Oracle® Database Move to Oracle Cloud Using Zero Downtime Migration

Release 21c (21.2) F43498-05 February 2022

ORACLE

Oracle Database Move to Oracle Cloud Using Zero Downtime Migration, Release 21c (21.2)

F43498-05

Copyright © 2019, 2022, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software" or "commercial computer software documentation" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle, Java, and MySQL are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

1 Introduction to Zero Downtime Migration

About Zero Downtime Migration	1-1
Physical Migrations with Zero Downtime Migration	1-2
Physical Online Migration	1-2
Physical Offline Migration	1-3
Supported Physical Migration Paths	1-4
Data Transfer Media Supported for Physical Migrations	1-4
Direct Data Transfer Support	1-5
Supported Database Architectures for Physical Migration	1-5
Target Placeholder Database Environment	1-6
Logical Migrations with Zero Downtime Migration	1-6
Logical Online Migration	1-6
Logical Offline Migration	1-7
Supported Logical Migration Targets	1-7
Initial Load Methods Supported for Logical Migrations	1-7
What Is Migrated During Initial Load	1-8
Data Replication	1-9
Zero Downtime Migration Requirements and Considerations	1-9
Supported Platforms	1-9
Supported Database Versions for Migration	1-10
Zero Downtime Migration Database Server Access	1-10
Zero Downtime Migration Operational Phases	1-10
Zero Downtime Migration Security Provisions	1-11

2 Setting Up Zero Downtime Migration Software

Prepare a Host for Zero Downtime Migration Software Installation	2-1
Install Zero Downtime Migration Software	2-2

3 Configuring Required Connections

Configuring Connectivity From the Zero Downtime Migration Service Host to the Source and Target Database Servers	3-1
Configuring SUDO Access	3-3
Configuring Connectivity Between the Source and Target Database Servers	3-4
Option 1: SQL*Net Connectivity Using SCAN	3-4
Option 2: Set up an SSH Tunnel	3-5
Additional Connectivity Prerequisites for Oracle GoldenGate Hub	3-8
Zero Downtime Migration Port Requirements	3-9
Generate SSH Keys Without a Passphrase	3-12

4 Preparing for a Physical Database Migration

Preparing the Source and Target Databases	4-1
Source Database Prerequisites	4-1
Target Database Prerequisites	4-3
Setting Up the Transparent Data Encryption Keystore	4-5
Setting Physical Migration Parameters	4-8
Provide Passwords Non-Interactively Using a Wallet	4-12
Preparing for Automatic Application Switchover	4-18
Configuring Resiliency to Intermittent Network Failures	4-19
Converting a Non-CDB Database to a CDB During Migration	4-19
Run a Migration Job Using an Existing RMAN Backup	4-21
Migrating an On-Premises Database to an On-Premises Exadata Database Machine	4-22

5 Preparing for a Logical Database Migration

Source Database Prerequisites for Logical Migration	5-1
Target Database Prerequisites for Logical Migration	5-3
Additional Logical Migration Prerequisites	5-4
Setting Logical Migration Parameters	5-5
Configuring the Transfer Medium and Specifying Transfer Nodes	5-7
Default Data Pump Parameter Settings for Zero Downtime Migration	5-11
Setting Advanced Data Pump Parameters	5-13
Data Pump Error Handling	5-14
Automatic Tablespace Creation	5-14

Automatic Tablespace Remap	5-15
Migrating to Oracle Autonomous Database on Exadata Cloud@Customer	5-16

6 Customizing a Migration Job

About Custom Plug-ins with User Actions	6-1
Parameters Supplied for Custom Plug-ins with User Actions	6-1
User Action Scripts	6-2
Registering User Actions	6-6
Creating an Action Template	6-8
Associating an Action Template with a Migration Job	6-8
Querying Action Plug-ins	6-8
Updating Action Plug-ins	6-9
Modifying User Action Scripts	6-9
Chained User Action Output	6-10

7 Migrating Your Database with Zero Downtime Migration

Evaluate the Migration Job	7-1
Using the ZDMCLI MIGRATE DATABASE -eval Option	7-2
Using the Cloud Premigration Advisor Tool	7-5
Running CPAT Manually with a Remote Connection	7-6
Migrate the Database	7-7
Query Migration Job Status	7-11
List Migration Job Phases	7-11
Pause a Migration Job	7-12
Resume a Migration Job	7-13
Suspend and Resume a Migration Job	7-16
Rerun a Migration Job	7-16
Terminate a Running Migration Job	7-17
Zero Downtime Migration Centralized Fleet Migration Management	7-17

8 Migrating from Amazon Web Services RDS to Oracle Autonomous Database

Setting Amazon as the Source Environment	8-1
Configure Secure Connections	8-1
Configuring the Data Transfer Method	8-2
Setting Up Database Link Transfer Method	8-2
Setting Up S3 Bucket Data Transfer Medium	8-2

9 Managing the Zero Downtime Migration Service

	Starting and Stopping the Zero Downtime Migration Service	9-1
	Checking Zero Downtime Migration Service Status	9-1
	Updating Zero Downtime Migration Software	9-1
	Uninstalling Zero Downtime Migration Software	9-3
	Performing a Silent Update or Deinstallation	9-4
	Viewing the Cloud Premigration Advisor Tool Version	9-4
	Updating the Cloud Premigration Advisor Tool	9-4
	Setting the MySQL Port	9-5
10	Troubleshooting Zero Downtime Migration	
	Handling Migration Job Failures	10-1
А	Database Server Connectivity Using a Bastion Host	
В	Zero Downtime Migration Encryption Requirements	
	Zero Downtime Migration Process Phases

Index

Preface

This book provides information about Zero Downtime Migration capabilities, how to set up the Zero Downtime Migration service, how to prepare your source and target databases for migration, and how to use the Zero Downtime Migration tool to quickly and smoothly move your Oracle databases to the Oracle Cloud or any Oracle Exadata Database Machine environment without incurring any significant downtime.

Audience

This book is intended for anyone who wants to learn about what Zero Downtime Migration can do, and for anyone tasked with migrating Oracle databases.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

See Zero Downtime Migration on the Oracle Help Center for all published Zero Downtime Migration documentation.

See Zero Downtime Migration Release Notes for the latest information about what's new in this release, known issues, and troubleshooting solutions.

See the README file included with the downloaded Zero Downtime Migration software for additional information about installation.

See Zero Downtime Migration Licensing Information User Manual for information about third party licenses included in the Zero Downtime Migration software kit.

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

1 Introduction to Zero Downtime Migration

Learn about how Zero Downtime Migration works, and its requirements and supported configurations.

About Zero Downtime Migration

With Zero Downtime Migration, you can migrate Oracle databases from on premises, Oracle Cloud Infrastructure Classic, from one Oracle Cloud Infrastructure region to another, or from Amazon Web Services RDS. You can move your databases to co-managed or Autonomous Database services in the cloud, or any Exadata Database Machine in the cloud or on premises.

Zero Downtime Migration provides a robust, flexible, and resumable migration process that is also easy to roll back. Zero Downtime Migration integrates Oracle Maximum Availability Architecture (MAA) and supports Oracle Database 11g Release 2 (11.2.0.4) and later database releases.

You can perform and manage a database migration of an individual database or perform database migrations at a fleet level. Leveraging technologies such as Oracle Data Guard, Oracle Recovery Manager (RMAN), Oracle GoldenGate, and Oracle Data Pump, you can migrate databases online or offline.

The Zero Downtime Migration software is a service with a command line interface that you install and run on a host that you provision. The server where the Zero Downtime Migration software is installed is called the Zero Downtime Migration service host. You can run one or more database migration jobs from the Zero Downtime Migration service host.

Zero Downtime Migration Capabilities

- Audit capability All custom user actions are audited including actions performed by the migration job.
- Work flow customization You can customize the migration work flow (marked by
 operational phases) with your own scripts, which can be run before or after any phase in
 the work flow.
- Job subsystem You can perform and manage database migrations at a fleet scale.
- Job scheduler You can schedule your migration job to run at a future point in time.
- **Pause and resume functionality** You can pause and resume your migration job if needed, which is useful to conform to a maintenance window, for example.
- **Job termination** You can terminate a running migration job, rather than waiting for it to complete.
- Job rerun ability Your migration job can be re-run (resumed) from a point of failure.
- **Job pre-check** You can run pre-checks for migration tasks to prevent errors during database migration.

 Compliance - Zero Downtime Migration is compliant with Oracle Maximum Availability Architecture best practices and supports Oracle Database 11g Release 2 (11.2.0.4.0) and later.

Migration Methods

Zero Downtime Migration supports both online and offline migration, and can perform both physical and logical migrations. Consider the following advantages of each migration method to choose which one is right for your needs.

- **Online** migration methods incur zero or minimal downtime (typically less than 15 minutes) and can leverage either physical or logical migration methods.
- **Offline** migration methods will incur downtime on the source database as part of the migration process. It can leverage either physical or logical migration methods.

Note that the only available method for migrating Oracle Database Standard Edition is the offline migration method.

- Physical migration methods:
 - Use Oracle Data Guard and RMAN to perform migrations
 - Allow you to convert a non-multitenant (non-CDB) source database to a multitenant (CDB) target database
- Logical migration methods:
 - Use Oracle Data Pump and, for online migrations, Oracle GoldenGate Microservices
 - Allow you to perform cross-platform migration (in offline mode) where the source Oracle Database is running on Oracle Solaris or IBM AIX operating system, and the target is an Oracle Autonomous Database or Co-managed Oracle Database on Oracle Linux.
 - Include integration with the Cloud Premigration Advisor Tool (CPAT), which a) warns you about any features used by your database that aren't supported in the target cloud environment, and b) makes suggestions for remedial changes and/or parameters to use for the Data Pump export and import operations

The migration methods are described in the following topics.

- Physical Migrations with Zero Downtime Migration
- Logical Migrations with Zero Downtime Migration

Physical Migrations with Zero Downtime Migration

Physical migrations with Zero Downtime Migration use the Recovery Manager (RMAN) and Oracle Data Guard to perform the data transfer from the source to the target database, and can handle the role switch of the target database to primary database for application connections.

Physical Online Migration

Zero Downtime Migration harnesses Oracle Data Guard to perform an online physical migration.

A Zero Downtime Migration online physical migration does the following:

- Backs up the source database to the specified data transfer medium
- · Instantiates a standby database from this backup to the target environment
- Configures Data Guard with Maximum Performance protection mode and asynchronous (ASYNC) redo transport mode
- Synchronizes the source and target databases
- Switches over to the target database as the new primary database with minimum downtime

Upon switchover, the target database becomes the primary database, and the source database becomes the standby.

If there is SQL*Net connectivity between the new primary and the new standby after the switchover, the configuration continues to synchronize data (ship redo) from the new primary to the new standby source database. This configuration makes it possible to perform a rollback with minimal downtime, if you need to switch the primary back to the original source database.

However, if there is no SQL*Net connectivity between the new primary and the new standby after the switchover, there is no data synchronization (ship redo) from the new primary to the new standby on the source database. With this configuration you cannot fall back to the original source database.

Note that any fallback operation must be done manually; Zero Downtime Migration does not handle reverse role switches to fall back to the original source database as the primary database.

Note that Transparent Data Encryption (TDE) is enabled on Oracle databases in the Oracle Cloud by default. Zero Downtime Migration handles the encryption of your target database, even if TDE is not enabled on the source Oracle database. However, once the switchover phase of the migration has taken place, the redo logs that the new primary database in the Oracle Cloud sends to the new standby database (the source) are encrypted. Therefore, if you decide to switch back and role swap again, making the source database the primary again and the database in the Oracle Cloud the standby, the source database will not be able to read the newly encrypted changed blocks applied by the redo logs unless TDE is enabled on the source database.

Physical Offline Migration

Zero Downtime Migration can perform a backup and restore operation to achieve an offline physical migration.

A Zero Downtime Migration offline physical migration does the following:

- Backs up the source database to the specified data transfer medium
- Instantiates a new database from this backup to the target environment

The offline migration method is similar to cloning a database. The target database has no relationship to the source, so there is no data synchronization or fallback capability. No SQL*Net connectivity is needed between the source and target database servers.

Note that for physical migrations, the offline methodology is the only one that supports Oracle Database Standard Edition

Supported Physical Migration Paths

Zero Downtime Migration supports the following physical migration paths.

- On-premises Oracle Database to Oracle Cloud Infrastructure (either virtual machine or bare metal)
- On-premises Oracle Database to Exadata Cloud Service
- On-premises Oracle Database to Oracle Exadata Cloud at Customer
- On-premises Oracle Database to On-Premises Exadata Database Machine
- Oracle Cloud Infrastructure Classic Database to Oracle Cloud Infrastructure (either virtual machine or bare metal)
- Oracle Cloud Infrastructure Database to a database in another Oracle Cloud Infrastructure region
 For example, you can move a database from the phoenix commercial OCI region to the frankfurt or ashburn region.

Data Transfer Media Supported for Physical Migrations

The Zero Downtime Migration physical migration process involves creating a backup of the source database and restoring it to the target database. Zero Downtime Migration supports the following backup media, depending on your target environment.

Oracle Cloud Infrastructure Object Storage

OCI Object Storage is supported as a backup medium when migrating a database to Oracle Cloud Infrastructure, Exadata Cloud Service, or any on-premises Exadata Cloud at Customer target.

If you back up the database to Object Storage, then the Zero Downtime Migration service initiates the source database backup and restores it to the target environment, so Object Storage must be accessible from both the source and target environments.

The Zero Downtime Migration service host uses an SSH connection to the source and target database servers to install and configure the backup module software necessary to back up to and restore from Object Storage. The backup from the source database to Object Storage takes place over an RMAN channel.

Zero Data Loss Recovery Appliance

Zero Data Loss Recovery Appliance is supported as a backup medium for migrating a database to an Exadata Cloud at Customer target or an Oracle Exadata Database Machine.

If Zero Data Loss Recovery Appliance is chosen as backup medium, then you must ensure that the Zero Data Loss Recovery Appliance has a valid backup of the source database, because Zero Downtime Migration does not initiate a backup to Zero Data Loss Recovery Appliance as part of the work flow.

You must also ensure that all instances of the database are up before initiating a backup to Zero Data Loss Recovery Appliance. The duplicate database operation might fail if the backup is initiated when an instance is down.

The Zero Downtime Migration service accesses the backup in Zero Data Loss Recovery Appliance and restores it to Exadata Cloud at Customer. The Zero Data Loss Recovery Appliance access credentials and wallet location are mandatory input parameters, so that Zero Downtime Migration can handle the Zero Data Loss Recovery Appliance wallet setup at the target database.

Any transfer of redo stream between the source and the target database server, in either direction, takes place over a SQL*Net link.

Refer to the Zero Data Loss Recovery Appliance documentation for information about creating backups.

Network File System (NFS)

NFS is supported as a backup medium when migrating a database to an Exadata Cloud at Customer target, or any on-premises Oracle Exadata Database Machine target.

If you choose to back up the database to an NFS mount, then the Zero Downtime Migration service initiates the source database backup and restores it to the Exadata target environment. The NFS should be accessible from both the source and target environments.

Direct Data Transfer Support

Zero Downtime Migration supports direct data transfer during a physical migration to avoid backing up the source database to an intermediate store such as Object Storage or NFS.

Backing up a large database to intermediate storage adds additional overhead because of the additional hop that the data has to be moved to. This intermediate step can be costly in migrations involving very large databases. Recovery Manager (RMAN) allows Zero Downtime Migration to support active database duplication and restore from service.

Active Database Duplication

RMAN active database duplication is supported in Oracle Database 11g (11.2) and later releases.

Active database duplication does not require backups of the source database. It duplicates the live source database to the destination host by copying the database files over the network to the auxiliary instance. RMAN can copy the required files as image copies or backup sets.

Restore From Service

RMAN restore from service is supported in Oracle Database 12g (12.1) and later releases. Oracle MAA best practices recommend using active duplication for Oracle Database 11.2 and using restore from service for Oracle Database 12.1 and later.

RMAN restores database files, over the network, by using the FROM SERVICE clause of the RESTORE command. During the restore operation RMAN creates backup sets of the files that need to be restored and then transfers these backup sets to the target database over the network.

Supported Database Architectures for Physical Migration

Zero Downtime Migration supports the following database architecture implementations.

- Oracle Database Single-Instance, which can be migrated to a single-instance or Oracle RAC database target
- Oracle RAC One Node, which can be migrated to an Oracle RAC database target
- Oracle RAC, which can be migrated to an Oracle RAC database target

Target Placeholder Database Environment

Zero Downtime Migration requires that you configure a placeholder database target environment before beginning the migration process. Zero Downtime Migration uses the provisioned target as a template and recreates the target during the course of migration.

You should configure the target database with the required and desired options of your native environment, because Zero Downtime Migration does not preserve this automatically during the migration.

During the migration process, the Zero Downtime Migration service host restores the source database to this placeholder database target environment by dropping the placeholder database and recreating a database in the target environment with the same db name as that of source database.

Any database parameters for the target database, including SGA parameters, are maintained during the migration, and the migrated database runs with this same configuration.

Once the migration is complete, the target database is accessible using Oracle Database Cloud Service console, and you can manage the database with SRVCTL commands. You can make any modifications to database parameters after the migration.

Logical Migrations with Zero Downtime Migration

Online and offline logical migrations using Zero Downtime Migration are described in the following topics:

Logical Online Migration

Zero Downtime Migration harnesses Oracle GoldenGate and Oracle Data Pump to perform an online logical migration.

During a logical online migration, the source database remains online for client connections while data is moved to the target database, using a combination of Oracle Data Pump and Oracle GoldenGate replication.

Note that for migrations to OCI targets you can use the Oracle GoldenGate license from Oracle Cloud Marketplace, which is the Oracle-certified way of deploying the GoldenGate hub in Oracle Cloud Infrastructure.

The source database can be either a pluggable database (PDB) or a non-multitenant database.

Logical online migration involves two steps:

Instantiation of target database.

Oracle Data Pump extracts data from the source database and loads it into the target database.

Real-time data replication between source and target databases.
 Zero Downtime Migration completes the migration once both databases are synchronized.

Optionally, you can configure the migration job to pause after replication is set up, and Oracle GoldenGate can continue to replicate data between the source and target databases in real-time until you choose to switch applications over to the target database.

Logical Offline Migration

Zero Downtime Migration can perform an offline logical migration using Oracle Data Pump to extract the data from the source database and load it into a target database.

Offline logical migration means that the source database is not available for clients while data is moved to the target database. When using the offline migration method, you must stop updates to the source database before you start a migration. When the migration is complete, the target database and source database do not require any direct SQL*Net connectivity between them.

Supported Logical Migration Targets

Zero Downtime Migration supports logical database migration to the following target databases.

- Oracle Autonomous Database Shared (Data Warehouse or Transaction Processing)
- Oracle Autonomous Database Dedicated Infrastructure (Data Warehouse or Transaction Processing)
- Oracle Autonomous Database on Exadata Cloud@Customer
- Oracle Co-managed Database Systems:
 - Virtual Machine
 - Bare Metal
 - Exadata Cloud Service
 - Exadata Cloud at Customer

Initial Load Methods Supported for Logical Migrations

Some Zero Downtime Migration logical migration work flows involve placing Oracle Data Pump dump files on storage media for transfer to the target database. Some migration work flows transfer the initial load without using intermediate storage.

Oracle Cloud Object Store

Object Storage is supported as a Data Pump dump file storage medium for logical migrations to all target Autonomous Database or co-managed databases.

To use Object Storage with OCI CLI on co-managed targets, see Command Line Interface (CLI).

Database Link

Autonomous Database Shared (Data Warehouse or Transaction Processing) and comanaged database targets support the use of a database link (DBLINK) for data transport.

Network File System (NFS)

For migrations to co-managed target databases, NFS is supported as a data transfer medium.

Direct Copy

For migrations to co-managed target databases, Data Pump dumps can be securely transferred directly from the source database to the target using secure copy (SCP) or RSYNC.

Amazon Simple Storage Service (Amazon S3) Bucket

An Amazon S3 bucket is supported as a Data Pump dump file storage medium for migrations of Oracle Database instances from Amazon Web Services RDS Oracle Database to Oracle Autonomous Database.

What Is Migrated During Initial Load

The initial load phases of a migration job moves the contents of all schemas from the source database to schemas of the same name in the target database. You can elect to exclude specific objects and rename objects when you create a migration.

There are some limitations on objects, schemas, roles, and users that can be migrated, because they cannot be exported by Data Pump, such as system-generated schemas that contain Oracle-managed data and metadata.

Objects Excluded by Default in Oracle 12c and Later Releases

By default, objects owned by Oracle-maintained users (ORACLE_MAINTAINED = Y), and the ggadmin and c##ggadmin users, are excluded from migration. In addition, Data Pump ignores objects listed in the KU NOEXP VIEW.

Oracle Database includes the column ORACLE_MAINTAINED in several dictionary views to indicate which objects, schemas, roles, and users are maintained by Oracle. You can query these views to discover object types which are Oracle-maintained, and therefore excluded from migration. See *Oracle Database Reference* at https:// docs.oracle.com/en/database/oracle/oracle-database/21/refrn/database-reference.pdf to find views that contain ORACLE_MAINTAINED.

Objects Excluded by Default in Oracle 11gR2

Zero Downtime Migration excludes the following Oracle-maintained schemas from Oracle 11gR2 migrations.

"ORACLE_OCM","OJVMSYS","XS\$NULL","GSMCATUSER","MDDATA","DIP", "APEX_PUBLIC_USER","SPATIAL_CSW_ADMIN_USR", "OWBSYS", "SPATIAL_WFS_ADMIN_USR","GSMUSER","AUDSYS","FLOWS_FILES", "MDSYS","ORDSYS","WMSYS","EXFSYS","APEX_040200","APPQOSSYS", "GSMADMIN_INTERNAL","ORDDATA","CTXSYS","ANONYMOUS","XDB",

"ORDPLUGINS","SI_INFORMTN_SCHEMA","OLAPSYS","DBSNMP","SYSKM", "SYSBACKUP","OUTLN","SYSDG","SYS","SYSTEM","APEX_030200", "GGADMIN", "LBACSYS", "MGMT_VIEW", "OWBSYS_AUDIT", "DVSYS", "TSMSYS", "MGDSYS"

Data Replication

Replication migrates all data and metadata operations in transactions committed after the initial load until you resume the migration job after the Monitor Replication Lag phase. It includes inserts, deletes, and updates of data in tables within the migrated schema. Create, alter, and drop DDL operations are not replicated.

The following objects are not supported:

- Changes to external tables
- Oracle GoldenGate Unsupported Types (see Understanding What's Supported)

Zero Downtime Migration Requirements and Considerations

Supported Platforms

Zero Downtime Migration supports the following platforms for the service host and the migration source and target database servers.

Zero Downtime Migration Service Host - Supported Platforms

The Zero Downtime Migration service host can be configured on Oracle Linux 7 (Linux-x86-64).

You can deploy the Zero Downtime Migration service on a standalone server on-premises or on a standalone Linux server (compute instance) in the Oracle Cloud. Oracle Linux is the supported platform for the Zero Downtime Migration service host.

Note that the Zero Downtime Migration service host can be shared with other applications for other purposes.

Supported Source Environments

- Oracle Cloud Infrastructure co-managed databases or on-premises environments
- Amazon Web Services RDS Oracle Database
- Linux-x86-64 (all migration modes), IBM AIX (logical offline mode only), and Oracle Solaris (logical offline mode only).

Supported Target Environments

 Oracle Cloud Infrastructure co-managed databases: Exadata Cloud Service, Exadata Cloud at Customer, Virtual Machine Database System, and Bare Metal Database System

The target co-managed database can be either a pluggable database or a nonmultitenant database.

- Linux-x86-64 is the supported operating system for target database servers.
- As a target environment only, Autonomous Database is supported platform for logical migrations. You can choose a Dedicated Infrastructure (Data Warehouse or Transaction Processing) or Shared (Data Warehouse or Transaction Processing).

An Autonomous Database is a pluggable database in an Autonomous Container Database (ACD) deployed on an Autonomous Exadata Infrastructure (AEI) rack.

On-premises Oracle Exadata Database Machine

Supported Database Versions for Migration

Zero Downtime Migration supports most Oracle Database versions available on Oracle Cloud Infrastructure, Exadata Cloud at Customer, and Exadata Cloud Service.

The following Oracle Database versions can be migrated using Zero Downtime Migration.

- Oracle Database 11g Release 2 (11.2.0.4)
- Oracle Database 12c Release 1 (12.1.0.2)
- Oracle Database 12c Release 2 (12.2.0.1)
- Oracle Database 18c
- Oracle Database 19c
- Oracle Database 21c
- All subsequent Oracle Database releases

Some restrictions apply to physical migration work flows. See Preparing the Source and Target Databases.

Zero Downtime Migration Database Server Access

The Zero Downtime Migration service host needs to access the source and target database servers during a database migration.

To perform the migration, the Zero Downtime Migration service host requires either root user or SSH key-based access to one of the source database servers, and the Zero Downtime Migration service host requires SSH key-based access to one of the target database servers. If you are migrating an Oracle RAC database, providing access to one of the Oracle RAC nodes is adequate. The Zero Downtime Migration service host copies the software needed for migration to the source and target servers and cleans it up at the end of the operation.

An SSH private key is required to establish SSH connections. This generated key must not use a passphrase. You can create and add a new SSH key to your existing deployment using the Oracle Cloud Service Console.

Zero Downtime Migration Operational Phases

The Zero Downtime Migration service defines the migration process in units of operational phases.

Zero Downtime Migration auto computes the migration work flow using defined operational phases based on configured input parameters, such as the target platform, backup medium, and so on. You can customize the work flow by inserting custom plug-ins on each of the operational phases. The Zero Downtime Migration service lets you pause and resume the migration work flow at any chosen operational phase.

Migration work flow-associated phases for a given operation can be listed. Phases that are performed on the source database server are listed with a _SRC suffix, and the phases associated with the target database server are listed with a _TGT suffix.

See Also: Zero Downtime Migration Process Phases

Zero Downtime Migration Security Provisions

Zero Downtime Migration permissions and ownership of files and directories, and handling of configurations for security features, are equivalent to those of Oracle Database.

Zero Downtime Migration installs in a location, named <code>ZDM_HOME</code>, that is structured similarly to the Oracle home directory, <code>ORACLE_HOME</code>, for Oracle Database. The permissions and ownership of files and directories in the <code>ZDM_HOME</code> follow the same conventions as that of a database <code>ORACLE_HOME</code>.

Zero Downtime Migration also creates a base directory structure for storing Zero Downtime Migration configuration files, logs, and other artifacts, named ZDM_BASE, that is similar to an Oracle base directory, ORACLE_BASE, that is associated with an Oracle home. The structure, owners, and permissions of directories and files in ZDM_BASE are similar to that of an ORACLE BASE.

ZDM BASE and ORACLE BASE do not allow access by group or others.

You do not need to do any additional steps to ensure security the of the Zero Downtime Migration configuration because the Zero Downtime Migration configuration is designed to be secure out of the box.

Zero Downtime Migration is configured to accept JMX connections only from the local host, and to listen on the loopback address for HTTP connections. Zero Downtime Migration operations can only be performed by the operating system user that installed the product.

For physical migrations, SSH connectivity from the Zero Downtime Migration service host to the source database server and the target database server is required. You must provide the SSH key file location as an input for a migration job, and the existence of this file is expected for the duration of the migration job. You must manage the security of the directories and files where these key files are located.

You can modify the communication ports when there is a port conflict with another application. Note that access to these ports are configured only from within the Zero Downtime Migration host. You can change the RMI and HTTP port properties in the file \$ZDM BASE/crsdata/zdm service host/rhp/conf/standalone config.properties.

The properties are:

- RMI port oracle.jwc.rmi.port=8895
- HTTP port oracle.jwc.http.port=8896

Restart the Zero Downtime Migration service after changing the properties.

When Zero Downtime Migration operations require passwords, prompts are given for password entry by default. Zero Downtime Migration can also operate non-interactively by entering wallet information in the migration response file settings.

Passwords are encrypted and stored in the Zero Downtime Migration database. Provided passwords are not expected to change for the duration of a migration job.

From an operation perspective, Zero Downtime Migration follows the guidelines in *Oracle Database Security Guide* for handling source and target database configurations for migration, such as Oracle Wallets, Transparent Data Encryption, and so on.

2 Setting Up Zero Downtime Migration Software

When you install Zero Downtime Migration software, read this section carefully as there may have been changes since the last time you performed an installation.

The Zero Downtime Migration software kit supports both physical and logical migrations. You only need to install one kit to get all of the functionality.

Always see the Zero Downtime Migration Release Notes for the latest information about known issues. Also, see the README file included with the downloaded Zero Downtime Migration software for any additional information about software installation and updates.

If you already have Zero Downtime Migration software installed on a host, you should always make sure it is the latest available release. Zero Downtime Migration software updates give you the latest features and fixes while retaining existing job information, metadata, and log files. Always check the version and determine if it is the latest by comparing it with what's available on the downloads page.

For information about updating existing software to the latest release, removing the software, and starting and stopping the Zero Downtime Migration service, see Managing the Zero Downtime Migration Service.

Prepare a Host for Zero Downtime Migration Software Installation

If a host has not had Zero Downtime Migration software installed on it previously, verify that it complies with the requirements and perform any pre-installation tasks, then download and install the software. Once the software is installed, the host is referred to as the Zero Downtime Migration service host.

Provision a host with the following prerequisites and complete the following pre-installation tasks before installing Zero Downtime Migration software on it.

- The Zero Downtime Migration service host should be a dedicated system, but it can be shared for other purposes; however, the Zero Downtime Migration service host should not have Oracle Grid Infrastructure running on it.
- Zero Downtime Migration software requires a standalone Linux host running Oracle Linux
 7.
- The Zero Downtime Migration service host requires PERL to run the install script.
- The Zero Downtime Migration service host must be able to connect to the source and the target database servers.
- Ensure that the Linux host has 100 GB of free storage space.
- You may use an existing user, or, on the Zero Downtime Migration service host, as root user, create a zdm group and add zdmuser user to the group.

For example,

```
root> groupadd zdm
root> useradd -g zdm zdmuser
```

• Verify that the glibc-devel and expect packages are installed.

For Oracle Linux 7 installations with Base Environment "Minimal Install" you also need to install the packages unzip libaio oraclelinux-developer-releaseel7.

- Verify that the /etc/hosts entry for the host name and IP address are configured as expected, so that the host selected for Zero Downtime Migration software installation resolves to the correct IP address and the IP address is reachable with ping.
- During the installation, the script might report any missing packages and instructions for setting appropriate values for kernel parameters. Be sure to install the missing packages and set the kernel parameters before the Zero Downtime Migration software installation.
- Optionally, set a ZDM_HOME environment variable to the absolute path of the directory where the Zero Downtime Migration software will be installed. All of the examples in this document use \$ZDM HOME.

zdmuser> export ZDM HOME=absolute path to zdm home

Install Zero Downtime Migration Software

All commands are run as zdmuser.

- Download the Zero Downtime Migration software kit from https://www.oracle.com/ database/technologies/rac/zdm-downloads.html to the Zero Downtime Migration service host.
- 2. Install the Zero Downtime Migration software as a non-root user.

In this example the installation user is *zdmuser*.

a. Change to the directory to where Zero Downtime Migration software is downloaded and unzip the software.

```
zdmuser> cd zdm_download_directory
zdmuser> unzip zdmversion.zip
```

b. Run the Zero Downtime Migration installation script.

```
zdmuser>./zdminstall.sh setup oraclehome=zdm_oracle_home
oraclebase=zdm_base_directory
        ziploc=zdm_software location -zdm
```

- zmdinstall.sh is the installation script
- oraclehome is the absolute path to the Oracle Home directory where the Zero Downtime Migration software will be installed.

- oraclebase is the absolute path to the base directory where all of the Zero Downtime Migration configuration files, logs, and other artifacts are stored
- ziploc is the location of the compressed software file (zip) included in the Zero Downtime Migration kit

For example,

Note that the Zero Downtime Migration service host requires PERL to run the install script.

Hereafter, the oraclehome value is referred to as ZDM_HOME, and the oraclebase value is referred to as ZDM BASE.

Ignore the following messages which are displayed on the terminal at the end of installation. There is no need to run these scripts.

```
As a root user, execute the following script(s):

1. $ZDM_HOME/inventory/orainstRoot.sh

2. $ZDM_HOME/root.sh
```

3. Start the Zero Downtime Migration service as user zdmuser.

zdmuser> \$ZDM HOME/bin/zdmservice start

You must start *zdmservice* before you can migrate your databases using Zero Downtime Migration.

If you must stop the Zero Downtime Migration service, run the following command.

zdmuser> \$ZDM HOME/bin/zdmservice stop

4. Verify that the Zero Downtime Migration service installation is successful.

When you run the following command, the output should be similar to that shown here.

5. If necessary, change the default MySQL port.

Zero Downtime Migration uses MySQL internally, configuring it by default on port 8897, as shown in the above <code>zdmservice status</code> example output. If you want to change this port number, see Setting the MySQL Port.

3 Configuring Required Connections

Connectivity must be set up between the Zero Downtime Migration service host and the source and target database servers.

Configuring Connectivity From the Zero Downtime Migration Service Host to the Source and Target Database Servers

Note:

These steps are applicable for physical migrations and logical migrations where both the source and target are accessed using SSH keys (co-managed databases). These steps are **not applicable** for logical migration where the target is Autonomous Database.

Complete the following procedure to ensure the required connectivity between the Zero Downtime Migration service host and the source and target database servers.

1. On the Zero Downtime Migration service host, verify that the RSA authentication key pairs are available without a passphrase for the Zero Downtime Migration software installed user.

If a new key pair must be generated without the passphrase, then, as a Zero Downtime Migration software installed user, generate new key pairs as described in Generate SSH Keys Without a Passphrase.

2. Rename the private key file.

Rename the *zdm_installed_user_homel.ssh/id_rsa* file name to *zdm_installed_user_homel.ssh/zdm_service_host.ppk*.

3. Add the contents of the *zdm_installed_user_homel.*ssh/id_rsa.pub file to the *opc_user_homel.*ssh/authorized_keys file, with the following dependencies:

For the source database server:

- If the source database server is accessed with the root user, then no action is required.
- If the source database server is accessed through SSH, then add the contents of the zdm_installed_user_homel.ssh/id_rsa.pub file into the opc_user_homel.ssh/ authorized_keys file on all of the source database servers.

For the target database server:

• Because the target database server is on cloud only and access is through SSH, add the contents of the *zdm_installed_user_homel.ssh/id_rsa.pub* file into the *opc_user_homel.ssh/authorized_keys* file on *all* of the target database servers.

Note that the <code>opc</code> user is a standard Oracle cloud user that is used to access database servers, but you can use any privileged user that has sudo privileges. You can also use different users for the source and target databases.

 Make sure that the source and target database server names are resolvable from the Zero Downtime Migration service host through either resolving name servers or alternate ways approved by your IT infrastructure.

One method of resolving source and target database server names is to add the source and target database server names and IP address details to the Zero Downtime Migration service host /etc/hosts file.

In the following example, the IP address entries are shown as 192.x.x.x, but you must add your actual public IP addresses.

```
#OCI public IP two node RAC server details
192.0.2.1 ocidb1
192.0.2.2 ocidb2
#OCIC public IP two node RAC server details
192.0.2.3 ocicdb1
192.0.2.4 ocicdb2
```

Optionally, Zero Downtime Migration allows connectivity through bastion hosts for both logical and physical migrations.

- 5. Make certain that port 22 in the source and target database servers accept incoming connections from the Zero Downtime Migration service host.
- 6. Test the connectivity from the Zero Downtime Migration service host to all source and target database servers.

```
zdmuser> ssh -i zdm_service_host_private_key_file_location
user@source/target database server name
```

For example,

zdmuser> ssh -i /home/zdmuser/.ssh/zdm_service_host.ppk opc@ocidb1 zdmuser> ssh -i /home/zdmuser/.ssh/zdm_service_host.ppk opc@ocidb1

Note:

SSH connectivity during Zero Downtime Migration operations requires direct, non-interactive access between the Zero Downtime Migration service host and the source and target database servers without the need to enter a passphrase.

7. Disable TTY and verify that it is disabled for the SSH privileged user.

TTY needs to be turned off so that Zero Downtime Migration can run commands on the remote hosts non-interactively.

Because there are many ways to set sudo privileges, there are many ways to disable TTY for the <code>zdmuser</code>. As an example, you could set the following default in /etc/sudoers file.

```
Defaults:zdmuser !requiretty
```

Run the following command to verify that TTY is disabled:

```
ssh -i zdm_service_host_private_key_file_location
  user@source_database/target_database_server_name
  "sudo_location_source/target_database /bin/sh -c date"
```

If TTY is disabled, the command above returns the date from the remote host without any errors.

If SSH is configured to require TTY, the output shows an error, such as the following:

```
[opc@zdm-server ~]$ ssh -i /home/zdmuser/.ssh/zdm_service_host.ppk
opc@ocidb1
   "/usr/bin/sudo /bin/sh -c date"
```

sudo: sorry, you must have a tty to run sudo

* See Also: Zero Downtime Migration Port Requirements

Configuring SUDO Access

You may need to grant certain users authority to perform operations using sudo on the source and target database servers.

Note:

These steps are applicable for physical migrations and logical migrations where both the source and target are accessed using SSH keys (co-managed databases). These steps are **not applicable** for logical migration where the target is Autonomous Database.

For source database servers:

• If the source database server is accessed with the root user, then there is no need to configure Sudo operations.

 If the source database server is accessed through SSH, then configure Sudo operations to run without prompting for a password for the database installed user and the root user.

For example, if database installed user is oracle, then run sudo su - oracle.

For the root user run sudo su -.

For target database servers:

 Because the target database server is on the cloud only, any Sudo operations are configured already. Otherwise, configure all Sudo operations to run without prompting for a password for the database installed user and the root user.

For example, if database installed user is oracle, then run sudo su - oracle.

For the root user run sudo su -.

Note, for example, if the login user is opc, then you can enable Sudo operations for the opc user.

Configuring Connectivity Between the Source and Target Database Servers

You have two options for configuring connectivity between the source and target database servers: SQL*Net connectivity using SCAN or SSH.

Configure connectivity using one of the following options.

Option 1: SQL*Net Connectivity Using SCAN

To use this option, the SCAN of the target should be resolvable from the source database server, and the SCAN of the source should be resolvable from the target server.

The specified source database server in the ZDMCLI migrate database command – sourcenode parameter can connect to the target database instance over target SCAN through the respective SCAN port and vice versa.

With SCAN connectivity from both sides, the source database and target databases can synchronize from either direction. If the source database server SCAN cannot be resolved from the target database server, then the SKIP_FALLBACK parameter in the response file must be set to TRUE, and the target database and source database cannot synchronize after switchover.

Test Connectivity

To test connectivity from the source to the target environment, add the TNS entry of the target database to the source database server <code>\$ORACLE_HOME/network/admin/tnsnames.ora file.</code>

```
[oracle@sourcedb ~] tnsping target-tns-string
```

To test connectivity from the target to the source environment, add the TNS entry of the source database to the target database server <code>\$ORACLE_HOME/network/admin/tnsnames.ora</code> file

[oracle@targetdb ~] tnsping source-tns-string

Note:

Database migration to Exadata Cloud at Customer using the Zero Data Loss Recovery Appliance requires mandatory SQL*Net connectivity from the target database server to the source database server.

See Also:

Zero Downtime Migration Port Requirements

Option 2: Set up an SSH Tunnel

If connectivity using SCAN and the SCAN port is not possible between the source and target database servers, set up an SSH tunnel from the source database server to the target database server.

The following procedure sets up an SSH tunnel on the source database servers for the root user. Note that this procedure amounts to setting up what may be considered a temporary channel. Using this connectivity option, you will not be able to synchronize between the target database and source database after switchover, and with this configuration you cannot fall back to the original source database.

Note:

The following steps refer to Oracle Cloud Infrastructure, but are also applicable to Exadata Cloud at Customer and Exadata Cloud Service.

- Generate an SSH key file without a passphrase for the opc user on the target Oracle Cloud Infrastructure server, using the information in Generate SSH Keys Without a Passphrase. If the target is an Oracle RAC database, then generate an SSH key file without a passphrase from the first Oracle RAC server.
- Add the contents of the Oracle Cloud Infrastructure server opc_user_home/.ssh/ id_rsa.pub file into the Oracle Cloud Infrastructure server opc_user_home/.ssh/ authorized_keys file.
- Copy the target Oracle Cloud Infrastructure server private SSH key file onto the source server in the /root/.ssh/ directory. If the source is an Oracle RAC database, copy the file into all of the source servers.

For better manageability, keep the private SSH key file name the same as the target server name, and keep the .ppk extension. For example, ocidb1.ppk (where ocidb1 is the target server name).

The file permissions should be similar to the following.

```
/root/.ssh>ls -l ocidb1.ppk
-rw----- 1 root root 1679 Oct 16 10:05 ocidb1.ppk
```

4. Put the following entries in the source server /root/.ssh/config file.

```
Host *
ServerAliveInterval 10
ServerAliveCountMax 2
Host OCI_server_name
HostName OCI_server_IP_address
IdentityFile Private_key_file_location
User OCI_user_login
ProxyCommand /usr/bin/nc -X connect -x proxy name:proxy port %h %p
```

Where

- OCI_server_name is the Oracle Cloud Infrastructure target database server name without the domain name. For an Oracle RAC database use the first Oracle RAC server name without the domain name.
- OCI_server_IP_address is the Oracle Cloud Infrastructure target database server IP address. For an Oracle RAC database use the first Oracle RAC server IP address.
- Private_key_file_location is the location of the private key file on the source database server, which you copied from the target database server in step 3 above.
- OCI_user_login is the OS user used to access the target database servers.
- proxy_name is the host name of the proxy server.
- proxy_port is the port of the proxy server.

