U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software" or "commercial computer software documentation" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate failsafe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited. The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

This software or hardware and documentation may provide access to or information on content, products and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

# 1. Preface

## 1.1 Introduction

This manual is designed to help you quickly get acquainted with the Integration Gateway of Oracle FLEXCUBE Investor Servicing.

It provides an overview to the module, and provides information on using the Integration Gateway module of Oracle FLEXCUBE Investor Servicing.

You can further obtain information specific to a particular field by placing the cursor on the relevant field and striking <F1> on the keyboard.

## 1.2 Audience

This manual is intended for the following User/User Roles:

Role	Function
IT department members responsible for integration	Input functions for maintenance related to the gateway
IT managers	Authorization functions

## 1.3 Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

## 1.4 Acronyms and Abbreviations

Abbreviation	Description
Oracle FLEX-CUBE IS	Oracle FLEXCUBE Investor Servicing

## 1.5 Organization

The manual is organized in the following manner:

Chapter	Description
Chapter 1	<i>About this Manual</i> gives information on the intended audience. It also lists the various chapters covered in this User Manual.
Chapter 2	<i>Gateway Functions - An Overview</i> explains the features of this module.
Chapter 3	<i>Message Formats</i> explains the different message formats.

# 1.6 Glossary of Icons

This User Manual may refer to all or some of the following icons:

Icons	Function
	Exit
	Add row
	Delete row
	Option List

---

## 2. Gateway Functions - An Overview

### 2.1 Introduction

Integration of different applications and solutions is a key area in today's systems. A variety of specialized applications deployed on disparate platforms and using different infrastructure need to be able to communicate and integrate seamlessly with Oracle FLEXCUBE IS in order to exchange data. The Oracle FLEXCUBE IS Integration Gateway (referred to as 'Gateway' in the rest of the document) will cater to these integration needs.

The integration needs supported by the Gateway can be broadly categorized from the perspective of the Gateway as follows:

- Inbound application integration – used when any external system needs to add, modify or query information within Oracle FLEXCUBE IS
- Outbound application integration – used when any external system needs to be notified of the various events that occur within Oracle FLEXCUBE IS.

### 2.2 Inbound Application Integration

Oracle FLEXCUBE IS Inbound Application Gateway provides XML based interfaces thus enhancing the need to communicate and integrate with the external systems. The data exchanged between Oracle FLEXCUBE IS and the external systems will be in the form of XML messages. These XML messages are defined in FCIS in the form of XML Schema Documents (XSD) and are referred to as 'FCIS formats'

FCIS Inbound Application Integration Gateway uses the Synchronous and Asynchronous Deployment Pattern for addressing the integration needs.

The Synchronous Deployment Pattern is classified into the following:

- Oracle FLEXCUBE IS EJB Based Synchronous Inbound Application Integration Deployment Pattern
- Oracle FLEXCUBE IS Web Services Based Synchronous Inbound Application Integration Deployment Pattern
- Oracle FLEXCUBE IS HTTP Servlet Based Synchronous Inbound Application Integration Deployment Pattern

Asynchronous Deployment Pattern is:

- Oracle FLEXCUBE IS MDB Based Asynchronous Inbound Application Integration Deployment Pattern

#### 2.2.1 EJB Based Synchronous Deployment Pattern

The Enterprise Java Beans (EJB) deployment pattern will be used in integration scenarios where the external system connecting to Oracle FLEXCUBE IS is 'EJB literate', i.e., the external system is capable of interacting with Oracle FLEXCUBE IS based upon the EJB interface. In this deployment pattern, the external system will use the RMI/IIOP protocol to communicate with the Oracle FLEXCUBE IS EJB.

In this deployment pattern the EJB displayed by Oracle FLEXCUBE IS will be a stateless session bean. The actual request will be in the form of an XML message. After the necessary processing is done in Oracle FLEXCUBE IS based on the request, the response is returned to the external system as an XML message. The transaction control for the processing will stay with the Oracle FLEXCUBE IS EJB.

## **2.2.2 Web Services Based Synchronous Deployment Pattern**

The web services deployment pattern will be used in integration scenarios where the external system connecting to Oracle FLEXCUBE IS wants to connect using standards-based, interoperable web services.

This deployment pattern is especially applicable to systems which meet the following broad guidelines:

- Systems that are not 'EJB literate', i.e., such systems are not capable of establishing connections with Oracle FLEXCUBE IS based upon the EJB interface; and/or
- Systems that prefer to use a standards-based approach

In this deployment pattern, the external system will use the SOAP (Simple Object Access Protocol) messages to communicate to the Oracle FLEXCUBE IS web services.

