

ANNEXURE – 1

**Oracle Banking Corporate Lending Process
Management**

Release 14.6.0.0.0

Part Number F56381-01

May 2022

Table of Contents

1. ANNEXURE - 1	1-1
1.1 INTRODUCTION	1-1
1.2 PLACEHOLDER UPDATE FOR ORACLE BANKING MICROSERVICES ARCHITECTURE SERVICES.....	1-1
1.2.1 Method 1 – Via setUserOverrides.sh file.....	1-1
1.2.2 Method 2 – Via passing the -D params in the Server start argument.....	1-5
1.2.3 Method 3 – Using env files and setUserOverrides.sh file.....	1-7
1.2.4 Method 4 – Workflow Configuration	1-15
1.3 HOW TO CREATE DOMAIN AND CLUSTER CONFIGURATION.....	1-20
1.3.1 Domain Creation Configuration	1-20
1.3.2 Post Domain Creation Configurations.....	1-29
1.4 HOW TO CREATE DATASOURCE.....	1-31
1.5 HOW TO DEPLOY APPLICATION	1-36
1.6 HOW TO UNDEPLOY APPLICATION.....	1-41
1.7 HOW TO RESTART SERVERS.....	1-42
1.8 HOW TO CHECK PORT NUMBER.....	1-45
1.9 WEBLOGIC EMBEDDED LDAP SETUP.....	1-46
1.9.1 Configuration of Weblogic LDAP.....	1-46
1.9.2 Creation of Users	1-47
1.9.3 Oracle Banking Microservices Architecture Security Config Table Entries	1-50
1.10 ORACLE ANALYTIC SERVER SETUP	1-51
1.10.1 Prerequisite	1-51
1.10.2 Start BI Server	1-51
1.10.3 Upload BI Reports	1-51
1.10.4 Test BI Reports	1-51

1.1 Introduction

This guide is a supporting document for the installation of Oracle Banking Microservices Architecture applications. You can find the reference in the respective installation guides.

1.2 Placeholder Update for Oracle Banking Microservices Architecture Services

The Placeholder update can be performed in the following methods:

- Method 1 – Via **setUserOverrides.sh** file
- Method 2 – Via passing the **-D params** in the Server start argument
- Method 3 – Using **env** files and **setUserOverrides.sh** file
- Method 4 – Via Workflow creation in Plato O

1.2.1 Method 1 – Via setUserOverrides.sh file

Perform the following steps:

1. Create a file called **setUserOverrides.sh** inside the Weblogic bin location.
2. The following formats of the **setUserOverrides.sh** file and the list of parameters that need to be passed in order to run Oracle Banking Microservices Architecture services properly.

NOTE: Below are the list of **-D params** (ENV Variables) which needs to be set for all the individual services. Set a single **-Dparam** as follows:

```
JAVA_OPTIONS="${JAVA_OPTIONS} -DParam =<ParamValue>"
export JAVA_OPTIONS
```

