenames (FNAMES)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details > Names)	First Name Middle Name

Field Derivation Rule: If a student has at least one Instance with REDUCEDI = 00, 01, 04, or 08 derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use the First Name and Middle Name values from the Primary Name record.
2. Derive as null.

Gender (GENDER)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Biographical Details (Campus Community , Personal Information (Student), Add/Update a Person, Biographical Details)	Gender

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use the Gender value from the Biographical History record.
 - If the gender value is Male, derive as *1*.
 - If the gender value is Female, derive as *2*.
 - If the gender value is unknown, derive as *9*.
2. Use default.

3. Derive as *NULL ERROR*.

Note: The GENDER field has been replaced with SEXID for 2012/13 onwards.

Gender Identity (GENDERID)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	GENDERID

Field Derivation Rule: If Instance.REDUCEDI = 00, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default.
3. Do not derive a value and leave the field blank.

HESA Unique Student Identifier (HUSID)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Step:

1. Select External System ID records for the person with the External ID Type defined for HUSID in the HESA Types page.

Validate that the derived value is in the correct format (refer to the Notes section for HUSID available on the HESA website). If the value is invalid, log an error message.

Nationality (NATION)

Return: Student Record

Entity: Student

Pages Used:

Page	Page Element
Person HESA Data	NATION
Citizenship and Passport (Campus Community , Personal Information (Student), Identification (Student), Citizenship, Citizenship and Passport)	Country
Nationality (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Nationality)	HESA Nationality Code

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Select person citizenship records and retrieve the related two-character code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL). If a mapping exists in the HESA Nationality Code page for the Campus Solutions Country code, use the mapped HESA value else use the COUNTRY_2CHAR value.

If a single record exists, derive the Campus Solutions country code or HESA country code.

3. If multiple person citizenship records are found and a record has a value of *GB*, derive as *GB*.
4. If multiple records are found, and none have the *GB* country value but a minimum one record has a country value that is marked as European Union (EU) country then derive the EU country. If there are multiple EU countries report the one with the lowest alphabetic HESA code. Note that the PS_COUNTRY_TBL contains an indicator (EU_MEMBER_STATE) to specify if the country is a member of the EU.
5. If multiple records are found and none have the UK or EU value, select the lowest alphabetic code
6. Use default.
7. If the student has at least one Instance with REDUCEDI = 00 or 03, COMDATE is on or after 2007-08-01, and Country is not Northern Ireland, derive as *NULL ERROR* else do not derive a value and leave the field blank.

In most cases, you can use the Campus Solutions two-character country code to report the NATION value. However, some Campus Solutions country codes are not valid for HESA reporting. For example, the Campus Solutions Cyprus code (CY) cannot be reported. Cyprus has to be reported as *XA*, *XB*, or *XC*. In these cases, you must use the Nationality code mapping page to ensure the correct NATION values are reported to HESA.

National Identity (NATIOND)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	NATIOND

Field Derivation Rule: Derive a value if the following conditions are met.

For Country = Wales:

- Student has at least one Instance with REDUCEDI = 00.
- Any one of the following:
 - Student has a related EntryProfile in the extract with DOMICILE = XI (Wales)
 - Student has any HESA Entry Profile record with DOMICILE = XI. Consider all records for the student (based on EMPLID), irrespective of effective date or career/instance.
 - Student has any Residency Self-Report record where country = GBR and the combination of Country and State is mapped to a HESA Country Code = XI in the UCAS Area of Permanent Residence page. Consider all records for the student (based on EMPLID), irrespective of effective date.

For Country = England: include for all students

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default.
3. If Country = Wales, derive as NULL ERROR
4. Derive as NULL.

National Identity (NATIOND2)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	NATIOND2

Field Derivation Rule: Derive a value if the following conditions are met.

For Country = Wales:

- Student has at least one Instance with REDUCEDI = 00.

- Any one of the following:
 - Student has a related EntryProfile in the extract with DOMICILE = XI (Wales)
 - Student has any HESA Entry Profile record with DOMICILE = XI. Consider all records for the student (based on EMPLID), irrespective of effective date or career/instance.
 - Student has any Residency Self-Report record where country = GBR and the combination of Country and State is mapped to a HESA Country Code = XI in the UCAS Area of Permanent Residence page. Consider all records for the student (based on EMPLID), irrespective of effective date.

For Country = England: include for all students

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default.
3. Derive as NULL.

ORCID Identifier (ORCID)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
External System ID (Campus Community, Personal Information (Student), Identification (Student), External System ID)	External System ID
Additional Information (Records and Enrollment, Graduate Research Management, Candidate Management, Consumption and Submission, Additional Information)	UK Research ORCID
HESA Types (Records and Enrollment, HESA Returns Setup, Returns Setup, HESA Types)	External ID Types

Field Derivation Rule: Include for all Student entities.

Derivation Step:

1. If there is a Research Candidate record for the instance, select the value of the CAF attribute defined for ORCID in Returns Setup from the most recent active consumption record, where the effective date is on or before the reporting period end date.
2. Select External System ID records for the person with the External System ID Type defined for ORCID in the HESA Return Setup record.

3. Derive as null.

Note: Although the ORCID field is optional for HESA reporting, the system derives this field value for research council students to assist with record identification.

Institution's Own Identifier for Student (OWNSTU)

Return: Student Record

Entity: Student

Pages Used: None

Field Derivation Rule: Include for all Student entities.

Derivation Step:

1. Derive as EMPLID.

Note: Although the OWNSTU field is optional for HESA reporting, the system derives this field value for all students to assist with record identification.

Religion or Belief (RELBLF)

Return: Student Record

Entity: Student

Pages Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	RELBLF
Religious Preference (Campus Community, Personal Information, Biographical, Personal Attributes, Religious Preferences).	Religious Preference
Religion (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Religion)	HESA Belief

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Select the religious preference from the personal information record. Use the mapping on the Religion page to derive the RELBLF code.
3. Use default.
4. Derive as NULL ERROR.

Sex Identifier (SEXID)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Biographical Details (Campus Community , Personal Information (Student), Add/Update a Person, Biographical Details)	Gender
Gender (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Gender)	HESA Identifier
Campus Community, Personal Information, Add/Update a Person, HESA Student Data	SEXID
Campus Community, Personal Information, Add/Update a Person, HESA Restricted Data	SEXID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from Person HESA Data.
2. Select the Gender value from the Biographical History record. Derive as the mapped HESA value for the selected Gender value.
3. If no mapping is found, then derive as:
 - If the gender value is Male, derive as *1*.
 - If the gender value is Female, derive as *2*.
4. Use default.
5. Derive as *NULL ERROR*.

Sexual Orientation (SEXORT)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	SEXORT

Page	Page Element
Personal (Campus Community, Personal Information, Add/Update a Person)	Sexual Orientation

Field Derivation Rule: If Instance.REDUCEDI = 00, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. (Applies only to Campus Solutions 9.2) If a coded value exists in the Person Biographic record and the value is mapped to a HESA code in the Orientation mapping, derive the HESA code.
3. Use default.
4. Do not derive a value and leave the field blank.

Scottish Candidate Number (SCN)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Derive a value if the following conditions are met:

- Student has an Instance related to a Course entity that has Course.COURSEAIM beginning with H, I, J, C, P, Q, R, or S
- Either EntryProfile.UCASAPPID exists or Country = Scotland
EntryProfile.UCASAPPID exists if one of the following is found:
 - Student has an Entry Profile in the extract with an EntryProfile.UCASAPPID value.
 - Student has a HESA Entry Profile record with an EntryProfile.UCASAPPID value.
 - An External Application Number exists in the Campus Solutions admission application record and this record is related to the student program record for an Instance being reported for the student.
- One of the following is true (a, b, or c):
 - a. Student has a related EntryProfile in the extract with EntryProfile.DOMICILE = XH (Scotland).
 - b. Student has any HESA Entry Profile record with EntryProfile.DOMICILE = XH. Consider all records for the student (based on EMPLID) irrespective of effective date or career/instance.

- c. Student has any Residency Self-Report record where the country = XH. Or the student has any Residency Self-Report record where the country = GBR and the combination of Country and State is mapped to a HESA Country Code = XH in the UCAS Area of Permanent Residence page. Consider all records for the student (based on EMPLID) irrespective of effective date.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for SCN in the HESA Types page. Value should not be 999999999.
2. Derive as null.

Dependants in Reporting Year (SDEPEND)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	SDEPEND

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- Student has at least one Instance with REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default.
3. Derive as *NULL ERROR*.

Family Name on 16th Birthday (SNAME16)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community, Personal Information (Student), Add/Update a Person, Biographical Details, Names)	Last Name

Note: The Last Name page element can accept a maximum of thirty characters.

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use the Last Name value from the Primary Name record. The last name must have a Type of Name value that corresponds with the Name Type set for SNAME16 in the HESA Types page.
2. Do not derive a value and leave the field blank.

Student Support Number (SSN)

Return: Student Record

Entity: Student

Pages Used:

Page	Page Element
SSAR (Financial Aid, Student Loans Company, View SLC Student Data, SSAR)	Student Support Nbr
HESA Instance	SSN

Field Derivation Rule: Derive a value if the student has at least one instance where the related Course.COURSEAIM does not end in 90 or 99.

Derivation Steps:

1. Derive from the HESA Instance page for each related Instance that meets the COURSEAIM condition.

If different multiple SSN values are found, select the value from the HESA instance with the most recent COMDATE.
2. Derive the SSN from the most recent Attendance Confirmation Report (ACR) record (that is, highest sequence number) for the EMPLID and Institution where:
 - The Aid Year start date falls on or before the reporting period end date.
 - The Aid Year end date is not before the reporting period start date for the reporting period in which Instance.COMDATE falls.
 - At least one row exists for the ACR with Attendance Indicator set to any value other than S or X.

This derivation also looks for an SSN from the ACR record when there is no SSAR record. This is because only students who apply for Maintenance Loans and Grants get SSAR records; and only

students who apply for Tuition Loan and Grants get ACR records – so students will have one and not the other.

3. Derive the SSN from the most recent SSAR record (that is, highest sequence number) for the EMPLID and institution where:
 - The Aid Year start date falls on or before the reporting period end date.
 - The Aid Year end date is not before the reporting period start date for the reporting period in which Instance.COMDATE falls.
 - A related first attendance confirmation record exists.
 - If the UCAS Course Code is defined in the SSAR, then the UCAS Course Code should be linked via a UCAS Course Mapping to the same career and program as an Instance being reported for the student. If the UCAS Course code is not defined in the SSAR, or if there are no UCAS Course Mapping records for the UCAS Course Code, then the SSAR record is assumed to be relevant to the Instance. You perform UCAS CourseMapping on the UCAS Courses page (Set Up SACR, Product Related, Recruiting and Admissions, UCAS, Mappings, UCAS Course).
4. Do not derive a value and leave the field blank.

Note: The SSN derivation does not currently consider whether Instance.MSTUFEE is reported as SLC full or partly funded (02, 03, 04, 52, 53 or 54).

Family Name (SURNAME)

Return: Student Record

Entity: Student

Page Used:

<i>Page</i>	<i>Page Element</i>
Names (Campus Community, Personal Information (Student), Add/Update a Person, Biographical Details, Names)	Last Name

Note: The Last Name page element can accept a maximum of thirty characters.

Field Derivation Rule: Include for all entities

Derivation Steps:

1. The Last Name value of the most recent effective dated name record with a name type defined for the return for SNAMECHNGE is selected.
2. Derive as *NULL ERROR*.

Term-time Accommodation (TTACCOM)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	TTACCOM

Field Derivation Rule: Derive a value if the following conditions are met:

- The student has at least one Instance with REDUCEDI = 00
- LOCSDY does not equal S
- MODE = 01, 02, 23, 24, or 25

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default
3. Derive as *NULL ERROR*.

Term-time Postcode (TTPCODE)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	TTPCODE
Addresses (Campus Community, Personal Information (Student), Biographical (Student), Addresses/Phones, Addresses)	Postal

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland, or Scotland, the student has at least one Instance with Instance.REDUCEDI = 00 or 07, AND Instance.LOCSDY is blank or does not equal 6, 9, D, S or T.
- Country = Wales, the student has at least one Instance with Instance.REDUCEDI = 00 or 07, Instance.LOCSDY does not equal 6, 9, D, S or T AND Course.COURSEAIM does not begin with P, Q, R, S or X.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Select the most recent address record (exclude records with an effective date greater than the end date of the reporting period) that has one of the UK-related country codes. The record must have an Address Type that corresponds with the Address Type set for TTPCODE in the HESA Types page.

The following country codes are considered as UK-related for the purposes of this derivation: GBR (United Kingdom), ENG (England), XF (England), NIR (Northern Ireland), XG (Northern Ireland), SCT (Scotland), XH (Scotland), WAL (Wales), XI (Wales), XK (UK not otherwise specified), XL (Channel Islands not otherwise specified), GG (Guernsey), GGY (Guernsey), JE (Jersey), JEY (Jersey), IM (Isle of Man), or IMN (Isle of Man).

3. Use default.
4. Derive as null.

For steps 1 and 2, the system validates that the derived post code value is in the correct format (refer to the examples for TTPCODE available on the HESA website).

UCAS Personal Identifier (UCASPERID)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Derive a value if the following conditions are met:

- The student has an Instance with Instance.COMDATE after 2007-07-31 and
- Either EntryProfile.UCASAPPID value exists on the Entry Profile page (any effective-dated row) or the External Application Number associated with the Instance begins *UC*. Use the Student Program record of the instance to find the admission application number (ADM_APPL_NBR). Use this admission application number to find the Admissions Data record (PS_ADM_APPL_DATA). Then, from the Application Data page for this record, find the External Application Number. The External Application Number holds the UCAS Application Code plus Choice Number for a UCAS application.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for UCASPERID in the HESA Types page.
2. Derive as *NULL ERROR*.

Unique Learner Number (ULN)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for ULN in the HESA Types page.

Validate the derived value using the checksum method. For information on the checksum method, refer to the Notes section for the ULN field available on the HESA website.

2. If Country = England and there is any instance for the student with Instance.FESTUMK = 1, 3, or 5 derive as *NULL ERROR*.
3. Do not derive a value and leave the field blank.

Welsh Speaker Indicator (WELSSP)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Person HESA Data	WELSSP

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Wales
- The student has an Instance with REDUCEDI = 00
- One of the following is true (a, b, or c):
 - (a) The student has a related EntryProfile in the extract with DOMICILE = XI
 - (b) The student has any HESA Entry Profile record with DOMICILE = XI. This includes consideration of all records for the student (based on EMPLID) irrespective of effective date or career/instance.
 - (c) The student has any Residency Self-Report record where the country = GBR and the combination of Country and State is mapped to a HESA Country Code = XI in the UCAS Area of Permanent Residence page. This includes consideration of all records for the student (based on EMPLID) irrespective of effective date.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Person HESA Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Student Record Return: Instance Entity

If you select the Include Student Entities check box on the Create Extract Data page, the Create Extract process creates Instance entities based on distinct student careers and the related HESA Instance.

The process includes a student career as an Instance entity if the following three conditions are met:

- The process has included the plan (or the subplan if the subplan rather than the plan is being reported) of the student program record as a Course entity in the extract. Note that if the student has multiple active plans the process considers the plan defined in the HESA Instance record.
- The plan or subplan is selected for COURSEID based on the most recent Student Program/Plan record on or before the reporting period end date where the program action/reason is not defined in the Award Only Mapping for the return.
- A related HESA Instance record exists for the career and academic institution with the Report To HESA check box selected.
- The student must be a *continuing student* (that is, the derived commencement date is prior to the start of the reporting period) or a *new student* (that is, the derived commencement date falls on or after the start of the reporting period).

If the student is a *continuing student*, then one of the following conditions must be satisfied:

- The student is in the HIN Population. That is, a HIN Population Year value exists in the HESA Instance record that matches the Reporting Period Year.
- You have not selected the HIN Population Only check box and the student has not left or completed prior to the reporting period. To determine whether the student has not left or completed prior to the reporting period, the process first selects the Student Program record that has an effective date nearest to the Reporting Period Start Date. Then, it checks whether the selected record has a Program Status that matches one of the eligible Program Statuses defined for the return on the HESA Returns page.

Note: If you have selected the check box, for each student career, the process only evaluates whether the first condition is met (that is, student is in the HIN population) and does not evaluate the second condition (that is, the student has not left or completed prior to the reporting period). In other words, if you select the check box and if the first condition is not met, the student career is not included.

If the student is a *new student*, then one of the following conditions must be satisfied:

- The student is in the HIN Population.

- The student has been term activated for at least one term that begins within the reporting period and the student has at least one enrolled class related to that term.
- The student has an FTE of greater than zero for the reporting period.

Note: The HIN Population Year value in the HESA Instance record may not exist for new students. Therefore, the process does not consider the HIN Population Only check box for selection of new students. It includes a new student based on either the class enrollment condition or the FTE condition, if the student is not in the HIN population.

The Create Extract process uses the following fields set up on the HESA Instance page for a student career:

- Academic Plan: Indicates the plan to report if the student has multiple active plans.
- Linked Career and Linked Career Number: Indicates that the student instance is associated with another instance.
- Report To HESA: If the check box is cleared, the process does not include the instance data.
- Start Date of Instance: The system calculates a value but you can use this field to override the calculated value.
- HIN Population Year: Indicates the reporting year for which the system should include the Instance in the return. You must manually enter the HIN Population Year on the HESA Instance page or import the values using the Import HIN Target List process.
- Year of Course: Indicates the year of course the student is undertaking for reporting in Instance.YEARPRG. You must update this value for each subsequent reporting period when the student has progressed to the next year of the program.
- Year of Student: Indicates the number of years the student has been undertaking the program for reporting in Instance.YEARSTU. You must update this value for each subsequent reporting period when the student has progressed to the next year of the program.

The system does not automatically calculate the Year of Course and Year of Student values on the HESA Instance page. You must use the HESA Instance page to manually enter the Year of Course and Year of Student values.

The Create Extract process derives the fields relevant to further education (FE) students only if the Include FE check box is selected on the HESA Returns page. Although you can include or exclude individual FE fields using the derived value for FESTUMK, the Include FE check box enables you to skip derivation of FE fields completely.

While creating Instance entities, the process checks if the student's External System ID records has a HUSID. If no records are found, the process creates a HUSID External System ID for the student with an Effective Date of the reporting period start date.

If you have selected the Null Errors Only check box for the Include Student Entities on the Create Extract Data page, the Create Extract process selects distinct EMPLIDs from the existing active extract data, where at least one field in the Instance, EntryProfile, QualificationsOnEntry, QualificationsAwarded, RAEData, StudentOnModule or Student extract data has a derived value of *NULL ERROR*. The process then selects all the Instance entity records for these EMPLIDs (if an EMPLID has multiple instances and if at least one instance has a *NULL ERROR*, then all the instances are selected).

If you have selected the Validation Errors Only check box for the Include Student Entities, the Create Extract process first deletes any Validation Error staging records where all of the COURSEID, MODID and EMPLID fields are blank. Then, it selects distinct EMPLIDs from the Validation Error staging table where the EMPLID is not blank. The process selects Instance entity records for these EMPLIDs. Finally, the process deletes records from the Validation Error staging table where EMPLID is populated.

Actual Progression Route (ACTPROGROUTE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	ACTPROGROUTE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK = 1, 3, or 4
- Instance.ENDDATE value exists
- Instance.PROGTYPE = 02, 03, 10, 19, 20 or 21
- Instance.AIMTYPE = 1

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Learning Support Cost (ADDSUPCT)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	ADDSUPCT

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01
- Instance.FUNDMODEL = 25 or 82
- LearnerFAM.LEARNFAMTYPE = HNS

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

The Type of Aim Recorded (AIMTYPE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	AIMTYPE
Plan HESA Data	AIMTYPE
Sub-Plan HESA	AIMTYPE
HESA Instance	AIMTYPE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01

- Instance.FESTUMK = 1, 3, 4, or 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Foundation Degree to Degree Bridging Course (BRIDGE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	BRIDGE
Plan HESA Data	BRIDGE
Sub-Plan HESA	BRIDGE

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland, or Scotland AND Instance.REDUCEDI = 00 AND Related Course.COURSEAIM is not Z99
- Country = Wales, REDUCEDI = 00, AND COURSEAIM does not begin with P, Q, R, S, or X, and is not Z99.

Derivation Steps:

1. Use constant.
2. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.

6. Derive as *NULL ERROR*.

Campus Identifier (CAMPID)

Return: Student Record

Entity: Instance

Pages Used:

<i>Page</i>	<i>Page Element</i>
Student Program	Campus
Campus (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Campus)	HESA Campus

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Use constant.
2. Use the mapping to derive the HESA Campus code for the Campus value entered in the Student Program page.
3. Use default.
4. Derive as *NULL ERROR*.

Completion Status (CSTAT)

Return: Student Record

Entity: Instance

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	CSTAT

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England or Wales
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Provider Transfer From Date (COLFROMDATE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	COLFROMDATE

Field Derivation Rule: Derive a value if related Course.COURSEAIM = D00, D01, L00, or L80.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as *NULL*.

Provider Transferred From (COLFROMPROV)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	COLFROMPROV

Field Derivation Rule: Derive a value if related Course.COURSEAIM = D00, D01, L00, or L80.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as *NULL*.

Provider Transfer to Date (COLTODATE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	COLTODATE

Field Derivation Rule:

Derive a value if the following conditions are met:

- Instance.RSEND = 12
- Related Course.COURSEAIM = D00, D01, L00, or L80

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as *ENDDATE*.

Provider Transferred To (COLTOPROV)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	COLTOPROV

Field Derivation Rule:

Derive a value if the following conditions are met:

- Instance.RSEND = 12
- Related Course.COURSEAIM = D00, D01, L00, or L80

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as *NULL*.

Start Date of Instance (COMDATE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	Start Date of Instance Effective Date

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive as the Start Date of Instance from the HESA Instance page.
2. If there is a Research Candidate record for the instance:
 - a. Select the Begin Date (SSR_RS_BEGIN_DT) from the most recent active Consumption record where the effective date is on or before the reporting period end date.
 - b. Derive the Begin Date formatted to YYYY-MM-DD.
 - c. Match the Research Candidate record (SSR_RS_CAND_HDR) to the instance on EMPLID, Institution, Career and Career Number to find the Research Candidate Number (SSR_RS_CANDIT_NBR). If multiple records are found, the record with the highest candidate number is selected.
 - d. Associate consumption records (SSR_RS_CONSMPTN) with the Research Candidate record by EMPLID, Institution and Research Candidate Number.

The calculated value is stored in the HESA Instance Data record.

3. Use the following process to calculate the earliest class start date for enrolled classes related to the Instance being reported. This selection is similar to that done for StudentOnModule except that it is not restricted to classes overlapping the reporting period and considers enrollments for linked careers.
 - a. Select all activated terms for the student career of the Instance.
 - b. From each activated term, select classes that satisfy the following conditions:
 - Status = *Enrolled*
 - Units Taken value is greater than zero.
 - Grading basis value matches one of the values defined in the Grading Basis Inclusion region with the Extract check box selected on the HESA Configuration page.
 - Repeat Code value does not exist or does not match a value defined in the Repeat Code Exclusion region with the Extract check box selected on the HESA Configuration page.
 - If the student has multiple careers with the same Academic Career value as the career being processed (that is, the same career value with different career numbers), then apply a further filter to the class enrollments. In such a case, select the class only if the program value of the enrollment record is does not exist or matches one of the program values in the Student Program records for that career and career number.

- c. If the Instance has been linked to a prior student career using the Linked Career and Linked Career Number fields in the HESA Instance record, then also consider classes for the previous career.
 - d. Derive the earliest Class Start Date from all the selected classes as COMDATE.
4. The earliest Effective Date of the HESA Instance records.

For steps 2 and 3, the system stores the derived date as the Start Date of Instance value in the HESA Instance record.

Course Identifier (COURSEID)

Return: Student Record

Entity: Instance

Pages Used: None

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. If the student's subplan is reported in the Course extract, derive from the student's subplan.
2. Derive from the student's plan.

Destination (DESTIN)

Return: Student Record

Entity: Instance

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	DESTIN

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01
- Course.COURSEAIM begins with P, Q, R, S or X.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Destination of Outward Credit Mobile Students (DESTOCM)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program Offering/Year HESA	DESTOCM, DESTOCM2, DESTOCM3 (Program Year HESA Data group box)
Plan Offering/Year HESA	DESTOCM, DESTOCM2, DESTOCM3 (Plan Year HESA Data group box)
Sub-Plan Offering/Year HESA	DESTOCM, DESTOCM2, DESTOCM3 (Sub-Plan Year Data group box)
HESA Instance	DESTOCM, DESTOCM2, DESTOCM3

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England, Wales, or Northern Ireland
- Instance.REDUCEDI = 00
- (Instance.EXCHANGE = 7, B, C, D, or E) or (Instance.LOCSYD = F, G or S)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant to create a single DESTOCM field.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.
4. Derive from the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.
5. Derive from the Program Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.

6. Use default to create a single DESTOCM field.
7. Derive a single DESTOCM field as *NULL ERROR*.

Note: The system can derive up to three values. Each of the values is included as a separate DESTOCM field in the XML file.

Department of Health Funding Body (DHFUND)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	DHFUND
Plan HESA Data	DHFUND
Sub-Plan HESA	DHFUND
HESA Instance	DHFUND

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Related Course.MSFUND = 37 or 38

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Regulatory Body Reference Number (DHREGREF)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.REDUCEDI = 00 or 01
- Related Course.REGBODY = 06 or 07 or is in the range 40 to 55 inclusive or is in the range 60 to 65 inclusive
- Related Course.COURSEAIM = M16, M26, M76, M86, H16, H62, H76, I16, I76, J26 or J76

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for DHREGREF in the HESA Types page.
2. Use default.
3. Derive as *NULL ERROR*.

You can define a default of 99999999 for this field.

Disabled Student Allowance (DISALL)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	DISALL
Impairment AUS (Campus Community > Personal Information > Health Information > Impairment AUS)	Support Services Request
Disability (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Disability)	HESA Disability Allowance

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland, or Scotland, Instance.REDUCEDI = 00 AND Student.DISABLE = 08 to 96 inclusive.

- Country = Wales, Instance.REDUCEDI = 00, Student.DISABLE = 08 to 96 inclusive, AND Course.COURSEAIM does not begin with P, Q, R, S or X.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If the student has a Support Services Request value defined on the Impairment AUS page, use the mapped HESA Disability Allowance code from the Disability page.
4. Use default.
5. Derive as *NULL ERROR*.

Note: The system derives Student.DISABLE before creating the Student entity in order to derive the Student.DISALL field.

Disadvantage Uplift Factor (DISUPFAC)

Return: Student Record

Entity: Instance

Pages Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	DISUPFAC

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Distance Learning SLN (DISTLEARNSLN)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	DISTLEARNSLN
Plan HESA Data	DISTLEARNSLN
Sub-Plan HESA	DISTLEARNSLN
HESA Instance	DISTLEARNSLN

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK = 1 or 3
- Instance.AIMTYPE = 2, 3 or 4

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. If Instance.FUNDMODEL = 21 or 22, derive as *NULL ERROR*.
8. Do not derive a value and leave the field blank.

Eligibility for Disadvantaged Uplift (ELIDISUP)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	ELIDISUP

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Eligibility for Enhanced Funding (ELIGENFD)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	ELIGENFD

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.

2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Aiming for an Equivalent or Lower Qualification (ELQ)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	ELQ

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FEEELIG = 1
- Instance.FESTUMK = 2 or 3
- Related Course.COURSEAIM begins E, M, H, I, J or C

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

Employer Role (EMPROLE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	EMPROLE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Do not derive a value and leave the field blank.

End Date of Instance (ENDDATE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason Effective Date
HESA Instance	ENDDATE
HESA Action Reasons	Reason for Ending Instance Mapping

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive the effective date of the record formatted to YYYY-MM-DD if the most recent effective dated Student Program record has Program Action/Reason values mapped to a HESA Reason for Ending Instance code on the HESA Action Reasons page and, either Instance.INTERCALATE is not 01, or the mapped HESA RSNEND value is not 01.
3. Derive as null.

Highest Grade GCSE English (ENGGRADE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	ENGGRADE

Field Derivation Rule: Derive a value if all the following conditions are met.

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01
- Instance.FUNDMODEL = 25 or 82

Derivation Steps:

1. Derive from the Further Education page.
2. Derive as *NONE*.

ITT Entry Route (ENTRYRTE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	ENTRYRTE
Plan HESA Data	ENTRYRTE
Sub-Plan HESA	ENTRYRTE
HESA Instance	ENTRYRTE

Field Derivation Rule: Derive a value if all the following conditions are met.

- Country = England
- Instance.REDUCEDI = 00, 01, or 04
- Related Course.TTCID = 1

Derivation Steps:

1. Use constant.

2. Derive from HESA Instance page.
3. If Instance.COURSEID is based on a sub-plan, derive value from the Sub-Plan HESA page.
4. Derive value from Plan HESA Data page.
5. Derive value from Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

Exchange Programmes (EXCHANGE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	EXCHANGE
Program Offering/Year HESA	EXCHANGE (Program Year HESA Data group box)
Plan HESA Data	EXCHANGE
Plan Offering/Year HESA	EXCHANGE (Plan Year HESA Data group box)
Sub-Plan HESA	EXCHANGE
Sub-Plan Offering/Year HESA	EXCHANGE (Sub-Plan Year HESA Data group box)
HESA Instance	EXCHANGE
HESA Instance	Year of Program

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland, or Scotland AND Instance.REDUCEDI = 00, 03 or 09 AND Instance.FESTUMK is not 5
- Country = Wales, Instance.REDUCEDI = 00, 03 or 09 AND Instance.FESTUMK is not 5 AND Course.COURSEAIM does not begin with P, Q, R, S or X.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where

Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.

4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Fee Eligibility (FEEELIG)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Residency Official 1 (Campus Community, Personal Information (Student), Identification (Student), Residency Data, Residency Official 1)	Residency
Program HESA Data	FEEELIG
Program Offering/Year HESA	FEEELIG (Program Offering HESA Data group box)
Plan HESA Data	FEEELIG
Plan Offering/Year HESA	FEEELIG (Plan Offering HESA Data group box)
Sub-Plan HESA	FEEELIG
Sub-Plan Offering/Year HESA	FEEELIG (Sub-Plan Offering HESA Data group box)
HESA Instance	FEEELIG
Fee Eligibility (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Fee Eligibility)	HESA Fee Eligibility

Field Derivation Rule: Derive a value if the following conditions are met.

- Instance.REDUCEDI = 00 or 01

- Instance.FESTUMK is not 5

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Select the residency records for the EMPLID, institution, and academic career combination for the most recent effective term that starts on or before the end of the reporting period. Use the HESA Fee Eligibility code mapped to the selected residency value. If the mapping does not exist, log an error message and skip to the next step.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
5. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
6. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
7. Derive from the Plan HESA Data page.
8. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
9. Derive from the Program HESA Data page.
10. Use default.
11. Derive as *NULL ERROR*.

Fee Regime Indicator (FEEREGIME)

Return: Student Record

Entity: Instance

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	FEEREGIME

Field Derivation Rule: Derive a value if one of the following sets of conditions is met. Otherwise, do not derive a value and leave the field blank.

Set	Conditions
England Postgraduate	<ul style="list-style-type: none"> • Country = England, and • Related Course.COURSEAIM begins with E or M excluding M22, M26 or M28, and • Related Course.TTCID is <i>not</i> Q, and • Instance.REDUCEDI = 00 or 01, and • Instance.FEEELIG = 1 or 3, and • Instance.EXCHANGE is not 4 or G, and • (Instance.MODE = 01, 02, 23, 24, 25, 31, 73, or 74) or (Instance.MODE = 43 or 44 and Instance.MCDATE is in the reporting period) • Instance.PROGTYPE is not 25 and • Instance.FUNDMODEL is not 36
England Undergraduate	<ul style="list-style-type: none"> • Country = England, and • Related Course.COURSEAIM begins with H, I, J, C or is M22, M26 or M28, and • Related Course.TTCID is not Q, and • Instance.REDUCEDI = 00 or 01, and • Instance.FEEELIG = 1 or 3, and • Instance.EXCHANGE is not 4 or G, and • Instance.MODE = 01, 02, 23, 24, 25, 31, 43, or 44 and • Instance.PROGTYPE is not 25 and • Instance.FUNDMODEL is not 36
Northern Ireland Postgraduate	<ul style="list-style-type: none"> • Country = Northern Ireland, and • Related Course.COURSEAIM is M71, M73, or M88 • Instance.REDUCEDI = 00 or 01, and • Instance.FEEELIG = 1 or 3, and • Instance.EXCHANGE is not 4 or G, and • Instance.SSN value does not exist, and • (Instance.MODE = 01, 02, 23, 24, or 25) or (Instance.MODE = 43 and Instance.MCDATE is in the reporting period)

Set	Conditions
Northern Ireland Undergraduate	<ul style="list-style-type: none"> • Country = Northern Ireland, and • Related Course.COURSEAIM begins with H, I, J, C or is M22, M26 or M28 • Instance.REDUCEDI = 00 or 01, and • Instance.FEEELIG = 1 or 3, and • Instance.EXCHANGE is not 4 or G, and • Instance.SSN value does not exist, and • Instance.MODE = 01, 02, 23, 24, 25, or 43
Scotland	<ul style="list-style-type: none"> • Country = Scotland, and • Instance.REDUCEDI = 00 or 01, and • Instance.FEEELIG = 1 or 3, and • Instance.EXCHANGE is not 4, G, Y or Z, and • Instance.MODE = 01, 02, 23, 24, or 25, and • Related Course.COURSEAIM is C20, C30, H00, H11, H16, H18, H22, H23, H50, H88, I00, I11, I16, J20, J26, J30, M22, M26, M28, M71, M73, or M88
Wales	<ul style="list-style-type: none"> • Country = Wales, and • Instance.REDUCEDI = 00, and • Instance.FEEELIG = 1 or 3, and • Instance.EXCHANGE is not 4 or G, and • Instance.SSN value does not exist, and • Instance.MODE = 01, 02, 23, 24, 25, or 43, and • Related Course.COURSEAIM begins H, I, J, C or is M22, M26, M28, M71, M73 or M88

Derivation Steps:

1. Derive from the HESA Instance page.
2. If Instance.COMDATE is before *01-SEP-2012*, derive as *10*.
3. If Instance.COMDATE is on or after *01-SEP-2012* and Country = Scotland and either DOMICILE is Scotland (XH) or DOMICILE is European Union (excluding England, Northern Ireland and Wales), derive as *10*.

The DOMICILE value is derived in the same way as EntryProfile.DOMICILE and is derived even if an EntryProfile is not being included in the extract (that is, for new and continuing students).

The check on European Union includes countries where the EU Member State check box is selected in the Country Table plus also the generic *EU* code (European Union not otherwise specified) and specifically excludes the individual country codes for England (XF), Northern Ireland (XG), Wales (XI) and UK not specified (XK).

4. If COMDATE is on or after *01-SEP-2012* and Country = Northern Ireland and either DOMICILE is Northern Ireland (XG) or DOMICILE is European Union (excluding England, Scotland and Wales), derive as *10*.
5. If Instance.COMDATE is on or after *01-SEP-2012*, derive as *20*.

Outcome (FEOUTCOME)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	FEOUTCOME

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK = 1, 3, 4, or 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

FE Student Marker (FESTUMK)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	FESTUMK
Plan HESA Data	FESTUMK
Sub-Plan HESA	FESTUMK
HESA Instance	FESTUMK
HESA Returns	Include FE

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Wales
- Instance.REDUCEDI is 00, 01, 03 or 04

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive as 2 if Include FE check box is not selected on the HESA Returns page.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Other Funding Adjustment (FUNDADJOTH)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	FUNDADJOTH

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01

- Either (Instance.AIMTYPE = 1, 3, or 4 and Instance.FUNDMODEL = 35 or 81) OR (Instance.AIMTYPE = 4 and LearningDeliveryFAM.LEARNDELFAMTYPE = ADL)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Funding Adjustment for Prior Learning (FUNDADJPRIOR)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	FUNDADJPRIOR

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01
- Either (Instance.AIMTYPE = 1, 3, or 4 and Instance.FUNDMODEL = 35 or 81) OR (Instance.AIMTYPE = 4 and LearningDeliveryFAM.LEARNDELFAMTYPE = ADL)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Franchise Partner (FRANPART)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	FRANPART
Plan HESA Data	FRANPART
Sub-Plan HESA	FRANPART
HESA Instance	FRANPART

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Franchised Out Arrangements (FROUTARR)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	FROUTARR
Plan HESA Data	FROUTARR
Sub-Plan HESA	FROUTARR

Page	Page Element
HESA Instance	FROUTARR

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

FTE Method (FTEMETHOD)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	FTEMETHOD
Program Offering/Year HESA	FTEMETHOD (Program Offering HESA Data group box)
Plan HESA Data	FTEMETHOD
Plan Offering/Year HESA	FTEMETHOD (Plan Offering HESA Data group box)
Sub-Plan HESA	FTEMETHOD
Sub-Plan Offering/Year HESA	FTEMETHOD (Sub-Plan Offering HESA Data group box)
HESA Instance	FTEMETHOD

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- Instance.REDUCEDI = 00, 01, or 03

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Fundability Code (FUNDCODE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	FUNDCODE
Plan HESA Data	FUNDCODE
Sub-Plan HESA	FUNDCODE
HESA Instance	FUNDCODE

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country is Northern Ireland, Scotland or Wales, and Instance.REDUCEDI = 00 or 01

- Country is England, and Instance.REDUCEDI = 00 or 01, and Instance.FESTUMK is not 1 or 4

Do not derive a value and leave the field blank, if the condition is not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Completion of Year of Instance (FUNDCOMP)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	FUNDCOMP

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England, Wales, or Northern Ireland
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK is not 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Level Applicable to Funding Council HESES (FUNDFEV)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	FUNDLEV
Program Offering/Year HESA	FUNDLEV (Program Year HESA Data group box)
Plan HESA Data	FUNDLEV
Plan Offering/Year HESA	FUNDLEV (Plan Year HESA Data group box)
Sub-Plan HESA	FUNDLEV
Sub-Plan Offering/Year HESA	FUNDLEV (Sub-Plan Year HESA Data group box)
HESA Instance	FUNDLEV

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Northern Ireland
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK is not 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.

10. Derive as *NULL ERROR*.

Funding Model (FUNDMODEL)

Return: Student Record

Entity: Instance

Pages Used:

<i>Page</i>	<i>Page Element</i>
Program HESA Data	FUNDMODEL
Plan HESA Data	FUNDMODEL
Sub-Plan HESA	FUNDMODEL
HESA Instance	FUNDMODEL

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK = 1, 3, 4, or 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Framework Code (FWORKCODE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	FWORKCODE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.PROGTYPE = 02, 03, 20, 21, 22 or 23

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Guided Learning Hours (GLHRS)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	GLHRS
Program Offering/Year HESA	GLHRS (Program Offering HESA Data group box)
Plan HESA Data	GLHRS
Plan Offering/Year HESA	GLHRS (Plan Offering HESA Data group box)
Sub-Plan HESA	GLHRS
Sub-Plan Offering/Year HESA	GLHRS (Sub-Plan Offering HESA Data group box)
HESA Instance	GLHRS

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England or Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Government Initiatives (GOVINIT)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	GOVINIT
Plan HESA Data	GOVINIT
Sub-Plan HESA	GOVINIT
HESA Instance	GOVINIT

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4

- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Gross Fee (GROSSFEE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
HESA Returns	Account Type Tuition
Fees After Calculation (Student Financials, Tuition and Fees, Review Fees After Calculation)	Amount
Program HESA Data	GROSSFEE
Program Offering/Year HESA	GROSSFEE (Program Offering HESA Data group box)
Plan HESA Data	GROSSFEE
Plan Offering/Year HESA	GROSSFEE (Plan Offering HESA Data group box)
Sub-Plan HESA	GROSSFEE
Sub-Plan Offering/Year HESA	GROSSFEE (Sub-Plan Offering HESA Data group box)
HESA Instance	GROSSFEE

Field Derivation Rule: if Instance.FEEREGIME = 20 derive a value. Otherwise, do not derive a value and leave the field blank.

Do not derive a value and leave the field blank, if the conditions are not met.

Note: FEEREGIME is derived depending on FEELIG, EXCHANGE, MODE and COURSEAIM values and for Scotland, Northern Ireland and Wales only, if SSN value does not exist.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as total of all the tuition fee charges for the student career for terms that start within the reporting period. Fee records where the Item Type Code is *Charge* and the Account Type is one of those defined with the Tuition check box selected on the HESA Returns page. The derived value is rounded to the nearest pound.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Do not derive a value and leave the field blank.

Implied Rate of Council Partial Funding (IMPRATE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	IMPRATE
Program Offering/Year HESA	IMPRATE (Program Offering HESA Data group box)
Plan HESA Data	IMPRATE
Plan Offering/Year HESA	IMPRATE (Plan Offering HESA Data group box)
Sub-Plan HESA	IMPRATE
Sub-Plan Offering/Year HESA	IMPRATE (Sub-Plan Offering HESA Data group box)
HESA Instance	IMPRATE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00
- Related Course.MSFUND = 86, 87, 88, AA, AB, AC, or AD

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Institution's Own Campus Identifier (INSTCAMP)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Student Program	Campus
Campus (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Campus)	HESA Campus

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Use constant.
2. Use the mapping to derive the HESA Campus code for the Campus value entered in the Student Program page.
3. Use default.
4. If Country = Wales and Course.COURSEAIM = X41, X42, X43, X44, X45 or X46 then derive as *NULL ERROR*.
5. Do not derive a value and leave the field blank.

Initiatives (INITIATIVES, INITIATIVES2, INITIATIVES3)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	INITIATIVES, INITIATIVES2, INITIATIVES3
Plan HESA Data	INITIATIVES, INITIATIVES2, INITIATIVES3
Sub-Plan HESA	INITIATIVES, INITIATIVES2, INITIATIVES3
HESA Instance	INITIATIVES, INITIATIVES2, INITIATIVES3

Field Derivation Rule: Include for all entities

Do not derive a value and leave the field blank, if the condition is not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Do not derive a value and leave the field blank.

Intended Level of MPhil/PhD Studies (INTENTLEV)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	INTENTLEV
Plan HESA Data	INTENTLEV
Sub-Plan HESA	INTENTLEV
HESA Instance	INTENTLEV

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Related Course.COURSEAIM = L99
- Instance.REDUCEDI = 00, 01, 03 or 04

If the conditions are not met, do not derive a value and leave the field blank.

Derivation steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a sub-plan, derive value from Sub-Plan HESA.
4. Derive value from Plan HESA Data.
5. Derive value from Program HESA Data.
6. Use default.
7. Derive as null.

Intercalation (INTERCALATE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	INTERCALATE
Program Offering/Year HESA	INTERCALATE (Program Year HESA Data group box)
Plan HESA Data	INTERCALATE
Plan Offering/Year HESA	INTERCALATE (Plan Year HESA Data group box)
Sub-Plan HESA	INTERCALATE

Page	Page Element
Sub-Plan Offering/Year HESA	INTERCALATE (Sub-Plan Year HESA Data group box)
HESA Instance	INTERCALATE

Field Derivation Rule: If Instance.REDUCEDI = 00, 01 or 03 derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
5. Derive from the Plan HESA Data page.
6. Derive from the Program Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.
7. Derive from the Program HESA Data page.
8. Use default.
9. Do not derive a value and leave the field blank.

ITT Qualification Aim (ITTAIM)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	ITTAIM
Plan HESA Data	ITTAIM
Sub-Plan HESA	ITTAIM

Field Derivation Rule: Derive a value if all the conditions are met.

- Country = England

- Instance.REDUCEDI = 00, 01 or 04
- Related Course.TTCID = 1

Derivation Steps:

1. Use constant.
2. If a sub-plan is reported, derive value from Sub-Plan HESA page.
3. Derive value from Plan HESA Data page.
4. Derive value from Program HESA Data page.
5. Use default.
6. Derive as NULL ERROR.

ITT Phase/Scope (ITTPHSC)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	ITTPHSC
Plan HESA Data	ITTPHSC
Sub-Plan HESA	ITTPHSC
HESA Instance	ITTPHSC

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Wales
- Related Course.TTCID = 1 or 2
- Related Course.REDUCEDC = 00, 01, 04 or 07

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.

5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

ITT Schemes (ITTSCHMS)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	ITTSCHMS
Plan HESA Data	ITTSCHMS
Sub-Plan HESA	ITTSCHMS
HESA Instance	ITTSCHMS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00, 01, or 04
- Related Course.TTCID = 1, 2, 8, or G

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Learning Difficulty (LEARNDIF)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	LEARNDIF

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Learning Planned End Date (LEARNPLANENDDATE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	LEARNPLANENDDATE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK = 1, 3, 4 or 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.

2. Derive from the HESA Instance page (in YYYY-MM-DD format).
3. End Date of the Expected Graduation Term defined for the Student Program, converted to YYYY-MM-DD format
4. Use default.
5. Derive as *NULL ERROR*.

FTE in Year A (LOADYRA)

Return: Student Record

Entity: Instance

Pages Used: None

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Northern Ireland
- Instance.INSTAPP = 1
- Instance.TYPEYR = 2, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01
- Course.COURSEAIM does not begin D, L, P, Q, R, S or X

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Step:

Note: For this release, this field is derived as *NULL ERROR*.

FTE in Year B (LOADYRB)

Return: Student Record

Entity: Instance

Pages Used: None

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Northern Ireland
- Instance.INSTAPP = 1
- Instance.TYPEYR = 2, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01
- Course.COURSEAIM does not begin D, L, P, Q, R, S or X

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Step:

Note: For this release, this field is derived as *NULL ERROR*.

Location of Study (LOCSDY)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	LOCSDY
Program Offering/Year HESA	LOCSDY (Program Year HESA Data group box)
Plan HESA Data	LOCSDY
Plan Offering/Year HESA	LOCSDY (Plan Year HESA Data group box)
Sub-Plan HESA	LOCSDY
Sub-Plan Offering/Year HESA	LOCSDY (Sub-Plan Year HESA Data group box)
HESA Instance	LOCSDY
HESA Instance	Year of Program

Field Derivation Rule: If Instance.REDUCEDI = 00, 01 or 09 derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.

8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Math Grade for GCSE (MATHGRADE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	MATHGRADE

Field Derivation Rule: Derive a value if all the following conditions are met.

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01
- Instance.FUNDMODEL = 25 or 82

Derivation Steps:

1. Derive value from the Further Education page.
2. Derive as *NONE*.

Change of Mode Date (MCDATE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason
HESA Instance	MCDATE
HESA Action Reasons	HESA Mode Direction (Change of Mode Mapping group box)

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Northern Ireland
- Instance.REDUCEDI = 00 or 04
- Related Course.COURSEAIM begins with D, E, L, or M (excluding M22, M26 or M28)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If MODE derivation step = 1 (that is derived from HESA Instance page), then derive MCDATE from HESA Instance page.
2. If MODE derivation step = 2 and the most recent record was selected to derive MODE, select any other earlier change of mode from the Student Program records where effective end date is within the reporting period.

For each record, determine from the Mode Direction mapping whether the MODE changed from Active to Inactive or vice versa.

If any one of the following three conditions is met, derive MCDATE as the effective date of the record that was used to derive MODE, formatted to YYYY-MM-DD:

- The earliest Mode Direction From = *Active* and the latest Mode Direction To = *Inactive*.
- The earliest Mode Direction From = *Inactive* and the latest Mode Direction To = *Active*.
- The earliest Mode Direction From = *Inactive*, the latest Mode Direction To = *Inactive*, and a minimum of one of the selected records for the reporting period has a Mode Direction To = *Active* (that is, student was active at some point).

3. Derive as null.

Mode of Study (MODE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program Offering/Year HESA	MODE (Program Year HESA Data group box)
Program Offering/Year HESA	MODE (Program Offering HESA Data group box)
Program HESA Data	MODE (Program HESA Data group box)
Plan Offering/Year HESA	MODE (Plan Year HESA Data group box)
Plan Offering/Year HESA	MODE (Plan Offering HESA Data group box)
Plan HESA Data	MODE (Plan HESA Data group box)

Page	Page Element
Sub-Plan Offering/Year HESA	MODE (Sub-Plan Year HESA Data group box)
Sub-Plan Offering/Year HESA	MODE (Sub-Plan Offering HESA Data group box)
Sub-Plan	MODE (Sub-Plan HESA Data group box)
Student Program	Program Action Action Reason
Student Program	Acad Load
HESA Instance	MODE
HESA Instance	Year of Program
Mode of Study (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Mode of Study)	HESA Mode of Study
HESA Action Reasons	Change of Mode Mapping
Term/Session Table (Set up SACR, Foundation Table, Term Setup, Term/Session Table)	Term
Enrollment Limit (Records and Enrollment, Student Term Information, Term Activate a Student, Enrollment Limit)	Approved Academic Load

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Select the Student Program record that has Program Action/Reason values mapped to a HESA Mode in the HESA Action Reasons page. Derive the mapped HESA mode value. If the derived value is 73 or 74 and the effective date of the record is prior to the reporting period start date, convert 73 to 63 and 74 to 64.
3. If Instance.COURSEID is based on a subplan and the MODE value from the Sub-Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance is defined, then derive the Sub-Plan Offering/Year HESA MODE value. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
4. If Instance.COURSEID is based on a subplan and MODE is defined in Sub-Plan Offering HESA Data for the academic load of the student instance, then derive the Sub-Plan Offering HESA Data MODE value. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
5. If Instance.COURSEID is based on a subplan and MODE is defined in Sub-Plan HESA page, then derive the Sub-Plan HESA MODE value.

6. If the MODE value from the Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance is defined, then derive the Plan Offering/Year HESA MODE value. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
7. If the MODE value is defined in Plan Offering HESA Data for the academic load of the student instance, then derive Plan Offering HESA Data MODE value. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
8. If MODE is defined in Plan HESA Data page, then derive that value.
9. If the MODE value from the Program Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance is defined, then derive the Program Offering/Year HESA MODE value.
10. If the MODE value is defined in Program Offering HESA Data for the academic load of the student instance, then derive the Program Offering HESA Data MODE value.
11. If MODE is defined in Program HESA Data, then derive that value.
12. Map the Approved Academic Load from the most recent activated student term record that overlaps the reporting period to a HESA code value using the HESA Mode mapping. A term is considered to overlap if the begin date or end date falls within the reporting period.
13. Map the Academic Load for the most recent effective-dated record in the Student Program/Plan stack that has an Effective Date on or before the reporting period end date to a HESA code using the HESA Mode mapping.
14. Derive as *NULL ERROR*.

