Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate failsafe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or de-compilation of this software, unless required by law for interoperability, is prohibited. The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

# 1. About this Manual

## 1.1 Purpose

This document provides security-related usage and configuration recommendations for Oracle Banking Virtual Account Management. This guide may outline procedures required to implement or secure certain features, but it is also not a general-purpose configuration manual.

## 1.2 Audience:

This guide is primarily intended for IT department or administrators deploying Oracle Banking Virtual Account Management and third party or vendor software's. Some information may be relevant to IT decision makers and users of the application are also included. Readers are assumed to possess basic operating system, network, and system administration skills with awareness of vendor/third-party software's and knowledge of Oracle Banking Virtual Account Management application.

## 1.3 Scope

### 1.3.1 Read Sections Completely

Each section should be read and understood completely. Instructions should never be blindly applied. Relevant discussion may occur immediately after instructions for an action, so be sure to read whole sections before beginning implementation.

### 1.3.2 Understand the Purpose of this Guidance

The purpose of the guidance is to provide security-relevant configuration recommendations. It does not imply the suitability or unsuitability of any product for any particular situation, which entails a risk decision.

### 1.3.3 Limitations

This guide is limited in its scope to security-related issues. This guide does not claim to offer comprehensive configuration guidance. For general configuration and implementation guidance refer to other sources such as Vendor specific sites.

### 1.3.4 Test in Non-Production Environment

To the extent possible, guidance should be tested in a non-production environment before deployment.

Ensure that any test environment simulates the configuration in which the application will be deployed as closely as possible.

## 2. Prerequisite

### 2.1 Operating Environment Security

Refer to the vendor specific documentation for making the environment more safe and secured.

### 2.2 Network Security

Refer to the vendor specific documentation for making the environment more safe and secured.

### 2.3 Oracle Database Security

Refer to the Oracle Database Security specification document for making the environment more safe and secured.

#### 2.3.1 Oracle Banking Virtual Account Management Recommended configuration

This section contains security recommendations for the Database used for Oracle Banking Virtual Account Management.

Init.ora	REMOTE_OS_AUTHENT=FALSE	Authentication
Init.ora	TRACE_FILES_PUBLIC=FALSE	Authorization
Init.ora	REMOTE_OS_ROLES=FALSE	Authorization
Init.ora	O7_DICTIONARY_ACCESSIBILITY = FALSE	Authorization
Init.ora	AUDIT_TRAIL = OS	Audit
Init.ora	AUDIT_FILE_DEST = E:\logs\db\audit	Audit
To audit sessions	SQL> audit session;	Audit
To audit schema changes	SQL> audit user;	Audit
To audit other events	SQL> AUDIT DATABASE LINK; -- Audit create or drop database links  SQL> AUDIT PUBLIC DATABASE LINK; -- Audit create or drop public database links  SQL> AUDIT SYSTEM AUDIT; -- Audit	Audit

	<p>statements themselves</p> <pre>SQL&gt; AUDIT ALTER ANY ROLE by ACCESS; -- Audit alter any role statements  SQL&gt; AUDIT ALTER DATABASE by ACCESS; -- Audit alter database statements  SQL&gt; AUDIT ALTER SYSTEM by ACCESS; -- Audit alter system statements  SQL&gt; AUDIT CREATE ROLE by ACCESS; -- Audit create role statements  SQL&gt; AUDIT DROP ANY ROLE by ACCESS; - - Audit drop any role statements  SQL&gt; AUDIT PROFILE by ACCESS; -- Audit changes to profiles  SQL&gt; AUDIT PUBLIC SYNONYM by ACCESS; -- Audit public synonyms statements  SQL&gt; AUDIT SYSDBA by ACCESS; -- Audit SYSDBA privileges  SQL&gt; AUDIT SYSOPER by ACCESS; -- Audit SYSOPER privileges  SQL&gt; AUDIT SYSTEM GRANT by ACCESS; -- Audit System grant privileges</pre>	
--	---	--

To audit the events, login through sqlplus as SYSTEM and issue the commands.