Note that the proxy setup might not be required when you are not using a proxy server for connectivity. For example, when the source database server is on Oracle Cloud Infrastructure Classic, you can remove or comment the line starting with ProxyCommand.

For example, after specifying the relevant values, the /root/.ssh/config file should be similar to the following.

```
Host *
ServerAliveInterval 10
ServerAliveCountMax 2
Host ocidb1
HostName 192.0.2.1
IdentityFile /root/.ssh/ocidb1.ppk
User opc
ProxyCommand /usr/bin/nc -X connect -x www-proxy.example.com:80
%h %p
```

The file permissions should be similar to the following.

```
/root/.ssh>ls -1 config
-rw----- 1 root root 1679 Oct 16 10:05 config
```

In the above example, the Oracle Cloud Infrastructure server name is ocidb1, and the Oracle Cloud Infrastructure server public IP address is 192.0.2.1.

If the source is an Oracle Cloud Infrastructure Classic server, the *proxy_name* is not required, so you can remove or comment the line starting with ProxyCommand.

If the source is an Oracle RAC database, then copy the same /root/.ssh/config file onto all of the source Oracle RAC database servers. This file will have the Oracle Cloud Infrastructure server name, Oracle Cloud Infrastructure server public IP address, and private key file location of first Oracle Cloud Infrastructure Oracle RAC server information configured.

5. Make sure that you can SSH to the first target Oracle Cloud Infrastructure server from the source server before you enable the SSH tunnel.

For an Oracle RAC database, test the connection from all of the source servers to the first target Oracle Cloud Interface server. Using the private key:

```
[root@ocicdb1 ~] ssh -i /root/.ssh/ocidb1.ppk opc@ocidb1
Last login: Fri Dec 7 14:53:09 2018 from 192.0.2.3
```

```
[opc@ocidb1 ~]$
```

Note:

SSH connectivity requires direct, non-interactive access between the source and target database servers, without the need to enter a passphrase.

6. Run the following command on the source server to enable the SSH tunnel.

```
ssh -f OCI_hostname_without_domain_name -L
ssh tunnel port number:OCI server IP address:OCI server listener port -N
```

Where

- OCI_hostname_without_domain_name is the Oracle Cloud Infrastructure target database server name without a domain name. For an Oracle RAC database use the first Oracle RAC server name without domain name.
- ssh_tunnel_port_number is any available ephemeral port in the range (1024-65545). Make sure that the SSH tunnel port is not used by any other process in the server before using it.
- OCI_server_listener_port is the target database listener port number. The listener port must be open between the source database servers and Oracle Cloud Infrastructure target servers.
- OCI_server_IP_address is the IP address of the target database server. For a single instance database, specify the Oracle Cloud Infrastructure server IP address. For an Oracle RAC database, specify the Oracle Cloud Infrastructure scan name with the

domain name. If the scan name with domain name is not resolvable or not working, then specify the IP address obtained using the <code>lsnrctl status</code> command output. For example,

```
Listening Endpoints Summary...
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc)(KEY=LISTENER)))
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=192.0.2.9)
(PORT=1521))
(DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)(HOST=192.0.2.10)
(PORT=1521)))
```

The following is an example of the command run to enable the SSH tunnel.

[root@ocicdb1~]ssh -f ocidb1 -L 9000:192.0.2.9:1521 -N

For an Oracle RAC database, this step must be repeated on all of the source servers.

7. Test the SSH tunnel.

Log in to source server, switch to the oracle user and source the database environment, and run the following command.

tnsping localhost:ssh tunnel port

For example,

[oracle@ocicdb1 ~] tnsping localhost:9000

The command output is similar to the following.

```
TNS Ping Utility for Linux: Version 12.1.0.2.0 - Production on 22-
JAN-2019 05:41:57
Copyright (c) 1997, 2014, Oracle. All rights reserved.
Used parameter files:
Used HOSTNAME adapter to resolve the alias
Attempting to contact (DESCRIPTION=(CONNECT_DATA=(SERVICE_NAME=))
(ADDRESS=(PROTOCOL=TCP)(HOST=127.0.0.1)(PORT=9000)))
OK (50 msec)
```

If thsping does not work, then the SSH tunnel is not enabled.

For Oracle RAC, this step must be repeated on all of the source servers.

Additional Connectivity Prerequisites for Oracle GoldenGate Hub

To perform online logical migrations with Oracle GoldenGate, in addition to the connectivity between the Zero Downtime Migration service host and the source and target database servers, you must also ensure connectivity between the Oracle GoldenGate hub and the source and target database servers.

Ensure that the OCI network security rules allow the following connections

Connection	Source	Destination
SQL*Net	GoldenGate hub	Source database
SQL*Net	GoldenGate hub	Target database
HTTPS	ZDM server	GoldenGate hub

Table 3-1 Prerequisite Connections for Online Logical Migration

The Zero Downtime Migration server should be allowed to make HTTPS over port 443 calls to an OCI REST endpoint.

Zero Downtime Migration Port Requirements

The ports required for communication between the Zero Downtime Migration service host, the source and target database servers, and Oracle Cloud Object Store Service are described in the following table.

Initiator	Target	Protocol	Port	Purpose	Description
Zero Downtime Migration service host	Source and target database servers	TCP	22	SSH	Authentication- based operations to run Zero Downtime Migration operational phases Source and target database servers should accept incoming connections from the Zero Downtime Migration service host. Not applicable to Autonomous Database targets
Zero Downtime Migration service host	Source and target database servers	TCP	1521, 2484, or a database SCAN Listener port applicable for job	SQL*Net	For logical migrations
Zero Downtime Migration service host	Oracle Cloud Interface REST endpoint	SSL	443	OCI REST endpoint	Target discovery for logical migrations

Table 3-2 Zero Downtime Migration Communication Ports

Initiator	Target	Protocol	Port	Purpose	Description
Source database servers	Target database servers	TCP	Port 1521 or database SCAN Listener port applicable for the job	SQL*Net	Should allow Oracle client connections to the database over Oracle's SQL*Net protocol Perform database queries, Data Guard sync, and configuration Note: If you are using a non- default port number (that is something other than port 1521) for the local listener
					address, then the non-default port should allow connections.

 Table 3-2
 (Cont.) Zero Downtime Migration Communication Ports

Initiator	Target	Protocol	Port	Purpose	Description
Target So database dat	Source database servers	TCP	1521 or a database SCAN Listener port applicable	SQL*Net	Should allow Oracle client connections to the database over Oracle's SQL*Net protocol Allows redo lo shipping if source database needs to be in sync with the new primary o Oracle Cloud after switchover. If there is no communication possible from Oracle Cloud to source database server then se SKIP_FALLBA K to TRUE in th response file t avoid this communication
					Note: If you a using a non- default port number (that is something other than por 1521) for the local listener address, then the non-defau port should allow connections.
Source database servers	Oracle Cloud Object Store Service	SSL	443	Database backup store. Create a backup of the source database to the specified Oracle Cloud Object store container.	If the chosen backup metho uses Oracle Cloud Object Store Service as the backup medium, then access ports a documented Oracle Cloud Object Store Service applie

Table 3-2 (Cont.) Zero Downtime Migration Communication Ports

ORACLE

Initiator	Target	Protocol	Port	Purpose	Description
Target database servers	Oracle Cloud Object Store Service	SSL	443	Database backup store. Restore backup of the source database from the specified Oracle Cloud Object store container to the target database.	If the chosen backup method uses Oracle Cloud Object Store Service as the backup medium, then access ports as documented Oracle Cloud Object Store Service applies.

Table 3-2 (Cont.) Zero Downtime Migration Communication Ports

Note:

If there is no SSH access to the source database, the following actions are skipped as part of the Zero Downtime Migration work flow.

- Dumps will not be uploaded or transferred from source node to Object Store or to the target server
- Zero Downtime Migration will not validate the source export path, if it is writable for the database user
- Zero Downtime Migration will not validate whether the source database server can successfully access the Oracle Cloud Object Store

Note:

When performing a migration with root credentials (migrate database - scroot), during the setup phase, Zero Downtime Migration uses six ports chosen from the ephemeral range, or six ports from the range of ports set in TRANSFERPORT_RANGE in *zdmbase*/crsdata/*zdm_service_host*/rhp/conf/ rhp.pref. The specified ports must be allowed to accept incoming connections from the Zero Downtime Migration service host on the source or target database server.

Generate SSH Keys Without a Passphrase

You can generate a new SSH key without a passphrase if on the Zero Downtime Migration service host the authentication key pairs are not available without a passphrase for the Zero Downtime Migration software installed user.

Note:

Currently, only the RSA key format is supported for configuring SSH connectivity, so use the ssh-keygen command, which generates both of the authentication key pairs (public and private).

The following example shows you how to generate an SSH key pair for the Zero Downtime Migration software installed user. You can also use this command to generate the SSH key pair for the opc user.

Run the following command on the Zero Downtime Migration service host.

```
zdmuser> ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/home/zdmuser/.ssh/id rsa):
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/zdmuser/.ssh/id rsa.
Your public key has been saved in /home/zdmuser/.ssh/id rsa.pub.
The key fingerprint is:
c7:ed:fa:2c:5b:bb:91:4b:73:93:c1:33:3f:23:3b:30 zdmuser@zdm service host
The key's randomart image is:
+--[ RSA 2048]----+
. . .
       S o . = |
         . E . * |
X.+o.|
         .= Bo.o|
         0+*0. |
+----+
```

This command generates the id_rsa and id_rsa.pub files in the zdmuser home, for example, /home/zdmuser/.ssh.

4

Preparing for a Physical Database Migration

Before starting a Zero Downtime Migration physical database migration you must configure connectivity between the servers, prepare the source and target databases, set parameters in the response file, and configure any required migration job customization.

See the Zero Downtime Migration Release Notes for the latest information about new features, known issues, and My Oracle Support notes.

Preparing the Source and Target Databases

There are several tasks you must complete on the source and target databases before configuring a migration job.

Note:

Zero Downtime Migration online physical migrations leverage Oracle Data Guard, so you must have the same operating system and database version on both source and target.

However, note that, while Standard Edition databases can use Zero Downtime Migration, they must use the offline migration method which is based on a backup and restore methodology that does not use Data Guard.

The Zero Downtime Migration physical migration work flow does not support crossedition migration; however, you can migrate Standard Edition to Enterprise Edition using the logical migration work flow.

Source Database Prerequisites

Meet the following prerequisites on the source database before the Zero Downtime Migration process starts.

- The source database must be running in ARCHIVELOG mode. See Changing the Database Archiving Mode.
- The character set on the source database must be the same as the target database.
- Configure the TDE wallet on Oracle Database 12c Release 2 and later. Enabling TDE on Oracle Database 11g Release 2 (11.2.0.4) and Oracle Database 12c Release 1 is optional.

For Oracle Database 12c Release 2 and later, if the source database does not have Transparent Data Encryption (TDE) enabled, then it is mandatory that you configure the TDE wallet before migration begins. The WALLET_TYPE can be AUTOLOGIN (preferred) or PASSWORD based.

Ensure that the wallet STATUS is OPEN and WALLET_TYPE is AUTOLOGIN (For an AUTOLOGIN wallet type), or WALLET TYPE is PASSWORD (For a PASSWORD based wallet type). For a

multitenant database, ensure that the wallet is open on all PDBs as well as the CDB, and the master key is set for all PDBs and the CDB.

SQL> SELECT * FROM v\$encryption wallet;

 If the source is an Oracle RAC database, and SNAPSHOT CONTROLFILE is not on a shared location, configure SNAPSHOT CONTROLFILE to point to a shared location on all Oracle RAC nodes to avoid the ORA-00245 error during backups to Oracle Object Store.

For example, if the database is deployed on ASM storage,

```
$ rman target /
RMAN> CONFIGURE SNAPSHOT CONTROLFILE NAME TO '+DATA/db_name/
snapcf_db_name.f';
```

If the database is deployed on an ACFS file system, specify the shared ACFS location in the above command.

- Verify that port 22 on the source database server allows incoming connections from the Zero Downtime Migration service host.
- Ensure that the scan listener ports (1521, for example) on the source database servers allow incoming connections from the target database servers and outgoing connections to the target database servers.

Alternate SQL connectivity should be made available if a firewall blocks incoming remote connection using the SCAN listener port.

 To preserve the source database Recovery Time Objective (RTO) and Recovery Point Objective (RPO) during the migration, the existing RMAN backup strategy should be maintained.

During the migration a dual backup strategy will be in place; the existing backup strategy and the strategy used by Zero Downtime Migration. Avoid having two RMAN backup jobs running simultaneously (the existing one and the one initiated by Zero Downtime Migration). If archive logs were to be deleted on the source database, and these archive logs are needed by Zero Downtime Migration to synchronize the target cloud database, then these files should be restored so that Zero Downtime Migration can continue the migration process.

- If the source database is deployed using Oracle Grid Infrastructure and the database is not registered using SRVCTL, then you must register the database before the migration.
- The source database must use a server parameter file (SPFILE).
- If RMAN is not already configured to automatically back up the control file and SPFILE, then set CONFIGURE CONTROLFILE AUTOBACKUP to ON and revert the setting back to OFF after migration is complete.

RMAN> CONFIGURE CONTROLFILE AUTOBACKUP ON;

• For offline migrations, plan to make sure no incoming transactions take place on the source database before the ZDM_BACKUP_DIFFERENTIAL_SRC phase, so that there is no loss of data during the migration. Once Zero Downtime Migration starts generating backups and transfers them, any new transactions on the source won't

be part of the backups and therefore the target in the cloud won't have those changes.

System time of the Zero Downtime Migration service host and source database server should be in sync with your Oracle Cloud Infrastructure target.

If the time on any of these systems varies beyond 6 minutes from the time on OCI, it should be adjusted. You can use <code>ntp_time_check</code> to synchronize the time if NTP is configured. If NTP is not configured, then it is recommended that you configure it. If configuring NTP is not an option, then you need to correct the time manually to ensure it is in sync with OCI time.

• Set the COMPATIBLE database initialization parameter to the same value on the source and target database. See Values for the COMPATIBLE Initialization Parameter in Oracle Database for valid values.

See Also:

Setting Up the Transparent Data Encryption Keystore Zero Downtime Migration Port Requirements

Target Database Prerequisites

The following prerequisites must be met on the target database before you begin the Zero Downtime Migration process.

• You must create a placeholder target database.

For Exadata Cloud Service and Exadata Cloud at Customer targets, the placeholder database must be created using Control Plane, not Grid Infrastructure Database Services before database migration begins.

Note:

For this release, only Grid Infrastructure-based database services are supported as targets. For example, an LVM-based instance or an instance created in compute node without Grid Infrastructure are not supported targets.

The placeholder target database is overwritten during migration, but it retains the overall configuration.

Pay careful attention to the following requirements:

- Size for the future When you create the database from the console, ensure that your chosen shape can accommodate the source database, plus any future sizing requirements. A good guideline is to use a shape similar to or larger in size than source database.
- Set name parameters
 - * DB_NAME If the target database is Exadata Cloud Service or Exadata Cloud at Customer, then the database DB_NAME should be the same as the source database DB_NAME. If the target database is Oracle Cloud Infrastructure, then the database DB_NAME can be the same as or different from the source database DB_NAME.

- * DB_UNIQUE_NAME: If the target database is Oracle Cloud Infrastructure, Exadata Cloud Service, or Exadata Cloud at Customer, the target database DB_UNIQUE_NAME parameter value must be unique to ensure that Oracle Data Guard can identify the target as a different database from the source database.
- Match the source SYS password Specify a SYS password that matches that of the source database.
- Disable automatic backups Provision the target database from the console without enabling automatic backups.
 For Oracle Cloud Infrastructure and Exadata Cloud Service, do not select the Enable automatic backups option under the section Configure database backups.

For Exadata Cloud at Customer, set Backup destination **Type** to None under the section **Configure Backups**.

• The target database version should be the same as the source database version. The target database patch level should also be the same as (or higher than) the source database.

If the target database environment is at a higher patch level than the source database (for example, if the source database is at Jan 2020 PSU/BP and the target database is at April 2020 PSU/BP), then Zero Downtime Migration runs the datapatch utility as part of the migration.

- The character set on the source database must be the same as the target database.
- The target database time zone version must be the same as the source database time zone version. To check the current time zone version, query the V\$TIMEZONE_FILE view as shown here, and upgrade the time zone file if necessary.

SQL> SELECT * FROM v\$timezone_file;

• Verify that the TDE wallet folder exists, and ensure that the wallet STATUS iS OPEN and WALLET_TYPE iS AUTOLOGIN (For an auto-login wallet type), or WALLET_TYPE iS PASSWORD (For a password-based wallet). For a multitenant database, ensure that the wallet is open on all PDBs as well as the CDB, and the master key is set for all PDBs and the CDB.

```
SQL> SELECT * FROM v$encryption wallet;
```

- The target database must use a server parameter file (SPFILE).
- If the target is an Oracle RAC database, then verify that SSH connectivity without a passphrase is set up between the Oracle RAC servers for the oracle user.
- Check the size of the disk groups and usage on the target database (ASM disk groups or ACFS file systems) and make sure adequate storage is provisioned and available on the target database servers.
- Make sure adequate storage is provisioned and available on the object store to accommodate the source database backup.
- Verify that ports 22 and 1521 (or the configured database listener port) on the target servers in the Oracle Cloud Infrastructure, Exadata Cloud Service, or Exadata Cloud at Customer environment are open and not blocked by a firewall.

- Verify that port 22 on the target database server allows incoming connections from the Zero Downtime Migration service host.
- Capture the output of the RMAN SHOW ALL command, so that you can compare RMAN settings after the migration, then reset any changed RMAN configuration settings to ensure that the backup works without any issues.

RMAN> show all;

• System time of the Zero Downtime Migration service host and source database server should be in sync with your Oracle Cloud Infrastructure target.

If the time on any of these systems varies beyond 6 minutes from the time on OCI, it should be adjusted. You can use ntp time check to synchronize the time if NTP is configured. If NTP is not configured, then it is recommended that you configure it. If configuring NTP is not an option, then you need to correct the time manually to ensure it is in sync with OCI time.

 Set the COMPATIBLE database initialization parameter to the same value on the source and target database. See Values for the COMPATIBLE Initialization Parameter in Oracle Database for valid values.

Managing User Credentials for information about generating the auth token for Object Storage backups

Zero Downtime Migration Port Requirements

Setting Up the Transparent Data Encryption Keystore

For Oracle Database 12c Release 2 and later, if the source and target databases do not have Transparent Data Encryption (TDE) enabled, then it is mandatory that you configure the TDE keystore before migration begins.

TDE should be enabled and the TDE WALLET status on both source and target databases must be set to OPEN. The WALLET_TYPE can be AUTOLOGIN, for an auto-login keystore (preferred), or PASSWORD, for a password-based keystore. On a multitenant database, make sure that the keystore is open on all PDBs as well as the CDB, and that the master key is set for all PDBs and the CDB.

If TDE is not already configured as required on the source and target databases, use the following instructions to set up the TDE keystore.

For a password-based keystore, you only need to do steps 1, 2, and 4; for an auto-login keystore, complete all of the steps.

1. Set ENCRYPTION_WALLET_LOCATION in the \$ORACLE_HOME/network/admin/sqlnet.ora file.

/home/oracle>cat /u01/app/oracle/product/12.2.0.1/dbhome_4/network/admin/
sqlnet.ora

ENCRYPTION WALLET LOCATION=(SOURCE=(METHOD=FILE)

```
(METHOD_DATA=(DIRECTORY=/u01/app/oracle/product/12.2.0.1/dbhome_4/network/admin/)))
```

For an Oracle RAC instance, also set ENCRYPTION_WALLET_LOCATION in the second Oracle RAC node.

- 2. Create and configure the keystore.
 - a. Connect to the database and create the keystore.

```
$ sqlplus "/as sysdba"
SQL> ADMINISTER KEY MANAGEMENT CREATE KEYSTORE '/u01/app/oracle/
product/12.2.0.1/dbhome_2/network/admin'
identified by password;
```

b. Open the keystore.

For a non-CDB environment, run the following command.

```
SQL> ADMINISTER KEY MANAGEMENT SET KEYSTORE OPEN IDENTIFIED BY password; keystore altered.
```

For a CDB environment, run the following command.

```
SQL> ADMINISTER KEY MANAGEMENT SET KEYSTORE OPEN IDENTIFIED BY
password container = ALL;
keystore altered.
```

c. Create and activate the master encryption key.

For a non-CDB environment, run the following command.

```
SQL> ADMINISTER KEY MANAGEMENT SET KEY IDENTIFIED BY password with backup; keystore altered.
```

For a CDB environment, run the following command.

SQL> ADMINISTER KEY MANAGEMENT SET KEY IDENTIFIED BY *password* with backup container = ALL; keystore altered.

d. Query V\$ENCRYPTION_KEYS to get the keystore status, keystore type, and keystore location.

SQL> SELECT * FROM v\$encryption keys;

```
FILE /u01/app/oracle/product/12.2.0.1/dbhome_2/network/admin/

OPEN PASSWORD SINGLE

NO 0
```

The configuration of a password-based keystore is complete at this stage, and the keystore is enabled with status OPEN and WALLET_TYPE is shown as PASSWORD in the query output above.

Continue to step 3 only if you need to configure an auto-login keystore, otherwise skip to step 4.

- 3. For an auto-login keystore only, complete the keystore configuration.
 - a. Create the auto-login keystore.

```
SQL> ADMINISTER KEY MANAGEMENT CREATE AUTO_LOGIN KEYSTORE FROM
KEYSTORE
'/u01/app/oracle/product/12.2.0.1/dbhome_2/network/admin/'
IDENTIFIED BY password;
keystore altered.
```

b. Close the password-based keystore.

SQL> ADMINISTER KEY MANAGEMENT SET KEYSTORE CLOSE IDENTIFIED BY password; keystore altered.

c. Query V\$ENCRYPTION_WALLET to get the keystore status, keystore type, and keystore location.

In the query output, verify that the TDE keystore STATUS is OPEN and WALLET_TYPE set to AUTOLOGIN, otherwise the auto-login keystore is not set up correctly.

This completes the auto-login keystore configuration.

4. Copy the keystore files to the second Oracle RAC node.

If you configured the keystore in a shared file system for Oracle RAC, or if you are enabling TDE for a single instance database, then no action is required.

If you are enabling TDE for Oracle RAC database without shared access to the keystore, copy the following files to the same location on second node.

/u01/app/oracle/product/12.2.0.1/dbhome 2/network/admin/ew*

/u01/app/oracle/product/12.2.0.1/dbhome 2/network/admin/cw*

Setting Physical Migration Parameters

Set the required physical migration response file parameters. Get the response file template, $DME/rhp/zdm/template/zdm_template.rsp$, which is used to create your Zero Downtime Migration response file for the database migration procedure, and edit the file as described here.

The following response file settings show you how to configure a typical use case. To further customize your configuration you can find additional parameters described in Zero Downtime Migration Physical Migration Response File Parameters Reference.

TGT_DB_UNIQUE_NAME

Set TGT_DB_UNIQUE_NAME to the target database DB_UNIQUE_NAME value. To find DB_UNIQUE_NAME run

SQL> show parameter db unique name

For Cloud type Exadata Cloud at Customer Gen 1, set TGT_DB_UNIQUE_NAME to a different DB_UNIQUE_NAME not currently in use.

PLATFORM_TYPE

Set PLATFORM TYPE to one of the following:

- VMDB Oracle Cloud Infrastructure virtual machine or bare metal targets.
- EXACS Exadata Cloud Service
- EXACC Exadata Cloud at Customer
- NON CLOUD On-premises Exadata Database Machine

MIGRATION_METHOD

Set MIGRATION METHOD to one of the following:

- ONLINE PHYSICAL Oracle Data Guard (online)
- OFFLINE_PHYSICAL RMAN backup and restore (offline). Note that this is the only migration method supported for Oracle Standard Edition databases.

DATA_TRANSFER_MEDIUM

DATA_TRANSFER_MEDIUM specifies the media used for the source database backup, or you can configure direct data transfer.

• OSS - Oracle Data Guard using Object Storage Service (OSS) for standby initialization.

Supported for PLATFORM_TYPE set to Oracle Cloud Infrastructure (VMDB), Exadata Cloud Service (EXACS), and Exadata Cloud at Customer (EXACC).

Also set <code>ZDM_LOG_OSS_PAR_URL</code> to the Cloud Object Store pre-authenticated URL if you want to upload migration logs onto Cloud Object Storage. For information about getting a pre-authenticated URL see Oracle Cloud documentation at https://

docs.cloud.oracle.com/en-us/iaas/Content/Object/Tasks/ usingpreauthenticatedrequests.htm#usingconsole.

When you perform a migration using backup and restore (OFFLINE_PHYSICAL) through Object Storage Service, SQL*Net connectivity between the source and target are not needed.

• EXTBACKUP - Oracle Data Guard with existing backup in external location.

Supported for PLATFORM_TYPE set to Exadata Cloud at Customer (EXACC) or on-premises Exadata Database Machine (NON CLOUD)

Also, create a standby control file backup in the specified path and provide read permissions to the backup pieces for the target database user. For example,

```
RMAN> BACKUP CURRENT CONTROLFILE FOR STANDBY FORMAT 'BACKUP_PATH/
lower_case_dbname/standby_ctl_%U';
```

Where standby ctl %U is a system-generated unique file name.

• ZDLRA - Oracle Data Guard using ZDLRA for standby initialization.

Supported for PLATFORM_TYPE set to Exadata Cloud at Customer (EXACC) or on-premises Exadata Database Machine (NON_CLOUD), and set the following parameters.

- Set SRC_ZDLRA_WALLET_LOC for the wallet location, for example,

SRC_ZDLRA_WALLET_LOC=/u02/app/oracle/product/12.1.0/dbhome_3/dbs/zdlra

- Set TGT_ZDLRA_WALLET_LOC for the wallet location, for example, TGT_ZDLRA_WALLET_LOC=target_database_oracle_home/dbs/zdlra.
- Set ZDLRA CRED ALIAS for the wallet credential alias, for example,

ZDLRA CRED ALIAS=zdlra scan:listener port/zdlra9:dedicated

• NFS - Oracle Data Guard using backup location such as NFS.

Supported for PLATFORM_TYPE set to Exadata Cloud at Customer (EXACC) or on-premises Exadata Database Machine (NON CLOUD).

Also set BACKUP_PATH to specify the actual NFS path which is made accessible from both the source and target database servers, for example, an NFS mount point. The NFS mount path should be same for both source and target database servers. This path does not need to be mounted on the Zero Downtime Migration service host.

When you perform a migration using backup and restore (OFFLINE_PHYSICAL) through NFS, SQL*Net connectivity between the source and target are not needed.

Note the following considerations:

- The source database is backed up to the specified path and restored to Exadata Cloud at Customer using RMAN SQL*Net connectivity.
- The path set in BACKUP_PATH should have 'rwx' permissions for the source database user, and at least read permissions for the target database user.
- In the path specified by BACKUP_PATH, the Zero Downtime Migration backup procedure will create a directory, \$BACKUP_PATH/dbname, and place the backup pieces in this directory.

 DIRECT - Uses RMAN active database duplication or restore from service to transfer data directly from the source to the target.

RMAN active database duplication is supported in Oracle Database 11g (11.2) and later releases, which makes it the only option available for 11gR2 databases. RMAN restore from service is supported in Oracle Database 12g (12.1) and later releases.

Because the connection is initiated from the target database host, both active duplication and restore from service direct transfer methods require SQL*Net connectivity from the target to the source database.

The transfer method (restore from service or active duplicate) is configured with ZDM RMAN DIRECT METHOD, which is set to RESTORE FROM SERVICE by default.

To use the restore from service method, also set ZDM_SRC_DB_RESTORE_SERVICE_NAME to the fully qualified name of the service on the source database to be used for the migration. If not specified, the default database service is used.

See Direct Data Transfer Support for more information about the transfer methods.

You must also set up non-interactive access between the source and target. See Provide Passwords Non-Interactively Using a Wallet.

Additional Oracle Cloud Object Storage Settings

When DATA_TRANSFER_MEDIUM=OSS, set the following parameters to access Oracle Cloud Object Storage. The source database is backed up to the specified container and restored to the target using RMAN SQL*Net connectivity.

- Set HOST to the cloud storage REST endpoint URL.
 - For Oracle Cloud Infrastructure storage the typical value format is HOST=https://swiftobjectstorage.us-phoenix-1.oraclecloud.com/v1/ ObjectStorageNamespace

To find the Object Storage Namespace value, log in to the Cloud Console and select **Menu**, **Administration**, **Tenancy Detail**, and in the **Object Storage Settings** section find **Value against entry Object Storage Namespace**:

- For Oracle Cloud Infrastructure Classic storage the typical value format is HOST=https://acme.storage.oraclecloud.com/v1/Storage-tenancy name
- Set the Object Storage bucket OPC CONTAINER parameter.

The bucket is also referred to as a container for Oracle Cloud Infrastructure Classic storage. Make sure that the Object Storage bucket is created using the Oracle Cloud Service Console as appropriate. Make sure adequate storage is provisioned and available on the object store to accommodate the source database backup.

TGT_SSH_TUNNEL_PORT

If SSH tunneling is set up, set the TGT SSH TUNNEL PORT parameter.

Data and Redo Locations

Zero Downtime Migration automatically discovers the location for data, reco, and redo (for non-Exadata systems) storage volumes from the specified target database. If you

need to override the discovered values, specify the target database data files storage (ASM or ACFS) location using the appropriate set of parameters.

- ASM: TGT DATADG, TGT REDODG, and TGT RECODG
- ACFS: TGT DATAACFS, TGT REDOACFS, and TGT RECOACFS

SKIP_FALLBACK

Set SKIP_FALLBACK=TRUE if you do not want to ship redo logs from the target to the source standby, either voluntarily or because there is no connectivity between the target and the source.

TGT_SKIP_DATAPATCH

Zero Downtime Migration runs the datapatch utility by default as part of the migration process if the target database environment is at a higher patch level than the source database (for example, if the source database is at Jan 2020 PSU/BP and the target database is at April 2020 PSU/BP).

If you want to skip this task set the TGT SKIP DATAPATCH=FALSE response file parameter.

PHASE_NAME_MONITORING_INTERVAL

Set *PHASE_NAME_MONITORING_INTERVAL=n mins* if you want Zero Downtime Migration to monitor and report the status of backup and restore operations at the configured time interval during the migration. The default interval value is 10 minutes. To disable monitoring, set these values to 0 (zero).

```
ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL=
ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL=
ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL=
ZDM_CLONE_TGT_MONITORING_INTERVAL=
ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL=
ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL=
```

ZDM_BACKUP_RETENTION_WINDOW

Set ZDM_BACKUP_RETENTION_WINDOW=number of days if you wish to retain source database backup after the migration.

ZDM_SRC_TNS_ADMIN

Set ZDM_SRC_TNS_ADMIN=TNS_ADMIN value in case of custom location.

Provide Passwords Non-Interactively Using a Wallet

You can avoid entering passwords in the command line and run the <code>ZDMCLI migrate database</code> command without user interaction, such as when you do automation using Rundeck.

Note:

This wallet-based password input option is only supported for physical online and offline migration jobs.

Currently, whenever you submit the *SZDM_HOME/bin/zdmcli migrate* database command, it prompts for the source database *SYS* password, Object Store user swift authentication token, and the source database Transparent Data Encryption (TDE) keystore password (if the wallet was configured as a PASSWORD-based TDE wallet).

Additionally, if you are converting a non-multitenant source database to a multitenant architecture on the target, that is a pluggable database (PDB), then you can also create an auto-login wallet for the target container database (CDB) TDE keystore password.

Run the following commands on the Zero Downtime Migration service host as Zero Downtime Migration software owner (for example, zdmuser).

To create an auto-login wallet for the source database sys user:

1. Create a directory where you want to create and store the wallet.

```
zdmuser> mkdir sys_wallet_path
```

For example:

/u01/app/zdmhome> mkdir sysWallet

2. Create a wallet.

```
zdmuser> $ZDM_HOME/bin/orapki wallet create -wallet sys_wallet_path
-auto login only
```

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/orapki wallet create -wallet
sysWallet
-auto_login_only
Oracle PKI Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

Operation is successfully completed.

3. Add a SYS user login credentials to wallet.

```
zdmuser> $ZDM_HOME/bin/mkstore -wrl sys_wallet_path
-createCredential store sysuser
```

At the prompt, enter the source database SYS password.

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/mkstore -wrl ./sysWallet
-createCredential store sysuser
Oracle Secret Store Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

Your secret/Password is missing in the command line Enter your secret/Password: Re-enter your secret/Password:

4. Verify that the wallet files were created.

```
zdmuser> ls -l sys wallet path
```

For example

```
/u01/app/zdmhome> ls -l sysWallet/
total 4
-rw-----. 1 opc opc 581 Jun 2 08:00 cwallet.sso
-rw-----. 1 opc opc 0 Jun 2 08:00 cwallet.sso.lck
```

To create an auto-login wallet for the Object Store user:

1. Create a directory where you want to create and store the wallet.

zdmuser> mkdir oss wallet path

For example

/u01/app/zdmhome> mkdir ossWallet

2. Create a wallet

```
zdmuser> $ZDM_HOME/bin/orapki wallet create -wallet oss_wallet_path
-auto_login_only
```

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/orapki wallet create
-wallet ./ossWallet -auto_login_only
Oracle PKI Tool Release 19.0.0.0.0 -Production
Version 19.4.0.0.0
```

```
Copyright (c) 2004, 2019,
Oracle and/or its affiliates. All rights reserved.
```

```
Operation is successfully completed.
```

3. Add the Object Store user login credentials to the wallet.

```
zdmuser> $ZDM_HOME/bin/mkstore -wrl oss_wallet_path
-createCredential store ossuser
```

For the prompt,

- If the backup destination is Object Store (Bucket), then enter the user swift authentication token.
- If the backup destination is Storage Classic (Container), then enter your tenancy login password.

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/mkstore -wrl ./ossWallet
-createCredential store ossuser
Oracle Secret Store Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

```
Your secret/Password is missing in the command line
Enter your secret/Password:
Re-enter your secret/Password:
```

4. Verify that the wallet files were created.

```
zdmuser> ls -l oss_wallet_path
```

For example

```
/u01/app/zdmhome> ls -l ./ossWallet
total 4
-rw-----. 1 opc opc 597 Jun 2 08:02 cwallet.sso
-rw-----. 1 opc opc 0 Jun 2 08:01 cwallet.sso.lck
```

To create an auto-login wallet for the source database TDE keystore:

1. Create a directory where you want to create and store the wallet.

```
zdmuser> mkdir tde wallet path
```

For example

/u01/app/zdmhome> mkdir tdeWallet

2. Create a wallet.

```
zdmuser> $ZDM_HOME/bin/orapki wallet create -wallet tde_wallet_path
-auto login only
```

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/orapki wallet create -wallet ./tdeWallet
-auto_login_only
Oracle PKI Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

Operation is successfully completed.

3. Add the source database TDE keystore credentials to the wallet.

```
zdmuser> $ZDM_HOME/bin/mkstore -wrl tde_wallet_path
-createCredential store tdeuser
```

At the prompt, enter the TDE keystore password.

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/mkstore -wrl ./tdeWallet
-createCredential store tdeuser
Oracle Secret Store Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

```
Your secret/Password is missing in the command line
Enter your secret/Password:
Re-enter your secret/Password:
```

4. Verify that the wallet files were created.

```
zdmuser> ls -l tde wallet path
```

For example

```
/u01/app/zdmhome> ls -l tdeWallet
total 4
-rw-----. 1 opc opc 581 Jun 2 08:06 cwallet.sso
-rw-----. 1 opc opc 0 Jun 2 08:04 cwallet.sso.lck
```

To create an auto-login wallet for the target CDB database TDE keystore password:

1. Create a directory where you want to create and store the wallet.

```
zdmuser> mkdir cdb_tde_wallet_path
```

For example

/u01/app/zdmhome> mkdir cdbtdeWallet

2. Create a wallet.

```
zdmuser> $ZDM_HOME/bin/orapki wallet create -wallet
cdb_tde_wallet_path
-auto_login_only
```

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/orapki wallet create -wallet ./
cdbtdeWallet
-auto_login_only
Oracle PKI Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

Operation is successfully completed.

3. Add the source database TDE keystore credentials to the wallet.

```
zdmuser> $ZDM_HOME/bin/mkstore -wrl cdb_tde_wallet_path
-createCredential store cdbtdeuser
```

At the prompt, enter the TDE keystore password.

For example

```
/u01/app/zdmhome> $ZDM_HOME/bin/mkstore -wrl ./cdbtdeWallet
-createCredential store cdbtdeuser
Oracle Secret Store Tool Release 19.0.0.0.0 - Production
Version 19.4.0.0.0
Copyright (c) 2004, 2019, Oracle and/or its affiliates. All rights
reserved.
```

Your secret/Password is missing in the command line Enter your secret/Password: Re-enter your secret/Password:

Setting Command Options to Access the Wallets

To specify wallet information in the ZDMCLI MIGRATE DATABASE command, set the - sourcesyswallet, -osswallet, -tdekeystorewallet, and -tgttdekeystorewallet options as shown here.

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb source_db_unique_name_value
-sourcenode source_database_server_name
-srcauth zdmauth
-srcarg1 user:source_database_server_login_user_name
-srcarg2 identity_file:zdm_installed_user_private_key_file_location
```

```
-srcarg3 sudo_location:/usr/bin/sudo
-targetnode target_database_server_name
-backupuser object_store_login_user_name
-rsp response_file_location
-tgtauth zdmauth
-tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:zdm_installed_user_private_key_file_location
-tgtarg3 sudo_location:/usr/bin/sudo
-sourcesyswallet sys_wallet_path
-osswallet oss_wallet_path
-tdekeystorewallet tde_wallet_path
-tgttdekeystorewallet cdb_tde_wallet_path
-eval
```

- -sourcesyswallet sys_wallet_path specifies the full path for the auto-login wallet file on the Zero Downtime Migration host containing the SYS password of the source database
- -osswallet oss_wallet_path specifies the full path for the auto-login wallet file on the Zero Downtime Migration host containing credentials for the Object Storage Service backup user
- -tdekeystorewallet *tde_wallet_path* specifies the full path for the auto-login wallet file on the Zero Downtime Migration host containing the TDE keystore password
- -tgttdekeystorewallet cdb_tde_wallet_path specifies the full path for the auto-login wallet file on the Zero Downtime Migration host containing the target CDB TDE keystore password

Evaluation Mode Example

```
zdmuser> $ZDM HOME/bin/zdmcli migrate database
-sourcedb zdmsdb
-sourcenode ocicdb1
-srcauth zdmauth
-srcarg1 user:opc
-srcarq2 identity file:/home/zdmuser/.ssh/zdm service host.ppk
-srcarg3 sudo location:/usr/bin/sudo
-targetnode ocidb1
-backupuser backup user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm template zdmsdb.rsp
-tgtauth zdmauth
-tgtarg1 user:opc
-tgtarg2 identity file:/home/zdmuser/.ssh/zdm service host.ppk
-tgtarg3 sudo location:/usr/bin/sudo
-sourcesyswallet /u01/app/zdmhome/sysWallet
-osswallet /u01/app/zdmhome/ossWallet
-eval
```

Operation "zdmcli migrate database" scheduled with the job ID "1".

Migration Mode Example

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb zdmsdb
```

```
-sourcenode ocicdb1
-srcauth zdmauth
-srcarg1 user:opc
-srcarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-srcarg3 sudo_location:/usr/bin/sudo
-targetnode ocidb1
-backupuser backup_user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm_template_zdmsdb.rsp
-tgtauth zdmauth
-tgtarg1 user:opc
-tgtarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-tgtarg3 sudo_location:/usr/bin/sudo
-sourcesyswallet /u01/app/zdmhome/sysWallet
-osswallet /u01/app/zdmhome/ossWallet
```

Operation "zdmcli migrate database" scheduled with the job ID "2".

Preparing for Automatic Application Switchover

To minimize or eliminate service interruptions on the application after you complete the database migration and switchover, prepare your application to automatically switch over connections from the source database to the target database.

Note:

In physical migrations, Autonomous Database targets are not supported for automatic application switchover.

In the following example connect string, the application connects to the source database, and when it is not available the connection is switched over to the target database.

```
(DESCRIPTION=
  (FAILOVER=on) (LOAD_BALANCE=on) (CONNECT_TIMEOUT=3) (RETRY_COUNT=3)
  (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=TCP) (HOST=source_database_scan) (PORT=1521))
      (ADDRESS=(PROTOCOL=TCP) (HOST=target_database_scan) (PORT=1521)))
  (CONNECT_DATA=(SERVICE_NAME=zdm_prod_svc)))
```

On the source database, create the service, named zdm_prod_svc in the examples.

```
srvctl add service -db clever -service zdm_prod_svc -role PRIMARY
-notification TRUE -session_state dynamic -failovertype transaction
-failovermethod basic -commit_outcome TRUE -failoverretry 30 -
failoverdelay 10
-replay_init_time 900 -clbgoal SHORT -rlbgoal SERVICE_TIME -preferred
clever1,clever2
-retention 3600 -verbose
```

If the db_domain changes between the source and target then the connect string specified in the application should cater to both for failover to be effective.

