ORACLE®

Oracle Banking Platform Host Extensibility Guide – Collections Algorithm Spots, Release 2.12.0.0.0

F43567-01

Contents

Preface

This document provides the detailed list of algorithm spots which can be used for extending and customizing the product.

Audience

This guide is intended for the users of Oracle Banking Platform.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/us/corporate/accessibility/index.html.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/us/corporate/accessibility/support/index.html#info or visit http://www.oracle.com/us/corporate/accessibility/support/index.html#trs if you are hearing impaired.

Related Documents

For more information, see the following documentation:

- For installation and configuration information, see the Oracle Banking Platform Localization Installation – Silent Installation Guide.
- For a comprehensive overview of security, see the Oracle Banking Platform Security Guide.
- For the complete list of licensed products and the third-party licenses included with the license, see the Oracle Banking Platform Licensing Guide.
- For information related to setting up a bank or a branch, and other operational and administrative functions, see the Oracle Banking Platform Administrator Guide.
- For information related to customization and extension of Oracle Banking Platform, see the Oracle Banking Platform Extensibility Guides for HOST and UI.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.

Convention	Meaning
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
`monospace`	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1 List of Algorithm Spots

The detailed list of algorithm spots which can be used for extending and customizing the product are listed in the following table.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
SaTypeSaStopAlgorithmSpot	This algorithm spot is used to stop the contarct.	void setServiceAgreement(ServiceAgreement serviceAgreement);	com.splwg.ccb.domain.collection.batch.algorithm.FinalizeCollectionContractStopAlgoComp	com.splwg.ccb.domain.collection.batch.algorithm.FinalizeCollectionContractStopAlgoComp_Impl	Stop Contract: C1-CURENTITY	This algorithm will stop the contract for the account which is to be cured.
CureEntityAlgorithmSpot	This algorithm spot is used to cure the account.	void setAccountId(Account_Id acctId);	com.splwg.ccb.domain.collection.batch.algorithm.CureEntityAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.CureEntityAlgorithm_Impl	Cure Account: C1-FINCOLL	This algorithm performs following activities: - Invoke OBP service to set the incollection flag in host as "N". - Mark incollection flag as "N" in collections. - Set end date in CI_PARTY_COLLECT as posting date. - Update number of times account is self cured(used for statistics). - Remove strategy review date. Parameter:

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						contactMethods : This soft parameter accept the comma separated value of customer contact method which is used to calculate the no. of times account is self cured
AllocationGroupQueueAlgorithmSpot	This algorithm spot is used to allocate the entities.	void setAllocationGroup(String allocationGroup); void setBusinessDate(Date businessDate); void seToQueueBean(AllocationGroupCasesToQueueBean caseAllocToQueue); AllocationGroupCasesToQueueBean getCaseToQueueBean(); AllocationGroupCasesToQueueBean getCaseAllocationMap();	Com.splwg.ccb.domain.collection.batch.algorithm.AllocationGroupQueueAlgoComp	com.splwg.ccb.domain.collection.batch.algorithm.AllocationGroupQueueAlgoComp_Impl	Queue Allocation: C1-ALLOCQUEU	This Algorithm type is used to allocate the entities such as cases to queues. ci_allocation_monitor_vw view is shipped from product to filter cases.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status.	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.batch.algorithm.CustomerLevelSwitchUpdateAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.CustomerLevelSwitchUpdateAlgorithm_Impl	Update Customer Switch: C1-CUSTSW	Update customer level case status on case enter processing. Customer Level Switch Name: Please enter the customer level case status switch which needs to update. eg. BANKRUPT_SW, HARDSHIP_SW, IMPRISONED_SW, DECEASED_SW, ABSCONDING_SW etc Switch Value: Please enter the switch value as Y or N