## 2.4 Application Server Security

Refer to the Oracle Web Logic Security specification document for making the environment more safe and secured.

Oracle Banking Virtual Account Management supports the following authentication schemes for the online web application.

- Standard LDAP Directory (e.g. OUD/AD/Embedded Weblogic)
- SSO with OAM (Oracle Access Manager – Part of the Oracle Identity Management Suite)
- SAML assertions with a Service Provider protecting the resource and an Identity Provider

Oracle Banking Virtual Account Management Solution supports the following authentication scheme for the API layer.

- OAuth (CLIENT CREDENTIALS) with OAM
- OAuth (CLIENT CREDENTIALS) without OAM

In case the customer does not have OAM, they can use OAUTH without OAM or it is expected that the customer has an enterprise API Management Layer that protects Oracle Banking Virtual Account Management's API layer with the same controls (i.e. OAuth).

### **Support for SSL (Secure Transformation of Data)**

Oracle Banking Virtual Account Management to be configured that all HTTP connections to the application are over SSL/TLS. In other words, all HTTP traffic in the clear will be prohibited; only HTTPS traffic will be allowed. It is highly recommended to enable this option in a production environment, especially when WebLogic Server acts as the SSL terminator.

## **2.5 Choice of the SSL cipher suite**

Oracle WebLogic Server allows for SSL clients to initiate a SSL connection with a null cipher suite. The null cipher suite does not employ any bulk encryption algorithm thus resulting in transmission of all data in clear text, over the wire.

The default configuration of Oracle WebLogic Server is to disable the null cipher suite. Ensure that the usage of the null cipher suite is disabled, preventing any client from negotiating an insecure SSL connection.

Furthermore, for installations having regulatory requirements requiring the use of only 'high' cipher suites, Oracle WebLogic Server can be configured to support only certain cipher suites. The restriction can be done in config.xml of the WebLogic domain. Provided below is an example config.xml restricting the cipher suites to those supporting 128-bit symmetric keys or higher, and using RSA for key exchange.

```
....
<ssl>
  <enabled>true</enabled>
  <iphersuite>TLS_RSA_WITH_AES_256_CBC_SHA</iphersuite>
</ssl>
....
```

Configuration of WebLogic Server to support the above defined cipher suites might also require an additional command line argument to be passed to WebLogic Server, so that a FIPS 140-2 compliant crypto module is utilized. This is done by adding `-Dweblogic.security.SSL.nojce=true` as a JVM argument.

The restriction on cipher suites needs to be performed for every managed server.

The order of cipher suites is important – Oracle WebLogic Server chooses the first available cipher suite in the list, that is also supported by the client.

Cipher suites with RC4 are enabled despite it being second best to AES. This is primarily for older clients that do not support AES (for instance, Microsoft Internet Explorer 6, 7 and 8 on Windows XP).

## **2.6 Securing the Oracle Banking Virtual Account Management**

Securing the Oracle Banking Virtual Account Management Application includes securing:

- The Online Web Application
- The API Layer exposed to external consumers

### 2.6.1 Online Web Application

Access to the online web application is granted only via the following methods.

- Standard LDAP Directory authentication
- SSO with OAM
- SSO with other External SSO Agents
- SAML with the Oracle Banking Virtual Account Management application acting as the service provider

In addition to the authentication, the Oracle Banking Virtual Account Management online web application uses JWT (JSON Web Tokens) to maintain the state for authenticated users.

JSON Web Tokens are an open, industry standard RFC 7519 method for representing claims securely between two parties. JSON Web Token (JWT) is a compact, URL-safe means of representing claims to be transferred between two parties. The claims in a JWT are encoded as a JSON object that is used as the payload of a JSON Web Signature (JWS) structure or as the plaintext of a JSON Web Encryption (JWE) structure, enabling the claims to be digitally signed.