```
(DESCRIPTION LIST=
```

```
(FAILOVER=ON)
(LOAD_BALANCE=ON)
(DESCRIPTION=
(ADDRESS= (PROTOCOL=TCP) (HOST=SRC_SCAN) (PORT=1521))
(CONNECT_DATA=
(SERVICE_NAME=SVC.SRC_DOMAIN)))
(DESCRIPTION=
(ADDRESS= (PROTOCOL=TCP) (HOST=TGT_SCAN) (PORT=1521))
(CONNECT_DATA=
(SERVICE_NAME= SVC.TGT_DOMAIN))
```

Configuring Resiliency to Intermittent Network Failures

Zero Downtime Migration physical migrations are resilient to intermittent network failures that can cause backups or SSH connectivity to fail.

Zero Downtime Migration can auto-detect intermittent network failures. Zero Downtime Migration automatically retries the RMAN retry-able errors, and some retry customization is available.

SSH connection retries are customized using the following parameters:

SRC_SSH_RETRY_TIMEOUT

TGT SSH RETRY TIMEOUT

You can customize RMAN backup retries with following parameters:

ZDM_OPC_RETRY_WAIT_TIME

ZDM OPC_RETRY_COUNT

ZDM OPC RETRY WAIT TIME

Converting a Non-CDB Database to a CDB During Migration

As part of the physical migration process, Zero Downtime Migration can handle conversion of a non-CDB source database to a PDB of the same version in the cloud. The conversion process transforms the source non-CDB into a target PDB that is then plugged into an existing CDB in the target.

Downtime will increase due to the non-CDB to CDB conversion. This process is offline (no redo transport and apply), and no rollback is possible.

Source non-CDB Database Prerequisites

- Oracle Database 12c or later versions, because this is when multitenant architecture became available
- Same character set as the target CDB

Target Database CDB and PDB Prerequisites

- The target CDB must not contain a PDB with same name as the resulting converted PDB, because Zero Downtime Migration will create the PDB.
- The target database must be at least the same major version as the source database.
 - If the minor version is different on the target, it must be a higher minor version than the source database.
 - If the patch level is different, you must set the response file parameter TGT SKIP DATAPATCH=FALSE.

Transparent Data Encryption Requirements

- Transparent Data Encryption (TDE) is optional on the source database. If TDE is not set there is no further information required; however if TDE is set up on source, the credentials for export and import TDE keys are required.
- For source credentials, the migrate database command must include either tdekeystorepasswd or the -tdekeystorewallet auto-login option.
- If any of these options is used then the target credentials must be also provided by using either -tgttdekeystorepasswd or the -tgttdekeystorewallet auto-login option.

Application Express Requirements

- If Application Express (APEX) is not installed on the source there are no further requirements.
- If APEX exists on the source, and the source database is a non-CDB, you must choose one of the following options:
 - Remove APEX from the source non-CDB.
 - Verify that the APEX version on the target CDB is the same as that on the source.

If APEX is not at the same version conversion is not possible; APEX schemas vary between versions and the target PDB will not be able to open.

The target CDB is not dropped in the process, and the presence or absence of other PDBs does not affect the outcome of the conversion and plug-in.

Parameters in the response file are set as follows:

- (Required) NONCOBTOPDB_CONVERSION: Set to TRUE to indicate that you want to convert a source database from non-CDB to PDB.
- (Optional) NONCOBTOPDB_SWITCHOVER: Set to TRUE for a physical migration using Data Guard switchover, to execute switchover operations during a migration job with non-CDB to PDB conversion enabled.

The following are examples of the ZDMCLI migrate database command usage for converting a non-CDB to a PDB during migration using the TDE credentials.

Example interactively supplying passwords:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb source_db_unique_name_value
-sourcenode source_database_server_name
-srcroot
-targetnode target_database_server_name
-backupuser Object_store_login_user_name
-rsp response_file_location
-tgtauth zdmauth
-tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:ZDM_installed_user_private_key_file_location
-tgtarg3 sudo_location:/user/bin/sudo
-tdekeystorepasswd
-tgttdekeystorepasswd
```

Example using auto-login wallet for CDB TDE keystore:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb source_db_unique_name_value
-sourcenode source_database_server_name
-srcroot
-targetnode target_database_server_name
-backupuser Object_store_login_user_name
-rsp response_file_location
-tgtauth zdmauth
-tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:ZDM_installed_user_private_key_file_location
-tgtarg3 sudo_location:/user/bin/sudo
-tdekeystorepasswd
-tgttdekeystorewallet /scratch/credentials/cdbtde.sso
```

Run a Migration Job Using an Existing RMAN Backup

Zero Downtime Migration lets you use an existing level 0 backup to skip the full backup phase of a migration job.

Zero Downtime Migration takes level 0 and level 1 backups on the fly for both online and offline physical migration jobs. During a migration job, Zero Downtime Migration lets you reuse existing source database backup in place of performing a full back up.

All types of backup devices, such as DISK, SBT_TAPE, and ZDLRA, are supported as data transfer media for this migration method.

Only level 0 backups with incremental_level=0 are valid for this use case.

To use an existing RMAN backup, set the following response file parameters.

ZDM_USE_EXISTING_BACKUP=TRUE ZDM_BACKUP_TAG=RMAN backup tag

When you run the ZDMCLI database migration command in evaluation mode (ZDMCLI database migration -eval), Zero Downtime Migration verifies the existence of the backup,

checks that it is valid, and displays whether the backup is available and validated in the job output.

In migrate mode (ZDMCLI database migration), Zero Downtime Migration performs the same steps done in evaluation mode, then skips full backup and performs other backup operations like incremental and differential backup.

Creating a Backup

To take a valid RMAN backup to use as a migration source, you can run the following commands.

For DISK:

```
RUN {
ALLOCATE CHANNEL channel_name DEVICE TYPE DISK FORMAT 'directory_path/
%d_backup_%U';
ALTER SYSTEM ARCHIVE LOG CURRENT;
BACKUP AS COMPRESSED BACKUPSET FORCE INCREMENTAL LEVEL 1 FOR RECOVER
OF TAG 'backup_tag'
DATABASE FORMAT 'directory_path/%d_backup_%U_DBF' SECTION SIZE 4G;
}
```

For SBT_TAPE:

```
RUN {
ALLOCATE CHANNEL channel_name DEVICE TYPE SBT FORMAT '%d_%I_%T-%s_%p'
PARMS 'SBT_LIBRARY=path/libopc.so, SBT_PARMS=(OPC_PFILE=path/OPC/
mzdm.conf)';
ALTER SYSTEM ARCHIVE LOG CURRENT;
BACKUP AS COMPRESSED BACKUPSET FORCE INCREMENTAL LEVEL 1 FOR RECOVER
OF TAG 'backup_tag'
DATABASE FORMAT '%d_%I_%T-%s_%p_DBF' SECTION SIZE 4G ;
}
```

Alternate Use Case

If the ZDM_BACKUP_TAG value is provided and ZDM_USE_EXISTING_BACKUP=FALSE the Zero Downtime Migration will create a full backup with the provided tag.

Using Backups with Password Authentication

To use an existing backup with backup password authentication, you can specify the password using the -backuppasswd *password* option in the command migrate database.

You can also specify a backup wallet path by using -backupwallet in the command migrate database.

Migrating an On-Premises Database to an On-Premises Exadata Database Machine

An on-premises migration to an on-premises Exadata Database Machine target using Zero Downtime Migration works the same way as a migration to a cloud target. In the

response file, you indicate that the migration target is on-premises by setting PLATFORM TYPE=NON CLOUD.

Just like in cloud migration scenarios, you must provision the target database with the shape and size desired, including configuring any initialization parameters, before starting the migration. The target database is expected to be the same major version as the source database, Oracle Grid Infrastructure is mandatory at the target database, and target datafiles can be stored on ASM or ACFS.

One aspect where an on-premises to on-premises migration is different from migrating to the cloud is in the handling of Transparent Data Encryption (TDE). On the cloud, TDE is mandatory for Oracle Database 12.2 and later releases; however, for an on-premises to on-premises migration, TDE must be configured at the target only if TDE is used at the source. You must configure TDE at the target before the migration starts; Zero Downtime Migration does not configure it for you.

You can specify that TDE is not configured at the source or target by setting the response file parameter <code>ZDM_TDE_MANDATORY=FALSE</code>. This parameter can only be used when you set <code>PLATFORM_TYPE=NON_CLOUD</code>. With <code>ZDM_TDE_MANDATORY=FALSE</code> set, Zero Downtime Migration does not require TDE at the target when the source is not using TDE, and does not encrypt the target on restore.

For an on-premises Exadata target database migration, MIGRATION_METHOD can be set to ONLINE_PHYSICAL or OFFLINE_PHYSICAL, and DATA_TRANSFER_MEDIUM can be set to any of the values supported by Zero Downtime Migration. Set the remaining parameters as you would for a cloud migration.

5 Preparing for a Logical Database Migration

The following topics describe how to complete the Zero Downtime Migration prerequisites before running a logical database migration job.

Source Database Prerequisites for Logical Migration

Complete the following prerequisites on the source database to prepare for a logical migration.

Offline and Online Migrations Require:

- The character set on the source database must be the same as the target database.
- Configure the streams pool with the initialization parameter STREAMS_POOL_SIZE.

For offline logical migrations, for optimal Data Pump performance, it is recommended that you set <code>STREAMS_POOL_SIZE</code> to a minimum of 256MB-350MB, to have an initial pool allocated, otherwise you might see a significant delay during start up.

For online logical migrations, set STREAMS_POOL_SIZE to at least 2GB. See https:// support.oracle.com/epmos/faces/DocumentDisplay?id=2078459.1 for the recommendation 1GB STREAMS_POOL_SIZE per integrated extract + additional 25 percent.

• System time of the Zero Downtime Migration service host and source database server should be in sync with your Oracle Cloud Infrastructure target.

If the time on any of these systems varies beyond 6 minutes from the time on OCI, it should be adjusted. You can use ntp_time_check to synchronize the time if NTP is configured. If NTP is not configured, then it is recommended that you configure it. If configuring NTP is not an option, then you need to correct the time manually to ensure it is in sync with OCI time.

- If you are using a database link, and your target database is on Autonomous Database Shared Infrastructure, you must configure TCPS on the source. Autonomous Database Shared Infrastructure doesn't allow a database link to a source that is not configured with TCPS.
- If you are migrating from an Amazon Web Services RDS environment, see Migrating from Amazon Web Services RDS to Oracle Autonomous Database for information about source environment preparations.
- In the PDB being exported, if you have created local objects in the C## user's schema and you want to import them, then either make sure a common user of the same name already exists in the target CDB instance (for non-Autonomous Database targets) or use the following Zero Downtime Migration parameter to rename the schema on import.

DATAPUMPSETTINGS_METADATAREMAPS-1=type:REMAP_SCHEMA,oldValue:c##common_use r,newValue:new name

• If you are migrating to Oracle Autonomous Database on Exadata Cloud@Customer from any on-premises Oracle Database, including existing Exadata Cloud@Customer

systems, see Migrating to Oracle Autonomous Database on Exadata Cloud@Customer for additional prerequisite setup tasks.

Online Migrations Require:

• If the source is Oracle Database 11.2, apply mandatory 11.2.0.4 RDBMS patches on the source database.

See My Oracle Support note Oracle GoldenGate -- Oracle RDBMS Server Recommended Patches (Doc ID 1557031.1)

- Database PSU 11.2.0.4.200414 includes a fix for Oracle GoldenGate performance bug 28849751 - IE PERFORMANCE DEGRADES WHEN NETWORK LATENCY BETWEEN EXTRACT AND CAPTURE IS MORE THAN 8MS
- OGG RDBMS patch 31704157 MERGE REQUEST ON TOP OF DATABASE PSU 11.2.0.4.200414 FOR BUGS 31182000 20448066 - This patch combines mandatory fixes for Oracle GoldenGate Microservices bug 20448066
 DBMS_XSTREAM_GG APIS SHOULD BE ALLOWED FOR SCA
 PROCESSES and required OGG RDBMS patch 31182000 MERGE
 REQUEST ON TOP OF DATABASE PSU 11.2.0.4.200414 FOR BUGS 2990912 12668795.

Although MOS note 1557031.1 mentions OGG patch 31177512, it conflicts with a patch for bug 20448066. As such, OGG patch 31704157 should be used instead of OGG patch 31177512.

- If the source is Oracle Database 12.1.0.2 or a later release, apply mandatory RDBMS patches on the source database.
 See My Oracle Support note Latest GoldenGate/Database (OGG/RDBMS) Patch recommendations (Doc ID 2193391.1), which lists the additional RDBMS patches needed on top of the latest DBBP/RU for Oracle Database 12c and later.
- Enable ARCHIVELOG mode for the database. See Changing the Database Archiving Mode.
- Enable FORCE LOGGING to ensure that all changes are found in the redo by the Oracle GoldenGate Extract process. See Specifying FORCE LOGGING Mode
- Enable database minimal supplemental logging. See Minimal Supplemental Logging.

SQL> ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;

- Enable initialization parameter ENABLE GOLDENGATE REPLICATION.
- Install the UTL_SPADV or UTL_RPADV package for Integrated Extract performance analysis.

See Collecting XStream Statistics Using the UTL_RPADV Package. Note that the package changes name from UTL_SPADV to UTL_RPADV in Oracle Database 19c.

 Create a GoldenGate administration user, ggadmin, granting all of the permissions listed in the example. If the source database is multitenant (CDB), create the user in the source PDB.

SQL> create user ggadmin identified by password default tablespace users temporary tablespace temp; SQL> grant connect, resource to ggadmin; SQL> alter user ggadmin quota 100M ON USERS;

SQL> grant unlimited tablespace to ggadmin; SQL> grant select any dictionary to ggadmin; SQL> grant create view to ggadmin; SQL> grant execute on dbms_lock to ggadmin; SQL> exec dbms goldengate auth.GRANT ADMIN PRIVILEGE('ggadmin');

 If the source database is multitenant (CDB), also create user c##ggadmin in CDB\$ROOT as shown here.

```
SQL> create user c##ggadmin identified by password default tablespace
users
temporary tablespace temp;
SQL> alter user c##ggadmin quota 100M ON USERS;
SQL> grant unlimited tablespace to c##ggadmin;
SQL> grant connect, resource to c##ggadmin container=all;
SQL> grant select any dictionary to c##ggadmin container=all;
SQL> grant create view to c##ggadmin container=all;
SQL> grant execute on dbms_lock to c##ggadmin container=all;
SQL> exec
dbms goldengate auth.GRANT ADMIN PRIVILEGE('c##ggadmin', container=>'all');
```

 During the migration period, to provide the most optimal environment for fast database replication, avoid large batch DML operations. Running large batch operations, like a single transaction that affects multi-millions of rows, can slow down replication rates. Create, alter, and drop DDL operations are not replicated.

Offline Migrations Require:

• The DATAPUMP_EXP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE roles are required. These roles are required for Data Pump to determine whether privileged application roles should be assigned to the processes comprising the migration job.

DATAPUMP_EXP_FULL_DATABASE is required for the export operation at the source database for the specified database user. The DATAPUMP_IMP_FULL_DATABASE role is required for the import operation at the specified target database for specified target database user.

See the Oracle Data Pump documentation for more information.

Target Database Prerequisites for Logical Migration

Complete the following prerequisites on the target database to prepare for a logical migration.

Logical migrations with Oracle GoldenGate require:

- If the target is Autonomous Database, unlock the pre-created ggadmin user.
- If the target is not Autonomous database, create a ggadmin user in the target PDB. This
 user is similar to the ggadmin user on the source database, but will require more
 privileges. See Establishing Oracle GoldenGate Credentials for information about
 privileges required for a "Replicat all modes" user.

Data Pump-only logical migrations require:

• The DATAPUMP_IMP_FULL_DATABASE role is required for the import operation at the specified target database for specified target database user.

All logical migrations require:

- The character set on the source database must be the same as the target database.
- System time of the Zero Downtime Migration service host and source database server should be in sync with your Oracle Cloud Infrastructure target.
- All source database requirements be met. Some tasks are performed on both the source and target. See Source Database Prerequisites for Logical Migration

Additional Logical Migration Prerequisites

Complete the following additional prerequisites to prepare for a logical migration.

Create an OCI API key pair

See Required Keys and OCIDs for details.

Set Up Data Transfer Media

• To use Object Storage data transfer medium:

Create an Object Store bucket on Oracle Cloud Infrastructure if you are using Object Storage as a data transfer medium. This is not required for Exadata Cloud at Customer or on-premises Exadata Database Machine targets.

• To use a database link (DBLINK):

If you are using an existing database link between the target database to an onpremises source database by global_name of the source database, ensure that the DBLINK is not broken. Zero Downtime Migration can reuse the pre-existing DBLINK for migration if that data transfer medium is configured.

Zero Downtime Migration supports DBLINK for Autonomous Database Dedicated Infrastructure, provided that there is TCP or TCPS connectivity available between the source and Autonomous Database instance. Customer need to setup IPSEC connectivity or FASTCONNECT.

 If you are **not** using a database link for data transfer, ensure that the file system used for the Data Pump export directory has sufficient space to store Data Pump dump files.

If the source uses self-signed database server certificates:

If the source database listener is configured with TLS (TCPS) using self-signed database server certificates, then ensure that the self-signed certificate is added to the Zero Downtime Migration home cert store as follows.

```
keytool -import -keystore ZDM_HOME/jdk/jre/lib/security/cacerts -
trustcacerts
-alias "src ca cert" -file source db server-certificate
```

Online Migration Additional Prerequisites

For online migration, do the following additional prerequisite tasks:

• Set up an Oracle GoldenGate Microservices hub:

For Oracle Database Cloud Services targets, deploy the "Oracle GoldenGate for Oracle - Database Migrations" image from Oracle Cloud Marketplace.:

The "Database Migrations" version of the Oracle GoldenGate Marketplace image provides limited free licensing for use with OCI Database Migration Service. See the license agreement for details.

Any other use of GoldenGate requires purchasing a license for the Oracle GoldenGate product. See the Oracle GoldenGate documentation for more information.

- **1.** Log in to Oracle Cloud Marketplace.
- Search for the "Oracle GoldenGate for Oracle Database Migrations" Marketplace listing.
- 3. From the Marketplace search results, select the "Oracle GoldenGate for Oracle Database Migrations" listing.
- 4. For instructions to deploy the Marketplace listing, see Deploying Oracle GoldenGate Microservices on Oracle Cloud Marketplace.

If you are migrating to Exadata Cloud@Customer, or any on-premises Oracle Exadata Database Machine, you must use an on-premises Oracle GoldenGate Microservices instance to create a deployment for the source and target.

• If the source database is configured to use SSL/TLS:

If the source database is configured to use SSL/TLS, then ensure that the wallet containing certificates for TLS authentication is located in directory /u02/deployments/ deployment name/etc on the GoldenGate instance.

• If the target database is configured to use SSL/TLS:

Ensure that the wallet containing certificates for TLS authentication is located in the correct location on the GoldenGate instance, as follows:

- For an Autonomous Database, the wallet file should be located in directory /u02/ deployments/deployment name/etc/adb
- For a co-managed database, the wallet file should be located in directory /u02/ deployments/deployment_name/etc

Autonomous databases are always configured to use TLS.

Setting Logical Migration Parameters

Set the required logical migration response file parameters. Get the response file template, \$ZDM_HOME/rhp/zdm/template/zdm_logical_template.rsp, which is used to create your Zero Downtime Migration response file for the database migration procedure, and edit the file as described here.

The logical migration response file settings are described in detail in Zero Downtime Migration Logical Migration Response File Parameters Reference.

The following parameters are required for an offline or online logical migration:

- MIGRATION_METHOD: Set to ONLINE_LOGICAL for online migration with GoldenGate or OFFLINE LOGICAL for an offline Data Pump transfer.
- DATA TRANSFER MEDIUM: Set to

OSS for Object Storage bucket

NFS for a shared Network File System

DBLINK for a direct transfer using a database link

COPY to use secure copy

AMAZONS3 to use an Amazon S3 bucket (only applies to migrations from an AWS RDS source to Oracle Autonomous Database targets; see Migrating from Amazon Web Services RDS to Oracle Autonomous Database)

Unless you are using the default data transfer servers for handling the Data Pump dumps, you may also need to configure the data transfer node settings for the source and target database environments.

See Configuring the Transfer Medium and Specifying Transfer Nodes for details.

- For an offline logical migration of an Oracle Database 11g source to an 11g target, set DATAPUMPSETTINGS SECUREFILELOB=FALSE or you may get errors.
- Set the following target database parameters.
 - TARGETDATABASE OCID specifies the Oracle Cloud resource identifier.
 - For example:

ocid1. instance.oc1. phx. abuw4 ljrlsfiqw6 vzzxb43 vyypt4 pkodawglp3 wqxjqof akrwvou52 gb6 s5 a

See also https://docs.cloud.oracle.com/en-us/iaas/Content/General/Concepts/ identifiers.htm

- TARGETDATABASE_ADMINUSERNAME specifies the database administrator user name. For example, for a co-managed database migration user name as system and for an Autonomous Database migration user name as admin.
- Set the following source database parameters.
 - SOURCEDATABASE_ADMINUSERNAME specifies the database administrator user name. For example, user name as system.
 - SOURCEDATABASE_CONNECTIONDETAILS_HOST specifies the listener host name or IP address. In case of Oracle RAC, the SCAN name can be specified. (not required for Autonomous Database)
 - SOURCEDATABASE_CONNECTIONDETAILS_PORT specifies the listener port number. (not required for Autonomous Database)
 - SOURCEDATABASE_CONNECTIONDETAILS_SERVICENAME specifies the fully qualified service name. (not required for Autonomous Database)

For example: service_name.DB_domain

See also https://docs.cloud.oracle.com/en-us/iaas/Content/Database/Tasks/ connectingDB.htm

- For migrations from an AWS RDS source, see Migrating from Amazon Web Services RDS to Oracle Autonomous Database for additional parameter settings.
- Set the following OCIAUTHENTICATIONDETAILS parameters.

For more information about the required settings, see https:// docs.cloud.oracle.com/en-us/iaas/Content/API/Concepts/ apisigningkey.htm#RequiredKeysandOCIDs

 OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_TENANTID specifies the OCID of the OCI tenancy. You can find this value in the Console under Governance and Administration, Administration, Tenancy Details. The tenancy OCID is shown under Tenancy Information.

For example:

ocid1.tenancy.oc1..aaaaaaaaba3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfd sq

See also https://docs.cloud.oracle.com/en-us/iaas/Content/Identity/Tasks/ managingtenancy.htm

- OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_USERID specifies the OCID of the IAM user. You can find this value in the Console under Profile, User Settings.

See also https://docs.oracle.com/en-us/iaas/Content/Identity/Tasks/ managingusers.htm

- OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_FINGERPRINT specifies the fingerprint of the public API key.
- OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_PRIVATEKEYFILE specifies the absolute path of API private key file.
- OCIAUTHENTICATIONDETAILS REGIONID specifies the OCI region identifier.

See the Region Identifier column in the table at https://docs.cloud.oracle.com/en-us/ iaas/Content/General/Concepts/regions.htm

Oracle GoldenGate Settings

For online logical migrations, in addition to the above, you must also set the GoldenGate parameters, TARGETDATABASE_GGADMINUSERNAME, SOURCEDATABASE_GGADMINUSERNAME, SOURCECONTAINERDATABASE_GGADMINUSERNAME, and the parameters prefixed with GOLDENGATEHUB and GOLDENGATESETTINGS.

See Zero Downtime Migration Logical Migration Response File Parameters Reference for details about these parameters.

Oracle Data Pump Settings

Zero Downtime Migration automatically sets optimal defaults for Data Pump parameters to achieve better performance and ensure data security. If you need to further tune performance, there are several Data Pump settings that you can configure in the response file.

The default DATAPUMPSETTINGS_JOBMODE=SCHEMA is recommended for migrations to Autonomous Database.

See Default Data Pump Parameter Settings for Zero Downtime Migration for information about the default Data Pump property settings, how to select schemas or objects for inclusion or exclusion, and Data Pump error handling.

See Zero Downtime Migration Logical Migration Response File Parameters Reference for all of the Data Pump parameters you can set through Zero Downtime Migration.

See Migrating from Amazon Web Services RDS to Oracle Autonomous Database for information about setting Data Pump parameters for migration from AWS RDS.

Configuring the Transfer Medium and Specifying Transfer Nodes

Zero Downtime Migration offers various transfer options to make Oracle Data Pump dumps available to the target database server.

Using the DATA_TRANSFER_MEDIUM response file parameter you can configure the following data transfer methods:

• OSS: Oracle Cloud Object Storage.

Supported for all migration types and targets.

NFS: Network File System

Supported for offline migrations to co-managed target database only.

• DBLINK: Direct data transfer from the source to the target over a database link.

Supported for online and offline migrations to Autonomous Database Shared (Data Warehouse or Transaction Processing) and co-managed targets only.

• COPY: Transfer dumps to the target transfer node using secure copy.

Supported for offline migrations to co-managed target databases only.

- AMAZON3: Amazon S3 bucket
- Only applies to migrations from an AWS RDS source to an Oracle Autonomous Database target. See Migrating from Amazon Web Services RDS to Oracle Autonomous Database for more information.

Note:

To take advantage of parallelism and achieve the best data transfer performance, Oracle recommends that you transfer data using OSS or NFS for databases over 50GB in size. The DBLINK transfer medium can be convenient for smaller databases, but this choice may involve uncertainty in performance because of its dependence on network bandwidth for the duration of the transfer.

Once the export of dumps on the source is completed, the dumps are uploaded or transferred in parallel as defined by parameter DUMPTRANSFERDETAILS_PARALLELCOUNT (defaults to 3), and any transfer failures are retried by default as specified in the parameter DUMPTRANSFERDETAILS_RETRYCOUNT (defaults to 3).

The transfer of dumps can be done from any node at the source data center, provided that the dumps are accessible from the given node. It is crucial to ascertain the network connectivity and transfer workload impact on the source database server in order to decide which data transfer approach to take.

Direct Transfer from Source to Target

This option applies only to co-managed cloud target databases.

Zero Downtime Migration enables logical migration using direct transfer of the Data Pump dump from the source to the target securely. The data is copied over from the source database directory object path to the target database server directory object path, or to a target transfer node, using either secure copy or RSYNC. This avoids the data being transferred over a WAN or needing additional shared storage between the source and target environments. This capability greatly simplifies the logical migration within the data center.

About Transfer Nodes

You will configure a node, referred as a **transfer node**, for both the source data center and the target tenancy.

The response file parameters that are prefixed with

DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE designate the node that handles the export dumps at the source data center. This **source transfer node** defaults to the source database.

Similarly, the response file parameters that are prefixed with DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE designate the node that handles the import of dumps at the target. This **target transfer node** defaults to the target database, for comanaged targets.

Transfer Node Requirements

The source transfer node can be any of the following:

- Source database server (default)
- NAS mounted server
- Zero Downtime Migration service node

The target transfer node can be any of the following:

- Target Database server (default)
- NAS mounted server
- Zero Downtime Migration service node

For a server to be designated as transfer node, the following critical considerations are necessary.

- Availability of CPU and memory to process the upload or transfer workload
- · Connectivity to the specified upload or transfer target
 - Port 443 connectivity to Object Storage Service if the chosen data transfer medium is
 OSS
 - Port 22 connectivity to target storage server if the chosen transfer medium is COPY
- Availability of Oracle Cloud Infrastructure CLI. For speedier and resilient upload of dumps this is the recommended transfer utility for the OSS transfer medium.
- OCI CLI must be installed and configured as detailed in https://docs.oracle.com/en-us/ iaas/Content/API/SDKDocs/cliinstall.htm.

Installing and configuring OCI CLI on each source database server may not be feasible. In such cases, one of the nodes in the data center can be designated as a transfer node with OCI CLI configured, and this node can share a network storage path with the database servers for Data Pump dumps to be created. This also avoids the upload workload consuming additional CPU and memory on production database servers.

The designated transfer node can act as the gateway server at the data center for the external data transfer allowing transfer data traffic, thus avoiding the need to allow data transfer from the source database server or to the target database server.

Optionally, the additional transfer node requirement can be avoided by leveraging the Zero Downtime Migration server as the transfer node, provided that the Zero Downtime Migration service is placed in an on-premises data center and can meet the transfer node requirements listed above.

Using the Oracle Cloud Object Storage Transfer Medium

Object Storage data transfer medium is supported for all migration types and targets.

When using Object Storage as the data transfer medium, by setting DATA_TRANSFER_MEDIUM=OSS, it is recommended that dumps be uploaded using OCI CLI for faster and more secure and resilient uploads. You must configure OCI CLI in the upload node, and set parameter DUMPTRANSFERDETAILS_SOURCE_USEOCICLI to TRUE, the parameters for OCI CLI are

DUMPTRANSFERDETAILS SOURCE USEOCICLI

DUMPTRANSFERDETAILS SOURCE OCIHOME

Using the Database Link Transfer Medium

Supported for online and offline migrations to Autonomous Database Shared (Data Warehouse or Transaction Processing) and co-managed targets only.

When you set DATA_TRANSFER_MEDIUM=DBLINK, a database link is created from the OCI co-managed database or Autonomous Database target to the source database using the global name of the specified source database.

Zero Downtime Migration creates the database link if it does not already exist, and the link is cleaned once the Data Pump import phase is complete.

Using the NFS Transfer Medium

Supported for offline migrations to co-managed target database only.

The NFS mode of transfer is available, by setting DATA_TRANSFER_MEDIUM=NFS, for comanaged target databases that avoid the transfer of dumps. You should ensure that the specified path is accessible between the source and target database server path.

Zero Downtime Migration ensures the security of dumps in the shared storage by preserving the restricted permission on the dumps such that only the source and target database users are allowed to access the dump.

Using the Copy Transfer Medium

Supported for offline migrations to co-managed target databases only.

Dumps can be transferred from the source to the target securely, by setting DATA TRANSFER MEDIUM=COPY. The relevant parameters are as follows:

DUMPTRANSFERDETAILS TRANSFERTARGET USER

DUMPTRANSFERDETAILS TRANSFERTARGET USERKEY

DUMPTRANSFERDETAILS TRANSFERTARGET HOST

DUMPTRANSFERDETAILS TRANSFERTARGET SUDOPATH

DUMPTRANSFERDETAILS TRANSFERTARGET DUMPDIRPATH

You can leverage the RSYNC utility instead of SCP. Set DUMPTRANSFERDETAILS_RSYNCAVAILABLE to TRUE, and verify that RSYNC is available both at the source and target transfer nodes.

Default Data Pump Parameter Settings for Zero Downtime Migration

Zero Downtime Migration automatically sets optimal defaults for Data Pump parameters to achieve better performance and ensure security of data. The following table lists the Data Pump parameters set by Zero Downtime Migration, and the values they are set to.

If there is a Zero Downtime Migration response file parameter available to override the default, it is listed in the Optional Zero Downtime Migration Response File Parameter to Override column. The override parameters are set in the response file at \$ZDM HOME/rhp/zdm/template/zdm_logical_template.rsp.

Data Pump Parameter	Default Value	Optional ZDM Response File Parameter to Override
EXCLUDE	cluster (ADB-D, ADB-S) indextype (ADW-S) db_link (ADB) statistics (User managed Target and ADB)	Allows additional EXCLUDE entries to be specified. See EXCLUDEOBJECTS- <i>LIST_ELEMENT_NUMBER</i> for information. Note Specifying invalid object types for EXCLUDE will lead to a Data Pump export error. Ensure that a valid object type is specified for the DATAPUMPSETTINGS_DATAPUMP PARAMETERS_EXCLUDETYPELIS T parameter.
		To see a list of valid object types query the following views: DATABASE_EXPORT_OBJECTS fo FULL mode, SCHEMA_EXPORT_OBJECTS for SCHEMA mode, and TABLE_EXPORT_OBJECTS for TABLE and TABLESPACE mode. The values listed in the OBJECT_PATH column are the valid object types.
		For example, specifying the invalid object type parameter in the response file will lead to export error.
		ORA-39038: Object path " <specified invalid="">" is not supported for SCHEMA jobs.</specified>

Table 5-1 Data Pump Parameter Defaults

Data Pump Parameter	Default Value	Optional ZDM Response File Parameter to Override
PARALLEL	ZDM sets PARALLEL parameter by default as follows	DATAPUMPSETTINGS_DATAPU MPPARAMETERS_IMPORTPAR
	For User managed DB :- (Sum of (2 x (no. of physical CPU) per node)) with Max 32 cap. For ADB :- No. of OCPUs	ALLELISMDEGREE DATAPUMPSETTINGS_DATAPU MPPARAMETERS_EXPORTPA RALLELISMDEGREE
CLUSTER	ZDM always sets the Cluster mode as default	DATAPUMPSETTINGS_DATAPU MPPARAMETERS_NOCLUSTE R
COMPRESSION	COMPRESSION_ALGORITHM is set to BASIC(for 11.2) and MEDIUM (for 12.1+) COMPRESSION is set to ALL	N/A
ENCRYPTION	ENCRYPTION is set to ALL	N/A
	ENCRYPTION_ALGORITHM is set to AES128	
	ENCRYPTION_MODE is set to PASSWORD	
FILESIZE	FILESIZE is set to 5G	N/A
FLASHBACK_SCN	For OFFLINE_LOGICAL ZDM set FLASHBACK_TIME System time now.	N/A
	For ONLINE LOGICAL ZDM uses neither FLASHBACK_SCN not FLASHBACK_TIME	
REUSE_DUMPFILES	Always set to YES	N/A
TRANSFORM	Always sets OMIT_ENCRYPTION_CLAUSE: Y for 19c+ targets	Allows additional TRANSFORM to be specified
	Always sets LOB_STORAGE:SECUREFILE	
	For ADB target, following transform is set by default	
	SEGMENT_ATTRIBUTES:N	
	DWCS_CVT_IOTS:Y	
	CONSTRAINT_USE_DEFAULT_ INDEX:Y	
METRICS	Always set to Yes	N/A
LOGTIME	Always set to ALL	N/A

Table 5-1 (Cont.) Data Pump Parameter Defaults

Data Pump Parameter	Default Value	Optional ZDM Response File Parameter to Override
LOGFILE	Always set to Data Pump job name and created under specified export or import directory object.	N/A
	Say if Data Pump job is ZDM_2_DP_EXPORT_8417 and directory object used is DATA_PUMP_DIR, then the operation log is created by name ZDM_2_DP_EXPORT_8417.log under DATA_PUMP_DIR.	

Table 5-1 (Cont.) Data Pump Parameter Defaults

Setting Advanced Data Pump Parameters

You might want to select specific schemas to migrate, rename tablespaces, or include or exclude specific objects from the as part of a migration.

The following are example parameter settings you can use to specify these selections or changes when you set DATAPUMPSETTINGS_JOBMODE=FULL or DATAPUMPSETTINGS JOBMODE=SCHEMA job modes.

These parameters are set in the response file at $ZDM_HOME/rhp/zdm/template/zdm$ logical template.rsp.

To exclude specific object types

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_EXCLUDETYPELIST=COMMENT,DOMAIN_INDEX,MATERIA LIZED VIEW LOG,RLS POLICY,TRIGGER

To exclude select SCHEMA objects for DATAPUMPSETTINGS_JOBMODE=FULL mode:

```
DATAPUMPSETTINGS_METADATAFILTERS-1=name:NAME_EXPR,value:'NOT IN(''SYSMAN'')',objectType:SCHEMA
```

```
DATAPUMPSETTINGS_METADATAFILTERS-3=name:NAME_EXPR,value:'NOT IN(''SH'')',objectType:SCHEMA
```

Note:

The SCHEMA name SYSMAN is surrounded by two single quotes and not a double quote.

To exclude select SCHEMA objects for DATAPUMPSETTINGS_JOBMODE=SCHEMA mode:

EXCLUDEOBJECTS-1=owner:SYSMAN

```
EXCLUDEOBJECTS-2=owner:SCOTT
```

By default, Zero Downtime Migration ignores Oracle Maintained Objects.

To include select SCHEMA objects for DATAPUMPSETTINGS_JOBMODE=SCHEMA mode:

INCLUDEOBJECTS-1=owner:SYSMAN

INCLUDEOBJECTS-2=owner:SCOTT

By default, Zero Downtime Migration ignores Oracle Maintained Objects.

Specify Included and Excluded Objects with Special Characters

The following examples show you how to specify objects names that use special characters in the EXCLUDEOBJECTS and INCLUDEOBJECTS parameters.

 To escape a special character, use two slashes (//) before and after all characters in the string before the special character.

For example, to escape dollar sign (\$):

\\INLUDEOBJECTS-3= owner:GRAF MULTI\\\$ HR

 To match all characters in between prefix and suffix pattern, add a period and an asterisk (.*) where the matching should occur.

For example, to exclude all schemas starting with GRAF and ending with HR:

EXCLUDEOBJECTS-3= owner:GRAF.*HR

To REMAP the tablespaces:

```
DATAPUMPSETTINGS_METADATAREMAPS-1=type:REMAP_TABLESPACE,oldValue:TS_DATA_X,newValue:DATA
```

```
DATAPUMPSETTINGS_METADATAREMAPS-2=type:REMAP_TABLESPACE,oldValue:DBS,newValue:DATA
```

Data Pump Error Handling

Some errors are ignored by Zero Downtime Migration. You must review any remaining errors appearing in the Data Pump log.

The following Data Pump errors are ignored by Zero Downtime Migration.

- ORA-31684: XXXX already exists
- ORA-39111: Dependent object type XXXX skipped, base object type
- ORA-39082: Object type ALTER_PROCEDURE: XXXX created with compilation warnings

Ensure that you clear all Cloud Premigration Advisor Tool (CPAT) reported errors to avoid any underlying Data Pump errors.

Automatic Tablespace Creation

For logical migrations, Zero Downtime Migration can automatically discover the source database tablespaces associated with user schemas that are being migrated, and automatically create them in the target database before the Data Pump import phase.

Zero Downtime Migration generates the DDL required to pre-create the tablespaces, creates the tablespaces on the target, and runs the generated DDL.

With automatic creation enabled, Zero Downtime Migration skips automatic creation for any tablespaces that are specified in the REMAP section in the response file, or that already exist in the target database.

Zero Downtime Migration validates whether tablespace creation is supported on the given target. There are no limitations for co-managed database systems. If the target is an Autonomous Database system, the following limitations apply:

- Autonomous Database systems support only BIGFILE tablespaces, so Zero Downtime Migration enforces BIGFILE tablespace by default on Autonomous Database targets, and reports an error if SMALLFILE tablespaces are found. You can remap any SMALLFILE tablespaces instead.
- Autonomous Database Shared systems do not support the automatic creation of tablespaces.

Use the following response file parameters to automatically create the required tablespaces at target database.

- TABLESPACEDETAILS AUTOCREATE enables automatic tablespace creation.
- TABLESPACEDETAILS_USEBIGFILE allows you to convert SMALLFILE tablespaces to BIGFILE tablespaces. Normally set to FALSE by default, Zero Downtime Migration enforces TRUE for Autonomous Database targets.
- TABLESPACEDETAILS_EXTENTSIZEMB enables tablespaces to AUTOEXTEND to avoid extend errors, with a default NEXT EXTENT size of 500MB.
- TABLESPACEDETAILS_EXCLUDE specifies tablespaces to be excluded from automatic creation at the target database during import of user schemas. By default 'SYSTEM', 'SYSAUX', 'USERS' tablespaces are excluded.

Automatic Tablespace Remap

For logical migrations, Zero Downtime Migration can automatically remap tablespaces on the source database to a specified tablespace on the target database.

Zero Downtime Migration automatically discovers the source database tablespaces necessary for migration. With automatic remap enabled, Zero Downtime Migration discovers the source tablespaces that require remapping by excluding any tablespaces that meet the following conditions:

- Specified for remap in DATAPUMPSETTINGS METADATAREMAPS
- Specified for exclude in TABLESPACEDETAILS_EXCLUDE
- Tablespaces with the same name that already exist on the target database

Use the following response file parameters to automatically remap the required tablespaces.

- TABLESPACEDETAILS AUTOREMAP enables automatic tablespace remap.
- TABLESPACEDETAILS_REMAPTARGET specifies the name of the tablespace on the target database to which to remap the tablespace on the source database. The default value is DATA.

Verifying Tablespace Remaps

Run command ZDMCLI migrate database in evaluation mode (-eval) to ensure that all necessary tablespaces to be remapped are listed. If any tablespaces are missed, you remap them using the DATAPUMPSETTINGS METADATAREMAPS parameter.

Note:

For a tablespace to be used as REMAP target, the user performing the import operation, for example, SYSTEM, should have some quota on the chosen tablespace.

Performance Considerations

There is operational overhead involved in tablespace remapping that adds to the overall Data Pump import time. To optimize performance, review and drop unwanted tablespaces from the source database to minimize the number of remapped tablespaces. For more information, see the REMAP_* section in What DataPump And Oracle RDBMS Parameters And Features Can Significantly Affect DataPump Performance ? (Doc ID 1611373.1).

Migrating to Oracle Autonomous Database on Exadata Cloud@Customer

Zero Downtime Migration supports migrations to Oracle Autonomous Database on Exadata Cloud@Customer from any on-premises Oracle Database, including existing Exadata Cloud@Customer systems, using the offline logical migration method and NFS as a data transfer medium.

Supported Use Cases

The following migration scenarios are supported by Zero Downtime Migration:

- Exadata Cloud@Customer (Gen 1 or Gen 2) source to Oracle Autonomous Database on Exadata Cloud@Customer target (given that the source and target databases have the same standard UID/GID for the Oracle user)
- On-premises Oracle Database source to Oracle Autonomous Database on Exadata Cloud@Customer target (given that the source database has a nonstandard UID/GID for the Oracle user)

Migration Parameters

In addition to the required source and target connection parameters, set the following in the logical migration response file:

MIGRATION METHOD=OFFLINE LOGICAL

DATA TRANSFER MEDIUM=NFS

Source Prerequisites

In addition to the usual source database prerequisites documented in Source Database Prerequisites for Logical Migration, you must also set up access to the Data Pump dump directory as detailed in the procedures below.

Prerequisite Setup for Exadata Cloud@Customer Environments

1. In all Oracle RAC nodes:

```
[root@onprem ~]# cat /etc/fstab | grep nfsshare
nas-server.us.com:/scratch/nfsshare /u02/app/oracle/mount nfs defaults 0 0
[root@onprem ~]#
```

2. On the Autonomous Database target, mount the path

nas-server.us.com:/scratch/nfsshare

to the Exadata infrastructure resource, giving you

specified mount path/CDB/PDB GUID

For example:

/scratch/nfsshare/CDB/PDB_GUID

For information about the option to mount NFS, contact support for details.

3. On the source PDB, run the following:

```
SQL> create or replace directory DATA_PUMP_DIR_ADBCC as '/u02/app/oracle/
mount/CDB/PDB_GUID';
```

Directory created.