Major Source of Tuition Fees (MSTUFEE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	MSTUFEE
Program Offering/Year HESA	MSTUFEE (Program Offering HESA Data group box)
Plan HESA Data	MSTUFEE
Plan Offering/Year HESA	MSTUFEE (Plan Offering HESA Data group box)
Sub-Plan HESA	MSTUFEE
Sub-Plan Offering/Year HESA	MSTUFEE (Sub-Plan Offering HESA Data group box)
HESA Instance	MSTUFEE

Field Derivation Rule: Derive a value if all the conditions are met:

- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK is not 5

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Net Fee (NETFEE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
HESA Returns	Account Type Waiver
Fees After Calculation (Student Financials, Tuition and Fees, Review Fees After Calculation)	Amount
Program HESA Data	NETFEE
Program Offering/Year HESA	NETFEE (Program Offering HESA Data group box)
Plan HESA Data	NETFEE
Plan Offering/Year HESA	NETFEE (Plan Offering HESA Data group box)

Page	Page Element
Sub-Plan HESA	NETFEE
Sub-Plan Offering/Year HESA	NETFEE (Sub-Plan Offering HESA Data group box)
HESA Instance	NETFEE

Field Derivation Rule: If Instance.FEEREGIME = 20 derive a value. Otherwise, do not derive a value and leave the field blank.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If Instance.GROSSFEE is derived from Step 2, NETFEE is derived as the rounded GROSSFEE minus the total of all waivers for the Student Career for terms that start within the reporting period. Fee records where the Item Type Code is *Waiver* and the Account Type is one of those defined with the Waiver check box selected in HESA Returns page. The derived value is then rounded to the nearest pound.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Do not derive a value and leave the field blank,

NHS Employer (NHSEMP)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	NHSEMP

Page	Page Element
Plan HESA Data	NHSEMP
Sub-Plan HESA	NHSEMP
HESA Instance	NHSEMP

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Related Course.COURSEAIM = M76, H76, I76, or J76

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Reason for Partial and Full Non-payment of Tuition (NONPAY)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	NONPAY

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

- Course.MSFUND does not equal 91

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Suspension of Active Studies (NOTACT)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason
HESA Instance	NOTACT
HESA Action Reasons	Suspension of Active Studies Mapping

Field Derivation Rule: If Instance.RSNEND and Instance.ENDDATE values do not exist, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If the most recent effective dated Student Program record has Program Action/Reason values mapped to the a HESA Suspension of Studies code on the HESA Action Reasons page, then derive the mapped HESA code value.
3. If Instance.MODE = 73 or 74, derive as *I*.
4. Do not derive a value and leave the field blank.

Note: For correct derivation, ensure that if you have mapped a Program Action/Reason to a MODE of 73 or 74, map the same Program Action/Reason to a NOTACT value of *I* on the HESA Action Reasons page.

Number of Units to Achieve Full Qualification (NOUNTACH)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	NOUNTACH
Plan HESA Data	NOUNTACH
Sub-Plan HESA	NOUNTACH
HESA Instance	NOUNTACH

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Student Instance Identifier (NUMHUS)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	Instance Identifier Linked Career Linked Career Number Academic Career Student Career Nbr

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from HESA Instance page as Instance Identifier.
2. Derive from HESA Instance page as Linked Career and Linked Career Number.
3. Derive from HESA Instance page as Academic Career and Student Career Nbr, for example, UGRD1.

Previous Student Instance Identifier (NUMHUSPREV)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	NUMHUSPREV

Field Derivation Rule: Derive a value if related Course.COURSEAIM = D00, D01, L00, or L80.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as *NULL*.

Number of Units Completed (NUMUNITS)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	NUMUNITS

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

Institution's Own Instance Identifier (OWNINST)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	OWNINST

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Do not derive a value and leave the field blank.

Subcontracted or Partnership UKPRN (PARTNERUKPRN)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	PARTNERUKPRN

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01 and Instance.AIMTYPE is not 1

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

PhD Submission Date (PHDSUB)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason
HESA Instance	PHDSUB
HESA Action Reasons	Phd Submission Action Reason Mapping

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.REDUCEDI = 00, 01, or 04
- Related Course.COURSEAIM = D00 or D01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If there is a Research Candidate record for the instance, select the earliest effective dated thesis record where Actual Submission Date has a value and the effective date is on or before the reporting period end date. Derive as the Actual Submission Date formatted to YYYY-MM-DD.

Note: The process matches the Research Candidate record (SSR_RS_CAND_HDR) to the instance on EMPLID, Institution, Career and Career Number to find the Research Candidate Number (SSR_RS_CANDIT_NBR). The process associates the thesis records (SSR_RS_THESIS) with the Research Candidate record by EMPLID, Institution and Research Candidate Number. It selects

the earliest Research Candidate record (by EFFDT, EFFSEQ) that has an Actual Submission Date (SSR_RS_ACT_SUB_DT).

3. Select the earliest Student Program record (exclude records with an effective date greater than the end date of the reporting period) that has Program Action/Reason values mapped in the Phd Submission Action Reason Mapping group box. Derive as the effective date of the record formatted to YYYY-MM-DD.
4. Derive as null.

Planned Employability, Enrichment and Pastoral Hours (PLANEEPHOURS)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	PLANEEPHOURS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01
- Instance.FUNDMODEL = 10, 25, 35, 81, 82 or 99 and Instance.PROGTYPE is not 20, 21, 22, 23 or 25

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

Planned Learning Hours (PLANLEARNHOURS)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	PLANLEARNHOURS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England AND Instance.FESTUMK = 1, 3, 4, or 5 AND Instance.REDUCEDI = 00 or 01
- Instance.FUNDMODEL = 10, 25, 35, 81, 82 or 99 AND Instance.PROGTYPE is not 20, 21, 22, 23 or 25

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

Good Standing Marker (PROGRESS)

Return: Student Record

Entity: Instance

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	PROGRESS

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Programme Type (PROGTYPE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	PROGTYPE
Plan HESA Data	PROGTYPE
Sub-Plan HESA	PROGTYPE
HESA Instance	PROGTYPE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. If Instance.AIMTYPE = 1 or 3, derive as *NULL ERROR*.
8. Do not derive a value and leave the field blank.

Proportion of Funding Remaining (PROPFUNDREMAIN)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	PROPFUNDREMAIN

Page	Page Element
Plan HESA Data	PROPFUNDREMAIN
Sub-Plan HESA	PROPFUNDREMAIN
HESA Instance	PROPFUNDREMAIN

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1 or 3
- Instance.REDUCEDI = 00 or 01
- Instance.AIMTYPE = 2, 3 or 4
- Instance.FUNDMODEL = 21, 22 or 45

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Apprenticeship Pathway (PWAYCODE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	PWAYCODE
Plan HESA Data	PWAYCODE
Sub-Plan HESA	PWAYCODE

Page	Page Element
HESA Instance	PWAYCODE

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01
- Instance.PROGTYPE = 02, 03, 20, 21, 22 or 23

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Qualified Teacher Status (QTS)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	QTS
Plan HESA Data	QTS
Sub-Plan HESA	QTS
HESA Instance	QTS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Northern Ireland

- Instance.REDUCEDI = 00, 01, or 04
- Related Course.TTCID = 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Research Council Student Identifier (RCSTDID)

Return: Student Record

Entity: Instance

Page Used:

<i>Page</i>	<i>Page Element</i>
External System ID	External System ID

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.REDUCEDI = 00, 01, or 04
- Instance.RCSTDNT is not 99

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If there is a Research Candidate record for the instance, select the value of the CAF attribute defined for RCSTDID in Returns Setup from the most recent active consumption record where the effective date is on or before the reporting period end date.
2. Select External System ID records for the person with the External ID Type defined for RCSTDID in the HESA Types page.
3. Do not derive a value and leave the field blank.

Research Council Student (RCSTDNT)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	RCSTDNT
Plan HESA Data	RCSTDNT
Sub-Plan HESA	RCSTDNT
HESA Instance	RCSTDNT

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.REDUCEDI = 00, 01, or 04
- Related Course.COURSEAIM begins D, E, L, or M (except M22, M26, M28, M71, or M73)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If there is a Research Candidate record for the instance, select the value of the CAF attribute defined for RCSTDNT in Returns Setup from the most recent active consumption record where the effective date is on or before the reporting period end date.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan HESA Data page.
6. Derive from the Program HESA Data page.
7. Use default.
8. Derive as *NULL ERROR*.

Amount of Tuition Fees Received/Expected for the Student (RECFEE)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	RECFEE

Field Derivation Rule: Derive a value only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.FESTUMK = 1, 3, or 4
- Instance.REDUCEDI = 00 or 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Reduced Instance Return Indicator (REDUCEDI)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	REDUCEDI

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Country = England, Scotland, or Northern Ireland and Instance.STULOAD is *10.0* or less, derive as *01*.
4. If Instance.EXCHANGE is *2, 4, 8, 9, A* or *G*, derive as *03*.
5. If Instance.MODE = *63* or *64*, derive as *04*.
6. Derive as *00*.

Reason for Ending Instance (RSNEND)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason
HESA Action Reasons	Reason for Ending Instance Mapping

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.REDUCEDI = 00, 01, 04, 07, 08 or 09
- Instance.ENDDATE is completed.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive value from the HESA Instance page.
2. If the most recent effective dated Student Program record has Program Action/Reason values mapped to a HESA Reason for Ending Instance code on the HESA Action Reasons page, then derive the mapped HESA code value.
3. Derive as *NULL ERROR*.

Number of Student Associates Scheme Days Completed (SASDAYS)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	SASDAYS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Course.REDUCEDC = 06 (SAS) or Course.TTCID = E (SAS)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Student Associates Scheme Placement (SASSCHL)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	SASSCHL

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Course.REDUCEDC = 06 (SAS) or Course.TTCID = E (SAS)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

School Direct Employing School (SDEMPLOY)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
Program HESA Data	SDEMPLOY
Plan HESA Data	SDEMPLOY
Sub-Plan HESA	SDEMPLOY

Page	Page Element
HESA Instance	SDEMPLOY

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.ENTRYRTE = 03 or 10
- Instance.MODE is not 63 or 64

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance page.
3. If Instance.COURSEID is based on a sub-plan, derive value from the Sub-Plan HESA page.
4. Derive value from Plan HESA Data page.
5. Derive value from Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

School Direct Lead School (SDLEAD)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
Program HESA Data	SDLEAD
Plan HESA Data	SDLEAD
Sub-Plan HESA	SDLEAD
HESA Instance	SDLEAD

Field Derivation Rule: Derive a value if the following conditions are met:

- Instance.ENTRYRTE = 02, 03, or 10
- Instance.MODE is not 63 or 64

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance page.

3. If Instance.COURSEID is based on a sub-plan, derive value from the Sub-Plan HESA page.
4. Derive value from Plan HESA Data page.
5. Derive value from Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

Subject Knowledge Enhancement Institution (SKEITT)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	SKEITT

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- Course.REDUCEDC = 07 (SKE) or Course.TTCID = F (SKE)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Special Fee Indicator (SPECFEE)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program Offering/Year HESA	SPECFEE (Program Year HESA Data group box)
Plan Offering/Year HESA	SPECFEE (Plan Year HESA Data group box)

Page	Page Element
Sub-Plan Offering/Year HESA	SPECFEE (Sub-Plan Year HESA Data group box)
HESA Instance	SPECFEE

Field Derivation Rule: Derive if one of the following conditions is met:

- Country = Northern Ireland or Scotland AND Instance.REDUCEDI = 00 AND Instance.PROGTYPE is not 25 AND Instance.FUNDMODEL is not 36
- Instance.REDUCEDI = 00 AND Country = England or Wales AND Instance.PROGTYPE is not 25 AND Instance.FUNDMODEL is not 36 AND Course.COURSEAIM does not begin with P, Q, R, S or X

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
4. Derive from the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
5. Derive from the Program Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance.
6. Use default.
7. Derive as *NULL ERROR*.

Expected Length of Study (SLENGTH)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	SLENGTH
Program Offering/Year HESA	SLENGTH (Program Offering HESA Data group box)
Plan HESA Data	SLENGTH
Plan Offering/Year HESA	SLENGTH (Plan Offering HESA Data group box)

Page	Page Element
Sub-Plan HESA	SPLENGTH
Sub-Plan Offering/Year HESA	SPLENGTH (Sub-Plan Offering HESA Data group box)
HESA Instance	SPLENGTH

Field Derivation Rule: Derive a value if the following conditions are met.

- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK is not 5

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as null.

SLDD-Discrete Provision (ST13)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	ST13

Field Derivation Rule: Derive a value only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = Wales
- Instance.FESTUMK = 1 or 3
- Instance.REDUCEDI = 00

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Student Instance FTE (STULOAD)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	Calculated FTE Report Zero Override FTE

Field Derivation Rule: Derive a value if the following conditions are met.

- Instance.REDUCEDI = 00, 01, or 03
- Instance.FESTUMK is not 5

Derivation Steps:

1. Derive as zero, if the Report Zero check box is selected on the HESA Instance page for the reporting period.
2. Derive as the Override FTE value on the HESA Instance page for the reporting period.
3. Derive as the Calculated FTE value on the HESA Instance page for the reporting period.
4. Use default.
5. Derive as *NULL ERROR*.

Teacher Reference Number (TREFNO)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Wales
- Instance.REDUCEDI = 00 or 01, or 04 or 08
- Related Course.TTCID = 1

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for TREFNO in the HESA Types page.
2. Use default.
3. If Country = England, derive NULL ERROR.
4. Do not derive a value and leave the field blank.

Type of Instance Year (TYPEYR)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	TYPEYR
Program Offering/Year HESA	TYPEYR (Program Year HESA Data group box)
Plan HESA Data	TYPEYR
Plan Offering/Year HESA	TYPEYR (Plan Year HESA Data group box)
Sub-Plan HESA	TYPEYR
Sub-Plan Offering/Year HESA	TYPEYR (Sub-Plan Year Data group box)
HESA Instance	TYPEYR

Field Derivation Rule: Derive a value if the following conditions are met.

- Instance.REDUCEDI = 00 or 01
- Instance.FESTUMK is not 5

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Derive as 1 if COMDATE is in the range 01-AUG to 31-DEC (any year) and ENDDATE is in the range 01-JAN to 31-JUL (any year) and RSNEND = 01 or 98.
4. Derive as 1 if Instance.COURSEID is based on a subplan, and a TYPEYR value of 1 is defined on the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
5. Derive as 2 if Instance.COURSEID is based on a subplan, a TYPEYR value of 2, 3, 4, or 5 is defined on the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance, and COMDATE is within the reporting period. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
6. Derive as 3 if Instance.COURSEID is based on a subplan, a TYPEYR value of 2, 3, 4, or 5 is defined on the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance, COMDATE is prior to the reporting period, ENDDATE value does not exist or is not within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
7. Derive as 4 if Instance.COURSEID is based on a subplan, a TYPEYR value of 2, 3, 4, or 5 is defined on the Sub-Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance, COMDATE is prior to the reporting period, ENDDATE is within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
8. Derive as 1 if Instance.COURSEID is based on a subplan and a TYPEYR value of 1 is defined on the Sub-Plan HESA page.
9. Derive as 2 if Instance.COURSEID is based on a subplan, a TYPEYR value of 2, 3, 4, or 5 is defined on the Sub-Plan HESA page, and COMDATE is within the reporting period.
10. Derive as 3 if Instance.COURSEID is based on a subplan, a TYPEYR value of 2, 3, 4, or 5 is defined on the Sub-Plan HESA page, COMDATE is prior to the reporting period, ENDDATE value does not exist or is not within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales.
11. Derive as 4 if Instance.COURSEID is based on a subplan, a TYPEYR value of 2, 3, 4, or 5 is defined on the Sub-Plan HESA page, COMDATE is prior to the reporting period, ENDDATE is within the reporting period, and and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales..

12. Derive as 1 if a TYPEYR value of 1 is defined on the Plan Offering/Year HESA page for the combination of academic load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
13. Derive as 2 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance, and COMDATE is within the reporting period. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
14. Derive as 3 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance, COMDATE is prior to the reporting period, ENDDATE value does not exist or is not within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
15. Derive as 4 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance, COMDATE is prior to the reporting period, ENDDATE is within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
16. Derive as 1 if a TYPEYR value of 1 is defined on the Plan HESA Data page.
17. Derive as 2 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Plan HESA Data page, and COMDATE is within the reporting period.
18. Derive as 3 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Plan HESA Data page, COMDATE is prior to the reporting period, ENDDATE value does not exist or is not within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales.
19. Derive as 4 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Plan HESA Data page, COMDATE is prior to the reporting period, ENDDATE is within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales.
20. Derive as 1 if a TYPEYR value of 1 is defined on the Program Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance.
21. Derive as 2 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Program Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance, and COMDATE is within the reporting period.
22. Derive as 3 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Program Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance, COMDATE is prior to the reporting period, ENDDATE value does not exist or is not within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales.
23. Derive as 4 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Program Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance, COMDATE is prior to the reporting period, ENDDATE is within the reporting period, and Country is "England". Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales.
24. Derive as 1 if a TYPEYR value of 1 is defined on the Program HESA Data page.

- 25. Derive as 2 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Program HESA Data page and COMDATE is within the reporting period.
- 26. Derive as 3 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Program HESA Data page, COMDATE is prior to the reporting period, ENDDATE value does not exist or is not within the reporting period, and Country is “England”. Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales.
- 27. Derive as 4 if a TYPEYR value of 2, 3, 4, or 5 is defined on the Program HESA Data page, COMDATE is prior to the reporting period, ENDDATE is within the reporting period, and Country is “England”. Else, derive as 2 if Country is Scotland, Northern Ireland, or Wales..
- 28. Use default.
- 29. Derive as *NULL ERROR*.

The derivation logic can use the TYPEYR values of 3, 4, or 5 set up for year, program, plan, or subplan. However, it is expected that only values 1 (Course academic year contained within the HESA reporting year 1 August - 31 July) or 2 (Course academic year not contained within the HESA reporting year 1 August - 31 July) are relevant because the remaining values of 3, 4, and 5 apply to the student instance rather than the year as a whole.

The system repeats Steps 3 to 6, depending on the level at which the TYPEYR value is defined in the academic structure.

Units of Length (UNITLGTH)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	UNITLGTH
Program Offering/Year HESA	UNITLGTH (Program Offering HESA Data group box)
Plan HESA Data	UNITLGTH
Plan Offering/Year HESA	UNITLGTH (Plan Offering HESA Data group box)
Sub-Plan HESA	UNITLGTH
Sub-Plan Offering/Year HESA	UNITLGTH (Sub-Plan Offering HESA Data group box)
HESA Instance	UNITLGTH

Field Derivation Rule: Derive a value if the following conditions are met.If or 09, derive a value. Otherwise, do not derive a value and leave the field blank.

- Instance.REDUCEDI = 00 or 01

- Instance.FESTUMK is not 5

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session, and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Withdrawal Reason (WITHDRAWREASON)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	WITHDRAWNREASON

Field Derivation Rule: Derive only if the Include FE check box is selected.

Derive a value if the following conditions are met:

- Country = England
- Instance.CSTAT = 3 (withdrawn)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.

4. Derive as *NULL ERROR*.

Length of Current Year of Instance (YEARLGTH)

Return: Student Record

Entity: Instance

Pages Used:

Page	Page Element
Program HESA Data	YEARLGTH
Program Offering/Year HESA	YEARLGTH (Program Year HESA Data group box)
Plan HESA Data	YEARLGTH
Plan Offering/Year HESA	YEARLGTH (Plan Year HESA Data group box)
Sub-Plan HESA	YEARLGTH
Sub-Plan Offering/Year HESA	YEARLGTH (Sub-Plan Year Data group box)
HESA Instance	YEARLGTH

Field Derivation Rule: Derive a value if one of the the following conditions is met:

- Country = Scotland AND Instance.REDUCEDI = 00.
- Country = Wales, Instance. REDUCEDI= 00 AND Course.COURSEAIM does not begin with P, Q, R, S or X

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Instance.LOCSDY = *D*, *F* or *T*, derive as null.
4. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
5. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
6. Derive from the Plan Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance. Only records where Offering Start Term, Offering Start Session, Campus, Year Term and Year Session are all blank are considered.
7. Derive from the Plan HESA Data page.

8. Derive from the Program Offering/Year HESA page for the combination of Academic Load and YEARPRG of the student instance.
9. Derive from the Program HESA Data page.
10. Use default.
11. Derive as *NULL ERROR*.

Year of Program (YEARPRG)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	Year of Program

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland, or Scotland AND Instance.REDUCEDI = 00 or 01 AND Instance.FESTUMK is not 5
- Country = Wales, Instance.REDUCEDI = 00 or 01 AND Instance.FESTUMK is not 5 AND Course.COURSEAIM does not begin with P, Q, R, S or X

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

Year of Student on This Instance (YEARSTU)

Return: Student Record

Entity: Instance

Page Used:

Page	Page Element
HESA Instance	Year of Student

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England, Northern Ireland, or Scotland AND Instance.REDUCEDI = 00 AND Instance.FESTUMK is not 5

- Country = Wales, Instance.REDUCEDI = 00 or 01 AND Instance.FESTUMK is not 5 AND Course.COURSEAIM does not begin with P, Q, R, S or X

Derivation Steps:

- Derive from the HESA Instance page.
- Use default.
- Derive as *NULL ERROR*.

Student Record Return: Entry Profile Entity

If you select the Include Student Entities check box on the Create Extract Data page, the Create Extract process creates a Entry Profile entity. The process creates a Entry Profile entity for each Instance entity if either the Instance.COMDATE is within the reporting period or if the Include Entry Profile check box is selected on the Entry Profile page. The process creates a single Entry Profile entity using the same key structure as the Instance record.

Access Programmes (ACCESS)

Return: Student Record

Entity: Entry Profile

Page Used:

<i>Page</i>	<i>Page Element</i>
Entry Profile	ACCESS

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- EntryProfile.QUALENT3 = X00 or X01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

- Use constant.
- Derive from the Entry Profile page.
- Use default.
- Derive as *NULL ERROR*.

Articulation (ARTICLN)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	ARTICLN

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- Entry Profile.DOMICILE = XF, XG, XH, XI, XK, XL, GG, JE, or IM
- Related Instance.REDUCEDI = 00 or 04
- Related Course.COURSEAIM = M22, M26, M28, H00, H11, H16, H18, H22, H23, I00, I11, or I16
- Instance.COMDATE is after 2007-07-31
- Instance.INTERCALATE is not 01

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Derive as *NULL ERROR*.

Care Leaver / Looked After Status (CARELEAVER)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	CARELEAVER

Field Derivation Rule: Derive a value if one of the following sets of conditions is met. Otherwise, do not derive a value and leave the field blank.

Set	Conditions
Set 1	<ul style="list-style-type: none"> • Country = England, and • Instance.REDUCEDI = 00 or 01 and • Course.COURSEAIM begins with H (except for H50, H60, H61, H62, H78 or H81), I (except I60, I61 or I81), J or C or is M22, M26, M28, M71, M73, or M88, and • Instance.FUNDCODE = 1 or 7 or null, and • Instance.COMDATE is greater than 2013-07-31, and • Instance.EXCHANGE is not 4, G or Z, and • Course.TTCID is not F
Set 2	<ul style="list-style-type: none"> • Country = England, and • Instance.REDUCEDI = 08, and • Course.COURSEAIM begins with H (except for H50, H60, H61, H62, H78 or H81), I (except I60, I61 or I81), J or C or is M22, M26, M28, M71, M73, or M88
Set 3	<ul style="list-style-type: none"> • Country = Scotland, and • Instance.REDUCEDI = 00, 01 or 04, and • Course.COURSEAIM begins with H, I, J or C or is M22, M26, M28 or M88, and • EntryProfile.DOMICILE = XF, XG, XH, XI or XK, and • Instance.COMDATE is greater than 2013-07-31
Set 4	<ul style="list-style-type: none"> • Country = Northern Ireland, and • Instance.REDUCEDI = 00, 01, or 04, and • EntryProfile.DOMICILE = XF, XG, XH, XI or XK • Course.COURSEAIM begins with H, I, J or C or is M22, M26, M28, M71, M73, or M88, and • EntryProfile.UCASAPPID exists or EntryProfile.DOMICILE = XF, XG, XH, XI or XK, and • Instance.COMDATE is greater than 2013-07-31
Set 5	<ul style="list-style-type: none"> • Country = Wales, and • Course.COURSEAIM begins with H, I, J or C or is M22, M26, M28, M71, M73, or M88, and • EntryProfile.UCASAPPID exists, and • Instance.COMDATE is greater than 2013-07-31

Derivation Steps:

1. Use constant.

2. Derive from the Entry Profile page.
3. Use default.
4. Derive as *NULL ERROR*.

Domicile (DOMICILE)

Return: Student Record

Entity: Entry Profile

Pages Used:

Page	Page Element
Residency Self-Report (Campus Community > Personal Information (Student) > Identification (Student) > Residency Data > Residency Self-Report)	State Country
Entry Profile	DOMICILE
Nationality (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Nationality)	HESA Domicile
Area of Permanent Residence (Set Up SACR > Product Related > Recruiting and Admissions > UCAS > Mappings > Area of Permanent Residence)	HESA Code

Field Derivation Rule: Include for all Entry Profile entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Select the Residency Self-Report record with the latest Date Reported before the Instance.COMDATE. If no record is found, then select the record with the earliest Date Reported date on or after Instance.COMDATE.

If a Residency Self-Report record is found and the Country value is not *GBR*, retrieve the related two-character code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL). If the mapping to a HESA Domicile exists on the Nationality page for the Campus Solutions country code, use the mapped HESA Domicile value; otherwise, use the COUNTRY_2CHAR value.

3. If the Residency Self-Report record is found, the Country value is *GBR*, and a State value exists, select the country and state values. If a mapping exists on the Area of Permanent Residence page between a HESA country code and the selected country and state values, use the mapped HESA Country code. If no mapping is found, log an error message and derive *XK*.
4. If a Residency Self-Report record is found, the Country value is *GBR*, and a State value does not exist, derive *XK*.
5. Use default.

6. Derive as *NULL ERROR*.

Note that some Campus Solutions country codes are invalid for HESA reporting. Use the Nationality page to map the valid HESA codes with the Campus Solutions country codes.

Marital Status (MARSTAT)

Return: Student Record

Entity: Entry Profile

Pages Used:

Page	Page Element
Biographical Details (Campus Community > Personal Information (Student) > Add/Update Person > Biographical Details)	Marital Status
Entry Profile	MARSTAT
Marital Status (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Marital Status)	HESA Marital Status

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Northern Ireland
- EntryProfile.DOMICILE = XG (Northern Ireland)
- Related Instance.REDUCEDI = 00 or 04

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Select the Marital Status value from the Biographical History record. Use the mapping on the Marital Status page to derive the HESA Martial Status code.
3. Derive as *NULL ERROR*.

New Entrant to Higher Education (NEWENT)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	NEWENT

Field Derivation Rule: Derive a value if the following conditions are met:

- Related Instance.REDUCEDI = 00
- Related Course.COURSEAIM begins with D, E, L, M, H, I, J, or C

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Do not derive a value and leave the field blank.

Dependents on Entry (NIDEPEND)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	NIDEPEND

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Northern Ireland
- EntryProfile.DOMICILE = XG (Northern Ireland)
- Related Instance.REDUCEDI = 00 or 04

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Derive as *NULL ERROR*.

Parental Education (PARED)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	PARED

Field Derivation Rule: Derive a value if the following conditions are met:

- EntryProfile.DOMICILE = XF, XG, XH, XI, XK, XL, GG, JE, or IM
- Related Course.COURSEAIM = M22, M26, M28, H00, H11, H16, H18, H22, H23, I00, I11, I16, J10, J16, J20, J26, J30, C20, or C30
- Related Instance.REDUCEDI = 00 or 04
- Instance.COMDATE is after 2007-07-31
- Instance.INTERCALATE is not 01
- If Country = Northern Ireland or Wales, then EntryProfile.UCASAPPID value should exist

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Derive as *NULL ERROR*.

PGCE Class of Undergraduate Degree (PGCECLSS)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	PGCECLSS

Field Derivation Rule: Derive a value if the following conditions are met:

- Related Instance.REDUCEDI = 00 or 04
- Related Course.COURSEAIM = M71, M73, or H71

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Derive as *NULL ERROR*.

PGCE Subject of Undergraduate Degree (PGCESBJ, PGCESBJ2, PGCESBJ3, PGCESBJ4, PGCESBJ5)

Return: Student Record

Entity: Entry Profile

Page Used:

<i>Page</i>	<i>Page Element</i>
Entry Profile	PGCESBJ PGCESBJ2 PGCESBJ3 PGCESBJ4 PGCESBJ5

Field Derivation Rule: Derive a value if the following conditions are met:

- Related Instance.REDUCEDI = 00 or 04
- Related Course.COURSEAIM = M71, M73, or H71

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant to create a single PGCESBJ field.
2. Derive from the Entry Profile page.
3. Use default to create a single PGCESBJ field.
4. Derive a single PGCESBJ field as *NULL ERROR*.

Note: The system can derive up to three values. Each of the values is included as a separate PGCESBJ field in the XML file.

Postcode (POSTCODE)

Return: Student Record

Entity: Entry Profile

Pages Used:

Page	Page Element
Addresses (Campus Community > Personal Information (Student) > Biographical (Student) > Addresses/Phones > Addresses)	Postal
Entry Profile	POSTCODE

Field Derivation Rule: Derive a value if the following conditions are met:

- EntryProfile.DOMICILE = XF, XG, XH, XI, XK, XL, GG, JE, or IM
- Related Instance.REDUCEDI = 00, 01, 04, 07 or 08

Do not derive a value and leave the field blank, if the conditions are not metPREVINST.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Select the address record with the country code of GBR whose effective date is most recent and falls prior to Instance.COMDATE. The record must have an address type that matches the address type mapped with POSTCODE in the HESA Types page. Derive the post code from this record. If multiple valid addresses are found with the same effective date then one will be randomly picked.

If no addresses are found prior to COMDATE, then select the earliest effective dated record with an effective date on or after COMDATE (that is, closest to COMDATE) that has an Address Type that corresponds with those defined as the Address Types for POSTCODE in the HESA Return Setup record. If multiple valid addresses are found with the same effective date then one will be randomly picked

If the country of the selected address is one of the UK-related codes, the postcode is derived.

The following country codes are considered as UK-related for the purposes of this derivation: GBR (United Kingdom), ENG (England), XF (England), NIR (Northern Ireland), XG (Northern Ireland), SCT (Scotland), XH (Scotland), WAL (Wales), XI (Wales), XK (UK not otherwise specified), XL (Channel Islands not otherwise specified), GG (Guernsey), GGY (Guernsey), JE (Jersey), JEY (Jersey), IM (Isle of Man), or IMN (Isle of Man).

3. Derive as null.

For steps 1 and 2, the system validates that the derived post code value is in the correct format.

Last School Attended (PREVINST)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	PREVINST

Field Derivation Rule: Derive a value if the following conditions are met:

- EntryProfile.DOMICILE = XF, XG, XH, XI, XK, XL, GG, JE, or IM
- Related Instance.REDUCEDI = 00 or 04
- Related Instance.INTERCALATE is not 01
- Related Course.COURSEAIM = M22, M26, M28, H00, H11, H12, H16, H18, H22, H23, I00, I11, I12, I16, I73, J10, J16, J20, J26, J30, C20, or C30

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Use default.
3. Derive as *NULL ERROR*.

Highest Qualification On Entry (QUALENT3)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	QUALENT3

Field Derivation Rule:

Derive a value if Instance.REDUCEDI = 00, 01, or 04.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Use default.
3. Derive as *NULL ERROR*.

Religion (RELIGION)

Return: Student Record

Entity: Entry Profile

Pages Used:

Page	Page Element
Religious Preference (Campus Community > Personal Information (Student) > Biographical (Student) > Personal Attributes > Religious Preference)	Religious Preference
Entry Profile	RELIGION
Religion (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Religion)	HESA Religion

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Northern Ireland
- EntryProfile.DOMICILE = XG (Northern Ireland)
- Related Instance.REDUCEDI = 00 or 04

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Select the religious preference from the personal information record. Use the mapping on the Religion page to derive the HESA Religion code.

If the HESA religion code mapping does not exist, log an error message and skip to the next step.

3. Use default.
4. Derive as *NULL ERROR*.

Socio-Economic Classification (SEC)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	SEC

Field Derivation Rule: Derive a value if the following conditions are met:

- A value for EntryProfile.UCASAPPID exists.
- EntryProfile.DOMICILE is XF, XG, XH, XI, XK, XL, GG, JE or IM

- Related Course.COURSEAIM begins with H, I, J, or C or is M22, M26 or M28.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Use default.
3. Derive as *NULL ERROR*.

Occupation Code (SOC2010)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	SOC2010

Field Derivation Rule: Derive a value if the following conditions are met:

- A value for EntryProfile.UCASAPPID exists.
- EntryProfile.DOMICILE is XF, XG, XH, XI, XK, XL, GG, JE or IM
- Related Course.COURSEAIM begins with H, I, J, or C or is M22, M26 or M28.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Use default.
3. Derive as *NULL ERROR*.

UCAS Application Number (UCASAPPID)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Application Data (Student Admissions > Application Maintenance > Maintain Applications > Application Data)	External Application Nbr

Page	Page Element
Entry Profile	UCASAPPID

Field Derivation Rule: Include for all Entry Profile entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Use the Student Program record of the instance to find the admission application number (ADM_APPL_NBR). Use this admission application number to find the Admissions Data record (PS_ADM_APPL_DATA). Then, from the Application Data page for this record, find the External Application Number. The External Application Number is used to record the UCAS Application Number or Application Code plus Choice Number for UCAS applications.

If External Application Number exists and is a UCAS number — that is, the number is a 4-character application code that begins *UC*, plus -, plus single-digit choice number (for example, UC01-1), then the system derives the UCAS number value minus the - and choice elements (for example, UC01). Only values beginning *UC* are derived. If any other value is found, the derivation step is skipped.

3. Use default.
4. Do not derive a value and leave the field blank.

Welsh Baccalaureate Advanced Diploma (WELBACC)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	WELBACC

Field Derivation Rule: Derive a value if the following conditions are met:

- EntryProfile.DOMICILE = XI (Wales)
- Related Instance.REDUCEDI = 00 or 04
- Related Course.COURSEAIM begins with H, I, J or C (that is, not FE)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Use default.
3. If Country is Wales on the HESA Returns page, derive as *NULL ERROR*.

- If Country is not Wales on the HESA Returns page, do not derive a value and leave the field blank.

Year Left Last Institution (YRLLINST)

Return: Student Record

Entity: Entry Profile

Page Used:

Page	Page Element
Entry Profile	YRLLINST

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- EntryProfile.ARTICLN = 1, 2, 3, or 4

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

- Derive from the Entry Profile page.
- Use default.
- Derive as *NULL ERROR*.

Student Record Return: Qualifications On Entry Entity

The Create Extract process creates Qualifications On Entry entities for each Entry Profile entity in the return where the Instance.COMDATE falls within the reporting period and the related course entity has an undergraduate COURSEAIM that does not begin with D, E, L or M with the exceptions of M22, M26 and M28, which are included.

The process creates the Qualifications On Entry entities only if the Include Student Entities check box is selected on the Create Extract Data page. To create the Qualifications On Entry entities, the process selects entry qualifications that have the Report To HESA check box selected and the QUALTYPE code imported from HESA.

Qualification Grade (QUALGRADE)

Return: Student Record

Entity: Qualifications On Entry

Page Used:

Page	Page Element
Entry Profile	Grade

Field Derivation Rule: Include for all Qualifications On Entry entities.

Derivation Steps:

The system performs the following steps to derive the values:

1. Derive from the Entry Profile page.
2. Do not derive a value and leave the field blank.

Qualification Subject (QUALSBJ)

Return: Student Record

Entity: Qualifications On Entry

Page Used:

Page	Page Element
Entry Profile	Subject

Field Derivation Rule: Include for all Qualifications On Entry entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Derive as *NULL ERROR*.

Qualification Sitting (QUALSIT)

Return: Student Record

Entity: Qualifications On Entry

Page Used:

Page	Page Element
Entry Profile	Sitting

Field Derivation Rule: Include for all Qualifications On Entry entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Do not derive a value and leave the field blank.

Qualification Type (QUALTYPE)

Return: Student Record

Entity: Qualifications On Entry

Page Used:

Page	Page Element
Entry Profile	Type

Field Derivation Rule: Include for all Qualifications On Entry entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Derive as *NULL ERROR*.

Qualification Year (QUALYEAR)

Return: Student Record

Entity: Qualifications On Entry

Page Used:

Page	Page Element
Entry Profile	Year

Field Derivation Rule: Include for all Qualifications On Entry entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Derive as *NULL ERROR*.

Student Record Return: Qualifications Awarded Entity

The Create Extract process creates Qualifications Awarded entities for each Instance entity where the student has completed the course and the academic institution has awarded a qualification to the student. The process uses the HESA Instance record for field derivation. If a field value does not exist in the HESA Instance record, the process uses the student degree records for derivation.

The process creates the Qualifications Awarded entities only if the Include Student Entities check box is selected on the Create Extract Data page. The selection logic for Qualifications Awarded that considers student degree records considers the completion term and confer dates when determining if the qualification should be included in the extract. That is, degrees should have status of *Awarded* with either a Confer Date that falls within the reporting period dates or a completion term that overlaps the reporting

period (which means, the term end date is on or after the reporting period start date and the term begin date is on or before the reporting period end date).

The process selects Qualifications Awarded records for Instance records where:

- Instance.REDUCEDI = 00,01 or 04 (not Reduced FE or Incoming Visiting/Exchange), and
- Instance.ENDDATE is not null *or* Instance.INTERCALATE = 01

Classification (CLASS)

Return: Student Record

Entity: Qualifications Awarded

Pages Used:

Page	Page Element
HESA Instance	Classification (Qualifications Awarded group box)
Degree Honors (Records and Enrollment > Graduation > Student Degrees > Degree Honors)	Honors Code
Classification (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Classification)	Honors Code

Field Derivation Rule: Derive a value if one of the following conditions is met:

- QualificationsAwarded.QUAL = M22, M26, M28, H00, H11, H12, H16, H18, H22, H23, H24, H50, I00, I11, I12, or I16
- Country = England or Wales AND QualificationsAwarded.QUAL begins P, Q, R, S or X

Derivation Steps:

1. If the entity is derived from the HESA Instance - Qualifications Awarded record, derive as the Classification value.
2. If the entity is derived from Student Degrees record, use the mapping on the Classification page to derive as the HESA Honors Code. On the Classification page the HESA Honors Code must be mapped to a HESA classification and a Honors Type where the Honors Type must be *Degree Honors*.
3. Derive as *NULL ERROR*.

Outcome of ITT Instance (OUTCOME)

Return: Student Record

Entity: Qualifications Awarded

Pages Used:

Page	Page Element
HESA Instance	Outcome of ITT Instance (Qualifications Awarded group box)
HESA Instance	OUTCOME (Instance HESA Data group box)

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Wales
- Related Course.TTCID = 1 or Q

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If the entity is derived from the HESA Instance - Qualifications Awarded record, derive as the Outcome of ITT Instance value.
2. If the entity is derived from Student Degrees record, derive as the OUTCOME value.
3. Use default.
4. Derive as *NULL ERROR*.

Qualification Awarded (QUAL)

Return: Student Record

Entity: Qualifications Awarded

Pages Used:

Page	Page Element
HESA Instance	Qualification Awarded (Qualifications Awarded group box)
Degree (Records and Enrollment > Graduation > Student Degrees > Degree)	Degree
Qualification (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Qualification)	Degree

Field Derivation Rule: Include for all Qualifications Awarded entities.

Derivation Steps:

1. If the entity is derived from the HESA Instance - Qualifications Awarded record, derive as the Qualification Awarded value.
2. If the entity is derived from Student Degrees record, use the mapping on the Qualification page to derive as the mapped HESA Degree code.
3. Derive as *NULL ERROR*.

Teaching Qualifications Gained Sector (TQGSEC)

Return: Student Record

Entity: Qualifications Awarded

Pages Used:

Page	Page Element
HESA Instance	Sector (Qualifications Awarded group box)
HESA Instance	TQGSEC (Instance HESA Data group box)
Program HESA Data	TQGSEC (Program HESA Instance Data group box)
Plan HESA Data	TQGSEC (Plan HESA Instance Data group box)
Sub-Plan HESA	TQGSEC (Sub-Plan HESA Instance Data group box)

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland or Northern Ireland
- Related Course.TTCID = 1 or 2

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If the entity is derived from the HESA Instance - Qualifications Awarded record, derive as the Sector value.
2. If the entity is derived from Student Degrees record, derive as the TQGSEC value. If two awards are reported, use this value for both entities.
3. If the related Instance.COURSEID is based on a sub-plan, derive value from Sub-Plan HESA.
4. Derive value from Plan HESA Data.
5. Derive value from Program HESA Data.
6. Use default.
7. Derive as *NULL ERROR*.

Teacher Qualification Gained Subject (TQGSUB)

Return: Student Record

Entity: Qualifications Awarded

Pages Used:

Page	Page Element
HESA Instance (Qualifications Awarded group box)	Subject 1, Subject 2, Subject 3
HESA Instance (Instance HESA Data group box)	TQGSUB, TQGSUB2, TQGSUB3
Program HESA Data (Program HESA Instance Data group box)	TQGSUB, TQGSUB2, TQGSUB3
Plan HESA Data (Plan HESA Instance Data group box)	TQGSUB, TQGSUB2, TQGSUB3
Sub-Plan HESA (Sub-Plan HESA Instance Data group box)	TQGSUB, TQGSUB2, TQGSUB3

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Scotland
- QualificationsAwarded.TQGSEC = 2

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If the entity is derived from the HESA Instance - Qualifications Awarded record, derive as the Subject 1, Subject 2, and Subject 3 values.
2. If the entity is derived from Student Degrees record, derive as the TQGSUB, TQGSUB2, and TQGSUB3 values. Use these values for both entities if two awards are reported.
3. If the related Instance.COURSEID is based on a sub-plan and TQGSUB is defined, derive all values from Sub-Plan HESA.
4. If TQGSUB is defined, derive all values from Plan HESA Data.
5. If TQGSUB is defined, derive all values from Program HESA Data.
6. Derive single TQGSUB field as *NULL ERROR*.

Note: The system can derive up to three values. Each of the values is included as a separate TQGSUB field in the XML file.

Student Record Return: Student On Module Entity

The Create Extract process can create a maximum of 128 Student On Module records for each Instance in the return to indicate which modules (Campus Solutions courses) the student has been studying during the reporting period. The process selects Student On Module records based on the student's course enrollments and the course offering records included in the related Module entities of the return.

The process creates the Student On Module entities only if the Include Student Entities check box is selected on the Create Extract Data page.

HESA requires Student On Module records only if Instance.STULOAD is greater than zero. However, academic institutions can optionally include Student On Module records in the return when STULOAD = 0.

To choose student enrollment records for the Student on Module entity creation, the process:

- Selects all activated terms for the student career.
- From each activated term, selects classes that satisfy the following conditions:
 - Class Start Date is within the reporting period, or Class End Date is within the reporting period, or Class Start Date is prior to the reporting period and Class End Date is after the reporting period.
 - Status = *Enrolled* or *Dropped*.
 - Units Taken value is greater than zero.
 - Grading basis value matches one of the values defined in the Grading Basis Inclusion region with the Extract check box selected on the HESA Configuration page.
 - A Repeat Code value does not exist or does not match a value defined in the Repeat Code Exclusion region with the Extract check box selected on the HESA Configuration page.
 - If the student has multiple careers with the same Academic Career value as the career being processed (that is, the same career value with different career numbers), then the process applies a further filter to the class enrollments. In that case, the process selects the class only if the program value of the enrollment record does not exist or matches one of the program values in the Student Program records for that career and career number.

When the process considers class start and end dates for class enrollments where the Session = *OEE* (open entry/exit), rather than selecting the class start/end dates, the process selects the values from the Student OEE Enrollment Data record for the class enrollment. If the end date is not defined in Student OEE Enrollment Data then the process uses the class end date. The start date is mandatory for a Student OEE Enrollment Data record. Note that the process does not consider linked careers for Student On Module.

For students with a STULOAD value of greater than zero, if there are no relevant class enrolments, the process creates a single Student On Module entity for the student. The process creates the single Student On Module entity only if the combination of Plan and Year has been defined as a dummy module and included in the Module entity.

If the Always Include check box is selected on the HESA Dummy Module Data page for the student's year of program, then a Student on Module entity is created together with any eligible class enrollments for the student.

APEL Indicator (APEL)

Return: Student Record

Entity: StudentOnModule

Page Used:

Page	Page Element
HESA Module Data	APEL

Field Derivation Rule: If Country = Wales, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Note: You can define an APEL value at Course Offering/Module level if the module is an APEL module only.

Percentage of Module Taught in Celtic Language (LANGPCNT)

Return: Student Record

Entity: StudentOnModule

Page Used:

Page	Page Element
HESA Module Data	LANGPCNT

Field Derivation Rule: If Country = Northern Ireland, Scotland, or Wales, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Module Identifier (MODID)

Return: Student Record

Entity: Student On Module

Pages Used: None

Field Derivation Rule: Include for all Student On Module entities.

Derivation Step:

1. For each student enrollment record valid for the reporting period, the process determines MODID as a combination of Course ID plus Course Offering Number from the related Course Offering record.

Module Countable (MODCOUNT)

Return: Student Record

Entity: Student On Module

Pages Used:

Page	Page Element
Module HESA Data	MODCOUNT

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Wales
- Course.COURSEAIM begins with C, D, E, L, M, H, I or J

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Module HESA Data page.
2. Use default.
3. Derive as *NULL ERROR*.

Module Outcome (MODOUT)

Return: Student Record

Entity: Student On Module

Pages Used:

Page	Page Element
Enrollment (Records and Enrollment > Enroll Students > Enrollment)	Grading Basis Grade In/Official
Module Outcome (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Module Outcome)	HESA Module Outcome

Field Derivation Rule: Include for all Student On Module entities.

Derivation Steps:

1. Derive as the mapped HESA Module Outcome for the grade selected in the enrollment record.
2. Use default.
3. Derive as *NULL ERROR*.

If HESA Module Data dummy module flag for MODID = Y, derive as *07*.

Module Status (MODSTAT)

Return: Student Record

Entity: Student On Module

Pages Used: None

Field Derivation Rule: Include for all Student On Module entities.

Derivation Steps:

1. Use constant.
2. Derive as *1* if the class start date is before the reporting period, and the class end date is within the reporting period.
3. Derive as *2* if the class start and end dates are within the reporting period.
4. Derive as *3* if the class start date is within the reporting period, and the class end date is after the reporting period.
5. Derive as *6* if the class start date is before the reporting period and the class end date is after the reporting period.

Note that the derivation logic compares class start and end dates with the reporting period dates to determine the status.

If HESA Module Data dummy module flag for MODID = Y, derive as *05*.

When considering class start and end dates for class enrollments where the Session = OEE, rather than selecting the class start and end dates, the derivation logic selects values from the Student OEE Enrollment Data record for the class enrollment. If the end date is not defined in Student OEE Enrollment Data record, then the logic uses the class end date. The start date is mandatory in the Student OEE Enrollment Data record.

Module Year (MODYR)

Return: Student Record

Entity: Student On Module

Page Used:

Page	Page Element
Module HESA Data	MODYR

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England or Northern Ireland
- Instance.INSTAPP = 1
- Instance.TYPEYR = 2, 3, 4, or 5

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Derive from the Module HESA Data page.
2. Use default.
3. Derive as *NULL ERROR*.

For dummy modules:

1. Derive from the HESA Dummy Module Data page.
2. Use default.
3. Derive as *NULL ERROR*.

Note: The field is only derived if INSTAPP = 1, therefore, usually this field will not have any value.

Student Record Return: REF Data Entity

The Create Extract process creates REF Data entities for each Instance entity where the student is studying a research program and the academic institution is creating a full return for the student.

The process:

- Selects REF Data entities records for the related course records that have a research COURSEAIM = *D00, L00, L80, or L99*, and Instance.REDUCEDI = *00, 01, or 04*.
- Creates entities based on one of the following steps. If a step does not have records, the derivation moves to the next step. If no records are found, then entities are not created.
 1. If values are defined in HESA Instance – Research Data, then use the records to create entities.
 2. If there is a Research Candidate record for the Instance, one or more supervisor records are selected and the associated Advisor HESA Data records are used to create entities.
 3. If advisor records exist for the student and a role is defined in HESA Returns Setup, one or more advisors are selected and the associated Advisor HESA Data records are used to create entities.
- Creates the REF Data entities only if the Include Student Entities check box is selected as a run parameter for the Create Extract process.

Deriving records from Research Supervisor/Advisor HESA Data (step 2)

1. Research supervisors are selected from the most recent effective dated record (linked to the instance via the research candidate record) where the date is on or before the reporting period end date, and all the following conditions are met:
 - If the Primary Supervisor Only option is selected in HESA Returns Setup, the primary flag of the Research Supervisor record is set.
 - If the Primary Supervisor Only option is *not* selected in HESA Returns Setup, the Supervision Percentage value is greater than zero.
 - If at least one Supervisor Role is defined in HESA Returns Setup, the Supervisor Role matches one of the setup values. If no Supervisor Roles are setup for the return, all roles are considered.
 - The supervisor status matches one of the values defined in HESA Returns Setup.
 - The end date of the supervisor record is not prior to the reporting period start date.
 - The begin date of the supervisor record is not after the reporting period end date.
 - At least one Advisor HESA Data record exists for the supervisor. If no records are found a message is logged.
2. For each selected advisor, the advisor percentage is adjusted to ensure that the total percentage for all selected advisors is 100.
3. Advisor HESA Data records are selected for each supervisor to create the REF Data entities:
 - If more distinct units are defined than allowed for the entity, a message is logged.
 - For each Advisor HESA Data record a weighted percentage is calculated based on the unit percentage and the supervisor's adjusted supervision percentage.
 - If the same REF Unit exists for more than one supervisor the records are merged into a single entity and the weighted percentages added together.
 - If the total of all the UAOPCNT values does not equal exactly 100 because of rounding during the calculation of adjusted and weighted percentages, the largest value is adjusted to ensure the total is 100.

Deriving records from Student Advisor/Advisor HESA data (step 3)

1. Student advisors are selected from the most recent effective dated record where the date is on or before the reporting period end date and all of the following conditions are met:
 - The Advisor Role defined matches one of the roles defined on the HESA Returns page.
 - The Academic Career and Academic Program match the career and program of the Instance being reported.
 - If the Primary Advisor Only option is selected in HESA Returns Setup, the advisor number is 1.
 - If the Primary Advisor Only option is NOT selected in HESA Returns Setup, the Percentage value is greater than zero.

- At least one Advisor HESA Data record exists for the advisor. If no records are found a message is logged.
2. For each selected advisor, the advisor percentage is adjusted to ensure that the total percentage for all selected advisors is 100.
 3. Advisor HESA Data records are selected for each advisor to create the REF Data entities:
 - If more distinct units are defined than allowed for the entity, a message is logged.
 - For each Advisor HESA Data record a weighted percentage is calculated based on the unit percentage and the advisor’s adjusted percentage.
 - If the same REF Unit exists for more than one advisor the records are merged into a single entity and the weighted percentages added together.
 - If the total of all the UAOPCNT values does not equal exactly 100 because of rounding during the calculation of adjusted and weighted percentages, the largest value is adjusted to ensure the total is 100.

Collaborating Provider (COLPROV)

Return: Student Record

Entity: REF Data

Pages Used:

Page	Page Element
HESA Instance	Collaborating Provider (Research Data region)
Advisor HESA Data	Collaborating Provider

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from HESA Instance Data and a collaborating provider is defined, derive the value.
2. If the entity is derived from Research Supervisor/Advisor HESA Data and a collaborating provider is defined, derive the value. However, if multiple Advisor HESA Data records with the same REF Unit are merged and different collaborating providers are defined, then derive the first code in alphabetic order.
3. If the entity is derived from Student Advisor/Advisor HESA Data, derive collaborating provider. However, if multiple Advisor HESA Data records with the same REF Unit are merged and different collaborating providers are defined, then derive the first code in alphabetic order.

RAE Unit of Assessment (OUA2008)

Return: Student Record

Entity: RAE Data

Pages Used:

Page	Page Element
HESA Instance	RAE Unit of Assessment
Advisor HESA Data (Curriculum Management, Instructor/Advisor Information, Instructor/Advisor Table, Advisor HESA Data)	RAE Unit of Assessment
Student Advisor (Records and Enrollment, Student Background Information, Student Advisor)	Academic Advisor

Field Derivation Rule: Include for all RAE Data entities.