- **No Session to Manage (stateless):** The JWT is a self-contained token which has authentication information, expire time information, and other user defined claims digitally signed.
- **Portable:** A single token can be used with multiple backend.
- **No Cookies Required, So It's Very Mobile Friendly**
- **Good Performance:** It reduces the network round trip time.
- **Decoupled/Decentralized:** The token can be generated anywhere. Authentication can happen on the resource server, or easily separated into its own server.

In addition, the following policies are followed for JWT.

- **Token Store:** To increase the security and better usability, every authentication/refresh request is secured by random unique key. The generated token and the secure key are persisted in the table, so that during the horizontal scaling of the servers, any API gateway instance can serve for the request.
- **Cipher strength:** Platform security module hashes the JWT footer with HS512 algorithm.
- **Refresh Token:** Users are allowed to get the new token any time before expiring the existing token.
- **Claims:** The JWT Claims Set represents a JSON object whose members are the claims conveyed by the JWT. Platform security module validates below claims during the process.

Claim Name	Description	Mandatory	Type
iss	Issuer	Yes	Registered
sub	Subject	Yes	Registered
aud	Audience	No	Registered

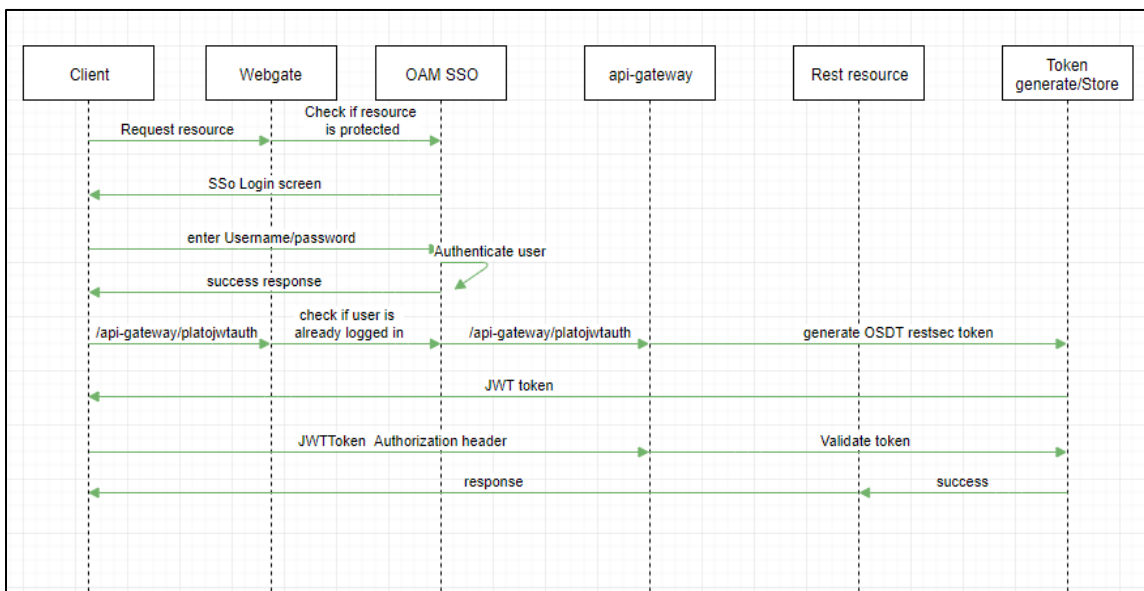

Claim Name	Description	Mandatory	Type
exp	Expiration Time	Yes	Registered
nbf	Not Before	No	Registered
iat	Issued At	Yes	Registered
jti	JWT Id	Yes	Registered
tid	Tenant Id	Yes	Private

- **Token Expiry:** Platform security module invalidates the token, if the client submits after the Expiration time.
- **Logout:** While user calls the logout operation, platform security module clears the issued token and deletes the record from the table as well. The old token no longer will be used for any purpose.