```
SQL> select grantee from all_tab_privs where table_name =
'DATA PUMP DIR ADBCC';
```

no rows selected

SQL> grant read, write on directory DATA_PUMP_DIR_ADBCC to SYSTEM;

Grant succeeded.

4. On the source, mount point permissions expected (drwxr-x---)

```
[oracle@onprem opc]$ ls -ldrt /u02/app/oracle/mount/CDB/PDB_GUID
drwxr-x--- 2 oracle asmadmin 4096 Jul 12 11:34 /u02/app/oracle/mount/CDB/
PDB_GUID
[oracle@onprem opc]$
```

Prerequisite Setup for On-Premises Environments

1. In all Oracle RAC nodes:

```
[root@onprem ~]# cat /etc/fstab | grep nfsshare
nas-server.us.com:/scratch/nfsshare /u02/app/oracle/mount nfs defaults 0 0
[root@onprem ~]#
```

2. Create a group with GID 1001 - miggrp

root> groupadd -g 1001 miggrp

3. Add the database user to this group.

```
root> usermod -aG migrp oracle
```

 On the Autonomous Database target, mount the NFS share (Group should get rwx)

nas-server.us.com:/scratch/nfsshare

to the Exadata infrastructure resource, giving you

specified mount path/CDB/PDB GUID

For example:

/scratch/nfsshare/CDB/PDB_GUID

For information about the option to mount NFS, contact support for details.

5. Ensure that the directory is writable.

Touch specified_mount_path/CDB/PDB_GUID/test.txt

6. In the source PDB, run the following:

SQL> create or replace directory DATA_PUMP_DIR_ADBCC as '/u02/app/ oracle/mount/CDB/PDB GUID';

Directory created.

SQL> select grantee from all_tab_privs where table_name =
'DATA PUMP DIR ADBCC';

no rows selected

SQL> grant read, write on directory DATA PUMP DIR ADBCC to SYSTEM;

Grant succeeded.

7. On the source, mount point permission expected (drwxrwx-), and the group should match the migration dummy group created.

6 Customizing a Migration Job

You can customize the Zero Downtime Migration work flow with scripts which can be run at the beginning or end of a specified migration job phase. In Zero Downtime Migration, these customizations are called **custom plug-ins with user actions**.

The following topics describe how to customize a migration job.

About Custom Plug-ins with User Actions

In Zero Downtime Migration, a custom script, or bundle of scripts, that you want to plug in and run as part of a migration job is called a **custom plug-in with user action**.

A custom plug-in with user action, which is also referred to as a **user action**, is associated with an operational phase in the migration job and can be run before the phase or after it.

A **pre-action** is a user action performed at the beginning of the associated phase. Likewise, a **post-action** is performed at the end of the associated phase.

Once a user action is associated with a migration phase, Zero Downtime Migration copies it to the respective node (for non-Autonomous Databases) and run the user action locally. Zero Downtime Migration supplies the user action script execution with a set of parameters for developers to use the DBNAME, DBHOME, DB SCAN and ZDM log locations, and many more parameters.

For Autonomous Database, Zero Downtime Migration allows SQL to be registered as a user action and executes the SQL in an Autonomous Database instance from the Zero Downtime Migration server through a JDBC connection.

Parameters Supplied for Custom Plug-ins with User Actions

At run time, Zero Downtime Migration invokes the user action script and supplies it with set of auto-populated ENV variables that can be used to program the logic.

These variables are supplied as ENV variables with values so you can program the custom plug-in using these values.

For example, the value of ZDM_SRCDBHOME specifies the database home associated with the current migration job source database, and similarly SRC_SCAN_NAME indicates the scan listener information for the source database that you can use to connect to the database.

The following is a listing of the user action parameters with expected values. See the footnotes for more details.

```
RHP_OPTYPE=MIGRATE_DATABASE
RHP_PHASE=PRE
ZDM_SRCDB=src_db_name
ZDM_SRCDBHOME=src_db_home
ZDM_TARGETDB=tgt_db_name
ZDM_TARGETDBHOME=tgt_db_home
```

```
RHP_PROGRESSLISTENERHOST=zdm_node_name

RHP_PROGRESSLISTENERPORT=zdm_progress_listener_port

LOG_PATH=src/tgt_zdm_log_path<sup>1</sup>

SRC_SCAN_NAME=src_scan_name

SRC_SCAN_PORT=src_scan_port

TGT_SCAN_PORT=tgt_scan_name

TGT_SCAN_PORT=tgt_scan_port

RHP_USERACTIONDATA=user_action_data<sup>2</sup>

RHP_OP_PHASE=current_job_phase<sup>3</sup>

RHP_UA_CHAIN_LIST=list_of_useractions<sup>4</sup>
```

¹LOG_PATH specifies the source or target node Zero Downtime Migration log path for the custom plug-in to store any log files for future reference.

 2 RHP_USERACTIONDATA specifies the useraction argument that was specified in zdmcli migrate database command option -useractiondata user action data

³RHP_OP_PHASE specifies the current phase of the migration job, for example, ZDM VALIDATE SRC.

⁴RHP_UA_CHAIN_LIST is passed to every user action execution call. This parameter holds the list of user actions chained to the executing user action. Chained user actions are the user actions whose output will be supplied to the executing user action.

User Action Scripts

You can use the following example user action scripts to help you create your own scripts.

For an on-premises source and Cloud target with node access, Zero Downtime Migration requires that the user action be a script. The script file is copied over to the respective node and is executed locally.

For Autonomous Database targets, Zero Downtime Migration requires that the user action script be a SQL file (.sql), which is executed in the Autonomous Database target using a JDBC connection.

Example 6-1 action.sh

Shown here is a sample user action script that discovers the supplied parameters.

```
#!/bin/sh
for var in $@
do
if [[ ${var} == *"ZDM_SRCDB="* ]]
then
IFS='=' read -ra DBARR <<< "${var}"
SRCDBNAME=${DBARR[1]}
fi
if [[ ${var} == *"ZDM_TARGETDB="* ]]
then
IFS='=' read -ra DBARR <<< "${var}"
TARGETDBNAME=${DBARR[1]}
fi
if [[ $var == *"ZDM_SRCDBHOME="* ]]</pre>
```

```
then
    IFS='=' read -ra PATHARR <<< "$var"
    SRCDBHOME=${PATHARR[1]}
    fi
   if [[ $var == *"ZDM TARGETDBHOME="* ]]
    then
    IFS='=' read -ra PATHARR <<< "$var"
   TARGETDBHOME=$ { PATHARR [1] }
    fi
    if [[ $var == *"RHP OP PHASE="* ]]
    then
    IFS='=' read -ra PHASEARR <<< "$var"
   ZDMPHASE=${PHASEARR[1]}
    fi
   if [[ $var == *"eval"* ]]
   then
    IFS='=' read -ra PATHARR <<< "$var"
   EVALRUN=${PATHARR[1]}
   fi
   if [[ $var == *"LOG PATH"* ]]
    then
   IFS='=' read -ra PATHARR <<< "$var"
   LOGPATH=${PATHARR[1]}
    fi
    done
    echo "`date` Starting CUSTOM USERACTION" >> $LOG PATH/
CUSTOM USERACTION.log
```

```
echo $@ >> $LOG_PATH/CUSTOM_USERACTION.log
```

Example 6-2 Running SQL*Plus in a user action

```
#!/bin/sh
```

```
for var in $@
do
if [[ ${var} == *"ZDM SRCDB="* ]]
then
IFS='=' read -ra DBARR <<< "${var}"</pre>
SRCDBNAME=${DBARR[1]}
fi
if [[ ${var} == *"ZDM_TARGETDB="* ]]
then
IFS='=' read -ra DBARR <<< "${var}"</pre>
TARGETDBNAME=$ { DBARR [ 1 ] }
fi
if [[ $var == *"ZDM SRCDBHOME="* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
SRCDBHOME=$ { PATHARR [1] }
fi
if [[ $var == *"ZDM TARGETDBHOME="* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
```

```
TARGETDBHOME=$ { PATHARR [1] }
fi
if [[ $var == *"RHP OP PHASE="* ]]
then
IFS='=' read -ra PHASEARR <<< "$var"
ZDMPHASE=${PHASEARR[1]}
fi
if [[ $var == *"eval"* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
EVALRUN=${PATHARR[1]}
fi
if [[ $var == *"LOG PATH"* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
LOGPATH=${PATHARR[1]}
fi
done
    check dv staus()
    {
        export ORACLE HOME=${2}
        export PATH=$ORACLE HOME/bin:$PATH
        export LOGFILE=$3
        export currenthostname=`hostname -a` >> $LOGFILE
        echo "Current DB Host=$currenthostname" >> $LOGFILE
        CURRENTNODE=`srvctl status database -db ${1} |
grep $currenthostname | cut -d" " -f2` >> $LOGFILE
        SQLRETURN=$?
        echo "Curent DB Node=${CURRENTNODE}" >> $LOGFILE
        if [ "$SQLRETURN" -ne "0" ]; then
            return 1
        fi
        export ORACLE SID=${CURRENTNODE}
        echo "`date` Checking Database Vault Status" >> $LOGFILE
        $ORACLE HOME/bin/sqlplus -s / as sysdba 2>> $LOGFILE << EOF</pre>
> /dev/null
        whenever sqlerror exit 1
        SET PAGESIZE 60
        SET LINESIZE 1300
        SET VERIFY OFF TRIMSPOOL ON HEADING OFF TERMOUT OFF
FEEDBACK OFF
        spool ${LOGFILE} append;
        SELECT 'Check Status : '||PARAMETER FROM V\$OPTION WHERE
PARAMETER = 'Oracle Database Vault' AND VALUE='TRUE';
        SELECT 'Check Grant : '||GRANTED ROLE from dba role privs
where GRANTED ROLE in ('DV PATCH ADMIN') and grantee='SYS';
        select distinct ('Check TDE enabled ' || ENCRYPTED) from
dba tablespaces where ENCRYPTED='YES';
        spool off
        EOF
        SQLRETURN=$?
        if [ "$SQLRETURN" -ne "0" ]; then
            return 1
```

```
fi
        if grep -g "Check Status : Oracle Database Vault" $LOGFILE;
        then
            echo "`date`:$ORACLE SID:Database Vault is enabled " >> $LOGFILE
        if grep -q "Check Grant : DV PATCH ADMIN" $LOGFILE;
        then
            return 3 # sys privs already granted
        else
            return 4 # sys privs are not granted
        fi
        else
           echo "`date`:$ORACLE SID: DV is not enabled" >> $LOGFILE
        return 2
        fi
    }
if [[ $ZDMPHASE == "ZDM VALIDATE SRC" || $ZDMPHASE == "ZDM VALIDATE TGT" ]]
then
 export LOGFILE=$LOG PATH/${SRCDBNAME} ${ZDMPHASE} datavault.log
 echo "`date` Start User Action for Phase: $ZDMPHASE " > $LOGFILE
 echo $@ >> $LOGFILE
 check dv staus $SRCDBNAME $SRCDBHOME $LOGFILE
 CHECKDV STATUS RETURN CODE=$?
 if [ "$CHECKDV STATUS RETURN CODE" -eq "1" ]; then
 echo "`date`:${SRCDBNAME}:Unable to check DataVault status" >> $LOGFILE
 exit 1
 fi
 if [ "$CHECKDV STATUS RETURN CODE" -eq "2" ]; then
   echo "`date`:${SRCDBNAME}:DataVault is not enabled " >> $LOGFILE
   exit 0
 fi
 if [ "$CHECKDV STATUS RETURN CODE" -eq "3" ];
  then
    echo "`date`:${SRCDBNAME}:Database Vault SYS privileges granted"
>> $LOGFILE
    exit 0
  fi
```

Example 6-3 Action file archive extractor action_extract.sh

If you bundle more than one user action into an action file, as described in Registering User Actions, you must also supply a script that unzips the action file, as shown in this example.

```
#!/bin/sh
MKDIR=/bin/mkdir
DATE=/bin/date
UNZIP=/usr/bin/unzip
#get the current location, extract path from it and then from the same
directory perform unzip to /tmp directory
script_path=$0
script_dir=${script_path%/*}
timestamp=$($DATE +%s)
```

```
unzip_dir=/tmp/rhp_${timestamp}
$MKDIR $unzip_dir
$UNZIP ${script_dir}/pack.zip -d $unzip_dir
```

```
echo "/bin/sh ${unzip_dir}/pack/main.sh $@"
/bin/sh ${unzip_dir}/pack/main.sh "$@"
```

Once the archive is extracted, action_extract.sh runs main.sh, which in turn runs any user action scripts.

```
#!/bin/sh
script_path=$0
script_dir=${script_path%/*}
#extract args and execute all scripts
echo "/bin/sh ${script_dir}/wc_add_pre.sh $@"
/bin/sh ${script_dir}/wc_add_pre.sh "$@"
```

action_phase_pre.sh

```
#!/bin/sh
touch /tmp/SAMPLE_PRE_OUT.txt;
echo $* >> /tmp/SAMPLE PRE_OUT.txt;
```

Registering User Actions

User actions must be registered with the Zero Downtime Migration service host to be plugged in as customizations for a particular operational phase.

Use the Zero Downtime Migration software installed user (for example, zmduser) to add user actions to a database migration job.

The ZDMCLI command add useraction registers a custom action script. The user action script, and any work flow options specified for when to run it, are copied to the Zero Downtime Migration metadata.

In the add useraction command, specify the following options.

-useraction user_action_name (required)

Assign the user action a name.

-actionscript script_name (required)

Provide the full path and script file name, for example, /home/zdmuser/useract.sh.

-optype MIGRATE_DATABASE (required)

Define the operation for which the user action is configured as MIGRATE DATABASE.

-phase

To run the script at the proper phase of the migration job work flow, specify the migration job phase that the action must be associated with. You can register custom plug-ins for phases after ZDM SETUP TGT in the migration job work flow.

See Zero Downtime Migration Process Phases

-pre and -post

Indicate whether the user action should run before or after the specified phase.

-onerror

You can specify a behavior if the user action encounters an error at runtime, which you can set to either ABORT, to end the process, or CONTINUE, to continue the migration job even if the custom plug-in exits with an error.

The following example shows you how to add user actions <code>zdmvaltgt</code> and <code>zdmvalsrc</code>.

```
zdmuser> $ZDM_HOME/bin/zdmcli add useraction
-useraction zdmvaltgt
-actionscript /home/zdmuser/useract.sh
-optype MIGRATE_DATABASE
-phase ZDM_VALIDATE_TGT
-pre
-onerror ABORT
zdmuser> $ZDM_HOME/bin/zdmcli add useraction
-useraction zdmvalsrc
-actionscript /home/zdmuser/useract1.sh
-optype MIGRATE_DATABASE
-phase ZDM_VALIDATE_SRC
-pre
-onerror CONTINUE
```

In the above commands, the scripts <code>useract.sh</code> and <code>useract1.sh</code>, specified in the <code>-</code> <code>actionscript</code> option, are copied to the Zero Downtime Migration service host repository meta data, and they are run if they are associated with any migration job run using an action template.

Running Multiple Scripts in One Action

If you need to run multiple scripts as a single user action, all of the action scripts can be bundled as an **action file** archive and supplied along with an action script, as shown in the following example. The action script should unzip the action file and invoke the scripts within.

```
zdmuser> $ZDM_HOME/bin/zdmcli add useraction
-useraction reconfigure_services
-actionscript /home/zdmuser/action_extract.sh
-actionfile /home/zdmuser/pack.zip
-optype MIGRATE_DATABASE
-phase ZDM_RECOVER_TGT
-post
-onerror ABORT
```

For example scripts and script requirements, see User Action Scripts.

For information about other options you can use with the ZDMCLI command ${\tt add}\ {\tt useraction}$ see add useraction

Creating an Action Template

After the useraction plug-ins are registered, you create an action template that combines a set of action plug-ins which can be associated with a migration job.

An action template is created using the ZDMCLI command add imagetype, where the image type, imagetype, is a bundle of all of the useractions required for a specific type of database migration. Create an image type that associates all of the useraction plug-ins needed for the migration of the database. Once created, the image type can be reused for all migration operations for which the same set of plug-ins are needed.

The base type for the image type created here must be CUSTOM_PLUGIN, as shown in the example below.

For example, you can create an image type ACTION_ZDM that bundles both of the useractions created in the previous example, zdmvalsrc and zdmvaltgt.

zdmuser> \$ZDM_HOME/bin/zdmcli add imagetype -imagetype ACTION_ZDM basetype CUSTOM_PLUGIN -useractions zdmvalsrc,zdmvaltgt

Associating an Action Template with a Migration Job

When you run a migration job you can specify the image type that specifies the plugins to be run as part of your migration job.

As an example, run the migration command specifying the action template ACTION_ZDM created in previous examples, -imagetype ACTION_ZDM, including the image type results in running the useract.sh and useract1.sh scripts as part of the migration job workflow.

By default, the action plug-ins are run for the specified operational phase on <u>all nodes</u> of the cluster. If the access credential specified in the migration command option – tgtarg2 is unique for a specified target node, then an additional auth argument should be included to specify the auth credentials required to access the other cluster nodes. For example, specify -tgtarg2

nataddrfile:auth_file_with_node_and_identity_file_mapping.

A typical nataddrfile for a 2 node cluster with node1 and node2 is shown here.

```
node1:node1:identity_file_path_available_on_zdmservice_node
node2:node2:identity_file_path_available_on_zdmservice_node
```

Querying Action Plug-ins

You can query action plug-ins registered with the Zero Downtime Migration service host.

To display the configuration of a user action:

```
zdmuser> $ZDM_HOME/bin/zdmcli query useraction -useraction user_action_name
```

See query useraction for usage information.

Updating Action Plug-ins

You can update a registered Zero Downtime Migration user action plug-in configuration.

The following example shows you how to modify the user action <code>zdmvalsrc</code> to run the user action script after phase <code>ZDM_VALIDATE_SRC</code> instead of before it.

```
zdmuser> $ZDM_HOME/bin/zdmcli modify useraction
-useraction zdmvalsrc
-phase ZDM_VALIDATE_SRC
-optype MIGRATE_DATABASE
-post
```

This change is propagated to all of the associated action templates, so you do not need to update the action templates.

To modify a user action script and update the user action, follow the instructions in Modifying User Action Scripts.

Modifying User Action Scripts

You can edit a user action script locally and use the ZDMCLI command modify useraction to update the script in the user action metadata.

1. If you do not have a local copy of the script, you can locate the cached user action script in the user action metadata using the ZDMCLI command query useraction.

```
zdmuser> $ZDM_HOME/bin/zdmcli query useraction
-useraction zdmvalsrc
```

The full base path to the script is displayed.

Note:

Do not directly modify the script in the location shown in the command output.

- 2. Copy the script to a temporary location and edit it.
- 3. Update the script in the user action metadata using the ZDMCLI command modify useraction.

```
zdmuser> $ZDM_HOME/bin/zdmcli modify useraction
-useraction zdmvalsrc
-actionscript /home/zdmuser/useract1.sh
```

Chained User Action Output

You can get data from one or more user actions and use that data to run another user action. For example, you can perform an action on the source database and use that data to perform an action on the target database.

When adding a user action, you can use the -outputfrom option to provide the list of user actions whose output will be supplied to the user action being added.

In the following example there are two user actions already registered in Zero Downtime Migration, USERAC1 and USERAC2, both of which generate some output. This output can be used by a third user action, USERAC3, by listing them with the – outputfrom option, as shown here.

```
$ZDM_HOME/bin/zdmcli add useraction
-useraction USERAC3
-actionscript useractionscript.sh
-outputfrom USERAC1,USERAC2
```

Accessing the Data

The output file is copied to the same location where the useraction file runs from, so the content of the output file can be accessed from the same location.

On an Autonomous Database system:

To access the output file in an Autonomous Database system user action SQL script, use

@:ACTION OUTPUT DIR/useraction name.out

Note that ACTION_OUTPUT_DIR indicates the directory where outputs will be stored, and @ will replace this variable with the actual directory path.

For example, to use output from the get_ddl1 user action, specify

@:ACTION_OUTPUT_DIR/get_ddl1.out;.

On a Co-Managed database system:

To access the output file in a user action script run on a co-managed database system, use

OUTPUTFILE=\$CURR DIR/useraction name.out;.

Where CURR_DIR is the current directory where the target user action file and the output from the other user actions are placed.

For example, to use output from the get_ddl1 user action, specify

OUTPUTFILE=\$CURR DIR/get ddl1.out;.

The user action script must also contain the parameter RHP_UA_CHAIN_LIST which gives the list of chained user action names.

Example User Actions in an Autonomous Database Migration

The following example shows how to get DDL output from the source database, and runs it on the target database.

User action get ddl1 runs on the source database and generates DDL output.

```
$ZDM_HOME/bin/zdmcli add useraction
-useraction get_ddl1
-phase ZDM_VALIDATE_SRC
-pre
-optype MIGRATE_DATABASE
-runscope ONENODE
-onerror ABORT
-actionscript /home/useraction1.sh
```

User action table_fromddl runs on the target database, and uses the output from user action get ddl1.

```
$ZDM_HOME/bin/zdmcli add useraction
-useraction table_fromddl
-phase ZDM_VALIDATE_TGT
-pre
-optype MIGRATE_DATABASE
-runscope ONENODE
-onerror ABORT
-actionscript /home/useraction2.sh
-outputfrom get ddl1
```

Adding both user actions to an imagetype:

```
$ZDM_HOME/bin/zdmcli add imagetype
-imagetype OUTPUTIMG1
-basetype CUSTOM_PLUGIN
-useractions get ddl1,table fromddl
```

Content of useraction1.sh:

#!/bin/sh

```
for var in $@
do
if [[ $var == *"ZDM_SRCDBHOME="* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
SRCDBHOME=${PATHARR[1]}
fi
if [[ $var == *"LOG_PATH"* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
LOGPATH=${PATHARR[1]}
fi
done</pre>
```

```
echo $SRCDBHOME;
ORACLE HOME=$SRCDBHOME;
export ORACLE HOME;
ORACLE SID=zdm1121;
export ORACLE SID;
export TMPLOG=/tmp/tmptmp.log;
true>$TMPLOG;
export PATH=$ORACLE HOME/bin:$PATH
#echo "home is $ORACLE HOME";
$ORACLE HOME/bin/sqlplus -s / as sysdba 2>> $TMPLOG << EOF > /tmp/
testlog
whenever sqlerror exit 1
SET PAGESIZE 60
SET LINESIZE 1300
SET VERIFY OFF TRIMSPOOL ON HEADING OFF TERMOUT OFF FEEDBACK OFF
spool ${TMPLOG} append;
select dbms metadata.get ddl('TABLE', 'TEST1') from DUAL;
spool off
EOF
SQLRETURN=$?
if [ "$SQLRETURN" -ne "0" ]; then
echo "Failed to run $SQLRETURN";
fi
sed -i 's/PCTFREE 10 PCTU//g' $TMPLOG;
echo "$(cat $TMPLOG)";
```

Content of useraction2.sh:

```
select name from v$database;
@:ACTION_OUTPUT_DIR/ZDM_VALIDATE_SRC_PRE_get_ddl1.out;
select name from v$database;
```

Example User Actions in a Co-Managed Database Migration

For this example, the add useraction and add imagetype commands are same as above in the Autonomous Database use case, but the script contents are different.

Content of useraction1.sh

```
#!/bin/sh
```

```
for var in $@
do
if [[ $var == *"ZDM_SRCDBHOME="* ]]
then
IFS='=' read -ra PATHARR <<< "$var"
SRCDBHOME=${PATHARR[1]}
fi
done</pre>
```

#SELECT 'NAME: '|| NAME FROM V\\$DATABASE;

7 Migrating Your Database with Zero Downtime Migration

Evaluate the database migration job, run the job, and perform other operations during and after a database migration.

See the Zero Downtime Migration Release Notes for the latest information about known issues, My Oracle Support notes, and runbooks.

Evaluate the Migration Job

Zero Downtime Migration provides options and tools for evaluating the migration job before you run it against the production database.

Ensure that you have met all of the prerequisites and completed the required preparations described in Preparing for a Physical Database Migration before you begin the migration procedures in this topic.

In addition be sure the following tasks are done:

Obtain the necessary access credentials required.

If Oracle Cloud Infrastructure Object Storage is used as the backup medium, obtain the Object Storage access credential. The user ID for the Oracle Cloud Infrastructure Console user and an auth token for Object Storage is required. If you are not using an existing auth token, a new auth token can be generated using the Oracle Cloud Infrastructure Console.

If the source database server is accessed with the root user, then you need the root user password. If the source and target database serves are accessed with a private key file, then you need the private key file. The SYS password for the source database environment is also required.

If Zero Data Loss Recovery Appliance is used as the backup medium, get the Zero Data Loss Recovery Appliance virtual private catalog (VPC) user credentials.

• Prepare the Zero Downtime Migration response file.

The database migration is driven by a response file that captures the essential parameters for accomplishing the task.

Use the sample RSP templates in <code>\$ZDM_HOME/rhp/zdm/template/</code> file for example entries needed to set up the response file for your particular source, target, and backup environments.

The ZDMCLI migrate database command has options to let you test the migration before you run it in production. The options are highlighted in the following syntax examples.

ZDMCLI migrate database syntax for an Autonomous Database migration:

zdmuser> \$ZDM_HOME/bin/zdmcli migrate database
-rsp file_path
-sourcedb source db unique name value

```
-sourcenode host
-srcauth zdmauth
-srcarg1 user:username
-srcarg2 identity_file:ssh_key_path
-srcarg3 sudo_location:sudo_path
-eval [-advisor [-ignoreadvisor] | -skipadvisor]]
```

ZDMCLI migrate database syntax for a co-managed database migration:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-rsp file_path
-sourcedb source_db_unique_name_value
-sourcenode host
-srcauth zdmauth
-srcarg1 user:username
-srcarg2 identity_file:ssh_key_path
-srcarg3 sudo_location:sudo_path
-targetnode host
-tgtauth zdmauth
-tgtarg1 user:username
-tgtarg2 identity_file:ssh_key_path
-tgtarg3 sudo_location:sudo_path
-tgtarg3 sudo_location:sudo_path
-eval [-advisor [-ignoreadvisor] | -skipadvisor]]
```

See the following topics for information about using the ZDMCLI migrate database options to evaluate your migration.

Using the ZDMCLI MIGRATE DATABASE -eval Option

Before submitting the database migration job for the production database, perform a test migration to determine how the process might fare with your configuration and settings.

It is highly recommended that for each migration job, you first run migrate database in evaluation mode. Evaluation mode allows you to correct any potential problems in the setup and configuration before performing the actual migration on a production database.

In evaluation mode, the migration process runs without effecting the changes. It is safe to run a migration job in evaluation mode as many times as needed before running the actual migration job.

The migrate database output indicates the migration job ID, which you can use to query the status of the job.

To run an evaluation of the migration job, run the ZDMCLI command migrate database with the -eval option, as shown in the following example.

Log in to the Zero Downtime Migration service host and switch to the zdmuser installed user.

su - zdmuser

If connectivity to the source database server is done through root credentials then the command would be the following:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb
source_db_unique_name_value
-sourcenode source_database_server_name -srcroot
-targetnode target_database_server_name
-backupuser Object_store_login_user_name
-rsp response_file_location
-tgtauth zdmauth
-tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:ZDM_installed_user_private_key_file_location
-tgtarg3 sudo location:/usr/bin/sudo -eval
```

For the prompts, specify the source database SYS password and the source database server root user password. If the backup destination is Object Store (Bucket), then specify user swift authentication token. If the backup destination is Storage Classic (Container) then specify your tenancy login password.

For example,

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb zdmsdb -sourcenode
ocicdb1
-srcroot -targetnode ocidb1 -backupuser backup_user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm_template_zdmsdb.rsp -tgtauth
zdmauth
-tgtarg1 user:opc -tgtarg2 identity_file:/home/zdmuser/.ssh/
zdm_service_host.ppk -tgtarg3
sudo_location:/usr/bin/sudo -eval
```

Enter source database zdmsdb SYS password: Enter source user "root" password: Enter user "backup user@example.com" password:

If connectivity to the source database server is through SSH key, then the command would be:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb
source_db_unique_name_value
-sourcenode source_database_server_name -srcauth zdmauth
-srcarg1 user:source_database_server_login_user_name
-srcarg2 identity_file:ZDM_installed_user_private_key_file_location
-srcarg3 sudo_location:/usr/bin/sudo -targetnode target_database_server_name
-backupuser Object_store_login_user_name -rsp response_file_location
-tgtauth zdmauth -tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:ZDM_installed_user_private_key_file_location
-tgtarg3 sudo location:/usr/bin/sudo -eval
```

For the prompts, specify the source database SYS password. If the backup destination is Object Store (Bucket), then specify user swift authentication token. If the backup destination is Storage Classic (Container), then specify your tenancy login password.

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb zdmsdb -
sourcenode ocicdb1 -srcauth zdmauth
-srcarg1 user:opc -srcarg2 identity_file:/home/zdmuser/.ssh/
zdm_service_host.ppk
-srcarg3 sudo_location:/usr/bin/sudo -targetnode ocidb1 -backupuser
backup_user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm_template_zdmsdb.rsp -
tgtauth zdmauth -tgtarg1 user:opc
-tgtarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk -
tgtarg3 sudo_location:/usr/bin/sudo -eval
```

```
Enter source database zdmsdb SYS password:
Enter user "backup_user@example.com" password:
```

Note that if a source single instance database is deployed without a Grid Infrastructure home, then in the above command use -sourcesid in place of -sourcedb.

Also, if a source database is configured for a PASSWORD based wallet, then add the tdekeystorepasswd option to the command above, and for the prompt, specify the source database TDE keystore password value.

Note that the -backupuser argument takes the Object Storage access user or Zero Data Loss Recovery Appliance VPC user, and is skipped if NFS is the backup medium. For NFS, the source database user should have 'rwx' access to the NFS path provided.

The migration command checks for patch compatibility between the source and target home patch level, and expects the target home patch level to be equal to or higher than the source. If the target home patch level is not as expected, then the migration job is stopped and missing patches are reported. You can either patch the target home with the necessary patches or you can force continue the migration by appending the – ignore PATCH CHECK or –ignore ALL option to the migration command.

When you run migrate database with -eval, Zero Downtime Migration only runs a subset of the migration job phases. For example, a logical migration job run with -eval would only run the following phases:

ZDM_VALIDATE_SRC ZDM_VALIDATE_TGT ZDM_SETUP_SRC ZDM_PRE_MIGRATION_ADVISOR ZDM_VALIDATE_DATAPUMP_SETTINGS_SRC ZDM_VALIDATE_DATAPUMP_SETTINGS_TGT ZDM_PREPARE_DATAPUMP_SRC ZDM_DATAPUMP_ESTIMATE_SRC ZDM_CLEANUP_SRC

The migrate database output indicates the job ID for the migration job, which you can use to query the status of the job.

If you want to run the command without providing passwords at the command line, see Provide Passwords Non-Interactively Using a Wallet.

Using the Cloud Premigration Advisor Tool

For logical migration jobs, the Cloud Premigration Advisor Tool (CPAT) can analyze the source database during a migration job, and advise you about database features and constructs that are problematic.

See Cloud Premigration Advisor Tool Support for CPAT use cases supported by Zero Downtime Migration.

CPAT is integrated with Zero Downtime Migration, and runs by default with logical migration jobs. CPAT provides the following benefits:

- Warns you about any features used by your database that aren't supported in the target environment
- Makes suggestions for remedial changes and/or parameters to use for the Data Pump export and import operations
- Optionally generates remedial scripts for failing checks that you can run against the source database

When you run a logical migration using ZDMCLI migrate database, CPAT is run by default as phase ZDM PRE MIGRATION ADVISOR.

The following are options you can use with migrate database to customize how CPAT runs, or to skip the CPAT phase.

 -advisor only runs the following minimum migration job phases required for exclusively running Cloud Premigration Advisor Tool (CPAT) on the migration.

ZDM_VALIDATE_SRC

ZDM_VALIDATE_TGT

ZDM_SETUP_SRC

ZDM_PRE_MIGRATION_ADVISOR

ZDM CLEANUP SRC

- -ignoreadvisor ignores any problems or errors reported by CPAT.
- -skipadvisor skips the CPAT phase in a migration job.
- -genfixup {YES | NO} generates remedial scripts for failing checks that you can run if you choose.

The migration job output displays the checks performed, descriptions of any problems, and actions you can take to resolve the issues, as shown in this example.

```
Cloud Premigration Advisor Tool Version 21.1.0-10
Cloud Premigration Advisor Tool completed with overall result: BLOCKER
Cloud Premigration Advisor Tool generated report location:

gg force logging.sql
```

See migrate database for more information about the command options, and see Cloud Premigration Advisor Tool (CPAT) Analyzes Databases for Suitability of Cloud Migration (Doc ID 2758371.1) for more information about Cloud Premigration Advisor Tool.

Note:

Excluding TABLES in the migration response file does not exclude it from CPAT analysis. SCHEMAS can be excluded from CPAT if the entire schema was excluded.

The presence of an Oracle Cloud unsupported table can lead to BLOCKER status in the CPAT report. You can submit a new migration job with – ignoreadvisor to ignore the BLOCKER error and proceed to migration, provided that all other CPAT BLOCKERS are addressed.

Running CPAT Manually with a Remote Connection

In cases where Cloud Premigration Advisor Tool (CPAT) cannot be run in the source database environment by <code>ZDMCLI migrate database</code>, for example when you migrate from Amazon Web Services RDS, you can run CPAT manually from the Zero Downtime Migration service host.

CPAT, as a Java based tool, requires that an appropriate Java Runtime Environment (JRE) be present on the machine where CPAT is run. The minimum JRE version required for CPAT is Java 7.

CPAT will look for a JRE using JAVA_HOME and/or ORACLE_HOME, so these must be defined before running CPAT on the Zero Downtime Migration service host.

The CPAT premigration.sh script is located in

./home/rhp/zdm/lib/cpat/

Use the following options to run CPAT against a remote source database:

- To run CPAT remotely, it must be run using a connect string. To specify the connection string use the option --connectstring jdbc:oracle:thin:@SOURCEDB_HOST:PORT/ SERVICE NAME
- To indicate where the CPAT output files should be stored, use the option --outdir path
- To specify whether the output should be JSON and/or TEXT use the option -reportformat
- Use --pdbname to provide the PDB name

For example:

```
zdm_user@zdm_host:/scratch/zdm_user/ZDM$ ./home/rhp/zdm/lib/cpat/
premigration.sh
   --connectstring jdbc:oracle:thin:@mysourcehost:1521/mysourcedb --username
system
   --targetcloud ATPS --schemas HR01 --outdir /scratch/zdm_user/ZDM/out --
logginglevel FINE
   --migrationmethod DATAPUMP GOLDENGATE --reportformat JSON TEXT --pdbname
myPDB
Enter password for system user:
Cloud Premigration Advisor Tool Version 22.2.0
Cloud Premigration Advisor Tool completed with overall result: BLOCKER
Cloud Premigration Advisor Tool generated report location:
   /scratch/zdm_user/ZDM/out/premigration_advisor_report.json
Cloud Premigration Advisor Tool generated report location:
   /scratch/zdm_user/ZDM/out/premigration_advisor_report.txt
```

For more information about CPAT, see Cloud Premigration Advisor Tool (CPAT) Analyzes Databases for Suitability of Cloud Migration (Doc ID 2758371.1)

Migrate the Database

Perform the database migration with Zero Downtime Migration using the ZDMCLI migrate database command.

Ensure that you have met all of the prerequisites and completed the required preparations described in Preparing for a Physical Database Migration before you begin the migration procedures in this topic.

In particular be sure the following tasks are done:

Obtain the necessary access credentials required.

If Oracle Cloud Infrastructure Object Storage is used as the backup medium, obtain the Object Storage access credential. The user ID for the Oracle Cloud Infrastructure Console user and an auth token for Object Storage is required. If you are not using an existing auth token, a new auth token can be generated using the Oracle Cloud Infrastructure Console.

If the source database server is accessed with the root user, then you need the root user password. If the source and target database serves are accessed with a private key file, then you need the private key file. The SYS password for the source database environment is also required.

If Zero Data Loss Recovery Appliance is used as the backup medium, get the Zero Data Loss Recovery Appliance virtual private catalog (VPC) user credentials.

Prepare the Zero Downtime Migration response file.

The database migration is driven by a response file that captures the essential parameters for accomplishing the task.

Use the sample \$ZDM_HOME/rhp/zdm/template/zdm_template.rsp file for example entries needed to set up the response file for your particular source, target, and backup environments.

 Determine if the migration process needs to be paused and resumed before you start the database migration. Once the migration job is initiated the job system runs the job as configured.

If the migration job needs to pause and resume at a particular point, then see the topics List Migration Job Phases and Pause and Resume Migration Job (cross references below) for more details.

Physical Migration with Root Credentials

The database migration job is submitted from the Zero Downtime Migration service host by the zdmuser user using the ZDMCLI command migrate database.

For a physical migration, if connectivity to the source database server is through root credentials, then the command would be:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb source_db_unique_name_value
-sourcenode source_database_server_name
-srcroot
-targetnode target_database_server_name
-backupuser Object_store_login_user_name
-rsp response_file_location
-tgtauth zdmauth
-tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:ZDM_installed_user_private_key_file_location
-tgtarg3 sudo location:/usr/bin/sudo
```

For the prompts, specify the source database SYS password and source database server root user password. If the backup destination is Object Store (Bucket), then specify user swift authentication token. If the backup destination is Storage Classic (Container), then specify your tenancy login password.

For example:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb zdmsdb
-sourcenode ocicdb1
-srcroot
-targetnode ocidb1
-backupuser backup_user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm_template_zdmsdb.rsp
-tgtauth zdmauth
-tgtarg1 user:opc
-tgtarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-tgtarg3 sudo_location:/usr/bin/sudo
Enter source database zdmsdb SYS password:
Enter source user "root" password:
```

Enter user "backup user@example.com" password:

Physical Migration with SSH Key

For a **physical migration**, if connectivity to the source database server is through **SSH key**, then the command would be:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb source_db_unique_name_value
-sourcenode source_database_server_name
-srcauth zdmauth
-srcarg1 user:source_database_server_login_user_name
-srcarg2 identity_file:ZDM_installed_user_private_key_file_location
-srcarg3 sudo_location:/usr/bin/sudo
-targetnode target_database_server_name
-backupuser Object_store_login_user_name
-rsp response_file_location
-tgtauth zdmauth
-tgtarg1 user:target_database_server_login_user_name
-tgtarg2 identity_file:ZDM_installed_user_private_key_file_location
-tgtarg3 sudo location:/usr/bin/sudo
```

For the prompts, specify the source database SYS password. If the backup destination is Object Store (Bucket), then specify user swift authentication token. If the backup destination is Storage Classic (Container), then specify your tenancy login password.

For example,

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-sourcedb zdmsdb
-sourcenode ocicdb1
-srcauth zdmauth
-srcarg1 user:opc
-srcarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-srcarg3 sudo_location:/usr/bin/sudo
-targetnode ocidb1
-backupuser backup_user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm template zdmsdb.rsp
```

```
-tgtauth zdmauth
-tgtarg1 user:opc
-tgtarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-tgtarg3 sudo_location:/usr/bin/sudo
```

```
Enter source database zdmsdb SYS password:
Enter user "backup_user@example.com" password:
```

If a source single instance is deployed without a Grid Infrastructure home, then in the command above use -sourcesid in place of -sourcedb.

If the source database is configured for a PASSWORD based wallet, then add the – tdekeystorepasswd option to the command above, and for the prompt, specify the source database TDE keystore password value.

Note that the -backupuser argument takes the Object Storage access user or Zero Data Loss Recovery Appliance VPC user and is skipped if NFS is the backup medium. For NFS, the source database user should have 'rwx' access to the NFS path provided.