The services displayed by Oracle FLEXCUBE IS are of a 'message based' style, i.e., the actual request will be in the form of an XML message, but the request will be a 'payload' within the SOAP message. After the necessary processing is done in Oracle FLEXCUBE IS based on the request, the response is returned to the external system as an XML message which will be a 'payload' within the response SOAP message. The transaction control for the processing will stay with the Oracle FLEXCUBE IS.

## **2.2.3 HTTP Servlet Based Synchronous Deployment Pattern**

The HTTP servlet deployment pattern will be used in integration scenarios where the external system connecting to Oracle FLEXCUBE IS wants to connect to Oracle FLEXCUBE IS using simple HTTP messages.

This is especially applicable to systems such as the following:

- Systems that are not 'EJB literate', i.e., are not capable establishing a connections with Oracle FLEXCUBE IS based upon the EJB interface; and/or
- Systems that prefer to use a simple http message based approach without wanting to use SOAP as the standard

In this deployment pattern, the external system will make an HTTP request to the Oracle FLEXCUBE IS servlet.

For this deployment pattern, Oracle FLEXCUBE IS will display a single servlet. The actual request will be in the form of an XML message. This XML message is embedded into the body of the HTTP request sent to the Oracle FLEXCUBE IS servlet. After the necessary processing is done in Oracle FLEXCUBE IS based on the request, the response is returned to the external system as an XML message which is once again embedded within the body of the response HTTP message. The transaction control for the processing will stay with the Oracle FLEXCUBE IS

## **2.2.4 MDB Based Asynchronous Deployment Pattern**

The MDB deployment pattern is used in integration scenarios where the external system connecting to Oracle FLEXCUBE IS wants to connect to Oracle FLEXCUBE IS using JMS queues.

This is especially applicable to systems such as the following:

- Systems that prefer to use JMS queues based approach without wanting to wait for the reply

Here external system sends messages in XML format to request queue on which an MDB is listening. When a message arrives on the queue, it is picked up for processing. After the necessary processing is done in Oracle FLEXCUBE IS, based on the request, the response is sent to the response queue as an XML message

## **2.3 Outbound Application Integration**

The Outbound Application Integration is also called the Oracle FLEXCUBE IS Notify Application Integration layer. This application layer sends out notification messages to the external system whenever events occur in Oracle FLEXCUBE IS.

The notification messages generated by FCIS on the occurrence of these events will be XML messages. These XML messages are defined in FCIS in the form of XML Schema Documents (XSD) and are referred to as 'FCIS formats'

## **2.4 Responsibilities of Integration Gateway**

The primary responsibilities of Oracle FLEXCUBE IS Integration Gateway include the following:

- Authentication
- Duplicate recognition
- Validation
- Routing
- Logging of messages

## **2.5 Deployment of Oracle FLEXCUBE IS Integration Gateway**

Message communication - incoming or outgoing from/to an external system in Oracle FLEXCUBE IS will happen only through an Oracle FLEXCUBE IS Integration Gateway. Hence, it becomes the first point of contact or last point of contact with the database in message flow. The Oracle FLEXCUBE IS Integration Gateway can be deployed to support both the distributed and single schema deployments of Oracle FLEXCUBE IS:

- Distributed deployment of FCIS – In this situation the database components of the Gateway are deployed as two or more schemas
  - The messaging schema as part of SMS schema in the SMS and/or HO instance
  - The business schema(s) in the various branch schemas in the branch instance(s)
- Single schema deployment of FCIS – In this situation the database components of the Gateway (messaging and business) are both deployed as part of the single Oracle FLEXCUBE IS schema.

## **2.6 Deployment Patterns for Application Integration**

<b>Business Integration Needs</b>	<b>Nature of Integration</b>	<b>Oracle FLEXCUBE IS Deployment Pattern</b>	<b>Remarks</b>

Inbound Transactions into Oracle FLEXCUBE IS	Synchronous	FLEXCUBE IS EJB	Recommended
		FLEXCUBE IS HTTP Servlet	This can be used if the external system cannot communicate to Oracle FLEXCUBE IS using EJB.
		FLEXCUBE IS Web Services	This can be used if the external system chooses to communicate only through Web Services.
	Asynchronous	FLEXCUBE IS MDB	This can be used if the external system chooses to communicate only through JMS queues
Inbound Queries into Oracle FLEXCUBE IS	Synchronous	FLEXCUBE IS EJB	Recommended
		FLEXCUBE IS In Servlet	This can be used if the external system cannot communicate to Oracle FLEXCUBE IS using EJB.
		FLEXCUBE IS Web Services	This can be used if the external system chooses to communicate only through Web Services.
	Asynchronous	FLEXCUBE IS MDB	This can be used if the external system chooses to communicate only through JMS queues
Handoffs from Oracle FLEXCUBE IS	Asynchronous	FLEXCUBE IS Notify	Recommended