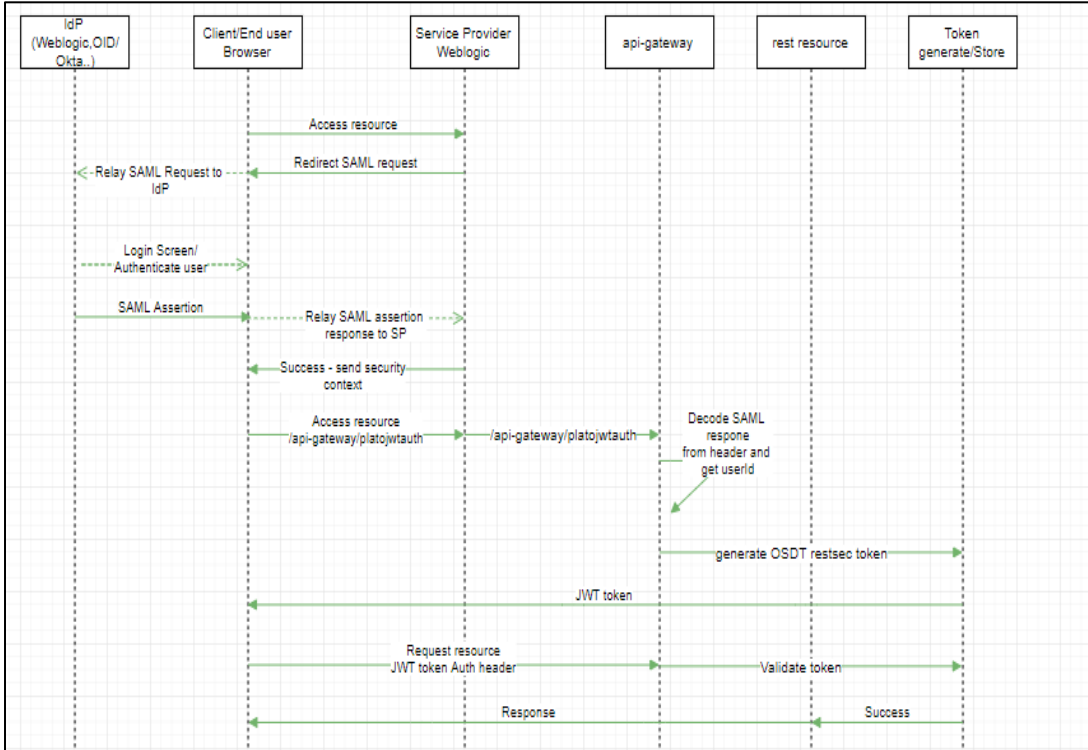

The various security flows for the **online web application** are depicted below:

### 1. OAM Based SSO

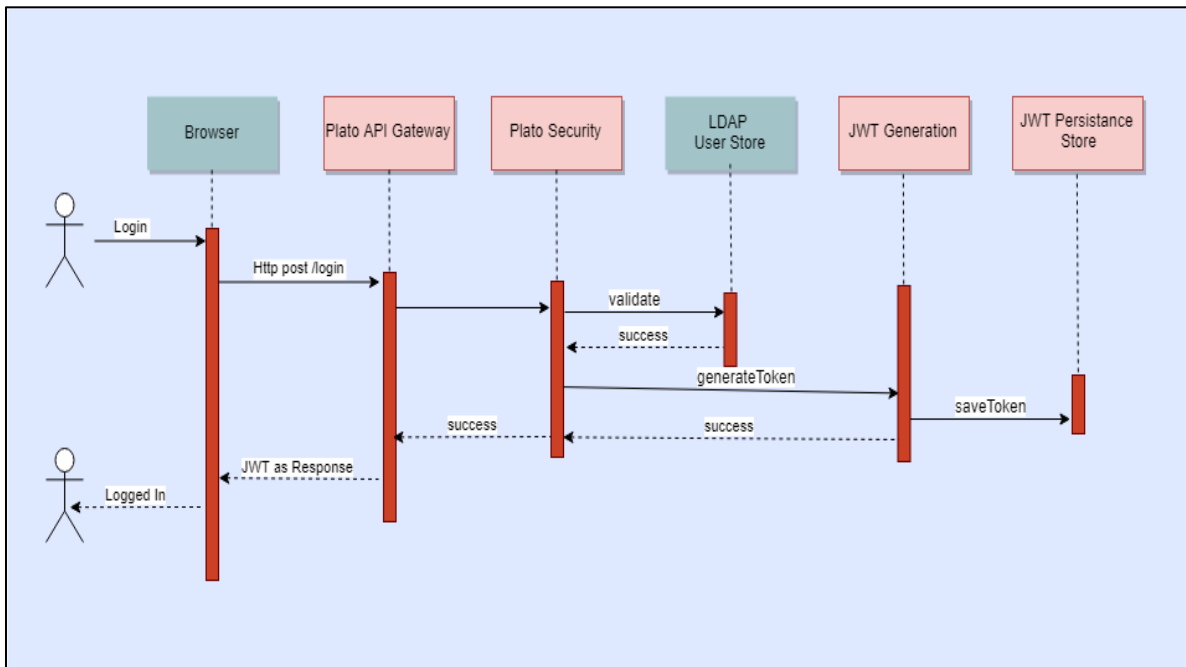

- The online UI is protected on OAM.
- Client requests protected resource. OAM presents SSO Login screen.
- Client enters a user id and password. In case of success, OAM sets the corresponding user profile details in the security context.
- The request is routed to the Gateway which extracts the profile details from the security context.
- The API Gateway creates a JWT token (Utilizing Oracle's Security Developer Toolkit part of Oracle's Platform Security Services), persists it in the Database and returns the same.
- The UI layer uses this token to maintain state and conduct subsequent invocations.

2. SAML Authentication

- The Identity Provider is external to the OBVAM Application (e.g. OKTA) with the OBVAM application acting as the Service Provider
- Client requests protected resource from OBVAM. The Idp presents a configured login screen to the user
- Client enters a user id and password. In case of success, the Idp sets the corresponding user profile details in the security context
- The request is routed to the Gateway which extracts the profile details by decoding the SAML response
- The API Gateway creates a JWT token (Utilizing Oracle’s Security Developer Toolkit part of Oracle’s Platform Security Services), persists it in the Database and returns the same.

### 3. LDAP Authentication

- The user is presented the standard login page for the *OBVAM* application
- The user enters a user id and password. The credentials are validated against a standard LDAP store.
- If successful, the API Gateway generates a JWT token (Utilizing Oracle's Security Developer Toolkit part of Oracle's Platform Security Services), persists it in the Database and returns the same.

#### 2.6.2 API Layer

The *OBVAM* application provides an API Layer (also known as the Service API Layer) which is used by external consumers to access *OBVAM*'s functionality.