Derivation Steps:

1. If the entity is derived from Instance HESA Data - Research Data record, derive from the HESA Instance page.
2. If the entity is derived from Advisor HESA Data record, derive from the Advisor HESA Data page.

REF Unit of Assessment (UOA2021)

Return: Student Record

Entity: REF Data

Pages Used:

Page	Page Element
HESA Instance	REF Unit 2021
Advisor HESA Data (Curriculum Management, Instructor/Advisor Information, Instructor/Advisor Table, Advisor HESA Data)	REF Unit 2021

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from HESA Instance Data - Research Data record, derive as REF Unit 2021.
2. If the entity is derived from Advisor HESA Data record, derive as REF Unit 2021.
3. If the entity is derived from Student Advisor HESA Data record, derive as REF Unit 2021.

4. Derive as null.

Unit of Assessment Percentage (UOAPCNT)

Return: Student Record

Entity: REF Data

Pages Used:

Page	Page Element
HESA Instance	Unit Of Assessment Percentage
Advisor HESA Data (Curriculum Management > Instructor/Advisor Information > Instructor/Advisor Table > Advisor HESA Data)	Unit Of Assessment Percentage
Student Advisor (Records and Enrollment, Student Background Information, Student Advisor)	Academic Advisor

Field Derivation Rule: Include for all REF Data entities.

Derivation Steps:

1. If the entity is derived from Instance HESA Data - Research Data record, derive from the HESA Instance page.
2. If the entity is derived from Research Supervisor/Advisor HESA Data, derive from the Advisor HESA Data page weighted for multiple supervisors.
3. If the entity is derived from Student Advisor/Advisor HESA Data record, derive from the Advisor HESA Data page.

REF Unit of Assessment (UOA2014)

Return: Student Record

Entity: REF Data

Pages Used:

Page	Page Element
HESA Instance	REF Unit of Assessment
Advisor HESA Data (Curriculum Management, Instructor/Advisor Information, Instructor/Advisor Table, Advisor HESA Data)	REF Unit of Assessment

Field Derivation Rule: Include for all REF Data entities.

Derivation Steps:

1. If the entity is derived from Instance HESA Data - Research Data record, derive from the HESA Instance page.
2. If the entity is derived from Research Supervisor/Advisor HESA Data, derive from Advisor HESA Data page.
3. If the entity is derived from Student Advisor/Advisor HESA Data record, derive from the Advisor HESA Data page.

Student Record Return: Learner Employment Status Entity

For each Instance entity, the Create Extract process creates Learner Employment Status entities when all of the following conditions are met:

- Country = England
- You have selected the Include FE check box on the HESA Returns page
- Instance.FESTUMK = 1, 3 or 4 AND Instance.REDUCEDI = 00 or 01 AND Instance.FUNDMODEL is between 25 and 99 inclusive

The Learner Employment Status entities are created based on Employment Status records defined on the Further Education page, starting with the record with the lowest Record Number value. There is no limit on the number of entities. If records are not defined on the page, then the process does not create the entities.

Date Employment Status Applies To (DATEEMPSTATAPP)

Return: Student Record

Entity: Learner Employment Status

Page Used:

<i>Page</i>	<i>Page Element</i>
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Status Date

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page, converted to YYYY-MM-DD format.

Employer Identifier (EMPID)

Return: Student Record

Entity: Learner Employment Status

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Employer ID

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.
2. Derive as *NULL ERROR* if one of the following conditions is met:
 - Instance.PROGTYPE = 02, 03, 20, 21, 22, 23, or 25
 - Instance.FUNDMODEL = 70 or 99
3. Do not derive a value and leave the field blank.

Employment Status (EMPSTAT)

Return: Student Record

Entity: Learner Employment Status

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Employment Status

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.

ILR Agreement Identifier (ILRAGREEID)

Return: Student Record

Entity: Learner Employment Status

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Agreement ID

Field Derivation Rule: Derive a value if all conditions are met:

- Instance.FUNDMODEL = 36
- A LearningDeliveryFAM entity exists for the Instance with LEARNDELFAMTYPE = ACT and LEARNDELFAMCODE = 1

Derivation Steps:

1. Derive from the Further Education page.
2. Derive as NULL ERROR.

Workplace Location Postcode (WORKLOCPOSTCODE)

Return: Student Record

Entity: Learner Employment Status

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Workplace Postcode

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.

Formatting: If the value is more than four continuous characters, add a space before the final three characters of the postcode.
2. If Instance.PROGTYPE = 02, 03, 10, 20 or 21 or Instance.FUNDMODEL = 45, do not derive a value, leave the field blank and set Reason For Null = 1.
3. Do not derive a value and leave the field blank.

Student Record Return: Employment Status Monitoring Entity

For each Employment Status entity created, the Create Extract process creates Employment Status Monitoring entities. The Employment Status Monitoring entities are created based on the Employment

Monitoring records defined on the Further Education page, starting with the record with the lowest Record Number value. If records are not defined on the page, then the process does not create the entities.

Employment Status Monitoring Code (ESMCODE)

Return: Student Record

Entity: Employment Status Monitoring

Page Used:

<i>Page</i>	<i>Page Element</i>
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Code (in the Employment Monitoring region)

Field Derivation Rule: Include for all Employment Status entities.

Derivation Steps:

1. Derive from the Further Education page.

Employment Status Monitoring Type (ESMTYPE)

Return: Student Record

Entity: Employment Status Monitoring

Page Used:

<i>Page</i>	<i>Page Element</i>
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Type (in the Employment Monitoring region)

Field Derivation Rule: Include for all Employment Status entities.

Derivation Steps:

1. Derive from the Further Education page.

Student Record Return: Learner FAM Entity

For each Instance entity, the Create Extract process creates Learner Funding and Monitoring (FAM) entities when:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5

- Instance.REDUCEDI = 00 or 01
- Include FE check box is selected on the HESA Returns page

The Learner Funding and Monitoring entities are created based on the Learner records defined on the Further Education page. A maximum of 15 records can be defined. If records are not defined on the page, then the process does not create the entities.

Learner Funding and Monitoring Code (LEARNFAMCODE)

Return: Student Record

Entity: Learner FAM

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Code (in the Learner region)

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.

Learner Funding and Monitoring Type (LEARNFAMTYPE)

Return: Student Record

Entity: Learner FAM

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Type (in the Learner region)

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.

Student Record Return: Learning Delivery FAM Entity

For each Instance entity, the Create Extract process creates Learner Delivery Funding and Monitoring entities when:

- Country = England
- Instance.FESTUMK = 1, 3, 4, or 5
- Instance.REDUCEDI = 00 or 01
- Include FE check box is selected on the HESA Returns page

The Learner Delivery Funding and Monitoring entities are created based on the Learning Delivery records defined on the Further Education page. A maximum of 15 records can be defined. If records are not defined on the page, then the process does not create the entities.

Student Record Return: Learning Delivery Funding and Monitoring Code (LEARNDELFAMCODE)

Return: Student Record

Entity: Learning Delivery FAM

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Code (in the Learning Delivery region)

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.

Learning Delivery Funding and Monitoring Date Applies From (LEARNDELFAMFROM)

Return: Student Record

Entity: Learning Delivery FAM

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Date From (in the Learning Delivery region)

Field Derivation Rule: Derive a value if LearningDeliveryFAM.LEARNDELFAMTYPE = LSF, ACT, or ALB. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Further Education page in the format YYYY-MM-DD.

2. Derive as *NULL ERROR*.

Learning Delivery Funding and Monitoring Date Applies To (LEARNDELFTAMTO)

Return: Student Record

Entity: Learning Delivery FAM

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Date To (in the Learning Delivery region)

Field Derivation Rule: Derive a value if LearningDeliveryFAM.LEARNDELFTAMTYPE = LSF, ACT, or ALB. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Further Education page in the format YYYY-MM-DD.
2. Derive as *NULL ERROR*.

Learning Delivery Funding and Monitoring Type (LEARNDELFTAMTYPE)

Return: Student Record

Entity: Learning Delivery FAM

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Type (in the Learning Delivery region)

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Further Education page.

Student Record Return: Learning Delivery Work Placement Entity

For each Instance entity, the Create Extract process creates Learning Delivery Work Placement entities when:

- Country = England
- Instance.FESTUMK = 1, 3 or 4
- Instance.REDUCEDI = 00 or 01
- Instance.COMDATE is on or after 2014-08-01
- Instance.FUNDMODEL is not 99
- Include FE check box is selected on the HESA Returns page

Entities are created based on placement records defined in HESA Instance Data, Further Education, Work Placement.

Records are not considered if the end date is earlier than the reporting period start date or the start date is after the reporting period end date.

Work Placement Employer Identifier (LEARNWORKEMPID)

Return: Student Record

Entity: Learning Delivery Work Placement

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Employer ID (in the Work Placement region)

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive from Further Education.
2. Derive as null.

Work Placement End Date (LEARNWORKEND)

Return: Student Record

Entity: Learning Delivery Work Placement

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	End Date (in the Work Placement region)

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive from Further Education, converted to YYYY-MM-DD.
2. Derive as null.

Work Placement End Date (LEARNWORKEND)

Return: Student Record

Entity: Learning Delivery Work Placement

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	End Date (in the Work Placement region)

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive from Further Education, converted to YYYY-MM-DD.
2. Derive as null.

Work Placement Hours (LEARNWORKHOURS)

Return: Student Record

Entity: Learning Delivery Work Placement

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Hours (in the Work Placement region)

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive from Further Education.
2. Derive as NULL ERROR.

Work Placement Start Date (LEARNWORKSTART)

Return: Student Record

Entity: Learning Delivery Work Placement

Page Used:

Page	Page Element
Further Education (Records and Enrollment, Career and Program Information, HESA Instance Details, Further Education)	Start Date (in the Work Placement region)

Field Derivation Rule: Include for all entities.

Derivation Steps: Derive from Further Education, converted to YYYY-MM-DD.

Student Record Return: Financial Support Entity

For each Instance entity, the Create Extract process can create up to four Financial Support entities when Country = England.

The Financial Support entity depends on the following instance fields for selecting data:

- Instance.FEELIG
- Instance.FUNDCODE
- Course.COURSEAIM

The process creates the extract records (SSR_HE_FS_EXT, SSR_HE_FS_EX_FL) only if you have selected the Include Student entities check box on the Create Extract Data page.

For each Instance (with a HUSID and NUMHUS) in the Instance Extract table that the process selects (that is, Instance with status of ACTIVE):

If the following conditions are all met, the process creates Financial Support entities based on the records defined in HESA Instance Data record:

- Country = England
- Instance.REDUCEDI = 00 or 01
- Instance.FEELIG = 1
- Instance.FUNDCODE = 1 or 7 or has no value
- Related Course.COURSEAIM begins with H (excluding H50, H60, H61, H62, H78 or H81), I (except I60, I61 or I81), J C or is M22, M26, M28, M71, M73, M88
- Instance.EXCHANGE is not 4, G or Z

If all the conditions are not met, a Financial Support entity is not required and the process skips to the next Instance.

Note: For England, the system derives the FUNDCODE only when Instance.FESTUMK is not 1 or 4. The system also checks whether the derived values are blank so that Financial Support entities can be derived when FESTUMK is 1 or 4.

Financial Support Amount (FINAMOUNT)

Return: Student Record

Entity: Financial Support

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance (Financial Support region)	Amount

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the HESA Instance page.

Note: Values to be returned in pounds (£).
A FINAMOUNT value is required to define a Financial Support record in HESA Instance record.

Financial Support Type (FINTYPE)

Return: Student Record

Entity: Financial Support

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance (Financial Support region)	Type

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the HESA Instance page.

Note: A FINTYPE value is required to define a Financial Support record in HESA Instance record.

Student Record Return: ITT Placement

The ITT Placement entity depends on the following instance fields to select data:

- Instance.ENTRYRTE

- Instance.REDUCEDI

The Create Extract process creates the extract records if you select the Include Student Entities check box on the Create Extract Data page.

If you do not select Retain Data from Previous Run, existing extract records are deleted regardless of their status.

For each instance (with a HUSID and NUMHUS) in the Instance Extract table that the process selects (that is, instance with status of ACTIVE), the following conditions must be met (Instance.ENTRYRTE is not null *and* Instance.REDUCEDI = 00, 01, or 04) so that:

- Placement entities are created based on the records defined for the most recent effective-dated HESA Instance Data record where the effective date is not after the reporting period end date, that is, not a future date.
- Only records with a Start Date that falls within the reporting period are selected.

If the conditions are not met, an ITT Placement entity is not required and the process skips to the next instance.

Number of days Spent in Placement School (PLMNTDYS)

Return: Student Record

Entity: ITT Placement

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance (ITT Placement region)	Days

Field Derivation Rule: Include for all Instance entities.

Derivation Steps: Derive value from HESA Instance page.

Placement School (PLMNTSCH)

Return: Student Record

Entity: ITT Placement

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance (ITT Placement region)	School URN

Field Derivation Rule: Include for all Instance entities.

Derivation Steps: Derive value from HESA Instance page.

Student Record Return: Placement

The ITT Placement entity depends on the Student entity. The Selection logic is as follows:

- If Retain Data from Previous Run is selected,
 - Delete any existing extract record for the Return with status *INACTIVE*.
 - Update any existing extract record for the Return with status of *ACTIVE*, then set its status to *INACTIVE*.
- If Retain Data from Previous Run is not selected, delete all existing extract records for the Return irrespective of status.
- For all Student entity records with status *ACTIVE*,
 - Placement entities are created based on the ITT Placement records (SSR_HE_INST_PLC) defined for the most recent effective-dated HESA Instance Data record, where the effective date is not beyond the reporting period end date (not a future reporting period). A maximum of 5 ITT Placement records can be defined in a HESA instance.
 - Only records with Start Dates that fall within the reporting period are selected.
 - No entities are created if relevant Placements records are not found.

Note: In the Student return, ITT Placement is only reported where ENTRYRTE = 01. The ITT return allows ENTRYRTE a subset of the codes allowed for the Student return: 01 (Provider-led), 02 (School Direct tuition fee), 03 (School Direct salaried), 09 (Undergraduate Opt-in).

The ITT Placement entity contains two fields.

Placement School

Return: ITT

Entity: ITT Placement

Page Used:

Page	Page Element
HESA Instance Data (ITT Placement)	School URN

Field Derivation Rule: Include for all Instance entities.

Derivation Step: Derive the value from the HESA Instance Data – ITT Placement.

Derivation Note: A required field on the page. Valid values are 1 to 999999.

Number of Days Spent in Placement School

Return: ITT

Entity: ITT Placement

Page Used:

Page	Page Element
HESA Instance Data (ITT Placement)	Days

Field Derivation Rule: Include for all Instance entities.

Derivation Step: Derive the value from the HESA Instance Data – ITT Placement.

Derivation Note: A required field on the page. Valid values are 1 to 999.

Student Record Return: Mobility Entity

For each Instance entity, the Create Extract process can create unlimited number of Mobility entities.

The process creates the mobility extract records (SSR_HE_MB_EXT, SSR_HE_MB_EX_FL) only if you have selected the Include Student entities check box on the Create Extract Data page.

If the Retain Data from Previous Run check box is selected on the Create Extract Data page, the process:

- Deletes any existing extract records for the return with status of INACTIVE.
- Updates any existing extract records for the return with status of ACTIVE and sets status of these records to INACTIVE.

If Retain Data from Previous Run is not selected, the process deletes existing extract records of any status for the return.

For each Instance (with a HUSID and NUMHUS) in the Instance Extract table for this run of the return (that is, with status of ACTIVE), if Instance.LOCSDY = T, U, or Z and Instance.REDUCEDI = 00 or 01:

- The process creates Mobility entities based on the records defined for the most recent effective dated HESA Instance Data record where the effective date is not after the reporting period end date (that is, not in future).
- The process selects only records that cover some or all of this reporting period based on the Mobility Start and End, where either:
 - The Start Date or the End Date falls within the reporting period
 - Or the Start Date is before the reporting period start date and the End Date is after the reporting period end date.
- The process selects only non-UK records whose location code is *not* XF, XG, XH, XI, XK, XL, JE, GG or IM.
- If either the Start Date or the End Date is outside of the reporting period (that is, overlapping) the process includes the record only if one of these conditions is met:
 - The duration in this reporting period is 25 days or more (that is, 4 weeks or more)

- The duration in this reporting period is less than 25 days and more than half of the total number of days are in this reporting period: That is, this is the major part of the duration, the minor part is in the next or previous period and will be added to this. If the major part is in the next or previous reporting period and the duration of this minor part is less than 24 days then the process does not include the record because those days will be added to the major part.
- The duration in this reporting period is less than 25 days and exactly half of the days are in this reporting period and the start date is in this reporting period. That is, for an exact split between periods where both parts are less than 25 days, the record is included in the first period only and all the days reported there.

For each Instance (with a HUSID and NUMHUS) in the Instance Extract table for this run of the return (that is, with status of ACTIVE), if Instance.LOCSDY is not equal to T or U and Instance.REDUCEDI is not equal to 00 or 01, then process does not create the Mobility entity and skips to the next Instance.

Mobility Duration (MOBDURA)

Return: Student Record

Entity: Mobility

Page Used:

<i>Page</i>	<i>Page Element</i>
Mobility (Records and Enrollment, Career and Program Information, HESA Instance Details, Mobility)	Start Date and End Date

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. If the Start and End Date both fall within the reporting period (that is, not overlapping), derive as the total number of days converted to weeks. Days are converted to weeks by dividing by 7 and rounding to the nearest week; 4 days is rounded up; 3 days is rounded down.
2. For overlapping records the total number of days is calculated as:
 - Number of days that fall in this reporting period. That is, days from the Start Date or reporting period start (whichever is later) until the End Date or reporting period end (whichever is earlier).
 - If the Start Date is before the reporting period and the number of days in the preceding period is between 1 and 24 inclusive, those days are added to the total.
 - If the End Date is after the reporting period and the total number of days in the following period is between 1 and 24 inclusive, those days are added to the total.

Derive as total number of days converted to weeks

Mobility Location (MOBLOCA)

Return: Student Record

Entity: Mobility

Page Used:

Page	Page Element
Mobility (Records and Enrollment, Career and Program Information, HESA Instance Details, Mobility)	Location

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Mobility page.

Mobility Scheme (MOBScheme)

Return: Student Record

Entity: Mobility

Page Used:

Page	Page Element
Mobility (Records and Enrollment, Career and Program Information, HESA Instance Details, Mobility)	Scheme

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Mobility page.

Mobility Type (MOBTYPE)

Return: Student Record

Entity: Mobility

Page Used:

Page	Page Element
Mobility (Records and Enrollment, Career and Program Information, HESA Instance Details, Mobility)	Type 1

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Mobility page.

Mobility Type (MOBTYPE2, MOBTYPE3)

Return: Student Record

Entity: Mobility

Page Used:

Page	Page Element
Mobility (Records and Enrollment, Career and Program Information, HESA Instance Details, Mobility)	Type 2 and Type 3

Field Derivation Rule: Include for all Instance entities.

Derivation Steps:

1. Derive from the Mobility page.
2. Do not derive a value and leave the field blank.

Aggregate Offshore Return: Institution Entity

The Create Extract process creates a single entity record for the institution with the RECID and UKRPN fields.

Record Type Indicator (RECID)

Return: Aggregate Offshore

Entity: Institution

Pages Used:

Page	Page Element
Reporting Period	Record Year
Returns	Record ID

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive as YYNNN, where YY is the final two digits of the Record Year (for example, 09 for 2009) and NNN is the 3-digit Record ID for the seeded return.
2. Derive as *NULL ERROR*.

For Aggregate Offshore Return, the Record ID must be 052. The Record ID is delivered with the CS updates of April 2009.

UK Provider Reference Number (UKPRN)

Return: Aggregate Offshore

Entity: Institution

Page Used:

Page	Page Element
HESA Configuration	UKPRN

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the HESA Returns page.
2. Derive as *NULL ERROR*.

Aggregate Offshore Return: Provision Entity

The Create Extract process creates Provision entities for Offshore plans and Offshore subplans. That is, the process selects only those subplans for which the Offshore Sub-Plan check box is selected on the Sub-Plan HESA page. If you have selected the Enable Sub-Plan Reporting check box on the HESA Returns page, the process selects only those subplans for which you have selected the Report to HESA and Offshore Sub-Plan check boxes on the Sub-Plan HESA Data page. Also, the process selects only those plans for which the Offshore Plan check box is selected on the Plan HESA Data page. If you have not selected the Enable Sub-Plan Reporting check box, the process selects only those plans for which you have selected the Report to HESA and Offshore Plan check boxes on the Plan HESA Data page.

Country of Activity (COUNTRY)

Return: Aggregate Offshore

Entity: Provision

Pages Used:

Page	Page Element
Plan HESA Data	COUNTRY
Sub-Plan HESA	COUNTRY

Field Derivation Rule: Include for all Provision entities.

Derivation Steps:

1. Use constant.
2. If Provision entity is based on a subplan, derive from the Sub-Plan HESA page.

3. Derive from the Plan HESA Data page.
4. Use default.
5. Derive as *NULL ERROR*.

Institutions Own Campus Identifier (INSTCAMP)

Return: Aggregate Offshore

Entity: Provision

Pages Used:

Page	Page Element
Campus (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Campus)	HESA Institutions Own Campus
Taxonomy/Campus (Set Up SACR > Foundation Tables > Academic Structure > Academic Program Table > Taxonomy/Campus)	Campus

Field Derivation Rule: Include for all Provision entities.

Derivation Steps:

1. Use constant.
2. If Provision entity is based on a subplan, select the associated program's campus from the Taxonomy/Campus page. Use the HESA Institutions Own Campus value mapped to the selected campus.
3. If Provision entity is based on a plan, select the associated program's campus from the Taxonomy/Campus page. Use the HESA Institutions Own Campus value mapped to the selected campus.
4. Use default.
5. Do not derive a value and leave the field blank.

Level of Provision (LEVEL)

Return: Aggregate Offshore

Entity: Provision

Pages Used:

Page	Page Element
Plan HESA Data	LEVEL
Sub-Plan HESA	LEVEL

Field Derivation Rule: Include for all Provision entities.

Derivation Steps:

1. Use constant.
2. If Provision entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Use default.
5. Derive as *NULL ERROR*.

Number of Students (HEADCOUNT)

Return: Aggregate Offshore

Entity: Provision

Field Derivation Rule: Include for all Provision entities.

Derivation Steps:

1. Derive this value by performing a similar selection as for the existing Instance return but restricting the selection to the plan and subplan of each Provision entity. The return will contain just the count. However, in the log file list each student included in the count including their EMPLID, and plan or subplan.
2. If students are not found, derive as *0*.

In the first step, the process includes students who have a plan or subplan that overlap the reporting period and have been enrolled; that is, the student either has a status of *Enrolled* or has an associated enrolled classes that the student enrolled on or before reporting period end date

Note: If the process does not return a HEADCOUNT value for the plan or subplan, include the student in the extract but do not include the student in the XML file.

Type of Activity (TYPE)

Return: Aggregate Offshore

Entity: Provision

Pages Used:

<i>Page</i>	<i>Page Element</i>
Plan HESA Data	TYPE
Sub-Plan HESA	TYPE

Field Derivation Rule: Include for all Provision entities.

Derivation Steps:

1. Use constant.
2. If Provision entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Use default.
5. Derive as *NULL ERROR*.

ITT Return: Institution Entity

The Create Extract process creates a single entity record for the institution with the RECID and UKRPN fields.

Record Type Indicator (RECID)

Return: ITT

Entity: Institution

Pages Used:

Page	Page Element
Reporting Period	Record Year
Returns	Record ID

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive as YYNNN, where *YY* is the final two digits of the Record Year (for example, 09 for 2009) and *NNN* is the 3-digit Record ID for the seeded return.
2. Derive as *NULL ERROR*.

For ITT Return, the Record ID is 053 which is delivered with Campus Solutions.

UK Provider Reference Number (UKPRN)

Return: ITT

Entity: Institution

Page Used:

Page	Page Element
HESA Configuration	UKPRN

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the HESA Returns page.
2. Derive as *NULL ERROR*.

ITT Return: Student Entity

The Create Extract process creates ITT Student entities only if all the following conditions are satisfied:

- Report to HESA check box is selected on the HESA Instance page for the HESA Instance record.
- The student's program commencement date is before or within the reporting period.
- Either: (a) the student has been term activated for a term that begins within the reporting period and the student has at least one enrolled class related to that term or (b) the student has an FTE value of greater than zero for the reporting period. The process determines the FTE value for the reporting period from the HESA Instance record as either the Override FTE value or else the Calculated FTE value.
- The most recent effective dated Student Program stack record has a Program Status matching one of the Eligible Program Statuses defined for the return on the HESA Returns page.
- If a subplan is selected as the run parameter, check that the Report to HESA check box is selected and the TTCID value is *1* for the subplan on the Sub-Plan HESA page.
- If subplan is not selected, check that the Report to HESA check box is selected and the TTCID value is *1* for the plan on the Plan HESA Data page or for the program on the Program HESA Data page.

Note: Students are not included in the return if TTCID is *0* (zero) or is one of the codes only relevant to the Student return (*5, 9, D, F, J, K*) or is blank or is *NULL ERROR*.

If all the conditions are satisfied, then the process create a record in the ITT Student Extract table with status set to ACTIVE using the following values:

- EMPLID
- HUSID: The process determines this value from External System ID record for the EMPLID, where the ID type is the same as that defined for HUSID on the HESA Types page. If HUSID does not exist, the process creates a new HUSID.
- NUMHUS (Student Instance Number): The process determines this value from the HESA Instance record as either Linked Career and Linked Career Number (if defined). Otherwise, it uses a combination of Career and Career Number as the NUHMUS value, that is ACAD_CAREER and STDNT_CAR_NBR. For example, UGRD1.
- COURSEID: If a sub-plan is selected as the run parameter, the process uses the Sub-Plan code as the COURSEID, If the subplan is not selected, the process uses the plan code.

If you provided an EMPLID for the Student ID run parameter, the process creates ITT Student entity records for only the selected EMPLID.

The Create Extract process selects External Degree records to derive the degree fields (such as DEGENDDT and DEGEST). If the student has multiple records, the process selects the most recent record.

If you have selected the Null Errors Only check box for the Include Student Entities on the Create Extract Data page, the process selects distinct EMPLIDs from the existing active ITT extract data, where at least one field in the Student or Course Subject extract data has a derived value of *NULL ERROR*. The process then selects Student entity records for these EMPLIDs.

If you have selected the Validation Errors Only check box for the Include Student Entities, the process first deletes any Validation Error staging records where EMPLID is blank. Then, it selects distinct EMPLIDs from the Validation Error staging table. The process selects Student entity records for these EMPLIDs. Finally, it deletes records from the Validation Error staging table where EMPLID is populated.

Allocated Place (ALLPLACE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	ALLPLACE

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive value from HESA Instance page.
3. Use default.
4. Derive as NULL ERROR.

Date of Birth (BIRTHDTE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Biographical Details (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details)	Date of Birth

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Biographical Details page in the format YYYY-MM-DD.
2. Derive as *NULL ERROR*.

Bursary Level Award (BURSLEV)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	BURSLEV

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Start Date of Instance (COMDATE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	Start Date of Instance

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If there is a Research Candidate record for the instance:
 - a. Select the Begin Date (SSR_RS_BEGIN_DT) from the most recent active Consumption record where the effective date is on or before the reporting period end date.
 - b. Derive the Begin Date formatted to YYYY-MM-DD.

- c. Match the Research Candidate record (SSR_RS_CAND_HDR) to the instance on EMPLID, Institution, Career and Career Number to find the Research Candidate Number (SSR_RS_CANDIT_NBR). If multiple records are found, the record with the highest candidate number is selected.
- d. Associate consumption records (SSR_RS_CONSMPTN) with the Research Candidate record by EMPLID, Institution and Research Candidate Number.

The calculated value is stored in the HESA Instance Data record.

3. Use the following process to calculate the earliest class start date for enrolled classes related to the Instance being reported. This selection is similar to that done for StudentOnModule except that it is not restricted to classes overlapping the reporting period and considers enrollments for linked careers.
 - a. Select all activated terms for the student career of the Instance.
 - b. From each activated term, select classes that satisfy the following conditions:
 - Status = *Enrolled*
 - Units Taken value is greater than zero.
 - Grading basis value matches one of the values defined in the Grading Basis Inclusion region with the Extract check box selected on the HESA Configuration page.
 - Repeat Code value does not exist or does not match a value defined in the Repeat Code Exclusion region with the Extract check box selected on the HESA Configuration page.
 - If the student has multiple careers with the same Academic Career value as the career being processed (that is, the same career value with different career numbers), then apply a further filter to the class enrollments. In such a case, select the class only if the program value of the enrollment record does not exist or matches one of the program values in the Student Program records for that career and career number.
 - c. If the Instance has been linked to a prior student career using the Linked Career and Linked Career Number fields in the HESA Instance record, then also consider classes for the previous career.
 - d. Derive the earliest Class Start Date from all the selected classes as COMDATE.
4. Derive as the earliest Effective Date of the HESA Instance records.

Course Identifier (COURSEID)

Return: ITT

Entity: Student

Pages Used: None

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. If subplan is being reported to HESA, derive as COURSEID from the Academic Sub-Plan Table record.
2. If plan is being reported to HESA, derive as COURSEID from the Academic Plan Table record.

Course Title (CTITLE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Plan HESA Data	Course Title
Sub-Plan HESA	HESA Course Title
Academic Plan Table (Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table)	Academic Plan
Academic Sub-Plan Table (Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table)	Academic Subplan

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive as the HESA Course Title value from the Sub-Plan HESA page.
2. If the Course Title field does not have a value, use a combination of the plan and subplan descriptions from the Academic Plan Table and Academic Sub-Plan Table pages (that is, .DESCR from PS_ACAD_PLAN_TBL + space + DESCR from PS_ACAD_SUBPLN_TBL).
3. Derive as the Course Title value from the Plan HESA Data page.
4. If the Course Title field does not have a value, use the plan description from the Academic Plan Table page (that is, DESCR from PS_ACAD_PLAN_TBL).

Course Mode (CRMODE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	CRMODE

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Convert the MODE value to a CRMODE value as follows: if MODE = 01, 02, 12, 13, 14, 23, 24, 25, 63 or 73, derive as 1 (full-time) else derive as 2 (part-time).
3. Do not derive a value and leave the field blank.

Previous Degree Country (DEGCTRY)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External Organization Location (Campus Community, Organization, Create/Maintain Organizations, Organization Locations, Location Details, Location History)	Country
Nationality (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Nationality)	HESA Nationality

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period
- Student.ITTAIM = 110, 113, 020, 027 or 031
- Student.DEGEST does not exist

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Derive from the External Organization Location page.

Select the most recent External Education Organization record with a Degree status of *complete* associated with the current reporting period. Select the most recent effective dated location record, if there are multiple records.

It is possible for the Ext Org to have multiple Location records with the same effective date. In this case, select the record with the lowest Location ID to determine the country.

Use the mapping on the Nationality page to derive as the mapped HESA Nationality code. Otherwise, derive as the COUNTRY_2CHAR value if the mapping does not exist.

2. Use default.
3. Derive as *NULL ERROR*.

The normal 2-character GB code is not valid for DEGCTRY. Therefore, if the value GB is derived, the system changes *GB* to the valid code *XX* (United Kingdom, not otherwise specified).

Previous Degree End Date (DEGENDDT)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Courses and Degrees (Student Admissions, Application/ Transcript Loads, Education, Courses and Degrees)	Degree Date

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period.
- Student.ITTAIM = 110, 113, 020 or 031.

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete associated with the current reporting period. Derive from the Courses and Degrees page for the selected record.
2. Use default.
3. Derive as *NULL ERROR*.

Previous Degree Establishment (DEGEST)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Region (Campus Community, Organization, Create/Maintain Organizations, Organization Table, Region)	HESA Degree Establishment

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period.
- Student.ITTAIM = 110, 113, 020, 027 or 031.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Select the most recent External Education Organization record associated with the current reporting period. Derive from the Region page for the selected record. Convert using 2-character code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL).
2. Use default.
3. Do not derive a value and leave the field blank.

Previous Degree Length in Years (DEGLENGTH)

Return: ITT

Entity: Student

Page Used: None

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period.
- Student.ITTAIM = 110, 113, 020 or 031.

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete associated with the current reporting period. Derive as Degree Date minus From Date from the External Education record. Convert number of days to years and round off to the nearest year.
2. Use default.
3. Derive as *NULL ERROR*.

The previous degree length is derived as the nearest number in whole years.

Previous Degree Start Date (DEGSTDT)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External Education (Student Admissions, Application/ Transcript Loads, Education, External Education)	From Date

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period.
- Student.ITTAIM = 110, 113, 020 or 031.

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete associated with the current reporting period. Derive from the External Education page for the selected record.
2. Use default.
3. Derive as *NULL ERROR*.

Previous Degree Type (DEGTYPE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Degree Table (Setup SACR, Foundation Tables, Academic Structure, Degree Table)	HESA Degree Type

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period.
- Student.ITTAIM = 110, 113, 020, 027 or 031.

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete associated with the current reporting period. Derive from the Degree Table page for the selected degree.
2. Use default.
3. Derive as *NULL ERROR*.

Disability (DISABLE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Person HESA Data	DISABLE

Page	Page Element
Impairment AUS (Campus Community > Personal Information > Health Information > Impairment AUS)	Type of Impairment
Disability (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Disability)	HESA Disability Code

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. If the student has a single impairment record, use the HESA Disability code from the mapping between the impairment type and the HESA disability code.
3. If the student has multiple mapped impairment records and all the records are mapped to a single HESA disability code, derive the HESA code.
4. If the student has multiple mapped impairment records and the records are mapped to more than one HESA disability code other than 00, 97, 98, or 99, then derive '08' (multiple disabilities).
5. If the student has multiple mapped impairment records and only one record is mapped to a HESA disability code other than 00, 97, 98, or 99, then derive as *NULL ERROR*.
6. If the student has multiple mapped impairment records and the records are all mapped to HESA disability codes 00, 97, 98, or 99, then derive the lowest mapped HESA code.

Note: Note: If all records are mapped to the same code, it is derived in step 3.

7. Use default.
8. Derive as *NULL ERROR*.

You can define a default as either *00* (no known disability) or *99* (not known).

Disabled Student Allowance (DISALL)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	DISALL
Impairment AUS (Campus Community, Personal Information, Health Information, Impairment AUS)	Support Services Request
Disability (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Disability)	HESA Disability Allowance

Field Derivation Rule: If related Student.DISABLE is between 02 and 96, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If the student has a Support Services Request value defined on the Impairment AUS page, use the mapped HESA Disability Allowance code from the Disability page.
4. Use default.
5. Derive as *NULL ERROR*.

Discretionary Funding (DISCFUND)

Return: ITT

Entity: Student

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	DISCFUND

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Use default.
4. Derive as *NULL ERROR*.

Note: DISCFUND is not derived when TTCID = 2. Valid values for DISCFUND are 1 (Received) and 2 (Not received).

Domicile (DOMICILE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Campus Community > Personal Information (Student) > Identification (Student) > Residency Data > Residency Self-Report	Residency Self-Report — State and Country
Entry Profile	DOMICILE

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Entry Profile page.
2. Select Residency Self-Report records. If the Country value is not GBR, then select the related two-character code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL).

If a mapping exists in the HESA Nationality/Domicile Mapping for the Campus Solutions Country code, use the mapped HESA value. Otherwise, use the COUNTRY_2CHAR code.

3. If a Residency Self-Report record exists, Country value is GBR, and State is defined, then map the Country and State to a HESA Country Code in the UCAS APR Mapping. Otherwise, log an error message and derive *XX*.

If State is not defined, report *XX*.

4. Use default.
5. Derive as NULL ERROR.

End Date of Instance (ENDDATE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason Effective Date
HESA Instance	ENDDATE
HESA Action Reasons	Reason for Ending Instance Mapping

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.

2. If the most recent effective dated Student Program record has Program Action/Reason values mapped to a HESA Reason for Ending Instance code on the HESA Action Reasons page, then derive the effective date of the record formatted to YYYY-MM-DD.
3. Do not derive a value, leave the field blank and set ReasonForNull = 9.

ITT Entry Route (ENTRYRTE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	ENTRYRTE
Plan HESA Data	ENTRYRTE
Sub-Plan HESA	ENTRYRTE
HESA Instance	ENTRYRTE

Field Derivation Rule: Include for all Student entities

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance page.
3. If Instance.COURSEID is based on a sub-plan, derive value from the Sub-Plan HESA page.
4. Derive value from Plan HESA Data page.
5. Derive value from Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

Ethnicity (ETHNIC)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Person HESA Data	ETHNIC

Page	Page Element
Ethnicity (Campus Community > Personal Information (Student) > Biographical (Student) > Personal Attributes > Ethnicity)	Regulatory Region, Ethnic Group
Ethnicity (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Ethnicity)	HESA Ethnic Code

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Select Person Ethnicity records as follows:
 - If a single record exists, use that record.
 - If multiple records exist and one is marked as Primary on the Campus Community Ethnicity page, use that record.
 - If multiple records exist and none are marked as Primary, select the record with the highest Percentage defined in the Ethnicity Detail page.
 - If multiple records are indistinguishable, select the lowest alphabetic Ethnic Group code.
 - For the selected record, use the HESA Ethnic code from the mapping between the Ethnic Group, Regulatory Region, and the HESA Ethnic code. If no mapping exists, log an error message and skip to next step.
3. Use default.
4. Derive as *NULL ERROR*.

Forenames (FNAMES)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details > Names)	First Name Middle Name

Note: The First Name page element can accept a maximum of 30 characters.

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use the First Name and Middle Name values from the Primary Name record.
2. Derive as NULL.

Fundability Code (FUNDCODE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	FUNDCODE
Plan HESA Data	FUNDCODE
Sub-Plan HESA	FUNDCODE
HESA Instance	FUNDCODE

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Student.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

HESA Unique Student Identifier (HUSID)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Step:

1. Select External System ID records for the person with the External ID Type defined for HUSID in the HESA Types page.
2. If HUSID is not found, calculate using the following method:
 - First 2 digits: Year of entry into institution (last 2 digits of year, for example, 09 for 2009).
 - Next 4 digits: HESA Institution Identifier + 1000 (for example, QUB = 0184 which becomes 1184).
 - Next 6 digits: 6-digit reference number internally allocated by institution (this is a sequence number, institutions may need to manually increase the sequence number to avoid reusing the same number in the same year of entry).
 - Last digit: Check digit
3. Derive as *NULL ERROR*.

Positive Indication that self-certification complete (INDSLFCRT)

Return: ITT

Entity: Student

Page Used:

<i>Page</i>	<i>Page Element</i>
Entry Profile	INDSLFCRT

Field Derivation Rule: If Student.COMDATE is in the current reporting period, derive a value. Otherwise, derive as *NULL ERROR*.

Derivation Step:

1. Derive from the Entry Profile page.
2. Use default.
3. Derive as *NULL ERROR*.

The system always returns a value, because the inclusion condition is always met and while selecting students for the extract, the system considers only those students for whom COMDATE is between reporting period start and end dates.

ITT Initiatives (INITIATIVES-ITT, INITIATIVES-ITT2)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	INITIATIVES-ITT, INITIATIVES-ITT2
Plan HESA Data (Plan Instance HESA Data)	INITIATIVES-ITT, INITIATIVES-ITT2
Sub-Plan HESA (Sub-plan Instance HESA Data)	INITIATIVES-ITT, INITIATIVES-ITT2
HESA Instance	INITIATIVES-ITT, INITIATIVES-ITT2

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If Instance.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Do not derive a value and leave the field blank.

Independent Safeguarding Authority Registration Number (ISANUM)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Determine from the External System ID records for the person with the External ID Type defined for ISANUM in the HESA Types page.
2. Do not derive a value and leave the field blank.

ITT Qualification Aim (ITTAIM)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	ITTAIM
Plan HESA Data	ITTAIM
Sub-Plan HESA	ITTAIM

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. If subplan is being reported, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Start Date of ITT Course (ITTCOMDATE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	ITTCOMDATE

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive as the same value as Student.COMDATE.

ITT Phase/Scope (ITTPHSC)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	ITTPhase/Scope
Plan HESA Data	ITTPhase/Scope
Sub-Plan HESA	ITTPhase/Scope
HESA Instance	ITTPhase/Scope

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Derive from the Sub-Plan HESA page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

ITT Schemes (ITTSCHMS)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	ITTSCHMS
Plan HESA Data	ITTSCHMS
Sub-Plan HESA	ITTSCHMS
HESA Instance	ITTSCHMS

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. Derive from the Sub-Plan HESA page.

4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as *NULL ERROR*.

Mode of Study (MODE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program Offering/Year HESA	MODE (Program Year HESA Data group box)
Plan Offering/Year HESA	MODE (Plan Year HESA Data group box)
Sub-Plan Offering/Year HESA	MODE (Sub-Plan Year Data group box)
Student Program	Program Action Action Reason
Student Program	Acad Load
HESA Instance	MODE
Mode of Study (Records and Enrollment > HESA Reporting > Codes and Mappings > Code Mappings > Mode of Study)	HESA Mode of Study
HESA Action Reasons	Change of Mode Mapping

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Select the Student Program record that has Program Action/Reason values mapped to a HESA Mode in the HESA Action Reasons page. Derive the mapped HESA mode value.

If the derived value is 73 or 74, convert 73 to 63 and 74 to 64.

If the derived value is 01, 12, 13, 14, 23, 24 or 25 (that is, a sandwich placement year), 43, 65, 66, 67, 68, 69, then convert as 01.

If the derived value is 02, derive as 02.

If the derived value is 31, 32, 33, 34, 35, 36, 37, 38, 39, 44, then convert as 31.

3. Select the academic load from the Student Program record. Derive the mapped HESA code for the selected academic load from the Mode of Study page.

If the derived value is 73 or 74, convert 73 to 63 and 74 to 64.

If the derived value is 01, 12, 13, 14, 23, 24 or 25 (that is, a sandwich placement year), 43, 65, 66, 67, 68, 69, then convert as 01.

If the derived value is 02, derive as 02.

If the derived value is 31, 32, 33, 34, 35, 36, 37, 38, 39, 44, then convert as 31.

4. Derive as *NULL ERROR*.

Major Source of Tuition Fees (MSTUFEE)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	MSTUFEE
Program Offering/Year HESA	MSTUFEE (Program Offering HESA Data group box)
Plan HESA Data	MSTUFEE
Plan Offering/Year HESA	MSTUFEE (Plan Offering HESA Data group box)
Sub-Plan HESA	MSTUFEE
Sub-Plan Offering/Year HESA	MSTUFEE (Sub-Plan Offering HESA Data group box)
HESA Instance	MSTUFEE

Field Derivation Rule: If Student.TTCID = G or Q, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Student.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance.
4. If Student.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance.
6. Derive from the Plan HESA Data page.

7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Derive as *NULL ERROR*.

Nationality (NATION)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Person HESA Data	NATION
Citizenship and Passport (Campus Community , Personal Information (Student), Identification (Student), Citizenship, Citizenship and Passport)	Country

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Select person citizenship records and retrieve the related two-character code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL). If a mapping exists in the HESA Nationality Code page for the Campus Solutions Country code, use the mapped HESA value else use the COUNTRY_2CHAR value.

If a single record exists, derive the Campus Solutions country code or HESA country code.
3. If multiple person citizenship records are found and a record has a value of *GB*, derive as *GB*.
4. If multiple records are found, and none have the *GB* country value but a minimum one record has a country value that is marked as European Union (EU) country then derive the EU country. If there are multiple EU countries report the one with the lowest alphabetic HESA code. Note that the PS_COUNTRY_TBL contains an indicator (EU_MEMBER_STATE) to specify if the country is a member of the EU.
5. If multiple records are found and none have the UK or EU value, select the lowest alphabetic code
6. Use default.
7. Derive as NULL.

In most cases, you can use the Campus Solutions two-character country code to report the NATION value. However, some Campus Solutions country codes are not valid for HESA reporting. For example, the Campus Solutions Cyprus code (CY) cannot be reported. Cyprus has to be reported as *XA*, *XB*, or *XC*.

In these cases, you must use the Nationality code mapping page to ensure the correct NATION values are reported to HESA.

National Identity (NATIOND)

Return: Student Record

Entity: Student

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	NATIOND

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default.
3. Derive as NULL.

National Identity (NATIOND2)

Return: Student Record

Entity: Student

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	NATIOND2

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Person HESA Data page.
2. Use default.
3. Derive as NULL.

National Insurance Number (NIN)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Determine from the External System ID records for the person with the External ID Type defined for NIN in the HESA Types page.
2. Do not derive a value and leave the field blank.

Email Addresses (NQTEMAIL)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Electronic Addresses	Email Address (preferred)

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from preferred email address defined for the student.
2. Derive as NULL.

Student Instance Identifier (NUMHUS)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	Instance Identifier Linked Career Linked Career Number Academic Career Student Career Nbr

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from HESA Instance page as Instance Identifier.
2. Derive from HESA Instance page as Linked Career + Linked Career Number.
3. Derive from HESA Instance page as Academic Career + Student Career Nbr, for example, UGRD1.

Institution's Own Identifier for Student (OWNSTU)

Return: ITT

Entity: Student

Pages Used: None

Field Derivation Rule: Include for all Student entities.

Derivation Step:

1. Derive as EMPLID.

Apprenticeship Start Date (PGAPPSTDT)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	PGAPPSTDT
Plan HESA Data (Plan Instance HESA Data)	PGAPPSTDT
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	PGAPPSTDT
HESA Instance Data	PGAPPSTDT

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Use the value from HESA Instance Data.
2. If COURSEID is based on a sub-plan, use the value from Sub-Plan Instance HESA Data.
3. Derive the value from Plan Instance HESA Data.
4. Derive the value from Program Instance HESA Data
5. Use the default value.

6. Derive as null.

PGCE Class of Undergraduate Degree (PGCECLSS)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Entry Profile	PGCECLSS

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period
- Student.ITTAIM = 110,113, 020, 027 or 031

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Derive as *NULL ERROR*.

PGCE Subject of Undergraduate Degree (PGCESBJ)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Entry Profile	PGCESBJ
	PGCESBJ2
	PGCESBJ3

Field Derivation Rule: Derive a value if the following conditions are met:

- Student.COMDATE is in the current reporting period
- Student.ITTAIM = 110,113, 020, 027 or 031

Derive as *NULL ERROR* if the conditions are not met.

Derivation Steps:

1. Use constant to create a single PGCESBJ field.
2. Derive from the Entry Profile page.
3. Use default to create a single PGCESBJ field.
4. Derive a single PGCESBJ field as *NULL ERROR* .

Note: The system can derive up to three values. Each of the values is included as a separate PGCESBJ field in the XML file.

Immediately Prior Surname (PSURNAME)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community, Personal Information (Student), Add/Update a Person, Biographical Details, Names)	Surname

Field Derivation Rule: If the student has at least one Instance with REDUCEDI = 00, 01, or 04 derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive the previous Last Name from the Primary Name Type History table. This is done by finding the most recent end dated record in which last name is different from the current one.
2. Do not derive a value and leave the field blank.

Qualification Aim (QLAIM)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Program HESA Data	QLAIM
Plan HESA Data	QLAIM
Sub-Plan HESA	QLAIM

Field Derivation Rule: Derive a value if Student.ITTAIM = 202.

Derivation Steps:

1. Use constant.
2. If a sub-plan is reported, derive value from Sub-Plan HESA page.
3. Derive value from Plan HESA Data page.
4. Derive value from Program HESA Data page.
5. Use default.
6. Derive as NULL ERROR.

Reason for Ending Instance (RSNEND)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Student Program	Program Action Action Reason
HESA Action Reasons	Reason for Ending Instance Mapping

Field Derivation Rule: If Student.ENDDATE is completed, derive a value. Otherwise, derive as *NULL ERROR*.

Derivation Steps:

1. Derive from the HESA Instance page.
2. If the most recent effective dated Student Program record has Program Action/Reason values mapped to a HESA Reason for Ending Instance code on the HESA Action Reasons page, then derive the mapped HESA code value.
3. Derive as *NULL ERROR*.

School Direct Employing School (SDEMPLOY)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	SDEMPLOY

Page	Page Element
Plan HESA Data (Plan Instance HESA Data)	SDEMPLOY
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	SDEMPLOY
HESA Instance Data	SDEMPLOY

Field Derivation Rule: If all the following conditions are met, derive a value:

- Student.ENTRYRTE = 03 or 10
- Student.MODE is not 63 or 64

All School Direct trainees should be associated with a lead school. When the lead school does not have a unique reference number (URN), these generic codes are used:

- 900000 — Establishments outside England and Wales
- 900010 — Not applicable nor available

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance Data.
3. If COURSEID is based on a sub-plan, derive from Sub-Plan Instance HESA Data.
4. Derive from Plan Instance HESA Data.
5. Derive from Program Instance HESA Data.
6. Use default.
7. Derive as *NULL ERROR*.

School Direct Lead School (SDLEAD)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	SDLEAD
Plan HESA Data (Plan Instance HESA Data)	SDLEAD
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	SDLEAD
HESA Instance Data	SDLEAD

Field Derivation Rule: If all the following conditions are met, derive a value:

- Student.ENTRYRTE = 02, 03, or 10
- Student.MODE is not 63 or 64

All School Direct trainees should be associated with a lead school. When the lead school does not have a unique reference number (URN), these generic codes are used:

- 900000 — Establishments outside England and Wales
- 900010 — Not applicable nor available

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance Data.
3. If COURSEID is based on a sub-plan, derive from Sub-Plan Instance HESA Data.
4. Derive from Plan Instance HESA Data.
5. Derive from Program Instance HESA Data.
6. Use default.
7. Derive as *NULL ERROR*.

Service Leavers (SERLEAVE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance Data	SERLEAVE

Dependant Fields: COMDATE, ITTCOMDATE

Field Derivation Rule: Derive if either COMDATE or ITTCOMDATE is after 2018-07-31. If not, derive as null.

Derivation Steps:

1. Derive the value from the HESA Instance Data page.
2. Use the default.
3. Derive as null.

Sex Identifier (SEXID)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Biographical Details (Campus Community , Personal Information (Student), Add/Update a Person, Biographical Details)	Gender
Gender (Records and Enrollment, HESA Reporting, Codes and Mappings, Code Mappings, Gender)	HESA Identifier
Campus Community, Personal Information, Add/ Update a Person, HESA Student Data Campus Community, Personal Information, Add/Update a Person, HESA Restricted Data	SEXID

Field Derivation Rule: Include for all Student entities.

Derivation Step:

1. Derive from Person HESA Data.
2. Select the Gender value from the Biographical History record. Derive as the mapped HESA value for the selected Gender value.
3. If no mapping is found, then derive as
 - If the gender value is Male, derive as *1*.
 - If the gender value is Female, derive as *2*.
4. Use default.
5. Derive as *NULL ERROR*.

Family Name on 16th Birthday (SNAME16)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community, Personal Information (Student), Add/Update a Person, Biographical Details, Names)	Last Name

Note: The Last Name page element can accept a maximum of thirty characters.

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use the Last Name value from the Primary Name record. The last name must have a Type of Name value that corresponds with the Name Type set for SNAME16 on the HESA Types page.
2. Do not derive a value and leave the field blank.