## 3. Message Formats

### 3.1 Introduction

Data exchanged between Oracle FLEXCUBE IS and the external systems will be in the form of XML messages. These XML messages are defined in FCUBS in the form of XML Schema Documents (XSD) and are referred to as 'FCIS formats'. An XML Schema is uniquely identified by its Namespace and its Root Element (root node). The root node for XSDs of gateway messages will be generated as per the following pattern:

- <OPERATION>\_<MESSAGE EXCHANGE PATTERN>\_REQ
- <OPERATION>\_<MESSAGE EXCHANGE PATTERN>\_RES
- Where
- <OPERATION> refers to an Oracle FLEXCUBE IS operation like CREATEUNITHOLDER
- <MESSAGE\_EXCHANGE\_PATTERN> refers to the request and response message patterns exchanged. The Message Pattern is of the following types
  - FS (Full Screen) - This indicates that the payload will contain all the elements on the corresponding Oracle FLEXCUBE IS screen.
  - IO (Input Only) - This indicates that the payload will contain the only input elements on the corresponding Oracle FLEXCUBE IS screen.
  - PK (Primary Key): This indicates that the payload will contain only the Primary Key elements of the corresponding Oracle FLEXCUBE IS screen.

<MESSAGE\_EXCHANGE\_PATTERN> is a combination of message patterns. The <MESSAGE\_EXCHANGE\_PATTERN> available in Oracle FLEXCUBE IS is shown below:

- FSFS - Full Screen Request and Full Screen Response
- IOPK - Input Only Request and Primary Key Response
- IOFS - Input Only Request and Full Screen Response

#### Non-Query Formats

For example, consider the Operation 'CREATEUNITHOLDER'. The root node of messages under this operation will be as under:

- CREATEUNITHOLDER\_FSFS\_REQ

- CREATEUNITHOLDER\_FSFS\_RES

- CREATEUNITHOLDER\_IOPK\_REQ

- CREATEUNITHOLDER\_IOPK\_RES

### Query Formats

For instance, consider the Operation 'QUERYUNITHOLDER'. The root node of messages under this operation will be as under:

- QUERYUNITHOLDER\_IOFS\_REQ

- QUERYUNITHOLDER\_IOFS\_RES

This chapter contains the following sections

- [Section 3.2, "Oracle FLEXCUBE IS Envelope"](#)
- [Section 3.3, "Oracle FLEXCUBE IS NOTIFICATION"](#):

## **3.2 Oracle FLEXCUBE IS Envelope**

This section contains the following topics:

- [Section 3.2.1, "FCUBS HEADER"](#)
- [Section 3.2.2, "FCUBS\\_BODY"](#)

A standard gateway message in the Oracle FLEXCUBE IS Envelope contains two main components namely:

- FCUBS\_HEADER – This is a node that forms the header of the FCUBS Envelope. The tags under the header portion of a message will identify a partner system, a service, an operation, user, branch, etc. These tags are constant across all messages.

- FCUBS\_BODY – This node contains the actual payload of a message. The contents of this node will vary for each message.

### 3.2.1 **FCUBS HEADER**

The tags under FCUBS HEADER have been described below:

#### **SOURCE**

This indicates the name of the External system that is the source of the message.

#### **UBSCOMP**

This indicates the Oracle FLEXCUBE IS component of the message - whether FCIS or FCUBS

#### **MSGID**

This unique ID identifies each message – incoming or outgoing in Oracle FLEXCUBE IS. Every message will have a distinct message ID.

#### **CORRELID**

This is the id using which any system which has sent a request to FCUBS can correlate to the response. In the External system maintenance, the Correlation Pattern can be configured for each external system. It can be maintained that either the 'MSGID' or the 'CORRELID' of the request message is returned back as the 'CORRELID' in the response message. Depending on this maintenance, Oracle FLEXCUBE IS will set either the 'MSGID' or the 'CORRELID' of the request message in the response message.

#### **USERID**

For request messages, this ID is used to submit message requests. Oracle FLEXCUBE IS will process this request using this id.

For response messages, the value of this will be 'null'.

#### **BRANCH**

This indicates the Oracle FLEXCUBE IS Branch Code where the request message needs to be processed. If the BRANCH is missing in the header, request message will be transmitted and processed in Head Office branch.

#### **MODULEID**

This indicates the module ID.

#### **SERVICE**

This provides details on the various services of Oracle FLEXCUBE IS. For every incoming message in Oracle FLEXCUBE IS, the service name is mandatory.