Logical Migration to Autonomous Database

For a logical migration to Autonomous Database, the command would be:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-rsp file_path
-sourcedb source_db_unique_name_value
-sourcenode host
-srcauth zdmauth
-srcarg1 user:username
-srcarg2 identity_file:ssh_key_path
-srcarg3 sudo_location:sudo_path
-eval [-advisor [-ignoreadvisor] | -skipadvisor]]
```

Logical Migration to a Co-Managed Database

For a logical migration to a co-managed system, the command would be:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database
-rsp file_path
-sourcedb source_db_unique_name_value
-sourcenode host
-srcauth zdmauth
-srcarg1 user:username
-srcarg2 identity_file:ssh_key_path
-srcarg3 sudo_location:sudo_path
-targetnode host
-tgtauth zdmauth
-tgtarg1 user:username
-tgtarg2 identity_file:ssh_key_path
-tgtarg3 sudo_location:sudo_path
[-ignoreadvisor | -skipadvisor]
```

Patch Compatibility

The migration command checks for patch compatibility between the source and target home patch level, and expects the target home patch level to be equal to or higher than the source. If the target home patch level is not as expected, then the migration job is stopped and missing patches are reported. You can either patch the target home with the necessary patches or you can force continue the migration by appending the <code>-ignore PATCH_CHECK or - ignore ALL option to the migration command.</code>

Job ID Value

The command result output indicates the job ID for the migration job, which you can use to query the status of the job.

Running Migrations Non-Interactively

If you want to run the command without providing passwords at the command line, see Provide Passwords Non-Interactively Using a Wallet.

Query Migration Job Status

You can query the migration job status while the job is running.

Query the status of a database migration job using the ZDMCLI query job command, specifying the job ID. The job ID is shown in the command output when the database migration job is submitted.

zdmuser> \$ZDM HOME/bin/zdmcli query job -jobid job-id

You can find the console output of the migration job in the file indicated (Result file path:) in the query job command output. You can see migration progress messages in the specified file

List Migration Job Phases

You can list the operation phases involved in the migration job.

To list the operation phases involved in the migration job, add the -listphases option in the ZDMCLI migrate command. This option will list the phases involved in the operation.

For example,

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb zdmsdb -sourcenode
ocicdb1 -srcauth zdmauth
-srcarg1 user:opc -srcarg2 identity_file:/home/zdmuser/.ssh/
zdm_service_host.ppk -srcarg3 sudo_location:/usr/bin/sudo
-targetnode ocidb1 -backupuser backup_user@example.com -rsp /u01/app/
zdmhome/rhp/zdm/template/zdm_template_zdmsdb.rsp
-tgtauth zdmauth -tgtarg1 user:opc -tgtarg2 identity_file:/home/zdmuser/.ssh/
zdm_service_host.ppk
-tgtarg3 sudo_location:/usr/bin/sudo -listphases
```

Pause a Migration Job

You can pause a migration job at any point after the $\text{ZDM}_\text{SETUP}_\text{TGT}$ phase, and resume the job at any time.

To pause a migration job, specify the <code>-pauseafter</code> option in the <code>ZDMCLI</code> migrate command with a valid phase to be paused after.

In the following example, if you specify <code>-pauseafter ZDM_SETUP_TGT</code>, the migration job will pause after completing the ZDM SETUP TGT phase.

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb zdmsdb -
sourcenode ocicdb1
-srcauth zdmauth -srcarg1 user:opc
-srcarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-srcarg3 sudo_location:/usr/bin/sudo -targetnode ocidb1
-backupuser backup_user@example.com -rsp /u01/app/zdmhome/rhp/zdm/
template/zdm_template_zdmsdb.rsp -tgtauth zdmauth
-tgtarg1 user:opc -tgtarg2 identity_file:/home/zdmuser/.ssh/
zdm_service_host.ppk
-tgtarg3 sudo_location:/usr/bin/sudo -pauseafter ZDM_SETUP_TGT
```

Choosing a Migration Job Phase to Pause After

Choose a valid phase after ZDM_CONFIGURE_DG_SRC **that is listed in the** migrate database ... -listphases **command output**.

Note that the -pauseafter option allows only one phase to be specified.

The following are some cases where you may need to pause a migration job, and resume after some manual steps:

- Convert the Standby Database to TDE. If the source is not encrypted, of if ZDLRA is used as the data transfer medium, or the Oracle Database version is earlier than 12.2, you need to encrypt the target Cloud database.
- Enable Active Data Guard (optional)
- Monitor Data Guard Configuration Health, before the switchover
- Test the Cloud database (optional). You can convert the standby to the primary without doing the application switchover, which can be used to duplicate the source database for testing in the Cloud.

Best Practices for Pausing a Physical Migration Job

In a physical migration, if you use <code>-pauseafter</code> at phase <code>ZDM_CONFIGURE_DG_SRC</code>, then at the end of the execution of the phase, a standby is created at the target database and synchronization occurs between source and target databases.

Pausing the migration job after <code>ZDM_CONFIGURE_DG_SRC</code> is recommended so that you can do the following:

- Perform the application switchover to the cloud
- Manually encrypt the cloud database if ZDLRA is the backup method or your database release is earlier than Oracle Database 12.2

 Perform a failover to test the cloud database without making changes to the on-premises database

Preserving Log Files During a Paused Migration Job

To prevent source and target database log files from getting cleaned up between pausing and resuming a migration job, log files are written to $\$

zdm_db_unique_name_zdm_job_id/zdm/log in their respective source and target database servers.

Ensure that all of the archive logs generated during and after the ZDM_BACKUP_INCREMENTAL_SRC phase are available, preferably until switchover, or at least until the target and source databases are in sync. Older archive logs, the archive logs generated prior to ZDM_BACKUP_INCREMENTAL_SRC are not needed.

Resume a Migration Job

A paused job can be resumed any time by running the ZDMCLI resume job command, specifying the respective job ID.

```
zdmuser> $ZDM_HOME/bin/zdmcli resume job -jobid Job_ID
[-pauseafter valid-phase | -rsp zdm logical template]
```

Scheduling Another Pause on Resume

To schedule another pause, specify the -pauseafter option in the resume job command with a valid phase to be paused after, as shown in the example below.

Choose a valid phase later than that at which the phase is currently paused. Phases are listed in the migrate database ... -listphases command output.

```
zdmuser> $ZDM_HOME/bin/zdmcli resume job -jobid Job_ID
-pauseafter valid-phase
```

Modifying Migration Parameters on Resume

In a logical migration job, some parameters can be modified upon either pausing the job or a job failure. When you are ready to resume the job, specify the modified response file in the command resume job, and the changes are picked up by Zero Downtime Migration when the job is resumed.

To modify parameters on resume, specify the -rsp option in the resume job command with the path to the logical migration response file containing the modified parameters, as shown below.

```
zdmuser> $ZDM_HOME/bin/zdmcli resume job -jobid Job_ID
-rsp modified zdm logical template
```

The following considerations and limitations apply:

- Only certain properties can be modified
- Any property modification is rejected if the phase in which it is used is already completed

- Removing or adding properties to the file is considered a modification, and Zero Downtime Migration performs a validation to determine if those adds/deletes can be included.
- Terminated (aborted) jobs and evaluation jobs cannot be resumed.

The following table identifies which parameters are modifiable and until which phase they can be changed. Note that the phases before which they can be set will differ if DATA TRANSFER MEDIUM is set to DBLINK.

Table 7-1 Migration Parameters Modifiable on Resume

Parameter	When can it be modified?
SOURCEDATABASE_CONNECTIONDETAILS_HOST	Modify at any phase
SOURCEDATABASE_CONNECTIONDETAILS_PORT	Modify at any phase
OCIAUTHENTICATIONDETAILS_*	Modify at any phase
TARGETDATABASE_CONNECTIONDETAILS_HOST	Modify at any phase

OCIPROXY_*	Modify at any phase
DUMPTRANSFERDETAILS_*	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

Parameter	When can it be modified?
TABLESPACEDETAILS_AUTOCREATE	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED
TABLESPACEDETAILS_USEBIGFILE	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED
TABLESPACEDETAILS_EXTENTSIZEMB	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED
TABLESPACEDETAILS_AUTOREMAP	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED
TABLESPACEDETAILS_REMAPTARGET	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED
TABLESPACEDETAILS_EXCLUDE	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED
WALLET_*	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED

 Table 7-1 (Cont.) Migration Parameters Modifiable on Resume

Suspend and Resume a Migration Job

You can suspend a migration job at any point, and resume the job at any time.

To suspend a migration job run the following command.

zdmuser> \$ZDM HOME/bin/zdmcli suspend job -jobid job id

Resuming a Suspended Migration Job

A suspended job can be resumed any time by running the <code>ZDMCLI resume job</code> command, specifying the respective job ID.

```
zdmuser> $ZDM_HOME/bin/zdmcli resume job -jobid Job_ID
[-pauseafter valid-phase]
```

You can optionally schedule a pause, by specifying the -pauseafter option in the resume command with a valid phase to be paused after. Choose a valid phase later than phase currently paused at, that is listed in the migrate database ... - listphases command output.

Rerun a Migration Job

If there are any unexpected errors in the migration workflow, you can correct them and rerun the migration job.

The errors are recorded in the job output, which can be queried using the ZDMCLI query job command. Upon resolving the error, the failed job can be continued from the point of failure.

Rerun the migration job by running the ZDMCLI resume job command, specifying the job ID of the job to be rerun, as shown here.

zdmuser> \$ZDM HOME/bin/zdmcli resume job -jobid Job ID

Terminate a Running Migration Job

If you want to resubmit a database migration job for a specified database, you must first terminate the running migration job.

Zero Downtime Migration blocks attempts to rerun the MIGRATE DATABASE command for a specified database if that database is already part of an ongoing migration job.

If you want to resubmit a database migration job for a specified database, you must first terminate the running migration job in either EXECUTING or PAUSED state using the ZDMCLI ABORT JOB command.

zdmuser> \$ZDM HOME/bin/zdmcli abort job -jobid job-id

Zero Downtime Migration Centralized Fleet Migration Management

Zero Downtime Migration allows you to centrally monitor fleet level migration using the Object Storage Service PAR URL.

Zero Downtime centralized fleet migration management gives you the following capabilities.

- Fleet level migration monitoring
- Fleet level log aggregation for easy troubleshooting and data mining
- Centralized migration per job metrics collection, which can be leveraged for executivelevel migration status dash-boards and future migration forecasting

Centralized fleet migration management also lets you to prohibit the operation team from accessing the source or target database server for migration failures. The operation team can be allowed to troubleshoot the failure with the logs available in the specified ZDM_LOG_OSS_PAR_URL or logs further staged to a different Oracle Cloud storage bucket for operation troubleshooting.

Centralized fleet migration management is only supported for physical migration jobs, and is enabled by setting the parameter <code>ZDM_LOG_OSS_PAR_URL</code> to a pre-authenticated URL, for example:

https://objectstorage.us-region.oraclecloud.com/ ... /DEV_ZDM_LOGS_RGN/o/

Zero Downtime Migration uploads the job specific data, shown in the table below, to the specified OSS PAR URL at regular interval while a migration job is in progress.

Category	URL Name space Suffix (Appended to value of ZDM_LOG_OSS_PAR_URL)	Content
Job Metrics	PAR_URL/1/POD_NAME/ZDM_HOST/ JOB_ID/METRICS.txt For example, /1/PRD_TEST_MIGRATION/ s16izp/1/METRICS.txt	Job Metrics details the source and target database vitals and backup and restore statistics per phase involved in the work flow and error. This data can be used for fleet level migration statistics for executive dashboards.
Job Status	PAR_URL/1POD_NAME/ZDM_HOST/ JOB_ID/CURRENT_PHASE.txt For example, /1/PRD_TEST_MIGRATION/ s16izp/1/CURRENT_PHASE.txt	Status entries are listed in the format Phase Name: Phase Status For example, ZDM_BACKUP_FULL_SRC: EXECUTIN G Phase Status values are EXECUTING, PAUSED, FAILED, or COMPLETED
Phase Log	PAR_URL/2/TIMESTAMP/ POD_NAME/ZDM_HOST/JOB_ID/ ACTION HOST/PHASE_NAME.log For example, 2/2011-11-07T17:58:34.049000/ PRD_TEST_MIGRATION/2- zdm-01/1/cldx01/ ZDM_BACKUP_FULL_SRC.log	Zero Downtime Migration uploads the phase-specific logs at the end of each phase with a UTC time- stamped name space. On job rerun, the time stamp would change and the rerun-specific log would be identified by latest time stamp.
Phase Status	<pre>PAR_URL/1/POD_NAME/ZDM_HOST/ JOB_ID/PHASE_NAME.txt For example, /1/PRD_TEST_MIGRATION/ s16izp/1/ ZDM_VALIDATE_TGT.txt</pre>	The file contents will be COMPLETED if the phase is completed or PENDING if it has yet to start. At the start of a migration job, Zero Downtime Migration creates all of the phase-named files with PENDING status, then updates them to COMPLETED as each phase is completed. Use the creation time of <i>PHASE_NAME</i> .txt to measure the phase elapsed time.
Progress Message	<pre>PAR_URL/1/POD_NAME/ZDM_HOST/ JOB_ID/CONSOLE.out For example, 1/PRD_TEST_MIGRATION/ s16izp/1/CONSOLE.out</pre>	Zero Downtime Migration updates CONSOLE.out for each <i>n</i> chunk of console messages received (for example, every 10 lines) normally, or instantly in case of errors. Progress messages are formatted like this: node name : UTC Time : Progress message For example, hxvdbfz03: 2021-02-10T09:51:11.851Z : Retrieving information from source node "hfzb06"

Table 7-2 Centralized Fleet Migration Job Data

8

Migrating from Amazon Web Services RDS to Oracle Autonomous Database

You can migrate an Oracle Database from Amazon Web Services (AWS) RDS to Oracle Autonomous Database (ADB) using the Zero Downtime Migration offline logical migration method.

Setting Amazon as the Source Environment

In the Zero Downtime Migration logical migration response file, set the following parameters to migrate Oracle databases from Amazon Web Services:

SOURCEDATABASE ENVIRONMENT NAME=AMAZON

SOURCEDATABASE ENVIRONMENT DBTYPE=RDS ORACLE

Configure Secure Connections

Ensure that the subnet Amazon RDS security policy allows connections from Zero Downtime Migration to the DB instance on the specified secure port. See the AWS documentation for details:

Scenarios for accessing a DB instance in a VPC

Scenarios for accessing a DB instance not in a VPC

Setting Endpoint Information

1. Find the Amazon RDS Oracle Instance endpoint (DNS name) and port number in the RDS console DB Instance **Connectivity & security** tab.

See Finding the endpoint of your Oracle DB instance for detailed help.

 Specify the endpoint and port number information in following Zero Downtime Migration logical response file parameters:

SOURCEDATABASE ADMINUSERNAME

SOURCEDATABASE CONNECTIONDETAILS HOST

SOURCEDATABASE_CONNECTIONDETAILS_SERVICENAME

SOURCEDATABASE CONNECTIONDETAILS PORT

 If connecting to Amazon RDS from the Zero Downtime Migration service host requires a proxy, then specify these logical response file parameters:

SOURCEDATABASE_CONNECTIONDETAILS_PROXYDETAILS_HOSTNAME

SOURCEDATABASE_CONNECTIONDETAILS_PROXYDETAILS_PORT

Allowing Zero Downtime Migration to connect to Amazon RDS Oracle DB instance using SSL/TLS

- Enable Secure Socket Layer (SSL) or Transport Layer Security (TLS) in the Amazon RDS Oracle Instance to secure the connection from Zero Downtime Migration to Amazon RDS Oracle Instance. See Encrypting client connections with SSL for details.
- 2. Create an orapki wallet as detailed in Updating applications to use new SSL/TLS certificates.
- 3. Set the following parameters in the Zero Downtime Migration logical response file: SOURCEDATABASE_CONNECTIONDETAILS_TLSDETAILS_DISTINGUISHEDNAME SOURCEDATABASE_CONNECTIONDETAILS_TLSDETAILS_CREDENTIALSLOCATION

Configuring the Data Transfer Method

To transfer the data from AWS, you have the following options:

- Amazon Simple Storage Service (Amazon S3) Bucket
- Database link (DBLINK)

Setting Up Database Link Transfer Method

To use a database link (DBLINK) to migrate Amazon RDS Oracle Database schema to Oracle Autonomous Database (ADB), you must have direct network connectivity between the Amazon RDS Oracle instance and the ADB target.

Set the following parameters in the Zero Downtime Migration logical response file.

- 1. Set the parameter DATATRANSFERMEDIUM to DBLINK.
- 2. Set the parameter SOURCEDATABASE_ENVIRONMENT_* as shown in Setting Amazon as a Source Environment.

Setting Up S3 Bucket Data Transfer Medium

Zero Downtime Migration performs the following steps to migrate an Amazon RDS Oracle Database schema to Oracle Autonomous Database target using an S3 bucket:

- Export dumps Invoke the DBMS_DATAPUMP procedure in the Amazon RDS Oracle Database instance to generate dumps in DATA PUMP DIR.
- Upload dumps to S3 using RDSADMIN Upload dumps from the RDS instance to the specified S3 bucket.
- Import dumps from S3 to ADB Import the schema to the ADB instance from the S3 bucket.

To configure the environments to use the S3 bucket for data transfer, complete the following tasks.

Complete AWS RDS Prerequisites

The RDS Oracle instance must have been integrated with S3 and the DB user should be allowed to upload the dumps to S3 bucket via RDSADMIN package.

1. Integrate RDS and S3 - Ensure that the RDS instance and S3 are integrated.

Enable RDS and S3 integration for the Oracle Database instance if not configured already.

See Amazon S3 integration for the detailed steps.

2. S3 Access Key - Create and provide Zero Downtime Migration with the AWS S3 Access Key and Access secret.

See AWS Account and Access Keys for the detailed steps.

3. S3 and RDS region - Ensure that the S3 bucket and RDS Oracle Database instance are in the same region, for example us-east-2.

Set Required Response File Parameters

Set the following parameters to perform a migration using the S3 bucket:

- **1.** Set the parameter DATATRANSFERMEDIUM to AMAZONS3.
- 2. Set the SOURCEDATABASE_ENVIRONMENT_* as shown in Setting Amazon as a Source Environment.

3. Set the following additional parameters:

```
DUMPTRANSFERDETAILS_S3BUCKET_NAME=
DUMPTRANSFERDETAILS_S3BUCKET_REGION=
DUMPTRANSFERDETAILS_S3BUCKET_ACCESSKEY=
DATAPUMPSETTINGS EXPORTDIRECTORYOBJECT NAME=
```

9 Managing the Zero Downtime Migration Service

Perform Zero Downtime Migration service life cycle operations using zdmservice.

Starting and Stopping the Zero Downtime Migration Service

You must start the Zero Downtime Migration service before you can migrate your databases using Zero Downtime Migration.

Start the Zero Downtime Migration service, <code>zdmservice</code>, as user <code>zdmuser</code>, with the following command.

zdmuser> \$ZDM HOME/bin/zdmservice start

If you must stop the Zero Downtime Migration service, run the following command.

zdmuser> \$ZDM HOME/bin/zdmservice stop

Checking Zero Downtime Migration Service Status

Check the status of the Zero Downtime Migration to see if it is running, and other service details.

To check the Zero Downtime Migration service status use the following command.

Updating Zero Downtime Migration Software

If you already have Zero Downtime Migration software installed on a host, you should always make sure it is the latest available release. Zero Downtime Migration software updates give you the latest features and fixes while retaining existing job information, metadata, and log files.

Before you begin the software update, review the following requirements.

 Updating from Zero Downtime Migration 19c to 21c can only be done from the latest Zero Downtime Migration 19c software kit. Verify your 19c software kit using the following command:

```
zdmuser> $ZDM_HOME/bin/zdmcli -build
full version: 19.8.0.0.0
label date: 200907
ZDM kit build date: Thu Sep 24 06:22:07 PDT 2020
```

- Verify that your existing Zero Downtime Migration software install location has at least 15GB free space.
- Verify that you have enough space to back up the existing Zero Downtime Migration home (ZDM HOME) and ZDM BASE to the software download location.
- Important: Run the update script from outside of the currently installed Zero Downtime Migration home.

Running the script from within a Zero Downtime Migration home results in home install and uninstall failures and leaves the service in an inconsistent state.

- The path specified in ziploc should have read/write access for zdmuser.
- All of the commands in the following procedure should be run as the existing Zero Downtime Migration software owner. For example, run as zdmuser in the examples that follow.
- Download the Zero Downtime Migration software kit from https://www.oracle.com/ database/technologies/rac/zdm-downloads.html to the Zero Downtime Migration service host.
- 2. Change to the directory to where Zero Downtime Migration software is downloaded and unzip the software.

```
zdmuser> cd zdm_download_directory
zdmuser> unzip zdmversion.zip
```

3. Run the zdminstall.sh script as the exiting Zero Downtime Migration home owner to update the software from the software download location.

```
zdmuser>./zdminstall.sh update oraclehome=existing_zdm_oracle_home
ziploc=zdm_software_location -zdm
```

- zmdinstall.sh is the installation and update script
- oraclehome is the absolute path to the Oracle Home where the existing Zero Downtime Migration software is installed
- ziploc is the location of the compressed software file (zip) included in the Zero Downtime Migration kit

For example,

```
zdmuser>/u01/app/oracle/zdm/shiphome/update/zdminstall.sh update
    oraclehome=/u01/app/zdmhome
    ziploc=/u01/app/oracle/zdm/shiphome/update/zdm_home.zip -zdm
```

The update script does the following operations.

- a. Backs up the existing Zero Downtime Migration home (ZDM_HOME) and ZDM_BASE into software download location
- b. Stops the currently running Zero Downtime Migration service
- c. Removes the currently installed Zero Downtime Migration home
- d. Installs the new binaries in the Zero Downtime Migration home
- e. Restores the configuration data.

The new Zero Downtime Migration home will retain all of the details of any migrations run with the previous Zero Downtime Migration home.

4. The Zero Downtime Migration service must be manually started after the upgrade. Start the Zero Downtime Migration service as user zdmuser.

```
zdmuser> $ZDM HOME/bin/zdmservice start
```

You must start *zdmservice* before you can migrate your databases using Zero Downtime Migration.

If you must stop the Zero Downtime Migration service, run the following command.

zdmuser> \$ZDM HOME/bin/zdmservice stop

5. Verify that the Zero Downtime Migration service installation is successful.

When you run the following command, the output should be similar to that shown here.

Uninstalling Zero Downtime Migration Software

Remove Zero Downtime Migration software from the Zero Downtime Migration service host.

All commands are run as zdmuser.

1. Stop the Zero Downtime Migration service.

zdmuser> \$ZDM HOME/bin/zdmservice stop

2. Run the following command to uninstall the software.

zdmuser> \$ZDM_HOME/bin/zdmservice deinstall

Performing a Silent Update or Deinstallation

You can skip the confirmation prompt during Zero Downtime Migration software update or deinstallation to ensure these operations run smoothly.

A -silent option is available for zdminstall.sh update or deinstall operations to avoid being asked for confirmation, as shown in the following examples.

Example of silent update:

```
zdmuser> cd zdm_download_directory
zdmuser> unzip zdmversion.zip
...
zdmuser>./zdminstall.sh update -silent
oraclehome=absolute_path_to_zdm_home
ziploc=zdm software location -zdm
```

Example of silent deinstall:

```
zdmuser> $ZDM HOME/bin/zdmservice deinstall -silent
```

Viewing the Cloud Premigration Advisor Tool Version

There are two ways to display the current version for the Cloud Premigration Advisor Tool (CPAT).

Run the Cloud Premigration Advisor Tool script with the --version option.

\$ZDM HOME/rhp/zdm/lib/cpat/premigration.sh --version

Run ZDMCLI with the -build option.

zdmuser> \$ZDM HOME/bin/zdmcli -build

Updating the Cloud Premigration Advisor Tool

Keep the Cloud Premigration Advisor Tool up to date to get the latest migration remedies, as well as any bug fixes in the tool.

Note:

Schedule Cloud Premigration Advisor Tool updates when no migrations are running.

 Download the latest version of the tool from Cloud Premigration Advisor Tool (CPAT) Analyzes Databases for Suitability of Cloud Migration (Doc ID 2758371.1).

2. Check the version of the tool that is currently installed in your Zero Downtime Migration home.

./ZDM home/rhp/zdm/lib/cpat/premigration.sh --version

- 3. Back up the currently installed tool by making a copy of the contents of directory \$ZDM HOME/rhp/zdm/lib/cpat.
- 4. Delete all of the files in directory \$ZDM HOME/rhp/zdm/lib/cpat.
- Unzip the new Cloud Premigration Advisor Tool release file to \$ZDM_HOME/rhp/zdm/lib/ cpat.
- 6. If needed, change the permissions on the unzipped files to remove unauthorized access.
- 7. Verify that the new version of the tool is installed in your Zero Downtime Migration home.

./ZDM home/rhp/zdm/lib/cpat/premigration.sh --version

Setting the MySQL Port

You can discover and set the port number that Zero Downtime Services uses for MySQL.

MySQL Default Port Number

Zero Downtime Migration uses MySQL internally, configuring it by default on port 3306. If a port number is not specified and the default is not available, Zero Downtime Migration increases the port value by one and retries up to five times.

Finding the Current Port Number

Run zdmservice status to see the current MySQL port number in the connection string, as shown here.

zdmuser> \$ZDM HOME/bin/zdmservice status

Conn String: jdbc:mysql://localhost:8897/

Changing the Port Number

You can change this default to another value using the *zdmservice* modify mysqlPort=*port* option.

zdmuser> \$ZDM HOME/bin/zdmservice modify mysqlPort=port

10 Troubleshooting Zero Downtime Migration

This section describes how to handle migration job failures.

For more information about troubleshooting Zero Downtime Migration and known issues in the current release, see the Zero Downtime Migration Release Notes.

Handling Migration Job Failures

If your migration job fails, the following logs can help you discover the issue.

Migration Job Output Logs

If your migration job encounters an error, refer to the migration job output logs, Zero Downtime Migration service logs, and server-specific operational phase logs present at the respective source or target database servers.

If the migration job encounters an exception (that is, fails) then the logs can provide some indication of the nature of the fault. The logs for the migration procedures executed in the source and target environments are stored on the servers in the respective source and target environments. The Zero Downtime Migration command output location is provided to you when the migration job is run with the ZDMCLI command migrate database. You can also find the log file location (Result file path) in the output of the ZDMCLI command query job – jobid *job-id*.

Zero Downtime Migration Service Host Log

Determine which operational phase the migration job was in at the time of failure, and whether the phase belongs to the source (phase name contains SRC) or target (phase name contains TGT). Check the Zero Downtime Migration service host log at \$ZDM_BASE/crsdata/ zdm_service_host/rhp/zdmserver.log.0, and access the respective source or target server to check the log associated with the operational phase in \$ORACLE_BASE/zdm/ zdm_db_unique_name_job-id/zdm/log.

If the Zero Downtime Migration service does not start, then check the Zero Downtime Migration service logs for process start-up errors to determine the cause of the error reported. The Zero Downtime Migration service log can be found at *\$ZDM_BASE/crsdata/ zdm service host/rhp/zdmserver.log.0*.

Data Pump Log

For logical migration jobs on co-managed target databases, refer to the Data Pump log in the specified DATA_PUMP_DIR. For Autonomous Database targets, the Data Pump logs are uploaded to a specified Object Storage bucket. If the data bucket is not specified, then you will need to upload the dump from Autonomous Database to Object Storage to access it. See How To View Import Log Generated For ADW/ATP (Doc ID 2448060.1)

If a migration job fails, you can fix the cause of the failure and then re-run the job while monitoring the logs for progress.

A

Database Server Connectivity Using a Bastion Host

Zero Downtime Migration lets you configure connectivity to the source and target database servers through a bastion host for both physical and logical migration work flows.

Note that a bastion host cannot be used to connect to an Autonomous Database, except for JDBC connections.

Use the following sections to configure the appropriate parameters for physical and logical migrations that must connect to the source or target database server through a bastion host.

SSH Connection to Database Servers

Connecting database servers through a bastion host requires the following information:

- Bastion Host IP Address and Source Database Server IP Address: To connect to the database server through a bastion host, the bastion host IP address and the source node IP address are required.
- Bastion Port Number: The port number defaults to 22 if not specified.
- **Bastion User:** The bastion host user is only required if the user specified for the argument zdmauth plug-in is different from the user of the bastion host. The bastion user defaults to the user specified for the source zdmauth plug-in if the property is not specified.
- **Bastion Identity File:** If the *SRC/TGT_BASTION_IDENTITY_FILE* parameter is not specified, the value defaults to the value specified for the identity_file argument of the zdmauth plug-in argument.

Physical Migration Response File Parameters

Configure the following response file parameters for a physical migration.

Source Database Server

SRC_BASTION_HOST_IP=
SRC_BASTION_PORT=
SRC_BASTION_USER=
SRC_BASTION_IDENTITY_FILE=
SRC_HOST_IP=
Target Database Server

TGT_BASTION_HOST_IP=

TGT_BASTION_PORT=

TGT_BASTION_USER=

TGT_BASTION_IDENTITY_FILE=

TGT HOST IP=

Logical Migration Response File Parameters

Configure the following response file parameters for a logical migration.

Source Database Server

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_IP= SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_PORT= SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_IDENTITYFILE= SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_USERNAME= SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_REMOTEHOSTIP=

Target Database Server (including Autonomous Database)

TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_IP= TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_PORT=22 TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_IDENTITYFILE= TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_USERNAME= TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_REMOTEHOSTIP=

B Zero Downtime Migration Encryption Requirements

Zero Downtime Migration does not always require encryption at the source (although, all Cloud databases are encrypted by default). The following tables list specific cases when encryption is not required.

Table B-1 On-Premises Unencrypted Primary and Cloud Encrypted Standby

Operation	On- Premises Primary 11g R2	Cloud Standby 11g R2	On- Premises Primary 12c R1	Cloud Standby 12c R1	On- Premises Primary 12c R2	Cloud Standby 12c R2 and later	Notes
Data Guard initial setup for on- premises primary and cloud standby	Unencrypted	Encrypted	Unencrypted	Encrypted	Unencrypted	Encrypted	In these cases the standby database is manually encrypted after instantiation
New tablespace creation on- premises primary	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Requires manual TDE conversion for standby database
Redo generated in on-premises primary	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Unencrypted	
Archived logs	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Unencrypted	Unencrypted	
New and changed blocks	Unencrypted	Encrypted	Unencrypted	Encrypted	Unencrypted	Encrypted	Redo shipped from the on- premises primary to the cloud is not encrypted
Recovery in the cloud standby	N/A	Encrypted	N/A	Encrypted	N/A	Encrypted	Redo shipped from the on- premises primary to the cloud is not encrypted

Operation	Cloud Primary 11g R2	On- Premises Standby 11g R2	Cloud Primary 12c R1	On- Premises Standby 12c R1	Cloud Primary 12c R2	On- Premises Standby 12c R2 and later	Notes
New tablespace creation in cloud primary	Encrypted	Encrypted	Encrypted	Encrypted	Encrypted	Encrypted	ASO required for on-premises to decrypt
Redo generated in cloud primary	Encrypted	Encrypted	Encrypted	Encrypted	Encrypted	Encrypted	ASO required for on-premises to decrypt
Archived logs	Encrypted	Encrypted	Encrypted	Encrypted	Encrypted	Encrypted	ASO required for on-premises to decrypt
New and changed blocks for existing unencrypted tablespace on standby	Encrypted	Encrypted*	Encrypted	Encrypted*	Encrypted	Unencrypted	ASO is required on- premises to decrypt and encrypt * For 11g R2 and 12c R1 redo apply will encrypt only if redo is encrypted
Recovery in the on- premises standby	N/A	Encrypted	N/A	Encrypted	N/A	Unencrypted data depends on whether the datafile is encrypted	ASO required for on-premises database

 Table B-2
 Cloud Encrypted Primary and On-Premises Unencrypted Standby

C Zero Downtime Migration Process Phases

The migration job process in Zero Downtime Migration runs in operational phases as a work flow. The tables below describe the phases for physical and logical migrations.

Example C-1 Listing Zero Downtime Migration Process Phases

Run the ZDMCLI migrate database command with the -listphases option to list the operational phases for your migration job, as shown here.