Expected Length of Study (SLENGTH)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	SLENGTH
Program Offering/Year HESA	SLENGTH (Program Offering HESA Data group box)
Plan HESA Data	SLENGTH
Plan Offering/Year HESA	SLENGTH (Plan Offering HESA Data group box)
Sub-Plan HESA	SLENGTH
Sub-Plan Offering/Year HESA	SLENGTH (Sub-Plan Offering HESA Data group box)
HESA Instance	SLENGTH

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Student.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session and Campus are all blank are considered.
4. If Student.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.

8. Derive from the Program HESA Data page.
9. Use default.
10. Do not derive a value, leave the field blank and set ReasonForNull = 9 .

Family Name (SURNAME)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community, Personal Information (Student), Add/Update a Person, Biographical Details, Names)	Last Name

Note: The Last Name page element can accept a maximum of thirty characters.

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use the Last Name value from the Primary Name record.
2. Derive as *NULL ERROR*.

Title (TITLE)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details > Names)	Name Title

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use the Name Title value from the Primary Name record.
2. Do not derive a value, leave the field blank, and set ReasonForNull = 9.

Teacher Reference Number (TREFNO)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for TREFNO in the HESA Types page.
2. Use default.
3. Do not derive a value and leave the field blank.

Teacher Training Course (TTCID)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	TTCID
Plan HESA Data	TTCID
Sub-Plan HESA	TTCID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.

Unique Learner Number (ULN)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
External System ID	External System ID

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Select External System ID records for the person with the External ID Type defined for ULN in the HESA Types page.

Validate the derived value using the checksum method. For information on the checksum method, refer to the Notes section for the ULN field available on the HESA website.

2. Do not derive a value and leave the field blank.

Units of Length (UNITLGTH)

Return: ITT

Entity: Student

Pages Used:

Page	Page Element
Program HESA Data	UNITLGTH
Program Offering/Year HESA	UNITLGTH (Program Offering HESA Data group box)
Plan HESA Data	UNITLGTH
Plan Offering/Year HESA	UNITLGTH (Plan Offering HESA Data group box)
Sub-Plan HESA	UNITLGTH
Sub-Plan Offering/Year HESA	UNITLGTH (Sub-Plan Offering HESA Data group box)
HESA Instance	UNITLGTH

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Instance page.
3. If Student.COURSEID is based on a subplan, derive from the Sub-Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session and Campus are all blank are considered.

4. If Student.COURSEID is based on a subplan, derive from the Sub-Plan HESA page.
5. Derive from the Plan Offering/Year HESA page for the academic load of the student instance. Only records where Offering Start Term, Offering Start Session and Campus are all blank are considered.
6. Derive from the Plan HESA Data page.
7. Derive from the Program Offering/Year HESA page for the academic load of the student instance.
8. Derive from the Program HESA Data page.
9. Use default.
10. Do not derive a value, leave the field blank and set ReasonForNull = 9.

Year of Program (YEARPRG)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	Year of Program

Field Derivation Rule: Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.
2. Use default.
3. Derive as *NULL ERROR*.

Year of Student on This Instance (YEARSTU)

Return: ITT

Entity: Student

Page Used:

Page	Page Element
HESA Instance	Year of Student

Include for all Student entities.

Derivation Steps:

1. Derive from the HESA Instance page.

2. Use default.
3. Derive as *NULL ERROR*.

ITT Return: Placement

The ITT Return Placement entity depends on the Student entity.

The Create Extract process creates the extract records if you select the Include Student Entities check box on the Create Extract Data page. If you do not select Retain Data from Previous Run, existing extract records are deleted regardless of their status.

The process creates up to five Placement entities for each Student entity based on the ITT Placement records defined for the HESA Instance Data record. Only records with a Start Date in the reporting period are reported.

If the conditions are not met, an ITT Placement entity is not required and the process skips to the next instance.

Note: In the Student Return, ITT Placement is only reported where ENTRYRTE = 01. In the ITT Return, ENTRYRTE allows a subset of codes: 01 (Provider-led), 02 (School Direct tuition fee), 03 (School Direct salaried), 09 (Undergraduate Opt-in).

Placement School (PLMNTSCH)

Return: Student Record

Entity: ITT Placement

Page Used:

Page	Page Element
HESA Instance (ITT Placement region)	School URN

Field Derivation Rule: Include for all Instance entities.

Derivation Steps: Derive value from HESA Instance page.

Number of days Spent in Placement School (PLMNTDYS)

Return: Student Record

Entity: ITT Placement

Page Used:

Page	Page Element
HESA Instance (ITT Placement region)	Days

Field Derivation Rule: Include for all Instance entities.

Derivation Steps: Derive value from HESA Instance page.

ITT Return: Course Subject Entity

The Create Extract process creates a maximum of five Course Subject entity records for each Student entity.

Subject of ITT Course (SBJCA)

Return: ITT

Entity: Course Subject

Pages Used:

Page	Page Element
Program HESA Data — HECoS Subjects	Subject ITT Subject
Plan HESA Data — HECoS Subjects	Subject ITT Subject
Sub-Plan HESA — HECoS Subjects	Subject ITT Subject

Field Derivation Rule: Include for all Course Subject entities.

Derivation Steps:

1. Use constant.
2. If Course entity is based on a sub-plan, derive from the Sub-Plan HESA — HECoS Subjects page.
3. Derive from the Plan HESA Data — HECoS Subjects page.
4. Derive from the Program HESA Data — HECoS Subjects page.
5. Use default.
6. Derive as *NULL ERROR*.

For steps 2, 3, or 4, the process:

- Chooses the records that have the ITT Subject check box selected.
- Determines the main subject by choosing the record with the greatest percentage, if multiple records have the ITT Subject check box selected.

- Determines the main subject by choosing the first record in the alphabetical code order, if multiple records have the ITT Subject check box selected and have the same percentage.

ITT Return: Previous Qualification

A Previous Qualification entity is created if the following conditions are met:

- Student.COMDATE is in the current reporting period
- Any one of the following conditions is true:
 - Student.QLAIM = 020, 021, or 031
 - Student.ENTRYRTE = 04, 05, or 08
 - Student.TTCID = 1 and Student.ITTAIM = 201

The most recent External Education Degree record that is associated with the current reporting period and whose status is *Complete* is used in the derivation.

Note: While five entities are allowed by the schema, only a single entry is created because only one value can be recorded for FIRSTDEG, PGCECLSS, and PGCESBJ in HESA Entry Profile.

Bursary Flag (BURSFLAG)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Entry Profile	BURSFLAG

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Use constant.
2. Derive from the Entry Profile page.
3. Use default.
4. Derive as NULL.

Previous Degree Country (DEGCTRY)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
External Organization Location (Campus Community >Organization >Create/Maintain Organizations >Organization Locations >Location Details >Location History)	Country

Field Derivation Rule: Derive a value if Student.DEGEST does not exist.

Derivation Steps:

1. Derive from the External Organization Location page.

Select the most recent External Education Organization record with a Degree status of complete associated with the current reporting period. Select the most recent effective dated location record, if there are multiple records.

It is possible for the Ext Org to have multiple Location records with the same effective date. In this case, select the record with the lowest Location ID to determine the country.

Use the mapping on the Nationality page to derive as the mapped HESA Nationality code. Otherwise, derive as the COUNTRY_2CHAR value if the mapping does not exist.

2. Use default.
3. If COMDATE is in the reporting period and QLAIM = 020, 021, or 031, derive as NULL ERROR.
4. Derive as NULL.

The normal two-character GB code is not valid for DEGCTRY. If the value 'GB' is derived, the system changes GB to the valid code XK (United Kingdom, not otherwise specified).

Previous Degree End Date (DEGENDDT)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Courses and Degrees (Student Admissions >Application/ Transcript Loads >Education >Courses and Degrees)	Degree Date

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete that is associated with the current reporting period. Derive from the Courses and Degrees page for the selected record.
2. Use default.
3. If COMDATE is in the reporting period and and QLAIM = 020, 021, or 031, derive as NULL ERROR.
4. Derive as NULL.

Previous Degree Establishment (DEGEST)

Return: ITT

Entity: Previous Qualification

Pages Used:

<i>Page</i>	<i>Page Element</i>
Student Admissions >Application Maintenance >Maintain Applications >Application Program Data At the bottom of the page, Transfer to Education, then click Go.	
Region (Campus Community >Organization > Create/Maintain Organizations > Organization Table >Region	HESA Degree Establishment

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Select the most recent External Education Organization record associated with the current reporting period. Derive from the Region page for the selected record. Convert using the two-character code (COUNTRY_2CHAR) from the Country table (PS_COUNTRY_TBL).
2. Use default.
3. Derive as NULL.

Previous Degree Length in Years (DEGLENGTH)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Student Admissions >Application Maintenance >Maintain Applications >Application Program Data At the bottom of the page, Transfer to Education, then click Go.	From Date Degree Date

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete that is associated with the current reporting period. Derive as Degree Date minus From Date from the selected record. The number of days is converted to years and rounded to the nearest year.
2. Use default.
3. If COMDATE is in the reporting period and and QLAIM = 020, 021, or 031, derive as NULL ERROR.
4. Derive as NULL.

Previous Degree Subject (DEGSBJ, DEGSBJ2, PGCESBJ3)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Entry Profile	DEGSBJ DEGSBJ2 PGCESBJ3

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Use constant to derive a single DEGSBJ field.
2. Derive values from Entry Profile page.
3. Use default to derive a single DEGSBJ field.
4. If COMDATE is in the reporting period and and QLAIM = 020, 021, or 031, derive as a single DEGSBJ field as NULL ERROR.
5. Derive as NULL.

Note: The system can derive up to three values. Each of the values is included as a separate DEGSBJ field in the XML file.

Previous Degree Start Date (DEGSTDT)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Student Admissions >Application Maintenance >Maintain Applications >Application Program Data At the bottom of the page, Transfer to Education, then click Go.	From Date

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Select the most recent External Education Degree record with a Degree status of complete that is associated with the current reporting period. Derive from the Education page for the selected record.
2. Use default.
3. If COMDATE is in the reporting period and and QLAIM = 020, 021, or 031, derive as NULL ERROR.
4. Derive as NULL.

Previous Degree Type (DEGTYPE)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Student Admissions >Application Maintenance >Maintain Applications >Application Program Data At the bottom of the page, Transfer to Education, then click Go.	
Setup SACR >Foundation Tables >Academic Structure >Degree Table	HESA Degree Type

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Derive the Previous Degree Type by mapping the most recent External Education Degree record with a Degree status of complete from the External degree region to the Degree Type value from the Degree Table.
2. Use default.
3. If COMDATE is in the reporting period and and QLAIM = 020, 021, or 031, derive as NULL ERROR.
4. Derive as NULL.

First Degree Flag (FIRSTDEG)

Return: ITT

Entity: Previous Qualification

Pages Used: None

Page	Page Element
Entry Profile	FIRSTDEG

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Derive value from the Entry Profile page.
2. If DEGTYPE is in the range 001 to 098, or is 400 or 402, derive as *01*.
3. Derive as *02*.

PGCE Class of Undergraduate Degree (PGCECLSS)

Return: ITT

Entity: Previous Qualification

Pages Used:

Page	Page Element
Entry Profile	PGCECLSS

Note: This value is included as DEGCLSS in the XML file.

Field Derivation Rule: Include for all Previous Qualification entities.

Derivation Steps:

1. Use constant.

2. Derive value from Entry Profile page.
3. Use default.
4. If COMDATE is in the reporting period and and QLAIM = 020, 021, or 031, derive as NULL ERROR.
5. Derive as NULL.

Data Futures Return: Course Delivery Entity

This entity is used to report each distinct delivery of a course based on a Start Date and Expected End Date.

Plan and Sub-Plan Offering HESA Data records are selected from the most recent non-future effective dated record, that is, effective date is on or before the reporting period end date to create Course Delivery entities. Only records with an Offering Start Term are considered.

As with Course entities, initially all records are selected before the data is compared with what has already been reported to HESA. This is to determine if the record should be returned as a new record or is an update to an existing record. This means that older Course Delivery records continue to be extracted unless the offering is removed from the most recent effective dated record in Plan or Sub-Plan.

Course Delivery extract records are created if the Include Course Entities check box has been selected.

Bilingual ITT Marker (BITTM)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	BITTM
Plan HESA Data	BITTM
Plan Offering HESA Data	BITTM
Sub-Plan HESA Data	BITTM
Sub-Plan Offering HESA Data	BITTM

Field Derivation Rule: Derive a value if all the conditions are met:

- Country = Scotland or Northern Ireland
- CourseDelivery.TTCID = 01 or 02

Derivation Steps:

1. Use constant.
2. If COURSEID is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
3. If Course entity is based on a sub-plan, derive from the Sub-Plan HESA Data page.
4. Derive from the Plan Offering HESA Data page.
5. Derive from the Plan HESA Data page.
6. Derive from the Program HESA Data page.
7. Use default.
8. Derive as NULL ERROR.

Bridging Course (BRIDGECRS)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	BRIDGE
Plan HESA Data	BRIDGE
Plan Offering HESA Data	BRIDGE
Sub-Plan HESA Data	BRIDGE
Sub-Plan Offering HESA Data	BRIDGE

Field Derivation Rule: If the related Qualification.QUALCAT = H0018, I0012, J0011, or C0008, derive a value.

Derivation Steps:

1. Use constant.
2. If COURSEID is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
3. If COURSEID is based on a sub-plan, derive from the Sub-Plan HESA Data page.
4. Derive from the Plan Offering HESA Data page.
5. Derive from the Plan HESA Data page.
6. Derive from the Program HESA Data page.
7. Use default.

8. Derive as NULL ERROR.

Closed Course (CLSDCRS)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	CLSDCRS
Plan HESA Data	CLSDCRS
Plan Offering HESA Data	CLSDCRS
Sub-Plan HESA Data	CLSDCRS
Sub-Plan Offering HESA Data	CLSDCRS

Field Derivation Rule: Include where country = ENGLAND

Derivation Steps:

1. Use constant.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
3. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data page.
4. If parent Course is based on a Plan, derive from the Plan Offering HESA Data page.
5. Derive from the Plan HESA Data page.
6. Derive from the Program HESA Data page.
7. Use default.
8. Derive as NULL ERROR.

Course Delivery Type (COURSEDELIVERYTITLE)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Plan HESA Data	Course Title

Page	Page Element
Plan Offering HESA Data	Offering Title
Sub-Plan HESA	Course Title
Sub-Plan Offering HESA Data	Offering Title

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
2. If parent Course is based on a Plan, derive from the Plan Offering HESA Data page.
3. If the Course entity is based on a sub-plan, derive as:
 - Course Title from Sub-Plan HESA Data page (if defined)
 - Combination of Plan and Sub-Plan descriptions separated by a space
4. Derive from Academic Plan.
 - Course Title from the Plan HESA Data page (if defined)
 - Plan description

Course Delivery Mode Type (COURSEDELMODETYPE)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Plan Offering HESA Data	Academic Load
Sub-Plan Offering HESA Data	Academic Load

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive Academic Load on the Sub-Plan Offering HESA Data page mapped to mode type.
2. If parent Course is based on a Plan, derive Academic Load on the Plan Offering HESA Data page mapped to mode type.

- Derive as NULL ERROR.

Course Delivery Start Date (COURSESTARTDATE)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Plan Offering HESA Data	Offering Start Term Offering Start Session COURSESTARTDATE
Sub-Plan Offering HESA Data	Offering Start Term Offering Start Session COURSESTARTDATE

Field Derivation Rule: Include for all entities

Derivation Steps:

- If parent Course is based on a sub-plan, derive COURSESTARTDATE on the Sub-Plan Offering HESA Data page.
- If parent Course is based on a sub-plan, derive date attribute for the Offering Start Session from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
- If parent Course is based on a sub-plan, derive Session Begin Date for the Offering Start Session from Sub-Plan Offering HESA Data converted to YYYY-MM-DD format.
- If parent Course is based on a sub-plan, derive date attribute for the Offering Start Term from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
- If parent Course is based on a sub-plan, derive Term Begin Date for Offering Start Term from Sub-Plan Offering HESA Data converted to YYYY-MM-DD format.
- If parent Course is based on a plan, derive COURSESTARTDATE from Plan Offering HESA Data.
- If parent Course is based on a plan, derive date attribute for the Offering Start Session from Plan Year HESA Data converted to YYYY-MM-DD format.
- If parent Course is based on a plan, derive Session Begin Date for the Offering Start Session from Plan Offering HESA Data converted to YYYY-MM-DD format.
- If parent Course is based on a plan, derive date attribute for Offering Start Term from Plan Year HESA Data converted to YYYY-MM-DD format.

10. If parent Course is based on a plan, derive Term Begin Date for Offering Start Term from Plan Offering HESA Data converted to YYYY-MM-DD format.

Course Delivery Type (COURSEDELTYPEID)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	COURSEDELTYPEID
Plan HESA Data	COURSEDELTYPEID
Plan Offering HESA Data	COURSEDELTYPEID
Sub-Plan HESA Data	COURSEDELTYPEID
Sub-Plan Offering HESA Data	COURSEDELTYPEID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
3. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data page.
4. If parent Course is based on a Plan, derive from the Plan Offering HESA Data page.
5. Derive from the Plan HESA Data page.
6. Derive from the Program HESA Data page.
7. Use default.
8. Derive as NULL ERROR.

Expected End Date (EXPECTEDENDDATE)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Plan Offering HESA Data	Offering End Term Offering End Session EXPECTEDENDDATE
Sub-Plan Offering HESA Data	Offering End Term Offering End Session EXPECTEDENDDATE

Field Derivation Rule: Include where COUNTRY = England or Scotland

Derivation Steps:

1. If parent Course is based on a sub-plan, derive EXPECTEDENDDATE from the Sub-Plan Offering HESA Data page.
2. If parent Course is based on a sub-plan, derive as the date attribute defined for the Offering End Session converted to YYYY-MM-DD format.
3. If parent Course is based on a sub-plan, derive Session End Date for the Offering End Session from Sub-Plan Offering HESA Data converted to YYYY-MM-DD format.
4. If parent Course is based on a sub-plan, derive as the date attribute defined for the Offering End Term converted to YYYY-MM-DD format.
5. If parent Course is based on a sub-plan, derive Term End Date for Offering End Term from Sub-Plan Offering HESA Data converted to YYYY-MM-DD format.
6. If parent Course is based on a Plan, derive EXPECTEDENDDATE from the Plan Offering HESA Data page.
7. If parent Course is based on a Plan, derive as the date attribute defined for the Offering End Session converted to YYYY-MM-DD format.
8. If parent Course is based on a Plan, derive Session End Date for the Offering End Session from Plan Offering HESA Data converted to YYYY-MM-DD format.
9. If parent Course is based on a Plan, derive as the date attribute defined for the Offering End Term converted to YYYY-MM-DD format.
10. If parent Course is based on a Plan, derive Term End Date for Offering End Term from Plan Offering HESA Data converted to YYYY-MM-DD format.
11. Derive as NULL ERROR.

Qualification Identifier (QUALID)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	Qualification ID
Plan HESA Data	Qualification ID
Plan Offering HESA Data	Qualification ID
Sub-Plan HESA Data	Qualification ID
Sub-Plan Offering HESA Data	Qualification ID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data page.
3. If parent Course is based on a Plan, derive from the Plan Offering HESA Data page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

Sandwich (SANDWICHCD)

Return: Data Futures

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	SANDWICHCD
Plan HESA Data	SANDWICHCD
Plan Offering HESA Data	SANDWICHCD
Sub-Plan HESA Data	SANDWICHCD
Sub-Plan Offering HESA Data	SANDWICHCD

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data page.
3. If parent Course is based on a Plan, derive from the Plan Offering HESA Data page.
4. Derive from the Plan HESA Data page.
5. Derive from the Program HESA Data page.
6. Use default.
7. Derive as null.

Teacher Training Course (TTCID)

Return: Student Record

Entity: Course Delivery

Pages Used:

Page	Page Element
Program HESA Data	TTCID
Plan HESA Data	TTCID
Plan/Offering HESA Data	TTCID
Sub-Plan HESA	TTCID
Sub-Plan/Offering HESA Data	TTCID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. If Course entity is based on a subplan, derive from the Sub-Plan/Offering HESA Data page.
3. If Course entity is based on a subplan, derive from the Sub-Plan HESA page.
4. Derive from the Plan/Offering HESA Data page.
5. Derive from the Plan HESA Data page.
6. Derive from the Program HESA Data page.
7. Use default.
8. Derive as *NULL ERROR*.

Data Futures Return: Curriculum Accreditation Entity

Curriculum accreditation extract records are created if the Include Course Entities on the Create Extract Data page is selected. For each Course Delivery entity in the extract for the return with an active status:

- If the CourseDelivery.COURSEID is derived from a sub-plan, an entity is created for each eligible record when:
 - at least one eligible accreditation is defined for the sub-plan offering and has an accreditation ID code. The derivation step for ACCREDITATIONID is set to 1.
 - at least one eligible accreditation is defined for the sub-plan and has an accreditation ID code. The derivation step for ACCREDITATIONID is set to 2.
 - at least one eligible accreditation is defined for the parent plan and has an accreditation ID code. The derivation step for ACCREDITATIONID is set to 4.
 - the parent plan is associated with an academic program and at least one eligible accreditation exists for the program and has an accreditation ID. The derivation step for ACCREDITATIONID is set to 5.
- If the CourseDelivery.COURSEID is derived from a plan, an entity is created for each eligible record when:
 - at least one eligible accreditation is defined for the plan offering and has an accreditation ID code. The derivation step for ACCREDITATIONID is set to 3.
 - at least one eligible accreditation is defined for the plan and has an accreditation code. The derivation step for ACCREDITATIONID is set to 4.
 - the parent plan is associated with an academic program and at least one eligible accreditation for the program and has an accreditation ID. The derivation step for ACCREDITATIONID is set to 5.

Accreditation Identifier (ACCREDITATIONIDCA)

Return: Data Futures

Entity: Curriculum Accreditation

Pages Used:

<i>Page</i>	<i>Page Element</i>
Program HESA Data — Accreditation	Accreditation ID
Plan HESA Data — Accreditation	Accreditation ID
Sub-Plan HESA Data — Accreditation	Accreditation ID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If Course entity is based on a sub-plan, derive from the Sub-Plan Offering HESA Data.
2. If Course entity is based on a sub-plan, derive from the Sub-Plan HESA Data.
3. Value from Plan Offering HESA Data.
4. Value from Plan HESA Data.
5. Value from Program HESA Data.

Data Futures Return: Course Delivery Reference Entity

This entity reports the same values reported in Course.OWNCOURSEID in Student Return and KISCourse.UCASPROGID and CourseLocation.UASCOURSEID in the Unistats return. Course Identifier extract records are created if the Include Course Entities check box has been selected.

OWNCOURSEID appears in HESA Data and Sub-Plan HESA Data. The other fields appear in KIS Course Data.

Extract records are created if the 'Include Course entities' parameter has been selected. For each Course Delivery entity in the extract for the return with status of ACTIVE:

- If the CourseDelivery.COURSEID is derived from a Sub-Plan:
 - If OWNCOURSEID is defined for the Sub-Plan Offering, Sub-Plan, or parent Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 01.
 - If UCASPROGID is defined for the Sub-Plan Offering, Sub-Plan, or parent Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 02.
 - If UCASCOURSEID is defined for the Sub-Plan Offering, Sub-Plan, or parent Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 03.
 - If UCASCOURSEID2 is defined for the Sub-Plan Offering, Sub-Plan, or parent Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 03.
 - If UCASCOURSEID3 is defined for the Sub-Plan Offering, Sub-Plan, or parent Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 03.
 - If none of the fields are defined for Sub-Plan Offering, Sub-Plan, or Plan, entities aren't created.
- If the CourseDelivery.COURSEID is derived from a Plan:
 - If OWNCOURSEID is defined for the Plan Offering or Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 01.
 - If UCASPROGID is defined for the Plan Offering or Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 02.
 - If UCASCOURSEID is defined for the Plan Offering or Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 03.

- If UCASCOURSEID2 is defined for the Plan Offering or Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 03.
- If UCASCOURSEID3 is defined for the Plan, a Course Identifier entity is created with COURSEDELREFRNCIDTYPE = 03.
- If none of the fields are defined for the Plan, entities aren't created.

Course Delivery Reference Identifier (COURSEDELREFRNCID)

Return: Student Record

Entity: Course Delivery Reference

Pages Used:

Page	Page Element
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	OWNCOURSEID
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASPROGID
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASCOURSEID
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASCOURSEID2
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASCOURSEID3

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If Course entity is based on a sub-plan, derive Code from the Sub-Plan/Offering HESA Data page.
2. If Course entity is based on a sub-plan, derive Code from the Sub-Plan HESA page.
3. Derive Code from the Plan/Offering HESA Data page.
4. Derive Code from the Plan HESA Data page.

Course Delivery Reference Identifier Type (COURSEDELREFRNCIDTYPE)

Return: Student Record

Entity: Course Delivery Reference

Pages Used:

Page	Page Element
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	OWNCOURSEID
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASPROGID
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASCOURSEID
Plan HESA Data Plan/Offering HESA Data Sub-Plan HESA Sub-Plan/Offering HESA Data	UCASCOURSEID2

Page	Page Element
Plan HESA Data	UCASCOURSEID3
Plan/Offering HESA Data	
Sub-Plan HESA	
Sub-Plan/Offering HESA Data	

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If Course entity is based on a sub-plan, derive from the Sub-Plan/Offering HESA Data page.
 - OWNCOURSEID = 01
 - UCASPROGID = 02
 - UCASCOURSEID, UCASCOURSEID2, UCASCOURSEID3 = 03
2. If Course entity is based on a sub-plan, derive from the Sub-Plan HESA page.
 - OWNCOURSEID = 01
 - UCASPROGID = 02
 - UCASCOURSEID, UCASCOURSEID2, UCASCOURSEID3 = 03
3. Derive from the Plan/Offering HESA Data page.
 - OWNCOURSEID = 01
 - UCASPROGID = 02
 - UCASCOURSEID, UCASCOURSEID2, UCASCOURSEID3 = 03
4. Derive from the Plan HESA Data page.
 - OWNCOURSEID = 01
 - UCASPROGID = 02
 - UCASCOURSEID, UCASCOURSEID2, UCASCOURSEID3 = 03

Data Futures Return: Course Delivery Initiative Entity

For each Course Delivery extract record, an entity is created if INITIATIVEIDCDI has a value defined at the Sub-Plan Offering, Sub-Plan, Plan Offering, Plan, or Program level. In each case, the latest record where the effective date falls on or before the reporting period end date is considered.

Course Delivery Initiative (INITIATIVEIDCDI)

Return: Data Futures

Entity: Course Delivery Initiative

Pages Used:

Page	Page Element
Program HESA Data	INITIATIVEIDCDI
Plan HESA Data	INITIATIVEIDCDI
Plan/Offering HESA Data	INITIATIVEIDCDI
Sub-Plan HESA	INITIATIVEIDCDI
Sub-Plan/Offering HESA Data	INITIATIVEIDCDI

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan/Offering HESA Data page.
2. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan HESA page.
3. If parent Course Delivery is based on a plan, derive value from the Plan/Offering HESA page.
4. Derive value from the Plan HESA Data page.
5. Derive value from the Program HESA Data page.

Data Futures Return: Course Delivery Role Entity

For each Course Delivery extract record, an entity is created for each Role defined at the Sub-Plan Offering, Sub-Plan, Plan Offering, Plan, or Program level. In each case the latest record where the effective date falls on or before the reporting period end date is considered. If no Roles are defined at any level, a single entity is derived using any default field values defined for the entity in Returns Setup. If no Roles are defined and no default values are defined, a single entity is derived with NULL ERROR values for HESAID and ROLETYPE.

HESA Identifier (HESAIDCDR)

Return: Data Futures

Entity: Course Delivery Role

Pages Used:

Page	Page Element
Program HESA Data — Roles	Identifier
Plan HESA Data — Roles	Identifier
Plan/Offering HESA Data — Roles	Identifier
Sub-Plan HESA — Roles	Identifier
Sub-Plan/Offering HESA Data — Roles	Identifier

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan/Offering HESA Data page.
2. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan HESA page.
3. If parent Course Delivery is based on a plan, derive value from the Plan/Offering HESA page.
4. Derive value from the Plan HESA page.
5. Derive value from the Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

Role Type (ROLETYPECDR)

Return: Data Futures

Entity: Course Delivery Role

Pages Used:

Page	Page Element
Program HESA Data — Roles	Type
Plan HESA Data — Roles	Type
Plan/Offering HESA Data — Roles	Type
Sub-Plan HESA — Roles	Type
Sub-Plan/Offering HESA Data — Roles	Type

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan/Offering HESA Data page.
2. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan HESA page.
3. If parent Course Delivery is based on a plan, derive value from the Plan/Offering HESA page.
4. Derive value from the Plan HESA page.
5. Derive value from the Program HESA Data page.
6. Use default.
7. Derive as NULL ERROR.

Course Delivery Role Proportion (CDRPROPORTION)

Return: Data Futures

Entity: Course Delivery Role

Pages Used:

Page	Page Element
Program HESA Data — Roles	Percentage
Plan HESA Data — Roles	Percentage
Plan/Offering HESA Data — Roles	Percentage
Sub-Plan HESA — Roles	Percentage
Sub-Plan/Offering HESA Data — Roles	Percentage

Field Derivation Rule: Derive a value if CourseDeliveryRole.ROLETYPE = 201, 202, 304, 305, or 401.

Derivation Steps:

1. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan/Offering HESA Data page if the value is greater than zero.
2. If parent Course Delivery is based on a sub-plan, derive value from the Sub-Plan HESA page if the value is greater than zero.
3. If parent Course Delivery is based on a plan, derive value from the Plan/Offering HESA page if the value is greater than zero.
4. Derive value from the Plan HESA page if the value is greater than zero.
5. Derive value from the Program HESA Data page if the value is greater than zero.
6. Use default.
7. If ROLETYPE = 202 or 401, derive as NULL ERROR.

8. Derive as null.

Data Futures Return: Course Delivery Venue Entity

Course Delivery Venue extract records are created if the ‘Include Course entities’ parameter has been selected.

For each Course Delivery entity in the extract for the return, entities are created if there are any associated CourseSession entities in the extract or master where these conditions are true:

- CourseSession.DISTANCELEARNING is not equal to 01
- CourseSession.PLACEMENT is not equal to 01
- CourseSession.STUDYABROAD is not equal to 01

If a constant value is defined for VENUEID in HESA Returns Setup, a single entity is created using that value in Step 1. One or more entities are created based on Venue records defined for the Course Delivery in either Sub-Plan Offering or Plan Offering HESA Data with derivation steps 2 or 5. In there are no venues defined for the Course Delivery in Offering HESA Data, a single entity is created based either on the Campus defined for the Offering, the default Campus defined for the parent Program, or from the default VENUEID defined in HESA Returns Setup.

Venue Identifier (VENUEID)

Return: Data Futures

Entity: Course Delivery Venue

Pages Used:

Page	Page Element
Sub-Plan/Offering HESA Data	Campus
Sub-Plan/Offering HESA Data — Venues	Venue ID
Plan/Offering HESA Data — Venues	Venue ID
Plan/Offering HESA Data	Campus
Academic Program	Campus
HESA Returns Setup — Fields	Constant, Default

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive constant value defined in HESA Returns Setup.

2. If the Course Delivery is derived from a sub-plan/offering, derive value from the Sub-Plan/Offering HESA Data — Venues page.
3. If the Course Delivery is derived from a sub-plan/offering, Campus is defined in sub-plan/offering, and Campus code is mapped to a Venue ID in the Campus Mapping, derive Venue ID.
4. If the Course Delivery is derived from a sub-plan/offering, the parent Academic Plan is associated with an Academic Program, and the default Campus for the Academic Program is mapped to a Venue ID in Campus Mapping, derive Venue ID.
5. If the Course Delivery is derived from a plan offering, derive value from the Plan/Offering HESA Data — Venues page.
6. If the Course Delivery is derived from a plan offering, Campus is defined in plan offering, and Campus code is mapped to a Venue ID in Campus Mapping, derive Venue ID.
7. If the Course Delivery is derived from a plan/offering, the parent Academic Plan is associated with an Academic Program, and the default Campus for the Academic Program is mapped to a Venue ID in Campus Mapping, derive Venue ID.
8. Derive default value in HESA Returns Setup.

Data Futures Return: Course Session Entity

This entity reports each distinct year for each delivery of a course based on a Start Date and Expected End Date.

Plan Year and Sub-Plan Year HESA Data records are selected from the most recent non-future effective dated record, that is, the effective date is on or before the reporting period end date to create Course Session entities.

As with Course and Course Delivery entities, initially all records will be selected before the data is compared with what has already been reported to HESA. This is to determine if the record should be returned as a new record or is an update to an existing record. This means that older Course Sessions continue to be extracted unless the Year is removed from the most recent effective dated record in Plan or Sub-Plan.

Course Session extract records are created if the Include Course Entities check box has been selected.

Distance Learning (DISTANCELEARNING)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Program HESA Data	DISTANCELEARNING
Plan HESA Data	DISTANCELEARNING

Page	Page Element
Plan Offering HESA Data	DISTANCELEARNING
Plan Year HESA Data	DISTANCELEARNING
Sub-Plan HESA Data	DISTANCELEARNING
Sub-Plan Offering HESA Data	DISTANCELEARNING
Sub-Plan Year HESA Data	DISTANCELEARNING

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Year HESA Data.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data.
3. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data.
4. If parent Course is based on a plan, derive from the Plan Year HESA Data.
5. If parent Course is based on a plan, derive from the Plan Offering HESA Data.
6. Value from Plan HESA Data
7. Value from Program HESA Data
8. Use default.
9. Derive as null.

Foundation Year (FOUNDYEAR)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Plan Year HESA Data	FOUNDYEAR
Sub-Plan Year HESA Data	FOUNDYEAR

Field Derivation Rule: Include where Country = England or Northern Ireland

Derivation Steps:

1. Use constant.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Year HESA Data page.

3. If parent Course is based on a Plan, derive from the Plan Year HESA Data page.
4. Use default.
5. Derive as NULL ERROR.

Funding Level (FUNDINGLEVEL)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Program HESA Data	FUNDINGLEVEL
Plan HESA Data	FUNDINGLEVEL
Plan Offering HESA Data	FUNDINGLEVEL
Plan Year HESA Data	FUNDINGLEVEL
Sub-Plan HESA Data	FUNDINGLEVEL
Sub-Plan Offering HESA Data	FUNDINGLEVEL
Sub-Plan Year HESA Data	FUNDINGLEVEL

Field Derivation Rule: Include where Country = England or Northern Ireland

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Year HESA Data page.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data page.
3. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data page.
4. If parent Course is based on a Plan, derive from the Plan Year HESA Data page.
5. If parent Course is based on a Plan, derive from the Plan Offering HESA Data page.
6. Derive from the Plan HESA Data page.
7. Derive from the Program HESA Data page.
8. Use default.
9. Derive as NULL ERROR.

Placement (PLACEMENT)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Program HESA Data	PLACEMENT
Plan HESA Data	PLACEMENT
Plan Offering HESA Data	PLACEMENT
Plan Year HESA Data	PLACEMENT
Sub-Plan HESA Data	PLACEMENT
Sub-Plan Offering HESA Data	PLACEMENT
Sub-Plan Year HESA Data	PLACEMENT

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Year HESA Data.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data.
3. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data.
4. If parent Course is based on a plan, derive from the Plan Year HESA Data.
5. If parent Course is based on a plan, derive from the Plan Offering HESA Data.
6. Value from Plan HESA Data
7. Value from Program HESA Data
8. Use default.
9. Derive as null.

Course Session End Date (SESSIONENDDATE)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Plan Year HESA Data	Year Term Year Session SESSIONENDDATE
Sub-Plan Year HESA Data	Year Term Year Session SESSIONENDDATE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course Delivery is based on a sub-plan, derive SESSIONENDDATE from the Sub-Plan Year HESA Data.
2. If parent Course Delivery is based on a sub-plan and the year is not defined as Final, derive as the SESSIONSTARTDATE plus 361 days.
3. If parent Course Delivery is based on a sub-plan and the year is defined as Final, derive as the date attribute defined for the Year Term converted to YYYY-MM-DD format.
4. If parent Course Delivery is based on a sub-plan and the year is defined as Final, derive Term End Date for Year Term from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
5. If parent Course Delivery is based on a Plan, derive SESSIONENDDATE from the Plan Year HESA Data.
6. If parent Course Delivery is based on a Plan, derive as the SESSIONSTARTDATE plus 361 days.
7. If parent Course Delivery is based on a Plan, derive as the date attribute defined for the Year Term converted to YYYY-MM-DD format.
8. If parent Course Delivery is based on a Plan, derive Term End Date for Year Term from Plan Year HESA Data converted to YYYY-MM-DD format.

Course Session Start Date (SESSIONSTARTDATE)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Plan Year HESA Data	Year Term Year Session SESSIONSTARTDATE

Page	Page Element
Sub-Plan Year HESA Data	Year Term Year Session SESSIONSTARTDATE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive SESSIONSTARTDATE from the Sub-Plan Year HESA Data.
2. If parent Course is based on a sub-plan, derive date attribute for the Year Session from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
3. If parent Course is based on a sub-plan, derive Session Begin Date for the Year Session from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
4. If parent Course is based on a sub-plan, derive date attribute for the Year Term from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
5. If parent Course is based on a sub-plan, derive Term Begin Date for Year Term from Sub-Plan Year HESA Data converted to YYYY-MM-DD format.
6. If parent Course is based on a Plan, derive SESSIONSTARTDATE from the Plan Year HESA Data converted to YYYY-MM-DD format.
7. If parent Course is based on a Plan, derive date attribute for the Year Session from Plan Year HESA Data converted to YYYY-MM-DD format.
8. If parent Course is based on a Plan, derive Session Begin Date for the Year Session from Plan Year HESA Data converted to YYYY-MM-DD format.
9. If parent Course is based on a Plan, derive date attribute for Year Term from Plan Year HESA Data converted to YYYY-MM-DD format.
10. If parent Course is based on a Plan, derive Term Begin Date for Year Term Plan Year HESA Data converted to YYYY-MM-DD format.
11. Derive as NULL ERROR.

Study Abroad (STUDYABROAD)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Program HESA Data	STUDYABROAD
Plan HESA Data	STUDYABROAD
Plan Offering HESA Data	STUDYABROAD
Plan Year HESA Data	STUDYABROAD
Sub-Plan HESA Data	STUDYABROAD
Sub-Plan Offering HESA Data	STUDYABROAD
Sub-Plan Year HESA Data	STUDYABROAD

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Year HESA Data.
2. If parent Course is based on a sub-plan, derive from the Sub-Plan Offering HESA Data.
3. If parent Course is based on a sub-plan, derive from the Sub-Plan HESA Data.
4. If parent Course is based on a plan, derive from the Plan Year HESA Data.
5. If parent Course is based on a plan, derive from the Plan Offering HESA Data.
6. Value from Plan HESA Data
7. Value from Program HESA Data
8. Use default.
9. Derive as null.

Programme Year (YEARPRG)

Return: Data Futures

Entity: Course Session

Pages Used:

Page	Page Element
Plan Year HESA Data	Year of Program
Sub-Plan Year HESA Data	Year of Program

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If parent Course is based on a sub-plan, derive from the Sub-Plan Year HESA Data page.
2. If parent Course is based on a plan, derive from the Plan Year HESA Data page.

Data Futures Return: Module Entity

If you select the Include Module Entities check box on the Create Extract Data page, the Create Extract process creates the Module entities. To create Module entities, the process uses the institution's Course Offering records that are active and have been set up as eligible for reporting to HESA. You must select the Report to HESA check box on the HESA Module Data page to make a course offering record eligible for HESA reporting.

If HESA Module Data records do not exist, the process does not include the course offerings in the Module entity. The process includes dummy modules in the module entity.

Note: When you run the Create Extract process, you can choose to enter the course ID or course offering number as a run parameter for testing purposes. The Create Extract process then uses the specified course ID or course offering number to create the Module entities.

If you have selected an academic career and no course offering on the Create Extract Data page, then the process selects only those course offerings that are related to the selected career.

If you have selected the Null Errors Only check box for the Include Module Entities on the Create Extract Data page, the Create Extract process selects distinct MODID values from the existing active Module extract data, where at least one field in the Module or Module Subject extract data has a Derived Value of *NULL ERROR*. The process then selects Module entity records for these MODIDs.

If you have selected the Validation Errors Only check box for the Include Module Entities, the Create Extract process first deletes any Validation Error staging records where all of the COURSEID, MODID and EMPLID fields are blank. Then, it selects distinct MODID values from the Validation Error staging table for rows where MODID is not blank and EMPLID is blank. The process selects Module entity records for these MODIDs. Note that the File Parser process removes the leading zeroes from MODID, therefore, the comparison of MODID with Course ID and Course Offering Number includes the logic to correctly match the values. The system makes an assumption that the Course Offering Number is a single digit. Finally, the Create Extract process deletes records from the Validation Error staging table where MODID is populated and EMPLID is blank.

Credit Value of Module (CRDTPTS)

Return: Data Futures

Entity: Module

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Data	CRDTPTS
Catalog Data (Curriculum Management, Course Catalog, Catalog Data)	Maximum Units, Academic Progress Units, Enrollment Unit Load Calc Type

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the HESA Module Data page.
2. Select the Course Catalog record for the Course ID. If the Enrollment Unit Load Calc Type value is *Academic Progress Units*, derive from the Academic Progress Units value. If the Enrollment Unit Load Calc Type value is any other value, derive from the Maximum Units value. Round off the fractional values to the nearest whole number. This step is not performed for dummy modules.
3. Use default.
4. Derive as null.

Credit Transfer Scheme (CRDTSCM)

Return: Data Futures

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	CRDTSCM

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Module FTE (FTE)

Return: Data Futures

Entity: Module

Page Used:

Page	Page Element
HESA Module Data	FTE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as *NULL ERROR*.

Level of Credit Points (LEVLPTS)

Return: Data Futures

Entity: Module

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Data	LEVLPTS
HESA Dummy Module	LEVLPTS

Field Derivation Rule: If Module.CRDTPTS is greater than zero, derive a value.

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data page.
3. Use default.
4. Derive as null.

Mark Scheme (MARKSCHEME)

Return: Data Futures

Entity: Module

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Data	MARKSCHEME

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Value from HESA Module Data.
2. Use default.

3. Derive as null.

Data Futures Return: Module Subject Entity

If you select the Include Module Entities check box on the Create Extract Data page, the Create Extract process selects HECoS subjects from the most recent effective dated record that falls on or before the reporting period end date from the HESA Module or HESA Dummy Module page. If one or more subjects are found, Module Subject entities are created using the key structure of the Module Extract record, and the derivation step for each field is set to 2. If Module Subjects aren't found for the course offering, a Module Subject record is created using steps 1, 3, and 4.

Subject Identifier (MODSBJ)

Return: Data Futures

Entity: Module Subject

Page Used:

Page	Page Element
HESA Module Data (HECoS Subjects)	Subject

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data — HECoS Subjects page.
3. Use Default.
4. Derive as *NULL ERROR*.

Module Proportion (MODPROPORTION)

Return: Data Futures

Entity: Module Subject

Page Used:

Page	Page Element
HESA Module Data (HECoS Subjects)	Percentage

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. Derive from the HESA Module Data — HECoS Subjects page.
3. Use Default.
4. Derive as *NULL ERROR*.

Data Futures Return: Module Delivery Entity

Module Delivery entities are created based on the scheduled enrollment class sections for each course offering (reported in Module) that overlaps the reporting period. (Curriculum Management >Schedule of Classes >Maintain Schedule of Classes)

For dummy modules, (years of program) a Module Delivery entity is created for each related term that overlaps the reporting period. (Curriculum Management >Course Catalog >HESA Dummy Module Details)

For each entity, the:

- MODID is populated as per the parent Module entity, that is, Course ID and Course Offering Number for non-dummy modules.
- MODDELID is generated and used to make the link between the Module Delivery and each related student Module Instance. Classes that overlap rather than just those that start within the reporting period is used to handle updates to values for Module Delivery entities that were previously reported (for example, change to end date).

The MODDELID unique identifier is generated as:

- MODID + Term + Session Code + Class Section for course offerings.
- MODID + Term for dummy modules.

Language Identifier (LANGUAGEIDMD)

Return: Data Futures

Entity: Module Delivery

Page Used:

Page	Page Element
HESA Module Data	LANGUAGEID

Field Derivation Rule: Include where Country = Northern Ireland, Scotland, or Wales

Derivation Steps:

1. Derive value from the HESA Module Data page.

2. Use default.
3. Derive as null.

Module Start Date (MODSTARTDATE)

Return: Data Futures

Entity: Module Delivery

Page Used:

Page	Page Element
Maintain Schedule of Classes (Curriculum Management >Schedule of Classes)	Start Date
Term/Session Table (Set Up SACR >Foundation Table >Setup, Term/Session Table)	Term Begin Date
Term Table > CAF Attributes	Date attribute for start of attendance
Returns Setup > Common Attributes	Common Attributes

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module is based on a Course Offering, derive Start Date for the Class Section as YYYY-MM-DD.
2. If the parent Module is a dummy module, derive date attribute for the term as YYYY-MM-DD.
3. If the parent Module is a dummy module, derive Term Begin Date for the term as YYYY-MM-DD.

Module End Date (MODENDDATE)

Return: Data Futures

Entity: Module Delivery

Page Used:

Page	Page Element
Maintain Schedule of Classes (Curriculum Management >Schedule of Classes)	End Date
Term/Session Table (Set Up SACR >Foundation Table >Setup, Term/Session Table)	Term End Date
Maintain Schedule of Classes > Associated Class Attributes (Curriculum Management >Schedule of Classes)	Date attribute for end of assessment

Page	Page Element
Term Table > CAF Attributes	Date attribute for end of assessment
Returns Setup > Common Attributes	Common Attributes

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module is based on a Course Offering, derive date attribute for the Class Section as YYYY-MM-DD.
2. If the parent Module is based on a Course Offering, derive date attribute for the Term as YYYY-MM-DD.
3. If the parent Module is based on a Course Offering, derive End Date for the Class Section as YYYY-MM-DD.
4. If the parent Module is a dummy module, derive date attribute for the term as YYYY-MM-DD.
5. If the parent Module is a dummy module, derive Term End Date for the term as YYYY-MM-DD.

Data Futures Return: Module Delivery Role Entity

For each Module Delivery entity in the extract, entities are created based on any Roles defined in HESA Module Details (for Module Delivery entities based on enrollment class sections) or HESA Dummy Module Details (for Module Delivery entities based on dummy modules or terms).

If no Roles are defined, entities aren't created. This doesn't consider default values that are defined in HESA Returns Setup because entities are only required where another provider is involved in the Module Delivery.

The unique identifier is generated as MODDELID of the parent Module Delivery + ROLETYPMDR + HESAIDMDR.

HESA Identifier (HESAIDMDR)

Return: Data Futures

Entity: Module Delivery Role

Page Used:

Page	Page Element
HESA Module Details — Roles	Identifier
HESA Dummy Module Details — Roles	Identifier

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module Delivery is based on a Course Offering, derive the value from Role in HESA Module Details.
2. If the parent Module Delivery is based on a dummy module, derive the value from Role in HESA Dummy Module Details.

Role Type (ROLETYPEMDR)

Return: Data Futures

Entity: Module Delivery Role

Page Used:

Page	Page Element
HESA Module Details — Roles	Type
HESA Dummy Module Details — Roles	Type

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module Delivery is based on a Course Offering, derive the value from Role in HESA Module Details.
2. If the parent Module Delivery is based on a dummy module, derive the value from Role in HESA Dummy Module Details.

Module Delivery Role Proportion (MDRPROPORTION)

Return: Data Futures

Entity: Module Delivery Role

Page Used:

Page	Page Element
HESA Module Details — Roles	Percentage
HESA Dummy Module Details — Roles	Percentage

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module Delivery is based on a Course Offering, derive the value from Role in HESA Module Details.

2. If the parent Module Delivery is based on a dummy module, derive the value from Role in HESA Dummy Module Details.

Venue Identifier (VENUEID)

Return: Data Futures

Entity: Module Delivery Role

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Details — Roles	Venue ID
HESA Dummy Module Details — Roles	Venue ID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module Delivery is based on a Course Offering, derive the value from Role in HESA Module Details.
2. If the parent Module Delivery is based on a dummy module, derive the value from Role in HESA Dummy Module Details.
3. Derive as null.

Data Futures Return: Module Delivery Location Entity

For each Module Delivery entity in the extract, entities are created based on any Venues defined in HESA Module Details (for Module Delivery entities based on enrollment class sections) or HESA Dummy Module Details (for Module Delivery entities based on dummy modules or terms).

Entities are created only if there are no related ModuleDeliveryRole entities in the extract for the Module Delivery. If venues aren't defined, entities aren't created.

There are no fields to report placement, study abroad, or distance learning for a Module Delivery so that isn't included in the entity selection logic.

Venue Identifier (VENUEID)

Return: Data Futures

Entity: Module Delivery Location

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Details — Venues	Venue ID
HESA Dummy Module Details — Venues	Venue ID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module Delivery is based on a Course Offering, derive the value from Venues in HESA Module Details.
2. If the parent Module Delivery is based on a dummy module, derive the value from Venues in HESA Dummy Module Details.

Module Delivery Location Proportion (MDLPROPORTION)

Return: Data Futures

Entity: Module Delivery Location

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Details — Venues	Percentage
HESA Dummy Module Details — Venues	Percentage

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the parent Module Delivery is based on a Course Offering, derive the value from Venues in HESA Module Details.
2. If the parent Module Delivery is based on a dummy module, derive the value from Venues in HESA Dummy Module Details.

Data Futures Return: Module Cost Centre Entity

For each Module Delivery entity in the extract, an entity is created for each unique cost centre value defined in HECoS Subjects in the most recent effective dated HESA Module or HESA Dummy Module record on or before the reporting period end date. If there are multiple records for the same COSTCN value, the Percentage values are totalled for COSTCNPROPORTION.

HESA Cost Centre (COSTCN)

Return: Data Futures

Entity: Module Cost Centre

Page Used:

Page	Page Element
HESA Module Data	HECoS Subjects — Cost Centre
HESA Dummy Module Data	HECoS Subjects — Cost Centre

Field Derivation Rule: Include for all entities

Derivation Steps: Derive value from HESA Module Data — HECoS Subjects.

HESA Cost Centre Proportion (COSTCNPROPORTION)

Return: Data Futures

Entity: Module Cost Centre

Page Used:

Page	Page Element
HESA Module Data	HECoS Subjects — Percentage
HESA Dummy Module Data	HECoS Subjects — Percentage

Field Derivation Rule: Include for all entities

Derivation Steps: Derive value from HESA Module Data — HECoS Subjects. If there are multiple records for the same COSTCN value, the Percentage values are added up for COSTCNPROPORTION.

Data Futures Return: Module Instance Entity

Module Instance entities are created in a similar way to Student On Module, that is, based on enrolled or dropped Student Enrollment records for activated terms for the career where the class section dates overlap the reporting period. Each Module Instance is linked to a Module Delivery by MODDELID and has a unique identifier, MODINSTID.

For each Student Course Session entity in the extract:

- For each activated term for the related Student Career, select classes from Student Enrollment (STDNT_ENRL) with:
 - One or more of the following based on Class Section dates from CLASS_TBL or from OEE dates are appropriate: Start Date or End Date in the reporting period, or Start Date prior to reporting period and End Date after reporting period, or Grade In/Official has a value and Grade Date is in the reporting period.
 - Status (STDNT_ENRL_STATUS) = E (Enrolled) or D (Dropped).

