1. Installation and Configuration of Apache 2.2.25

1.1 Purpose

The objective of this document is to explain the installation and configuration of Apache 2.2.25. This includes setting up of server details and enabling SSL.

1.2 Introduction

Below is the typical deployment diagram and this document covers the setup for Apache Webserver Instance.

2. Installation of Apache

Unzip the Apache software, in this example the unzipped location is /scratch/oracle/software/httpd-2.2.25. Below steps should be executed from inside this directory location.

Software Directory: /scratch/oracle/software/httpd-2.2.25

1. \$./configure --prefix=/scratch/oracle/apache --enable-ssl --with-included-apr

Where / scratch/oracle/apache is the apache home directory

- 2. \$ make
- 3. \$ make install

3. Configure Apache Server infront of Weblogic Server

1. Copy mod_wl_22.so from any weblogic Server (\$WLS_HOME/server/plugin/linux/x_86_64) to \$PREFIX/modules/ location in Apache Server.

NOTE: In this example the OS is linux, copy the file from appropriate folder according to the weblogic installed directory.

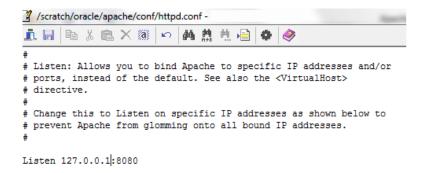

2. Edit http.conf located under folder \$PREFIX/conf to include mod_wl_22.conf file.

LoadModule weblogic_module /scratch/oracle/apache/modules/mod_wl_22.so

3. Modify http.conf file for the required listen port

Listen <HOST NAME>:<PORT>

NOTE: This port is for http protocol and not for https

- 4. Modify the http.conf file to include the weblogic server details
 - a. For WebLogic in single instance

<Location /<<context/url>> >

SetHandler weblogic-handler

WebLogicHost <<server name>>

WeblogicPort <<port>>

</Location>

Example:

<Location /FCJNeoWeb>

SetHandler weblogic-handler

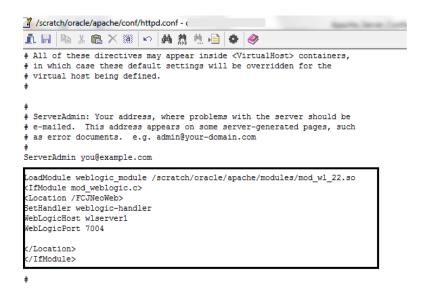

WebLogicHost wlserver1

WeblogicPort 7004

</Location>

This will forward /FCJNeoWeb from Apache server to /FCJNeoWeb on WebLogic Server wlserver1: 7004

NOTE: If you want to allow more than one context root, then either add different Location entries for each context root eg: <Location /FCJNeoWeb>, <Location /FCJWebServices>, etc or Add <Location /> which will all the context roots.

b. For Weblogic instances in cluster

<Location /<<context/url>>>

SetHandler weblogic-handler

WebLogicCluster <server1>:<port1>,<server2>:<port2>

</Location>

Example

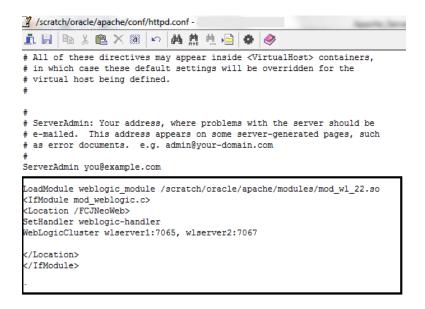

<Location / FCJNeoWeb >

SetHandler weblogic-handler

WebLogicCluster wlserver1:7065, wlserver2:7067

</Location>

This will forward /FCJNeoWeb from Apache server to /FCJNeoWeb on WebLogic Cluster wlserver1:7065 and wlserver2:7067

5. Enable "WebLogic Plug-In Enabled" flag in weblogic

This flag needs to be enabled in weblogic if it is accessed through proxy plugins. When the WebLogic plugin is enabled, a call to getRemoteAddr will return the address of the browser client from the proprietary WL-Proxy-Client-IP header instead of the web server.

- a. Plugin flag at managed server level
 - i. Click on 'Environment'- > 'Servers' -> '<ManagedServer>' -> 'General' -> 'Advanced'
 - ii. Check the 'WebLogic Plug-In Enabled' box.

- iii. Click 'Save'
- iv. Restart the Server.
- b. Plugin flag at domain level
 - i. Click on <Domain> -> 'Web Applications'
 - ii. Check the 'WebLogic Plug-In Enabled' box.
 - iii. Click 'Save'
 - iv. Restart the server.
- 6. Restart the apache server and application can be accessed using link

http://<hostname>:<port>/FCJNeoWeb/

4. Configuring SSL for Apache Server

Secure Sockets Layer (SSL) is required to run any Web site securely. Secure Sockets Layer (SSL) is an encrypted communication protocol that is designed to securely send messages across the Internet.

Reading of "**SSL_Configuration on Weblogic**" document provided as part of FCUBS installation is recommended before proceeding with further setup.

SSL configuration can be done between

- 1. Browser to Apache Server(Mandatory)
- 2. Apache to Oracle Weblogic Server(If required)

4.1 SSL configuration for Inbound Request to Apache

Perform these tasks to enable and configure SSL between browser and Apache Server.