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.batch.algorithm.RepoAndLegalCaseUpdateAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.RepoAndLegalCaseUpdateAlgorithm_Impl	Update Legal/Repo Switch: C1-LEREPOCT	Algorithm Type to update Legal and Repo case status on enter process Legal Repo Switch Name: Please enter the Legal or Repo case switch column name of account extension eg. LEGAL_CASE_EXISTS_SW or REPO_CASE_EXISTS_SW etc Switch Value: Please enter the switch value as Y or N
UserAllocationAlgorithmSpot	This spot being used for allocation of user using various algorithms.	void setUserToQueueBean(UserAllocationToQueueBean userAllocToQueue); UserAllocationToQueueBean getUserToQueueBean(); UserAllocationToQueueBean	com.splwg.ccb.domain.collection.batch.algorithm.UserAllocationRoundRobinAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.UserAllocationRoundRobinAlgorithm_Impl	User Allocation - Round Robin: C1-USRALCRR	User Allocation Round Robin algorithm type allocates cases to users on the basis of capacity set during configuration on queue admin. OverFlow cases will get assigned to Exception User.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
		getUserAllocation Map();				
UserAllocationAlgorithmSpot	This spot being used for allocation of user using various algorithms.	void setUserToQueueBean(UserAllocationToQueueBean userAllocToQueue); UserAllocationToQueueBean getUserToQueueBean(); UserAllocationToQueueBean getUserAllocationMap();	com.splwg.ccb.domain.collection.batch.algorithm.UserAllocationPercentageBaseAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.UserAllocationPercentageBaseAlgorithm_Impl	User Allocation - % Based: C1-USRALCPR	User Allocation Percentage based algorithm type allocates cases to users on the basis of percentage allocations set during configuration on queue admin. OverFlow cases will get assigned to Exception User.
VendorAllocationAlgorithmSpot	This spot being used for allocation of vendor using various algorithms.	void setVendorToQueueBean(VendorAllocationToQueueBean vendorAllocToQueue); VendorAllocationToQueueBean getVendorToQueueBean(); VendorAllocationToQueueBean getVendorAllocationMap();	com.splwg.ccb.domain.collection.batch.algorithm.VendorAllocationRoundRobinAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.VendorAllocationRoundRobinAlgorithm_Impl	Vendor Allocation - Round Robin: C1-VENALCRR	This algorithm will allocate cases to vendors in round robin fashion. This algorithm is invoked from the User Allocation batch (C1-USALC). OverFlow cases will get assigned to Exception User of the queue.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
VendorAllocationAlgorithmSpot	This spot being used for allocation of vendor using various algorithms.	void setVendorToQueueBean(VendorAllocationToQueueBean vendorAllocToQueue); VendorAllocationToQueueBean getVendorToQueueBean(); VendorAllocationToQueueBean getVendorAllocationMap();	com.splwg.ccb.domain.collection.batch.algorithm.VendorAllocationPercentageBaseAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.VendorAllocationPercentageBaseAlgorithm_Impl	Vendor Allocation - % Based: C1-VENALCPR	This algorithm will allocate cases to vendors in percentage base. This algorithm is invoked from the User Allocation batch (C1-USALC). OverFlow cases will get assigned to Exception User of the queue.

BulkContactCreationAlgorithmSpot	This algorithm spot is used for creation of contact for accounts in bulk.	void setAccountId(String accountId);
		void setContactClass(String contactClass);
		void setContactTypeCode(String contactTypeCode);
		void setMode(String mode);
		void setCharacteristicType(String characteristicType);
			com.splwg.ccb.domain.collection.batch.algorithm.BulkContactCreationAlgoComp	com.splwg.ccb.domain.collection.batch.algorithm.BulkContactCreationAlgoComp_Impl	Bulk Contact Creation: C1-BLKCNTCRE	This algorithm type is called from Bulk Contact Creation Batch. It invokes business service 'C1-GenMultipleCorrespondence' which creates a customer contact for the accounts filtered by the condition builder attached to the process codes in bulk contact admin.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary

		void setCharacteristicValue(String characteristicValue);
		void setJointNominationForAcc(String jointNominationForAcc);
		void setContactDateTime(String contactDateTime);
		void setGeneratedBy(String generatedBy);				

CrossStrategyActionMatrixAlgorithmSpot	This algorithm spot is used to execute the business logic when a case enters into a particular state and all the changes related to the state change are committed to DB.	void setCase(ToDoCase toDoCase);
		void setCaseOriginalStatus(CaseStatus caseStatus);
		String getNextCaseStatus();
			com.splwg.ccb.domain.collection.batch.algorithm.CrossStrategyActionMatrixAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.CrossStrategyActionMatrixAlgorithm_Impl	Cross Strategy Action Matrix: C1-CSAM	Cross Strategy Action Matrix Algorithm Type is used by Strategy Monitor and case association process in order to take actions on existing strategies and recommended strategies based on CSAM Matrix.
						