- Units Taken (UNT_TAKEN) is greater than zero or FTE is greater than zero for the associated HESA Module.
- Grading Basis (GRADING_BASIS_ENRL) matches one of the values defined in the “Grading Basis Inclusion” region with the Extract check box selected in HESA Configuration, e.g. GRD (Graded).
- Repeat Code (REPEAT_CODE) is blank or is not defined in the Repeat Code Exclusion region with the Extract check box selected in HESA Configuration.
- Enrollment Action Reason (ENRL_ACTN_RSN_LAST) is blank or is not defined in Drop Reason Exclusion region with the Extract checkbox selected in HESA Configuration.
- If the student has multiple careers with the same Academic Career value as the career being processed (i.e. the same career value with different career numbers) then a further filter is applied to the Class enrollments. In that case a Class is only included if the program (ACAD_PROG) of the enrollment record (in STDNT_ENRL) matches one of the programs in the Student Program records for that career/career number.
- For each record determine the MODID and validate.

Determine MODID as concatenation of Course ID plus Course Offering Number from the related Course Offering record.

Validate that the MODID exists in the Module Extract record for the return or the Module Master record for the institution.

If the MODID does not exist, the record is excluded and a message is logged.

- For each record determine the MODDELID as per Module Delivery and validate.

MODID + Session Term + Session Code + Class Section.

Validate that the MODDELID exists in the Module Delivery Extract records for the return or the Module Delivery Master records for the institution.

If the MODDELID does not exist, the record is excluded and a message is logged.

- For each valid record, entities are created using the key structure of the parent Student Course Session extract record along with the MODINSTID (see below) and MODDELID.

MODINSTID is generated as the SCSESSIONID plus MODDELID.

- If one or more Module Instance entities have been created (i.e. some class enrollments have been included) and either the derived PREDICTEDFTE or derived STULOAD in the extract for Student Course Session is greater than zero, or there is a FullTimeEquivalence entity in the extract or master with a derived FTE greater than zero.
- The combination of the student’s Plan and Year of Program (from the derived YEARPRG for the related Course Session) is used to form the MODID and this value is checked against the Module Extract and Module Master records to verify that the combination exists as a dummy module.

If the student’s sub-plan is being reported the parent Plan is used to create a dummy record.

- If the MODID is not included in the Module Extract or Module Master, or Year of Program was not determined, an entity isn't created.
- If the “Always Include” check box is selected in HESA Dummy Module Detail:
 - The most recent activated term for the student where the term overlaps the reporting period is selected, a single Module Instance entity is created using MODID.
 - MODDELID is derived as per the Module Delivery: MODID + Session Term
 Otherwise, if “Always Include” is not selected, an entity isn't created.
- If no Module Instance entities have been created and either the derived PREDICTEDFTE or derived STULOAD in the extract for Student Course Session is greater than zero, or there is a FullTimeEquivalence entity in the extract, or master with a derived FTE greater than zero:
 - The combination of the student's Plan and Year of Program is used to form the MODID and this value is checked against the Module Extract and Module Master records to verify that the combination exists as a dummy module. If the student's sub-plan is being reported, the parent Plan is used to create a dummy record.
 - If the MODID is not included in the Module extract or Module Master, or Year of Program was not determined, an entity isn't created and a message is logged.
 - Otherwise, MODID is valid and Year of Program has a value.
 - The most recent activated term for the student where the term overlaps the reporting period is selected, then a single Module Instance entity is created using MODID.
 - MODDELID is derived as per the Module Delivery: MODID + Session Term.

Module Start Date (MODULESTARTDATE)

Return: Data Futures

Entity: Module Instance

Page Used:

Page	Page Element
Records and Enrollment > Enroll Students > Student OEE Enrollment Data	Start Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the entity is based on an OEE enrollment and the OEE Start Date is different from the MODSTARTDATE reported for the related Module Delivery, derive the date in YYYY-MM-DD format.

2. Derive as null.

Module Instance Proportion (MIPROPORTION)

Return: Data Futures

Entity: Module Instance

Page Used: None

Field Derivation Rule: If the following conditions are met, derive a value:

- Country = England or Northern Ireland
- The related CourseDelivery.COURSEDELTYPEID is not 03.

Derivation Steps:

1. Derive as the related Module.FTE from the extract or master record.
2. Derive as null.

Data Futures Return: Module Outcome Entity

For each dummy Module Instance entity in the return, a Module Outcome entity is created if the related ModuleDelivery.MODENDDATE is in the reporting period.

For each non-dummy Module Instance entity in the return, a Module Outcome entity is created if either the Grade Date is in the reporting period or the Drop Date is in the reporting period for dropped enrollments.

Language Percentage (LANGPCNT)

Return: Data Futures

Entity: Module Outcome

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Module Data	LANGUAGEID

Field Derivation Rule: Derive a value if the Module Delivery related to the parent Module Instance doesn't have a null LANGUAGEID.

Derivation Steps: Derive as 100.

Module Outcome End Date (MODOUTENDDATE)

Return: Data Futures

Entity: Module Outcome

Page Used:

Page	Page Element
Records and Enrollment > Enroll Students > Enrollment	Grade Date, Drop Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. For dummy modules, derive as null.
2. If Grade Date is after the related ModuleDelivery.MODENDDATE and is on or before the StudentCourseSession.SCSENDDATE, then derive Grade Date in YYYY-MM-DD format.
3. If Drop Date is different from the related ModuleDelivery.MODENDDATE and is on or before the StudentCourseSession.SCSENDDATE, derive Drop Date in YYYY-MM-DD format
4. Derive as null.

Module Marks (MODULEMARKS)

Return: Data Futures

Entity: Module Outcome

Page Used:

Page	Page Element
Records and Enrollment > Enroll Students > Enrollment	Grade In/Official

Field Derivation Rule: Include for all entities where:

- MODULEOUTCOME exists and is not 05 (outcome not yet known) or 06 (will complete in subsequent session).
- The related Module.MARKSCHEME is not 97, 98, 99, or null.
- The related CurriculumAccreditation.ACCREDITATIONID = 05901 (GMC).

Derivation Steps:

1. Derive as Grade.
2. If the Enrollment Status is Dropped, derived as null.
3. Use default.
4. Derive as NULL ERROR.

Module Outcome (MODULEOUTCOME)

Return: Data Futures

Entity: Module Outcome

Page Used:

Page	Page Element
Records and Enrollment > Enroll Students > Enrollment	Grading Basis/Official Grade

Field Derivation Rule: Include for all entities

Derivation Steps:

1. For dummy modules, derive as 99 (not coded).
2. Map grade to a HESA Module Outcome.

To map the outcome, the Grading Scheme is determined either from the Academic Program of the student (if a Grading Scheme is defined), or from the Academic Career of the student.

3. If the Enrollment Status is Dropped, derived as 03 (not completed).
4. Use default.
5. Derive as NULL ERROR.

Module Result (MODULERESULT)

Return: Data Futures

Entity: Module Outcome

Page Used:

Page	Page Element
Records and Enrollment > Enroll Students > Enrollment	Grading Basis/Official Grade

Field Derivation Rule: Include for all entities where:

- Country = Northern Ireland
- Either CourseDeliveryInitiative.INITIATIVEID = 004 or StudentInitiatives.INITIATIVEID = 004

Derivation Steps:

1. For dummy modules, derive as 05 (not passed or failed).
2. Map grade to HESA Module Result.
3. If the Enrollment Status is Dropped, derive as 05.

4. Derive as NULL ERROR.

Data Futures Return: Leaver Entity

For each Student Registration entity in the extract, a single Leaver entity is created if the derived LEAVERENDDATE for the Instance/Student Registration falls within the reporting period.

Intended Destination (INTENDEDESTINATION)

Return: Data Futures

Entity: Leaver

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	INTENDEDESTINATION

Field Derivation Rule: Derive a value if Leaver.RSNREGEND = 12.

Derivation Steps:

1. Derive from HESA Instance.
2. Derive as NULL ERROR.

Leaver End Date (LEAVERENDDATE)

Return: Data Futures

Entity: Leaver

Page Used:

<i>Page</i>	<i>Page Element</i>
Records and Enrollment > Career and Program Information > Student Program/Plan	Program Action/Reason
HESA Instance	LEAVERENDDATE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from HESA Instance Data.
2. Derive the latest related StudentCourseSession.SCSENDDATE value if all of the following is true:
 - The student is a taught student where Engagement.STUDYINTENTION has a value that does not start with D or L *or* the related Qualification.QUALCAT value in extract or master does not start

with D or L. The Student Course Session is linked to the Course Delivery via Course Session and the QUALID from Course Delivery is used to link to Qualification.

- The latest row in Student Program that has an effective date in the reporting period has a program action/reason combination that is mapped to a RSNREGEND value.
3. If the latest row in Student Program that has an effective date in the reporting period has a program action/reason combination that is mapped to a RSNREGEND value *and* the student is not a taught student, derive the effective date in YYYY-MM-DD format.

Open Engagement Flag (OPENENG)

Return: Data Futures

Entity: Leaver

Page Used:

Page	Page Element
HESA Instance	OPENENG

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from HESA Instance.
2. Derive as null.

Reason for Registration Ending (RSNREGEND)

Return: Data Futures

Entity: Leaver

Page Used:

Page	Page Element
Records and Enrollment > Career and Program Information > Student Program/Plan	Program Action/Registration Reason
HESA Instance Data	RSNREGEND

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from HESA Instance.
2. If the latest row in Student Program that has an effective date in the reporting period has a program action/reason combination that is mapped to a Leaver Reason value, derive the mapped value.

3. Derive as NULL ERROR.

Data Futures Return: Full Time Equivalence Entity

For each Student Course Session entity in the extract, a single entity is created for each Student Course Session if:

- Country = England.
- There is not a related SessionStatus entity in the extract with a blank STATUSVALIDTO date.
- The most recent related SessionStatus entity in master (if one exists) does not have a blank STATUSVALIDTO date.
- There is an FTE record associated with the HESA Instance with a Reporting Period value that matches the Reporting Period of the return.

Full Time Equivalence (FTE)

Return: Data Futures

Entity: Full Time Equivalence

Page Used:

Page	Page Element
HESA Instance Data	Calculated FTE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the Report Zero check box is selected for the reporting period of the return in the HESA Instance FTE record, derive as zero.
2. If that value is greater than zero, override FTE for the reporting period of the return in HESA Instance Data.
3. Calculate FTE for the reporting period of the return in HESA Instance Data.
4. Use default.
5. Derive as NULL ERROR.

Reference Period (REFPERIOD)

Return: Data Futures

Entity: Full Time Equivalence

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Returns Setup	Reporting Period

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as final character of the Reporting Period code for the return with leading zero.
For example: 01, 02, or 03.

Year (YEAR)

Return: Data Futures

Entity: Full Time Equivalence

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Returns Setup — Reporting Period	Reporting Period > Record Year

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as the Record Year of the Reporting Period code for the return.

Data Futures Return: Funding and Monitoring Entity

For each Student Course Session entity in the extract, a single entity is created.

Allocated Place (ALLPLACE)

Return: Data Futures

Entity: Funding and Monitoring

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	ALLPLACE

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = England
- The related Student Registration entity is associated with a Course Delivery entity with TTCID = 01.

Derivation Steps:

1. Use constant.

2. Derive value from HESA Instance.
3. Use default.
4. Derive as NULL ERROR.

Equivalent or Lower Qualification (ELQ)

Return: Data Futures

Entity: Funding and Monitoring

Page Used:

Page	Page Element
HESA Instance	ELQ

Field Derivation Rule: Include for entities where:

- Country = England
- The related StudentRegistration.FEEELIG = 01 (home fees)
- Either the related Engagement.STUDYINTENTION that begins with E, M, H, I, J or C, *or* the related Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT begins with E, M, H, I, J or C
- The related StudentRegistration.INCOMINGEXCHANGE is null

Derivation Steps:

1. Use constant.
2. Derive value from HESA Instance.
3. Use default.
4. Derive as NULL ERROR.

Funding Completion (FUNDCOMP)

Return: Data Futures

Entity: Funding and Monitoring

Page Used:

Page	Page Element
HESA Instance	FUNDCOMP

Field Derivation Rule: Derive a value if all the following conditions are met:

- Country = England or Northern Ireland
- The related StudentCourseSession.SCSENDDATE is not null
- The related StudentRegistration.INCOMINGEXCHANGE is null

Derivation Steps:

1. Use constant.
2. Derive value from HESA Instance.
3. Use default.
4. Derive as NULL ERROR.

Regulating Body (REGULATINGBODY)

Return: Data Futures

Entity: Funding and Monitoring

Page Used:

Page	Page Element
HESA Instance	REGULATINGBODY
Program HESA Data	REGULATINGBODY
Plan HESA Data	REGULATINGBODY
Sub-Plan HESA Data	REGULATINGBODY

Field Derivation Rule: If there are two or more related CourseRole entities with ROLETYPE = 501 (Regulating Body), derive a value

Derivation Steps:

1. Use constant.
2. Derive value from HESA Instance.
3. If the related StudentRegistration entity is based on a sub-plan, derive value from Sub-Plan HESA Data.
4. Derive value from Plan HESA Data based on the related StudentRegistration entity.
5. Derive value from Program HESA Data based on the related StudentRegistration entity.
6. Use default.
7. Derive as NULL ERROR.

Sandwich Fee (SANDWICHFEE)

Return: Data Futures

Entity: Funding and Monitoring

Page Used:

Page	Page Element
HESA Instance	SANDWICHFEE
Plan Year HESA Data	SANDWICHFEE
Sub-Plan Year HESA Data	SANDWICHFEE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from HESA Instance.
2. If the related CourseSession is based on a sub-plan, derive value from Sub-Plan Year HESA Data.
3. Derive value from Plan Year HESA Data based on the related CourseSession.
4. Use default.
5. Derive as null.

Data Futures Return: Session Status Entity

For each Student Course Session entity in the extract, the student's current mode is derived for STATUSCHANGEDTO using similar steps to StudentCourseSessionMode.SCSMODETYPE, but mapping Academic Load to Session Status rather than Session Mode.

If the derived value for STATUSCHANGEDTO is 45 or 66, a Session Status entity is created

Status Changed To (STATUSCHANGEDTO)

Return: Data Futures

Entity: Session Status

Page Used:

Page	Page Element
HESA Instance	Instance Load
Records and Enrollment > Career and Program Information > Student Program/Plan	Program Action and Reason

Page	Page Element
Records and Enrollment > Student Term Information > Term Activate a Student > Student Session	Approved Academic Load
Records and Enrollment > Student Term Information > Term Activate a Student > Enrollment Limit	Approved Academic Load
Records and Enrollment > Career and Program Information > Student Program/Plan	Academic Load
Academic Structure > Academic Plan > HESA Offering/Year	Academic Load
Academic Structure > Academic Sub-Plan > HESA Offering/Year	Academic Load

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If a continuing student is not active and has a Student Course Session entity created because they have not already been reported as interrupted or dormant/writing up, derive value as 66 (dormant).
2. If the Instance Load value from the most recent HESA Instance Data record is mapped to a Session Status, derive that value.
3. Select the most recent effective-dated record in the Student Program that has an Effective Date on or before the reporting period end date and a Program Action and Reason mapped to a Session Status (as part of the Change of Mode Mapping in Return Setup). If a mapped HESA code exists, derive the value.
4. Map the Approved Academic Load from the most recent Student Session record by session begin date for sessions that overlap the reporting period to a Session Status using the HESA Mode of Study mapping.
5. Map the Approved Academic Load from the most recent activated Student Term record by term begin date for terms that overlap the reporting period to a Session Status using the HESA Mode of Study mapping.
6. Map the Academic Load for the most recent effective-dated record in Student Program that has an Effective Date on or before the reporting period end date to a Session Status using the HESA Mode of Study Mapping.
7. If the related Course Session is based on a sub-plan, map the Academic Load from Sub-Plan Year to a Session Status using the HESA Mode of Study Mapping.
8. If the related Course Session is based on a plan, map the Academic Load from Plan Year to a Session Status using the HESA Mode of Study Mapping.

Status Valid From (STATUSVALIDFROM)

Return: Data Futures

Entity: Session Status

Page Used:

Page	Page Element
HESA Instance	Effective Date
Records and Enrollment > Career and Program Information > Student Program/Plan	Effective Date
Set Up SACR > Foundation Tables > Term Setup > Term/Session Table > Session Table	Begin Date
Set Up SACR > Foundation Tables > Term Setup > Term/Session Table > Term Table	Term Begin Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If STATUSCHANGEDTO is derived from Instance Load in HESA Instance Data, select the earliest effective dated row with that Instance Load value.

If the effective date is after the StudentCourseSession.SCSSTARTDATE, the date is derived as YYYY-MM-DD. Else, derive SCSSTARTDATE.
2. If STATUSCHANGEDTO is derived from a mapped row in Student Program, select the effective date of the row.

If the effective date is after the StudentCourseSession.SCSSTARTDATE, the date is derived as YYYY-MM-DD. Else, derive SCSSTARTDATE .
3. If STATUSCHANGEDTO is derived from Approved Academic Load in the most recent Student Session record, select the related Session Begin Date. If the session begin date is after the StudentCourseSession.SCSSTARTDATE, the date is derived as YYYY-MM-DD. Else, derive SCSSTARTDATE.
4. If STATUSCHANGEDTO is derived from Approved Academic Load in the most recent activated Student Term record, select the related Term Begin Date. If the term begin date is after the StudentCourseSession.SCSSTARTDATE, the date is derived as YYYY-MM-DD. Else, derive SCSSTARTDATE.
5. If STATUSCHANGEDTO is derived from Academic Load in the most recent Student Program record, select the effective date of the row. If the effective date is after the StudentCourseSession.SCSSTARTDATE, the date is derived as YYYY-MM-DD. Else, derive SCSSTARTDATE.
6. Derive as SCSSTARTDATE.

Status Valid To (STATUSVALIDTO)

Return: Data Futures

Entity: Session Status

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as null.

Data Futures Return: Study Location Entity

For each Student Course Session extract record, entities are created if any one of these conditions is true:

- DISTANCELEARNING for the related CourseSession in the extract or master is null *and* DISTANCESL is defined in HESA Instance Data for the most recent effective date on or before the reporting period end date.
- More than one CourseDeliveryVenue entity exists in the extract or master for the related Course Delivery, PLACEMENT for the related CourseSession in the extract or master does not equal 01, STUDYABROAD for the related CourseSession in the extract or master does not equal 01, and DISTANCELEARNING for the related CourseSession in the extract or master does not equal 01.

STUDYLOCID is derived as SCSESSIONID and a sequence number.

Distance Learning (DISTANCESL)

Return: Data Futures

Entity: Study Location

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	DISTANCESL

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from HESA Instance.
2. Derive as null.

Study Proportion (STUDYPROPORTION)

Return: Data Futures

Entity: Study Location

Page Used:

<i>Page</i>	<i>Page Element</i>
Plan Offering HESA Data — Venues	Percentage

Page	Page Element
Plan Year HESA Data — Venues	Percentage
Sub-Plan Offering HESA Data – Venues	Percentage
Sub-Plan Year HESA Data – Venues	Percentage

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If DISTANCESL is not null, derive as 100.
2. If the related Course Session is based on a sub-plan, derive value from Sub-Plan Year HESA Data – Venues.
3. If the related Course Session is based on a sub-plan, derive value from Sub-Plan Offering HESA Data – Venues.
4. If the related Course Session is based on a plan, derive value from Plan Year HESA Data — Venues.
5. If the related Course Session is based on a plan, derive value from Plan Offering HESA Data — Venues.

Venue Identifier (VENUEID)

Return: Data Futures

Entity: Study Location

Page Used:

Page	Page Element
Plan Offering HESA Data — Venues	Venue ID
Plan Year HESA Data — Venues	Venue ID
Sub-Plan Offering HESA Data – Venues	Venue ID
Sub-Plan Year HESA Data – Venues	Venue ID

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If DISTANCESL is not null, derive as null.
2. If the related Course Session is based on a sub-plan, derive value from Sub-Plan Year HESA Data – Venues.
3. If the related Course Session is based on a sub-plan, derive value from Sub-Plan Offering HESA Data – Venues.

4. If the related Course Session is based on a plan, derive value from Plan Year HESA Data — Venues.
5. If the related Course Session is based on a plan, derive value from Plan Offering HESA Data — Venues.

Data Futures Return: Supervisor Allocation Entity

For each Student Course Session entity in the extract, entities are derived if any one of these conditions is true:

- The associated Engagement.STUDYINTENTION (in extract or master) = D0003, L0000 or L0001.
- The associated Engagement.STUDYINTENTION is null and the associated Qualification.QUALCAT = D0003, L0000 or L0001.

SUPALLID is derived as SCSESSIONID and a sequence number.

The process creates entities based on one of the following steps. If a step does not have records, the derivation moves to the next step. If no records are found, then entities are not created.

1. If values are defined in HESA Instance – Research Data, then use the records to create entities.
2. If there is a Research Candidate record for the Instance, one or more supervisor records are selected and the associated Advisor HESA Data records are used to create entities.
3. If advisor records exist for the student and a role is defined in HESA Returns Setup, one or more advisors are selected and the associated Advisor HESA Data records are used to create entities.

Deriving records from Research Supervisor/Advisor HESA Data (step 2)

1. Research supervisors are selected from the most recent effective dated record (linked to the instance via the research candidate record) where the date is on or before the reporting period end date, and all the following conditions are met:
 - If the Primary Supervisor Only option is selected in HESA Returns Setup, the primary flag of the Research Supervisor record is set.
 - If the Primary Supervisor Only option is *not* selected in HESA Returns Setup, the Supervision Percentage value is greater than zero.
 - If at least one Supervisor Role is defined in HESA Returns Setup, the Supervisor Role matches one of the setup values. If no Supervisor Roles are setup for the return, all roles are considered.
 - The supervisor status matches one of the values defined in HESA Returns Setup.
 - The end date of the supervisor record is not prior to the reporting period start date.
 - The begin date of the supervisor record is not after the reporting period end date.
 - At least one Advisor HESA Data record exists for the supervisor. If no records are found a message is logged.

2. For each selected advisor, the advisor percentage is adjusted to ensure that the total percentage for all selected advisors is 100.
3. Advisor HESA Data records are selected for each supervisor to create entities:
 - For each Advisor HESA Data record, a weighted percentage is calculated based on the unit percentage and the supervisor's adjusted supervision percentage.
 - If the same combination of REF Unit 2014, REF Unit 2021, and Collaborating Provider exists for more than one supervisor, the records are merged into a single entity and the weighted percentages added together.
 - If the total of all the percentage values does not equal exactly 100 because of rounding during the calculation of adjusted and weighted percentages, the largest value is adjusted to ensure the total is 100.

Deriving records from Student Advisor/Advisor HESA data (step 3)

1. Student advisors are selected from the most recent effective dated record where the date is on or before the reporting period end date and all of the following conditions are met:
 - The Advisor Role defined matches one of the roles defined on the HESA Returns page.
 - The Academic Career and Academic Program match the career and program of the Instance being reported in Student Registration.
 - If the Primary Advisor Only option is selected in HESA Returns Setup, the advisor number is 1.
 - If the Primary Advisor Only option is NOT selected in HESA Returns Setup, the Percentage value is greater than zero.
 - At least one Advisor HESA Data record exists for the advisor. If no records are found a message is logged.
2. For each selected advisor, the advisor percentage is adjusted to ensure that the total percentage for all selected advisors is 100.
3. Advisor HESA Data records are selected for each advisor to create entities:
 - For each Advisor HESA Data record, a weighted percentage is calculated based on the unit percentage and the advisor's adjusted percentage.
 - If the same combination of REF Unit 2014, REF Unit 2021, and Collaborating Provider exists for more than one advisor, the records are merged into a single entity and the weighted percentages added together.
 - If the total of all the percentage values does not equal exactly 100 because of rounding during the calculation of adjusted and weighted percentages, the largest value is adjusted to ensure the total is 100.

HESA Identifier (HESAIDSA)

Return: Data Futures

Entity: Supervisor Allocation

Page Used:

Page	Page Element
HESA Instance Data — Research Data	Collaborating Provider
Advisor HESA Data	Collaborating Provider

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from HESA Instance Data – Research Data and a Collaborating Provider is defined, derive that value.
2. If the entity is derived from Research Supervisor/Advisor HESA Data and a Collaborating Provider is defined, derive that value.

If multiple Advisor HESA Data records with the same REF Unit are being merged, then derive the first Collaborating Provider (ordered by code ascending).

3. If the entity is derived from Student Advisor/Advisor HESA Data, derive as Collaborating Provider.

If multiple Advisor HESA Data records with the same REF Unit are being merged, then derive the first Collaborating Provider (ordered by code ascending).

4. Derive as null.

REF 2014 Unit of Assessment (REF2014UNITOFASSESSMENT)

Return: Data Futures

Entity: Supervisor Allocation

Page Used:

Page	Page Element
HESA Instance Data — Research Data	REF Unit 2014
Advisor HESA Data	REF Unit 2014

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from HESA Instance Data – Research Data, derive as REF 2014 Unit.
2. If the entity is derived from Research Supervisor / Advisor HESA Data, derive as REF 2014 Unit.
3. If the entity is derived from Student Advisor / Advisor HESA Data, derive as REF 2014 Unit.

4. Derive as NULL ERROR.

REF 2021 Unit of Assessment (REF2021UNITOFASSESSMENT)

Return: Data Futures

Entity: Supervisor Allocation

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Research Data	REF Unit 2021
Advisor HESA Data	REF Unit 2021

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from HESA Instance Data – Research Data, derive as REF 2021 Unit.
2. If the entity is derived from Research Supervisor / Advisor HESA Data, derive as REF 2021 Unit.
3. If the entity is derived from Student Advisor / Advisor HESA Data, derive as REF 2021 Unit.
4. Derive as null.

Supervisor Allocation Proportion (SUPALLPROP)

Return: Data Futures

Entity: Supervisor Allocation

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Research Data	Percentage
Advisor HESA Data	Percentage

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from HESA Instance Data – Research Data, derive as Percentage.
2. If the entity is derived from Research Supervisor/Advisor HESA Data, derive as Percentage weighted for multiple supervisors.
3. If the entity is derived from Student Advisor/Advisor HESA Data, derive as Percentage.

Data Futures Return: Entry Qualification Award Entity

For each Student entity in the extract, one or more entities are created when one of the following conditions is true:

- Country = England.

The student has an Engagement entity where HIGHESTQUALOE begins with P (except for P0013), is X0000 or X0001.

The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, or IM.

There it at least one Entry Qualification record with Report to HESA = Y in the HESA Instance related to the most recent Student Registration entity (that is, highest REGNUM) for the student in the extract.

- The student has an Engagement entity with a UCASSCHEMECODE value.

There it at least one Entry Qualification record with Report to HESA = Y in the HESA Instance related to the most recent Student Registration entity (i.e. highest REGNUM) for the student in the extract.

- Country = England.

The student has a Student Registration entity in the extract where the associated Course Delivery entity has TTCID = 01.

Either the student has an Engagement entity with STUDYINTENTION = M0016, M0018, H0013 or I0005 *or* an Engagement entity where STUDYINTENTION is blank and the associated Qualification.QUALCAT = M0016, M0018, H0013, or I0005.

The student has an External Degree record with Degree Status of Complete and a Degree Date that falls on or before the reporting period end date.

- Country = England or Northern Ireland.

Either the student has an Engagement entity with STUDYINTENTION = M0016, M0018, or H0013 *or* an Engagement entity where STUDYINTENTION is blank and the associated Qualification.QUALCAT = M0016, M0018 or H0013.

The student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.

The student has an External Degree record with Degree Status of Complete and a Degree Date that falls on or before the reporting period end date.

For entities created from HESA Instance – Entry Qualification, an entity is created for each record where Report to HESA = Y and the QUALTYPEID code has been imported from HESA (based on the imported flag in SSR_HE_CODES).

For entities created from External Degrees, a single entity is created based on the record with the latest Degree Date on or before the reporting period end date where the Degree is mapped to a QUALTYPEID

in the Qualification mapping. If no records exist with a mapped QUALTYPEID, a single entity is created based on the latest Degree Date and the QUALTYPEID field will be derived as NULL ERROR.

ENTRYQUALAWARID is created based on the SID and a sequence number.

Award Date (AWARDDATE)

Return: Data Futures

Entity: Entry Qualification Award

Page Used:

Page	Page Element
Entry Profile HESA Data – Entry Qualifications	Award Date
Entry Profile HESA Data – Entry Qualifications	Year/Sitting
Student Admissions > Application/Transcript Loads > Education > Courses and Degrees	Degree Date

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is created from an Entry Qualification record, derive Award Date as YYYY-MM-DD from Entry Profile HESA Data.
2. If the entity is created from an Entry Qualification record and Year has a value, the date is generated with:
 - YYYY derived from Year.
 - MM derived as 08 if Sitting is Summer, or 01 if Sitting is Winter or blank.
 - DD is derived as 01.
3. If the entity is created from an External Degree record, derive Degree Date as YYYY-MM-DD.
4. Derive as NULL ERROR.

Bursary Flag (BURSFLAG)

Return: Data Futures

Entity: Entry Qualification Award

Page Used:

Page	Page Element
Entry Profile HESA Data	BURSARY

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is created from an External Degree record, derive value from Entry Profile HESA Data.
2. Derive as null.

Qualification Result (QUALRESULTEQQA)

Return: Data Futures

Entity: Entry Qualification Award

Page Used:

Page	Page Element
Entry Profile HESA Data – Entry Qualifications	Result
Entry Profile HESA Data	QUALRESULTEQQA

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is created from an Entry Qualification record, derive Result from Entry Profile HESA Data.
2. If the entity is created from an External Degree record, derive QUALRESULTEQQA from Entry Profile HESA Data.
3. Derive as NULL ERROR.

Qualification Type Identifier (QUALTYPEID)

Return: Data Futures

Entity: Entry Qualification Award

Page Used:

Page	Page Element
Entry Profile HESA Data – Entry Qualifications	Type
Entry Profile HESA Data	QUALTYPEID

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is created from an Entry Qualification record, derive value from Entry Profile HESA Data.

2. If the entity is created from an External Degree record, derive QUALTYPEID defined in Entry Profile.
3. If the entity is created from an External Degree record, derive Degree mapped to Type in the Qualification mapping.
4. Derive as NULL ERROR.

Data Futures Return: Entry Qualification Subject Entity

For each Entry Qualification Award entity in the extract, up to five Subject entities are created based on either Entry Qualifications or External Degree records.

For records derived from Entry Qualifications, a single entity is created using the Subject value.

For records derived from External Degrees, up to five entities are created based on the HECOS1, HECOS2, HECOS3, HECOS4 and HECOS5 fields defined in Entry Profile.

Subject Identifier (SUBJECTID)

Return: Data Futures

Entity: Entry Qualification Subject

Page Used:

Page	Page Element
Entry Profile HESA Data – Entry Qualifications	Subject
Entry Profile HESA Data	HECOS1
Entry Profile HESA Data	HECOS2
Entry Profile HESA Data	HECOS3
Entry Profile HESA Data	HECOS4
Entry Profile HESA Data	HECOS5

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is created from an Entry Qualification record, derive Subject from Entry Profile HESA Data.
2. If the entity is created from an External Degree record, derive HECOS code from Entry Profile.
3. Derive as NULL ERROR.

Data Futures Return: ITT Engagement Entity

For each Entry Qualification Award in the extract where BURSLAG is not null, a single entity is created based on the External Degree record.

Degree Country (DEGCTRY)

Return: Data Futures

Entity: ITT Engagement

Page Used:

<i>Page</i>	<i>Page Element</i>
Campus Community > Organization > Create/Maintain Organizations > Organization Table > Location Details	Country
Entry Profile HESA Data	DEGCTRY

Field Derivation Rule: If ITTEngagement.DEGREEPROVIDER is null, derive a value.

Derivation Steps:

1. Derive value defined in Entry Profile HESA Data.
2. Derive value from the Country of the most recent effective-dated Location for the External Org ID associated with the External Degree record being reported in Entry Qualification Award. If multiple Locations exist with the same effective date, the record with the lowest Location number is used.
 - If the three-character Country code exists in the HESA Nationality mapping, derive the HESA Nationality code. For example, CYP (Cyprus) is mapped to XA.
 - If the three-character Country code is GBR, derive XK (rather than GB which is not valid for DEGCTRY).
 - Derive the two-character country code.
3. Use default.
4. Derive as NULL ERROR.

Degree End Date (DEGENDDT)

Return: Data Futures

Entity: ITT Engagement

Page Used:

Page	Page Element
Student Admissions > Application/Transcript Loads > Education > External Education > Career Data	To Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive To Date from the Career Data record with the lowest Data Number for the External Org ID associated with the External Degree record being reported in Entry Qualification Award.
2. Use default.
3. Derive as NULL ERROR.

Degree Length (DEGLENGTH)

Return: Data Futures

Entity: ITT Engagement

Page Used:

Page	Page Element
Student Admissions > Application/Transcript Loads > Education > External Education > Career Data	From Date, To Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If DEGSTDT and DEGENDDT both have a date value, derive the value calculated as the number of days between the dates inclusive converted to years and rounded to the nearest year.
2. Use default.
3. Derive as NULL ERROR.

Degree Provider (DEGREEPROVIDER)

Return: Data Futures

Entity: ITT Engagement

Page Used:

Page	Page Element
Student Admissions>Application/Transcript Loads > Education > External Education	External Org ID

Page	Page Element
Campus Community > Organization > Create/Maintain Organizations > Organization Table > Region Tab > UK Region	UKPRN
Entry Profile HESA Data	DEGREEPROVIDER

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value defined in Entry Profile HESA Data.
2. Derive UKPRN for the External Org ID associated with the External Degree record being reported in Entry Qualification Award.
3. Derive as null.

Degree Start Date (DEGSTDT)

Return: Data Futures

Entity: ITT Engagement

Page Used:

Page	Page Element
Student Admissions > Application/Transcript Loads > Education > External Education > Career Data	From Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive From Date from the Career Data record with the lowest Data Number for the External Org ID associated with the External Degree record being reported in Entry Qualification Award.
2. Use default.
3. Derive as NULL ERROR.

Data Futures Return: Person Identifier Entity

For each Student entity in the extract, entities are created for each ID type depending on the inclusion criteria for each type. In cases where an ID is required for a particular population of students and a default value is specified by HESA, a default derivation step is included for PERSONALIDENTIFIER.

National Insurance Number - 01

Derivation step 1. If all the conditions are met, an entity is created with IDTYPECODE = 01:

- Country = England.
- The student has a Student Registration entity in the extract where the associated Course Delivery entity has TTCID = 01.
- ID Type 01 is mapped to one or more External Systems in Returns Setup.
- The student has at least one External System ID for a system mapped to the ID Type with an effective date on or before the reporting period end date.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 01 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 1.

ORCID - 02

If all the following conditions are met an entity is created with IDTYPECODE = 02 and derivation step 1:

- There is a Common Attribute defined for ORCID in HESA Returns Setup.
- There is a Research Consumption record for the student and Institution with a value defined for the ORCID attribute (in SSR_RS_CONSP_CA) in the most recent record where the effective date is on or before the reporting period end date.

PERSONALIDENTIFIER is derived from the CAF attribute defined for ORCID with derivation step 1. If there are multiple Consumption records with the CAF attribute defined, the value is derived from the record with the highest Candidate Number (SSR_RS_CANDIT_NBR).

If all of the following conditions are met, an entity is created with IDTYPECODE = 02 and derivation step 2:

- An entity is not created in derivation step 1.
- ID Type 02 is mapped to one or more External Systems in Returns Setup.
- The student has at least one External System ID for a system mapped to the ID Type with an effective date on or before the reporting period end date.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 01 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 2.

Own Student Identifier – 03

A single entity is created with IDTYPECODE = 03 and derivation step 1.

PERSONALIDENTIFER is derived as EMPLID with derivation step 1.

Persistent HUSID – 04

If all of the following conditions are met, an entity is created with IDTYPECODE = 04 and derivation step 1:

- ID Type 04 is mapped to one or more External Systems in Returns Setup.
- The student has at least one External System ID for a system mapped to the ID Type with an effective date on or before the reporting period end date, where the ID value is different from the SID being reported for the Student.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 04 and the effective date is on or before the reporting period end date. If multiple records are found (i.e. ID's for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 1.

Research Council Student Identifier – 06

If all the following conditions are met, an entity is created with IDTYPECODE = 06 and derivation step 1:

- The student has a Student Registration entity in the extract with INCOMINGEXCHANGE = null.
- There is a FundingBody entity (in extract or master) associated with the Student Registration via Student Course Session with FUNDINGBODY = 0002, 0003, 0009, 0012, 0018, 0019, or 0022.

There is a Common Attribute defined for RCSTDTID in HESA Returns Setup.

- There is a Research Consumption record for the student and Institution with a value defined for the ORCID attribute (in SSR_RS_CONSP_CA) in the most recent record where the effective date is on or before the reporting period end date.

PERSONALIDENTIFIER is derived from the CAF attribute defined for ORCID with derivation step 1. If there are multiple Consumption records with the CAF attribute defined, the value is derived from the record with the highest Candidate Number (SSR_RS_CANDIT_NBR).

If all of the following conditions are met, an entity is created with IDTYPECODE = 02 and derivation step 2:

- An entity is not created in derivation step 1.
- The student has a Student Registration entity in the extract with INCOMINGEXCHANGE = null.
- There is a FundingBody entity (in extract or master) associated with the Student Registration via Student Course Session with FUNDINGBODY = 0002, 0003, 0009, 0012, 0018, 0019, or 0022.
- ID Type 02 is mapped to one or more External Systems in Returns Setup.
- The student has at least one External System ID for a system mapped to the ID Type with an effective date on or before the reporting period end date.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 01 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 2.

Scottish Candidate Number – 07

If the Scottish Candidate Number is not known, then the not available code 999999999 should be returned as the Person Identifier.

If all of the following conditions are met, an entity is created with IDTYPECODE = 07 and derivation step 1:

- Country = Scotland
- The student has a ContactPurpose entity with CONTACTYPEID = 01 (Permanent home address) and an associated PersonAddress entity with COUNTRYID = XH (Scotland).
- The student has either an Engagement entity with STUDYINTENTION code that begins with H, I, J or C, or an Engagement entity with STUDYINTENTION null, which has a Student Registration entity that is linked via Course Delivery to a Qualification with QUALCAT beginning H, I, J, or C.
- ID Type 07 is mapped to one or more External Systems in Returns Setup.

If all of the following conditions are met, an entity is created with IDTYPECODE = 07 and derivation step 2:

- Country = England or Northern Ireland.
- The student has a ContactPurpose entity with CONTACTYPEID = 01 and an associated PersonAddress entity with COUNTRYID = XH.
- The student has an Engagement entity with a UCASSCHEMECODE value.
- The student has either an Engagement entity with STUDYINTENTION code that begins with H, I, J, or C, or an Engagement entity with STUDYINTENTION null, which has a Student Registration entity that is linked via Course Delivery to a Qualification with QUALCAT beginning H, I, J, or C.
- ID Type 07 is mapped to one or more External Systems in Returns Setup.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 01 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 1 or 2 depending on the derivation step for IDTYPECODE. If the student does not have a relevant External System ID, PERSONALIDENTIFIER is derived as 999999999 with derivation step is set to 3.

Student Support Number – 08

If the following condition is met, an entity is created with IDTYPECODE = 08 and derivation step 1: The student has a Student Registration entity in the extract with an associated HESA Instance where SSN is defined in the most recent record with effective date on or before the reporting period end date.

PERSONALIDENTIFIER is derived as the SSN value from HESA Instance Data with derivation step 1.

If all of the following conditions are met, an entity is created with IDTYPECODE = 08 and derivation step 2:

- An entity is not created in derivation step 1.

- The student has at least one SLC ACR record for the Institution where:
 - The Aid Year start date is on or before the reporting period date.
 - The Aid Year end date is on or after the REGISTRATIONSTARDATE for a Student Registration entity in the extract.
 - At least one row exists for the ACR with Attendance Indicator other than S or X.

PERSONALIDENTIFIER is derived as the SSN value from the most recent ACR record (by Aid Year and Sequence) meeting the entity selection criteria where the Aid Year end date is on or before the reporting period end date. The derivation step is set to 2.

If all of the following conditions are met, an entity is created with IDTYPECODE = 08 and derivation step 3:

- An entity is not created in derivation step 1 or 2.
- The student has an SLC SSAR record for the Institution where:
 - The Aid Year start date is on or before the reporting period date.
 - The Aid Year end date is on or after the REGISTRATIONSTARDATE for a Student Registration entity in the extract.
 - A related First Attendance Confirmation record exists.

PERSONALIDENTIFIER is derived as the SSN value from the most recent SSAR record (by Aid Year and Sequence) meeting the entity selection criteria where the Aid Year end date is on or before the reporting period end date. The derivation step is set to 3.

Teacher Reference Number – 09

Where the student is in coverage for this identifier, but one is not available, 999999999 should be returned as the Person Identifier.

If all of the following conditions are met, an entity is created with IDTYPECODE = 09 and derivation step 1:

- Country = England.
- The student has a Student Registration entity in the extract where the associated Course Delivery entity has TTCID = 01.
- ID Type 09 is mapped to one or more External Systems in Returns Setup.

If all of the following conditions are met, an entity is created with IDTYPECODE = 09 and derivation step 2:

- Country = Scotland.
- The student has a Student Registration entity in the extract with INCOMINGEXCHANGE = null and the associated Course Delivery entity has TTCID = 01.

- There is a related Qualification Awarded entity that is associated with a Qualification entity (via QUALID) with QUALCAT= M0016, M0018, H0003, H0013, I0001, or I0005.
- There is a QualificationAwardAccreditation associated with the Qualification Awarded entity with ACCREDITATIONID = 06602 to 06603 or 20201 to 20211.
- ID Type 09 is mapped to one or more External Systems in Returns Setup.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 09 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 1 or 2 depending on the derivation step of IDTYPECODE.

If the student does not have a relevant External System ID, PERSONALIDENTIFIER is derived as 999999999 with derivation step is set to 3.

UCAS Personal Identifier – 11

If all of the following conditions are met, an entity is created with IDTYPECODE = 11 and derivation step 1:

- The student has a Student Registration entity in the extract where the associated Engagement entity (in extract or master) has a value for UCASSCHEMECODE.
- ID Type 11 is mapped to one or more External Systems in Returns Setup.
- The student has at least one External System ID for a system mapped to the ID Type with an effective date on or before the reporting period end date.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 11 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 1.

Unique Learner Number – 12

If all of the following conditions are met, an entity is created with IDTYPECODE = 12 and derivation step 1:

- ID Type 12 is mapped to one or more External Systems in Returns Setup.
- The student has at least one External System ID for a system mapped to the ID Type with an effective date on or before the reporting period end date.

PERSONALIDENTIFIER is derived as the ID from the most recent External System ID record where the External System is mapped to ID Type 11 and the effective date is on or before the reporting period end date. If multiple records are found (that is, IDs for different mapped systems with the same effective date), the record with the lowest alpha system code is used. The derivation step is set to 1.

Data Futures Return: Carer Entity

For each Student entity in the extract, if all of the following conditions are met a single entity is created using the current value in HESA Person Data:

- Country = Scotland
- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XH.

Carer Type (CARER)

Return: Data Futures

Entity: Carer

Page Used:

Page	Page Element
Person HESA Data	CARER

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from the most recent effective dated Person HESA Data where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

Carer Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Carer

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If CARER is derived from Person HESA Data in Step 1, derive as the effective date of the earliest row in Person HESA Data with the derived value converted to YYYY-MM-DD.

2. If CARER is not derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Carer Valid To Date (VALIDTO)

Return: Data Futures

Entity: Carer

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as null.

Data Futures Return: Ethnicity Entity

For each Student entity in the extract, if any one of the following conditions is met a single entity is created using either the current value in HESA Person Data or the Person Ethnicity record:

- Country = England.
 Either the student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, or IM *or* has a Student Registration entity in the extract where the associated Course Delivery entity has TTCID = 01.
- Country = Northern Ireland or Scotland.
 The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, or IM.

Ethnicity (ETHNIC)

Return: Data Futures

Entity: Ethnicity

Page Used:

Page	Page Element
Person HESA Data	ETHNIC
Person Information > Biographical > Personal Attributes > Ethnicity	Regulatory Region, Ethnic Group

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from the most recent effective-dated Person HESA Data where the effective date is on or before the reporting period end date.
2. Select Person Ethnicity records if:
 - A single record exists that record is used.
 - Multiple records exist and one is flagged as Primary that record is used.
 - Multiple records exist and none are flagged as primary, the record with the highest Percentage defined under Ethnicity Detail is used.
 - There is no way to distinguish between multiple records, the most recent record based on last updated date (LASTUPDDTTM from ETHNICITY_DTL) is used.
3. Use default.
4. Derive as NULL ERROR.

Ethnicity Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Ethnicity

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If ETHNIC is derived from Person HESA Data in Step 1, derive as the effective date of the earliest row in Person HESA Data with the derived value converted to YYYY-MM-DD format.
2. If ETHNIC is not derived from Person HESA Data (that is, from Person Ethnicity, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Ethnicity Valid To Date (VALIDTO)

Return: Data Futures

Entity: Ethnicity

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as null.

Data Futures Return: Marital Status Entity

For each Student entity in the extract, if all of the following conditions are met a single entity is created using either the current value in HESA Person Data or the Biographic History record:

- Country = Northern Ireland.
- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 (permanent home address) and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XG (Northern Ireland).
- The student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.
- Either the student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period *or* there is no existing Marital Status entity in master for the student

Marital Status (MARSTAT)

Return: Data Futures

Entity: Marital Status

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Biographical History	Marital Status
Person HESA Data	MARSTAT

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from the most recent effective-dated Person HESA Data where the effective date is on or before the reporting period end date.
2. Derive the Marital Status value from the most recent effective-dated active Biographical History record where the effective date is on or before the reporting period end date. This is mapped to a HESA code using the HESA Marital Status mapping for the institution.
3. Use default.
4. Derive as NULL ERROR.

Marital Status Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Marital Status

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If MARSTAT is derived from Person HESA Data in Step 1, derive as the effective date of the earliest row in Person HESA Data with the derived value, converted to YYYY-MM-DD.
2. If MARSTAT is derived from Biographical History in Step 2, derive as the effective date of the earliest row in Biographical History with the value that was mapped to the derived HESA code, converted to YYYY-MM-DD format.
3. If MARSTAT is not derived from Person HESA Data or Biographical History (that is, from default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Marital Status Valid To Date (VALIDTO)

Return: Data Futures

Entity: Marital Status

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as null.

Data Futures Return: Disability Entity

For each Student entity in the extract, if the student has a StudentRegistration entity in the extract where INCOMINGEXCHANGE is null, then entities are created using either the current value in HESA Person Data or Impairment records. Only one of the following steps is used to create entities.

- If either DISABILITY or DISABILITY2 (or both) are defined in the most recent effective-dated Person HESA Data where the effective date is on or before the reporting period end date, if DISABILITY is defined an entity is created with derivation step 1. If DISABILITY2 is defined and the code is not the same as DISABILITY, an entity is created with derivation step 1.
- If there are multiple Impairment records for the student mapped to more than two distinct DISABILITY codes other than 00 (no known disability), 09 (three or more), 98 (information refused), or 99 (not available), then a single entity is derived with DISABILITY = 09 using derivation step 2.
- If there are multiple Impairment records for the student mapped to exactly two distinct DISABILITY codes other than 00 (no known disability), 09 (three or more), 98 (information refused), or 99 (not available), then two entities are created, one for each code with derivation step 3.

- If there are one or more Impairment records for the student mapped to a single DISABILITY code (including 00, 09, 98 or 99), then a single entity is derived using the DISABILITY code with derivation step 3.
- A single entity is created with DISABILITY derived either from the default value (if defined) with derivation step 4 or as NULL ERROR with derivation step 5. The default value can be defined as 99 (not available).

Disability Type (DISABILITY)

Return: Data Futures

Entity: Disability

Page Used:

Page	Page Element
Person HESA Data	DISABILITY, DISABILITY2
Personal Information > Health Information > Impairment Regional	Type of Impairment

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from Person HESA Data.
2. If there are multiple mapped impairment records mapped to three or more distinct DISABILITY codes excluding 00, 09, 98 and 99, derive 09.
3. Derive value as the mapped DISABILITY code for the Impairment record. If there are two distinct mapped codes, an entity is created for each code.
4. Use default.
5. Derive as NULL ERROR.

Disability Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Disability

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If DISABILITY is derived from Person HESA Data in Step 1, derive as the effective date of the earliest row in Person HESA Data with the value converted to YYYY-MM-DD format.
2. If DISABILITY is not derived from Person HESA Data (that is, from Impairment, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Disability Valid To Date (VALIDTO)

Return: Data Futures

Entity: Disability

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as null.

Data Futures Return: Qualification Entity

Qualification extract records are created only if the ‘Include Course entities’ parameter has been selected.

Select HESA Qualification records for the Institution where the Effective Status is Active for the most recent row, and the effective date is on or before the reporting period end date.

- If ‘Null Errors Only’ is selected for Course Entities:
 - Select distinct QUALID values from the existing active Qualification extract data where at least one field in the Qualification, Qualification Subject, or Awarding Body Role has a derived value of NULL ERROR.
 - Restrict the selection based on the selected QUALIDs.
- If ‘Validation Errors Only’ is selected for Course Entities, all selected Qualifications are included.
- If Academic Plan or Academic Sub-Plan are selected, all selected Qualifications are included.

The QUALID is derived from the selected HESA Qualification record.

Qualification Category (QUALCAT)

Return: Data Futures

Entity: Qualification

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Qualification	Qualification Category

Field Derivation Rule: Include for all entities

Derivation Steps: Derive from the HESA Qualification page.

Qualification Title (QUALTITLE)

Return: Data Futures

Entity: Qualification

Page Used:

Page	Page Element
HESA Qualification	Qualification Title

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the HESA Qualification page.
2. Derive as null.

Data Futures Return: Qualification Subject Entity

Extract records are created if the 'Include Course entities' parameter has been selected. For each QUALID in the Qualification Extract for the return with an active status, up to 5 entities are created. These are arranged in descending order of percentage, selected by Institution and QUALID from the most recent effective dated HESA Qualification record where the effective date is on or before the reporting period end date record.

Qualification ITT Specialism (QUALITT)

Return: Data Futures

Entity: Qualification Subject

Page Used:

Page	Page Element
HESA Qualification — HECoS Subjects	ITT Subject

Field Derivation Rule: Derive a value if one of the following conditions is met:

- Country = England and at least one associated CourseDelivery.TTCID = 01 and at least one associated Curriculum Accreditation entity exists with ACCREDITATIONID in the range 13909 to 13919

- Country = Scotland and at least one associated CourseDelivery.TTCID = 01 and at least one associated Curriculum Accreditation entity exists with ACCREDITATIONID = 06603 (GTCS Secondary)

Derivation Steps:

- If ITT Subject is selected on the HESA Qualification – HECoS Subjects page, derive as 01.
- Derive as null.

Qualification Proportion (QUALPROPORTION)

Return: Data Futures

Entity: Qualification Subject

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Qualification — HECoS Subjects	Percentage

Field Derivation Rule: Include for all entities

Derivation Step: Derive value from the HESA Qualification percentage.

Qualification Subject (QUALSUBJECT)

Return: Data Futures

Entity: Qualification Subject

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Qualification — HECoS Subjects	Subject

Field Derivation Rule: Include for all entities

Derivation Steps: Derive from the HESA Qualification page.

Data Futures Return: Engagement Entity

For each combination of SID and NUMHUS in the Student Registration extract records, a single Engagement entity is created. If there are multiple Student Registration extract record with different NUMREG values, one Engagement entity is created.

Any changes to field values within Engagement are reported only if a related Student Registration entity is also extracted. Instances are extracted for each reporting period while they are active.