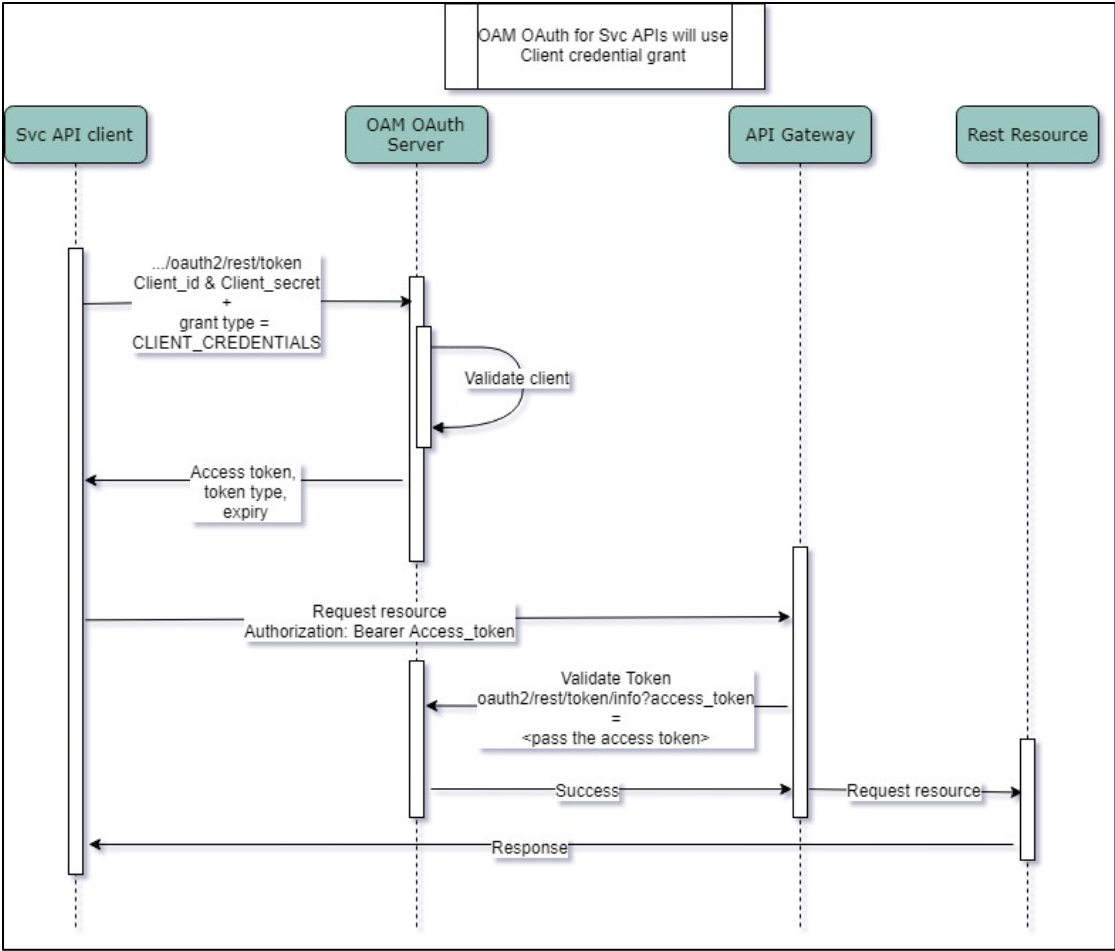

Access to this API layer is granted only via the following methods

- OAuth with OAM (Oracle Access Manager)
- OAuth without OAM

As stated before, in case the customer does not have OAM, they can use OAUTH without OAM or enterprise API Management layer should be implemented to protect the service API(s).

#### **OAuth with OAM**

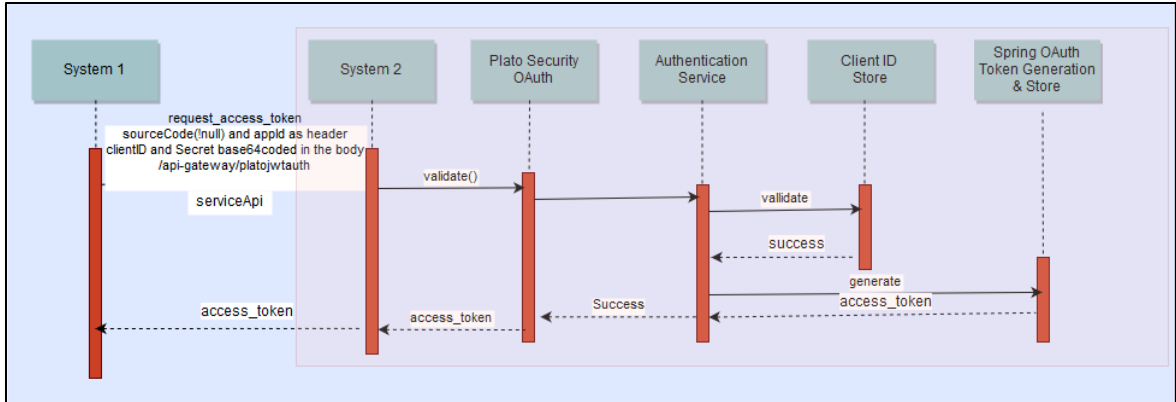

The flow is depicted as below:

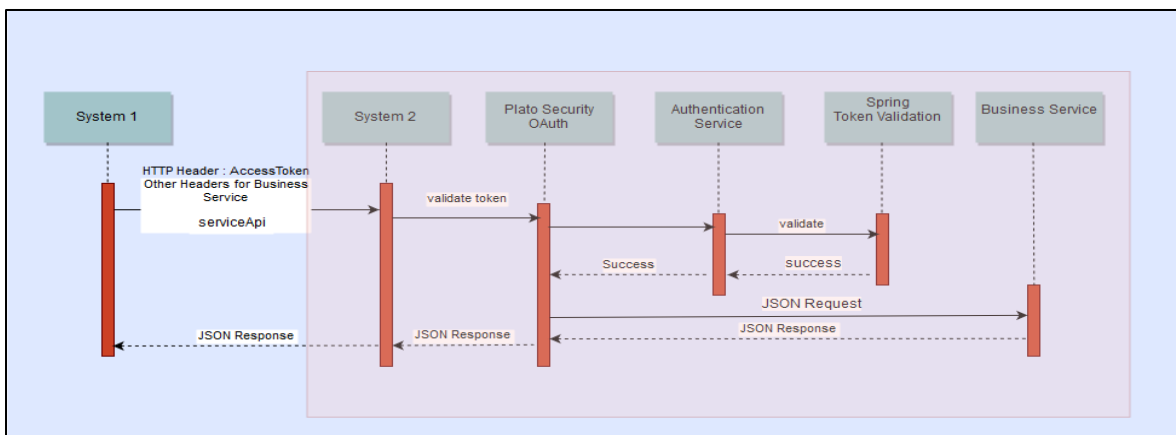

- API clients pass the client id & client secret and grant type as CLIENT CREDENTIALS, to get the access token , using the below endpoint
- /oauth2/rest/token
- API Clients will pass the access token in the Authorization Header as Bearer token in their subsequent calls to access the Service APIs.
- API Gateway validates the client access token on OAM Authorization server
- If valid, it passes the request on to the Svc APIs and gets the response.
- The client can choose to get a new token (refresh) before the expiry of the current token. In case the token expires, they will pass the client Id and client secret to get a new token.

**OAuth without OAM**

The flow for token generation is depicted as below:

The flow for accessing svc is depicted as below:

- API clients pass the client id and client secret in the body and other required headers, to get the access token, using the below endpoint:  
<http://<<hostname>>:<<port>>/api-gateway/platojwtauth/>
- API Clients will pass the access token in the Authorization Header as Bearer token in their subsequent calls to access the Service APIs.
- API Gateway validates the client access token on Authorization server.
- If valid, it passes the request on to the Svc APIs and gets the response.
- The client can choose to get a new token (refresh) before the expiry of the current token. In case the token expires, they will pass the client Id and client secret to get a new token.
- Also, an additional facility of increasing the token is provided.

### 2.6.3 Two-way SSL Connection

A two-way SSL is used when the server needs to authenticate the client. In a two-way SSL connection, the client verifies the identity of the server and then passes its identity certificate to the server. The server then validates the identity certificate of the client before completing the SSL handshake.

In order to establish a two-way SSL connection, you must have two certificates, one for the server and the other for client.

## **3. Securing Oracle Banking Virtual Account Management**

### **3.1 Desktop Security**

Refer to the vendor specific relevant sections for securing the Desktops Operating system. Also do refer to the browser specific security settings mentioned in the vendor specific docs.

Refer to the client browser setting required for OBVAM.

### **3.2 Oracle Banking Virtual Account Management Controls**

#### **3.2.1 Overview**

This chapter describes the various programs available within the Oracle Banking Virtual Account Management, to help in the maintenance of security.

Access to the system is possible only if the user logs in with a valid ID and the correct password. The activities of the users can be reviewed by the Security Officer in the Event Log and the Violation Log reports.

#### **3.2.2 Disable Logging**

It is recommended that the debug logging facility of the application be turned off, once the system is in production. This is achieved by updating the logback.xml file of the application.

The above described practice does not disable logging performed by the application in the database tier. This can be disabled by running the lockdown scripts provided. The lockdown scripts will disable logging across all modules and across all users in the system.