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -sourcedb zdmsdb
-sourcenode ocicdb1 -srcauth zdmauth -srcarg1 user:opc
-srcarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-srcarg3 sudo_location:/usr/bin/sudo -targetnode ocidb1
-backupuser backup_user@example.com
-rsp /u01/app/zdmhome/rhp/zdm/template/zdm_template_zdmsdb.rsp
-tgtauth zdmauth -tgtarg1 user:opc
-tgtarg2 identity_file:/home/zdmuser/.ssh/zdm_service_host.ppk
-tgtarg3 sudo location:/usr/bin/sudo -listphases
```

Phase name	Online/Offline	Description
ZDM_GET_SRC_INFO	Both	Gets information about the source database
ZDM_GET_TGT_INFO	Both	Gets information about the target database
ZDM_SETUP_SRC	Both	Sets up Zero Downtime Migration helper modules on the source server
ZDM_SETUP_TGT	Both	Sets up Zero Downtime Migration helper modules on the target server
ZDM_PREUSERACTIONS	Both	Runs migration pre-user actions, if any, at the source
ZDM_PREUSERACTIONS_T GT	Both	Runs migration pre-user actions, if any, at the target
ZDM_VALIDATE_SRC	Both	Perform validations at the source
ZDM_VALIDATE_TGT	Both	Performs validations at the target
ZDM_OBC_INST_SRC	Both	Installs Oracle Database Cloud Backup Module at the source
ZDM_OBC_INST_TGT	Both	Installs Oracle Database Cloud Backup Module at the target
ZDM_BACKUP_FULL_SRC	Both	Performs full backup of the source database
ZDM_BACKUP_INCREMEN TAL_SRC	Both	Performs incremental backup of the source database
ZDM_DISCOVER_SRC	Both	Performs database discovery at the source for setting up Data Guard

Table C-1 Physical Migration Phase Descriptions

Phase name	Online/Offline	Description
ZDM_COPYFILES	Both	Copies Oracle password file and TDE wallets from source to target
ZDM_SETUP_TDE_TGT	Both	Copies TDE wallet files from the source to the target keystore location
ZDM_RESTORE_TARGET	Online	
ZDM_RECOVER_TARGET	Online	
ZDM_OSS_RESTORE_TGT	Offline	Performs full database restore
ZDM_BACKUP_DIFFERENT IAL_SRC	Offline	Performs differential backup of the source database
ZDM_OSS_RECOVER_TGT	Offline	Performs incremental restore, recovery database, and opens database with reset logs
ZDM_PREPARE_TGT	Both	Prepares target for Data Guard standby creation
ZDM_CLONE_TGT	Online	Creates Data Guard standby from the Cloud backup
ZDM_FINALIZE_TGT	Both	Finalizes Data Guard standby preparation of the target. Converts the target database to RAC if originally provisioned as Oracle RAC.
ZDM_CONFIGURE_DG_SR C	Online	Registers the Cloud standby with the source
ZDM_SWITCHOVER_SRC	Online	Initiates switchover actions at the source
ZDM_SWITCHOVER_TGT	Online	Completes switchover actions at the target
ZDM_POST_DATABASE_OP EN_TGT	Both	Performs activities after database is opened, such as restore pluggable database state, DBA directories, RMAN configuration
ZDM_DATAPATCH_TGT	Both	Runs datapatch at the target
ZDM_SHUTDOWN_SRC	Both	Shuts down source database at the end of the migration
ZDM_POSTUSERACTIONS	Both	Performs any post-migration user actions at the source
ZDM_POSTUSERACTIONS_ TGT	Both	Performs any post-migration user actions at the target
ZDM_CLEANUP_SRC	Both	Performs clean up at the source
ZDM_CLEANUP_TGT	Both	Performs clean up at the target

 Table C-1
 (Cont.) Physical Migration Phase Descriptions

Phase name	Online/Offline	Description
ZDM_VALIDATE_TGT	Both	Verifies that the target database exists, discovers the database type, and validates access credentials, security, and connectivity.
		For an Autonomous Database target, sets up the access to the target database from the Zero Downtime Migration node by downloading the target database access wallet with OCI REST services and discovers the target OCPU.
		Online only: verifies ggadmin user privileges.
ZDM_VALIDATE_SRC	Both	Validates the source database access credentials, database parameter settings.
		Online only: verifies ggadmin user privileges and GoldenGate capture support for objects in source database.
ZDM_VALIDATE_DATAPUMP _SETTINGS_SRC	Both	Validates the export directory object (if applicable), and checks for sufficient space and permission for specified user in the source database to export dumps. Checks if the specified Oracle Cloud Object Store buckets, data bucket, and wallet bucket are accessible from the source. Also validates the proxy configuration if applicable.
ZDM_VALIDATE_DATAPUMP _SETTINGS_TGT	Both	Verifies that the Data Pump import directory object exists.
		If a pre-existing DBLINK was specified, checks if it exists and is valid, and ensures that the Autonomous Database requirements for the DBLINK and wallet files are met.
		For a co-managed target database, ensures that the OCI OSS data bucket and wallet bucket are valid and accessible from the target server. Ensures that the local path to download the dump is valid and has sufficient space.
ZDM_PREPARE_DATAPUMP _SRC	Both	Creates a new directory object for Data Pump, if required. Creates OCI Auth Token to access OCI OSS bucket if required.
ZDM_DATAPUMP_ESTIMAT	Both	Performs Data Pump export dump size estimation.
E_SRC		See also, DATAPUMPSETTINGS_DATAPUMPPARAMETER S_ESTIMATEBYSTATISTICS.
		Not used with DBLINK
ZDM_PREPARE_DATAPUMP _TGT	Both	Creates a new directory object for Data Pump, if required. Stores OCI Auth token in the database for secure OSS access.
		If migrating via DBLINK, and a DBLINK must be created, creates the necessary database credentials to access the source and create a new DBLINK.
		Ensures Autonomous Database security requirements are met using DBLINK over SSL.

Table C-2 Logical Migration Phase Descriptions

Phase name	Online/Offline	Description
ZDM_DATAPUMP_EXPORT_ SRC		Starts and monitors the Data Pump Export on the source database.
ZDM_UPLOAD_DUMPS_SR C	Both	Uploads Data Pump dump files from the source to OCI OSS.
ZDM_DATAPUMP_IMPORT_ TGT	Both	Starts import of Data Pump Dumps to the target database, either from the OCI OSS bucket or via DBLINK, and monitors the Data Pump import progress.
ZDM_POST_DATAPUMP_SR C	Both	Removes any Data Pump directory object created by Zero Downtime Migration.
ZDM_POST_DATAPUMP_TG T	Both	Fixes any invalid objects in the target database. Removes the database access and OCI OSS access credentials that were created for the migration. Removes any DBLINK created by Zero Downtime Migration. Optionally, removes source database dumps stored in OCI OSS bucket.
ZDM_POST_ACTIONS	Both	Removes Autonomous Database access wallet from the Zero Downtime Migration node.
ZDM_PRE_MIGRATION_AD VISOR	Both	Runs the Oracle Database Premigration Advisor Tool on the migration job.
ZDM_VALIDATE GG_HUB	Online	Verifies GoldenGate Microservices REST endpoints, software configuration, health, and connectivity to the source and target databases.
ZDM_PREPARE_GG_HUB	Online	Registers database connection details and credentials with GoldenGate Microservices.
ZDM_ADD_HEARTBEAT_SR C	Online	Creates GoldenGate heartbeat table in the source database. If the table already exists, sets update frequency to 60 seconds.
ZDM_ADD_SCHEMA_TRAN DATA_SRC	Online	Prepares the source database schemas for instantiation by enabling schema level supplemental logging.
ZDM_CREATE_GG_EXTRA CT_SRC	Online	Starts the GoldenGate Extract process at the source database
ZDM_ADD_HEARTBEAT_TG T	Online	Creates the GoldenGate heartbeat table in the target database. If the table already exists, sets update frequency to 60 seconds.
ZDM_ADD_CHECKPOINT_T GT	Online	Creates GoldenGate checkpoint table in the target database to track Replicat progress.
ZDM_CREATE_GG_REPLIC AT_TGT	Online	Starts GoldenGate Replicat process for the target database.
ZDM_MONITOR_GG_LAG	Online	Polls the GoldenGate checkpoint and heartbeat data to measure end-to-end apply lag until lag decreases below desired threshold.
ZDM_SWITCHOVER_APP	Online	If the source database is idle, stops GoldenGate Extract, waits for GoldenGate Replicat to complete apply, and stops GoldenGate Replicat.

 Table C-2
 (Cont.) Logical Migration Phase Descriptions

Phase name	Online/Offline	Description
ZDM_RM_GG_EXTRACT_S RC	Online	Deletes GoldenGate Extract process on source database
ZDM_RM_GG_REPLICAT_T GT	Online	Deletes GoldenGate Replicat process on target database
ZDM_DELETE_SCHEMA_T RANDATA_SRC	Online	Disables schema level supplemental logging on source database
ZDM_RM_HEARTBEAT_SR C	Online	Drops the GoldenGate heartbeat table in source database, if the table was created by Zero Downtime Migration. Otherwise, resets update frequency to original setting.
ZDM_RM_CHECKPOINT_T GT	Online	Drops the GoldenGate checkpoint table in the target database.
ZDM_RM_HEARTBEAT_TGT	Online	Drops the GoldenGate heartbeat table in the target database, if the table was created by Zero Downtime Migration. Otherwise, resets the update frequency to the original value.
ZDM_CLEAN_GG_HUB	Online	Deletes the database connection details and credentials saved with GoldenGate Microservices

 Table C-2
 (Cont.) Logical Migration Phase Descriptions

D Zero Downtime Migration Physical Migration Response File Parameters Reference

The following topics describe the Zero Downtime Migration response file parameters used in physical migrations.

BACKUP_PATH

BACKUP_PATH specifies a valid path accessible at the source and target for migration backup type.

Property	Description
Syntax	BACKUP_PATH = {STORAGEPATH EXTBACKUP}
Default value	There is no default value.
Range of values	STORAGEPATH - NFS backup location
	EXTBACKUP - external backup location
	Leave this parameter value blank for other migration backup types

DATA_TRANSFER_MEDIUM

DATA_TRANSFER_MEDIUM specifies the media used for the source database backup, or you can specify a direct data transfer method.

Property	Description
Syntax	DATA_TRANSFER_MEDIUM = {OSS EXTBACKUP ZDLRA NFS DIRECT}
Default value	OSS

Property	Description
Property Range of values	 OSS - When MIGRATION_METHOD=ONLINE_PHYSICAL, Oracle Data Guard using OSS for standby initialization, supported for Oracle Cloud Infrastructure(OCI) virtual machine or bare metal, Exadata Cloud Service (EXACS) and Exadata Cloud at Customer (EXACC) When MIGRATION_METHOD=OFFLINE_PHYSICAL, specifying OSS will perform the migration using backup and restore through OSS, supported for Oracle Cloud Infrastructure(OCI) virtual machine or bare metal, Exadata Cloud Service (EXACS) and Exadata Cloud at Customer (EXACC) and no SQL*Net connectivity needed between source and target EXTBACKUP - Oracle Data Guard with existing backup in external location, supported for Exadata Cloud at Customer (EXACC) ZDLRA - Oracle Data Guard using ZDLRA for standby initialization, supported for Exadata Cloud at Customer (EXACC) ZDLRA - Oracle Data Guard using ZDLRA for standby initialization, supported for Exadata Cloud at Customer (EXACC) NFS - When MIGRATION_METHOD=ONLINE_PHYSICAL, Oracle Data Guard using backup location such as NFS, supported for Exadata Cloud a Customer (EXACC) When MIGRATION_METHOD=OFFLINE_PHYSICAL, specifying NFS performs the migration using backup and restore through NFS, supported for Exadata Cloud at Customer (EXACC) and no SQL*Net connectivity needed between source and target DIRECT - RMAN active database duplication or restore from service to transfer data directl from the source to the target, This transfer method also uses the ZDM_RMAN_DIRECT_METHOD and

DATAPATCH_WITH_ONE_INSTANCE_RUNNING

DATAPATCH_WITH_ONE_INSTANCE_RUNNING specifies whether or not to stop all instances except one running on the target database server when the datapatch utility is run. When datapatch completes all of the stopped instances are started.

Property	Description
Syntax	DATAPATCH_WITH_ONE_INSTANCE_RUNNING ={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Stops all instances except one running on the target database server when running the datapatch utility.
	FALSE - Does not stop all instances except one running on the target database server when running the datapatch utility.

HOST

HOST specifies the cloud storage REST endpoint URL to access Oracle Cloud Object Storage.

Property	Description
Syntax	HOST = rest_endpoint_url
Default value	There is no default value.
Range of values	For Oracle Cloud Infrastructure storage the typical value format is
	https://swiftobjectstorage.us- phoenix-1.oraclecloud.com/v1/ ObjectStorageNamespace
	For Oracle Cloud Infrastructure Classic storage the typical value format is
	https:// acme.storage.oraclecloud.com/v1/ Storage- <i>tenancy nam</i> e

Usage Notes

To access Oracle Cloud Object Storage, you must set both the <code>HOST</code> and <code>OPC_CONTAINER</code> parameters.

MAX_DATAPATCH_DURATION_MINS

MAX_DATAPATCH_DURATION_MINS specifies a timeout value, in minutes, after which if the datapatch utility has failed to complete then the operation is stopped.

Property	Description
Syntax	MAX_DATAPATCH_DURATION_MINS = minutes
Default value	There is no default value. Zero Downtime Migration waits until datapatch completes by default.

MIGRATION_METHOD

MIGRATION_METHOD specifies whether the migration uses Oracle Data Guard (online) or backup and restore (offline).

Property	Description
Syntax	MIGRATION_METHOD = {ONLINE_PHYSICAL OFFLINE_PHYSICAL}
Default value	This is no default value
Range of values	ONLINE_PHYSICAL uses Data Guard switchover migration method
	OFFLINE_PHYSICAL uses backup and restore database migration method

NONCOBTOPDB_CONVERSION

NONCDBTOPDB_CONVERSION indicates whether to convert a source database from non-CDB to PDB or skip the conversion.

Property	Description
Syntax	NONCDBTOPDB_CONVERSION = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE performs the conversion FALSE does not perform the conversion

NONCDBTOPDB_SWITCHOVER

NONCOBTOPDB_SWITCHOVER, for a physical migration using Data Guard switchover, indicates whether the switchover operations will be executed during a migration job with non-CDB to PDB conversion enabled.

Property	Description
Syntax	NONCDBTOPDB_SWITCHOVER = {TRUE FALSE}
Default value	TRUE
Range of values	TRUE performs the switchover
	FALSE does not perform the switchover

OPC_CONTAINER

OPC_CONTAINER specifies the Object Storage bucket (called the container on Oracle Cloud Infrastructure Classic), and is set to access Oracle Cloud Object Storage.

Property	Description
Syntax	OPC_CONTAINER = bucket
Default value	There is no default value.

Usage Notes

To access Oracle Cloud Object Storage, you must set both the HOST and OPC_CONTAINER parameters.

The bucket is also referred to as a container for Oracle Cloud Infrastructure Classic storage.

PLATFORM_TYPE

PLATFORM_TYPE specifies the target database platform.

Property	Description
Syntax	PLATFORM_TYPE = {VMDB EXACS EXACC NON_CLOUD}
Default value	VMDB
Range of values	VMDB - indicates target platform is Oracle Cloud Infrastructure(OCI) virtual machine or bare metal
	EXACS - indicates target platform is Exadata Cloud Service
	EXACC - indicates target platform is Exadata Cloud at Customer
	NON_CLOUD - indicates the target is an on- premises environment

SHUTDOWN_SRC

 ${\tt SHUTDOWN_SRC}$ specifies whether or not to shut down the source database after migration completes.

Property	Description
Syntax	SHUTDOWN_SRC ={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Shut down the source database after migration completes.
	FALSE - Dos not shut down the source database after migration completes.

SKIP_FALLBACK

SKIP_FALLBACK specifies whether or not to ship redo logs from the primary (target) database to the standby (source) database, either voluntarily or because there is no connectivity between the target and source database servers.

Property	Description
Syntax	SKIP_FALLBACK = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE - do not ship redo logs from the primary (target) database to the standby (source) database.
	FALSE - ship redo logs from the primary (target) database to the standby (source) database.

SKIP_SRC_SERVICE_RETENTION

SKIP_SRC_SERVICE_RETENTION specifies whether or not to retain the source database services and run them on the target database. This parameter is only effective for the BACKUP RESTORE OSS and BACKUP RESTORE NFS migration methods.

Property	Description
Syntax	SKIP_SRC_SERVICE_RETENTION ={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Do not retain the source database services. FALSE - Retain the source database services.

SRC_BASTION_HOST_IP

SRC_BASTION_HOST_IP specifies the bastion host IP address, if you want to connect to the source database server using a bastion host.

Property	Description
Syntax	<pre>SRC_BASTION_HOST_IP = IP_address</pre>
Default value	There is no default value.

Usage Notes

If you want to connect to the source database server using a bastion host, values for the bastion host IP address parameter, SRC_BASTION_HOST_IP, and the source database host IP address parameter, SRC_HOST_IP, are required in the Zero Downtime Migration response file.

If you do not want to use the default value, set the following parameters for bastion host connection.

SRC BASTION PORT - The port number defaults to 22 if not specified.

SRC_BASTION_USER - The bastion host source user is only required if the user specified for the source <code>zdmauth</code> plug-in is different from the user of the source bastion host. The

bastion user defaults to the user specified for the source zdmauth plug-in if the parameter is not specified.

SRC_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the source zdmauth plug-in.

SRC_BASTION_IDENTITY_FILE

SRC_BASTION_IDENTITY_FILE specifies the bastion user, if you want to connect to the source database server using a bastion host.

Property	Description
Syntax	<pre>SRC_BASTION_IDENTITY_FILE = identity_file</pre>
Default value	If not specified, the value defaults to the value specified for the identity_file argument of the source zdmauth plug-in.

Usage Notes

If you want to connect to the source database server using a bastion host, values for the bastion host IP address parameter, SRC_BASTION_HOST_IP, and the source database server IP address parameter, SRC_HOST_IP, are required in the Zero Downtime Migration response file.

If you do not want to use the default value, set the following parameters for bastion host connection.

SRC_BASTION_PORT - The port number defaults to 22 if not specified.

SRC_BASTION_USER - The bastion host source user is only required if the user specified for the source zdmauth plug-in is different from the user of the source bastion host. The bastion user defaults to the user specified for the source zdmauth plug-in if the parameter is not specified.

SRC_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the source zdmauth plug-in.

SRC_BASTION_PORT

SRC_BASTION_PORT specifies the bastion host port number, if you want to connect to the source database server using a bastion host.

Property	Description
Syntax	<pre>SRC_BASTION_PORT = port_number</pre>
Default value	22

Usage Notes

If you want to connect to the source database server using a bastion host, values for the bastion host IP address parameter, SRC_BASTION_HOST_IP, and the source database server IP address parameter, SRC_HOST_IP, are required in the Zero Downtime Migration response file.

If you do not want to use the default value, set the following parameters for bastion host connection.

SRC BASTION PORT - The port number defaults to 22 if not specified.

SRC_BASTION_USER - The bastion host source user is only required if the user specified for the source <code>zdmauth</code> plug-in is different from the user of the source bastion host. The bastion user defaults to the user specified for the source <code>zdmauth</code> plug-in if the parameter is not specified.

SRC_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the source zdmauth plug-in.

SRC_BASTION_USER

SRC_BASTION_USER specifies the bastion user, if you want to connect to the source database server using a bastion host.

Property	Description
Syntax	<pre>SRC_BASTION_USER = bastion_user</pre>
Default value	The bastion user defaults to the user specified for the source zdmauth plug-in if the parameter is not specified.

Usage Notes

If you want to connect to the source database server using a bastion host, values for the bastion host IP address parameter, SRC_BASTION_HOST_IP, and the source database server IP address parameter, SRC_HOST_IP, are required in the Zero Downtime Migration response file.

If you do not want to use the default value, set the following parameters for bastion host connection.

SRC BASTION PORT - The port number defaults to 22 if not specified.

SRC_BASTION_USER - The bastion host source user is only required if the user specified for the source <code>zdmauth</code> plug-in is different from the user of the source bastion host. The bastion user defaults to the user specified for the source <code>zdmauth</code> plug-in if the parameter is not specified.

SRC_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity_file argument of the source zdmauth plug-in.

SRC_CONFIG_LOCATION

SRC_CONFIG_LOCATION specifies the SSH configuration file location on the Zero Downtime Migration service host (host where Zero Downtime Migration service is running).

Property	Description
Syntax	<pre>SRC_CONFIG_LOCATION = SSH_config_file_path</pre>
Default value	User_home/.ssh/config

Usage Notes

Set SRC_CONFIG_LOCATION to the full path of the SSH configuration file location on the Zero Downtime Migration service host, for example, /home/crsuser/.ssh/config.

SRC_DB_LISTENER_PORT

SRC_DB_LISTENER_PORT indicates the source database listener port. Set this property when there is Standalone Database (no Grid Infrastructure) configured with non-default SCAN listener port other than 1521.

Property	Description
Syntax	<pre>SRC_DB_LISTENER_PORT = listener_port_number</pre>
Default value	1521

SRC_HOST_IP

SRC_HOST_IP specifies the bastion user, if you want to connect to the source database server using a bastion host.

Property	Description
Syntax	SRC_HOST_IP = IP_address
Default value	There is no default value.

Usage Notes

If you want to connect to the source database server using a bastion host, values for the bastion host IP address parameter, SRC_BASTION_HOST_IP, and the source database server IP address parameter, SRC_HOST_IP, are required in the Zero Downtime Migration response file.

If you do not want to use the default value, set the following parameters for bastion host connection.

SRC BASTION PORT - The port number defaults to 22 if not specified.

SRC_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the source zdmauth plug-in.

SRC_HTTP_PROXY_PORT

SRC_HTTP_PROXY_PORT specifies the HTTPS proxy port number on the source database server if an SSH connection needs to connect using a proxy.

_PROXY_PORT = oxy_port_number
o default value.

SRC_HTTP_PROXY_URL

SRC_HTTP_PROXY_URL specifies the HTTPS proxy URL on the source database server if an SSH connection needs to connect using a proxy.

Property	Description
Syntax	SRC_HTTP_PROXY_URL = https_proxy_url
Default value	There is no default value.

SRC_OSS_PROXY_HOST

SRC_OSS_PROXY_HOST specifies the Object Storage Service proxy host on the source database server if a proxy is needed for connecting to the Object Store.

Property	Description
Syntax	<pre>SRC_OSS_PROXY_HOST = oss_proxy_host</pre>
Default value	There is no default value.

Usage Notes

Set both the SRC_OSS_PROXY_HOST and SRC_OSS_PROXY_PORT parameters if a proxy is needed for connecting to the Object Store.

SRC_OSS_PROXY_PORT

SRC_OSS_PROXY_PORT specifies the Object Storage Service proxy port number on the source database server if a proxy is needed for connecting to the Object Store.

Property	Description
Syntax	<pre>SRC_OSS_PROXY_PORT = oss_proxy_port_number</pre>
Default value	There is no default value.

Usage Notes

Set both the SRC_OSS_PROXY_HOST and SRC_OSS_PROXY_PORT parameters if a proxy is needed for connecting to the Object Store.

SRC_PDB_NAME

 $\ensuremath{\texttt{SRC_PDB_NAME}}$ indicates the source database PDB name.

Property	Description
Syntax	<pre>SRC_PDB_NAME = source_database_pdb_name</pre>
Default value	No default value

SRC_RMAN_CHANNELS

SRC_RMAN_CHANNELS specifies the number of RMAN channels to be allocated at the source database server for performing RMAN backups.

Property	Description
Syntax	<pre>SRC_RMAN_CHANNELS = number_of_channels</pre>
Default value	10

SRC_SSH_RETRY_TIMEOUT

SRC_SSH_RETRY_TIMEOUT specifies a timeout value, in minutes, after which Zero Downtime Migration stops attempting SSH connections after an initial failure to connect.

Property	Description
Syntax	SRC_SSH_RETRY_TIMEOUT = number_of_minutes
Default value	There is no default value.

SRC_TIMEZONE

SRC_TIMEZONE specifies the source database server time zone, which is needed for SIDB case when there is no Grid Infrastructure configured.

Property	Description
Syntax	<pre>SRC_TIMEZONE = source_db_time_zone</pre>
Default value	There is no default value.

SRC_ZDLRA_WALLET_LOC

SRC_ZDLRA_WALLET_LOC specifies the path of the Zero Data Loss Recovery Appliance wallet on the source database server.

Property	Description
Syntax	<pre>SRC_ZDLRA_WALLET_LOC = source_zdlra_wallet_location</pre>
	The expected format for the location is /u02/app/oracle/product/12.1.0/ dbhome_3/dbs/zdlra
Default value	There is no default value.

Usage Notes

When using Zero Data Loss Recovery Appliance as the migration backup medium, you must set the following parameters.

SRC ZDLRA WALLET LOC

TGT ZDLRA WALLET LOC

ZDLRA_CRED_ALIAS

TGT_BASTION_HOST_IP

TGT_BASTION_HOST_IP specifies the bastion host IP address, if you want to connect to the target database server using a bastion host.

Property	Description
Syntax	TGT_BASTION_HOST_IP = bastion_ip_address
Default value	There is no default value.

Usage Notes

If you want to connect to the target database server using a bastion host, you are required to configure values for the bastion host IP address parameter, TGT_BASTION_HOST_IP, and the target database server IP address parameter, TGT_HOST_IP, in the Zero Downtime Migration response file.

If you do not want to use the default values for the remaining bastion connection parameters, set the following parameters to configure the bastion host connection.

TGT BASTION PORT - The port number defaults to 22 if not specified.

 $TGT_BASTION_USER$ - The bastion host target user is only required if the user specified for the target zdmauth plug-in is different from the user of the target bastion host. The bastion user defaults to the user specified for the target zdmauth plug-in if the parameter is not specified.

TGT_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the target zdmauth plug-in.

TGT_BASTION_IDENTITY_FILE

TGT_BASTION_IDENTITY_FILE specifies the bastion user, if you want to connect to the target database server using a bastion host.

Property	Description
Syntax	TGT_BASTION_IDENTITY_FILE = identity_file
Default value	If not specified, the value defaults to the value specified for the identity_file argument of the target zdmauth plug-in.

Usage Notes

If you want to connect to the target database server using a bastion host, you are required to configure values for the bastion host IP address parameter, <code>TGT_BASTION_HOST_IP</code>, and the target database server IP address parameter, <code>TGT_HOST_IP</code>, in the Zero Downtime Migration response file.

If you do not want to use the default values for the remaining bastion connection parameters, set the following parameters to configure the bastion host connection.

TGT BASTION PORT - The port number defaults to 22 if not specified.

TGT_BASTION_USER - The bastion host target user is only required if the user specified for the target zdmauth plug-in is different from the user of the target bastion host. The bastion user defaults to the user specified for the target zdmauth plug-in if the parameter is not specified.

TGT_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the target zdmauth plug-in.

TGT_BASTION_PORT

TGT_BASTION_PORT specifies the bastion host port number, if you want to connect to the target database server using a bastion host.

Property	Description
Syntax	TGT_BASTION_PORT = port_number
Default value	22

Usage Notes

If you want to connect to the target database server using a bastion host, you are required to configure values for the bastion host IP address parameter, <code>TGT_BASTION_HOST_IP</code>, and the target database server IP address parameter, <code>TGT_HOST_IP</code>, in the Zero Downtime Migration response file.

If you do not want to use the default values for the remaining bastion connection parameters, set the following parameters to configure the bastion host connection.

TGT BASTION PORT - The port number defaults to 22 if not specified.

TGT_BASTION_USER - The bastion host target user is only required if the user specified for the target zdmauth plug-in is different from the user of the target bastion host. The bastion user defaults to the user specified for the target zdmauth plug-in if the parameter is not specified.

TGT_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the target zdmauth plug-in.

TGT_BASTION_USER

TGT_BASTION_USER specifies the bastion user, if you want to connect to the target database server using a bastion host.

Property	Description
Syntax	TGT_BASTION_USER = bastion_user
Default value	The bastion user defaults to the user specified for the target zdmauth plug-in if the parameter is not specified.

Usage Notes

If you want to connect to the target database server using a bastion host, you are required to configure values for the bastion host IP address parameter, TGT_BASTION_HOST_IP, and the target database server IP address parameter, TGT_HOST_IP, in the Zero Downtime Migration response file.

If you do not want to use the default values for the remaining bastion connection parameters, set the following parameters to configure the bastion host connection.

TGT BASTION PORT - The port number defaults to 22 if not specified.

TGT_BASTION_USER - The bastion host target user is only required if the user specified for the target zdmauth plug-in is different from the user of the target bastion host. The bastion user defaults to the user specified for the target zdmauth plug-in if the parameter is not specified.

TGT_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity_file argument of the target zdmauth plug-in.

TGT_CONFIG_LOCATION

TGT_CONFIG_LOCATION specifies the SSH configuration file location on the Zero Downtime Migration service host (host where Zero Downtime Migration service is running).

Property	Description
Syntax	TGT_CONFIG_LOCATION = SSH_config_file_path
Default value	User_home/.ssh/config

Set TGT_CONFIG_LOCATION to the full path of the SSH configuration file location on the Zero Downtime Migration service host, for example, /home/crsuser/.ssh/config.

TGT_DATAACFS

TGT_DATAACFS specifies the location for the data files ACFS volume (data) on the target database. Use only if required to override the values discovered automatically by Zero Downtime Migration.

Property	Description
Syntax	TGT_DATAACFS = data_location
Default value	There is no default value.

Usage Notes

Zero Downtime Migration discovers the location for ASM and ACFS data, redo, and reco storage volumes from the specified target database, making these target database storage properties optional.

If you need to override the values automatically discovered by Zero Downtime Migration, then you can set the following parameters. For example, TGT DATADG=+DATAC3

For ASM use these parameters

TGT DATADG

TGT_REDODG

TGT RECODG

For ACFS use these parameters

TGT_DATAACFS

TGT_REDOACFS

TGT RECOACFS

TGT_DATADG

TGT_DATADG specifies the location for the data files ASM disk group (data) on the target database. Use only if required to override the values discovered automatically by Zero Downtime Migration.

Property	Description
Syntax	$TGT_DATADG = data_location$
Default value	There is no default value.

Zero Downtime Migration discovers the location for ASM and ACFS data, redo, and reco storage volumes from the specified target database, making these target database storage properties optional.

If you need to override the values automatically discovered by Zero Downtime Migration, then you can set the following parameters. For example, TGT DATADG=+DATAC3

For ASM use these parameters

TGT DATADG

TGT_REDODG

TGT_RECODG

For ACFS use these parameters

- TGT_DATAACFS
- TGT_REDOACFS

TGT RECOACFS

TGT_DB_UNIQUE_NAME

TGT_DB_UNIQUE_NAME is used by Zero Downtime Migration to identify the target database.

Property	Description
Syntax	TGT_DB_UNIQUE_NAME = value of target database DB_UNIQUE_NAME
Default value	

Usage Notes

Set TGT_DB_UNIQUE_NAME to the target database DB_UNIQUE_NAME value.

If the target database is Oracle Cloud Infrastructure, Exadata Cloud Service, or Exadata Cloud at Customer, the target database DB_UNIQUE_NAME parameter value must be unique to ensure that Oracle Data Guard can identify the target as a different database from the source database.

TGT_HOST_IP

TGT_HOST_IP specifies the bastion user, if you want to connect to the target database server using a bastion host.

Property	Description
Syntax	TGT_HOST_IP = <i>IP_address</i>
Default value	There is no default value.

If you want to connect to the target database server using a bastion host, you are required to configure values for the bastion host IP address parameter, <code>TGT_BASTION_HOST_IP</code>, and the target database server IP address parameter, <code>TGT_HOST_IP</code>, in the Zero Downtime Migration response file.

If you do not want to use the default values for the remaining bastion connection parameters, set the following parameters to configure the bastion host connection.

TGT BASTION PORT - The port number defaults to 22 if not specified.

TGT_BASTION_USER - The bastion host target user is only required if the user specified for the target zdmauth plug-in is different from the user of the target bastion host. The bastion user defaults to the user specified for the target zdmauth plug-in if the parameter is not specified.

TGT_BASTION_IDENTITY_FILE - If not specified, the value defaults to the value specified for the identity file argument of the target zdmauth plug-in.

TGT_HTTP_PROXY_PORT

TGT_HTTP_PROXY_PORT specifies the HTTPS proxy port if an SSH connection needs to use a proxy to connect to the target database server.

Property	Description
Syntax	TGT_HTTP_PROXY_PORT = https_proxy_port_number
Default value	There is no default value.

Usage Notes

Set both the TGT_HTTP_PROXY_URL and TGT_HTTP_PROXY_PORT parameters if the SSH connection needs to use an HTTPS proxy to connect to the target database server.

TGT_HTTP_PROXY_URL

TGT_HTTP_PROXY_URL specifies the HTTPS proxy URL if an SSH connection needs to use a proxy to connect to the target database server.

Property	Description
Syntax	TGT_HTTP_PROXY_URL = https_proxy_url
Default value	There is no default value.

Usage Notes

Set both the TGT_HTTP_PROXY_URL and TGT_HTTP_PROXY_PORT parameters if the SSH connection needs to use an HTTPS proxy to connect to the target database server.

TGT_OSS_PROXY_HOST

TGT_OSS_PROXY_HOST specifies the Object Storage Service proxy host on the target database server if a proxy is needed for connecting to the Object Store.

Property	Description
Syntax	TGT_OSS_PROXY_HOST = oss_proxy_host
Default value	There is no default value.

Usage Notes

Set both the TGT_OSS_PROXY_HOST and TGT_OSS_PROXY_PORT parameters if a proxy is needed for connecting to the Object Store.

TGT_OSS_PROXY_PORT

TGT_OSS_PROXY_PORT specifies the Object Storage Service proxy port number on the target database server if a proxy is needed for connecting to the Object Store.

Property	Description
Syntax	TGT_OSS_PROXY_PORT = oss_proxy_port_number
Default value	There is no default value.

Usage Notes

Set both the TGT_OSS_PROXY_HOST and TGT_OSS_PROXY_PORT parameters if a proxy is needed for connecting to the Object Store.

TGT_RECOACFS

TGT_RECOACFS specifies the location for the fast recovery area ACFS volume (reco) on the target database. Use only if required to override the values discovered automatically by Zero Downtime Migration.

Property	Description
Syntax	TGT_RECOACFS = reco_location
Default value	There is no default value.

Usage Notes

Zero Downtime Migration discovers the location for ASM and ACFS data, redo, and reco storage volumes from the specified target database, making these target database storage properties optional.

If you need to override the values automatically discovered by Zero Downtime Migration, then you can set the following parameters. For example, ${\tt TGT_DATADG=+DATAC3}$

For ASM use these parameters

TGT DATADG

TGT REDODG

TGT_RECODG

For ACFS use these parameters

TGT_DATAACFS

TGT REDOACFS

TGT RECOACFS

TGT_RECODG

TGT_RECODG specifies the location for the fast recovery area ASM disk group (reco) on the target database. Use only if required to override the values discovered automatically by Zero Downtime Migration.

Property	Description
Syntax	TGT_RECODG = reco_location
Default value	There is no default value.

Usage Notes

Zero Downtime Migration discovers the location for ASM and ACFS data, redo, and reco storage volumes from the specified target database, making these target database storage properties optional.

If you need to override the values automatically discovered by Zero Downtime Migration, then you can set the following parameters. For example, TGT DATADG=+DATAC3

For ASM use these parameters

TGT DATADG

TGT_REDODG

TGT_RECODG

For ACFS use these parameters

TGT DATAACFS

TGT REDOACFS

TGT RECOACFS

TGT_REDOACFS

TGT_REDOACFS specifies the location for redo log files ACFS volume (redo) on the target database. Use only if required to override the values discovered automatically by Zero Downtime Migration.

Property	Description
Syntax	TGT_REDOACFS = redo_location
Default value	There is no default value.

Zero Downtime Migration discovers the location for ASM and ACFS data, redo, and reco storage volumes from the specified target database, making these target database storage properties optional.

If you need to override the values automatically discovered by Zero Downtime Migration, then you can set the following parameters. For example, TGT DATADG=+DATAC3

For ASM use these parameters

TGT_DATADG

TGT_REDODG

TGT RECODG

For ACFS use these parameters

TGT DATAACFS

TGT_REDOACFS

TGT RECOACFS

TGT_REDODG

TGT_REDODG specifies the location for redo log files ASM disk group (redo) on the target database. Use only if required to override the values discovered automatically by Zero Downtime Migration.

Property	Description
Syntax	TGT_REDODG = redo_location
Default value	There is no default value.

Usage Notes

Zero Downtime Migration discovers the location for ASM and ACFS data, redo, and reco storage volumes from the specified target database, making these target database storage properties optional.

If you need to override the values automatically discovered by Zero Downtime Migration, then you can set the following parameters. For example, ${\tt TGT_DATADG=+DATAC3}$

For ASM use these parameters

TGT_DATADG

TGT_REDODG

TGT_RECODG

For ACFS use these parameters

TGT DATAACFS

TGT REDOACFS

TGT_RECOACFS

TGT_RETAIN_DB_UNIQUE_NAME

TGT_RETAIN_DB_UNIQUE_NAME specifies whether to ship redo logs from Oracle Cloud to the on-premises standby, observe the environment for some time, and remove the fallback later.

When TGT_RETAIN_DB_UNIQUE_NAME=TRUE then the workflow phase ZDM_RETAIN_DBUNIQUENAME_TGT is present as the final phase. You must pause the migration job at a prior phase and resume the job when the fallback has to be removed.

Property	Description
Syntax	TGT_RETAIN_DB_UNIQUE_NAME = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE - enables this feature FALSE - disables this feature

TGT_RMAN_CHANNELS

TGT_RMAN_CHANNELS specifies the number of RMAN channels to be allocated at the target database server for performing RMAN restore.

Property	Description
Syntax	TGT_RMAN_CHANNELS = number_of_channels
Default value	10

TGT_SKIP_DATAPATCH

TGT_SKIP_DATAPATCH specifies whether or not Zero Downtime Migration runs the datapatch utility on the target database as part of the post-migration tasks.

Property	Description
Syntax	TGT_SKIP_DATAPATCH = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE - do not allow Zero Downtime Migration to run datapatch
	FALSE - allow Zero Downtime Migration to run datapatch

If the target database environment is at a higher patch level than the source database (for example, if the source database is at Jan 2020 PSU/BP and the target database is at April 2020 PSU/BP), then set the TGT_SKIP_DATAPATCH parameter to FALSE to allow Zero Downtime Migration to run the datapatch utility on the target database as part of the post-migration tasks.

Otherwise, set the parameter to TRUE, and if the target database environment is at a higher patch level than the source database, you will need to run the datapatch utility manually after the migration.

TGT_SSH_RETRY_TIMEOUT

TGT_SSH_RETRY_TIMEOUT specifies the number of minutes during which retries are attempted after SSH connection failures. Retries stop when the timeout value has elapsed.

Property	Description
Syntax	TGT_SSH_RETRY_TIMEOUT = number_of_minutes
Default value	There is no default value.

TGT_SSH_TUNNEL_PORT

TGT_SSH_TUNNEL_PORT specifies the forwarding port on the source database server where the SSH tunnel to the target database server for SQL*Net connection is set up.

Property	Description
Syntax	TGT_SSH_TUNNEL_PORT = ssh_tunnel_port_number
Default value	There is no default value.

TGT_ZDLRA_WALLET_LOC

TGT_ZDLRA_WALLET_LOC specifies the path of the Zero Data Loss Recovery Appliance wallet on the target database server.

Property	Description
Syntax	TGT_ZDLRA_WALLET_LOC = target_zdlra_wallet_location
	The expected format for the location is /u02/app/oracle/product/12.1.0/ dbhome_3/dbs/zdlra
Default value	There is no default value.

When using Zero Data Loss Recovery Appliance as the migration backup medium, you must set the following parameters.

SRC_ZDLRA_WALLET_LOC
TGT_ZDLRA_WALLET_LOC

ZDLRA_CRED_ALIAS

ZDLRA_CRED_ALIAS

ZDLRA CRED ALIAS specifies the Zero Data Loss Recovery Appliance wallet credential alias.

Property	Description
Syntax	ZDLRA_CRED_ALIAS = zdlra_wallet_alias
	The expected format for the alias is <i>zdlra scan:listener port/zdlra9:dedicated</i>
Default value	There is no default value.

Usage Notes

When using Zero Data Loss Recovery Appliance as the migration backup medium, you must set the following parameters.

SRC_ZDLRA_WALLET_LOC

TGT_ZDLRA_WALLET_LOC

ZDLRA_CRED_ALIAS

ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERV AL

ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL specifies the time interval, in minutes, at which to monitor and report the progress of the ZDM_BACKUP_DIFFERENTIAL_SRC migration job phase.

Property	Description
Syntax	ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_ INTERVAL = minutes
Default value	10

Usage Notes

The migration job phase monitoring interval parameters, listed below, monitor and report the backup and restore operations progress at the set time interval, specified in minutes. Note that the migration job phase for which the monitoring interval applies is prefixed to MONITORING INTERVAL in each parameter listed above.

- ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL
- ZDM_CLONE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

To disable a monitoring interval parameter, set it to 0 (zero).

ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL

ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL specifies the time interval, in minutes, at which to monitor and report the progress of the ZDM_BACKUP_FULL_SRC migration job phase.

Property	Description
Syntax	ZDM_BACKUP_FULL_SRC_MONITORING_INTER VAL = minutes
Default value	10

Usage Notes

The migration job phase monitoring interval parameters, listed below, monitor and report the backup and restore operations progress at the set time interval, specified in minutes. Note that the migration job phase for which the monitoring interval applies is prefixed to MONITORING INTERVAL in each parameter listed above.

- ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL
- ZDM_CLONE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

To disable a monitoring interval parameter, set it to 0 (zero).

ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INT ERVAL

ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL specifies the time interval, in minutes, at which to monitor and report the progress of the ZDM_BACKUP_INCREMENTAL_SRC migration job phase.

Property	Description
Syntax	ZDM_BACKUP_INCREMENTAL_SRC_MONITORIN
	G_INTERVAL = minutes

Property	Description
Default value	10

The migration job phase monitoring interval parameters, listed below, monitor and report the backup and restore operations progress at the set time interval, specified in minutes. Note that the migration job phase for which the monitoring interval applies is prefixed to MONITORING INTERVAL in each parameter listed above.

- ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL
- ZDM_CLONE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

To disable a monitoring interval parameter, set it to 0 (zero).

ZDM_BACKUP_RETENTION_WINDOW

ZDM_BACKUP_RETENTION_WINDOW specifies the number of days after which backups created by Zero Downtime Migration become obsolete.

Property	Description
Syntax	ZDM_BACKUP_RETENTION_WINDOW = days
Default value	60

ZDM_BACKUP_TAG

ZDM_BACKUP_TAG specifies an RMAN backup tag that can be used to perform a database migration or create a backup.

Use cases:

Set ZDM_USE_EXISTING_BACKUP=TRUE to use the specified RMAN backup in ZDM_BACKUP_TAG as the full backup, to skip the full backup phase in a migration job. An error is thrown if the backup associated with the specified tag is not valid.

Set ZDM_USE_EXISTING_BACKUP=FALSE if you wish to create a backup with the specified tag in ZDM BACKUP TAG

Property	Description
Syntax	ZDM_BACKUP_TAG= <i>RMAN backup tag</i>
Default value	There is no default value
Range of values	Specify a valid RMAN backup tag to create or use an existing backup in the migration.

ZDM_CLONE_TGT_MONITORING_INTERVAL

ZDM_CLONE_TGT_MONITORING_INTERVAL specifies the time interval, in minutes, at which to monitor and report the progress of the ZDM_CLONE_TGT migration job phase.

Property	Description
Syntax	ZDM_CLONE_TGT_MONITORING_INTERVAL = minutes
Default value	10

Usage Notes

The migration job phase monitoring interval parameters, listed below, monitor and report the backup and restore operations progress at the set time interval, specified in minutes. Note that the migration job phase for which the monitoring interval applies is prefixed to MONITORING INTERVAL in each parameter listed above.

- ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL
- ZDM_CLONE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

To disable a monitoring interval parameter, set it to 0 (zero).

ZDM_CURL_LOCATION

ZDM CURL LOCATION specifies a custom location for the CURL binary on the source.

Property	Description
Syntax	<pre>ZDM_CURL_LOCATION = curl_location</pre>
Default value	/usr/bin/curl

ZDM_LOG_OSS_PAR_URL

ZDM_LOG_OSS_PAR_URL specifies the pre-authenticated URL to use when uploading logs to Object Storage Service. The logs capture the current migration job phase and the execution status of the phase.

Property	Description
Syntax	ZDM_LOG_OSS_PAR_URL = url
Default value	There is no default value. By default this parameter is disabled.

ZDM_OPC_RETRY_COUNT

ZDM_OPC_RETRY_COUNT specifies the number of retry attempts tat will be made after an initial Object Store connection failure.

Property	Description
Syntax	ZDM_OPC_RETRY_COUNT = number
Default value	0 (zero)
	The default behavior is to attempt no retries.

ZDM_OPC_RETRY_WAIT_TIME

ZDM_OPC_RETRY_WAIT_TIME specifies the number of seconds to wait after an Object Store connection failure before attempting to retry the connection.

Property	Description
Syntax	<pre>ZDM_OPC_RETRY_WAIT_TIME = seconds</pre>
Default value	529 (seconds)

ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL specifies the time interval, in minutes, at which to monitor and report the progress of the ZDM OSS RECOVER TGT migration job phase.

Property	Description
Syntax	<pre>ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL = minutes</pre>
Default value	10

Usage Notes

The migration job phase monitoring interval parameters, listed below, monitor and report the backup and restore operations progress at the set time interval, specified in minutes. Note that the migration job phase for which the monitoring interval applies is prefixed to MONITORING INTERVAL in each parameter listed above.

- ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL
- ZDM_CLONE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

To disable a monitoring interval parameter, set it to 0 (zero).

ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL

ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL specifies the time interval, in minutes, at which to monitor and report the progress of the ZDM_OSS_RESTORE_TGT migration job phase.

Property	Description
Syntax	ZDM_OSS_RESTORE_TGT_MONITORING_INTER VAL = minutes
Default value	10

Usage Notes

The migration job phase monitoring interval parameters, listed below, monitor and report the backup and restore operations progress at the set time interval, specified in minutes. Note that the migration job phase for which the monitoring interval applies is prefixed to _MONITORING_INTERVAL in each parameter listed above.

- ZDM_BACKUP_FULL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_INCREMENTAL_SRC_MONITORING_INTERVAL
- ZDM_BACKUP_DIFFERENTIAL_SRC_MONITORING_INTERVAL
- ZDM_CLONE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RESTORE_TGT_MONITORING_INTERVAL
- ZDM_OSS_RECOVER_TGT_MONITORING_INTERVAL

To disable a monitoring interval parameter, set it to 0 (zero).

ZDM_RMAN_COMPRESSION_ALGORITHM

ZDM_RMAN_COMPRESSION_ALGORITHM specifies which RMAN compression algorithm to use for backups.

Property	Description
Syntax	ZDM_RMAN_COMPRESSION_ALGORITHM ={BASIC LOW MEDIUM HIGH}
Default value	MEDIUM
Range of values	BASIC - Does not require the Advanced Compression Option (ACO).
	LOW - Least impact on backup throughput and suited for environments where CPU resources are the limiting factor.
	MEDIUM - Recommended for most environments. Good combination of compression ratios and speed
	HIGH - Best suited for backups over slower networks where the limiting factor is network speed

ZDM_RMAN_DIRECT_METHOD

ZDM_RMAN_DIRECT_METHOD specifies the RMAN method (restore from service or active duplicate) to use when DATA_TRANSFER_MEDIUM=DIRECT data transfer method is specified.

You must also set the ZDM_SRC_DB_RESTORE_SERVICE_NAME parameter if you configure a physical migration using direct data transfer (DATA_TRANSFER_MEDIUM=DIRECT).

See Direct Data Transfer Support for more information about using direct data transfer in a physical migration

Property	Description
Syntax	ZDM_RMAN_DIRECT_METHOD = {RESTORE_FROM_SERVICE ACTIVE_DUPLICATE}
Default value	RESTORE_FROM_SERVICE
Range of values	 RESTORE _FROM _SERVICE - Instantiates the standby target using RMAN restore from service. Restore from service is supported in Oracle Database 12.1 and later. ACTIVE_DUPLICATE - Instantiates the standby target using RMAN active duplicate. Active duplicate is supported in Oracle Database 11gR2 and later.

ZDM_SHARD_ID

ZDM_SHARD_ID is used to ensure that a migration job is running or is being resumed in the correct intended pod.

In a scenario where Zero Downtime Migration is scaled out to service multiple simultaneous migrations, each ZDM server has its own metadata store, which means that the same migration job ID values could be repeated across multiple ZDM servers.

To avoid job ID conflicts which could cause the incorrect job to be resumed on the incorrect ZDM server, the ZDM_SHARD_ID for each job will be configured contain the ZDM host name to which the migration job is being sent. This value will be seeded by E2E during RSP creation.

The value of ZDM_SHARD_ID and the other RSP tokens will be used by ZDM to confirm that the job metadata matches the RSP file values for the source and target database properties to ensure the correct job ID and ZDM server are resumed.

If the value from <code>ZDM_SHARD_ID</code> in the response file is set, and it does not match the current host name, the following exception is thrown:

PRGZ-##### : Specified shard ID zdm_host_name_a does not match with current ZDM host zdm_host_name_b.

in which den01gl is the value read from the response file, and den01glt is the current pod's host name

Property	Description
Syntax	ZDM_SHARD_ID = zdm_host_name
Default value	No default value
	By default, ZDM will not consider the host name before starting or resuming a job.
Range of values	ZDM_SHARD_ID accepts the host name of the pod in which the current job will be run or resumed. It accepts host name or fully qualified domain name.
	The ZDM_SHARD_ID verification is case insensitive

ZDM_SKIP_DG_CONFIG_CLEANUP

ZDM_SKIP_DG_CONFIG_CLEANUP indicates whether Zero Downtime Migration should clean up the Oracle Data Guard configuration from the source and target databases at the end of the migration when using online physical migration.

Property	Description
Syntax	ZDM_SKIP_DG_CONFIG_CLEANUP ={TRUE FALSE}
Default value	FALSE
	By default, ZDM will deconfigure Data Guard parameters configured for migration.
Range of values	TRUE - Do not clean up the Oracle Data Guard configuration.
	FALSE - Clean up the Oracle Data Guard configuration.

ZDM_SRC_DB_RESTORE_SERVICE_NAME

ZDM_SRC_DB_RESTORE_SERVICE_NAME specifies the fully qualified name of the service on the source database to be used for an online physical migration (MIGRATION_METHOD=ONLINE_PHYSICAL) using direct data transfer (DATA_TRANSFER_MEDIUM=DIRECT).

You must also set the ZDM_RMAN_DIRECT_METHOD parameter if you configure a physical migration using direct data transfer (DATA TRANSFER MEDIUM=DIRECT).

See Direct Data Transfer Support for more information about using direct data transfer in a physical migration

Property

Description

Syntax

ZDM_SRC_DB_RESTORE_SERVICE_NAME =
source_database_service

Property	Description
Default value	There is no default value.
	If not specified, the default database service is used.

ZDM_SRC_TNS_ADMIN

ZDM_SRC_TNS_ADMIN specifies the custom location for TNS_ADMIN on the source database server when there is no Oracle Grid Infrastructure. If a Grid Infrastructure exists, then the TNS_ADMIN property must be set in the CRS resource attribute environment of the database resource.

Property	Description
Syntax	<pre>ZDM_SRC_TNS_ADMIN = tns_admin_location</pre>
Default value	There is no default value.

ZDM_USE_EXISTING_BACKUP

ZDM_USE_EXISTING_BACKUP indicates whether Zero Downtime Migration can use an existing RMAN backup to perform a database migration.

If this parameter is set to TRUE, you must also set parameter ZDM_BACKUP_TAG. If no value is provided for ZDM BACKUP TAG, and ZDM USE EXISTING BACKUP=TRUE an error is thrown.

Property	Description
Syntax	ZDM_USE_EXISTING_BACKUP ={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Use an existing RMAN backup for the migration
	FALSE - Do not use an existing RMAN backup for the migration

ZDM_USE_EXISTING_UNDO_SIZE

ZDM_USE_EXISTING_UNDO_SIZE specifies whether Zero Downtime Migration should use the existing undo tablespace size when creating a new undo tablespace, if required.

Property	Description
Syntax	ZDM_USE_EXISTING_UNDO_SIZE ={TRUE FALSE}
Default value	TRUE
	By default, Zero Downtime Migration uses the largest size of the existing undo tablespaces.

Property	Description
Range of values	TRUE - Use the existing undo tablespace size.
	FALSE - Do not use the existing undo tablespace size.

E Zero Downtime Migration Logical Migration Response File Parameters Reference

Zero Downtime Migration response file parameters supported for logical migrations.

DATA_TRANSFER_MEDIUM

Specifies how data will be transferred from the source database system to the target database system.

See also Configuring the Transfer Medium and Specifying Transfer Nodes

Property	Description
Syntax	DATA_TRANSFER_MEDIUM = {OSS NFS DBLINK COPY AMAZON3}
Default value	OSS
Range of values	OSS - Object Storage Service
	NFS - Network File System
	DBLINK - Direct transfer of data over a database link
	COPY - secure copy (for user-managed targets only)
	AMAZON3 - Amazon Simple Storage Service (Amazon S3) bucket (only supported when SOURCEDATABASE_ENVIRONMENT_NAME=AMAZON
Required	Yes
Modifiable on Resume	No

DATAPUMPSETTINGS_CREATEAUTHTOKEN

Indicates whether to create a new OCI Auth Token.

If you are not using a network database link for Data Pump Import, an OCI Auth Token is created for the specified OCI user to import Data Pump dump files from the Object Storage into an Autonomous Database.

To reuse an existing Auth Token, set this property to FALSE.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_CREATEAUTHTOKEN ={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Creates an OCI Auth Token for the specified OCI user FALSE - Does not create an OCI Auth Token.
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATABASELINKDETAILS_NAME

Specifies the name of the database link from the OCI database to the on-premise database.

Zero Downtime Migration creates the database link if the link does not already exist.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

The DATAPUMPSETTINGS_DATABASELINKDETAILS_* parameters are optional details for creating a network database link from OCI database to the on-premise database.

Property	Description
Syntax	DATAPUMPSETTINGS_DATABASELINKDETAILS _NAME = db_link_name
Default value	There is no default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until
	ZDM_VALIDATE_DATAPUMP_SETTINGS_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATABASELINKDETAILS_WALLE TBUCKET_BUCKETNAME

Specifies the OCI Object Storage bucket.

The DATAPUMPSETTINGS_DATABASELINKDETAILS_WALLETBUCKET_* parameters are used with Autonomous Database migration targets. These parameters settings specify the OCI Object Storage details used to store the wallet containing the certificate for on-premise database to create a database link from the Autonomous Database to the on-premise database using TLS.

Not required for a TCP connection from Autonomous Database to the on-premise database.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_DATABASELINKDETAILS_WA LLETBUCKET_BUCKETNAME = Object Storage bucket name
Default value	There is no default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATABASELINKDETAILS_WALLETBU CKET NAMESPACENAME

Specifies the Object Storage namespace.

The DATAPUMPSETTINGS_DATABASELINKDETAILS_WALLETBUCKET_* parameters are used with Autonomous Database migration targets. These parameters settings specify the OCI Object Storage details used to store the wallet containing the certificate for on-premise database to create a database link from the Autonomous Database to the on-premise database using TLS.

Not required for a TCP connection from Autonomous Database to the on-premise database.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_DATABASELINKDETAILS_WA LLETBUCKET_NAMESPACENAME = Object Storage bucket namespace
Default value	There is no default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATABUCKET_BUCKETNAME

In lieu of a network database link, the OCI Object Storage bucket specified in DATAPUMPSETTINGS_DATABUCKET_BUCKETNAME is used to store Data Pump dump files for migrating to an Autonomous Database.

DATAPUMPSETTINGS_DATABUCKET_BUCKETNAME is one of the optional settings for logical migrations using Data Pump.

Use with <code>DATAPUMPSETTINGS_DATABUCKET_NAMESPACENAME</code>

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_DATABUCKET_BUCKETNA ME = Name of the Object Storage bucket
Default value	There is no default value
Range of values	Enter the storage bucket name
Required	No
Modifiable on Resume	Until ZDM_VALIDATE_DATAPUMP_SETTINGS_SRC phase is COMPLETED.

DATAPUMPSETTINGS_DATABUCKET_NAMESPACENAM

In lieu of a network database link, the OCI Object Storage bucket specified with DATAPUMPSETTINGS_DATABUCKET_NAMESPACENAME is used to store Data Pump dump files for migrating to an Autonomous Database.

DATAPUMPSETTINGS_DATABUCKET_NAMESPACENAME is one of the optional settings for logical migrations using Data Pump.

Use with datapumpsettings databucket bucketname

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_DATABUCKET_NAMESPAC ENAME = Object Storage namespace
Default value	There is no default value
Range of values	Enter the storage bucket namespace

Property	Description
Required	No
Modifiable on Resume	Until ZDM_VALIDATE_DATAPUMP_SETTINGS_SRC phase is COMPLETED.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_ESTIMAT EBYSTATISTICS

Specifies the STATISTICS method for Data Pump dump size estimation.

Zero Downtime Migration estimates the Data Pump dump size using the BLOCKS or STATISTICS methods. You are expected to apply discretion in arriving at the FILESYSTEM space required for the dump path, considering other factors that affect the actual dump size expected. The estimated dump size and actual size varies based on the data compression applied on the data in the database.

- If data is compressed, then it would be the same as that of the reported ESTIMATE
- If data is uncompressed, then Zero Downtime Migration exports with COMPRESSION set as MEDIUM and the resulting dump would be ~50% of estimate
- There is deviation in dump size expected between data having HCC vs. Advanced compression modes

Note that by default, Zero Downtime Migration performs estimation using the BLOCKS method as part of the precheck and as part of the actual migration part of phase ZDM_DATAPUMP_ESTIMATE_SRC.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_EST IMATEBYSTATISTICS = [TRUE FALSE]
Default value	FALSE
Valid values	TRUE enables this parameter FALSE disables this parameter
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_ESTIMATE_SRC phase is COMPLETED.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_EXCL UDETYPELIST

Specifies a comma separated list of object types to exclude.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_ EXCLUDETYPELIST = object_type_list
Default value	There is no default
Valid values	A comma separated list of object types
Required	No
Modifiable on Resume	No

Example

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_EXCLUDETYPELIST=cluster,dblink,comm ent

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_EXPO RTPARALLELISMDEGREE

Specifies the maximum number of worker processes that can be used for a Data Pump Import job.

For migration to an Autonomous Database target, Zero Downtime Migration automatically queries its CPU core count and sets this parameter.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_ EXPORTPARALLELISMDEGREE = <i>integer</i>
Default value	There is no default value

Property	Description
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_EXPORT_SRC phase is COMPLETED.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_IMPORTP ARALLELISMDEGREE

Specifies the maximum number of worker processes that can be used for a Data Pump Import job.

For migration to an Autonomous Database target, Zero Downtime Migration automatically queries its CPU core count and sets this parameter.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_IMP ORTPARALLELISMDEGREE = integer
Default value	There is no default value
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_NOCLUST ER

Specifies whether all Data Pump workers are started on the current instance or on instances usable by the job.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_ NOCLUSTER = [TRUE FALSE]
Default value	FALSE
Valid values	TRUE all Data Pump workers are started on the current instance
	FALSE Data Pump workers are started on instances usable by the job
Required	No
Modifiable on Resume	No

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_RETAI NINDEX

Specifies whether to retain the index.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_ RETAININDEX = [TRUE FALSE]
Default value	FALSE
Valid values	TRUE retains the index
	FALSE does not retain the index
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_EXPORT_SRC phase is COMPLETED, or until
	ZDM_DATAPUMP_IMPORT_TGT phase when using DATA_TRANSFER_MEDIUM=DBLINK.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_SKIPC URRENT

Specifies whether actions that were "in progress" on a previous execution of the job are skipped when the job restarts.

This mechanism allows you to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file identifies which actions are skipped.

The skip is only honored for Import jobs.

If a domain index was being processed, all pieces of the domain index are skipped, even if the error only occurred in a sub-component of the domain index.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_SKI PCURRENT = [TRUE FALSE]
Default value	FALSE
Valid values	TRUE enables this parameter
	FALSE disables this parameter
Required	No
Modifiable in Resume	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_TABLEEXI STSACTION

Specifies the action to be performed when data is loaded into a preexisting table.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_TAB LEEXISTSACTION = [SKIP TRUNCATE REPLACE APPEND]
Default value	SKIP

Property	Description
Range of values	SKIP - the preexisting table is left unchanged.
	TRUNCATE - rows are removed from a preexisting table before inserting rows from the Import. Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE.
	REPLACE - preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped.
	APPEND - new rows are added to the existing rows in the table
	See TABLE_EXISTS_ACTION entry in Table 48-25 "Valid Options for the name Parameter in the SET_PARAMETER Procedure" in SET_PARAMETER Procedures
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED.

DATAPUMPSETTINGS_DATAPUMPPARAMETERS_USER METADATA

For EXPORT and Network IMPORT, if set to a nonzero value for schema-mode operations, specifies that the metadata to re-create the user's schemas should also be part of the operation.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

DATAPUMPSETTINGS_DATAPUMPPARAMETER_* are optional parameters for Data Pump Export and Import. See SET_PARAMETER Procedures for more information.

Property	Description
Syntax	DATAPUMPSETTINGS_DATAPUMPPARAMETERS_ USERMETADATA = integer
Default value	There is no default value
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_EXPORT_SRC is COMPLETED, or until ZDM_DATAPUMP_IMPORT_TGT phase when using DATA_TRANSFER_MEDIUM=DBLINK.

DATAPUMPSETTINGS_DELETEDUMPSINOSS

Indicates whether to retain dump files which are uploaded to Object Storage as part of the migration.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_DELETEDUMPSINOSS = {TRUE FALSE}
Default value	TRUE
Range of values	TRUE = delete dumps
	FALSE = retain dumps
Required	No
Modifiable on Resume	Until ZDM_POST_DATAPUMP_TGT phase is COMPLETED.

DATAPUMPSETTINGS_EXPORTDIRECTORYOBJECT_NAME

Specifies the object name of a directory on server file system of an on-premises database.

In lieu of a network database link, a directory on the server file system of an on-premises database, specified with the DATAPUMPSETTINGS_EXPORTDIRECTORYOBJECT_* properties is used to store Data Pump Export dump files.

Zero Downtime Migration creates this object if it does not already exist

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_EXPORTDIRECTORYOBJECT_ NAME = Name
Default value	There is no default value
Range of values	Name of directory object in the database.
Required	No
Modifiable on Resume	Until ZDM_VALIDATE_DATAPUMP_SETTINGS_SRC phase is COMPLETED.

DATAPUMPSETTINGS_EXPORTDIRECTORYOBJECT_PA TH

Specifies the object path of a directory on server file system of an on-premises database.

In lieu of a network database link, a directory on the server file system of an onpremises database, specified with the DATAPUMPSETTINGS_EXPORTDIRECTORYOBJECT_* properties is used to store Data Pump Export dump files.

Zero Downtime Migration creates this object if it does not already exist

Note:

For Oracle Database 19c and later releases, the UTL_FILE_DIR initialization parameter is desupported, which means symbolic links for Data Pump directories are not supported.

If you attempt to use an affected feature configured with symbolic links, then you encounter ORA-29283: invalid file operation: path traverses a symlink. Oracle recommends that you instead use directory objects in place of symbolic links.

See How Does Oracle Data Pump Move Data? for more information.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_EXPORTDIRECTORYOBJE CT_PATH = Path
Default value	There is no default value
Range of values	Absolute path of directory on database server
Required	No
Modifiable on Resume	Until ZDM_VALIDATE_DATAPUMP_SETTINGS_SRC phase is COMPLETED.

DATAPUMPSETTINGS_FIXINVALIDOBJECTS

Specifies whether invalid objects are recompiled in the database as part of the migration job.

Migration can result in invalid schema objects. Typically, invalid objects fix themselves as they are accessed or run. However, Oracle recommends that invalid objects are recompiled in the database as part of the Zero Downtime Migration migration job so

that issues with invalid objects, and any required dependencies, are resolved before users encounter these invalid objects.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_FIXINVALIDOBJECTS = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE = fix invalid objects
	FALSE = do not fix invalid objects
Required	No
Modifiable on Resume	Until ZDM_POST_DATAPUMP_TGT phase is COMPLETED.

DATAPUMPSETTINGS_IMPORTDIRECTORYOBJECT_NAME

Specifies the name of an import directory object.

In lieu of a network database link, a directory on the server file system of OCI database is used to store Data Pump dump files.

Zero Downtime Migration creates this object if it does not already exist.

For Autonomous Database migration targets, the DATA PUMP DIR object will already exist.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_IMPORTDIRECTORYOBJECT_ NAME = Name of the directory object
Default value	There is no default value
Range of values	Name of directory object in database
Required	No
Modifiable on Resume	Until ZDM_VALIDATE_DATAPUMP_SETTINGS_TGT phase is COMPLETED.

DATAPUMPSETTINGS_IMPORTDIRECTORYOBJECT_PATH

Specifies the path of an import directory object.

In lieu of a network database link, a directory on the server file system of OCI database is used to store Data Pump dump files.

Zero Downtime Migration creates this object if it does not already exist.

For Autonomous Database migration targets, the DATA_PUMP_DIR object will already exist.

Note:

For Oracle Database 19c and later releases, the UTL_FILE_DIR initialization parameter is desupported, which means symbolic links for Data Pump directories are not supported.

If you attempt to use an affected feature configured with symbolic links, then you encounter ORA-29283: invalid file operation: path traverses a symlink. Oracle recommends that you instead use directory objects in place of symbolic links.

See How Does Oracle Data Pump Move Data? for more information.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_IMPORTDIRECTORYOBJE CT_PATH = Path of the directory object
Default value	There is no default value
Range of values	Absolute path of directory on database server
Required	No
Modifiable on Resume	Until ZDM_VALIDATE_DATAPUMP_SETTINGS_TGT phase is COMPLETED.

DATAPUMPSETTINGS_JOBMODE

Specifies the Data Pump export mode.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_JOBMODE = jobModeValue
Default value	SCHEMA

Property	Description
Range of values	FULL performs a full database export.
	SCHEMA (default) lets you specify a set of schemas to export.
	TABLE lets you specify a set of tables to export. In this mode, Zero Downtime Migration precreates the target schema before Data Pump import.
	TABLESPACE lets you specify a set of tablespaces to export. In this mode, Zero Downtime Migration precreates the target schema before Data Pump import.
	TRANSPORTABLE is not supported by Zero Downtime Migration.
See Oracle Data Pump Export Mode information.	See Oracle Data Pump Export Modes for more information.
Required	No
Modifiable on Resume	No

DATAPUMPSETTINGS_METADATAFILTERS-LIST_ELEMENT_NUMBER

Defines the name, the object type, and the value of the filter for the Data Pump METADATA FILTER property.

To add multiple filters, increment the integer appended to the parameter name, as shown in the examples below.