Access Programme (ACCESSPRG)

Return: Data Futures

Entity: Engagement

Page Used:

Page	Page Element
Entry Profile	ACCESSPRG

Field Derivation Rule: Derive a value if all conditions are met:

- Country = Scotland
- Engagement.HIGHESTQUALOE = X0000 or X0001

Derivation Steps:

1. Derive from the Entry Profile page where the HESA Instance with the highest Registration Number (NUMREG) matches NUMHUS and Report to HESA = Y.
2. Use default.
3. Derive as NULL ERROR.

ITT Entry Route (ENTRYRTE)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	ENTRYRTE
Plan HESA Data (Plan Instance HESA Data)	ENTRYRTE
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	ENTRYRTE
HESA Instance Data	ENTRYRTE

Field Derivation Rule: Derive a value if all these conditions are met:

- Country = England
- Any related CourseDelivery.TTCID = 01
- INCOMINGEXCHANGE is null for any related Student Registration entity

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance Data.
3. If Instance.COURSEID is based on a sub-plan, derive from Sub-plan Instance HESA Data.
4. Derive from Plan Instance HESA Data.
5. Derive from Program Instance HESA Data.
6. Use default.
7. Derive as NULL ERROR.

Highest Qualification on Entry (HIGHESTQUALOE)

Return: Data Futures

Entity: Engagement

Page Used:

<i>Page</i>	<i>Page Element</i>
Entry Profile	HIGHESTQUALOE

Field Derivation Rule: Derive a value if INCOMINGEXCHANGE is null for any related Student Registration entity.

Derivation Steps:

1. Derive from the Entry Profile page where the HESA Instance with the highest Registration Number (NUMREG) matches NUMHUS and Report to HESA = Y.
2. Use default.
3. Derive as null.

Intention End Date of Engagement (INTENTIONENDDATE)

Return: Data Futures

Entity: Engagement

Page Used:

<i>Page</i>	<i>Page Element</i>
Entry Profile	INTENTIONENDDATE

Field Derivation Rule: Derive a value if INCOMINGEXCHANGE is null for any related Student Registration entity.

Derivation Steps:

1. Derive from the Entry Profile page where the HESA Instance with the highest Registration Number (NUMREG) matches NUMHUS and Report to HESA = Y.
2. Select the latest EXPECTEDENDDATE value for related Student Registration entities.
3. Derive as null.

Postgraduate Teaching Apprenticeship Start Date (PGAPPSTDT)

Return: Data Futures

Entity: Engagement

Page Used:

Page	Page Element
HESA Instance Data	PGAPPSTDT

Field Derivation Rule:

- A value is derived if Engagement.ENTRYRTE = 10.
- Else field = null

Derivation Steps:

1. Derive Value from HESA Instance Data.
2. Use default.
3. Derive as null.

Previous Provider (PREVIOUSPROVIDER)

Return: Data Futures

Entity: Engagement

Page Used:

Page	Page Element
Entry Profile	PREVIOUSPROVIDER

Field Derivation Rule: Derive a value if all conditions are met:

- Permanent home address is UK (based on PersonAddress.COUNTRYID codes of XF, XG, XH, XI or XK where CONTACTTYPEID is 01) in extract or master
- INTERCALATE is not 01 for any related Student Course Session entity
- INCOMINGEXCHANGE is null for any related Student Registration entity

- STUDYINTENTION is M0002, H0003, H0004, H0005, I0001, I0007, J0000, J0001, J0002, J0003, C0000 or C0001 *OR* • STUDYINTENTION is null and Qualification.QUALCAT is M0002, H0003, H0004, H0005, I0001, I0007, J0000, J0001, J0002, J0003, C0000 or C0001

Derivation Steps:

1. Derive from Entry Profile page.
2. Use default.
3. Derive as NULL ERROR.

Study Intention (STUDYINTENTION)

Return: Data Futures

Entity: Engagement

Page Used:

Page	Page Element
Entry Profile	STUDYINTENTION

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the Entry Profile page where the HESA Instance with the highest Registration Number (NUMREG) matches NUMHUS and Report to HESA = Y.
2. Derive as null.

UCAS Scheme Code (UCASSCHEMECODE)

Return: Data Futures

Entity: Engagement

Page Used:

Page	Page Element
Application Data (Student Admissions > Application Maintenance > Maintain Applications > Application Data)	External Application Number
Entry Profile	UCASSCHEMECODE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from Entry Profile page.

- Reference the Student Program record for the related Instance with the highest Registration Number to find the admission application number (ADM_APPL_NBR), which is used to reference the Admissions Data record (ADM_APPL_DATA) to find the External Application Number (EXT_ADM_APPL_NBR) that holds the UCAS Application Code plus Choice Number for UCAS applications.

If the External Application Number is not null and is a UCAS number, that is, a 4-character application code that begins with 'UC' plus '-' plus a single-digit choice number (for example, UC01-1), then the UCAS value minus the '-' and choice elements is derived (for example, UC01). Only values beginning with 'UC' are derived.

- Derive as null.

Year Left Last Provider (YRLPPROV)

Return: Data Futures

Entity: Engagement

Page Used:

Page	Page Element
Entry Profile	YRLPPROV

Field Derivation Rule:

- If all the following conditions are met a value is derived:
 - Country = Scotland *and*
 - A related Student Initiatives entity exists with INITIATIVEID = 016 (Articulation)
- Else field = null

Derivation Steps:

- Derive from Entry Profile page.
- Use default.
- Derive as null.

Data Futures Return: Student Registration Entity

Entities are created for all Student Program/Plan records that are active and where the corresponding HESA Instance record is set to Report To HESA = Y. Records continue to be included until the Student Program/Plan is completed. The compare logic then determines if the entity should be reported to HESA because some of the data has changed (as compared to the master records) or a child entity should be reported.

Students starting in the reporting period are considered active if:

- They are term-activated for a term that begins within the reporting period, and have at least one enrollment related to that term.
- They have an FTE value of greater than zero for a period that overlaps the reporting period.

Continuing students are considered active if they have a Program Status defined as eligible for inclusion in Returns Setup.

SID, NUMHUS, and NUMREG are derived during the entity selection.

The field derivation is similar to those currently for Instance while considering the values defined in HESA Instance as well as at Program, Plan, and Sub-Plan level.

To allow some fields to be derived from Plan Offering Year and Sub-Plan Offering Year level (that is, Course Session level), the COURSESESSIONID is determined from the child Student Course Session entity for the Student Registration in the extract. If there are multiple child entities, the Student Course Session with the latest SCSSTARTDATE is used.

School Direct Employing School (EMPLOYING SCHOOL)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	EMPLOYINGSCHOOL
Plan HESA Data (Plan Instance HESA Data)	EMPLOYINGSCHOOL
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	EMPLOYINGSCHOOL
HESA Instance Data	EMPLOYINGSCHOOL

Field Derivation Rule: Derive a value if the following condition is Engagement.ENTRYRTE = 03 or 10

Derivation Steps:

1. Use constant.
2. Derive value from HESA Instance Data.
3. If entity is based on a sub-plan, derive value from Sub-Plan Instance HESA Data.
4. Derive value from Plan Instance HESA Data.
5. Derive value from Program Instance HESA Data.
6. Use default.

7. Derive as NULL ERROR.

Expected End Date (EXPECTEDENDDATE)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
HESA Instance	EXPECTEDENDDATE
Student Program	Expected Graduation Term
Term Table — Attributes (Set Up SACR >Foundation Tables >Term Setup >Term/Session Table >Term Table)	Date attribute for end of assessment
HESA Returns Setup — Common Attributes	Common Attributes

Field Derivation Rule: Derive a value if the following conditions are met:

- REGISTRATIONSTARTDATE falls within the reporting period
- REGISTRATIONSTARTDATE is null in master

Derivation Steps:

1. Derive from the HESA Instance page.
2. Derive the EXPECTEDENDDATE of the Course Delivery to which the Student Registration is related.
3. Derive as NULL ERROR.

Fee Eligibility (FEEELIG)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Residency Official 1 (Campus Community, Personal Information (Student), Identification (Student), Residency Data, Residency Official 1)	Residency
Program HESA Data (Program Instance HESA Data)	FEEELIG
Plan HESA Data (Plan Instance HESA Data)	FEEELIG

Page	Page Element
Plan Offering/Year HESA	FEELIG
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	FEELIG
Sub-Plan Offering/Year HESA	FEELIG
HESA Instance Data	FEELIG

Field Derivation Rule: Derive a value if Country = England or Northern Ireland

Derivation Steps:

1. Derive from HESA Instance Data.
2. If the entity is based on a sub-plan, derive from Sub-Plan Offering/Year HESA based on the COUDELID from Student Course Session > Course Session > Course Delivery.
3. If entity is based on a sub-plan, derive from Sub-plan Instance HESA Data.
4. Derive from Plan Offering/Year HESA based on the COUDELID from Student Course Session > Course Session > Course Delivery.
5. Derive from Plan Instance HESA Data.
6. Derive from Program Instance HESA Data.
7. Select the student's official Residency value and map to a HESA Fee Eligibility code. Residency records are selected for the EMPLID, Institution, and Academic Career for the most recent Effective Term that starts on or before the end of the reporting period. If the mapping to a HESA code can't be done, an error message is logged.
8. Use default.
9. Derive as NULL ERROR.

Fee Status (FEESTATUS)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Residency Official 1 (Campus Community, Personal Information (Student), Identification (Student), Residency Data, Residency Official 1)	Residency
Program HESA Data (Program Instance HESA Data)	FEESTATUS
Plan HESA Data (Plan Instance HESA Data)	FEESTATUS

Page	Page Element
Plan Offering/Year HESA	FEESTATUS
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	FEESTATUS
Sub-Plan Offering/Year HESA	FEESTATUS
HESA Instance Data	FEESTATUS

Field Derivation Rule: Derive a value if Country = Scotland

Derivation Steps:

1. Derive from HESA Instance Data.
2. If the entity is based on a sub-plan, derive from Sub-Plan Offering/Year HESA based on the COUDELID from Student Course Session > Course Session > Course Delivery.
3. If entity is based on a sub-plan, derive from Sub-plan Instance HESA Data.
4. Derive from Plan Offering/Year HESA based on the COUDELID from Student Course Session > Course Session > Course Delivery.
5. Derive from Plan Instance HESA Data.
6. Derive from Program Instance HESA Data.
7. Select the student's official Residency value and map to a HESA Fee Eligibility code. Residency records are selected for the EMPLID, Institution, and Academic Career for the most recent Effective Term that starts on or before the end of the reporting period. If the mapping to a HESA code can't be done, an error message is logged.
8. Use default.
9. Derive as NULL ERROR.

Incoming Exchange (INCOMINGEXCHANGE)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	INCOMINGEXCHANGE
Plan HESA Data (Plan Instance HESA Data)	INCOMINGEXCHANGE
Plan Offering/Year HESA	INCOMINGEXCHANGE
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	INCOMINGEXCHANGE

Page	Page Element
Sub-Plan Offering/Year HESA	INCOMINGEXCHANGE
HESA Instance Data	INCOMINGEXCHANGE
HESA Instance Data	Instance Load
Student Program	Academic Load

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from HESA Instance Data.
2. If the entity is based on a sub-plan, derive from Sub-Plan Offering/Year HESA based on the COURSESESSIONID of the child Student Course Session entity.
3. If entity is based on a sub-plan, derive from Sub-plan Instance HESA Data.
4. Derive from Plan Offering/Year HESA based on the COURSESESSIONID of the child Student Course Session entity.
5. Derive from Plan Instance HESA Data.
6. Derive from Program Instance HESA Data.
7. Derive as null.

NHS Employer (NHSEMP)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	NHSEMP
Plan HESA Data (Plan Instance HESA Data)	NHSEMP
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	NHSEMP
HESA Instance Data	NHSEMP

Field Derivation Rule: Derive a value if all these conditions are met:

- Country = England
- At least one associated Curriculum Accreditation entity associated with the Course Delivery with ACCREDITATIONID = 06919, 11107 or 999021

Derivation Steps:

1. Derive from HESA Instance Data.
2. If entity is based on a sub-plan, derive from Sub-plan Instance HESA Data.
3. Derive from Plan Instance HESA Data.
4. Derive from Program Instance HESA Data.
5. Use default.
6. Derive as null.

Qualified Teacher Status (QTS)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	QTS
Plan HESA Data (Plan Instance HESA Data)	QTS
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	QTS
HESA Instance Data	QTS

Field Derivation Rule: Derive a value if all these conditions are met:

- Country = England, Northern Ireland
- Related CourseDelivery.TTCID = 03
- StudentRegistration.INCOMINGEXCHANGE is null

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance Data.
3. If entity is based on a sub-plan, derive from Sub-plan Instance HESA Data.
4. Derive from Plan Instance HESA Data.
5. Derive from Program Instance HESA Data.
6. Use default.
7. Derive as NULL ERROR.

Student Registration Start Date (REGISTRATIONSTARTDATE)

Return: Data Futures

Entity: Student Registration

Page Used:

Page	Page Element
HESA Instance	Start Date of Instance

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Value as ‘Start Date of Instance’ in the HESA Instance record, if a value has previously been calculated or manually determined and stored
2. If there is a Research Candidate record for the instance, select the Begin Date (SSR_RS_BEGIN_DT) from the most recent active Consumption record where the effective date is on or before the reporting period end date. Derive as the Begin Date formatted to YYYY-MM-DD. Note: The Status and Consumption Indicator values are not considered.

The Research Candidate record (SSR_RS_CAND_HDR) is matched to the instance on EMPLID, Institution, Career and Career Number to find the Research Candidate Number (SSR_RS_CANDIT_NBR). If multiple records are found the record with the highest candidate number is selected.

The consumption records (SSR_RS_CONSMPTN) are associated with the Research Candidate record by EMPLID, Institution and Research Candidate Number.

The calculated value is stored in HESA Instance Data.

SSR_RS_CAND_HDR – PK is EMPLID, INSTITUTION, SSR_RS_CANDIT_NBR – potentially there could be more than one header record for an EMPLID, INSTITUTION, CAREER and CAREER NUMBER

SSR_RS_CONSMPTN – PK is EMPLID, INSTITUTION, SSR_RS_CANDIT_NBR, EFFDT, EFFSEQ

3. Calculated as the earliest Class Start Date for enrolled classes related to the Instance being reported. This selection is similar to that done for StudentOnModule except that it is not restricted to classes overlapping the reporting period and considers enrollments for linked careers:
 - Select activated Terms for the Student Career of the Instance
 - For each activated term, select classes with:
 - o Status = Enrolled
 - o Units Taken is greater than zero
 - o Grading Basis matches one of the values defined for Grading Basis Inclusion with the Extract check box selected in HESA Configuration
 - o Repeat Code is not one of the value defined for Repeat Code Exclusion with the Extract check box selected in HESA Configuration
 - If the student has multiple careers with the same Academic Career value as the career being processed (i.e. same Career but different Career Number) then a further filter is applied to the enrollments. In that case a class is only considered if the program value of the enrollment record (PS_STDNT_ENRL) is null or matches one of the program values in the Student Program records for that career/career number.
 - If the Instance has been linked to a prior Student Career using the ‘Linked Career’ and ‘Linked Career Number’ fields in the HESA Instance record, then classes for the previous

career are also considered • The earliest Class Start Date from all the selected classes is derived The calculated value is stored in HESA Instance Data.

4. The earliest Effective Date of the HESA Instance Data records.

Data Futures Return: Student Initiatives Entity

For each Registration extract record, an entity is created if INITIATIVEIDSI has a value defined in the latest HESA Instance record where the effective date falls on or before the reporting period end date.

Student Initiatives (INITIATIVEID)

Return: Data Futures

Entity: Student Registration

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data	INITIATIVEIDSI

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Value from HESA Instance Data.

Data Futures Return: Qualification Awarded Entity

For each Student Registration entity in the extract, entities are created based on either Qualification Awarded records defined in HESA Instance or Student Degree records.

- Select HESA Qualification Awarded records for the HESA Instance record for the Student Registration, or
- Select Student Degree records related to either the Student Plan or the Sub-Plan being reported. If the Sub-Plan is being reported all Degree records associated with the parent Student Plan record are considered.
 - The Student Plan is determined with respect to the most recent non-future effdt record in ACAD_PLAN. Note: For Qualification Awarded the selection includes consideration of rows where the action/reason combination is defined under Award Only Mapping.
 - Degrees are considered if the Degree Status is Awarded and either one of these is true:
 - A QUALAWARDDATE attribute setup for the return is defined for the Student Degree, with a date that falls within the reporting period.

— There is no QUALAWARDDATE attribute defined in Student Degree and the Confer Date falls within the reporting period.

Note: If the attribute is set up in the return and a value is defined for the Student Degree but the date does not fall within the reporting period, the record won't be included.

For Qualification Awarded (from HESA Instance), the QUALID is selected directly from the record.

For Student Degrees the QUALID is derived as the combination of Degree, Primary Plan (i.e. from Degree Plan record with lowest Plan Sequence), Secondary Plan (if defined, Degree Plan record with next lowest Plan Sequence). If the derived QUALID does not exist the Qualification extract or master records the value is set to NULL ERROR.

The QUALAWARDID is derived as the same value as QUALID (unique identifier for qualification).

Qualification Award Date (QUALAWARDDATE)

Return: Data Futures

Entity: Qualification Awarded

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data – Awards	Award Date
Student Degrees > CAF Attributes	Date attribute for award date
Records and Enrollment >Graduation >Student Degrees	Confer Date
HESA Returns Setup — Common Attributes	Common Attributes

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. If the entity is derived from Instance HESA Data – Awards, derive as the Award Date converted to YYYY-MM-DD.
2. If the entity is derived from Student Degrees and a QUALAWARDDATE attribute setup for the return is defined for the Student Degree, derive as the date converted to YYYY-MM-DD.
3. If the entity is derived from Student Degrees, derive as the Confer Date converted to YYYY-MM-DD.

Qualification Result (QUALRESULTQA)

Return: Data Futures

Entity: Qualification Awarded

Page Used:

Page	Page Element
HESA Instance Data – Qualification Awarded	Result
Records and Enrollment > Graduation > Student Degrees > Degree Honors	Honors Type/Honors Code

Field Derivation Rule:

If the following condition is met a value is derived: Qualification.QUALCAT = M0002, H0003, H0004, H0005, H0009, I0001; else field = null.

Derivation Steps:

1. If the entity is derived from Instance HESA Data – Qualifications Awards, derive as the Result value.
2. If the entity is derived from Student Degrees, derive as the Degree Honors Type (DH) and Honors Code mapped to a Result using the HESA Classification mapping. If there are multiple Degree Honors records, the record with the lowest Honors Number is used.
3. Default, e.g. 9999 Not applicable
4. Derive as NULL ERROR.

Thesis Title (THESISTITLE)

Return: Data Futures

Entity: Qualification Award

Page Used:

Page	Page Element
Graduate Research Management > Thesis Management > Thesis Submission	Thesis Title
Graduate Research Management > Candidate Management > Research Topic	Thesis Title
HESA Instance – Thesis Details	Intended Thesis Title
HESA Instance – Qualification Awarded	Thesis Title

Field Derivation Rule: If the following conditions are met a value is derived:

- FundingBody.FUNDINGBODY is a research council: 0002, 0003, 0009, 0012, 0018, 0019, 0022, and
- Qualification.QUALCAT = D0003, and
- StudentRegistration.INCOMINGEXCHANGE does not exist.

Else, field = null.

Derivation Steps:

1. If the entity is derived from Instance HESA Data – Qualification Awarded, derive as Thesis Title from Qualification Awarded.
2. If the entity is derived from Instance HESA Data – Qualification Awarded, derive as Intended Thesis Title from Thesis Details.
3. If there is a Research Candidate record for the related Instance, derive the Thesis Title from the latest (by EFFDT and EFFSEQ) Thesis Management record.

Note: The Research Candidate record (SSR_RS_CAND_HDR) is matched to the instance on EMPLID, Institution, Career and Career Number to find the Research Candidate Number (SSR_RS_CANDIT_NBR).

The thesis records (SSR_RS_THESIS) are associated with the Research Candidate record by EMPLID, Institution and Research Candidate Number.

4. If there is a Research Candidate record for the related instance, derive the Thesis Title from the latest (by EFFDT and EFFSEQ) Research Topic record for the record with the highest sequence (SSR_RS_TOPIC_SEQ).

Note: The Research Candidate record (SSR_RS_CAND_HDR) is matched to the instance on EMPLID, Institution, Career and Career Number to find the Research Candidate Number (SSR_RS_CANDIT_NBR).

The topic records (SSR_RS_TOPIC) are associated with the Research Candidate record by EMPLID, Institution and Research Candidate Number.

5. Derive as null.

Data Futures Return: Qualification Award Accreditation Entity

For each Qualification Awarded entity, entities are created based on the Award Accreditation records defined in HESA Qualification for the QualificationAwarded.QUALID. Records are selected from the most recent effective dated HESA Qualification record where the effective date is on or before the reporting period end date.

Accreditation Identifier (ACCREDITATIONIDQAA)

Return: Data Futures

Entity: Qualification Award Accreditation

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Qualification – Award Accreditation	Accreditation ID

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Value from HESA Qualification.

Data Futures Return: Student Course Session Entity

For each Student Registration entity in the extract, a Student Course Session is created if the student is deemed to be “active” for the reporting period.

For new students (those starting in the reporting period), Student Registration entities are created only if the student is deemed to be active, that is, their term is activated with enrollment or with FTE.

For continuing students, a Student Course Session entity is created if any of the following conditions is met:

- The student has been term-activated for a term that overlaps the reporting period and has at least one enrolled class related to that term.
- For activated terms for the related Student Career, at least one class exists in Student Enrollment (STDNT_ENRL) where Grade In/Official has a value and Grade Date is in the reporting period.
- The student has an FTE value of greater than zero for the reporting period of the return, or for a reporting period that has dates that overlap the reporting period of the return.
- The student hasn’t already been reported as interrupted, dormant, or writing up. This occurs if all the following conditions are met:
 - There is no StudentCourseSession entity related to the Student Registration in master, or the most recent StudentCourseSession entity in master (by latest effective date and then latest SCSSTARTDATE) has a RSNSENSEND value other than 02 (interrupted).
 - There is no SessionStatus entity related to the Student Registration in master, or the most recent SessionStatus entity in master (based on latest effective date and then latest STATUSCHANGEDTO date) has a STATUSVALIDTO value.

The related COURSESESSIONID is determined based on the value defined for Current Course Session in HESA Instance. If Current Course Session is not defined, the COURSESESSIONID is determined with reference to values from Student Program and HESA Instance.

Intended Thesis Title (INTENDEDTHESISTITLE)

Return: Data Futures

Entity: Student Course Session

Page Used:

Page	Page Element
Graduate Research Management > Thesis Management > Thesis Submission	Thesis Title
Graduate Research Management > Candidate Management > Research Topic	
HESA Instance – Thesis Details	Intended Thesis Title

Field Derivation Rule: If all the following conditions are met, derive a value:

- At least one child FundingBody entity has FUNDINGBODY = 0002, 0003, 0009, 0012, 0018, 0019 or 0022,
- Engagement.STUDYINTENTION = D0003 *OR* Engagement.STUDYINTENTION is null *and* the related Qualification.QUALCAT = D0003
- StudentRegistration.INCOMINGEXCHANGE is null

Derivation Steps:

1. Derive from HESA Instance.
2. If there is a Research Candidate record for the related instance, derive Thesis Title from the latest Thesis Management record.
3. If there is a Research Candidate record for the related instance, derive Thesis Title from the latest Research Topic record for the record with the highest sequence (SSR_RS_TOPIC_SEQ).
4. Derive as null.

Intercalation (INTERCALATE)

Return: Data Futures

Entity: Student Course Session

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	INTERCALATE
Plan HESA Data (Plan Instance HESA Data)	INTERCALATE
Plan Offering/Year HESA	INTERCALATE
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	INTERCALATE
Sub-Plan Offering/Year HESA	INTERCALATE
HESA Instance Data	INTERCALATE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from HESA Instance.
2. If the Course Session is based on a sub-plan, derive from Sub-Plan Offering/Year HESA based on the COURSESESSIONID.
3. If the Course Session is based on a sub-plan, derive from Sub-Plan HESA Data.
4. Derive from Plan Offering/Year HESA based on the COURSESESSIONID.
5. Derive from Plan Instance HESA Data.
6. Derive from Program Instance HESA Data.
7. Use default.
8. Derive as null.

PhD Submission Date (PHDSUB)

Return: Data Futures

Entity: Student Course Session

Page Used:

Page	Page Element
Records and Enrollment > Career and Program Information > Student Program/Plan	Program Action and Reason
Graduate Research Management > Thesis Management > Thesis Submission	Actual Submission Date
HESA Instance	PHDSUB

Field Derivation Rule: If all the following conditions are met, derive a value:

- Engagement.STUDYINTENTION = D0003 *or* Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT = D0003
- StudentRegistration.INCOMINGEXCHANGE is null

Derivation Steps:

1. Derive from HESA Instance.
2. If there is a Research Candidate record for the instance, select the earliest Thesis record where Actual Submission Date has a value and the effective date is on or before the reporting period end date. Derive as the Actual Submission Date formatted to YYYY-MM-DD.
3. Select the earliest effective-dated record in the Student Program/Plan stack that has a Program Action and Reason defined in HESA Return Setup – PhD Submission Action Reason Mapping and an

effective date on or before the reporting period end date. Derive as the Effective Date of the record formatted to YYYY-MM-DD.

4. If at least one child FundingBody entity has FUNDINGBODY = 0002, 0003, 0009, 0012, 0018, 0019, or 0022, derive as NULL ERROR
5. Derive as null.

Predicted Full-Time Equivalence (PREDICTEDFTE)

Return: Data Futures

Entity: Student Course Session

Page Used:

Page	Page Element
HESA Instance	Calculated FTE Override FTE Report Zero

Field Derivation Rule: Derive a value if the following conditions are met:

- Country = Northern Ireland or England
- StudentCourseSession.STULOAD is null

Derivation Steps:

1. Derive as zero if the Report Zero check box is selected in the HESA Instance FTE record.
2. If the value is greater than zero, override the FTE recorded in HESA Instance Data.
3. Derive calculated FTE in HESA Instance Data.
4. If Country = Northern Ireland, derive as zero.
5. Derive as null.

Reason for Student Course Session Ending (RSNSCSEND)

Return: Data Futures

Entity: Student Course Session

Page Used:

Page	Page Element
Records and Enrollment > Career and Program Information > Student Program/Plan	Program Action/Action Reason

Page	Page Element
HESA Instance	RSNSCSEND

Field Derivation Rule: Derive a value if SCSENDDATE has a value.

Derivation Steps:

1. Derive from HESA Instance.
2. If the latest non-future row in Student Program/Plan has a program action/reason combination that is mapped to a RSNSCSEND value, derive the mapped value.
3. If there is a related SessionStatus entity in the extract with STATUSCHANGEDTO = 66 (dormant) and STATUSVALIDTO = blank, derive as 02 (Interrupted).
4. Derive as default.
5. Derive as NULL ERROR.

Student Course Session End Date (SCSENDDATE)

Return: Data Futures

Entity: Student Course Session

Page Used:

Page	Page Element
HESA Instance	SCSENDDATE
Plan Year HESA Data	Year Term
Sub-Plan Year HESA Data	Year Term
Term Table — Attributes (Set Up SACR >Foundation Tables >Term Setup >Term/Session Table >Term Table)	Date attribute for end of assessment
HESA Returns Setup — Common Attributes	Common Attributes

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the date is on or before the reporting period end date, derive from HESA Instance.
2. If the latest non-future row in Student Program/Plan (that is, the effective date on or before the reporting period end date) has a program action/reason combination that is mapped to a RSNSCSEND value other than 02 (Interrupted), the effective date of the record is derived in YYYY-MM-DD format.
3. If the related Course Session is based on a Year that is defined as Final, derive as CourseSession.SESSIONENDDATE if that date is on or before the reporting period end date.

4. If the related Course Delivery is based on a Sub-plan, derive as the date attribute defined for the Sub-Plan Year Term for the related Course Session (converted to YYYY-MM-DD format) if that date is on or before the reporting period end date.
5. If the related Course Delivery is based on a Sub-plan, derive as the Term End Date of Sub-Plan Year Term for the related Course Session (converted to YYYY-MM-DD format) if that date is on or before the reporting period end date.
6. If the related Course Delivery is based on a Plan, derive as the date attribute defined for the Plan Year Term for the related Course Session (converted to YYYY-MM-DD format) if that date is on or before the reporting period end date.
7. If the related Course Delivery is based on a Plan, derive as the Term End Date of the Plan Year Term for the related Course Session (converted to YYYY-MM-DD format) if that date is on or before the reporting period end date.
8. Derive as null.

Student Course Session Start Date (SCSSTARTDATE)

Return: Data Futures

Entity: Student Course Session

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	Session Start Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the date is the same as or later than the related CourseSession.SESSIONSTARTDATE, and is on or before CourseSession.SESSIONENDDATE, derive from HESA Instance.
2. Derive as CourseSession.SESSIONSTARTDATE.

Student Load (STULOAD)

Return: Data Futures

Entity: Student Course Session

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	Calculated FTE Override FTE Report Zero

Field Derivation Rule: Derive a value if the following conditions are met:

- Country is Northern Ireland, Scotland, or England
- SCSENDDATE has a value

Derivation Steps:

1. Derive as zero if the Report Zero check box is selected on the HESA Instance FTE record.
2. Override FTE recorded in HESA Instance if the value is greater than zero
3. Calculate FTE in HESA Instance.
4. Use default.
5. If Country is Northern Ireland or Scotland, derive as NULL ERROR.
6. Derive as null.

Data Futures Return: Student Course Session Mode Entity

For each Student Course Session entity in the extract with an SCSSTARTDATE value, a single Student Course Session Mode entity is created.

Student Course Session Mode Type (SCSMODETYPE)

Return: Data Futures

Entity: Student Course Session Mode

Page Used:

Page	Page Element
HESA Instance Data	Instance Load
Student Program (Records and Enrollment > Career and Program Information > Student Program/Plan)	Program Action and Reason Academic Load (ACAD_APPR_LOAD from ACAD_PROG)
Records and Enrollment > Student Term Information > Term Activate a Student > Student Session	Approved Academic Load (ACAD_APPR_LOAD from STDNT_SESSION)
Records and Enrollment > Student Term Information > Term Activate a Student > Enrollment Limit	Approved Academic Load (ACAD_APPR_LOAD from STDNT_CAR_TERM)
Plan Offering/Year HESA (Set Up SACR > Foundation Tables > Academic Structure > Academic Plan Table > Plan Offering/Year HESA)	Academic Load
Sub-Plan Offering/Year HESA (Set Up SACR > Foundation Tables > Academic Structure > Academic SubPlan Table > Sub-Plan Offering/Year HESA)	Academic Load

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the Instance Load value from the most recent HESA Instance Data record is mapped to a HESA Session Mode, derive a value.
2. Select the most recent effective-dated record in the Student Program that has an Effective Date on or before the reporting period end date *and* a Program Action and Reason mapped to a HESA Session Mode as part of the Change of Mode Mapping in HESA Return Setup.
3. Using HESA Mode mapping, map the Approved Academic Load from the most recent Student Session record by session begin date (for sessions that overlap the reporting period) to a HESA Session Mode value.
4. Using HESA Mode mapping, map the Approved Academic Load from the most recent activated Student Term record by term begin date (for terms that overlap the reporting period) to a HESA Session Mode value.
5. Using HESA Mode mapping, map the Academic Load for the most recent effective-dated record in Student Program that has an Effective Date on or before the reporting period end date to a HESA Session Mode.
6. If the related Course Session is based on a Sub-Plan, map the Academic Load from Sub-Plan Year to a HESA Session Mode using HESA Mode mapping.
7. If the related Course Session is based on a Plan, map the Academic Load from Plan Year to a HESA Session Mode using HESA Mode Mapping.
8. Derive as NULL ERROR.

Student Course Session Mode Valid From (SCSMODEVALIDFROM)

Return: Data Futures

Entity: Student Course Session Mode

Page Used:

Page	Page Element
HESA Instance Data	Effective Date
Student Program (Records and Enrollment > Career and Program Information > Student Program/Plan)	Effective Date
Session Table (Set Up SACR >Foundation Tables >Term Setup >Term/Session Table >Session Table)	Begin Date
Term Table (Set Up SACR >Foundation Tables >Term Setup >Term/Session Table >Term Table)	Term Begin Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If SCSSMODETYPE is derived from Instance Load in HESA Instance Data, select the earliest effective-dated row with that Instance Load value.

If the effective date is after the StudentCourseSession.SCSSTARTDATE, derive the date as YYYY-MM-DD, else derive SCSSTARTDATE.

2. If SCSSMODETYPE is derived from a mapped row in Student Program, select the effective date of the row.

If the effective date is after the StudentCourseSession.SCSSTARTDATE, derive the date as YYYY-MM-DD, else derive SCSSTARTDATE.

3. If SCSSMODETYPE is derived from Approved Academic Load in the most recent Student Session record, select the related Session Begin Date.

If the session begin date is after the StudentCourseSession.SCSSTARTDATE, derive the date as YYYY-MM-DD, else derive SCSSTARTDATE.

4. If SCSSMODETYPE is derived from Approved Academic Load in the most recent activated Student Term record, select the related Term Begin Date.

If the term begin date is after the StudentCourseSession.SCSSTARTDATE, derive the date as YYYY-MM-DD, else derive SCSSTARTDATE.

5. If SCSSMODETYPE is derived from Academic Load in the most recent Student Program record, select the effective date of the row.

If the effective date is after the StudentCourseSession.SCSSTARTDATE, derive the date as YYYY-MM-DD, else derive SCSSTARTDATE.

6. Derive as SCSSTARTDATE.

Student Course Session Mode Valid To (SCSSMODEVALIDTO)

Return: Data Futures

Entity: Student Course Session Mode

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Steps: Derive as null.

Data Futures Return: Awarding Body Role Entity

Extract records are created if the 'Include Course entities' parameter has been selected.

For each QUALID in the Qualification Extract for the return, entities are created based on the Awarding Body Role records defined for the HESA Qualification reported in the parent Qualification entity. This occurs if QUALCAT is not P0002 *and* there is at least one Course Delivery entity associated with the QUALID that does not have a child CourseDeliveryRole entity with ROLETYPE = 100.

Awarding Body Identifier (AWARDINGBODYID)

Return: Data Futures

Entity: Awarding Body Role

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Qualification – Awarding Bodies	Awarding Body

Field Derivation Rule: Include for all entities

Derivation Step: Derive value from HESA Qualification page.

Relationship (RELATIONSHIP)

Return: Data Futures

Entity: Awarding Body Role

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Qualification – Awarding Bodies	Relationship

Field Derivation Rule: Include for all entities

Derivation Step:

1. Derive value from HESA Qualification page.
2. Derive as null.

Data Futures Return: Funding Body Entity

For each Student Course Session entity in the extract, a single entity is created if these conditions are met and a non-null FUNDINGBODY value can be derived:

- The related StudentRegistration entity in the extract doesn't have FEEELIG = 02 (not eligible to pay home fees) or 03 (eligibility not assessed).
- The related StudentRegistration entity in the extract doesn't have FEESTATUS = 03 (overseas fees) or 04 (eligibility not assessed).
- The related FundingAndMonitoring entity in the extract doesn't have ELQ = 01 (non-exempt ELQ) or 09 (not required).

Funding Body (FUNDINGBODY)

Return: Data Futures

Entity: Funding Body

Page Used:

Page	Page Element
Program HESA Data (Program Instance HESA Data)	FUNDINGBODY
Plan HESA Data (Plan Instance HESA Data)	FUNDINGBODY
Sub-Plan HESA Data (Sub-plan Instance HESA Data)	FUNDINGBODY
HESA Instance Data	FUNDINGBODY

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Use constant.
2. Derive from HESA Instance.
3. If the related StudentRegistration entity is based on a sub-plan, derive from Sub-Plan HESA Data
4. Derive from Plan HESA Data based on the related StudentRegistration entity.
5. Derive from Program HESA Data based on the related StudentRegistration entity.
6. Use default.
7. Derive as null.

Data Futures Return: Financial Support Scheme Entity

Extract records are created only if the 'Include Course entities' parameter has been selected.

An entity is created for each unique Scheme ID defined under Financial Support in Institution HESA Data from the most recent effective-dated record, where the effective dates is on or before the reporting period end date.

If there are multiple records for the Scheme ID with different Offer ID values, then the row with the lowest Offer ID is used to derive field values.

FINSUPSCHEMEID is derived from the Financial Support record.

Financial Support Type (FINSUPTYPEID)

Return: Data Futures

Entity: Financial Support Scheme

Page Used:

Page	Page Element
Institution HESA Data – Financial Support	Support Type

Field Derivation Rule: Include for all entities

Derivation Steps: Derive value from Financial Support.

Data Futures Return: Financial Support Offer Entity

For each Financial Support Scheme extract record:

- An entity is created for each unique Offer ID defined for the Scheme ID under Financial Support in Institution HESA Data from the most recent effective-dated record, where the effective date is on or before the reporting period end date.
- The FINSUPOFFERID is derived from the selected record.

Data Futures Return: Student Entity

For each distinct SID in the Student Registration extract records, a single Student entity is created.

Birthdate (BIRTHDTE)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Person Information	Date of Birth

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive Date of Birth in the format YYYY-MM-DD.
2. Derive as NULL ERROR.

First Names (FNAMES)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Names	First Name Middle Name

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive the First Name and Middle Name values of the most recent effective dated Primary name record that falls within the reporting period.
2. Derive as null.

Previous Surname (PREVSURNAME)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Names	Last Name

Field Derivation Rule: If all these conditions are met, derive a value:

- Country = England
- The student has a Student Registration entity in the extract that is associated with a CourseDelivery with TTCID = 01.

Derivation Steps:

1. Derive the Last Name value of the most recent effective dated Primary name record where the effective date is before the date of the record used to derive SURNAME and the Last Name is different from the derived value for SURNAME.
2. Derive as null.

Sex Identifier (SEXID)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Biographical History	Gender
HESA Student Data/HESA Restricted Data	SEXID

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from Person HESA Data.
2. Map the Gender value from the most recent effective dated active Biographical History record that falls within the reporting period to a HESA code via the Gender mapping.
3. If a mapping doesn't exist, then the Gender value defaults as follows:
 - F (Female) to 10
 - M (Male) to 11
4. Use default.
5. Derive as NULL ERROR.

Surname at 16 (SNAME16)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Names	Last Name

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive the Last Name value of the most recent effective dated name record that falls on or before the reporting period end date where the name type is defined for the field in Returns Setup.
2. Derive as null.

Surname (SURNAME)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Names	Last Name

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive the Last Name value of the most recent effective dated Primary name record that falls on or before the reporting period end date.
2. Derive as NULL ERROR.

Title (TITLEID)

Return: Data Futures

Entity: Student

Page Used:

Page	Page Element
Personal Information (Student) > Add/Update a Person > Biographical Information > Names	Prefix

Field Derivation Rule: If all these conditions are met, derive a value:

- Country = England
- The student has a Student Registration entity in the extract that is associated with a CourseDelivery with TTCID = 01.

Derivation Steps:

1. Map the Prefix value of the most recent effective dated Primary name record on or before the reporting period end date to a TITLEID code using the Prefix Mapping.
2. If the Prefix is blank or is not mapped, derive as null.

Data Futures Return: Contact Purpose Entity

For each distinct SID in the Student Registration extract records, up to three entities are created based on the following conditions:

- If either of the following conditions are met, an entity is created with CONTACTTYPEID = 01 (permanent home address):
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - A Contact Purpose entity with CONTACTTYPEID = 01 doesn't exist in the master record.
- If all the following conditions are met, an entity is created with CONTACTTYPEID = 02 (term time address):
 - The student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.
 - The student has a StudentCourseSession entity in the extract associated with a CourseSession entity where DISTANCELEARNING, PLACEMENT, and STUDYABROAD are not 01.
- If the following condition is met, an entity is created with CONTACTTYPEID = 03 (QTS email): The student has a QualificationAwardAccreditation entity in the extract where ACCREDITATIONID = 13902 to 13919 (NCTL).

If the student doesn't have a relevant address or email record, a Person Address entity is created with NULL ERROR values.

Data Futures Return: Person Address Entity

For each Contact Purpose entity in the extract, a single entity is created based on the CONTACTTYPEID value.

The ADDRESSID is created as SID + CONTACTTYPEID + Sequence Number. The sequence defaults to 1 and is adjusted by the compare processing depending on existing entities in master.

Term Time Accommodation Type (ACCOMTYPEID)

Return: Data Futures

Entity: Person Address

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	ACCOMTYPEID

Field Derivation Rule: If all these conditions are met, derive a value:

- ContactPurpose.CONTACTTYPEID = 02 (term time address).
- The student has a StudentCourseSession Mode entity in the extract with SCSMODETYPE = 01, 02, or 03.
- The Course Session associated with the StudentCourseSessionMode (via StudentCourseSession) where DISTANCELEARNING, PLACEMENT, and STUDYABROAD are not 01.

Derivation Steps:

1. Derive from Person HESA Data.
2. Use default.
3. Derive as NULL ERROR.

Country Identifier (COUNTRYID)

Return: Data Futures

Entity: Person Address

Page Used:

Page	Page Element
Personal Information (Student) > Biographical (Student) > Addresses/Phones > Addresses	Country

Field Derivation Rule: If ContactPurpose.CONTACTTYPEID = 01 (permanent home address), derive a value.

Derivation Steps:

1. Select the Country Code from the most recent active effective-dated address record that falls on or before the end of the reporting period. The address record must have an Address Type that corresponds to those defined as the Contact Address Types for Contact Type = 01 in HESA Returns Setup. If multiple valid addresses are found with the same effective date (that is, when multiple address types are defined), then one is randomly selected.
2. Use default.
3. Derive as NULL ERROR.

Email (EMAIL)

Return: Data Futures

Entity: Person Address

Page Used:

Page	Page Element
Email Addresses	Email address (preferred)

Field Derivation Rule: If ContactPurpose.CONTACTTYPEID = 03, derive a value.

Derivation Steps:

1. Derive from the student's preferred email address.
2. Derive as NULL ERROR.

Country Identifier (POSTCODE)

Return: Data Futures

Entity: Person Address

Page Used:

Page	Page Element
Personal Information (Student) > Biographical (Student) > Addresses/Phones > Addresses	Postal Code

Field Derivation Rule: If either condition is met, derive a value:

- ContactPurpose.CONTACTTYPEID = 01 (permanent home address) *AND* COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE or IM.
- ContactPurpose.CONTACTTYPEID = 02 (term time address) *AND* the student has a StudentCourseSession entity in the extract associated with a CourseSession entity where DISTANCELEARNING, PLACEMENT, and STUDYABROAD are not 01.

Derivation Steps:

1. If CONTACTTYPEID = 01, select the Postal Code from the most recent active effective dated address record that falls on or before the end of the reporting period. The address record must have an Address Type that corresponds to those defined as the Contact Address Types for Contact Type = 01 in HESA Returns Setup. If multiple valid addresses are found with the same effective date, then one is randomly selected.

If the derived Postal Code is longer than 8 characters, the step is skipped.

2. If CONTACTTYPEID = 02, select the Postal Code from the most recent active effective dated address record that falls on or before the end of the reporting period. The address record must have an Address Type that corresponds to those defined as the Contact Address Types for Contact Type = 02 in HESA Returns Setup.

If the country is one of the UK-related codes, the Postal Code is derived. If multiple valid UK addresses are found with the same effective date, then one is randomly selected.

The following country codes are considered as UK-related for the purposes of this derivation: GBR (United Kingdom), ENG (England), XF (England), NIR (Northern Ireland), XG (Northern Ireland),

SCT (Scotland), XH (Scotland), WAL (Wales), XI (Wales), XK (UK not otherwise specified), XL (Channel Islands not otherwise specified), GG (Guernsey), GGY (Guernsey), JE (Jersey), JEY (Jersey), IM (Isle of Man), or IMN (Isle of Man).

3. Use default.
4. Derive as NULL ERROR.

Address Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Person Address

Page Used:

<i>Page</i>	<i>Page Element</i>
Personal Information (Student) > Biographical (Student) > Addresses/Phones > Addresses	Effective Date

Field Derivation Rule: If ContactPurpose.CONTACTTYPEID = 01 or 02, derive a value.

Derivation Steps:

1. If CONTACTTYPEID = 01 and COUNTRYID is derived in Step 1, derive as the effective date of the address record used to derive COUNTRYID and convert to YYYY-MM-DD.
2. If CONTACTTYPEID = 02 and POSTCODE is derived in Step 2 (for non-distance learning students), derive as the effective date of the address record used to derive POSTCODE then convert to YYYY-MM-DD.
3. Derive as the start date of the reporting period.

Address Valid To Date (VALIDTO)

Return: Data Futures

Entity: Person Address

Page Used: None

Field Derivation Rule: If ContactPurpose.CONTACTTYPEID = 01 or 02, derive a value.

Derivation Steps: Derive as null.

Data Futures Return: Venue Entity

Venue extract records are only created if the 'Include Course entities' parameter is selected.

An entity is created for each Venue ID defined in Institution HESA Data from the most recent effective-dated record, where the effective date is on or before the reporting period end date.

Postcode (POSTCODE)

Return: Data Futures

Entity: Venue

Page Used:

<i>Page</i>	<i>Page Element</i>
Institution HESA Data — Venues	Postcode

Field Derivation Rule: Include for all entities.

Derivation Step: Derive value from Venue.

Venue Name (VENUENAME)

Return: Data Futures

Entity: Venue

Page Used:

<i>Page</i>	<i>Page Element</i>
Institution HESA Data — Venues	Venue Name

Field Derivation Rule: Include for all entities.

Derivation Step: Derive value from Venue.

Venue Type (VENUETYPE)

Return: Data Futures

Entity: Venue

Page Used:

<i>Page</i>	<i>Page Element</i>
Institution HESA Data — Venues	Venue Type

Field Derivation Rule: Include for all entities.

Derivation Step: Derive value from Venue.

Venue UKPRN (VENUEUKPRN)

Return: Data Futures

Entity: Venue

Page Used:

Page	Page Element
Institution HESA Data — Venues	UKPRN

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from Venue.
2. If VENUETYPE = 03, derive as null.
3. Derive as UKPRN for the provider institution from HESA Configuration.

Data Futures Return: Off Venue Activity Entity

For each Student Course Session in the extract, entities are created based on Off Venue Activity records defined for the most recent effective-dated HESA Instance record where the effective date falls on or before the reporting period end date. Records are not included if the Start Date is after the reporting period end date. Records without Start Dates are included.

The OVAID unique identifier is derived as SCSESSIONID (unique identifier for parent Student Course Session) + Sequence Number.

Activity Duration Amount (ACTDURATION)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	Duration

Field Derivation Rule: Include for all entities.

Derivation Step: Derive value from HESA Instance — Off Venue Activity.

Activity Duration Type (ACTDURATIONTYPE)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility)	Duration Type

Field Derivation Rule: Include for all entities.

Derivation Step: Derive value from HESA Instance — Off Venue Activity.

Activity End Date (ACTENDDATE)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility)	End Date

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity, converted to YYYY-MM-DD.
2. Derive as null.

Activity Start Date (ACTSTARTDATE)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility)	Start Date

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity, converted to YYYY-MM-DD.
2. Derive as null.

Activity Type Identifier (ACTTYPEID)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	Activity Type

Field Derivation Rule: Include for all entities.

Derivation Step: Derive value from HESA Instance — Off Venue Activity.

Host Identifier (HOSTID)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Campus Community >Organization >Create/Maintain Organizations >Organization Table	UKPRN, Unique Reference Number, Companies House Number, National Health Service ID, Host ID
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	External Org ID
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	Host ID Type

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity.
2. If an External Org ID is defined, derive UKPRN from the most recent effective-dated Organization Table record.
3. If an External Org ID is defined, derive Unique Reference Number from the most recent effective-dated Organization Table record.
4. If an External Org ID is defined, derive Companies House Number from the most recent effective-dated Organization Table record.
5. If an External Org ID is defined, derive National Health Service ID from the most recent effective-dated Organization Table record.

6. If an External Org ID is defined, derive the Host ID from the most recent effective dated Organization Table record.
7. Derive as NULL ERROR.

Host Identifier Type (HOSTIDTYPE)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Campus Community >Organization >Create/Maintain Organizations >Organization Table	UKPRN, Unique Reference Number, Companies House Number, National Health Service ID, Host ID
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	External Org ID
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	Host ID Type

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity.
2. If an External Org ID is defined and UKPRN is defined in the most recent effective dated Organization Table record, derive 01.
3. If an External Org ID is defined and Unique Reference Number is defined in the most recent effective dated Organization Table record, derive 02.
4. If an External Org ID is defined and Companies House Number is defined in the most recent effective dated Organization Table record, derive 03.
5. If an External Org ID is defined and National Health Service ID is defined in the most recent effective dated Organization Table record, derive 04.
6. If an External Org ID is defined and HESA Identifier is defined in the most recent effective dated Organization Table record, derive 05.
7. Derive as NULL ERROR.

Host Name (HOSTNAME)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Campus Community >Organization >Create/Maintain Organizations >Organization Table	Long Description
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	External Org ID
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	Host Name

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity.
2. If an External Org ID is defined, derive Long Description from the most recent effective-dated Organization Table record.

Lead School (LEADSCHOOL)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

Page	Page Element
Campus Community >Organization >Create/Maintain Organizations >Organization Table	Unique Reference Number
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	External Org ID
Off Venue Activity (Records and Enrollment >Career and Program >Information >HESA Instance Details >Mobility	Lead School

Field Derivation Rule: Include when these conditions are met:

- Country = England
- Engagement.ENTRYRTE = 02, 03, or 10

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity.
2. If an External Org ID is defined, derive Unique Reference Number from the most recent effective-dated Organization Table record.
3. Derive as default.

4. Derive as NULL ERROR.

Mobility Scheme (MOBScheme)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

<i>Page</i>	<i>Page Element</i>
Campus Community >Organization >Create/Maintain Organizations >Organization Table	Scheme

Field Derivation Rule: Include for all entities

Derivation Step: Derive value from HESA Instance — Off Venue Activity.

Module Instance Identifier (MODINSTID)

Return: Data Futures

Entity: Off Venue Activity

Page Used:

<i>Page</i>	<i>Page Element</i>
Campus Community >Organization >Create/Maintain Organizations >Organization Table	Module Instance

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from HESA Instance — Off Venue Activity.
2. Derive as null.

Data Futures Return: Off Venue Activity Location Entity

For each Off Venue Activity entity in the extract, a single OVA Location entity is created if the derived value for OffVenueActivity.ACTTYPEID is 03, 04, 05, 06, or 07.

The entity is not derived when ACTTYPEID is 01 (clinical placement) or 02 (teacher training placement).

Country (COUNTRY)

Return: Data Futures

Entity: Off Venue Activity Location

Page Used:

Page	Page Element
Campus Community >Organization >Create/Maintain Organizations >Organization Location	Country
Records and Enrollment >Career and Program Information >HESA Instance Details >Mobility—Off Venue Activity	External Org ID
Records and Enrollment >Career and Program Information >HESA Instance Details >Mobility—Off Venue Activity	Country

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If an External Org ID is defined, derive the Country for the primary location from the most recent effective-dated Organization Table and Organization Location records.
2. Derive from HESA Instance – Off Venue Activity.
3. Derive as NULL ERROR.