						Parameters :
						Check Status- It checks the status with which the matrix has to be

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						dealt with. Possible values are "Y" or "N"

CustomerClassFtFreezeAlgorithmSpot	The purpose of the algorithm spot is to call an algorithm defined as the FT Freeze algorithm for FT Freeze System Event on a Customer Class.	void setFinancialTransaction(FinancialTransaction financialTransaction);
		void setFinancialTransactionType(FinancialTransactionTypeLookup financialTransactionType);
		void setRegularFinancialTransaction(FinancialTransaction regularFinancialTransaction);
		Bool getFinancialTransactionProcessAdded();
			com.splwg.ccb.domain.collection.batch.algorithm.LastPaymentDtAmtUpdateAlgorithm	com.splwg.ccb.domain.collection.batch.algorithm.LastPaymentDtAmtUpdateAlgorithm_Impl	Last Payment for Account: C1-PAYDTAMTU	This algorithm is used to stamp the last payment date and last payment amount for written off accounts.

CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckAssociationReview	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckAssociationReview_Impl	Association Review Check: C1-ASORVCHK	This is to decide if the system association of entities should be reviewed by the user or not. Soft Parameters: Next Status: Values Possible

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
	entry and links the Case to it as FK Characteristic	String getNextCaseStatus() String getNextTransCondition()				for Next Status{ASSNEWLSP}. This is applicable if Association Review Required is set N. Association Review Required= Possible Values{Y,N} If Association Review is Required {Y}- Stay in current status for user review. Set display date to current business date. If association Review Not Required {N} - Transition to specified next status.
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.DefaultNoticeExpiryCheck	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.DefaultNoticeExpiryCheck_Impl	Validate Expired Default Notice: C1-DEFNOEXP	System should check that for associated accounts default notice has expired, This check can be for primary account or for all associated delinquent account based on

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
	Case to it as FK Characteristic	getNextCaseStatus() String getNextTransCondition()				parameter. 1. Association Type= {P,A}.P=Primary Type Association,A= Primary as well as Secondary type association 2. To Do Type= To Do will be created if validation failure option is N. 3. To Do Role= To Do Role for the specified To Do Type. 4. Validationfailure Option= {Y,N}. If it is Y then case transition will be failed elsen a To Do will be created.
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckLegalCase	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckLegalCase_Impl	Associate Related Entity: C1-ASSOENTY	The algorithm checks the associated accounts of the primary account.The association of the primary account is done on the basis of the persons attached to the account and their financially

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
	Characteristic	String getNextTransCondition()				responsible status.if the account has the same set of financially reponsible persons attached as in the case for the primary account, the accound is associated. The algorithm parameter are as follows: 1)To Do Role:Specifies the role for the To Do Type created in case of any exception arrising in association of accounts. 2)To Do Type:Specifies the To Do Type created in case of any exception arrising in association of accounts. 3)Host Id:Specifies the host Id.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckLegalCase	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckLegalCase_Impl	Validate Legal Case Exists: C1-CHKLGL	The Algorithm checks if there is already open legal case for the primary account/Associated accounts linked to the case.The algorithm takes the parameters as follows: 1)To Do Role:Specifies the Role for the To Do Type. 2)To Do Type:Specifies the todo type created when the legal case has been created from batch mode and there is open legal case for the Primary Account/Associated Accounts. 3)Case Category:Specifies the case category for the case(LEGL is for Legal Case)

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.AssignNewLSP	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.AssignNewLSP_Impl	Assign New LSP: C1-ASGNLSP	This algorithm will assign a new LSP to the current case. LSP is a external vendor which is mapped LEGAL service Type. If manual review is not required then case will automatically transition to next status metntioned in softparameter.Below are the softparameter eaxample 1. Next Status: value can be possible next status example{PREPLGLDOC etc.} 2. Prv Allocation Check: Possible values {Y, N}. If this switch is Y system will check if a legal case was created for any of the accounts associated with the current legal case in past.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						3 .Reset Doc Sub Date Sw= Possible values {Y, N}. Value N means document submission date from previous assignment will be copied to new assignment. 4. Change Allocation Option= Possible values {AUTO_WITH_REVIEW,AUTO_WITHOUT_REVIEW, MANUAL}. AUTO_WITH_REVIEW= System allocation with review option. AUTO_WITHOUT_REVIEW=System allocation without review option. MANUAL=Manual allocation. System will not allocate LSP. 5. New Allocation And Review Option= Possible values {AUTO_WITH_RE