```
DATAPUMPSETTINGS_METADATAFILTERS-1=name:nameValue1st,
objectType:objectTypeValue1st, value:valueValue1st
DATAPUMPSETTINGS_METADATAFILTERS-2=name:nameValue2nd,
objectType:objectTypeValue2nd, value:valueValue2nd
```

To exclude select SCHEMA Objects for FULL mode:

```
DATAPUMPSETTINGS_METADATAFILTERS-1=name:NAME_EXPR,value:'NOT IN(' 'SYSMAN'
')',objectType:SCHEMA
DATAPUMPSETTINGS_METADATAFILTERS-2=name:NAME_EXPR,value:'NOT IN(' 'SH'
')',objectType:SCHEMA
```

Note that the SCHEMA name SYSMAN is surrounded by two single quotes and not a double quote.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_METADATAFILTERS- LIST_ELEMENT_NUMBER = name:nameValue, objectType:objectTypeValue, value:valueValue
Default value	There is no default value
Range of values	An entry specifying the name, type, and value is expected, as shown in the examples above.
Required	No
Modifiable on Resume	No

DATAPUMPSETTINGS_METADATAREMAPS-LIST_ELEMENT_NUMBER

Defines remapping to be applied to objects as they are processed.

To add multiple remappings, increment the integer appended to the parameter name, as shown in the examples below.

```
DATAPUMPSETTINGS_METADATAREMAPS-1=type:typeValue1st,
oldValue:oldValueValue1st, newValue:newValueValue1st
DATAPUMPSETTINGS_METADATAREMAPS-2=type:typeValue2nd,
oldValue:oldValueValue2nd, newValue:newValueValue2nd
```

See METADATA_REMAP Procedure for more information.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_METADATAREMAPS- LIST_ELEMENT_NUMBER = newValue:newValueValue, oldValue:oldValueValue, type:typeValue
Default value	There is no default value
Range of values	An entry specifying the new value, old value and type is expected, as shown in the examples above.
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_EXPORT_SRC phase is COMPLETED, or until ZDM_DATAPUMP_IMPORT_TGT phase when using DATA_TRANSFER_MEDIUM=DBLINK

DATAPUMPSETTINGS_METADATATRANSFORMS-LIST_ELEMENT_NUMBER

Defines the name, the object type, and the value for the Data Pump METADATA_TRANSFORM property.

To add multiple filters, increment the integer appended to the parameter name, as shown in the examples below.

```
DATAPUMPSETTINGS_METADATATRANSFORMS-1=name:nameValue1st,
objectType:objectTypeValue1st, value:valueValue1st
DATAPUMPSETTINGS_METADATATRANSFORMS-2=name:nameValue2nd,
objectType:objectTypeValue2nd, value:valueValue2nd
```

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_METADATATRANSFORMS- LIST_ELEMENT_NUMBER = name:nameValue, objectType:objectTypeValue, value:valueValue
Default value	There is no default value
Range of values	An entry specifying the name, type, and value is expected, as shown in the examples above.
Required	No
Modifiable on Resume	No
•	

DATAPUMPSETTINGS_MONITORINTERVALMINUTES

Specifies the Data Pump monitor interval in minutes. This setting is optional.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_MONITORINTERVALMINUTES = number
Default value	10
Range of values	An integer value is expected
Required	No
Modifiable on Resume	No

DATAPUMPSETTINGS_OMITENCRYPTIONCLAUSE

Sets TRANSFORM=OMIT_ENCRYPTION_CLAUSE, which directs Data Pump to suppress any encryption clauses associated with objects using encrypted columns.

This parameter is valid for targets on Oracle Database 19c and later releases.

OMIT_ENCRYPTION_CLAUSE applies to materialized view, table, and tablespace objects, and enables objects which were using encrypted columns in the source to get created in a target database environment where encryption attributes are not supported.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_OMITENCRYPTIONCLAUS E = [TRUE FALSE]
Default value	TRUE
Valid values	TRUE enables this parameter FALSE disables this parameter
Required	No
Modifiable on Resume	No

DATAPUMPSETTINGS_SECUREFILELOB

Sets TRANSFORM=LOB_STORAGE: SECUREFILE, which directs Data Pump to transform basic LOBs into securefile LOBs during the Data Pump import.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_SECUREFILELOB = [TRUE FALSE]
Default value	TRUE
Valid values	TRUE enables this parameter FALSE disables this parameter
Required	No
Modifiable on Resume	No

DATAPUMPSETTINGS_SKIPDEFAULTTRANSFORM

Skips default transform parameters.

Set this property to TRUE to avoid all internal Zero Downtime Migration transform defaults.

Parameter Relationships

The optional DATAPUMPSETTINGS_* parameters let you customize Oracle Data Pump Export and Import jobs.

Property	Description
Syntax	DATAPUMPSETTINGS_SKIPDEFAULTTRANSFORM = [TRUE FALSE]
Default value	FALSE
Valid values	TRUE enables this parameter FALSE disables this parameter
Required	No
Modifiable on Resume	No

DUMPTRANSFERDETAILS_PARALLELCOUNT

Specifies the maximum number of Export dump files to transfer to Object Storage or remote node in parallel.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

Property	Description
Syntax	DUMPTRANSFERDETAILS_PARALLELCOUNT = integer
Default value	3
Range of values	This parameter accepts integer values
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_RETRYCOUNT

Specifies the number of times to retry upload or transfer of dump failure.

Intermittent network failures observed during the transfer of Data Pump dumps can mitigated by setting the DUMPTRANSFERDETAILS_RETRYCOUNT parameter.

Parameter Relationships

The DUMPTRANSFERDETAILS parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

Property	Description
Syntax	DUMPTRANSFERDETAILS_RETRYCOUNT = integer
Default value	3
Range of values	This parameter accepts integer values
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_RSYNCAVAILABLE

Specifies that the transfer dump files are using the Linux rsync utility.

Ensure rsync is installed in both source and target servers. Oracle Exadata does not ship with rsync, refer to MOS Doc ID 1556257.1 for details. ZDM defaults to scp command for transfer.

Parameter Relationships

The ${\tt DUMPTRANSFERDETAILS}_*$ parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

Property	Description
Syntax	DUMPTRANSFERDETAILS_RSYNCAVAILABLE = {TRUE FALSE
Default value	FALSE
Range of values	TRUE - transfer dump files are using the Linux rsync utility FALSE - not using rsync
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_S3BUCKET_ACCESSKEY

Specifies the access key of the Amazon Simple Storage Service (Amazon S3) bucket.

When you set DATA_TRANSFER_MEDIUM=AMAZON3 to migrate an Amazon Web Services RDS Oracle database to Oracle Autonomous Database using an S3 bucket, you must also set the DUMPTRANSFERDETAILS_S3BUCKET_* parameters.

See Migrating from Amazon Web Services RDS to Oracle Autonomous Database for details.

Parameter Relationships

The $DUMPTRANSFERDETAILS_*$ parameters specify details to transfer dumps from the source node to the target node.

Property	Description
Syntax	DUMPTRANSFERDETAILS_S3BUCKET_ACCESSKEY = s3_bucket_access_key
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_S3BUCKET_NAME

Specifies the name of the Amazon Simple Storage Service (Amazon S3) bucket.

When you set DATA_TRANSFER_MEDIUM=AMAZON3 to migrate an Amazon Web Services RDS Oracle database to Oracle Autonomous Database using an S3 bucket, you must also set the DUMPTRANSFERDETAILS S3BUCKET * parameters.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Property	Description
Syntax	DUMPTRANSFERDETAILS_S3BUCKET_NAME = s3_bucket_name
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_S3BUCKET_REGION

Specifies the region of the Amazon Simple Storage Service (Amazon S3) bucket.

When you set DATA_TRANSFER_MEDIUM=AMAZON3 to migrate an Amazon Web Services RDS Oracle database to Oracle Autonomous Database using an S3 bucket, you must also set the DUMPTRANSFERDETAILS_S3BUCKET_* parameters.

See Migrating from Amazon Web Services RDS to Oracle Autonomous Database for details.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Property	Description
Syntax	DUMPTRANSFERDETAILS_S3BUCKET_REGION = s3_bucket_region
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_OCIHOME

Specifies the Oracle Cloud OCI-CLI Binary path.

Parameter Relationships

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

Property	Description
Syntax	<pre>DUMPTRANSFERDETAILS_SOURCE_OCIHOME = path</pre>
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_PARTSIZEMB

Specifies the part size in MB for chunked transfer.

Parameter Relationships

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

The <code>DUMPTRANSFERDETAILS_*</code> parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

Property	Description
Syntax	<pre>DUMPTRANSFERDETAILS_SOURCE_PARTSIZEMB = integer</pre>
Default value	128
Range of values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_DU MPDIRPATH

Specifies the absolute path of the directory to copy or upload dump files.

The DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using Oracle Cloud OCI-CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node. Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_SOURCE_TRANSFERN ODE_DUMPDIRPATH = path
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_ HOST

Specifies the dump transfer node host name.

The DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using Oracle Cloud OCI-CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node. Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_SOURCE_TRANSFERN ODE_HOST = host_name
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_SU DOPATH

Specifies the Sudo path on the dump transfer node.

The DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using Oracle Cloud OCI-CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node. Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE _SUDOPATH = path
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_US ER

Specifies the user allowed to execute OCI CLI in the dump transfer node.

The DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using Oracle Cloud OCI-CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_SOURCE_TRANSFERN ODE_USER = <i>user</i>
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_ USERKEY

Specifies the user's authentication key.

The DUMPTRANSFERDETAILS_SOURCE_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using Oracle Cloud OCI-CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node. Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_SOURCE_TRANSFERN ODE_USERKEY = user_auth_key
Default value	No default value
Range of values	A string value is expected

Property	Description
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_SOURCE_USEOCICLI

Indicates that transfer dump files use Oracle Cloud Infrastructure command line interface (CLI).

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_SOURCE_* parameters specify details to upload the Dump files from source node Data Pump dump location to Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_SOURCE_USEOCICLI = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE or FALSE
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_OCIHOME

Specifies the Oracle Cloud Infrastructure command line interface (CLI) Binary path.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_OCIHOME = path

Property	Description
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_PARTSIZEMB

Specifies the part size in MB for chunked transfer.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_PARTSIZEM B = integer
Default value	128
Range of values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_ DUMPDIRPATH

Specifies the absolute path of the directory to copy or upload dump files.

The DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using the OCI CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through Oracle Cloud Infrastructure command line interface (CLI) or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE _DUMPDIRPATH = path
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_HOS

Specifies the dump transfer node host name.

The DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using OCI CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through Oracle Cloud Infrastructure command line interface (CLI) or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE _HOST = host_name
Default value	No default value

Property	Description
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_ SUDOPATH

Specifies the Sudo path on the dump transfer node.

The DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using OCI CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through Oracle Cloud Infrastructure command line interface (CLI) or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_TRANSFERN ODE_SUDOPATH = path
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_USE R

Specifies the user allowed to execute OCI CLI in the dump transfer node.

The DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using OCI CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node. Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through Oracle Cloud Infrastructure command line interface (CLI) or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE _USER = <i>user</i>
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_USE RKEY

Specifies the user's authentication key.

The DUMPTRANSFERDETAILS_TARGET_TRANSFERNODE_* parameters are configured when you use a standalone server as transfer server.

Transfer dump files using OCI CLI or curl, or copy to or from a node other than the database server.

This option can be leveraged for cases where OCI CLI is installed and configured in a specific node per data center and the node has the Data Pump export or import directory path shared with it. This avoids the requirement of installing OCI CLI on the database node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through Oracle Cloud Infrastructure command line interface (CLI) or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_TRANSFERN ODE_USERKEY = user_auth_key
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TARGET_USEOCICLI

Indicates that transfer dump files use Oracle Cloud Infrastructure command line interface (CLI).

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TARGET_* parameters specify details to download the Dump files to the target node Data Pump dump location from Oracle Cloud Object Storage.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TARGET_USEOCICLI = {TRUE FALSE}
Default value	FALSE
Range of values	TRUE or FALSE
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TRANSFERTARGET_DUMPDIRP ATH

Specifies the absolute path of the directory to copy or upload dump files.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TRANSFERTARGET_* parameters specify details for the target node to copy the Dump files from source node Data Pump dump location or transfer node directory path specified. Default target database host.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TRANSFERTARGET_DUMP DIRPATH = path
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TRANSFERTARGET_HOST

DUMPTRANSFERDETAILS TRANSFERTARGET HOST specifies the dump transfer node host name.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TRANSFERTARGET_* parameters specify details for the target node to copy the Dump files from source node Data Pump dump location or transfer node directory path specified. Default target database host.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TRANSFERTARGET_HOST = host_name
Default value	No default value
Range of values	A string value is expected
Required	No

Pro	perty

Description

Modifiable on Resume

Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TRANSFERTARGET_SUDOP ATH

Specifies the Sudo path on the dump transfer node.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TRANSFERTARGET_* parameters specify details for the target node to copy the Dump files from source node Data Pump dump location or transfer node directory path specified. Default target database host.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TRANSFERTARGET_S UDOPATH = path
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TRANSFERTARGET_USER

Specifies the host user name that has write permission to the indicated dump storage path.

The user specified in <code>DUMPTRANSFERDETAILS_TRANSFERTARGET_USER</code> should be allowed to

- Execute OCI CLI in the specified host to download the dumps from the Object Storage bucket if DATA TRANSFER MEDIUM=OSS
- Copy the dump files from the source node to the target host specified if DATA TRANSFER MEDIUM=COPY.

See Configuring the Transfer Medium and Specifying Transfer Nodes for more information about configuring the dump transfer details parameters.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TRANSFERTARGET_* parameters specify details for the target node to copy the Dump files from source node Data Pump dump location or transfer node directory path specified. Default target database host.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TRANSFERTARGET_USER = host_username
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

DUMPTRANSFERDETAILS_TRANSFERTARGET_USERKEY

Specifies the user's authentication key.

Parameter Relationships

The DUMPTRANSFERDETAILS_* parameters specify details to transfer dumps from the source node to the target node.

Supported modes of transfer are OSS and secure copy. Upload of dumps to OSS can be either through OCI CLI or Curl.

The DUMPTRANSFERDETAILS_TRANSFERTARGET_* parameters specify details for the target node to copy the Dump files from source node Data Pump dump location or transfer node directory path specified. Default target database host.

Property	Description
Syntax	DUMPTRANSFERDETAILS_TRANSFERTARGET_USER KEY = user_auth_key
Default value	No default value
Range of values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_TRANSFER_DUMPS_SRC phase is COMPLETED

EXCLUDEOBJECTS-LIST_ELEMENT_NUMBER

Specifies database objects to exclude from migration.

To exclude multiple objects, increment the integer appended to the parameter name, as shown in the examples below.

EXCLUDEOBJECTS-1=owner:ownerValue1st, objectName:objectNameValue1st EXCLUDEOBJECTS-1=owner:ownerValue2nd, objectName:objectNameValue2nd

Property	Description
Syntax	<pre>EXCLUDEOBJECTS-LIST_ELEMENT_NUMBER = owner:ownerValue, objectName:objectNameValue,</pre>
Default value	There is no default value.
Range of values	owner:
-	owner can be the OWNER value of a database object Note that when creating an exclude rule, you must enter the owner name in uppercase letters. If you use lowercase letters for the owner name the rule is ignored.
	For example, if you use the following settings then the objects specified in the first two rules are not excluded, but the third rule is valid so that owner's objects are excluded.
	EXCLUDEOBJECTS-1=owner:tpcc1, objectName:.* EXCLUDEOBJECTS-2=owner:tpcc2, objectName:.* EXCLUDEOBJECTS-3=owner:TEST9, objectName:.*
	objectName:
	objectName can be the OBJECT_NAME value of a database object.
	Only TABLE object types are supported for exclusion by Database Migration.
	You can filter owner and object values by any valid pattern in Java class Pattern.
	For example, you can enter . * in the objectName argument to exclude all tables (including views) owned by owner.
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_EXPORT_SRC phase is COMPLETED, or until ZDM_DATAPUMP_IMPORT_TGT phase when using DATA_TRANSFER_MEDIUM=DBLINK.

GOLDENGATEHUB_ADMINUSERNAME

Specifies the GoldenGate hub administrator user name.

Parameter Relationships

For online logical migration, you must set the GOLDENGATEHUB_* parameters to provide Zero Downtime Migration with details about Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATEHUB_ADMINUSERNAME = user_name
Default value	There is no default value
Range of values	Oracle GoldenGate hub's administrator user name
Required	No*
	*Required for online logical migration
Modifiable on Resume	Until ZDM_PREPARE_GG_HUB phase is COMPLETED.

GOLDENGATEHUB_COMPUTEID

Specifies the Oracle Cloud identifier of the VM.

Parameter Relationships

For online logical migration, you must set the GOLDENGATEHUB_* parameters to provide Zero Downtime Migration with details about Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATEHUB_COMPUTEID = vm_identifier
Default value	There is no default value
Range of values	Oracle Cloud identifier of the VM
Required	No*
	*Required for online logical migration
Modifiable on Resume	Until ZDM_PREPARE_GG_HUB phase is COMPLETED.

GOLDENGATEHUB_SOURCEDEPLOYMENTNAME

Specifies the name of the GoldenGate Microservices deployment to operate on the source database.

Parameter Relationships

For online logical migrations, you must set the GOLDENGATEHUB parameters to provide Zero Downtime Migration with details about Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATEHUB_SOURCEDEPLOYMENTNAME = GG_microservices_deployment_name
Default value	There is no default value
Range of values	Name of the GoldenGate Microservices deployment to operate on the source database
Required	No*
	*Required for online logical migration
Modifiable on Resume	Until ZDM_PREPARE_GG_HUB phase is COMPLETED.

GOLDENGATEHUB_TARGETDEPLOYMENTNAME

Specifies the name of the GoldenGate Microservices deployment to operate on the target database.

Parameter Relationships

For online logical migrations, you must set the GOLDENGATEHUB parameters to provide Zero Downtime Migration with details about Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATEHUB_TARGETDEPLOYMENTNAME = GG_microservices_deployment_name
Default value	There is no default value
Range of values	Name of the GoldenGate Microservices deployment to operate on the target database
Required	No*
	*Required for online logical migration
Modifiable on Resume	Until ZDM_PREPARE_GG_HUB phase is COMPLETED.

GOLDENGATEHUB_URL

Specifies the Oracle GoldenGate hub's REST endpoint.

Parameter Relationships

For online logical migrations, you must set the GOLDENGATEHUB parameters to provide Zero Downtime Migration with details about Oracle GoldenGate Microservices configuration.

Property

Description

Syntax

GOLDENGATEHUB_URL =
GG_hub_rest_endpoint

Property	Description
Default value	There is no default value
Range of values	Oracle GoldenGate hub's REST endpoint
Required	No*
	*Required for online logical migration
Modifiable on Resume	Until ZDM_PREPARE_GG_HUB phase is COMPLETED.

GOLDENGATESETTINGS_ACCEPTABLELAG

Specifies GoldenGate end-to-end latency lag time

Zero Downtime Migration monitors GoldenGate end-to-end latency until the lag time is lower than the value (in seconds) specified in GOLDENGATESETTINGS_ACCEPTABLELAG.

Parameter Relationships

For online logical migrations, you can set the optional GOLDENGATESETTINGS_* parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_ACCEPTABLELAG = seconds
Default value	30 seconds
Required	No
Required	No
Modifiable on Resume	Until ZDM_MONITOR_GG_LAG phase is COMPLETED.

GOLDENGATESETTINGS_EXTRACT_NAME

Specifies a name for the GoldenGate Extract processes.

Parameter Relationships

The GOLDENGATESETTINGS_EXTRACT_* parameters define settings for the Integrated Extract process.

Only one Extract can be configured.

For online logical migrations, you can set the optional <code>GOLDENGATESETTINGS_*</code> parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	
roperty	

Description

Syntax

GOLDENGATESETTINGS_EXTRACT_NAME =
nameValue

Property	Description
Default value	There is no default value
Valid values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_EXTRACT_SRC phase is COMPLETED.

GOLDENGATESETTINGS_EXTRACT_PERFORMANCEPR OFILE

Tunes Oracle GoldenGate Integrated Capture.

Use this setting to automatically configure relevant parameters to achieve the desired throughput and latency.

Parameter Relationships

The GOLDENGATESETTINGS_EXTRACT_* parameters define settings for the Integrated Extract process.

Only one Extract can be configured.

For online logical migrations, you can set the optional GOLDENGATESETTINGS_* parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_EXTRACT_PERFORMAN CEPROFILE = [HIGH MEDIUM LOW- RES]
Default value	HIGH
Valid values	HIGH, MEDIUM, LOW-RES
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_EXTRACT_SRC phase is COMPLETED.

GOLDENGATESETTINGS_EXTRACT_WARNLONGTRAN S_CHECKINTERVAL

Specifies the frequency in seconds with which Oracle GoldenGate checks for longrunning transactions.

Parameter Relationships

GOLDENGATESETTINGS_EXTRACT_WARNLONGTRANS_* parameters specify a length of time in seconds that a transaction can be open before Extract generates a warning message that the transaction is long-running.

The GOLDENGATESETTINGS_EXTRACT_* parameters define settings for the Integrated Extract process.

Only one Extract can be configured.

For online logical migrations, you can set the optional <code>GOLDENGATESETTINGS_*</code> parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_EXTRACT_WARNLONGTRAN S_CHECKINTERVAL = <i>integer</i>
Default value	There is no default value
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_EXTRACT_SRC phase is COMPLETED.

GOLDENGATESETTINGS_EXTRACT_WARNLONGTRANS_D URATION

Specifies a length of time in seconds that a transaction can be open before the GoldenGate Extract process generates a warning message that the transaction is long-running.

Parameter Relationships

GOLDENGATESETTINGS_EXTRACT_WARNLONGTRANS_* parameters specify a length of time in seconds that a transaction can be open before Extract generates a warning message that the transaction is long-running.

The GOLDENGATESETTINGS_EXTRACT_* parameters define settings for the Integrated Extract process.

Only one Extract can be configured.

For online logical migrations, you can set the optional <code>GOLDENGATESETTINGS_*</code> parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_EXTRACT_WARNLONGTRAN S_DURATION = integer
Default value	There is no default value
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_EXTRACT_SRC phase is COMPLETED.

GOLDENGATESETTINGS_REPLICAT_MAPPARALLELISM

Specifies the number of threads used to read GoldenGate trail files.

Valid for Parallel Replicat.

Parameter Relationships

The GOLDENGATESETTINGS_REPLICAT_* parameters define settings for the Parallel Replicat process.

For online logical migrations, you can set the optional <code>GOLDENGATESETTINGS_*</code> parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_REPLICAT_MAPPARAL LELISM = integer
Default value	4
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_REPLICAT_TGT phase is COMPLETED.

GOLDENGATESETTINGS_REPLICAT_MAXAPPLYPARAL LELISM

Defines the range in which the GoldenGate Replicat automatically adjusts its apply parallelism.

Valid for Parallel Replicat.

Parameter Relationships

The GOLDENGATESETTINGS_REPLICAT_* parameters define settings for the Parallel Replicat process.

For online logical migrations, you can set the optional GOLDENGATESETTINGS_* parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_REPLICAT_MAXAPPLY PARALLELISM = integer
Default value	50
Valid values	An integer value is expected
Required	No

Р	ro	pe	rty

Description

Modifiable on Resume

Until ZDM_CREATE_GG_REPLICAT_TGT phase is COMPLETED.

GOLDENGATESETTINGS_REPLICAT_MINAPPLYPARALLELI SM

Defines the range in which the GoldenGate Replicat automatically adjusts its apply parallelism.

Valid for Parallel Replicat.

Parameter Relationships

The GOLDENGATESETTINGS_REPLICAT_* parameters define settings for the Parallel Replicat process.

For online logical migrations, you can set the optional GOLDENGATESETTINGS_* parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_REPLICAT_MINAPPLYPAR ALLELISM = integer
Default value	4
Valid values	An integer value is expected
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_REPLICAT_TGT phase is COMPLETED.

GOLDENGATESETTINGS_REPLICAT_NAME

Specifies a name for the GoldenGate Replicat process.

Parameter Relationships

The GOLDENGATESETTINGS_REPLICAT_* parameters define settings for the Parallel Replicat process.

For online logical migrations, you can set the optional <code>GOLDENGATESETTINGS_*</code> parameters to provide Zero Downtime Migration with details about the Oracle GoldenGate Microservices configuration.

Property	Description
Syntax	GOLDENGATESETTINGS_REPLICAT_NAME = nameValue
Default value	There is no default value

Property	Description
Valid values	A string value is expected
Required	No
Modifiable on Resume	Until ZDM_CREATE_GG_REPLICAT_TGT phase is COMPLETED.

INCLUDEOBJECTS-LIST_ELEMENT_NUMBER

Specifies database objects to include for migration.

To include multiple objects, increment the integer appended to the parameter name, as shown in the examples below.