Postcode (POSTCODE)

Return: Data Futures

Entity: Off Venue Activity Location

Page Used:

Page	Page Element
Campus Community >Organization >Create/Maintain Organizations >Organization Location—Location Details	Postcode
Records and Enrollment >Career and Program Information >HESA Instance Details >Mobility—Off Venue Activity	External Org ID
Records and Enrollment >Career and Program Information >HESA Instance Details >Mobility—Off Venue Activity	Postcode

Field Derivation Rule: Include where the derived COUNTRY code is GB, XF, XG, XH, XI, XK, XL, GG, IM, or JE.

Derivation Steps:

1. If an External Org ID is defined, derive the Postcode for the primary location from the most recent effective-dated Organization Table and Organization Location records.
2. Derive from HESA Instance – Off Venue Activity.
3. Derive as NULL ERROR.

Data Futures Return: Collaborative Provision Entity

For each Engagement entity in the extract, a single Collaborative Provision entity is created for the most recent Student Registration entity (that is, highest Registration Number) based on the defined COLPROVTYPEID.

Entities are created using one of these steps. If an entity is created in a step, the subsequent steps are skipped.

1. An entity is created if COLPROVTYPEID is defined in the most recent HESA Instance record for the most recent Student Registration entity in the extract for the SID and NUMHUS of the Engagement entity.
2. An entity is created if COLPROVTYPEID is defined for the most recent effective-dated Sub-Plan HESA Data record for the most recent Student Registration entity in the extract for the SID and NUMHUS of the Engagement entity.
3. An entity is created if COLPROVTYPEID is defined for the most recent effective-dated Plan HESA Data record for the most recent Student Registration entity in the extract for the SID and NUMHUS of the Engagement entity.
4. An entity is created if COLPROVTYPEID is defined for the most recent effective-dated Program HESA Data record of the most recent Student Registration entity in the extract for the SID and NUMHUS of the Engagement entity.

If COLPROVTYPEID isn't defined, entities aren't created.

Collaborative Provision Type (COLPROVTYPEID)

Return: Data Futures

Entity: Collaborative Provision

Page Used:

<i>Page</i>	<i>Page Element</i>
Program HESA Data — Collaborative Provision	Provision Type
Plan HESA Data — Collaborative Provision	Provision Type
Sub-Plan HESA Data — Collaborative Provision	Provision Type
HESA Instance Data — Collaborative Provision	Provision Type

Field Derivation Rule: Derive for all entities.

Derivation Steps:

1. Derive from HESA Instance Data.
2. Derive from Sub-Plan HESA Data.
3. Derive from Plan HESA Data.
4. Derive from Program HESA Data.

Partner NUMHUS (PARTNERNUMHUS)

Return: Data Futures

Entity: Collaborative Provision

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Collaborative Provision	Partner NUMHUS

Field Derivation Rule: Include where COLPROVTYPEID = 03

Derivation Steps:

1. Derive from HESA Instance Data.
2. Derive as null.

Partner SID (PARTNERSID)

Return: Data Futures

Entity: Collaborative Provision

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Collaborative Provision	Partner SID

Field Derivation Rule: Include where COLPROVTYPEID = 03

Derivation Steps:

1. Derive from HESA Instance Data.
2. Derive as null.

Partner UKPRN (PARTNERUKPRN)

Return: Data Futures

Entity: Collaborative Provision

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Collaborative Provision	Partner UKPRN

Field Derivation Rule: Include where COLPROVTYPEID = 03

Derivation Steps:

1. Derive from HESA Instance Data.
2. Derive as null.

Data Futures Return: Student Accreditation Aim Entity

For each Student Course Session entity in the extract, a single entity is created when these conditions are true:

- The related Course Delivery for the Student Course Session (linked via Course Session) has at least one Curriculum Accreditation entity in the extract or master. ACCREDITATIONIDCA must be in the range 05802 to 05809, or in the range 06901 to 06920, or in the range 11102 to 11108.
- ACCREDITATIONSAA is defined in the most recent non-future HESA Instance record.

Accreditation Identifier (ACCREDITATIONIDSAA)

Return: Data Futures

Entity: Student Accreditation Aim

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance	ACCREDITATIONIDSAA

Field Derivation Rule: Include for all entities

Derivation Step: Derive from HESA Instance Data.

Data Futures Return: Student Financial Support Entity

For each Student Registration entity in the extract, entities are derived based on:

- Financial Support records defined for the most recent non-future HESA Instance record for the Registration. Only records with populated Scheme ID and Offer ID are selected. The derivation step for the related fields is set to 1.
- Whether the student has a Support Service Request value defined in the Impairment record, and that value is mapped to a Scheme ID and Offer ID in the Disability Allowance mapping, and that combination of Scheme ID and Offer ID has not been extracted from Financial Support. A single entity is created using the mapped Scheme ID and Offer ID. The derivation step for the related fields is set to 2.

The FINSUPID identifier is derived as the key values for the Student Registration: SID + NUMHUS + NUMREG + Sequence Number. The SID, NUMHUS and NUMREG fields in the entity are derived from the parent Student Registration entity.

Student Course Session Identifier (SCSESSIONID)

Return: Data Futures

Entity: Student Financial Support

Page Used:

Page	Page Element
HESA Instance Data	Current Course Session
HESA Instance Data — Financial Support	Session Specific

Field Derivation Rule: If the entity is derived from HESA Instance — Financial Support and the Session Specific check box is selected.

Derivation Steps:

1. Derive Current Course Session from HESA Instance Data.
2. Derive as NULL ERROR.

Financial Support Scheme Identifier (FINSUPSCHEMEID)

Return: Data Futures

Entity: Student Financial Support

Page Used:

Page	Page Element
HESA Instance Data — Financial Support	Scheme ID
Personal Information >Health Information >Impairment Regional	Support Services Request

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from HESA Instance Data — Financial Support.
2. Derive value mapped from Support Services Request.

Financial Support Offer (FINSUPOFFERID)

Return: Data Futures

Entity: Student Financial Support

Page Used:

Page	Page Element
HESA Instance Data — Financial Support	Offer ID
Personal Information >Health Information >Impairment Regional	Support Services Request

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from HESA Instance Data — Financial Support.
2. Derive value mapped from Support Services Request.

Financial Support Amount (FINSUPAMOUNT)

Return: Data Futures

Entity: Student Financial Support

Page Used:

Page	Page Element
HESA Instance Data — Financial Support	Amount

Field Derivation Rule: Derive a value if the related FinancialSupportScheme entity (based on the derived FINSUPSCHEMEID) has FINSUPTYPE that's *not* equal to 100, 300, 301, 302, 303, 304, or 305.

Derivation Steps:

1. Derive value from HESA Instance Data — Financial Support.
2. Derive as NULL ERROR.

Data Futures Return: Student Fee Entity

For each Student Course Session entity in the extract, a single entity is derived if one of these conditions is met:

For England undergraduates:

- Country = England
- Either one is true:
 - Engagement.STUDYINTENTION starts with H, I, J or C or is M0002
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT starts with H, I, J or C or is M0002
- StudentRegistration.FEEELIG = 01 or 03
- StudentRegistration.INCOMINGEXCHANGE doesn't exist
- A PersonIdentifier entity with IDTYPECODE = 08 (SSN) does not exist in the extract or master.

For England Postgraduates:

- Country = England
- Either Engagement.STUDYINTENTION starts with E or M excluding M0002 *or* Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT starts with E or M excluding M0002
- StudentRegistration.FEEELIG = 01 or 03
- StudentRegistration.INCOMINGEXCHANGE doesn't exist
- The related CourseDelivery.TTCID doesn't equal 06.

For Northern Ireland

- Country = Northern Ireland
- Any one of these is true:
 - Engagement.STUDYINTENTION starts with H, I, J or C or is M0002, M0016 or M0018
 - Engagement.STUDYINTENTION = M0019 and CurriculumAccreditation.ACCREDITATIONID = 00103
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT starts with H, I, J, or C or is M0002
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT = M0019 and CurriculumAccreditation.ACCREDITATIONID = 00103
- StudentRegistration.FEEELIG = 01 or 03

- StudentRegistration.INCOMINGEXCHANGE doesn't exist
- A PersonIdentifier entity with IDTYPECODE = 08 (SSN) doesn't exist in the extract or master.

For Scotland:

- Country = Scotland
- Either one of these is true:
 - Engagement.STUDYINTENTION = Engagement.STUDYINTENTION = M0002, M0016, M0018, M0019, H0003, H0004, H0005, H0009, H0017, I0001, J0002, J0003, C0000, C0001
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT = M0002, M0016, M0018, M0019, H0003, H0004, H0005, H0009, H0017, I0001, J0002, J0003, C0000, C0001
- StudentRegistration.FEESTATUS = 02
- StudentRegistration.INCOMINGEXCHANGE doesn't exist
- CollaborativeProvision.COLPROVTYPEID doesn't equal 01 or 02

And for all students, the student isn't dormant for the whole Student Course Session:

A Session Status entity doesn't exist for the Student Course Session in the extract or master of the most recent Session Status entity (by STATUSVALIDFROM date) for the Student Course Session in the extract, or the master doesn't meet all of these conditions:

- STATUSCHANGEDTO = 66
- STATUSVALIDFROM is on or before the StudentCourseSession.SCSSTARTDATE
- Either one is true:
 - STATUSVALIDTO is blank
 - Both STATUSVALIDTO and StudentCourseSession.SCSENDDATE have values
- STATUSVALIDTO is on or after SCSENDDATE

Fee Amount (FEEAMOUNT)

Return: Data Futures

Entity: Student Fee

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data	Fee Amount

Page	Page Element
Fees After Calculation (Student Financials >Tuition and Fees >Review Fees After Calculation)	Amount
Program Instance HESA Data	FEEAMOUNT
Plan Instance HESA Data	FEEAMOUNT
Plan Offering HESA Data	FEEAMOUNT
Plan Offering/Year HESA Data	FEEAMOUNT
Sub-Plan Instance HESA Data	FEEAMOUNT
Sub-Plan Offering HESA Data	FEEAMOUNT
Sub-Plan Offering/Year HESA Data	FEEAMOUNT

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive value from HESA Instance Data.
2. Derive the total of all the tuition fee charges for the Student Career for terms that start within the reporting period. Fees records where the Item Type Code is 'Charge' and the Account Type is one of those defined when the Tuition check box is selected in HESA Returns Setup. The derived value is rounded to the nearest pound.
3. If the Student Course Session is based on a sub-plan, derive from Sub-Plan Year HESA Data for the related Course Session.
4. If the Student Course Session is based on a sub-plan, derive from Sub-Plan Offering HESA Data for the related Course Delivery.
5. If the Student Course Session is based on a sub-plan, derive from Sub-Plan HESA Data for the related Course Delivery.
6. If the Student Course Session is based on a plan, derive from Sub-Plan Year HESA Data for the related Course Session.
7. If the Student Course Session is based on a plan, derive from Plan Offering HESA Data for the related Course Delivery.
8. Derive from Plan HESA Data for the related Course Delivery.
9. Derive from Program HESA Data for the related Course Delivery.
10. Use default.
11. Derive as NULL ERROR.

Fee Collector (FEECOLLECTOR)

Return: Data Futures

Entity: Student Fee

Page Used:

Page	Page Element
HESA Instance Data	Fee Collector

Field Derivation Rule: Derive a value if there are no related CourseRole entities with ROLETYPE = 100, 101, or 102.

Derivation Steps:

1. Derive value from HESA Instance Data.
2. If the Student Course Session is based on a sub-plan, derive from Sub-Plan Year HESA Data for the related Course Session.
3. If the Student Course Session is based on a sub-plan, derive from Sub-Plan Offering HESA Data for the related Course Delivery.
4. If the Student Course Session is based on a sub-plan, derive from Sub-Plan HESA Data for the related Course Delivery.
5. If the Student Course Session is based on a plan, derive from Plan Year HESA Data for the related Course Session.
6. If the Student Course Session is based on a plan, derive from Plan Offering HESA Data for the related Course Delivery.
7. Derive from Plan HESA Data for the related Course Delivery.
8. Derive from Program HESA Data for the related Course Delivery.
9. Use default.
10. Derive as NULL ERROR.

Data Futures Return: Fee Invoice Amount Entity

For each Student Course Session entity in the extract, entities are created if the related StudentRegistration.INCOMINGEXCHANGE value is blank in the extract. Entities are created for each Fee Invoice record in HESA Instance.

The INVOICEID unique identifier is derived as SCSESSIONID + Sequence Number.

HESA Identifier (HESAIDFIA)

Return: Data Futures

Entity: Fee Invoice Amount

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Fee Invoices	Identifier

Field Derivation Rule: Include for all entities

Derivation Step: Derive from HESA Instance Data.

Fee Amount (FEEAMOUNT)

Return: Data Futures

Entity: Fee Invoice Amount

Page Used:

<i>Page</i>	<i>Page Element</i>
HESA Instance Data — Fee Invoices	Amount

Field Derivation Rule: Include for all entities

Derivation Step: Derive from HESA Instance Data.

Data Futures Return: Care Leaver Entity

For each Student entity in the extract, if one of the following sets of conditions is met a single entity is created:

For Country = England:

- There is an Engagement entity for the student in the extract where either condition is true:
 - Engagement.STUDYINTENTION starts with H, I, J, or C; or is M0002, M0016, M0018 or M0019 excluding H0009, H0010, H0011, H0017.
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT starts with H, I, J, or C; or is M0002, M0016, M0018 or M0019 excluding H0009, H0010, H0011, H0017.
- There is a related Student Registration entity for the student in the extract where INCOMINGEXCHANGE is null and REGISTRATIONSTARTDATE is after 2013-07-31.
- There is a related Student Course Session entity for the student in the extract with a related FundingBody entity in the extract with FUNDINGBODY = 0016 (OfS) or 0020 (DfE).
- If any one of these conditions is true:

- The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
- There is no existing Care Leaver entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

For Country = Scotland:

- There is a ContactPurpose entity for the student in the extract with CONTACTTYPEID = 01 and the associated PersonAddress entity in the extract has COUNTRYID = XF, XG, XH, XI, or XK.
- There is an Engagement entity for the student in the extract where either condition is true:
 - Engagement.STUDYINTENTION starts with H, I, J, or C; or is M0002 or M0019
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT starts with H, I, J, or C; or is M0002 or M0019
- There is a related Student Registration entity for the student in the extract where REGISTRATIONSTARTDATE is after 2013-07-31.
- If any one of these conditions is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Care Leaver entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

For Country = Northern Ireland:

- There is an Engagement entity for the student in the extract with a UCASSCHEMECODE value.
- There is an Engagement entity for the student in the extract where either condition is true:
 - Engagement.STUDYINTENTION starts with H, I, J or C or is M0002, M0016, M0018 or M0019
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT starts with H, I, J, or C; or is M0002, M0016, M0018 or M0019.
- There is a related Student Registration entity for the student in the extract where REGISTRATIONSTARTDATE is after 2013-07-31.
- If any one of these conditions is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Care Leaver entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

The compare logic updates the VALIDFROM and VALIDTO dates as appropriate, and creates a new entity for existing entities that are amended.

Care Leaver Type (CARELEAVER)

Return: Data Futures

Entity: Care Leaver

Page Used:

Page	Page Element
Person HESA Data	CARELEAVER

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

Care Leaver Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Care Leaver

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If CARELEAVER is derived from Person HESA Data in step 1, derive the effective date of the earliest record, with the derived value converted to YYYY-MM-DD.
2. If CARELEAVER is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Care Leaver Valid To Date (VALIDTO)

Return: Data Futures

Entity: Care Leaver

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Dependant Entity

For each Student entity in the extract, if one of the following set of conditions are met, then a single entity is created using the current value in HESA Person Data:

For Country = Northern Ireland:

- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 (permanent home address) and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XG (Northern Ireland).
- The student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.
- If one of the following is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Dependent entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

For Country = Scotland, the student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.

The compare logic updates the VALIDFROM and VALIDTO dates as appropriate, and creates a new entity for existing entities that are amended.

Dependant Type (DEPENDANT)

Return: Data Futures

Entity: Dependant

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	DEPENDANT

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

Dependant Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Dependant

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If DEPENDANT is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If DEPENDANT is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Dependant Valid To Date (VALIDTO)

Return: Data Futures

Entity: Dependant

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Gender Identity Entity

For each Student entity in the extract, a single entity is created if GENDERID is derived as a non-null value.

Gender Identity Type (GENDERID)

Return: Data Futures

Entity: Gender Identity

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	GENDERID

Field Derivation Rule: Include for all entities

Derivation Step: Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.

Gender Identity Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Gender Identity

Page Used:

<i>Page</i>	<i>Page Element</i>
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Step: If GENDERID is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.

Gender Identity Valid To Date (VALIDTO)

Return: Data Futures

Entity: Gender Identity

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Language Proficiency Entity

For each Student entity in the extract, if all these conditions are met, a single entity is created:

- Country = Scotland

- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 (permanent home address) and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, IM (UK related).
- LANGUAGEIDLP is defined in the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.

Language Identifier (LANGUAGEIDLP)

Return: Data Futures

Entity: Language Proficiency

Page Used:

Page	Page Element
Person HESA Data	LANGUAGEIDLP

Field Derivation Rule: Include for all entities

Derivation Step: Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.

First or Preferred Language Marker (PREFLANGUAGE)

Return: Data Futures

Entity: Language Proficiency

Page Used:

Page	Page Element
Person HESA Data	PREFLANGUAGE

Field Derivation Rule: Derive a value if LANGUAGEIDLP = 04 (BSL).

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as null.

Proficiency Type (PROFICIENCYTYPE)

Return: Data Futures

Entity: Language Proficiency

Page Used:

Page	Page Element
Person HESA Data	PROFICIENCYTYPE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as null.

Data Futures Return: National Identity Entity

For each Student entity in the extract, a single entity is created if a non-null value is derived for NATIOND.

National Identity Type (NATIOND)

Return: Data Futures

Entity: National Identity

Page Used:

Page	Page Element
Person HESA Data	NATIOND

Field Derivation Rule: Include for all entities

Derivation Step: Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.

National Identity Valid From Date (VALIDFROM)

Return: Data Futures

Entity: National Identity

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Step: If NATIOND is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.

National Identity Valid To Date (VALIDTO)

Return: Data Futures

Entity: National Identity

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Nationality Entity

For each Student entity in the extract, a single entity is created if a non-null value is derived for NATION.

National Type (NATION)

Return: Data Futures

Entity: Nationality

Page Used:

Page	Page Element
Person HESA Data	NATION
Campus Community >Personal Information (Student) >Identification (Student) >Citizenship >Citizenship and Passport	Country

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Select Person Citizenship records and pick up the related two-character codes (COUNTRY_2CHAR) from the Country table (COUNTRY_TBL). If a mapping exists in the HESA Nationality Mapping for the CS Country, use the mapped HESA value. Otherwise, use the COUNTRY_2CHAR value.

If a single record is found, derive the CS country or HESA country value.

3. Select Person Citizenship records (as in step 2). If multiple records are found and one has a value of 'GB', derive that value.

4. Select Person Citizenship records (as in step 2). If multiple records are found, none are 'GB' but at least one is flagged as European Union country, then derive the EU country.

If there are multiple EU countries, report the one with the lowest alpha HESA code.

Note: The COUNTRY_TBL contains a flag (EU_MEMBER_STATE) to indicate if the country is a member or the EU.

5. Select Person Citizenship records (as in step 2). If multiple records are found and none are UK or EU, select the lowest alpha code.
6. Use default.
7. If the Country is England or Scotland, derive as NULL ERROR.

Nationality Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Nationality

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If NATION is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If NATION is *not* derived from Person HESA Data (that is, from Citizenship, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Nationality Valid To Date (VALIDTO)

Return: Data Futures

Entity: Nationality

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Parental Education Entity

For each Student entity in the extract, if one of the following sets of conditions is met, a single entity is created:

If Country = Northern Ireland:

- There is an Engagement entity for the student in the extract where UCASSCHEMECODE has a value.
- There is a ContactPurpose entity for the student in the extract with CONTACTTYPEID = 01 and the associated PersonAddress entity in the extract has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, or IM.
- There is an Engagement entity for the student in the extract where either one is true:
 - Engagement.STUDYINTENTION equals M0002, H0003, H0004, H0005, I0001, J0000, J0001, J0002, J0003, C0000, or C0001.
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT equals M0002, H0003, H0004, H0005, I0001, J0000, J0001, J0002, J0003, C0000, or C0001.
- The student has a Student Course Session entity in the extract where INTERCALATE is not 01.
- The student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.
- If either one is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Parental Education entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

If Country = England or Scotland:

- There is a ContactPurpose entity for the student in the extract with CONTACTTYPEID = 01 and the associated PersonAddress entity in the extract has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, or IM.
- There is an Engagement entity for the student in the extract where either one is true:
 - Engagement.STUDYINTENTION equals M0002, H0003, H0004, H0005, I0001, J0000, J0001, J0002, J0003, C0000, or C0001.
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT and equals M0002, H0003, H0004, H0005, I0001, J0000, J0001, J0002, J0003, C0000, or C0001.
- The student has a Student Course Session entity in the extract where INTERCALATE is not 01.
- The student has a Student Registration entity in the extract where INCOMINGEXCHANGE is null.
- If either one is true:

- The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
- There is no existing Parental Education entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

The compare logic updates the VALIDFROM and VALIDTO dates as appropriate, and creates a new entity for existing entities that are amended.

Parental Education Type (PARED)

Return: Data Futures

Entity: Parental Education

Page Used:

Page	Page Element
Person HESA Data	PARED

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

Parental Education Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Parental Education

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If PARED is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.

2. If PARED is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Parental Education Valid To Date (VALIDTO)

Return: Data Futures

Entity: Parental Education

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Religion Entity

For each Student entity in the extract, a single entity is created.

Religion Type (RELIGION)

Return: Data Futures

Entity: Religion

Page Used:

Page	Page Element
Person HESA Data	RELIGION
Campus Community >Personal Information >Biographical >Personal Attributes >Religious Preferences	Religious Preference

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Derive Religious Preference for the person mapped to a HESA code using HESA Religion Mapping. If the value is not mapped, log an error then skip to the next step.
3. Use default.
4. Derive as NULL ERROR.

Religion Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Religion

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If RELIGION is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If RELIGION is *not* derived from Person HESA Data (that is, from Religious Preference, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Religion Valid To Date (VALIDTO)

Return: Data Futures

Entity: Religion

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Religious Background Entity

For each Student entity in the extract, a single entity is created if all of these conditions are met:

If Country = Northern Ireland:

- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 (permanent home address) and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XG (Northern Ireland).
- If either one is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Religious Background entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

The compare logic updates the VALIDFROM and VALIDTO dates as appropriate, and creates a new entity for existing entities that are amended.

Religious Background Type (RELIGIOUSBGROUND)

Return: Data Futures

Entity: Religious Background

Page Used:

Page	Page Element
Person HESA Data	RELIGIOUSBGROUND

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

Religious Background Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Religious Background

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If RELIGIOUSBGROUND is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If RELIGIOUSBGROUND is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Religious Background Valid To Date (VALIDTO)

Return: Data Futures

Entity: Religious Background

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Service Leaver Entity

For each Student entity in the extract, if one of the following sets of conditions is met and the derived SERLEAVE value is not null, a single entity is created:

If Country = Scotland:

- There is a ContactPurpose entity for the student in the extract with CONTACTTYPEID = 01 and the associated PersonAddress entity in the extract has COUNTRYID = XH (Scotland).
- Either one is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Service Leaver entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

Note: The initial selection includes both undergraduate (required) and postgraduate (optional). The SERLEAVE derivation step includes reporting NULL ERROR for undergraduate students without a value.

If Country = England:

- There is a Student Course Session entity for the student in the extract where the related CourseDelivery has TTCID = 01.
- The StudentRegistration.REGISTRATIONSTARTDATE for the related Student Registration entity in the extract is after 2018-07-31.
- Either one is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Service Leaver entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

The compare logic updates the VALIDFROM and VALIDTO dates as appropriate, and creates a new entity for existing entities that are amended.

Service Leaver Type (SERLEAVE)

Return: Data Futures

Entity: Service Leaver

Page Used:

Page	Page Element
Person HESA Data	SERLEAVE

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. If Country is England, or Course is Scotland and there is an Engagement entity for the student in the extract where either Engagement.STUDYINTENTION starts with H, I, J or C, or Engagement.STUDYINTENTION is null, and the related Qualification.QUALCAT starts with H, I, J, C, derive as NULL ERROR.

Service Leaver Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Service Leaver

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If SERLEAVE is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If SERLEAVE is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

Service Leaver Valid To Date (VALIDTO)

Return: Data Futures

Entity: Service Leaver

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Sexual Orientation Entity

For each Student entity in the extract, a single entity is created if a non-null value is derived for SEXORT.

Sexual Orientation Type (SEXORT)

Return: Data Futures

Entity: Sexual Orientation

Page Used:

Page	Page Element
Person HESA Data	SEXORT
Personal (Campus Community, Personal Information, Add/Update a Person)	Sexual Orientation

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. The coded value from the most recent effective-dated active Person Biographic record (SCC_PERS_BIOG) that falls on or before the reporting period end date is used and mapped to a HESA code via the Orientation mapping.
3. Use default.

Sexual Orientation Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Sexual Orientation

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If SEXORT is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If SEXORT is derived from Person Biographic in step 2, derive the effective date of the earliest row in Person Biographic, with the mapped value converted to YYYY-MM-DD.
3. If SEXORT is derived from the default, derive VALIDFROM as the reporting period start date.

Sexual Orientation Valid To Date (VALIDTO)

Return: Data Futures

Entity: Sexual Orientation

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Socio Economic Classification Entity

For each Student entity in the extract, if all conditions are met a single entity is created:

- There is an Engagement entity for the student in the extract where UCASSCHEMECODE has a value and either one is true:
 - Engagement.STUDYINTENTION begins with H, I, J, or C or is M0002.
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT begins with H, I, J, or C or is M0002.
- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 (permanent home address) and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, IM (UK related).
- If either one is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Parental Education entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

Socio Economic Classification (SEC)

Return: Data Futures

Entity: Socio Economic Classification

Page Used:

Page	Page Element
Person HESA Data	SEC

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

SEC Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Socio Economic Classification

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If SEC is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If SEC is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

SEC Valid To Date (VALIDTO)

Return: Data Futures

Entity: Socio Economic Classification

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Data Futures Return: Standard Occupational Classification Entity

For each Student entity in the extract, if all conditions are met a single entity is created:

- There is an Engagement entity for the student in the extract where UCASSCHEMECODE has a value and either one is true:
 - Engagement.STUDYINTENTION begins with H, I, J, or C or is M0002.
 - Engagement.STUDYINTENTION is null and the related Qualification.QUALCAT begins with H, I, J, or C or is M0002.
- The student has a ContactPurpose entity (in extract or master) where CONTACTYPEID = 01 (permanent home address) and the most recent child PersonAddress entity (based on VALIDFROM) date has COUNTRYID = XF, XG, XH, XI, XK, XL, GG, JE, IM (UK related).
- If either one is true:
 - The student has a Student Registration entity in the extract with a REGISTRATIONSTARTDATE within the reporting period.
 - There is no existing Parental Education entity in master for the student.

This creates entities for continuing students where a value has not already been reported to HESA, but it will not create entities for updates to previously reported entities.

Standard Occupational Classification 2010 (SOC2010)

Return: Data Futures

Entity: Standard Occupational Classification

Page Used:

Page	Page Element
Person HESA Data	SOC2010

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from the most recent effective-dated Person HESA Data, where the effective date is on or before the reporting period end date.
2. Use default.
3. Derive as NULL ERROR.

SOC2010 Valid From Date (VALIDFROM)

Return: Data Futures

Entity: Standard Occupational Classification

Page Used:

Page	Page Element
Person HESA Data	Effective Date

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If SOC2010 is derived from Person HESA Data in step 1, derive the effective date of the earliest row in Person HESA Data, with the derived value converted to YYYY-MM-DD.
2. If SOC2010 is *not* derived from Person HESA Data (that is, default or NULL ERROR), derive VALIDFROM as the reporting period start date.

SOC2010 Valid To Date (VALIDTO)

Return: Data Futures

Entity: Standard Occupational Classification

Page Used: None

Field Derivation Rule: Include for all entities

Derivation Step: Derive as null.

Graduate Outcomes Return: Provider Entity

If Retain Data from Previous Run is:

- selected, initially any existing inactive extract records are deleted and any existing active records are set to inactive for all the extract records before new entities are created.
- not selected, then initially all the existing extract records for the return are deleted before new entities are created. This applies to all the extract records.

Entity selection and field derivation is as per INSTITUTION in DLHE return.

A single active Provider entity is created in the Institution Extract Data record (SSR_HE_INST_EXT) for a Graduate Outcomes return based on the HESA Returns Setup record.

The SSR_HE_INSTAPP value is saved as blank as this field is not required for GRADOUT returns.

Census (CENSUS)

Return: GRADOUT

Entity: Provider

Pages Used: None

Field Derivation Rule: Include for all entities.

Derivation Steps:

Derive as the short translate name for the selected survey parameter:

- A = Dec
- B = Mar
- C = Jun
- D = Sep

Record Type Indicator (RECID)

Return: GRADOUT

Entity: Provider

Pages Used:

Page	Page Element
Reporting Periods (Records and Enrollment, HESA Reporting, HESA Returns Setup, Reporting Periods)	Record Year
Returns (Records and Enrollment, HESA Reporting, HESA Returns Setup, Returns)	Record ID

Field Derivation Rule: Include for all Institution entities

Derivation Step: Derive as YYNNN, where YY is the final two digits of the Record Year (for example, 17 for 2017) and NNN is the three-digit Record ID for the seeded return (071 for GRADOUT).

UK Provider Reference Number (UKPRN)

Return: GRADOUT

Entity: Provider

Pages Used:

Page	Page Element
HESA Configuration	UKPRN

Field Derivation Rule: Include for all Institution entities.

Derivation Step: Derive from the HESA Configuration page.

Graduate Outcomes Return: Graduate Entity

A Graduate entity is created in the survey extract record (SSR_HE_DL_EXT) for each distinct survey record for the return that meets the following criteria:

- If at least one survey status has been defined in HESA Returns Setup (SSR_HE_DL_STAT), then a survey is only included if it has a status value that matches one of the defined statuses. If a survey status is not defined, then the survey is included irrespective of status.
- A survey is only included based on Survey (SSR_HE_APRJAN) when the corresponding Survey (that is, CENSUS) parameter (A, B, C, or D) is selected.
- If the Student Override check box is selected, survey selection is restricted based on the defined EMPLID values.
- If *Null Error Only* is selected for Student entities:
 - Select only survey records where at least one field has a derived value of NULL ERROR
 - A flag in the survey extract table (SSR_HE_DL_EXT) is set to “Y” if there is at least one field with a derived value of NULL ERROR (SSR_HE_STD_NULLERR) in either the Survey or Postal Address extract fields records

The record SSR_HE_DL_EXT and SSR_HE_DL_EX_FL are used to hold the Graduate entity values.

The derived values for APRJAN and HUSID are stored in the main table. The fields table holds the derived values for the other fields.

The Null Error flag (SSE_HE_STD_NULLERR) is set to ‘Y’ if any of the fields in any of the related entities is derived as NULL ERROR.

Country (COUNTRY)

Return: GRADOUT

Entity: Graduate

Pages Used: None

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Select the most recent active, effective-dated address record with an Address Type that corresponds to Address Types for COUNTRY in the HESA Return Setup record (or if no Address Types are defined then consider all address types) where the country code is one of the UK codes (GBR, ENG, SCT, WAL, NIR, XF, XG, XH or XI).

If multiple UK addresses are found with the same effective date, then one is randomly selected.

Derive the HESA country code as follows:

- GBR = XK
- ENG or XF = XF
- NIR or XG = XG
- SCT or XH = XH
- WAL or XI = XI

2. Select the most recent active, effective-dated address record with an Address Type that corresponds to Address Types for COUNTRY in the HESA Return Setup record (or if no Address Types are defined then consider all address types) where the country code is *not* one of the UK codes.

If multiple non-UK addresses are found with the same effective date, then one is randomly selected.

Derive the two-character country code from the Country table, for example: AUS (Australia) = AU.

3. Use default. (for example, ZZ = not known)
4. Derive as NULL ERROR.

Email Address (EMAIL, EMAIL2, EMAIL3)

Return: GRADOUT

Entity: Graduate

Pages Used:

Page	Page Element
Electronic Addresses (Campus Community >Personal Information (Student) >Add/Update a Person >Biographical Information	Email Address, Type

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Select up to three email addresses where the email type matches one of the types set up in Returns Setup – HESA types for EMAIL, or no types are set up for the return for EMAIL.

If one of the selected emails has preferred = “Y,” that record is used for EMAIL and any other selected email addresses are used for EMAIL2 and EMAIL3. If more than three email addresses are selected, then the values are derived by by email type in ascending order.

2. Derive as NULL.

Forenames (FNAMES)

Return: GRADOUT

Entity: Graduate

Pages Used:

Page	Page Element
Survey Details — Supplied Fields	Forenames

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive from the survey record.
2. Derive as NULL.

Forename Change (FNMECHNGE)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details > Names)	First Name Middle Name

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If First Name space Middle Name of the most recent effective-dated primary name record is different from the derived FNAMES value, derive the value.
2. Derive as null.

Status of Graduate (GRADSTATUS)

Return: GRADOUT

Entity: Graduate

Pages Used:

Page	Page Element
Survey Details — Supplied Fields	Graduate Status
Campus Community >Personal Information >Biographical >Personal Attributes >Decedent Data	Date of Death

Field Derivation Rule: Include for all entities.

Derivation Steps:

1. Derive from the survey record.
2. If Date of Death is populated, derive as 01 (deceased).
3. If null values are derived for all email and telephone fields, derive as 02 (not contactable by email or telephone).
4. Derive as NULL.

HESA Unique Graduate Identifier (HUSID)

Return: GRADOUT

Entity: Graduate

Pages Used:

Page	Page Element
Survey Details — Supplied Fields	HUSID

Field Derivation Rule: Include for all entities.

Derivation Step: Derive from the survey record.

International Telephone (INTTEL, INTTEL2, INTTEL3)

Return: GRADOUT

Entity: Graduate

Pages Used:

Page	Page Element
Campus Community >Personal Information >Addresses/Phones >Phone Numbers	Phone Number Country Code

Field Derivation Rule: Derive up to three values from non-UK phone numbers where the phone type matches one of the types set up in Returns Setup – HESA Types for INTTEL, or no types are set up for the return for that field and either one of the following:

- Country Code has a value and is *not* 000 nor 044
- Country Code is blank or 000, phone number starts with +, and Phone number does not start +44

If one of the selected records has Preferred = “Y,” that record is used for INTTEL and any other records are used for INTTEL2 and INTTEL3. If more than three non-UK phone numbers are selected, then fields are derived by phone type in ascending order.

Derivation Step:

1. Remove special characters, spaces, and leading zeros from the phone number as well as any country code with leading zeros. Two leading zeroes are added for the UK international direct dialing code.

Derive the value if it is 17 digits or fewer.
2. For INTTEL, if the preferred phone number is derived and the derived number is longer than 17 digits, derive as NULL ERROR.

Own Graduate Identifier (OWNSTU)

Return: GRADOUT

Entity: Graduate

Pages Used:

Page	Page Element
Survey Details — Header	EMPLID

Field Derivation Rule: Include for all entities.

Derivation Step: Derive from the survey record.

Surname Change (SNAMECHNGE)

Return: Student Record

Entity: Student

Page Used:

Page	Page Element
Names (Campus Community > Personal Information (Student) > Add/Update a Person > Biographical Details > Names)	Last Name

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the Last Name of the most recent effective-dated primary name record is different from the derived SURNAME value, derive the value.
2. Derive as null.

Surname (SURNAME)

Return: GRADOUT

Entity: Graduate

Pages Used:

<i>Page</i>	<i>Page Element</i>
Survey Details — Supplied Fields	Surname

Field Derivation Rule: Include for all entities.

1. Derive from the survey record.
2. Derive as NULL ERROR.

UK Mobile (UKMOB, UKMOB2, UKMOB3)

Return: GRADOUT

Entity: Graduate

Pages Used:

<i>Page</i>	<i>Page Element</i>
Campus Community >Personal Information >Addresses/ Phones >Phone Numbers	Phone Number

Field Derivation Rule: Derive up to three values from UK phone numbers where:

- Phone type matches one of the types set up in Returns Setup – HESA Types for UKMOB, or types are not set up for the return for that field
- Country code is blank, 000, or 044
- Phone number does not start with + or starts with +44
- Phone number where the special characters, spaces, leading 44, and leading zeros are removed starts in the range 71 to 79

If one of the selected records has Preferred = “Y,” that record is used for UKMOB and any other records are used for UKMOB2 and UKMOB3. If more than three UK phone numbers are selected, then fields are derived by phone type in ascending order.

Derivation Step:

1. Remove special characters, spaces, and leading 44 from the phone number. A leading zero is added if one does not exist.

Derive the value if it is 11 digits.

2. If the preferred phone number is derived and the derived number is not 11 digits, derive as NULL ERROR.

Note: This selection excludes personal numbers that begin with 070.

UK Telephone (UKTEL, UKTEL2, UKTEL3)

Return: GRADOUT

Entity: Graduate

Pages Used: None

Field Derivation Rule: Derive up to three values from UK phone numbers where:

- Phone type matches one of the types set up in Returns Setup – HESA Types for UKTEL, or types are not set up for the return for that field
- Country code is blank, 000, or 044
- Phone number does not start with + or +44
- Phone number where the special characters, spaces, leading 44, and leading zeros are removed does not start in the range 71 to 79

If one of the selected records has Preferred = “Y,” that record is used for UKTEL and any other records are used for UKTEL2 and UKTEL3. If more than three UK phone numbers are selected, then UKTEL2 and UKTEL3 are derived by phone type in ascending order.

Derivation Step:

1. Remove special characters, spaces, and leading 44 from the phone number. A leading zero is added if one does not exist.

Derive the value if it is 10 or 11 digits.

2. If the preferred phone number is derived and the derived number is not 10 or 11 digits, derive as NULL ERROR.

Note: This selection includes personal numbers that begin with 070.

Graduate Outcomes Return: Postal Address Entity

For each Graduate entity where the derived GRADSTATUS = 2 (cannot be contacted by email or telephone), one or two Postal Address entities are created where COUNTRY has been derived from a

UK address in derivation step 1 and is one of the UK codes XF, XH, XI, XG, or XK. At least one entity is required where COUNTRY is XF, XH, XI, XG, or XK (that is, UK), and, in a similar way to the COUNTRY field, UK addresses are derived ahead of non-UK addresses.

Entities are created based on address records with an Address Type that corresponds to those defined as the Address Types for COUNTRY in the HESA Return Setup record. If Address Types are not defined, then all address types are considered. Initially, addresses with UK country codes (GBR, ENG, SCT, WAL, NIR, XF, XG, XH or XI) are selected (with the most recent ones first) to create two entities. If multiple UK addresses are found with the same effective date, then the addresses are randomly selected. Because this selection matches the first derivation step of COUNTRY, at least one Postal Address entity should always be created when COUNTRY is XF, XH, XI, XG, or XK.

Address Line 1 (ADDRESSLN1)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	Address 1

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from Address 1, truncated to 50 characters.
2. Derive as NULL.

Address Line 2 (ADDRESSLN2)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	Address 2

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from Address 2, truncated to 50 characters.
2. Derive as NULL.

Address Line 3 (ADDRESSLN3)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	Address 3

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from Address 3, truncated to 50 characters.
2. Derive as NULL.

Address Line 4 (ADDRESSLN4)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	Address 4

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from Address 4, truncated to 50 characters.
2. Derive as NULL.

Note: This is not derived for UK addresses unless the delivered UK address format is updated to add Address 4.

Address Line 5 (ADDRESSLN5)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	City

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive from City.
2. Derive as NULL.

Address Line 6 (ADDRESSLN6)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	County

Field Derivation Rule: Include for all entities

Derivation Steps:

1. Derive as description for the County code.
2. Derive as NULL.

Postcode (POSTCODE)

Return: GRADOUT

Entity: Postal Address

Pages Used:

Page	Page Element
Campus Community >Personal Information >Biographical >Addresses/Phones >Addresses	Post Code

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If the value is 8 characters or fewer, derive from the selected address record.

2. Derive as NULL ERROR.

DLHE Return: Institution Entity

The Create Extract Application Engine (SSR_HE_DATA) process creates a single Institution entity. The Institution entity is composed of two fields.

Record Type Indicator (RECID)

Return: DLHE

Entity: Institution

Pages Used:

Page	Page Element
Reporting Periods (Records and Enrollment, HESA Reporting, HESA Returns Setup, Reporting Periods)	Record Year
Returns (Records and Enrollment, HESA Reporting, HESA Returns Setup, Returns)	Record ID

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive as YYNNN, where YY is the final 2-digits of the Record Year (for example, 11 for 2011) and NNN is the 3-digit Record ID for the seeded return.

UK Provider Reference Number (UKPRN)

Return: DLHE

Entity: Institution

Pages Used:

Page	Page Element
HESA Configuration	UKPRN

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the HESA Configuration page.

DLHE Return: Student Entity

The Create Extract process creates a Student entity for each distinct DLHE survey record.

If at least one survey status has been defined on the HESA Returns page, then the process includes a survey only if the survey has a status value that matches one of the defined statuses. If you have not defined a survey status on the HESA Returns page, then the process includes the survey irrespective of status value. Use the Survey Management component to verify the status of a survey (Records and Enrollment, HESA Reporting, Destination of Leavers, Survey Management).

If you have selected the Null Errors Only check box for the Include Student Entities on the Create Extract Data page, the process selects distinct EMPLIDs from the existing active DLHE extract data, where at least one field in the Student, Employment, Study, or Teaching extract data has a derived value of *NULL ERROR*. The process then selects the survey records for these EMPLIDs. If a student has more than one survey record, then the process selects all the student's surveys if any of them has any *NULL ERROR* values.

If you have selected the Student Override check box, the process considers the survey records for only the EMPLIDs you have selected.

All Activities – Q1 (ALLACT1)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Enter DLHE Survey (Section A) self-service	Q1 – Activities check box 1

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. If Student.STATUS = 07 or 08, derive as *X* (ineligible or explicit refusal).
2. If the check box is selected, derive as *I*.
3. If none of the check boxes has been selected (that is, Student.ALLACT2 to Student.ALLACT8 are all derived as NULL), derive as *NULL ERROR*.
4. Do not derive a value and leave the field blank.

All Activities – Q1 (ALLACT2-8)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Enter DLHE Survey (Section A) self-service	Q1 – Activities check boxes 2 to 8

Field Derivation Rule: Student.STATUS is not 07 or 08.

Derivation Steps:

1. Derive as follows:
 - ALLACT2 - Derive as 2 if the check box is selected.
 - ALLACT3 - If reporting period is 2013/14 or later, derive as 9 if the check box is selected. Otherwise, derive as 3 if the check box is selected.
 - ALLACT4 - Derive as 4 if the check box is selected.
 - ALLACT5 - Derive as 5 if the check box is selected.
 - ALLACT6 - Derive as 6 if the check box is selected.
 - ALLACT7 - Derive as 7 if the check box is selected.
 - ALLACT8 - Derive as 8 if the check box is selected.
2. Do not derive a value and leave the field blank.

April or January Survey (APRJAN)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Survey Details	Survey

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. Derive from the survey record, either 1 or 2.

Higher Education experience for business – Q33 (HEBUSNEXP)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Enter DLHE Survey (Section E) self-service	Q33

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. If Student.STATUS = 03, 05, 06, 07 or 08, derive as 6 (unable to code).
2. Derive from the survey record.
3. If Student.STATUS = 02, derive as 6.
4. Use default (from HESA Fields page in the HESA returns setup).
5. Derive as *NULL ERROR*.

Higher Education experience for study – Q32 (HESTUDYEXP)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Enter DLHE Survey (Section E) self-service	Q32

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. If Student.STATUS = 03, 05, 06, 07 or 08, derive as 6 (unable to code).
2. Derive from the survey record.
3. If Student.STATUS = 02, derive as 6.
4. Use default.
5. Derive as *NULL ERROR*.

Higher Education experience for work – Q31 (HEWORKEXP)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Enter DLHE Survey (Section E) self-service	Q31

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. If Student.STATUS = 03, 05, 06, 07 or 08, derive as 6 (unable to code).
2. Derive from the survey record.
3. If Student.STATUS = 02, derive as 6.
4. Use default.
5. Derive as *NULL ERROR*.

HESA unique student identifier (HUSID)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Survey Details	HUSID

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. Derive from the survey record.

Most important activity – Q1 (MIMPACT)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Enter DLHE Survey (Section A) self-service	Q1 – Most important option

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. If Student.STATUS = 07 or 08, derive as X (ineligibility or explicit refusal).

2. If a Most important option has been selected, derive the value from 1 to 8 (depending on which Most important option is selected).

If the reporting period is 2013/14 or later, convert 3 to 9.

3. Derive as *NULL ERROR*.

Status of data collection (STATUS)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Survey Details	Survey Method

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. Derive from the survey record.
2. Use default value (this is derived from the HESA Fields page not from the Survey Status value on the HESA Returns page).
3. Derive as *NULL ERROR*.

Opt Out from Communications (OPTOUT)

Return: DLHE

Entity: Student

Page Used:

Page	Page Element
Survey Details	Opt out check box

Field Derivation Rule: Include for all survey records in a DLHE return.

Derivation Steps:

1. If check box is selected, derive as 1.
2. Derive as null.

DLHE Return: Employment Entity

For each Student entity, if Student.ALLACT1 = 1 or Student.ALLACT2 = 2, then an Employment entity is included in the Student entity and the Employment entity fields are derived. Otherwise, an Employment entity is not included.

Note: Student.ALLACT is derived as *X* and Student.ALLACT2 is derived as blank if Student.STATUS is 07 (deceased) or 08 (reply explicitly refused) so in that case an Employment entity is not created.

Employment basis (EMPBASIS)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q5

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from the survey record (01 to 11).
2. If Student.STATUS = 03, 05 or 06, derive as 99 (unknown).
3. Derive as *NULL ERROR*.

Country of employment (EMPCOUNTRY)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q13 – Employment Country *

* Not available in student self-service. The system displays this field only when you access the self-service page by clicking the Enter Survey button on the Survey Management page.

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from the survey record.

2. If Employment.EMPPCODE value does not exist, derive as *NULL ERROR*.
3. Do not derive a value and leave the field blank.

Currency of Pay (EMPCURRENCY)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q8

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If Employment.EMPPAY > 0, derive from survey record.
2. Derive as null.

Hours Worked per Week (EMPHOURS)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q9

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If ALLACT1 = 1 or ALLACT2 = 2 and the value is greater than zero, derive from survey record.
2. Derive as null.

Importance to employer (EMPIMP)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q16

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If Employment.QUALREQ = 11 or 12, derive from the survey record (1, 2, 4, 5 or 8).
2. Do not derive a value and leave the field blank.

Employer name (EMPNAME)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q11

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from the survey record.
2. Derive as *NULL ERROR*.

PAY (EMPPAY)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q6

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If the value is greater than zero, derive from survey record.
2. Derive as null.

Note: The system derives the Employment.EMPPAY field prior to Employment.EMPUNPAID.

Payment Period (EMPPAYPERIOD)

Return: DLHE

Entity: Employment

Page Used:

<i>Page</i>	<i>Page Element</i>
Enter DLHE Survey (Section B) self-service	Q7

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If Employment.EMPPAY value is greater than zero, derive from the survey record.
2. Derive as null.

UK Postcode for place of employment (EMPPCODE)

Return: DLHE

Entity: Employment

Page Used:

<i>Page</i>	<i>Page Element</i>
Enter DLHE Survey (Section B) self-service	Q13 – Postcode (UK only)

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from the survey record.
2. Do not derive a value and leave the field blank.

Note: The system derives the Employment.EMPPCODE field prior to the derivation of Employment.EMPCOUNTRY.

Place of employment (EMPPLACE)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q13 – Town/city/area

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from the survey record.
2. Do not derive a value and leave the field blank.

Unpaid work (EMPUNPAID)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q6 – Unpaid Work

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If Employment.EMPPAY value does not exist, derive from survey record (1 if Unpaid Work check box is selected)
2. Derive as null.

Total estimated earnings for a year (ESTEARN)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q10

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record if the value is greater than zero.
2. Do not derive a value and leave the field blank.

Job duties (JOBduties)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q4

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record.
2. Do not derive a value and leave the field blank.

How found job (JOBfound)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q18

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record (01 to 09).
 - If the reporting period is 2013/14 or later:
 - 01 is converted to 10
 - 06 is converted to 12

2. Do not derive a value and leave the field blank.

All reasons for taking the job (JOBrsnall1)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q17 – Reasons check box 1

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive as *01* if the check box has been selected.
2. Do not derive a value and leave the field blank.

All reasons for taking the job (JOBRSNALL2 to 9)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q17 – Reasons check boxes 2 to 9

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive as follows:
 - JOBRSNALL2 - Derive as *02* if the check box is selected.
 - JOBRSNALL3 - Derive as *03* if the check box is selected.
 - JOBRSNALL4 - Derive as *04* if the check box is selected.
 - JOBRSNALL5 - Derive as *05* if the check box is selected.
 - JOBRSNALL6 - Derive as *06* if the check box is selected.
 - JOBRSNALL7 - Derive as *07* if the check box is selected.
 - JOBRSNALL8 - Derive as *08* if the check box is selected.
 - JOBRSNALL9 - Derive as *09* if the check box is selected.
2. Do not derive a value and leave the field blank.

Main reason for taking the job (JOBRSNMAIN)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q17 – Main reason

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record (01 to 09).
2. Do not derive a value and leave the field blank.

Note: There is validation on the self-service page to ensure that the option selected for Main reason has also been selected as one of the Reasons.

Number of jobs (JOBSNO)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q2

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record if greater than 1 (2 to 9).
2. Do not derive a value and leave the field blank.

Note: There is validation on the self-service page to ensure the value entered is greater than 1. In step 1, the value is checked to ensure that zero is not derived.

Job title (JOBTITLE)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q3

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record.
2. If Employment.JOBDUTIES value does not exist, derive as *NULL ERROR*.
3. Do not derive a value and leave the field blank.

Nature of employer's business (MAKEDO)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q12

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record.
2. Derive as *NULL ERROR*.

NHS Organisation – Q14 (NHSORG)

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q14

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record. (1, 2, or 8)
2. Derive as *X*.

Postdoctoral research contract – derived from Q3 and Q4 (POSTDOC)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Postdoctoral Research Contract *

* Not available in student self-service. The system displays this field only when you access the self-service page by clicking the Enter Survey button on the Survey Management page.

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record (1, 2 or 3).
2. Do not derive a value and leave the field blank.

Previously employed (PREVEMP)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q19

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record (1, 2, 3, or 4).
2. Do not derive a value and leave the field blank.

Category of previous employment (PREVWORK1)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q20 – check box 1

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. If PREVEMP = 1, 2 or 3, then derive as *01* if the check box has been selected.
2. Do not derive a value and leave the field blank.

Category of previous employment (PREVWORK2 to 7)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q20 – check boxes 2 to 7

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive as follows:
 - PREVWORK2 - Derive as *02* if the check box is selected.
 - PREVWORK3 - Derive as *03* if the check box is selected.
 - PREVWORK4 - Derive as *04* if the check box is selected.
 - PREVWORK5 - Derive as *05* if the check box is selected.
 - PREVWORK6 - Derive as *06* if the check box is selected.
 - PREVWORK7 - Derive as *07* if the check box is selected.
2. Do not derive a value and leave the field blank.