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						VIEW,AUTO_WITH_REVIEW_PRVALLOC,AUTO_WITHOUT_REVIEW, MANUAL} AUTO_WITH_REVIEW= System allocation with review option. AUTO_WITH_REVIEW_PRVALLOC=System allocation and review will be required if previous allocation was retained. AUTO_WITHOUT_REVIEW=System allocation without review option. MANUAL=Manual allocation. System will not allocate LSP.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CreateApprovalRequest	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CreateApprovalRequest_Impl	Check Approval Requirement: C1-APPRCHK	This algorithm creates approval request if required based on certain conditions.This process will check if LSP assignment needs to be approved if LSP assignment status = "Pending Approval" Approval would be required if either of below is true • System allocation override by user i.e. user has changed the LSP assigned by the system. Set Approval Reason as "Allocation override" • Exposure i.e. sum of balances for all accounts associated with the case is more than a specified threshold. However if no threshold has been specified this parameter should be ignored. Set

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						Approval Reason as "High Exposure" • In case approval is required for both the reason, concatenate the approval reasons before sending for approval. If approval is required • Transition the case to a specified status defined as the parameter
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.ResumeStatusLSP	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.ResumeStatusLSP_Impl	Resume Status from Previous LSP: C1-RESSTATUS	Algorithm to resume previous status

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
CaseTypeAutoTransitionAlgorithmSpot	This algorithm type is used to perform auto transition processing for a Case.	void setCase(ToDoCase toDoCase); Bool getShouldAutoTransition(); CaseStatus getNextCaseStatus(); String getNextTransCondition();	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckSubmissionDate	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.CheckSubmissionDate_Impl	Check Submission date - CI_CHKSUBDT1	The algorithm checks if the legal documents have been submittedand if that is the case,it changes the status for the caseId. The algorithm takes the following parameters: 1)Next Status: Specifies the next status for case transition if change status is{Y} 2)Change Status{Y,N}: Y defines to change the status,N defines not to change the status.
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatu	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.UpdateLSPAssignment	com.splwg.ccb.domain.collection.caseType.specialisedCollections.legal.UpdateLSPAssignment_Impl	Update LSP (CLOS): C1-LSPSTATUS	Set LSP assignment status to value provided in the parameter. This should be done only for Latest LSP assignment and if it was done by current legal case. If Status = Closed or Cancelled set

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
	Characteristic	s() String getNextTransCondition()				Assignment End date = Business Date Status possible values {CLOS,REJ,CAN, PNAP} CLOS=Closed REJ=Rejected PNAP=Pending for Approval.
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.CollateralVerification	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.CollateralVerification_Impl	Collateral Verification: C1-VRFYCOLS	This will perform following validations for the collateral with the case • if soft parameter Collateral type to this algorithm type is "PROPERTY" then, Only one collateral is associated with the case also that Collateral is associated with Facility for the primary account associated with the case • If collateral type soft parameter is blank, then above validation should be ignored and Collateral status

