Oracle® NoSQL Database

Quick Start to KVLite

Release 20.1

E87605-09

June 2020

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

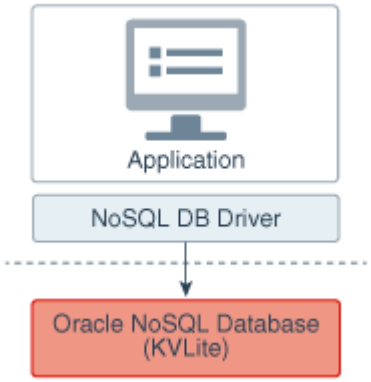
Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Introduction

The Oracle NoSQL Database is a scalable, distributed NoSQL database, designed to provide highly reliable, flexible and available data management across a configurable set of storage nodes. It consists of two parts - a NoSQL DB Driver and a collection of storage nodes called the KVStore. The NoSQL DB Driver is an intelligent driver that transparently handles all the core operations of Oracle NoSQL Database, and the KVStore consists of storage nodes.

KVLite is a simplified version of the Oracle NoSQL Database. It provides a single storage node, single shard store, that is not replicated. It runs in a single process without requiring any administrative interface. You configure, start, and stop KVLite using a command line interface.



Note: KVLite is intended for use by application developers who need to develop and unit test their Oracle NoSQL Database applications. It can be used as a development platform for developers to get familiar with Oracle NoSQL APIs, and test different ways of interacting with these APIs. KVLite runs on a single machine. It is not intended for production deployment, or for performance measurements.

Also, KVLite is secure by default. If you are performing an unsecured installation, for example, if you are installing KVLite on a Windows platform, refrain from setting the security parameters when executing the commands.

This Quick Start Guide demonstrates how to perform the following tasks:

1. Install KVLite
2. Start KVLite
3. Verify your Installation
4. Stop and Restart KVLite

Install KVLite

KVLite is bundled with the Oracle NoSQL Database software. To install KVLite, follow the steps below:

1. Download the tar.gz or .zip file from Oracle Technology Network.
2. Gunzip and untar the .tar.gz package (or unzip if you downloaded the .zip package). Oracle NoSQL Database version 4.4.6 Enterprise Edition is used in this example. The actual package names and directory names will change, depending upon the release version you are using, and whether you are using Community Edition (CE), Enterprise Edition (EE), or Basic Edition (BE).

   Be aware that the examples used in this document are part of a separate download and must be unpacked separately.

   Also, make sure you meet the following requirements to run KVLite:

   - Install Java version 8 in your machine.
   - Maintain a minimum disk space of 5GB if you are working with Oracle NoSQL Database release 4.5 or later.

The examples download package (`kv-examples-4.4.6.tar.gz` in this tutorial) can be obtained from the same location as you obtained your server download package.

```
$ gunzip kv-ce-4.4.6.tar.gz
$ tar xvf kv-ce-4.4.6.tar

// To extract the examples package:
$ gunzip kv-examples-4.4.6.tar.gz
$ tar xvf kv-examples-4.4.6.tar
```

In this case, the contents of `kv-ce-4.4.6.tar.gz` is unpacked to a directory called `kv-4.4.6` and the contents of `kv-examples-4.4.6.tar.gz` is unpacked to a directory called `kv-4.4.6/examples`.

Start KVLite

Perform the following steps to start a KVLite instance:

To start KVLite in secure mode:

1. Open a terminal and `cd` into the `kv-4.4.6` directory to start the NoSQL Database server.

   ```
   $ cd kv-4.4.6
   $ java -Xmx64m -Xms64m -jar lib/kvstore.jar kvlite
   ```

   Expected Output:

   ```
   Generated password for user admin: password
   User login file: ./kvroot/security/user.security
   Created new kvlite store with args:
   -root ./kvroot -store kvstore -host localhost -port 5000 -secure-config
   enable
   ```

   Where `kvstore` is the name of the store, `localhost` is the name of the local host, and `kvroot` is the directory where Oracle NoSQL Database data is placed. It takes about 10 - 60 seconds before this message is issued, depending on the speed of your machine.

   Note that you will not get the command line prompt back until you stop the KVLite.

2. In a second shell, `cd` into the `kv-4.4.6` directory and ping your KVLite instance to test that it's alive. The details of the output will vary but you should see a running store.

```
$ cd kv-4.4.6
$ java -Xmx64m -Xms64m -jar lib/kvstore.jar ping -host localhost -port
5000 -security kvroot/security/user.security
```

Expected output:

```
Pinging components of store kvstore based upon topology sequence #14
10 partitions and 1 storage nodes
Time: 2017-05-02 09:34:43 UTC   Version: 12.2.4.4.6
Shard Status: healthy:1 writable-degraded:0 read-only:0 offline:0
Admin Status: healthy
Zone [name=KVLite id=zn1 type=PRIMARY allowArbiters=false]   RN Status:
online:1 offline:0
Storage Node [sn1] on localhost:5000    Zone: [name=KVLite id=zn1
type=PRIMARY allowArbiters=false]
    Status: RUNNING   Ver: 12cR2.4.4.6 2017-04-13 06:54:25 UTC  Build
id: d6a9b947763f
    Admin [admin1]        Status: RUNNING,MASTER
    Rep Node [rg1-rn1]    Status: RUNNING,MASTER sequenceNumber:204
haPort:5006
```

The status indicates that the KVLite is up and running.