//Common Properties

```
-Dplato.services.config.port= <CONFIG_SERVICE_PORT>
-Dplato.services.config.uri=
http://<CONFIG_SERVICE_HOSTNAME>:<CONFIG_SERVICE_PORT>
-Ddeureka.client.serviceUrl.defaultZone=
http://<DISCOVERY_SERVICE_HOST>:<DISCOVERY_SERVICE_PORT>/plato-
discovery-service/eureka
-Dplato.services.entityservices.port= <PLATO_ORCH_SERVICE_PORT>

 services.server.pollerInitialDelay=<Poller_Initial_Delay>

-Dflyway.domain.placeholders.cmc-fc-ai-ml-
 services.server.emailPassword=<Poller_Email_Password>

1.2.2 Method 2 – Via passing the -D params in the Server start argument

All the above mentioned -D parameters can be passed through the Server start argument in respective managed server. Perform the following steps:

1. Navigate to the Server **Configuration** tab and click managed server to which you want to pass the values.

Summary of Servers

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration.
 This page summarizes each server that has been configured in the current WebLogic Server domain.

[Customize this table](#)

Servers (Filtered - More Columns Exist)

Click the **Lock & Edit** button in the Change Center to activate all the buttons on this page.

New Clone Delete Showing 1 to 2 of 2 Previous | Next

	Name	Type	Cluster	Machine	State	Health	Listen Port
☐	AdminServer(admin)	Configured		whf00dkx	RUNNING	✓ OK	7001
☐	managed1_server	Configured		whf00dkx	RUNNING	✓ OK	7003

New Clone Delete Showing 1 to 2 of 2 Previous | Next

2. Select **Server Start** tab in the next screen.

Settings for managed1_server

Configuration Protocols Logging Debug Monitoring Control Deployments Services Security Notes

General Cluster Services Keystores SSL Federation Services Deployment Migration Tuning Overload Concurrency Health Monitoring **Server Start**

Web Services Coherence

Click the **Lock & Edit** button in the Change Center to modify the settings on this page.

Save

Node Manager is a WebLogic Server utility that you can use to start, suspend, shut down, and restart servers in normal or unexpected conditions. Use this page to configure the startup settings that Node Manager will use to start this server on a remote machine.

Java Home: The Java home directory (path on the machine running Node Manager) to use when starting this server. [More Info...](#)

Java Vendor: The Java Vendor value to use when starting this server. [More Info...](#)

BEA Home: The BEA home directory (path on the machine running Node Manager) to use when starting this server. [More Info...](#)

Root Directory: The directory that this server uses as its root directory. This directory must be on the computer that hosts Node Manager. If you do not specify a Root Directory value, the domain directory is used by default. [More Info...](#)

Class Path: The classpath (path on the machine running Node Manager) to use when starting this server. [More Info...](#)

3. Edit the **Arguments** field and pass all the environment parameters required for the service to run.

Node Manager is a WebLogic Server utility that you can use to start, suspend, shut down, and restart servers in normal or unexpected conditions. Use this page to configure the startup settings that Node Manager will use to start this server on a remote machine.

Java Home: The Java home directory (path on the machine running Node Manager) to use when starting this server. [More Info...](#)

Java Vendor: The Java Vendor value to use when starting this server. [More Info...](#)

BEA Home: The BEA home directory (path on the machine running Node Manager) to use when starting this server. [More Info...](#)

Root Directory: The directory that this server uses as its root directory. This directory must be on the computer that hosts Node Manager. If you do not specify a Root Directory value, the domain directory is used by default. [More Info...](#)

Class Path: The classpath (path on the machine running Node Manager) to use when starting this server. [More Info...](#)

Arguments: The arguments to use when starting this server. [More Info...](#)

```
-Deureka.server.enable-self-preservation=false
-Dspring.flyway.enabled=false -Dflyway.enabled=false
-Deureka.client.serviceUrl.defaultZone=http://whf00dkx:7003
/plato-discovery-service/eureka -Dserver.port=7003
```

4. Save the configuration and restart the managed server. After you restart, the service can be started or deployed properly.

1.2.3 **Method 3 – Using env files and setUserOverrides.sh file**

Perform the following steps:

1. Copy the **setUserOverrides.sh** file to each of the <domain>/bin folder. The example of the file is given below:

```
#!/bin/bash
# shellcheck disable=SC1090
# Common functions

set -e -x

config_file=""
PLATO_CONFIG_MANAGED_SERVER_NAME=""

# This file is used only for PLATO-CONFIG service
plato_config_file="${DOMAIN_HOME}/bin/plato-config-deploy.env"

# This file is used for rest of the services
domain_config_file="${DOMAIN_HOME}/bin/domain-config-deploy.env"

if [ -f "$plato_config_file" ] ; then
    PLATO_CONFIG_MANAGED_SERVER_NAME=`cat ${DOMAIN_HOME}/bin/plato-
config-deploy.env | grep "PLATO_CONFIG_MANAGED_SERVER_NAME" | cut -d=' ' -f2`
fi

if [ "${SERVER_NAME}" = "${PLATO_CONFIG_MANAGED_SERVER_NAME}" ] ; then
    # This will get executed only for Plato-config service entries
    config_file="${plato_config_file}"
else
    # This will get executed for all other services
    config_file="${domain_config_file}"
fi

if [ -f "$config_file" ]
then
    while read -r prop || [ -n "$prop" ]
    do
        case "$prop" in \#*) continue ;; esac
        if [ -z "${prop}" ] ; then
            continue
        else
            PLACEHOLDERS=${PLACEHOLDERS}" $(echo -D$prop)
            PLACEHOLDERS=${PLACEHOLDERS}"
        fi
    done
fi
```

