Introduction

This document intends to explain the process of performing bulk export of structured data in machine readable format using API (Oracle BI Publisher).

Pre-requisites

Following are the pre-requisites to be noted:

- » Download the required version of Oracle Financial Service Lending and Leasing release package from e-delivery.
- » Ensure that BI Publisher is installed and JDBC data source is configured. The process for the same is detailed in https://docs.oracle.com/cd/E89525_01/html/BIP_Installation_Guide/BIP_Installation_GuideTOC.htm
- » Ensure that BI Publisher plugin for MS word is installed. If not, follow the procedure detailed in section 'Installing BI Publisher Plugin'.

Assumptions

» It is assumed that you are familiar with basics of BI Publisher, SQL and Microsoft Word usage.

Bulk Data Export

Following are the steps to be followed while doing a bulk data export using BI Publisher:

- » Identify required data for export
 - » Look for column details where data exist
 - » Identify relation of column data from main table
- » Create Data Model
 - » Create Data Set using SQL query
 - » Define Parameters with variable elements
 - » Export variable parameter data in XML format
 - » Create reporting template using BI Publisher plugin
 - » Import and upload template in BI Publisher
 - » Map reporting template to Data Model in BI Publisher
 - » Customize Data Output format
- » Generate Data in BI Publisher
- » Export BI Publisher data to required format

The above steps are explained in detail in the subsequent section using sample data to indicate data export functionality. However, since exporting data has to comply with confidentiality norms, it is recommended to contact your IT staff for assistance.

Sample Data Export

As a sample exercise, assume you need the data of portfolio companies associated with matching accounts. To know how to extract the details of the same from database, refer to the below sections.

Identify Required Data for Export

The first step in data extraction is to identify the required data and its location in the database.

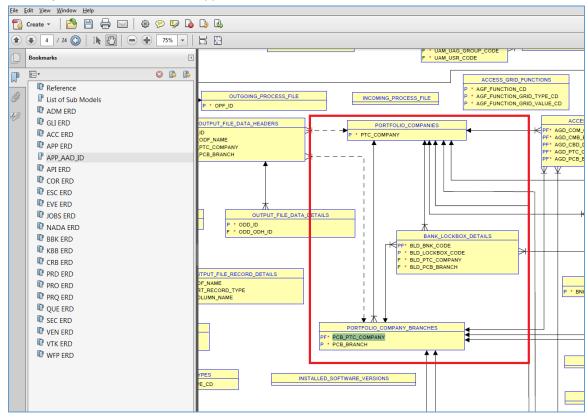

Look for column details where data exist

- » In the Oracle Financial Services Lending and Leasing release directory access the tech doc which is available in the path (<user directory>\LL\release\<OFSLL version>\docs\techdoc). Unzip the files and open 'Index.html'.
- » Search and select the appropriate table which matches the data you need. As indicated below, searching for 'companies' displays the table PORTFOLIO_COMPANIES which has the required field information. On clicking the same, you can identify the column to which it is mapped in the database.

OFSLL							
ables eins adoxes adoxes	PORTFOLIO_C			ndencies	Details Partitions	Indexes	Contraction of the

RTFOLIO COMPANY BRANCHES	PTC_FAX_NO1	NUMBER	No	0		16	Phone number where Facsimile can be sent to company
P ACCOUNTING COMPANIES	PTC_FAX_NO2	NUMBER	Yes	null		17	Second phone number where Facsimile can be sent to company
	PTC_REMITTANCE_ADDRESS1	VARCHAR2(80 BYTE)	Yes	null		18	First line of address where payment can be remitted to company
	PTC_REMITTANCE_ADDRESS2	VARCHAR2(80 BYTE)	Yes	null		19	Second line of address where payment can be remitted to compan
	PTC REMITTANCE CITY	VARCHAR2(80 BYTE)	Yes	nul		20	City name where payment can be remitted to company

Identify relation of column data from main table

» In Oracle Financial Services Lending and Leasing release - tech doc directory, open the Entity Relationship Diagram available in pdf format with the name ofsll_<version>_erd.pdf. This helps you to identify the relation of the required data from the main table(s).

Create Data Model

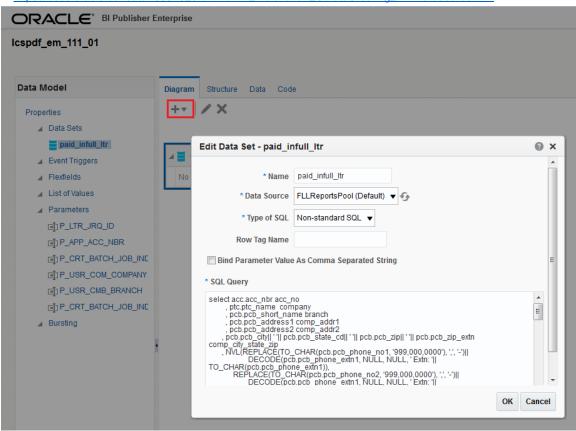

Once you have the required information that needs to be extracted from database tables, open Oracle BI Publisher using which you need to create a data model with SQL query.