```
INCLUDEOBJECTS-1=owner:ownerValue1st, objectName:objectNameValue1st
INCLUDEOBJECTS-1=owner:ownerValue2nd, objectName:objectNameValue2nd
```

Property	Description
Syntax	<pre>INCLUDEOBJECTS-LIST_ELEMENT_NUMBER = owner:ownerValue, objectName:objectNameValue</pre>
Default value	There is no default value
Range of values	An entry specifying the owner and object name is expected, as shown in the examples above.
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_EXPORT_SRC phase is COMPLETED, or until ZDM_DATAPUMP_IMPORT_TGT phase when using DATA_TRANSFER_MEDIUM=DBLINK.

MIGRATION_METHOD

In a logical migration, specifies whether the migration is online logical or offline logical

The required MIGRATION_METHOD parameter specifies whether the migration is online (Data Pump with Oracle GoldenGate replication) or offline (Data Pump only).

Property	Description
Syntax	MIGRATION_METHOD = {ONLINE_LOGICAL OFFLINE_LOGICAL}
Default value	OFFLINE_LOGICAL
Range of values	ONLINE_LOGICAL migrate the database with Data Pump, with replication using Oracle GoldenGate for minimal downtime
	OFFLINE_LOGICAL migrate the database with Data Pump, with no replication

Property	Description	
Required	Yes	
Modifiable on Resume	No	

OCIAUTHENTICATIONDETAILS_REGIONID

Specifies the OCI region identifier.

See the Region Identifier column in the table at Regions and Availability Domains.

Parameter Relationships

To call REST APIs, you must configure the OCIAUTHENTICATIONDETAILS * parameters.

Property	Description
Syntax	OCIAUTHENTICATIONDETAILS_REGIONID = region_id
Default value	There is no default value
Required	Yes
Modifiable on Resume	Yes

OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_FINGERP RINT

Specifies the fingerprint of the public API key.

See Required Keys and OCIDs for more information.

Parameter Relationships

To call REST APIs, you must configure the OCIAUTHENTICATIONDETAILS_* parameters.

Property	Description
Syntax	OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_ FINGERPRINT = fingerprint
Default value	There is no default value
Required	Yes
Modifiable on Resume	Yes

OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_PRIVATEK EYFILE

Specifies the absolute path of API private key file.

See Required Keys and OCIDs for more information.

Parameter Relationships

To call REST APIs, you must configure the OCIAUTHENTICATIONDETAILS * parameters.

Property	Description
Syntax	OCIAUTHENTICATIONDETAILS_USERPRINCIP AL_PRIVATEKEYFILE = path
Default value	There is no default value
Required	Yes
Modifiable on Resume	Yes

OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_TENA NTID

Specifies the OCID of the OCI tenancy.

You can find the tenant OCID on OCI at Governance and Administration, Administration, Tenancy Details. The tenancy OCID is shown under Tenancy Information.

Example: ocid1.tenancy.oc1..aaaaaaaaba3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfds q

See Managing the Tenancy and Required Keys and OCIDs for more information.

Parameter Relationships

To call OCI REST APIs, you must configure the OCIAUTHENTICATIONDETAILS_* parameters.

Property	Description
Syntax	OCIAUTHENTICATIONDETAILS_USERPRINCIP AL_TENANTID = ocid_string
Default value	There is no default value
Valid values	A string value is expected
Required	Yes
Modifiable on Resume	Yes

OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_USERI D

Specifies the OCID of the IAM user.

You can find the IAM OCID on OCI at Console, Profile, User Settings.

See Managing Users and Required Keys and OCIDs for more information.

Parameter Relationships

To call OCI REST APIs, you must configure the OCIAUTHENTICATIONDETAILS * parameters.

Property	Description
Syntax	OCIAUTHENTICATIONDETAILS_USERPRINCIPAL_ USERID = userid
Default value	There is no default value
Required	Yes
Modifiable on Resume	Yes

OCIPROXY_HOSTNAME

Specifies the HTTP proxy host name.

Parameter Relationships

The ${\tt OCIPROXY}_{\star}$ parameters specify details about the proxy for connecting to OCI REST endpoints.

Property	Description
Syntax	OCIPROXY_HOSTNAME = hostname
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

OCIPROXY_PORT

Specifies the HTTP proxy port number.

Parameter Relationships

The ${\tt OCIPROXY}_{\star}$ parameters specify details about the proxy for connecting to OCI REST endpoints.

Property	Description
Syntax	OCIPROXY_PORT = port number
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_ADMINUSERNAME

Specifies the source CDB administrator user name.

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_* parameters specify connection details for the source database CDB root.

Property	Description
Syntax	SOURCECONTAINERDATABASE_ADMINUSERNAM E = username
Default value	There is no default value
Required	No
Modifiable on Resume	No

SOURCECONTAINERDATABASE_CONNECTIONDETAILS _BASTIONDETAILS_IDENTITYFILE

Specifies the identity file to access the bastion, as part of the database connection details for bastion-based access to the database.

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB.

The SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_* parameters specify details for bastion based access to the database.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDE TAILS_BASTIONDETAILS_IDENTITYFILE = bastion_id_file
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BA STIONDETAILS_IP

Specifies the IP address of the source CDB bastion host, as part of the database connection details for bastion-based access to the database.

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB root.

The <code>SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_*</code> parameters specify details for bastion based access to the database.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDETAI LS_BASTIONDETAILS_IP = bastion_ip_address
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BA STIONDETAILS_PORT

Specifies the bastion host port, as part of the database connection details for bastion-based access to the container database (CDB).

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB root.

The <code>SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_*</code> parameters specify details for bastion based access to the database.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDETAI LS_BASTIONDETAILS_PORT = bastion_port_number
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS BASTIONDETAILS_REMOTEHOSTIP

Specifies the remote host IP address to access from the bastion, as part of the database connection details for bastion-based access to the container database (CDB).

Parameter Relationships

For online logical migrations, the <code>sourcecontainerdatabase_connectiondetails_*</code> parameters specify connection details for the source CDB root.

The SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_* parameters specify details for bastion based access to the database.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDE TAILS_BASTIONDETAILS_REMOTEHOSTIP = ip_address
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS BASTIONDETAILS_USERNAME

Specifies the user name to access the bastion, as part of the database connection details for bastion-based access to the container database (CDB).

Parameter Relationships

For online logical migrations, the <code>SOURCECONTAINERDATABASE_CONNECTIONDETAILS_*</code> parameters specify connection details for the source CDB root.

The SOURCECONTAINERDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_* parameters specify details for bastion based access to the database.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDE TAILS_BASTIONDETAILS_USERNAME = username
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_H OST

Specifies the listener host name or IP address for the source container database (CDB).

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB root.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDETAI LS_HOST = listener_host
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required for migrations to Autonomous Database.
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_P ORT

Specifies the listener port number for the source container database (CDB).

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB root.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDETAI LS_PORT = listener_port
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required for migrations to Autonomous Database.
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS _PROXYDETAILS_HOSTNAME

Specifies the HTTPS proxy host name for the CDB.

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB root.

The SOURCECONTAINERDATABASE_CONNECTIONDETAILS_PROXYDETAILS_* parameters specify connection details for the source CDB root through an HTTP proxy.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDE TAILS_PROXYDETAILS_HOSTNAME = proxy_hostname
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS _PROXYDETAILS_PORT

Specifies the HTTPS proxy host port number for the CDB.

Parameter Relationships

For online logical migrations, the <code>sourcecontainerdatabase_connectiondetails_*</code> parameters specify connection details for the source CDB root.

The <code>SOURCECONTAINERDATABASE_CONNECTIONDETAILS_PROXYDETAILS_*</code> parameters specify connection details for the source CDB root through an HTTP proxy.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDE TAILS_PROXYDETAILS_PORT = proxy_port
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_SE RVICENAME

Specifies the fully qualified source CDB service name.

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_* parameters specify connection details for the source database CDB root.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDETAI LS_SERVICENAME = service_name
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required for Autonomous Database
Modifiable on Resume	No

SOURCECONTAINERDATABASE_CONNECTIONDETAILS_TL SDETAILS_CREDENTIALSLOCATION

Specifies the directory containing client credentials (wallet, keystore, trustfile, etc.) for the CDB.

Parameter Relationships

For online logical migrations, the <code>SOURCECONTAINERDATABASE_CONNECTIONDETAILS_*</code> parameters specify connection details for the source CDB root.

The <code>sourcecontainerdataBase_connectiondetails_tlsdetails_*</code> parameters specify details for TLS connection to the database CDB. These settings are not required if you are using TCP.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDETAI LS_TLSDETAILS_CREDENTIALSLOCATION = directory
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required for Autonomous Database
	Not required if you are using TCP
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_CONNECTIONDETAILS _TLSDETAILS_DISTINGUISHEDNAME

Specifies the distinguished name (DN) of the database server (SSL SERVER CERT DN).

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source CDB root.

The SOURCECONTAINERDATABASE_CONNECTIONDETAILS_TLSDETAILS_* parameters specify details for TLS connection to the CDB. These settings are not required if you are using TCP.

Property	Description
Syntax	SOURCECONTAINERDATABASE_CONNECTIONDE TAILS_TLSDETAILS_DISTINGUISHEDNAME = distinguished_name
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required for Autonomous Database
	Not required if you are using TCP
Modifiable on Resume	Yes

SOURCECONTAINERDATABASE_GGADMINUSERNAME

Specifies the source CDB GoldenGate administrator user name.

Parameter Relationships

For online logical migrations, the SOURCECONTAINERDATABASE_* parameters specify connection details for the source database CDB root.

Property	Description
Syntax	SOURCECONTAINERDATABASE_GGADMINUSERN AME = GoldenGate administrator username
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	No

SOURCEDATABASE_ADMINUSERNAME

Specifies the source database administrator user name.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_ADMINUSERNAME = source administrator username
Default value	There is no default value
Required	Yes
Modifiable on Resume	No

SOURCEDATABASE_CONNECTIONDETAILS_BASTIONDETA ILS_IDENTITYFILE

Specifies the identity file to access the bastion for bastion-based access to the database.

Parameter Relationships

The $sourcedatabase_connectiondetails_*$ parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_BASTIO NDETAILS_IDENTITYFILE = identity file
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_BASTIONDETA ILS_IP

Specifies the IP address of the bastion host for bastion-based access to the database.

Parameter Relationships

The SOURCEDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_BASTIO
	NDETAILS IP = <i>ip</i> address

Property	Description
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_BASTIOND ETAILS_PORT

Specifies the port number of the bastion host for bastion-based access to the database.

Parameter Relationships

The $sourcedatabase_connectiondetails_*$ parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_BAS TIONDETAILS_PORT = port_number
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_BASTIOND ETAILS_REMOTEHOSTIP

Specifies the remote host IP address to access from the bastion for bastion-based access to the database.

Parameter Relationships

The <code>sourcedatabase_connectiondetails_*</code> parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_BAS TIONDETAILS_REMOTEHOSTIP = ip_address
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_BASTIONDETA ILS_USERNAME

Specifies the user name to access the bastion for bastion-based access to the database.

Parameter Relationships

The <code>SOURCEDATABASE_CONNECTIONDETAILS_*</code> parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_BASTIO NDETAILS_USERNAME = username
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_HOST

Specifies the source database listener host name or IP address.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_HOST = hostname_or_ip
Default value	There is no default value
Required	Yes*
	*Not required for Autonomous Database.
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_PORT

Specifies the source database listener port number.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_PORT = listener port number
Default value	There is no default value

Property	Description
Required	Yes*
	*Not required for Autonomous Database.
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_PROXYDE TAILS_HOSTNAME

Specifies the proxy host name to connect to the source database through an HTTPS proxy.

Parameter Relationships

The $sourcedatabase_connectiondetails_*$ parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_PRO XYDETAILS_HOSTNAME = proxy host name
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_PROXYDE TAILS_PORT

Specifies the HTTP proxy port number to connect to the source database through an HTTPS proxy.

Parameter Relationships

The SOURCEDATABASE_CONNECTIONDETAILS parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_PRO XYDETAILS_PORT = proxy port number
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_SERVICENAM

Specifies the source database fully qualified service name.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_SERVIC ENAME = service name
Default value	There is no default value
Required	Yes*
	*Not required for Autonomous Database
Modifiable on Resume	No

SOURCEDATABASE_CONNECTIONDETAILS_TLSDETAILS_ CREDENTIALSLOCATION

Specifies the directory containing client credentials (wallet, keystore, trustfile, etc.) for a TLS connection to the database.

Parameter Relationships

The <code>sourcedatabase_connectiondetails_*</code> parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_TLSDET AILS_CREDENTIALSLOCATION = directory
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required if using TCP
	Not required for Autonomous Database
Modifiable on Resume	Yes

SOURCEDATABASE_CONNECTIONDETAILS_TLSDETAIL S_DISTINGUISHEDNAME

Specifies the distinguished name (DN) of the database server (SSL_SERVER_CERT_DN) for a TLS connection to the database.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

The <code>SOURCEDATABASE_CONNECTIONDETAILS_*</code> parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_CONNECTIONDETAILS_TLS DETAILS_DISTINGUISHEDNAME = distinguished_name
Default value	There is no default value
Required	Not mandatory for migration jobs
	Not required if using TCP
	Not required for Autonomous Database
Modifiable on Resume	Yes

SOURCEDATABASE_ENVIRONMENT_DBTYPE

Indicates the type of database to migrate from the specified environment.

If you specify that the source database environment is Amazon Web Services RDS by setting SOURCEDATABASE_ENVIRONMENT_NAME=AMAZON, then you must also set SOURCEDATABASE_ENVIRONMENT_DBTYPE=RDS_ORACLE.

See Migrating from Amazon Web Services RDS to Oracle Autonomous Database.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_ENVIRONMENT_DBTYPE = RDS_ORACLE
Default value	RDS_ORACLE
Required	No
Modifiable on Resume	No

SOURCEDATABASE_ENVIRONMENT_NAME

Specifies the environment of the source database.

You can specify whether the source database environment is Oracle (ORACLE) or Amazon Web Services RDS (AMAZON).

If you set SOURCEDATABASE_ENVIRONMENT_NAME=AMAZON you must also set SOURCEDATABASE_ENVIRONMENT_DBTYPE=RDS_ORACLE. See Migrating from Amazon Web Services RDS to Oracle Autonomous Database.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_ENVIRONMENT_NAME = [ORACLE AMAZON]
Default value	ORACLE
Required	No
Modifiable on Resume	No

SOURCEDATABASE_GGADMINUSERNAME

Specifies the GoldenGate administrator user name for online logical migrations.

Parameter Relationships

The SOURCEDATABASE * parameters specify connection details for the source database.

Property	Description
Syntax	SOURCEDATABASE_GGADMINUSERNAME = gg_admin_username
Default value	There is no default value
Required	No
Modifiable on Resume	No

TABLESPACEDETAILS_AUTOCREATE

Specifies whether Zero Downtime Migration automatically creates tablespaces at the target database necessary to allocate space in the database to contain schema objects.

This option is prohibited for Autonomous Database Shared targets.

See Automatic Tablespace Creation for more information.

Parameter Relationships

In a logical migration, the TABLESPACEDETAILS_* parameters specify details that allow Zero Downtime Migration to automatically create the required tablespaces at target database..

Property	Description
Syntax	TABLESPACEDETAILS_AUTOCREATE={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Zero Downtime Migration automatically creates tablespaces FALSE - Zero Downtime Migration does not create tablespaces
Required	No This option is prohibited for Autonomous Database Shared targets.
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED

TABLESPACEDETAILS_AUTOREMAP

Specifies whether Zero Downtime Migration automatically remaps a tablespace at the target database.

See Automatic Tablespace Remap for more information.

Parameter Relationships

In a logical migration, the TABLESPACEDETAILS_* parameters specify details that allow Zero Downtime Migration to automatically create the required tablespaces at target database..

Property	Description
Syntax	TABLESPACEDETAILS_AUTOREMAP={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Zero Downtime Migration automatically remaps tablespaces FALSE - Zero Downtime Migration does not
	remap tablespaces
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED

TABLESPACEDETAILS_EXCLUDE

Specifies tablespaces to be excluded from automatic creation at the target database.

See Automatic Tablespace Creation for more information.

Example

TABLESPACEDETAILS_EXCLUDE='B2B_LOB_TS', 'B2B_HR_TS'

Parameter Relationships

In a logical migration, the TABLESPACEDETAILS_* parameters specify details that allow Zero Downtime Migration to automatically create the required tablespaces at target database.

Property	Description
Syntax	TABLESPACEDETAILS_EXCLUDE=tablespace_na mes
Default value	By default SYSTEM, SYSAUX, and USERS tablespaces are excluded.
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED

TABLESPACEDETAILS_EXTENTSIZEMB

Specifies an extent size for AUTOEXTEND in support of automatic tablespace creation.

Properly setting TABLESPACEDETAILS_EXTENTSIZEMB enables AUTOEXTEND to avoid extend errors when automatic tablespace creation is enabled.

See Automatic Tablespace Creation for more information.

Parameter Relationships

In a logical migration, the TABLESPACEDETAILS_* parameters specify details that allow Zero Downtime Migration to automatically create the required tablespaces at target database..

Property	Description
Syntax	TABLESPACEDETAILS_EXTENTSIZEMB=MB
Default value	500
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED

TABLESPACEDETAILS_REMAPTARGET

Specifies tablespaces to be remapped.

For a tablespace to be used as REMAP target, the user performing the import operation, for example SYSTEM, should have some quota on the chosen tablespace.

See Automatic Tablespace Remap for more information.

Parameter Relationships

In a logical migration, the TABLESPACEDETAILS_* parameters specify details that allow Zero Downtime Migration to automatically create the required tablespaces at target database..

Property	Description
Syntax	TABLESPACEDETAILS_REMAPTARGET=target _tablespace_names
Default value	By default the DATA tablespace is remapped.
Required	No
Modifiable on Resume	Until ZDM_DATAPUMP_IMPORT_TGT phase is COMPLETED

TABLESPACEDETAILS_USEBIGFILE

Specifies whether to use bigfile tablespaces, if Zero Downtime Migration is configured to create tablespaces automatically.

Using bigfile tablespaces, which can be up to 128 TB, significantly reduces the number of data files for your database. Combined with Oracle Managed Files (OMF), bigfile tablespaces simplify data file management.

See Automatic Tablespace Creation for more information.

Parameter Relationships

In a logical migration, the TABLESPACEDETAILS_* parameters specify details that allow Zero Downtime Migration to automatically create the required tablespaces at target database..

Property	Description
Syntax	TABLESPACEDETAILS_USEBIGFILE={TRUE FALSE}
Default value	FALSE
Range of values	TRUE - Zero Downtime Migration automatically creates bigfile tablespaces
	FALSE - Zero Downtime Migration does not create bigfile tablespaces
Required	No

Property	Description
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is
	COMPLETED

TARGETDATABASE_ADMINUSERNAME

Specifies the target database administrator user name.

Parameter Relationships

The TARGETDATABASE * parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_ADMINUSERNAME = username
Default value	There is no default value
Required	Yes
Modifiable on Resume	No

TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS_IDENTITYFILE

Specifies the identity file to access the bastion for bastion-based access to the target database.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_BASTIO NDETAILS_IDENTITYFILE = bastion_id_file
Default value	There is no default value
Required	Not mandatory for migration jobs
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_BASTIOND ETAILS_IP

Specifies the IP address of the bastion host for bastion-based access to database.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

These are optional for Autonomous Database; however if an HTTP proxy is required to connect, specify them.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_BAS TIONDETAILS_IP = <i>ip</i> address
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_BASTIOND ETAILS_PORT

Specifies the port number of the bastion host for bastion-based access to database.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_BAS TIONDETAILS_PORT = port_number
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAILS REMOTEHOSTIP

Specifies the remote host IP address to access from the bastion for bastion-based access to database.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

These are optional for Autonomous Database; however if an HTTP proxy is required to connect, specify them.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_BASTIO NDETAILS_REMOTEHOSTIP = <i>ip_address</i>
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_BASTIONDETAI LS_USERNAME

Specifies the user name to access the bastion for bastion-based access to database.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_BASTIO NDETAILS_USERNAME = username
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_HOST

Specifies the listener host name or IP address.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS parameters specify connection details for the target OCI database.

These properties are optional for Autonomous Database; however if an HTTP proxy is required to connect, specify them.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_HOS T = hostname_or_ip
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_PORT

Specifies the listener port number.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

These are optional for Autonomous Database; however if an HTTP proxy is required to connect, specify them.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_POR T = listener port number
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_PROXYDET AILS_HOSTNAME

Specifies the proxy host name for connecting to the target database through an HTTPS proxy.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_PROXYD ETAILS_HOSTNAME = proxy host name
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_PROXYDETAIL S_PORT

Specifies the HTTP proxy port number for connecting to the source database through an HTTPS proxy.

Parameter Relationships

The ${\tt TargetDataBase_connectiondetails_*}$ parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_PROXYD ETAILS_PORT = proxy port number
Default value	There is no default value
Required	No
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_SERVICENAME

Specifies the fully qualified service name.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_SERVIC ENAME = service name
Default value	There is no default value
Required	No
Modifiable on Resume	No

TARGETDATABASE_CONNECTIONDETAILS_TLSDETAIL S_CREDENTIALSLOCATION

Specifies the directory containing client credentials (wallet, keystore, trustfile, etc.) for a TLS connection.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

These are optional for Autonomous Database; however if an HTTP proxy is required to connect, specify them.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_TLS DETAILS_CREDENTIALSLOCATION = directory
Default value	There is no default value
Required	Not mandatory for migrations
	Not required if using TCP
Modifiable on Resume	Yes

TARGETDATABASE_CONNECTIONDETAILS_TLSDETAIL S_DISTINGUISHEDNAME

Specifies the distinguished name (DN) of the database server (SSL_SERVER_CERT_DN) for a TLS connection.

Parameter Relationships

The TARGETDATABASE_CONNECTIONDETAILS_* parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_CONNECTIONDETAILS_TLS DETAILS_DISTINGUISHEDNAME = distinguished_name
Default value	There is no default value
Required	Not mandatory for migrations
	Not required if using TCP
Modifiable on Resume	Yes

TARGETDATABASE_GGADMINUSERNAME

Specifies the GoldenGate administrator user name for online logical migrations.

Parameter Relationships

The TARGETDATABASE * parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_GGADMINUSERNAME = gg_admin_username
Default value	There is no default value
Required	No
Modifiable on Resume	No

TARGETDATABASE_OCID

Specifies the Oracle Cloud resource identifier.

Parameter Relationships

The TARGETDATABASE * parameters specify connection details for the target OCI database.

Property	Description
Syntax	TARGETDATABASE_OCID = ocid
Default value	There is no default value
Required	Yes
Modifiable on Resume	No

WALLET_AMAZONS3SECRET

Specifies the Amazon S3 Secret Key wallet path.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The WALLET_* parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
Syntax	WALLET_AMAZONS3SECRET = wallet_path
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

WALLET_DATAPUMPENCRYPTION

Specifies the absolute path to the directory that contains the auto login wallet file cwallet.sso, which is used to get the Data Pump encryption password.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The WALLET_* parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
	Description
Syntax	WALLET_DATAPUMPENCRYPTION = wallet_path
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

WALLET_OGGADMIN

Specifies the absolute path to the directory that contains the auto login wallet file cwallet.sso, which is used to get the Oracle GoldenGate hub administrative password.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The WALLET_* parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
Syntax	WALLET_OGGADMIN = wallet_path
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

WALLET_SOURCECONTAINER

Specifies the absolute path to the directory that contains the auto login wallet file cwallet.sso, which is used to get the source database administrative user password.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The WALLET_* parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
Syntax	WALLET_SOURCECONTAINER = wallet_path
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

WALLET_SOURCECGGADMIN

Specifies the absolute path to the directory that contains the auto login wallet file cwallet.sso, which is used to get the source database administrative c##ggadmin user password.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The WALLET_* parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
Syntax	WALLET_SOURCECGGADMIN = wallet_path
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

WALLET_SOURCEGGADMIN

Specifies the absolute path to the directory that contains the auto login wallet file cwallet.sso, which is used to get the source database administrative user ggadmin password.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The WALLET_* parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
Syntax	WALLET_SOURCEGGADMIN = wallet_path
Default value	There is no default value

Property	Description
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

WALLET_TARGETADMIN

Specifies the absolute path to the directory that contains the auto login wallet file cwallet.sso, which is used to get the target database administrative admin password.

The path should be resolvable from the Zero Downtime Migration service host.

About the WALLET_* Parameters

The <code>WALLET_*</code> parameters specify the full path for the auto login wallet file on the Zero Downtime Migration service host.

Property	Description
Syntax	WALLET_TARGETADMIN = wallet_path
Default value	There is no default value
Required	No
Modifiable on Resume	Until ZDM_PREPARE_DATAPUMP_SRC phase is COMPLETED.

F Zero Downtime Migration ZDMCLI Command Reference

ZDMCLI is the command line interface for Zero Downtime Migration migration operations.

To run ZDMCLI commands, go to the /bin directory in the Zero Downtime Migration software home and enter one of the commands listed in the topics below. For example:

zdmuser> \$ZDM HOME/bin/zdmcli migrate database

To list help pages for any ZDMCLI command use the -help option. The following command lists the help for all of the ZDMCLI commands.

```
zdmuser> $ZDM HOME/bin/zdmcli -help
```

To get the current release information for your Zero Downtime Migration software, run ZDMCLI with the -build option.

```
zdmuser> $ZDM HOME/bin/zdmcli -build
```

The following topics describe the Zero Downtime Migration ZDMCLI command usage and options.

ZDMCLI Options

You can run options on ZDMCLI without specifying a command.

Syntax

\$ZDM HOME/bin/zdmcli -option

Options

Table F-1 ZDMCLI Options

Option	Description
-build	Returns Zero Downtime Migration version information, including Cloud Premigration Advisor version.

abort job

Terminates the specified job, if running.

Syntax

```
$ZDM_HOME/bin/zdmcli abort job
    -jobid job id
```

Options

Table F-2 ZDMCLI abort job Options

Option	Description
-jobid job_id	Unique job ID value (integer) for the scheduled job. The job ID is assigned when the job is scheduled.

add imagetype

Configures a new image type of the specified name and its associated user actions.

Syntax

```
$ZDM_HOME/bin/zdmcli add imagetype
-imagetype image_type
-basetype CUSTOM_PLUGIN
[-useractions user action list]
```

Options

Table F-3 ZDMCLI add imagetype Options

Option	Description
-imagetype image_type	Name of the image type to be created
-basetype CUSTOM_PLUGIN	The base image type for which the image type is created.
	Note that CUSTOM_PLUGIN is the only valid value for this mandatory argument.
-useractions user_action_list	Comma-separated list of user action names

add useraction

Configures a new user action of the specified name with its associated script and action file.

Syntax

```
$ZDM_HOME/bin/zdmcli add useraction
-useraction user_action_name
-actionscript script_name
[-actionfile file_name]
```

```
{-pre | -post}
-optype MIGRATE_DATABASE
[-phase operation_phase]
[-onerror {ABORT | CONTINUE}]
[-runscope
    {ONENODE |
    ALLNODES |
    AUTO}]
[-outputfrom useraction names]
```

Options

Table F-4	ZDMCLI	add	useraction	Options
-----------	--------	-----	------------	---------

Option	Description
-useraction user_action_name	Name of the user action
-actionscript script_name	Script file to be run
-actionfile file_name	File associated with and needed by the user action
-pre	Runs the user action before the operation
-post	Runs the user action after the operation
-optype MIGRATE_DATABASE	Defines the operation for which the user action is configured as MIGRATE_DATABASE.
-phase phase_of_operation	Migration operation phase for which the user action is configured
-onerror {ABORT CONTINUE}	The response if the user action encounters an error during execution
-runscope {ONENODE ALLNODES AUTO}	The servers on which the user action is run.
	Specify AUTO to choose the run scope based on the other command options.
-outputfrom useraction_names	Comma-separated list of user action names whose output is to be supplied to the current user action.

Examples

For more examples, see Registering User Actions.

migrate database

Performs a migration of a database to the Oracle Cloud.

Syntax

```
$ZDM_HOME/bin/zdmcli migrate database
[-sourcedb db_name |
    -sourcesid source_oracle_sid}
-rsp zdm_template_path
-sourcenode source_host_name
-targetnode target_host_name
[-targethome target_home]
```

```
[-eval]
  [-tdekeystorepasswd
     [-tgttdekeystorepasswd]]
  [-tdemasterkey]
  [-useractiondata user action data]
  [-imagetype]
  [-backupuser user name]
  [-dvowner database vault owner]
                                   [-backuppasswd]
  [-tdewallet wallet path
     [-tgttdewallet wallet path]]
  [-tdekeystorewallet tde wallet path
     [-tgttdekeystorewallet tde wallet path]]
  [-sourcesyswallet sys wallet path]
  [-osswallet oss wallet path]
  [-dvwallet dv wallet path]
  [-backupwallet backup wallet path]
  [{-srcroot |
    -srccred cred name |
    -srcuser user name |
     {-srcsudouser sudo user name -srcsudopath sudo binary path} |
        {-srcauth plugin name
            [-srcarg1 user:source database server login user name
             -srcarg2
identity file: ZDM installed user private key file location
             -srcarg3 sudo location: sudo location]}}]
  {-tgtroot |
    -tgtcred cred name |
     -tgtuser user name |
    {-tgtsudouser sudo user name -tgtsudopath sudo binary path} |
       {-tqtauth plugin name
          [-tgtarg1 user:target database server login user name
           -tgtarg2
identity file: ZDM installed user private key file location
           -tgtarg3 sudo location:sudo location]}}
  [-schedule {timer value | NOW}]
  [-pauseafter phase]
  [-stopafter phase]
  [-listphases]
  [-ignoremissingpatches patch name
     [,patch name...]]
  [-ignore {ALL | WARNING | PATCH CHECK}]
  [-incrementalinterval timer minutes]
  [-advisor |
     -ignoreadvisor |
     -skipadvisor] [-genfixup {YES | NO}]
```

Options

Option	Description
-advisor	Similar to -eval, migrate database will run the minimum phases required for exclusively running Cloud Premigration Advisor Tool (CPAT) on the migration job, without actually running the migration job against the source and target
-backuppasswd password	In a physical migration, allows you to
	1. Create an RMAN backup with provided backup password
	Use an existing RMAN backup with backup password authentication
-backupuser user_name	Name of the user allowed to back up or restore the database
-backupwallet backup_wallet_path	Full path for the auto-login wallet file on the Zero Downtime Migration host containing the RMAN backup password
-dvowner database_vault_owner	Name of the Oracle Database Vault owner allowed to grant or revoke SYS privileges
-dvwallet dv_wallet_path	Full path for the auto-login wallet file on the Zero Downtime Migration host, containing the credential for the Oracle Database Vault owner
-eval	Evaluates the migration job without actually running the migration job against the source and target
-genfixup {YES NO}	Displays remedial scripts for failing checks when a migration is run with Cloud Premigration Advisor Tool (CPAT) enabled. Any remedies that can be run automatically on the source database are run.
	See Cloud Premigration Advisor Tool Support for CPAT use cases supported by Zero Downtime Migration.
-ignore {ALL WARNING PATCH_CHECK}	Ignore all checks or specific type of checks
-ignoreadvisor	Runs Cloud Premigration Advisor Tool (CPAT), but ignores errors generated by CPAT.
-ignoremissingpatches	Proceeds with the migration even though the specified patches, which are present in the source path or working copy, might be missing from the destination path or working copy
-imagetype image_type	Name of the user action imagetype
-incrementalinterval timer_minutes	Run periodic incremental RMAN backup every interval (in minutes)
-listphases	Lists the phases for the migration job
-osswallet oss_wallet_path	Full path for the auto-login wallet file on the Zero Downtime Migration host containing the credential for the Object Storage Service (OSS) backup user

Table F-5 ZDMCLI migrate database Options

Option	Description
-pauseafter phase	Pause the job after running the specified phase
-rsp zdm_template_path	Location of the Zero Downtime Migration response file
-schedule timer_value	Scheduled time to run the migration, in ISO-8601 format.
	For example, 2016-12-21T19:13:17+05 Object the ODAT shares of the selection is in
-skipadvisor	Skips the CPAT phase of the migration job
-sourcedb db_name	Name of the source database you want to migrate
-sourcenode source_host_name	Host on which the source database is running
-sourcesid source_oracle_sid	ORACLE_SID of the source single instance database without Grid Infrastructure
-sourcesyswallet sys_wallet_path	Full path for the auto-login wallet file on the Zero Downtime Migration host containing the SYS password of the source database
-srcauth plug-in_name [plug-in_args]	Use the zdmauth authentication plug-in to access the source database server, and enter the following arguments:
	<pre>-srcarg1 user:source_database_server_login_use r_name -srcarg2 identity_file:ZDM_installed_user_priv ate_key_file_location -srcarg3 sudo_location:sudo_location</pre>
	If you don't specify the sudo location, the default (/usr/bin/sudo) is used by Zero Downtime Migration.
-srccred cred_name	Credential name with which to associate the user name and password credentials to access the source database server
-srcroot	Directs Zero Downtime Migration to use root credentials to access the source database server
-srcsudopath <pre>sudo_binary_path</pre>	Location of sudo binary on the source database server
-srcsudouser <i>user_name</i>	Perform super user operations as sudo user name on the source database server
-srcuser user_name	Name of the privileged user performing operations on the source database server

Table F-5	(Cont.)	ZDMCLI	migrate	database	Options
-----------	---------	--------	---------	----------	---------

Option	Description
-stopafter phase	Truncates the work flow by the specified phase, and upon completion of the specified phase, the migration job is marked with status completed.
	There is no option to resume the job beyond this phase.
	For example, if you intend to stop the work flow after Data Guard setup, then specifying – stopafter ZDM_CONFIGURE_DG_SRC stops the job at this phase and the job is marked completed once the ZDM_CONFIGURE_DG_SRC is completed successfully.
-targethome target_home	Location of the target database ORACLE_HOME
-targetnode target_host_name	Target server to which the source database is migrated
-tdekeystorepasswd	Transparent Data Encryption (TDE) keystore password, required for password-based keystore or wallet
-tdekeystorewallet	Full path for the auto-login wallet file on the Zero Downtime Migration host containing the Transparent Data Encryption (TDE) keystore password
-tdemasterkey	Transparent Data Encryption (TDE) master encryption key
-tdewallet wallet_path	Full path for the auto-login wallet file on the Zero Downtime Migration host containing the Transparent Data Encryption (TDE) keystore password
-tgtauth plugin_name [plugin_args]	Use the zdmauth authentication plug-in to access the target database server, and enter the following arguments:
	-tgtarg1
	user:target_database_server_login_use
	r_name -tgtarg2
	identity_file:ZDM_installed_user_priv
	<pre>ate_key_file_location -tgtarg3 sudo_location:sudo_location</pre>
	If you don't specify the sudo location the default (/usr/bin/sudo) is used by Zero Downtime Migration.
-tgtcred cred_name	Credential name with which to associate the user name and password credentials to access the target database server
-tgtroot	Use root credentials to access the target database server

Table F-5 (Cont.) ZDMCLI migrate database Options

Option	Description
-tgtsudopath sudo_binary_path	Location of the sudo binary on the target database server
-tgtsudouser user_name	Perform super user operations as sudo user name on the target database server
-tgttdekeystorepasswd	Target container database TDE keystore password
-tgttdekeystorewallet	Full path for the auto-login wallet file on the Zero Downtime Migration host that contains the target TDE keystore password
-tgttdewallet wallet_path	Full path for the auto-login wallet file on the Zero Downtime Migration host containing target container database Transparent Data Encryption (TDE) keystore password
	If you are converting a non-multitenant source database to a multitenant architecture on the target, that is a pluggable database (PDB), then you can also create an auto-login wallet for the target container database (CDB) TDE keystore password.
-tgtuser user_name	Name of the user performing operations on the target database server
-useractiondata user_action_data	Value to be passed to <i>useractiondata</i> parameter of the user action script

Table F-5	(Cont.)	ZDMCLI	migrate	database	Options
-----------	---------	--------	---------	----------	---------

Examples

ZDMCLI migrate database options for an Autonomous Database migration:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -rsp file_path -
sourcenode host
-srcauth zdmauth -srcarg1 user:username -srcarg2
identity_file:ssh_key_path
-srcarg3 sudo_location:sudo_path -eval [-advisor [-ignoreadvisor]] | -
skipadvisor]]
```

ZDMCLI migrate database options for a co-managed database migration:

```
zdmuser> $ZDM_HOME/bin/zdmcli migrate database -rsp file_path -
sourcenode host
-srcauth zdmauth -srcarg1 user:username -srcarg2
identity_file:ssh_key_path
-srcarg3 sudo_location:sudo_path -targetnode host -tgtauth zdmauth
-tgtarg1 user:username -tgtarg2 identity_file:ssh_key_path
-tgtarg3 sudo_location:sudo_path -eval [-advisor [-ignoreadvisor] | -
skipadvisor]]
```

modify useraction

Modifies the configuration of the user action with the specified name.

Syntax

```
$ZDM_HOME/bin/zdmcli modify useraction
  -useraction user_action_name
  [-actionscript script_name]
  [-actionfile file_name]
  [-pre | -post]
  [-optype MIGRATE_DATABASE]
  [-oherror {ABORT | CONTINUE}]
  [-runscope
      {ONENODE |
      ALLNODES |
      AUTO}]
  [-outputfrom useraction names]
```

Options

Option	Description
-useraction user_action_name	Name of the user action
-actionscript script_name	Script file to be run
-actionfile file_name	Accompanying file needed by the user action
-pre	Runs the user action before the operation
-post	Runs the user action after the operation
-optype MIGRATE_DATABASE	Defines the operation for which the user action is configured as MIGRATE_DATABASE
-onerror {ABORT CONTINUE}	Defines whether to stop or continue running if an error occurs while the user action is running
-runscope {ONENODE ALLNODES AUTO}	The servers where the user action will be run.
	Specify AUTO to choose the run scope based on the other command options.
-outputfrom useraction_names	Comma-separated list of user action names whose output is to be supplied to the current user action.

Table F-6 ZDMCLI modify useraction Options

query job

Gets the current status of scheduled migration jobs.

Syntax

```
$ZDM_HOME/bin/zdmcli query job
  [-jobid job id
     [-jobtype]]
  [-sourcenode source host name
     [-sourcedb db name |
     -sourcesid sid]]
  [-targetnode target_host_name]
  [-latest]
  [-eval |
  -migrate]
  [-status
     {SCHEDULED |
      EXECUTING |
     UNKNOWN |
     TERMINATED |
      FAILED |
      SUCCEEDED |
      PAUSED |
      ABORTED}]
  [-phase]
  [-dbname database_name]
  [-since timer value]
  [-upto timer_value]
  [-brief]
  [-statusonly]
```

Options

Table F-7	ZDMCLI	query	job	Options
-----------	--------	-------	-----	---------

Option	Description
-jobid job_id	Unique job ID value (integer) for the scheduled migration job
	The job ID is assigned when the migration job is scheduled.
-job_type	Returns the type of the scheduled job
-sourcenode source_host_name	Server on which the source database is running
-sourcedb db_name	Name of the source database to be migrated
-sourcesid sid	The ORACLE_SID of the source single instance database without Grid Infrastructure
-targetnode target_host_name	Target server to which the database is migrated
-latest	Returns the most recent job that matches the given criteria
-eval	Returns evaluation jobs only
-migrate	Returns migration jobs only

Option	Description
-status {SCHEDULED EXECUTING UNKNOWN TERMINATED FAILED SUCCEEDED PAUSED ABORTED}	Returns jobs that match the specified job status
-phase	Returns the status of the given phase. If the phase supplied by the user is invalid, the query returns an error.
	<pre>./zdmcli query job -jobid 33 - phase ZDM_PREUSERACTIONS_TGT - statusonly # exmaple.com: Audit ID: 153 # Job ID: 33 # ZDM_PREUSERACTIONS_TGT:PENDING</pre>
-dbname unique_db_name	Specifies the database DB_UNIQUE_NAME value
-since timer_value	Date from which to get the jobs, in ISO-8601 format. For example: 2016-12-21T19:13:17+05
-upto timer_value	Upper limit time to which to get the jobs, in ISO-8601 format. For example: 2016-12-21T19:13:17+05
-brief	Returns job details summary only
-statusonly	Returns only the job status and current phase name

Table F-7	(Cont.) ZDMCLI	query job	Options
-----------	----------------	-----------	---------

Usage Notes

To identify if the current run is a resumption of a PAUSED migration job, a restart of a FAILED migration job, or a fresh start for a migration job, use the following options:

- zdmcli query job -latest gets the latest job without considering the job type
- zdmcli query job -latest -migrate gets the latest non-evaluation migration job
- zdmcli query job -latest -eval get the latest evaluation migration job

query useraction

Displays the configuration of a user action.

Syntax

```
$ZDM_HOME/bin/zdmcli query useraction
    [-useraction user_action_name | -imagetype image_type
    [-optype MIGRATE_DATABASE]]
```

Options

Table F-8	ZDMCLI	query	useraction	Options
-----------	--------	-------	------------	---------

Option	Description
-useraction user_action_name	Name of the user action
-imagetype image_type	Specify the image type name
-optype MIGRATE_DATABASE	Operation for which the user action is configured

resume job

Resumes a specified job that was paused.

Syntax

```
$ZDM_HOME/bin/zdmcli resume job
-jobid job_id
[-pauseafter pause_phase |
-rsp zdm_logical_template_path]
```

Options

Table F-9 ZDMCLI resume job Options

Option	Description
-jobid job_id	Unique job ID value (integer) for the scheduled job
	The job ID is assigned when the migration job is scheduled.
-pauseafter pause_phase	Pauses the migration job after running the specified phase
<pre>-rsp zdm_logical_template_path</pre>	Specify the migration response file if you modified any parameters to be picked up by ZDM on resume.
	This option can only be used with logical migration jobs.

Usage Notes

See Resume a Migration Job

suspend job

Suspends the specified job if running. Executing suspend job stops the ongoing job at the current work flow phase and allows jobs to be resumed later.

The command suspend job is only applicable to physical migration jobs.

Syntax

```
$ZDM_HOME/bin/zdmcli suspend job
-jobid job_id
```

Options

Table F-10 ZDMCLI suspend job Options

Option	Description
-jobid job_id	Unique job ID value (integer)
	The job ID number is assigned when the migration job is scheduled.