Qualification required for job (QUALREQ)

Return: DLHE

Entity: Employment

Page Used:

Page	Page Element
Enter DLHE Survey (Section B) self-service	Q15

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record (11, 12, 13 or 14).
2. Do not derive a value and leave the field blank.

Standard Occupational Classification 2010 - derived from Q3 and Q4 (SOCDLHE2010)

Return: DLHE

Entity: Employment

Page Used:

<i>Page</i>	<i>Page Element</i>
Enter DLHE Survey (Section B) self-service	Occupational Classification *

* Not available in student self-service. The system displays this field only when you access the self-service page by clicking the Enter Survey button on the Survey Management page.

Field Derivation Rule: Include for all survey records in a DLHE return with an Employment entity.

Derivation Steps:

1. Derive from survey record.
2. Derive as *NULL ERROR*.

DLHE Return: Teaching Entity

For each Student entity, if Student.STATUS is not 07 or 08, then a Teaching entity is included in the Student entity and the Teaching entity fields are derived. Otherwise (that is, Student.STATUS is 07 or 08), a Teaching entity is not included in the Student entity.

Employed as teacher (EMPLDTEACH)

Return: DLHE

Entity: Teaching

Page Used:

<i>Page</i>	<i>Page Element</i>
Enter DLHE Survey (Section C) self-service	Q21
Enter DLHE Survey (Section C) self-service	Newly qualified teacher status – check box

Field Derivation Rule: Include for all survey records in a DLHE return with a Teaching entity.

Derivation Steps:

1. Derive from survey record (1 or 2).
2. If the check box is selected, derive as *NULL ERROR*.
3. Do not derive a value and leave the field blank.

GTC Scotland Teacher Induction scheme (GTCSTIS)

Return: DLHE

Entity: Teaching

Page Used:

Page	Page Element
HESA Returns	Country
Enter DLHE Survey (Section C) self-service	Q22
Enter DLHE Survey (Section C) self-service	Newly qualified teacher status – check box

Field Derivation Rule: Include for all survey records in a DLHE return with a Teaching entity only if Country in HESA Returns page = Scotland.

Derivation Steps:

1. Derive from survey record (1 or 2).
2. Do not derive a value and leave the field blank.

Seeking a teaching post (SEEKTEACH)

Return: DLHE

Entity: Teaching

Page Used:

Page	Page Element
Enter DLHE Survey (Section C) self-service	Q25
Enter DLHE Survey (Section C) self-service	Newly qualified teacher status – check box

Field Derivation Rule: Include for all survey records in a DLHE return with a Teaching entity.

Derivation Steps:

1. Derive from survey record (1 or 2).
2. If the check box is selected and Teaching.EMPLDTEACH = 2 and Student.STATUS is 01, 02 or 04, then derive as *NULL ERROR*.

- Do not derive a value and leave the field blank.

Teaching funded (TEACHFUND)

Return: DLHE

Entity: Teaching

Page Used:

Page	Page Element
Enter DLHE Survey (Section C) self-service	Q23
Enter DLHE Survey (Section C) self-service	Newly qualified teacher status – check box

Field Derivation Rule: Include for all survey records in a DLHE return with a Teaching entity.

Derivation Steps:

- If Teaching.EMPLDTEACH = 1, derive from survey record (1, 2, 3, or 4).
- Do not derive a value and leave the field blank.

Teaching phase (TEACHPHS)

Return: DLHE

Entity: Teaching

Page Used:

Page	Page Element
Enter DLHE Survey (Section C) self-service	Q24
Enter DLHE Survey (Section C) self-service	Newly qualified teacher status – check box

Field Derivation Rule: Include for all survey records in a DLHE return with a Teaching entity.

Derivation Steps:

- If Teaching.EMPLDTEACH = 1, derive from survey record (1, 2, 3, or 4).
- Do not derive a value and leave the field blank.

DLHE Return: Study Entity

For each Student entity, if Student.ALLACT5 = 5 or Student.ALLACT6 = 6, then a Study entity is included in the Student entity and the Study entity fields are derived. Otherwise, a Study entity is not included in the Student entity.

Note: Student.ALLACT5 and Student.ALLACT6 are derived as blank if Student.STATUS is 07 (deceased) or 08 (reply explicitly refused) so in that case a Study entity is not created.

Course name (COURSENAME)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	Q27

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record.
2. Do not derive a value and leave the field blank.

JACS 3.0 – derived from Q27 and Q28 (JACS)

Return: DLHE

Entity: Study

Page	Page Element
Enter DLHE Survey (Section D) self-service	JACS Subject*

*Not available in student self-service. The system displays this field only when you access the self-service page by clicking the Enter Survey button on the Survey Management page.

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record.
2. Derive as *NULL ERROR*.

JACS 3.0 – derived from Q27 and Q28 (JACS-S2, JACS-S3)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	JACS Subject 2*, JACS Subject 3*

*Not available in student self-service. The system displays this field only when you access the self-service page by clicking the Enter Survey button on the Survey Management page. Also, the field is enabled only if you enter JACS Subject.

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record.
2. Do not derive a value and leave the field blank.

How funding further study (STUDYFUND)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	Q30

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record (01, 02, 03, 04 or 05).
2. Do not derive a value and leave the field blank.

Subject of study, training or research (SUBJECT)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	Q28

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record.

2. If Study.COURSENAME value does not exist, derive as *NULL ERROR*.
3. Do not derive a value and leave the field blank.

Type of qualification – Q26 (TYPEQUAL)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	Q26

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record (01 to 07 or 98).
2. Derive as *NULL ERROR*.

Name of university or college (UCNAME)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	Q29

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record.
2. Do not derive a value and leave the field blank.

Note: The system does not derive a value and leaves this field as blank if Study.UCPROV value does not exist or is derived as 6 (unknown) and the institution name is not provided for Q29.

University or college providing study – Derived from Q29 (UCPROV)

Return: DLHE

Entity: Study

Page Used:

Page	Page Element
Enter DLHE Survey (Section D) self-service	Q29*

*Not available in student self-service. The system displays this field only when you access the self-service page by clicking the Enter Survey button on the Survey Management page.

Field Derivation Rule: Include for all survey records in a DLHE return with a Study entity.

Derivation Steps:

1. Derive from survey record.
2. Do not derive a value and leave the field blank.

Note: The system derives this field prior to Study.UCNAME

Unistats/KIS Return: Institution Entity

The Create Extract process creates a single Institution entity and saves it to the Institution Extract record (SSR_HE_INST_EXT).

Where fields are derived from the Institution HESA Data record, values are selected from the most recent effective dated record where the effective date falls on or before the end of the reporting period. Values are stored in the Institution Fields Extract record (SSR_HE_INTEX_FL).

National Scholarship Programme Participation (NSP)

Return: Unistats/KIS

Entity: Institution

Page Used:

Page	Page Element
Institution HESA Data	NSP

Field Derivation Rule: If Country = England, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Derive as *NULL ERROR*.

Franchise UK Provider Reference Number (OTHERINST)

Return: Unistats/KIS

Entity: Institution

Page Used:

Page	Page Element
Institution HESA Data	OTHERINST

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Do not derive a value and leave the field blank.

Note: Nine fields are provided rather than the maximum 100 available.

Franchise UK Provider Reference Number (OTHERINST2 to 9)

Return: Unistats/KIS

Entity: Institution

Page Used:

Page	Page Element
Institution HESA Data	OTHERINST2 to OTHERINST9

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Do not derive a value and leave the field blank.

Record Type Indicator (RECID)

Return: Unistats/KIS

Entity: Institution

Pages Used:

Page	Page Element
Reporting Periods (Records and Enrollment > HESA Reporting > HESA Returns Setup > Reporting Periods)	Record Year
Returns (Records and Enrollment > HESA Reporting > HESA Returns Setup > Returns)	Record ID

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive as YYNNN, where *YY* is the final two digits of the Record Year (for example, 09 for 2009) and *NNN* is the 3-digit Record ID for the seeded return.

The seeded record ID for the Unistats/KIS return is *061*.

Student Union URL (SUURL)

Return: Unistats/KIS

Entity: Institution

Page Used:

Page	Page Element
Institution HESA Data	Student Union URL

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Derive as *NULL ERROR*.

UK Provider Reference Number (UKPRN)

Return: Unistats/KIS

Entity: Institution

Page Used:

Page	Page Element
HESA Configuration	UKPRN

Field Derivation Rule: Include for all Institution entities.

Derivation Steps:

1. Derive from the HESA Returns page.
2. Derive as *NULL ERROR*.

Unistats/KIS Return: Location Entity

The Create Extract process creates one or more Location entities in the Location Extract Data record (SSR_HE_LOCN_EXT) for the single Institution extract record for the Unistats/KIS return. As with the Institution entity fields, values are selected from the most recent effective dated Institution HESA Data record where the effective date is on or before the reporting period end date.

The LOCID and LOCNAME are derived as part of the initial entity selection and stored in the Location Extract Data record (SSR_HE_LOCN_EXT). The remaining fields are derived and stored in the Location Fields Extract record (SSR_HE_LOC_EXFL).

Accommodation Cost URL (ACCOMURL)

Return: Unistats/KIS

Entity: Location

Page Used:

Page	Page Element
Institution HESA Data (Locations group box)	ACCOMURL

Field Derivation Rule: Include for all Location entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Derive as *NULL ERROR*.

Location Latitude (LATITUDE)

Return: Unistats/KIS

Entity: Location

Page Used:

Page	Page Element
Institution HESA Data (Locations group box)	LATITUDE

Field Derivation Rule: If Location.INSTBEDS exists, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Derive as *NULL ERROR*.

Location Identifier (LOCID)

Return: Unistats/KIS

Entity: Location

Page Used:

Page	Page Element
Institution HESA Data (Locations group box)	Location ID

Field Derivation Rule: Include for all Location entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.

Location Identifier Name (LOCNAME)

Return: Unistats/KIS

Entity: Location

Page Used:

Page	Page Element
Institution HESA Data (Locations group box)	Location Name

Field Derivation Rule: Include for all Location entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.

Location UKPRN (LOCUKPRN)

Return: Unistats/KIS

Entity: Location

Page Used:

Page	Page Element
Institution HESA Data (Locations group box)	LOCUKPRN

Field Derivation Rule: Include for all Location entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Do not derive a value and leave the field blank.

Location Longitude (LONGITUDE)

Return: Unistats/KIS

Entity: Location

Page Used:

<i>Page</i>	<i>Page Element</i>
Institution HESA Data (Locations group box)	LONGITUDE

Field Derivation Rule: Include for all Location entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Derive as *NULL ERROR*.

Student Union URL (SUURL)

Return: Unistats/KIS

Entity: Location

Page Used:

<i>Page</i>	<i>Page Element</i>
Institution HESA Data (Locations group box)	Student Union URL

Field Derivation Rule: Include for all Location entities.

Derivation Steps:

1. Derive from the Institution HESA Data page.
2. Do not derive a value and leave the field blank.

Note: The return uses this field when the location has a different student union. This field is also included in the Institution entity.

Unistats/KIS Return: KISCourse Entity

The Create Extract process creates records in the Course Extract Data record (SSR_HE_CRSEXT) in a similar way to the Course entity in the student return, except that academic plans and academic subplans are included based on whether *KIS Type* has been defined rather than whether *Report to HESA* has been selected. For each academic plan or subplan the effective dated record relevant to the start date of the reporting period is considered.

When selecting records, the *Null Errors Only*, *Validation Errors Only*, *Academic Plan* and *Academic Sub-Plan* parameters of the Create Extract process are considered.

The KISCOURSEID is derived as part of the initial entity selection and stored in the Course Extract Data record (in SSR_HE_COURSEID). The value is derived as the subplan or plan code. The remaining fields are derived and stored in the Course Fields Extract record (SSR_HE_CRSEX_FL).

Dependent fields are derived first including KISTYPE and UCASCOURSEID that are required for the derivation of a number of other fields.

The most recent effective dated records on or before the reporting period end date are considered for programs, plans or subplans. The exception to this is KISTYPE that is derived from the effective dated record relevant to the start of the reporting period to be consistent with the logic for including plans and subplans in the KISCourse entity.

Assessment Methods URL (ASSURL)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Links group box)	Assessment Methods URL
Plan HESA Data (KIS Course Links group box)	Assessment Methods URL
Sub-Plan HESA (KIS Course Links group box)	Assessment Methods URL

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 3, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Derive as *NULL ERROR*.

Course Costs URL (CRSECSTURL)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Links group box)	Course Costs URL
Plan HESA Data (KIS Course Links group box)	Course Costs URL
Sub-Plan HESA (KIS Course Links group box)	Course Costs URL

Field Derivation Rule: Include for all entities

Derivation Steps:

1. If KISCourse entity is based on a sub-plan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Derive as *NULL ERROR*.

Course Page URL (CRSEURL)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Links group box)	Course Page URL
Plan HESA Data (KIS Course Links group box)	Course Page URL
Sub-Plan HESA (KIS Course Links group box)	Course Page URL

Field Derivation Rule: Include for all KISCourse entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.

4. If KISTYPE = 1 or 2, derive as *NULL ERROR*.

Distance Learning Only (DISTANCE)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	DISTANCE
Plan HESA Data (KIS Course Data group box)	DISTANCE
Sub-Plan HESA (KIS Course Data group box)	DISTANCE

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Employment Details URL (EMPLOYURL)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Links group box)	Employment Details URL
Plan HESA Data (KIS Course Links group box)	Employment Details URL
Sub-Plan HESA (KIS Course Links group box)	Employment Details URL

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 3, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Derive as *NULL ERROR*.

Foundation Year Availability (FOUNDATION)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	FOUNDATION
Plan HESA Data (KIS Course Data group box)	FOUNDATION
Sub-Plan HESA (KIS Course Data group box)	FOUNDATION

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Subject of Course – HECOS

For HECOS 1 to 5, records are selected from HECoS Subjects defined at Sub-Plan, Plan or Program level (maximum 5 records). Records are ordered with the highest percentage first and then used in descending order for HECOS 1 to 5. The values are selected from the most recent effective-dated records where the effective date falls on or before the reporting period end date.

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (HECoS Subjects)	Subject
Plan HESA Data (HECoS Subjects)	Subject
Sub-Plan HESA (HECoS Subjects)	Subject
Plan HESA Data (ILR Aims)	ILR Year
Sub-Plan HESA (ILR Aims)	ILR Year
Plan HESA Data (HESA Course)	HESA Year
Sub-Plan HESA (HESA Course)	HESA Year

Field Derivation Rule: Derive a value if the following conditions are met:

- HESA Year is not defined for Sub-Plan or Plan (that is, HESACourse does not exist)
- ILR Year is not defined for Sub-Plan or Plan (that is, ILRAims does not exist)

Otherwise, derive as null.

Derivation Steps:

1. If KISCourse entity is based on a Sub-Plan, derive as Subject value from the Sub-Plan HESA (HECoS Subjects) page.
2. Derive as Subject value from the Plan HESA Data (HECoS Subjects) page.
3. Derive as Subject value from the Program HESA Data (HECoS Subjects) page.
4. Derive as *NULL ERROR*.

Subject of Course – HECOS (HECOS2, HECOS3, HECOS4, HECOS5)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (HECoS Subjects)	Subject
Plan HESA Data (HECoS Subjects)	Subject
Sub-Plan HESA (HECoS Subjects)	Subject

Field Derivation Rule: If KISCourse.HECOS1 is not null or NULL ERROR, derive a value.

Derivation Steps:

1. If HECOS1 is derived from a Sub-Plan (Step 1), derive as Subject value from the Sub-Plan HESA (HECoS Subjects) page.
2. If HECOS1 is derived from a Plan (Step 2), derive as Subject value from the Plan HESA Data (HECoS Subjects) page.
3. If HECOS1 is derived from a Program (Step 3), derive as Subject value from the Program HESA Data (HECoS Subjects) page.
4. Derive as null.

Because HECOS1 is the only entity required, the other fields are derived as null if HECoS Subjects are not found or only one is defined.

Honours Award Provision (HONOURS)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	HONOURS
Plan HESA Data (KIS Course Data group box)	HONOURS
Sub-Plan HESA (KIS Course Data group box)	HONOURS

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Subject of Course – Full JACS (JACSA)

For JACSA, JACSB and JACSC, records are selected from Course Subjects defined at Subplan, Plan or Program level (maximum 3 records) in the same way as for the CourseSubject entity in the Student return. Records are ordered with the highest percentage first and then used in order for JACSA, JACSB and then JACSC.

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (Course Subjects group box)	Subject
Plan HESA Data (Course Subjects group box)	Subject
Sub-Plan HESA (Course Subjects group box)	Subject
Plan HESA Data (ILR Aims group box)	ILR Year
Sub-Plan HESA (ILR Aims group box)	ILR Year
Plan HESA Data (HESA Course group box)	HESA Year
Sub-Plan HESA (ILR Aims group box)	HESA Year

Field Derivation Rule: Derive a value if the following conditions are met:

- KISCourse.KISTYPE = 1
- HESA Year is not defined for subplan or plan (that is, HESACourse does not exist)
- ILR Year is not defined for subplan or plan (that is, ILRAims does not exist)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive as Subject value from the Sub-Plan HESA page.
2. Derive as Subject value from the Plan HESA Data page.
3. Derive as Subject value from the Program HESA Data page.
4. Derive as *NULL ERROR*.

Subject of course – Full JACS (JACSB and JACSC)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (Course Subjects group box)	Subject
Plan HESA Data (Course Subjects group box)	Subject

Page	Page Element
Sub-Plan HESA (Course Subjects group box)	Subject

Field Derivation Rule: If KISCourse.JACSA is not blank or is *NULL ERROR*, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If JACSA is derived from a subplan (Step 1), derive as Subject value from the Sub-Plan HESA page.
2. If JACSA is derived from a plan (Step 2), derive as Subject value from the Plan HESA Data page.
3. If JACSA is derived from a program (Step 3), derive as Subject value from the Program HESA Data page.
4. Do not derive a value and leave the field blank.

KIS Course Mode (KISAIM)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	KISAIM
Plan HESA Data (KIS Course Data group box)	KISAIM
Sub-Plan HESA (KIS Course Data group box)	KISAIM

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

KIS Course Mode (KISMODE)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	KISMODE
Plan HESA Data (KIS Course Data group box)	KISMODE
Sub-Plan HESA (KIS Course Data group box)	KISMODE

Field Derivation Rule: Include for all KISCourse entities.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Change of Course Location (LOCCHNGE)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	LOCCHNGE
Plan HESA Data (KIS Course Data group box)	LOCCHNGE
Sub-Plan HESA (KIS Course Data group box)	LOCCHNGE

Field Derivation Rule: Derive a value only if KISCourse.DISTANCE = 0 or 2.

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.

4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Learning and Teaching Methods URL (LTURL)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Links group box)	Learning/Teaching Methods URL
Plan HESA Data (KIS Course Links group box)	Learning/Teaching Methods URL
Sub-Plan HESA (KIS Course Links group box)	Learning/Teaching Methods URL

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 3, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Derive as *NULL ERROR*.

NHS Funded Students (NHS)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	NHS
Plan HESA Data (KIS Course Data group box)	NHS
Sub-Plan HESA (KIS Course Data group box)	NHS

Field Derivation Rule: Derive a value if the following conditions are met:

- KISCourse.KISTYPE = 1 or 2

- HESACourse does not exist
- ILRAims does not exist

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Length of Courses (NUMSTAGE)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	NUMSTAGE
Plan HESA Data (KIS Course Data group box)	NUMSTAGE
Sub-Plan HESA (KIS Course Data group box)	NUMSTAGE

Field Derivation Rule: If KISCourse.KISMODE = 1 (full-time) or 3 (both), derive a value. Otherwise, derive as null.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Related KIS 2, 3 (RELATEDKIS2, RELATEDKIS3)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	RELATEDKIS2, RELATEDKIS3
Plan HESA Data (KIS Course Data group box)	RELATEDKIS2, RELATEDKIS3
Sub-Plan HESA (KIS Course Data group box)	RELATEDKIS2, RELATEDKIS3

Field Derivation Rule: If KISCourse.RELATEDKIS is not blank or is *NULL ERROR*, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If RELATEDKIS is derived from Step 2, derive from the Sub-Plan HESA page.
2. If RELATEDKIS is derived from Step 3, derive from the Plan HESA Data page.
3. If RELATEDKIS is derived from Step 4, derive from the Program HESA Data page.
4. Do not derive a value and leave the field blank.

Sandwich Year Availability (SANDWICH)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	SANDWICH
Plan HESA Data (KIS Course Data group box)	SANDWICH
Sub-Plan HESA (KIS Course Data group box)	SANDWICH

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.

4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Support Details URL (SUPPORTURL)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Links group box)	SUPPORTURL
Plan HESA Data (KIS Course Links group box)	SUPPORTURL
Sub-Plan HESA (KIS Course Links group box)	SUPPORTURL

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Use default.
5. Derive as null.

Teaching Institution UK Provider Reference Number (TEACHUKPRN)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	TEACHUKPRN
Plan HESA Data (KIS Course Data group box)	TEACHUKPRN
Sub-Plan HESA (KIS Course Data group box)	TEACHUKPRN

Field Derivation Rule: Derive a value if the following conditions are met:

- HESACourse does not exist
- ILRAims does not exist

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Do not derive a value and leave the field blank.

Note: Three fields are provided for TEACHUKPRN in Campus Solutions rather than the maximum 50 allowed by HESA.

Teaching Institution UK Provider Reference Number (TEACHUKPRN2, TEACHUKPRN3)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	TEACHUKPRN2, TEACHUKPRN3
Plan HESA Data (KIS Course Data group box)	TEACHUKPRN2, TEACHUKPRN3
Sub-Plan HESA (KIS Course Data group box)	TEACHUKPRN2, TEACHUKPRN3

Field Derivation Rule: If KISCourse.TEACHUKPRN is not blank, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Do not derive a value and leave the field blank.

Course Title (TITLEK)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Plan HESA Data	KIS Title Course Title
Academic Plan Table	Description (maximum 30 characters)
Sub-Plan HESA	KIS Title Course Title
Academic Sub-Plan Table	Description (maximum 30 characters)

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive as KIS Title from the Sub-Plan HESA page.
2. If KISCourse entity is based on a subplan, derive as Course Title from the Sub-Plan HESA page.
3. If KISCourse entity is based on a subplan, derive as combination of plan and subplan descriptions separated by a space.
4. Derive as KIS Title from the Plan HESA Data page.
5. Derive as Course Title from the Plan HESA Data page.
6. Derive as plan description.

Note: Because the TITLEK is derived as part of the initial creation of the KIS Course entity, the derivation steps are not captured in the Course Extract Field record and so TITLEK is not displayed on the Course Extract Data page.

Teacher Training Course (TTCID)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data	TTCID
Plan HESA Data	TTCID
Sub-Plan HESA	TTCID
Plan HESA Data (ILR Aims group box)	ILR Year
Sub-Plan HESA (ILR Aims group box)	ILR Year
Plan HESA Data (HESA Course group box)	HESA Year
Sub-Plan HESA (ILR Aims group box)	HESA Year

Field Derivation Rule: Derive a value if the following conditions are met:

- KISCourse.KISTYPE = 1
- HESA Year is not defined for subplan or plan (that is, HESACourse does not exist)
- ILR Year is not defined for subplan or plan (that is, ILRAims does not exist)

Do not derive a value and leave the field blank, if the conditions are not met.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Note: This field is derived as per Course.TTCID in the Student return.

UCAS Programme Code for the Course (UCASPROGID)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Plan HESA Data (KIS Course Data group box)	UCASPROGID

Page	Page Element
Sub-Plan HESA (KIS Course Data group box)	UCASPROGID

Field Derivation Rule: Derive a value if KISCourse.KISTYPE = 1 or 2. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Do not derive a value and leave the field blank.

Application UKPRN (UKPRNAPPLY)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	UKPRNAPPLY
Plan HESA Data (KIS Course Data group box)	UKPRNAPPLY
Sub-Plan HESA (KIS Course Data group box)	UKPRNAPPLY

Field Derivation Rule: Include for all KISCourse entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Do not derive a value and leave the field blank.

Year Abroad Availability (YEARABROAD)

Return: Unistats/KIS

Entity: KISCourse

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	YEARABROAD
Plan HESA Data (KIS Course Data group box)	YEARABROAD
Sub-Plan HESA (KIS Course Data group box)	YEARABROAD

Field Derivation Rule: If KISCourse.KISTYPE = 1 or 2, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. Use constant.
2. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
3. Derive from the Plan HESA Data page.
4. Derive from the Program HESA Data page.
5. Use default.
6. Derive as *NULL ERROR*.

Unistats/KIS Return: Accreditation Entity

The Create Extract process creates up to ten Accreditation entities in the Accreditation Extract Data record (SSR_HE_ACR_EXT) for each KISCourse entity where the derived KISTYPE = 1 or 2. If no Accreditation records are defined for the academic plan or subplan then no entities are created. KISTYPE defaults to 1. Only records with an Accreditation Type value are considered.

The fields are derived and stored in the Accreditation Fields Extract record (SSR_HE_ACREX_FL).

Accreditation Type (ACCTYPE)

Return: Unistats/KIS

Entity: Accreditation

Pages Used:

Page	Page Element
Program HESA Data (Accreditation group box)	Accreditation Type
Plan HESA Data (Accreditation group box)	Accreditation Type
Sub-Plan HESA (Accreditation group box)	Accreditation Type

Field Derivation Rule: Include for all Accreditation entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.

Accreditation Dependency (ACCDEPEND)

Return: Unistats/KIS

Entity: Accreditation

Pages Used:

Page	Page Element
Program HESA Data (Accreditation group box)	Dependency (check box)
Plan HESA Data (Accreditation group box)	Dependency (check box)
Sub-Plan HESA (Accreditation group box)	Dependency (check box)

Field Derivation Rule: Include for all Accreditation entities.

Derivation Steps:

1. If ACCTYPE is derived from Step 1 (subplan), derived from the same Accreditation record. If the check box is selected, *I* is derived, otherwise *0* is derived.
2. If ACCTYPE is derived from Step 2 (plan), derived from the same Accreditation record. If the check box is selected, *I* is derived, otherwise *0* is derived.
3. If ACCTYPE is derived from Step 3 (program), derived from the same Accreditation record. If the check box is selected, *I* is derived, otherwise *0* is derived.

Accreditation Dependency URL (ACCDEPENDURL)

Return: Unistats/KIS

Entity: Accreditation

Pages Used:

Page	Page Element
Program HESA Data (Accreditation group box)	Dependency URL
Plan HESA Data (Accreditation group box)	Dependency URL
Sub-Plan HESA (Accreditation group box)	Dependency URL

Field Derivation Rule: If Accreditation.ACCDEPEND = 1, derive a value. Otherwise, do not derive a value and leave the field blank.

Derivation Steps:

1. If ACCTYPE is derived from Step 1 (subplan), derived from the same Accreditation record.
2. If ACCTYPE is derived from Step 2 (plan), derived from the same Accreditation record.
3. If ACCTYPE is derived from Step 3 (program), derived from the same Accreditation record.

Unistats/KIS Return: CourseLocation Entity

The Create Extract process creates up to three CourseLocation entities for each KISCourse record where KISCourse.KISTYPE = 1 or 2, where the Location ID fields are defined for the subplan, plan or program. If Location ID values are not defined, the process does not create the entities.

Location Identifier (LOCID)

Return: Unistats/KIS

Entity: CourseLocation

Pages Used:

Page	Page Element
Program HESA Data (KIS Course Data group box)	LOCID, LOCID2, LOCID3
Plan HESA Data (KIS Course Data group box)	LOCID, LOCID2, LOCID3
Sub-Plan HESA (KIS Course Data group box)	LOCID, LOCID2, LOCID3

Derivation Steps: Include for all CourseLocation entities.

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Derive from the Program HESA Data page.
4. Use default that is defined for LOCID.

UCAS Course Code for the Course (UCASCOURSEID)

Return: Unistats/KIS

Entity: CourseLocation

Pages Used:

Page	Page Element
Plan HESA Data (KIS Course Data group box)	UCASCOURSEID, UCASCOURSEID2, UCASCOURSEID3
Sub-Plan HESA (KIS Course Data group box)	UCASCOURSEID, UCASCOURSEID2, UCASCOURSEID3
UCAS Course (Set Up SACR, Product Related, Recruiting and Admissions, UCAS, Mappings, UCAS Course)	UCAS Course Code

Derivation Steps: Include for all CourseLocation entities.

Derivation Steps:

1. If LOCID is derived in Step 1 (that is, subplan) from LOCID, derive UCASCOURSEID value from the Sub-Plan HESA page.
2. If LOCID is derived in Step 1 (that is, subplan) from LOCID, map the combination of subplan and plan to a UCAS course code via the UCAS mappings on the UCAS Course page. Refer to the following notes on UCAS Course mappings.
3. If LOCID is derived in Step 1 (that is, subplan) from LOCID2, derive UCASCOURSEID2 value from the Sub-Plan HESA page.
4. If LOCID is derived in Step 1 (that is, subplan) from LOCID3, derive UCASCOURSEID3 value from the Sub-Plan HESA page.
5. If LOCID is derived in Step 1 (that is, subplan) from LOCID, LOCID2 or LOCID3, do not derive a value and leave the field blank.
6. If LOCID is derived in Step 2 (that is, plan) from LOCID, derive UCASCOURSEID value from the Plan HESA Data page.
7. If LOCID is derived in Step 2 (that is, plan) from LOCID, map the plan to a UCAS course code via the UCAS mappings on the UCAS Course page. Refer to the following notes on UCAS Course mappings.
8. If LOCID is derived in Step 2 (that is, plan) from LOCID2, derive UCASCOURSEID2 value from the Plan HESA Data page.
9. If LOCID is derived in Step 2 (that is, plan) from LOCID3, derive UCASCOURSEID3 value from the Plan HESA Data page.
10. If LOCID is derived in Step 2 (that is, plan) from LOCID, LOCID2 or LOCID3, do not derive a value and leave the field blank.
11. If LOCID is derived in Step 3 (that is program) or Step 4 (that is default), do not derive a value and leave the field blank.

Notes on UCAS Course mappings

The UCAS course code (SAD_UC_COURSE) is selected from the most recent record (by entry year and entry month) in SAD_UC_COURSE where the subplan (for step 2) or the plan (for step 7) is defined for the UCAS Course. The mappings are only done for entities derived from LOCID and not for entities derived for LOCID2 or LOCID3.

Step 2 - For subplans, records are selected from SAD_UC_COURSE where the academic institution matches the institution of the Unistats/KIS return, the academic subplan matches the KISCOURSEID and the active flag is 'Y'. If multiple records are found the record with the highest entry year (SAD_UC_ENTRYYEAR) is selected. If multiple records for the same Entry Year are found, the record with the highest Entry Month is selected. If multiple records for the same Entry Year and Entry Month are found (that is, more than one UCAS Course Code is found), *NULL ERROR* is derived.

Step 7 - For plans, records are selected from SAD_UC_COURSE where the academic institution matches the institution of the Unistats/KIS return, the academic plan matches the KISCOURSEID, the subplan is blank and the Active flag is 'Y'. If multiple records are found the record with the highest entry year (SAD_UC_ENTRYYEAR) is selected. If multiple records for the same Entry Year are found, the record with the highest Entry Month is selected. If multiple records for the same Entry Year and Entry Month are found (that is, more than one UCAS Course Code is found), *NULL ERROR* is derived.

Unistats/KIS Return: HESACourse Entity

The Create Extract process creates one or more HESACourse entities in the HESA Course Extract Data record (SSR_HE_HCR_EXT) for each KIS Course entity where the derived KISTYPE = 1. If no HESACourse records are defined for the academic plan or subplan then no entities are created.

The fields are derived and stored in the HESA Course Fields Extract record (SSR_HE_HCREX_FL).

HESA Course Identifier (HESACOURSEID)

Return: Unistats/KIS

Entity: HESACourse

Pages Used:

Page	Page Element
Plan HESA Data (HESA Course group box)	Course ID
Sub-Plan HESA (HESA Course group box)	Course ID

Field Derivation Rule: Include for all HESACourse entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.

Note: Course ID is mandatory to define a HESA Course record.

Reporting Year of HESA Course (HESAYEAR)

Return: Unistats/KIS

Entity: HESACourse

Pages Used:

Page	Page Element
Plan HESA Data (HESA Course group box)	HESA Year
Sub-Plan HESA (HESA Course group box)	HESA Year

Field Derivation Rule: Include for all HESACourse entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.

Registering Institution UK Provider Reference Number (REGUKPRN)

Return: Unistats/KIS

Entity: HESACourse

Pages Used:

Page	Page Element
Plan HESA Data (HESA Course group box)	Registering Institution UKPRN
Sub-Plan HESA (HESA Course group box)	Registering Institution UKPRN

Field Derivation Rule: Include for all HESACourse entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Do not derive a value and leave the field blank.

Note: Only non-zero values are derived.

Teaching Institution UK Provider Reference Number (TEACHUKPRN)

Return: Unistats/KIS

Entity: HESACourse

Pages Used:

Page	Page Element
Plan HESA Data (HESA Course group box)	Teaching Institution UKPRN

Page	Page Element
Sub-Plan HESA (HESA Course group box)	Teaching Institution UKPRN

Field Derivation Rule: Include for all HESACourse entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Do not derive a value and leave the field blank.

Note: Only non-zero values are derived.

Unistats/KIS Return: ILRAims Entity

The Create Extract process creates one or more ILRAims entities in the ILRAims Extract Data record (SSR_HE_ILR_EXT) for each KISCourse entity where the derived KISTYPE = 1. If no ILRAims records are defined for the academic plan or subplan then no entities are created.

The fields are derived and stored in the ILRAims Extract record (SSR_HE_ILREX_FL).

LAD/LARA Qualification Aim Course Code (ILRAIMID)

Return: Unistats/KIS

Entity: ILRAims

Pages Used:

Page	Page Element
Plan HESA Data (ILR Aims group box)	ILR Aim
Sub-Plan HESA (ILR Aims group box)	ILR Aim

Field Derivation Rule: Include for all ILRAims entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.

Year of ILR Course (ILRYEAR)

Return: Unistats/KIS

Entity: ILRAims

Pages Used:

Page	Page Element
Plan HESA Data (ILR Aims group box)	ILR Year
Sub-Plan HESA (ILR Aims group box)	ILR Year

Field Derivation Rule: Include for all ILRAims entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.

Registering Institution UK Provider Reference Number (REGUKPRN)

Return: Unistats/KIS

Entity: ILRAims

Pages Used:

Page	Page Element
Plan HESA Data (ILR Aims group box)	Registering Institution UKPRN
Sub-Plan HESA (ILR Aims group box)	Registering Institution UKPRN

Field Derivation Rule: Include for all ILRAims entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Do not derive a value and leave the field blank.

Note: Only non-zero values are derived.

Teaching Institution UK Provider Reference Number (TEACHUKPRN)

Return: Unistats/KIS

Entity: ILRAims

Pages Used:

Page	Page Element
Plan HESA Data (ILR Aims group box)	Teaching Institution UKPRN

Page	Page Element
Sub-Plan HESA (ILR Aims group box)	Teaching Institution UKPRN

Field Derivation Rule: Include for all ILRAims entities.

Derivation Steps:

1. If KISCourse entity is based on a subplan, derive from the Sub-Plan HESA page.
2. Derive from the Plan HESA Data page.
3. Do not derive a value and leave the field blank.

Note: Only non-zero values are derived.

(NZL) Generating Government Reports

Understanding New Zealand Government Reports

This section discusses:

- The SDR process.
- NZQA reports.
- The Graduation Destination Survey report.

The SDR Process

Use the Single Data Return SQR process (SRSDRNZL) to create the SDR report for the New Zealand Ministry of Education (MoE). The SDR consists of five separate data files:

- **Student File:** This file contains records for individual students who are enrolled in a course or program in the current year and have not received a complete refund of tuition fees.

All students who are enrolled in courses or programs should be reported, regardless of the level of study or the funding source. Every student in the course enrollment file should appear once in the student file.

- **Course Enrollment File:** This file contains records for each course enrollment instance.

For each individual student, a record of each separate course enrollment is required. All valid enrollments should be reported, regardless of the level of study or the funding source. Every student in the student file should appear at least once in the course enrollment file—a student who is enrolled in two or more courses will have two or more rows in the course enrollment file, but only one row in the student file.

- **Course Register file:** This file contains records for all courses in which students are enrolled in the current year.

Every unique course in the course enrollment file should appear in the course register file.

- **Qualification Completion file:** This file contains records for individual students who have passed all of the academic requirements for a recognized qualification in the previous year.

Only students who are completing a formally recognized qualification should be included in the qualification completion file.

- **Course Completion file:** This file contains course enrollment records for all individual students who were enrolled in a recognized qualification during the previous year.

The file should include all courses for which these students were actively studying in the January to December period in the previous year. Only students who are enrolled in a formally recognized

qualification should be included in the course completion file. All type D student course enrollments for the previous full year must be reported in June of the following year with the course outcome.

The MoE requires that your institution generate these SDR files on predefined dates—once a year for the Qualification Completion file, three times a year for the other three files. With the exception of the Qualification Completion file, these files provide a snapshot of student, course, and course enrollment data at a particular point in time.

The SQR process contains two sections. The first section of the process extracts the data fields that are required by the MoE and loads them into a work table for SDR. This work table is the record `SSR_SDR_EXTRACT`, and it serves as a temporary holding place for the data that you extract. The process extracts data for all four file types, but the type and number of records that are written to the work table depend on the parameters that are entered on the run control panel. The extract includes student data, enrollment data, course data, and qualification completion data from various parts of your PeopleSoft Campus Solutions system.

Because the data fields in each of the SDR files overlap, the SDR work table acts as a storage table for the extracted data of all the files. All the records are deleted from the work table prior to extraction. When the SDR process is run in final mode, the process additionally saves the Qualification Complete file and selected SDR fields in history tables.

The second section of the SQR generates the ASCII flat files using the data that is in the SDR work table. These ASCII flat files can be either the Student file, the Course Enrollment file, the Course Register file, or the Qualification Completion file.

NZQA Reports

The `NZQARPTS.sqr` report process produces three reports:

- **Hook On Request:** This report provides a listing of all students who have not previously been registered with NQF and have paid the 25.00 NZD Hook On fee.

The system selects students who do not have an NZQA ID in the system, have not previously been reported to the NQF (`SCC_PERSONL_NZL.SSR_NZQA_RPT_FLAG` is not *Y*), and who have paid the NQF Hook On fee.

When the process selects a student, the `SCC_PERSONL_NZL.SSR_NZQA_RPT_FLAG` is always set to *Y*.

The system produces the Personal Details file with one row per student and the SQR report (`NZQARPTS.lis`) listing the total number of students in the Hook On file.

- **US Results (Unit Standard Results):** This report includes unit standard results (complete or not completed) for students who have paid the per credit fees.

The system selects students who:

- Have a milestone flag (`MLSTN_ATMPT.MILESTONE_COMPLETE`) equal to *Y* or *N*.
- Have a reported flag (`SSR_MLSTATM_NZL.REPORTED_FLAG`) that is not *Y*.
- Have paid the associated fees.

The system produces the Results file with one row per student per unit standard, the Personal Details file with one row per student in the Results file, and the SQR Report (`NZQARPTS.lis`) listing a row

for each unit standard (milestone) showing the NQF code, NQF credits for that code, and total number of credits reported for all students who have been reported in that unit standard.

- NZDipBus (NZ Diploma in Business Results): This part of the process is used to report paid NZQA exam results for the NZ Diploma in Business and for Advanced Vocational Awards. Exam results are determined by the grade in STDNT_ENRL. Milestones are not used for this process. The process selects students for this report by searching for payment of a specific exam fee (identified by an item type code specified on the NZQA Run Control page).

The system produces the Personal Details file and the Results file.

The Graduation Destination Survey Report

The Graduate Destination Report contains the following information:

- The NZVCC Institution code.
- Bio/Demo data on each student, including ethnicity and residency data.
- The NZVCC Qualification.
- The NZVCC Subject.

Processing SDR Extracts

This section provides an overview of SDR processing and discusses how to:

- Process SDR extracts.
- Suppress course offerings in the Course Enrollment and Course Completion files.

Understanding SDR Processing

The enrollment reporting for the SDR is based on course enrollments. In Campus Solutions you enroll in classes, not courses. Thus, you might have multiple classes for a particular course in a given term. The SDR extract, therefore, includes enrollments only in classes that are primary components.

Data that is specific to the SDR report is entered in the different enrollment components. While the system maintains data for all class enrollment records, the SDR process extracts data for only the enrollment records of primary components.

Page Used to Process Single Data Return Extracts

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
SDR Extract NZL	SSR_SDR_EXTRACT	Records and Enrollment > Enrollment Reporting > SDR Reporting NZL > SDR Extract NZL > SDR Extract NZL	Process the SDR extracts for enrollment reporting to the New Zealand Ministry of Education.

Page Name	Definition Name	Navigation	Usage
SDR Course Suppression	SSR_SDR_CRSE_SUP	Records and Enrollment > Enrollment Reporting > SDR Reporting NZL > SDR Course Suppression > SDR Course Suppression	Identify the course offerings that you want to suppress in the Course Enrolment and Course Completion files.

Processing SDR Extracts

Access the SDR Extract NZL page (Records and Enrollment > Enrollment Reporting > SDR Reporting NZL > SDR Extract NZL > SDR Extract NZL).

Image: SDR Extract NZL page

This example illustrates the fields and controls on the SDR Extract NZL page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'SDR Extract NZL' page with the following elements:

- Run Control ID:** SDR
- Navigation:** [Report Manager](#), [Process Monitor](#), [Run](#) (button)
- *Academic Institution:** PSNZL (with search icon) Silver Fern University
- *Extract Date:** 18/08/2011 (with calendar icon)
- File Mode:** Review (dropdown menu)
- Permanent Post Code:** HOME (with search icon)
- Term Post Code:** HOME (with search icon)
- Qualification Completion File**
- Pop Selection:**
 - Selection Tool:** PS Query (dropdown menu)
 - Query Name:** NZL_SDR_EXTRACT_BASIC (with search icon)
 - [Launch Query Manager](#)
 - [Preview Selection Results](#)
- *SDR Output Directory:** (empty text box)

Extract Date

Enter the MoE-prescribed date for running the extract.

File Mode

Select a value to indicate whether the process extracts the records in *Review* mode or *Final* mode. *Review* appears by default.

In *Review* mode, the process produces the SDR files. In *Final* mode, the process produces the SDR files and the Qualification Completion File is stored in the history table (PS_SSR_SDR_QC_HIST). Emplid, Extract Date, Permanent Post Code, Last School Attended, and Last School Year are also stored for use in subsequent SDR reporting in the PS_SSR_SDR_HISTORY table.

Permanent Post Code and Term Post Code

You must enter a value in these fields for extract of the post codes in the Student files.

Pop Selection

The Pop Selection group box becomes available when you select the Qualification Completion File check box. *PS Query* is the only available Selection Tool. The Population Selection query is mandatory if the Qualification Completion File check box is selected.

The extract process uses the Population Selection query to identify records for the Qualification Completion extract.

If the Qualification Completion check box is not selected, the extract process selects all students awarded a degree.

Suppressing Course Offerings in the Course Enrollment and Course Completion Files

Access the SDR Course Suppression page (Records and Enrollment > Enrollment Reporting > SDR Reporting NZL > SDR Course Suppression > SDR Course Suppression).

Course Enrollment File	If you select this check box, the course offering is suppressed during the extract of the Course Enrollment File.
Course Completion File	If you select this check box, the course offering is suppressed during the extract of the Course Completion File.

Running NZQA Reports

Run the NZQARPTS SQR process to generate one of the three required NZQA reports.

This section discusses how to run the NZQA reports.

Page Used to Run the NZQA Reports

Page Name	Definition Name	Navigation	Usage
NZQA Reports	SSR_RUN_NZQA_RPTS	Records and Enrollment > Enrollment Reporting > NZQA Reports NZL > NZQA Reports	Select and run one of the NZQA reports.

Running the NZQA Reports

Access the NZQA Reports page (Records and Enrollment > Enrollment Reporting > NZQA Reports NZL > NZQA Reports).

Term	If running the NZDipBus report, enter the term for which you are running the report.
NZDipBus Exam Item Type	If running the NZDipBus report, enter the item type used for the NZDipBus exam fee at your institution.

Fee Code	If running the Hook-On Request report, enter the fee code used for the Hook-On fee at your institution.
Address Usage	Select the address usage that the process should follow. The process uses this to determine which address to use for students included in the report.
Personal Details File	Enter the file path and file name that you want the system to use to save the Personal Detail file.
Results File	Enter the file path and file name that you want the system to use to save the Results file.
Credits File	Enter the file path and file name that you want the system to use to save the Credits file.

Generating the Graduation Destination Survey Data File

Use the SRUGDNZL SQR to generate the data file for the NZVCC graduation destination survey.

This section discusses how to run the NZVCC SQR.

Page Used to Generate the Graduation Destination Survey Data File

<i>Page Name</i>	<i>Definition Name</i>	<i>Navigation</i>	<i>Usage</i>
NZVCC Survey Data File	SSR_RUNCTL_UGDS_NZ	Records and Enrollment > Graduation > NZVCC Survey Data File NZL > NZVCC Survey Data File	Run the SQR to generate the NZVCC Survey Data file.

Running the NZVCC SQR

Access the NZVCC Survey Data File page (Records and Enrollment > Graduation > NZVCC Survey Data File NZL > NZVCC Survey Data File).

File Name	Enter the file path and name for the system to use to save the University Graduate Destinations Survey file.
------------------	--

Appendix A

Student Records Reports

Student Records Reports: A-Z

This table lists the Student Records reports, sorted by report ID.

See the product documentation for *PeopleTools: Process Scheduler*

Report ID and Report Name	Description	Navigation	Run Control Page
CCDATADC Data Dictionary	Lists all the fields in your database with their basic information, including field name, description, field type, field size and field format. Reporting Tool: SQR	Set Up SACR > Product Related > Student Records > Reports > Data Dictionary	PRCSRUNCNTL
SR201 Schedule of Classes	Lists a variety of details for each class that you schedule. Reporting Tool: SQR	Curriculum Management > Schedule of Classes > Print Class Schedule	RUNCTL_SRYSCHD
SR301 Course Catalog	Generates the Course Catalog report based on the selection criteria and report options you specify at runtime. Reporting Tool: SQR	Curriculum Management > Course Catalog > Print Course Catalog	RUNCTL_SRYCATLG
SR800CA Class Attendance	Generates the Class Attendance Report. This is a useful tool for hard-copy attendance tracking. Reporting Tool: Oracle BI Publisher	Curriculum Management > Class Attendance > Attendance Roster by Class	CLASS_ATTENDANCE
SR802 Enrollment Verification	Generates an enrollment verification report for individual students. Reporting Tool: Oracle BI Publisher	Records and Enrollment > Enrollment Verifications > Enrollment Verification	ENRL_VER_REQUEST

Report ID and Report Name	Description	Navigation	Run Control Page
SR805 Graduation Report	Lists all current degree checkout status data for all students in your selected population, including ID, career, program, plan, subplan, degree, status, expected graduation term and completion term data. (Reporting tool: Oracle BI Publisher)	Records and Enrollment > Graduation > Graduation Report	RUNCTL_GRAD_RPT
SRCLSRST Class Roster	Generates a report of students enrolled in a particular class, including name, grading basis, units taken, primary academic program, and enrollment status. If requested, this report also lists class permissions information. Reporting Tool: SQR	Curriculum Management > Class Roster > Class Roster	RUNCTL_SRCLASSRSTR
SRENRADV Enrollment Advisement	Generates an Enrollment Advisement report. Reporting Tool: SQR	Curriculum Management > Enrollment Requirements > Enrollment Advisement Report	RUNCTL_SRENRADV
SREXSCHD Exam Scheduling	Lists each course's scheduled exam time and facility. Reporting Tool: SQR	Curriculum Management > Schedule of Classes > Generate Exam Schedule	RUNCTL_SREXSCHD
SRGBEXPT Grading Basis Exception	Displays active grade basis exception mapping rules and their details. Reporting Tool: SQR	Set Up SACR > Product Related > Student Records > Reports > Grade Basis Exception	RUNCTL_SRGBEXCPT
SRGRDLPS Grade Lapse	Lists parameter information and enrollment request numbers for all lapsed grade processes. Reporting Tool: SQR	Curriculum Management > Grading > Grade Lapse	RUNCTL_SR_GRD_LPS

Report ID and Report Name	Description	Navigation	Run Control Page
SRLMSEX LMS Batch Extract	Lists high level information about a specific extract process. Detail such as setup values, run control parameters, output file formats, and total record counts referenced by a specific extract process are listed on the report. The report does NOT list the extracted data and is not to be confused with the actual extract file(s). To view the extracted data you must view the extract file itself. Reporting Tool: SQR	Curriculum Management > Learning Management Systems > LMS Batch Extract Process	RUNCTL_SRLMSEX3
SRNSLCEX NSLC Extract File Creation	Generates a report for National Student Clearinghouse (NSLC). This report lists run variables, informational messages about the process run, and NSLC report totals. Reporting Tool: SQR	Records and Enrollment > Enrollment Reporting > NSLC Report	RUNCTL_SRNSLC
SRRSTRPT Grade Roster	Generates a report of the grade roster that instructors can use to write their midterm or final grades, or administrators can use to print out hard copies of the final grades for classes. Reporting Tool: SQR	Curriculum Management > Grading > Print Grade Roster	RUNCTL_SRGRDROSTER
SRSRMSN Class Permission	Generates a report that lists the number of class permissions assigned for each class. Reporting Tool: SQR	Records and Enrollment > Term Processing > Class Permissions > Class Permissions	RUNCTL_SRSRMSN
SRSTDNT2 Study List	Generates an individual student's study list by academic career and term. Reporting Tool: SQR	Records and Enrollment > Enrollment Summaries > Enrollment Summary	STDNT_ENRL_INQ

Report ID and Report Name	Description	Navigation	Run Control Page
SRTCSTEV Student Transfer Evaluation	Lists an individual's transfer credit record. The report is designed in an easy-to-read format intended to be distributed to prospects, applicants, students, recruiters, or advisors. They can see what classes transferred and to which equivalent classes. They can also view their internal and external GPAs. Reporting Tool: SQR	Records and Enrollment > Transfer Credit Evaluation > Transfer Evaluation Report	RUNCTL_SR_TRCR_RPT
SRTRMDF Mid-Term Deficiency Summary	Lists students that have deficient mid term grades for the term you specify. Reporting Tool: SQR	Curriculum Management > Grading > Mid-Term Deficiency Report	RUNCTL_SRTRMDFCNY
SRTRPRNT Advisement Report or Transcript report	Generates advisement reports for a transcript request, or all transcripts for a transcript request. The transcript type you specify at runtime determines which format the system uses (advisement or transcript). The advisement report is the degree audit report that reflects a student's progress towards graduation. This report is the core function of the Academic Advisement application. The transcript report reflects a student's course work, organized chronologically or by term. This report is used primarily by the Student Records application. Reporting Tool: SQR	Records and Enrollment > Transcripts > Batch Transcripts > Transcript Print	RUNCTL_SRTRPRINT
SRWORKLD Workload Copy and Recalc	Generates a report of part time and full time instructors that are over or under the allowed workload assignment. Reporting Tool: SQR	Curriculum Management > Roll Curriculum Data Forward > Copy/Update Workload Process	RUNCTL_WORKLD

Report ID and Report Name	Description	Navigation	Run Control Page
SRWORKLD Workload Copy and Update	Lists workload data for individuals who fall into one of six reporting categories. Reporting Tool: SQR	Curriculum Management > Roll Curriculum Data Forward > Update Classes w/ Ctgl Changes	RUNCTL_WORKLD