Create Data Set using SQL query

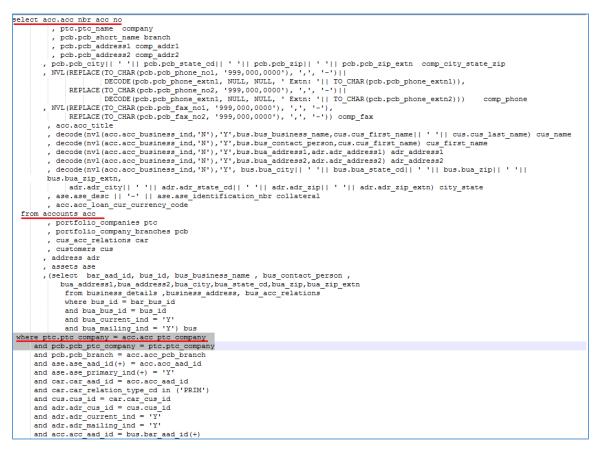

» In BI Publisher home page, select Data Model from 'New' drop-down list.

	Publisher Enterprise	Search All	•	Q Administration			
Home		Home	Catalog	New 🔻 Open 🔻			
				🛔 Report			
Create	Recent		눦 Reg				
Report	Reports			📜 Data Model			
				A Style Template			

» Click '+' button and create a data set as indicated below. In 'Data Source' field, ensure that the same data source is used as configured during BI Publisher installation. For information, refer to the following link https://docs.oracle.com/cd/E89525_01/html/BIP_Installation_Guide/Creating_BIPDatasource.htm

» While building the query, ensure that the three components; select, from, and where clause are defined accurately based on requirement. In the image below, the 'Select' statement indicates the elements being presented in the output, the 'From' statement indicates from where the elements are being called, and the 'Where' statement indicates the criteria on which the elements are being represented.

Define Parameters with Variable elements

- » In BI Publisher, click 'Parameters' and define the values for each parameter that is identified as the variable element. In the above query, information for the following variables are to be generated:
 - » ACC_NO Account Number
 - » COMPANY Portfolio Company Name
 - » COMP_ADDR1 Portfolio Company Address
 - » COMP_ADDR2 Portfolio Company Address
 - » COMP_PHONE Portfolio Company Phone
 - » CUS_NAME Customer Name associated with Account

Export variable parameter data in XML format

» Save the query details clicking on 'Save As Sample Data'. Click 'Export' and export the sample data to a local directory.

Create reporting template using BI Publisher plugin

- » Using the exported sample data, create template in Microsoft word using the BI Publisher plugin. For information on plugin configuration, refer to section <u>'Installing BI Publisher Plugin</u>'.
- » Open Microsoft Word and in the BIP tab, click 'Sample XML' and import the sample data.

	5-0	Ŧ				Docun	nent2 [(Compatibilit	y Mode] -	Word

The BI Publisher helps to visualize on how the data from tables would be represented in the template layout. Also the BI Publisher plugin supports multiple options to create template. For information on other supported options, refer 'Template Builder for Word Tutorial' document.

- » Once done, save the template in RTF (Rich text format) format. You can also choose other required format which are in common for export and import.
 - The common supported export formats of Microsoft Word / Excel are doc, xls, rtf, xml and html and BI Publisher supports importing files in rtf, pdf, xls, xsl formats.

Import and upload template in BI Publisher

» The next step is to import the template in BI Publisher. Select Catalog link in the LHS menu, click '+' and select 'Report'.

» By default, the BI Publisher interface provides you with Create Report option. Since you need to upload a predefined report template, click 'Cancel' and close the Create Report window. » Select 'Upload or Generate Layout' option in the second section. In the 'Upload Template File' dialog specify the required details (Layout Name, Type, Locale), browse to the existing RTF file and click 'Upload'.

Map reporting template to Data Model in BI Publisher

» Once the template is uploaded, map the template to Data Model in BI Publisher to fetch and present the data. Click the Search icon and select the data model created.

	r Enterprise

Customize Data Output format

BI Publisher by default displays the output data in pre-defined format (html or so on) and the same can be customized as per requirement. In this case a machine readable output such as xml or csv is required, and hence the default format is to be set.

» Click 'View a List' option and select the required formats (XML, CSV and so on) in 'Output Formats' drop-down list. If you are in the reporting format screen, select and click 'Edit Report' to view this screen.