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						is set to not Sold • it will also validate that if There is not active Asset repossession case running for the collateral. If any of the above validations fail case creation process should be terminated
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.AccountAssociationForAssetRepossessionCase	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.AccountAssociationForAssetRepossessionCase_Impl	Account Association for Asset Repossession Case: C1-ARSACCTS	This algorithm will perform following actions: • It will get all facilities to which this collateral is associated also it will get all accounts for these facilities. • It will Associate these accounts with the case. Scope of this association is limited to accounts already in collections. This process will not check for any accounts not in collections.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						This algorithm doesn't have any soft parameter.
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific sample algorithm creates To Do entry and links the Case to it as FK Characteristic	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.CustomerAssociationForAssetRepossessionCase	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.CustomerAssociationForAssetRepossessionCase_Impl	Customer Association for Asset Repossession Case: C1-ARSCUSTS	This algorithm will perform following actions: • It will get all customers who are the owners for the selected collateral • It will Associate these customers with the case Scope of this association is limited to customers already in collections. This process will not check for any customers not in collections. This algorithm doesn't have any soft parameter.
CaseTypeEnterStatusAlgorithmSpot	The purpose of the algorithm spot is to execute the business logic when Case is moved into specific status. The specific	void setCase(ToDoCase toDoCase) void setCaseOriginalStatus(CaseStatus caseStatus) Bool	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.UpdateCollateralProperty	com.splwg.ccb.domain.collection.caseType.specialisedCollections.AssetRepo.UpdateCollateralProperty_Impl	Update Collateral Property: C1-UPCOLPROP	This algorithm will perform foolowing operations: 1)if the value of updateCollateralProperty soft parameter is "SET" and type of

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
	sample algorithm creates To Do entry and links the Case to it as FK Characteristic	getShouldAutoTransition() String getNextCaseStatus() String getNextTransCondition()				possession is "Warrant" then Fetch the collateral for which case is created and update the IS_LEGAL_SW= "Y" and populate the case_id on this collateral. 2)if the value of updateCollateralProperty soft parameter is "RESET" then Fetch the collateral for which case is created and update the IS_LEGAL_SW= "N" and IS_REPO_SW= "N". nullify the case_id on this collateral

Processing logic should be as below • Validate that "Total Debit Amount" is greater than zero. Else transition into the status should fail and appropriate error message be displayed OR recorded in case log (if not executed manually). • It is possible that target account balance got updated after user

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						had entered the debit amounts. System should refresh balance from host. • Re-compute maximum amount which can be debited for each target account For each of the target account with set-off status as "Pending", • If maximum amount which can be debited is < Debit amount specified by the user then o Set set-off status and exclude reason as "Not eligible". o Skip rest of the processing and move to next target account • Call Rule engine to validate the account, which will output "Success" or "Failure". o If for any of the account

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						validation status = "Failure", § Set set-off status and exclude reason as "Not eligible". Once all target accounts have been processed get sum of debit amounts for all target accounts with set-of status as "Pending". Three scenarios are possible • There are no target accounts in pending status. Go to cancel set-off step • Sum of Debit amounts of target account > Overdue amount for delinquent account. In this case check the "Excess debit" option o Adjust Debit Amounts - Proportionately reduce debit amounts from all target accounts.

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						See example at bottom of section. o Cancel Set-off - Go to Cancel set-off step • Sum of Debit amounts of target account <= Overdue amount for delinquent account. In this case there is no exception and set-off process should proceed. Cancel Set-off • Case status should be transitioned to the specified status. Set given char value for the given char type (as defined in parameters) Example of proportionate adjustment: Say A1 is delinquent account and has $

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						120 as arrear. Say debit amounts of $ 60 and $40 have been set from target accounts TA1 and TA2. So total amount to be debited is $ 100 Now during revalidation it is found that overdue has dropped to $ 60. So now below computations should be done • X = (Overdue amount) / (Sum of debit amounts) • New Amount to debited from TA1 = Previous debit amount for TA1 * X • New Amount to debited from TA2 = Previous debit amount for TA2 * X So in this case • X = $ 60 / ($60 + $ 40) = 0.6 • New Amount to debited from TA1 = $ 60 * 0.6 = $ 36

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						• New Amount to debited from TA2 = $ 40 * 0.6 = $ 24 Parameters - • Cancel Reason Char Type - Characteristic type to set as case characteristic if validation failure option is transition status. • Cancel Reason Char Value - Characteristic value for the defined characteristic type. • Validation Failure Transition Status - Case transition status in case of validation failure. • Excess Debit Option - Can have value ADJUST_DEBIT_AMOUNTS(Adjust Debit Amounts) or CANCEL_SETOFF(Cancel Set-off).

Algorithm Spot	Spot Detail	Spot Interface Funtions	Collections Algorithm Component	Collections Algorithm Impl	Collections Algorithm Description and Code	Algorithm Summary
						• Minimum Residual Amount - Minimum amount that must be present in account after set-off. • Rule ID - Defined rule id to validate account.