#### **3.2.3 Sign-on Messages**

<b>Message</b>	<b>Explanation</b>
User Authentication Failed/Invalid Login	An incorrect user ID or password was entered.

#### **3.2.4 Authentication & Authorization**

Only authenticated users can access the system. Secondly, a user should have access rights to execute a function. The user profile of a user contains the User ID and the functions to which the user has access. Oracle Banking Virtual Account Management operation such as new, copy, query, unlock and so on will be enabled based on function rights available for the user. The function rights will be checked for each operation performed by the user, in Security Management Service module of Oracle Banking Virtual Account Management.

### **3.2.5 Role Based Access Controls**

- Application level access has implemented via the Security Management System (SMS) module.
- SMS supports “ROLE BASED” access of Screens and different types of operations.
- Oracle Banking Virtual Account Management supports dual control methodology, wherein every operation performed has to be authorized by another user with the requisite rights.
- SMS provides an option to map multiple roles for a user in a given branch. Allowed operations are mapped to the roles and SMS authorizes the user based on it.

### **3.2.6 Access Controls - Branch Level**

SMS provides the branch level access through the roles provided for the user at a particular branch.

### **3.2.7 Maker – Checker**

Application supports dual control methodology, wherein every operation performed has to be authorized by another user with the requisite rights.

### **3.2.8 Access Enforcement**

Access management in Oracle Banking Virtual Account Management can be done in two steps as mentioned below:

- **Branch level:** In such a case the user cannot view even the menu list of the Oracle Banking Virtual Account Management when he tries to login into the restricted branch. Thus, no transactions could be performed.
- **Roles wise:** As described above based on the user-roles mapping, the user can access different functions of Oracle Banking Virtual Account Management. For an example, a bank clerk will have access to customer creation, account opening, term-deposits opening and liquidation screens, but he will not have access to User Creation function activity.

### **3.2.9 Password Management**

The OBVAM application relies on external password management and does not store any credentials. If an external LDAP is used, password management and policy rules can be set on that. For example: For Weblogic Embedded-LDAP, the user and password rules can be configured via the admin console of the weblogic). If OIM/OAM is configured, password management and policy rules can be set on OIM. The IdP (Identity Provider), in case of SAML, takes care of the password policies.

---

## 4. General Information

### 4.1 Cryptography

Oracle Banking Virtual Account Management uses cryptography to protect the sensitive data.

For encryption, AES, which is considered to be of gold standard, is used. It produces a key size of 256 bits when it comes to symmetric key encryption.

### 4.2 Security Patch

Security patches needs to be applied whenever it's available for the applicable product version.

### 4.3 Oracle Database Security Suggestions

#### Access Control

Database Vault (DV) provides enterprises with protection from the insider threats and in advantage leakage of sensitive application data. Access to application data by users and administrators is controlled using DV realms, command rules and multi factor authorization. DV also address Access privilege by separating responsibilities.

#### Data Protection

Advance Security provides the most advance encryption capabilities for protecting sensitive information without requiring any change to the application. TDE is native database solution that is completely transparent to the existing applications.

Advance Security also provides strong protection for data in transit by using network encryption capabilities. Features like Easy to deploy, Ensure secure by default to accept communication from client using encryption, Network encryption using SSL/TLS.

#### Monitoring and Compliance

Audit Vault (AV) transparently collects and consolidate audit data from multiple databases across the enterprise, does provide valuable insight into who did what with which data and when including privilege users. The integrity of the audit data is ensured using controls including DV, Advance Security. Access to AV data is strictly controlled. It also does provide graphical summaries of activity causing alerts, in addition database audit setting are centrally managed and monitored.

### 4.4 Oracle Software Security Assurance - Standards

Every acquired organization must complete the Mergers and Acquisitions (M&A) Security Integration process. The issues identified during this review must be addressed according to the agreed upon M&A remediation plan. The acquired organization must complete SPOC assignments and plan integration of OSSA methodologies and processes into its SDLC.