#### **OPERATION**

This indicates the functional operation.

#### **SOURCE\_OPERATION**

This indicates the functional operation as registered in Oracle FLEXCUBE IS.

#### **SOURCE\_USERID**

This is the User ID with which the request message was invoked from the SOURCE.

#### **DESTINATION**

For incoming messages, the destination will be Oracle FLEXCUBE IS. For response messages, system will populate the SOURCE of the request message as DESTINATION.

#### **MULTIRIPID**

This is a unique id which indicates overrides.

**FUNCTIONID**

This indicates the Oracle FLEXCUBE IS Function ID

**ACTION**

This indicates the action type.

**MSGSTAT**

This indicates whether the transaction is a SUCCESS or FAILURE.

**PASSWORD**

This indicates the password.

**ADDL**

This is used to send additional parameters i.e. parameters not available in Oracle FLEXCUBE IS

**3.2.2 FCUBS\_BODY**

The FCUBS\_BODY will contain the actual payload to perform the respective transaction. The contents of the payload will vary for each operation.

The following snapshot shows a sample FCUBS\_BODY of QUERYUNITHOLDER operation.

FCUBS\_BODY will contain additional nodes for error response and warning response. A diagrammatic representation of the Error response is as shown below:

### 3.2.2.1 FCUBS\_ERROR\_RESP

The error response message will be sent from Oracle FLEXCUBE IS when errors are raised in a transaction. The error response will have another tag 'ERROR' within it.

#### **ERROR**

The 'ERROR' node will have tags for error code and error description. The 'ERROR' node will be generated for each error raised by FCIS.

### 3.2.2.2 FCUBS\_WARNING\_RESP

The warning response message will be sent when overrides are raised in a transaction. The Warning response will have another tag 'WARNING' within it.

#### **WARNING**

This node will have tags for warning code and warning description. The 'WARNING' node will be generated for each override raised by FCIS.

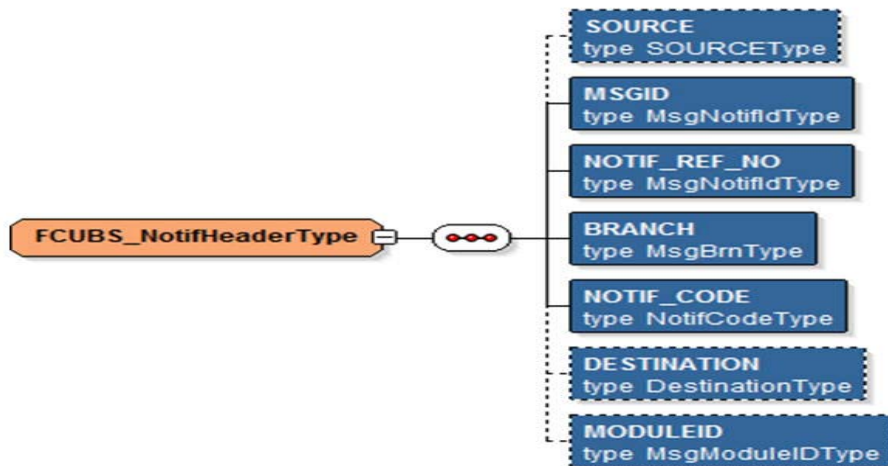

## 3.3 Oracle FLEXCUBE IS NOTIFICATION

The notification messages are generated in a standard format. The notification messages will consist of two main components:

**FCUBS\_NOTIF\_HEADER** – This forms the header portion of a notification message. This contains a standard set of tags that can identify a notification. These tags are constant across all notification messages.

**FCUBS\_NOTIF\_IDENTIFIER** – This will identify the maintenance records based on the information provided under this node. The contents of this node will vary for each notification.

A diagrammatic representation of FCISS NOTIFICATION is as shown below:

### 3.3.1 FCIS NOTIFICATION HEADER

The tags under FCIS NOTIFICATION HEADER have been described below:

#### **SOURCE**

This indicates the name of the External system or the source of the message.

#### **MSGID**

This is the unique reference number generated by Oracle FLEXCUBE IS.

#### **NOTIF\_REF\_NO.**

This unique reference number identifies each notification message generated in Oracle FLEXCUBE IS.

#### **BRANCH**

This indicates the branch in which notification has been triggered.

#### **NOTIF\_CODE**

This indicates the code for the notification that has been triggered.

#### **DESTINATION**

For incoming messages, the DESTINATION should be Oracle FLEXCUBE IS. For response messages, system will populate the SOURCE of the request message as DESTINATION.

#### **MODULEID**

This indicates the module ID.

*Refer 'Service-Documentation' available under 'Gateway' for details about each message.*
