The users created using the above SMS script must also be created in the LDAP server.
Refer Oracle Banking Microservices Platform Foundation Services – ANNEXURE-1 for LDAP setup.

7. Restarts and Refresh

Once everything is deployed, restart all the managed servers. And for each application call path “/refresh” for refreshing the configuration properties.

7.1 Restarting Servers

To restart the server, refer to Oracle Banking Microservices Platform Foundation Installation ANNEXURE-1 “**How to restart**” section.

8. Workflow Setup

8.1 Conductor & Plato-Orchestrator Setup

Refer " Oracle Banking Microservices Platform Foundation Installation Guide" and setup Conductor & Plato-Orchestrator

8.2 Account Closure Workflow

Workflow needs to be created manually and it's a one-time activity. Account Closure has 2 workflows that are factory shipped. These need to be created using plato-orch-service API through postman.

VirtualAccountClosure

This is the Main workflow which is started upon Batch Execution. This workflow instance will be assigned a new workflow id and can be tracked using this id.

VirtualAccountClosureSWF

This is the Sub workflow which is started by the Main workflow. This workflow will be assigned a new workflow id and can be tracked using this id.

Batch Job Setup

Virtual Account closure uses plato-batch-server for Job execution.

Account closure process uses "virtualAccountCloseJob" and below setup needs to be done for the same.

1. In PLATO_BATCH_TASK_TRIGGER_DEFINITIONS table, an entry for "virtualAccountCloseJob" should be added and its definition should be as below
"appld:::VAM;microServiceName:::obvam-account-services;contextRoot:::obvam-account-services;jobName:::virtualAccountCloseJob;type:::schedule;cronExpression:::0 0/1 * * * ?"
In the above definition, cronExpression is the string containing details of schedule.
2. In PROPERTIES table, the following entries should have valid user and branch code for which applicable roles are present to run the job
APPLICATION = "plato-batch-server", KEY = "batchServer.userId", VALUE = "<user-id>"
APPLICATION = "plato-batch-server", KEY = "batchServer.branchCode", VALUE = "<branch-code>"
3. After above setup, plato-batch-server needs to be restarted.

Note:

Postings on virtual accounts for which closure request is in progress is controlled through a non-mandatory header parameter "allowPosting" in Balance Transfer stage. The values to this can either be

- "Y" – This indicates transaction postings are allowed.
- "N" - This indicates transaction postings are not allowed.

Once the latest subworkflow is registered, on triggering the "virtualAccountCloseJob", the workflow ID gets generated and the table VAM_TB_VA_CLOSURE_STATUS will be updated for the picked up virtual accounts (VA's with closure status as 'P') with the value (Y/N) that is defined in the subworkflow.

External Validation

External validation is done using OBPM. This has to be configured in the Routing-Hub using OBRH config files that are factory shipped.

8.3 EOD Workflow

EOD has 2 workflows that are factory shipped.
Please refer **EOD Configuration Guide** and do the setup

9. Logging Area

This part of the document will talk about the logging area of Oracle Banking Virtual Account Management applications in server.

9.1 Logging Area

Logging area is configurable, you can configure any path within the server, where you want Oracle Banking Virtual Account Management application to write logs. Oracle Banking Virtual Account Management applications will write logs in the configured path with below name:

<Application name>.logs

Example: if application name is **obvam-account-services**, then logs file name would be obvam-account-services.log

To configure logging path, refer Oracle Banking Virtual Account Management Pre-Installation "Annexure: domain-config-deploy.env" Section.