To start KVLite in unsecure mode:

1. Open a terminal and `cd` into the `kv-4.4.6` directory.

```
$ cd kv-4.4.6
```

2. Execute the `kvstore.jar` file using the `-enable-secure disable` flag to disable security and start KVLite in unsecure mode.

```
$   java -jar lib/kvstore.jar kvlite -secure-config disable
```

3. In a second shell, `cd` into the `kv-4.4.6` directory and ping your KVLite instance to test that it's alive. You should see a running store.

```
$ cd kv-4.4.6
$ java -jar lib/kvstore.jar ping -host localhost -port 5000
```

Verify your Installation

There are several ways to verify your installation and ensure that KVLite is running. Perform one of these steps to verify your installation:

- Start a new shell and run the following command:

  ```
  $ jps -m
  ```

  You should see a similar output showing KVLite (and possibly other things as well) running in your machine:

  ```
  2674 kvstore.jar kvlite
  3118 Jps -m
  ```

- Or, cd into the `kv-4.4.6` directory and ping your KVLite instance. The details of the output will vary but you should see a running store.

  ```
  $ cd kv-4.4.6
  $ java -Xmx64m -Xms64m -jar lib/kvstore.jar ping -host localhost -port
  5000 -security kvroot/security/user.security
  ```

  Expected output:

  ```
  Pinging components of store kvstore based upon topology sequence #14
  10 partitions and 1 storage nodes
  Time: 2017-05-02 09:34:43 UTC   Version: 12.2.4.4.6
  Shard Status: healthy:1 writable-degraded:0 read-only:0 offline:0
  Admin Status: healthy
  Zone [name=KVLite id=zn1 type=PRIMARY allowArbiters=false]   RN Status:
  online:1 offline:0
  Storage Node [sn1] on localhost:5000    Zone: [name=KVLite id=zn1
  type=PRIMARY allowArbiters=false]
      Status: RUNNING   Ver: 12cR2.4.4.6 2017-04-13 06:54:25 UTC  Build
  id: d6a9b947763f
      Admin [admin1]        Status: RUNNING,MASTER
      Rep Node [rg1-rn1]    Status: RUNNING,MASTER sequenceNumber:204
  haPort:5006
  ```

  If you have started KVLite in an unsecured mode, ping the KVLite instance without using the `-security` parameter:

  ```
  $ cd kv-4.4.6
  $ java -Xmx64m -Xms64m -jar lib/kvstore.jar ping -host localhost -port
  5000
  ```

- Or, run the `kvclient` test application using the following commands:

  ```
  $ cd kv-4.4.6
  $ java -Xmx64m -Xms64m -jar lib/kvclient.jar
  ```

This should write a similar release output to stdout:

```
12cR2.4.4.6 2017-04-13 06:54:25 UTC  Build id: d6a9b947763f
```

- Or, if you have not already, download the *examples* package and unpack it so that the examples directory is in **KVHOME**. In this tutorial, we have already downloaded and extracted the *examples* package.

  1. Compile the *Hello* example program:

     ```
     $ export KVHOME=<the directory where you have unzipped the CE
     package>
     $ javac -cp lib/kvclient.jar:examples examples/hello/
     HelloBigDataWorld.java
     ```

  2. Run the example using all default parameters:

     ```
     $ cd $KVHOME
     $ java -Xmx64m -Xms64m -Doracle.kv.security=./kvroot/security/
     user.security \
         -cp lib/kvclient.jar:examples hello.HelloBigDataWorld \
         -port 5000 -store kvstore -host localhost
     ```

     – **Note:** In case of an unsecured installation, do not specify the security parameter and run the example:

       ```
       $ java -Xmx64m -Xms64m -cp lib/kvclient.jar:examples
       hello.HelloBigDataWorld \
           -port 5000 -store kvstore -host localhost
       ```

     Or, run it using non-default parameters, if you started KVLite using non-default values:

     ```
     $ java -Xmx64m -Xms64m -cp lib/kvclient.jar:examples
     hello.HelloBigDataWorld \
         -port <hostport> -store <kvstore name> -host <hostname>
     ```

     Expected output:

     ```
     Hello Big Data World!
     ```

Stop and Restart KVLite

To stop and restart KVLite, perform the following steps:

To stop KVLite, use `Ctrl C (^C)` from within the shell where KVLite is running.

To restart the process, simply run the KVLite utility without any command line options. Do this even if you provided non-standard options when you first started KVLite. This is because KVLite remembers information such as the port value and the store name

in between run times. You cannot change these values by using the command line options.

```
$ java -Xmx64m -Xms64m -jar KVHOME/lib/kvstore.jar kvlite
```

If you want to start over with different options than you initially specified, delete the KVROOT directory (`./kvroot`, by default), and then re-run the kvlite utility with whatever options you desire. Refer to Start KVLite.

Alternatively, specify the `-root` command line option, making sure to specify a location other than your original KVROOT directory, as well as any other command line options that you want to change.

Note: If you choose to start over, all your previous data will be lost.

Oracle® NoSQL Database Quick Start to KVLite, Release 20.1