1. In httpd.conf, uncomment the below line

Include conf/extra/httpd-ssl.conf

2. Edit httpd-ssl.conf file located in \$PREFIX/conf/extra/ to give the server address and port as below

Listen <hostname>:<port>

NOTE: This is the https port and not for http

- 3. Obtain a certificate from CA or create a self signed certificate using openSSL
 - a. Steps to create certificate using openSSL

openssl genrsa -des3 -out test.key 1024

openssl req -new -key test.key -out test.csr

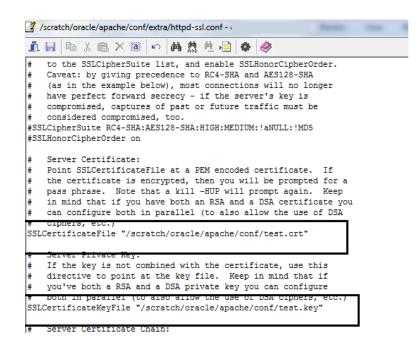

openssl x509 -req -days 365 -in test.csr -signkey test.key -out test.crt

This will generate 3 files named test.key, test.csr, test.crt

- 4. Copy the files with extension.crt and .key to \$PREFIX/conf/ folder.
- 5. Edit httpd-ssl.conf to give the location and name for .crt and .key as below

SSLCertificateFile "/scratch/oracle/apache/conf/test.crt"

SSLCertificateKeyFile "/scratch/oracle/apache/conf/test.key"

6. Restart apache and application can be accessed using URL

https://<hostname>:<port>/FCJNeoWeb/

NOTE: When apache is started with SSL enabled it will ask for pass phrase: here enter the pass phrase used during creation of certificate

4.2 <u>Configuring SSL between Apache and Oracle Weblogic</u> <u>Server</u>

1. Obtain a certificate from CA or create a self signed certificate using Keytool

keytool -genkeypair -alias testselfcert -keyalg RSA -keypass admin123 -validity 365 -keystore testidentity.jks

keytool -export -alias testselfcert -file test.cer -keystore testidentity.jks

- 2. Configure in weblogic to use the generated keyStore
 - a. Enable the enable SSL port for the managed server

Certificate displayed by Weblogic needs to be copied to apache, below steps needs to be followed

e. Execute the openSSL command, openssl s_client -connect <WL host: Port>

Eg: openssl s_client -connect wlserver1:7004. It will give output as below

-bash-4.1\$ openssl s_client -connect wlserver1:7004 CONNECTED(0000003) depth=0 C = IN, ST = IN, L = IN, O = IN, OU = IN, CN = IN verify error:num=18:self signed certificate verify return:1 depth=0 C = IN, ST = IN, L = IN, O = IN, OU = IN, CN = IN verify return:1 ---Certificate chain 0 s:/C=IN/ST=IN/L=IN/O=IN/OU=IN/CN=IN i:/C=IN/ST=IN/L=IN/O=IN/OU=IN/CN=IN

- f. The section highlighted in red above is the certificate presented by weblogic. This needs to be copied to new file and name this file as server.pem under location \$PREFIX/conf/
- 3. Apache to be configured to use the SSL

In httpd.conf add the below directive

<Location /FCJNeoWeb> SetHandler weblogic-handler

SecureProxy ON

WLProxySSL ON

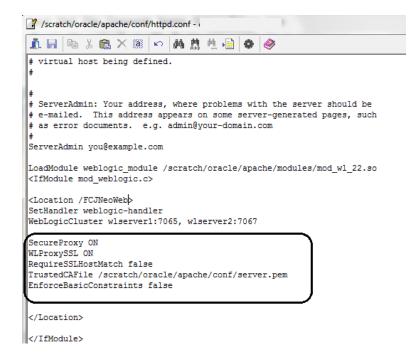

RequireSSLHostMatch false

TrustedCAFile /scratch/oracle/apache/conf/server.pem

EnforceBasicConstraints false

</Location>

4. Restart Apache and access using the URL

https://<hostname>:<port>/FCJNeoWeb/

5. Starting, Stopping, and Restarting Apache

Run below commands

- \$PREFIX/bin/apachectl start
- \$PREFIX/bin/apachectl stop
- \$PREFIX/bin/apachectl restart

6. Debugging

1. LogLevel and ErrorLog directives in httpd.conf file control the location and log file severity.

3 /scratch/oracle/apache/conf/httpd.conf -
直 🖩 陆 🎖 🛍 🗙 🛞 🗠 🛤 🎎 性 📄 🗇 🧇
<pre># # ErrorLog: The location of the error log file. # If you do not specify an ErrorLog directive within a <virtualhost> # container, error messages relating to that virtual host will be # logged here. If you *do* define an error logfile for a <virtualhost> # container, that host's errors will be logged there and not here.</virtualhost></virtualhost></pre>
₹ ErrorLog "logs/error_log"
<pre># # LogLevel: Control the number of messages logged to the error_log. # Possible values include: debug, info, notice, warn, error, crit, # alert. emerg. # LogLevel warn</pre>
<ifmodule log_config_module=""></ifmodule>

2. To enable debugging for communication between apache and weblogic add the following directives under Location tag

WLLogFile <File path>

Debug ALL

DebugConfigInfo ON