```

done < "$config_file"
else
    echo "$config_file not found. please provide the property file to set -D parameter"
    exit 1
fi

PLACEHOLDERS="${PLACEHOLDERS}"

JAVA_OPTIONS="${JAVA_OPTIONS}${PLACEHOLDERS}"

export JAVA_OPTIONS

echo "${JAVA_OPTIONS}"

```

2. Place the **env** files containing all the key value pairs of the **-D params** in the respective <domain>/env folder.

NOTE: The plato-config-deploy.env file contains all the key value pairs specific only to the plato-config-service and need to be placed in the bin folder of the plato-domain. The domain-config-deploy.env file contains the key-value pairs for the rest of the services and should be placed in each <domain>/bin folder.

The sample for each of the files are given below:

plato-config-deploy.env

```

1.2.4 Method 4 – Workflow Configuration

Follow the below steps to create a workflow:

1. Metadata of the workflow creation. The sample DSL for workflow creation is given below:

```

{
  "name": "initialTest",
  "description": "Test workflow",
  "version": 4,
  "tasks": [
    {
      "name": "TEST",
      "taskReferenceName": "TESTING3",
      "description": "TESTING2",

```

```

    "inputParameters": {
      "FUNCTIONAL_CODE": "TEST_FA_ILS_REGTN2",
      "processRefNo":
        "${workflow.input.transactionModel.txnIdentification.processRefNo}",
      "processName": "Testing Process2",
      "processCode":
        "${workflow.input.transactionModel.txnIdentification.processName}",
      "transactionModel": "${workflow.input.transactionModel}",
      "stage": "TESTING2",
      "priority":
        "${workflow.input.transactionModel.transactionData.moduleData.taskPriority}",
      "applicationDate":
        "${workflow.input.transactionModel.txnIdentification.applicationDate}",
      "applicationNumber":
        "${workflow.input.transactionModel.txnIdentification.processRefNo}",
      "processRefNumber":
        "${workflow.input.transactionModel.txnIdentification.processRefNo}",
      "branch": "${workflow.input.transactionModel.txnIdentification.branchCode}",
      "user": "${workflow.input.transactionModel.txnIdentification.currentUser}",
      "customerNumber":
        "${workflow.input.transactionModel.transactionData.moduleData.customerId}",
      "amount":
        "${workflow.input.transactionModel.transactionData.moduleData.amount}",
      "currencyCode":
        "${workflow.input.transactionModel.transactionData.moduleData.currency}",
      "TASK_OUTCOMES": [
        "PROCEED"
      ],
      "moduleCode": "OBTFPM",
      "customFilter": [
        {
          "key": "contractRefNo",
          "label": "Back Office Reference"
        },
        {
          "key": "otherRefNo",
          "label": "External Reference"
        }
      ]
    },
    "type": "WAIT",

```

```

        "startDelay": 0,
        "optional": false,
        "asyncComplete": false
    }
},
"outputParameters": {
    "stage": "CLMO_FA_SNPOAR_APPEN",
    "taskOutcome": "PROCEED_WITH_PARTICIPANT"
},
"schemaVersion": 2,
"restartable": true,
"workflowStatusListenerEnabled": false
}

```

Call the API (/api/metadata/workflow) and pass the DSL in body. The following screen depicts the sample workflow:

2. Workflow Creation

Call the API (/api/workflow) to create the workflow. This API provides the information to the workflow metadata which we have created using previous call.

Body:

```

{
    "name": "initialTest",
    "description": "initialTest",
    "version": 4,
    "input": {
        "transactionModel": {

```

```

    "transactionData": {
      "moduleData": {
        "amount": 122,
        "currency": "GBP",
        "customerId": "001506",
        "customerName": "MARKS AND SPENCER",
        "taskPriority": "H"
      }
    },
    "txnIdentification": {
      "branchCode": "000",
      "currentStage": "TEST_FA_ILS_REGTN2",
      "currentUser": "SWAGATIKA",
      "key1": "Desk",
      "moduleCode": "TRMO",
      "processName": "Testing Process2",
      "processRefNo": "300ILCI012260",
      "applicationDate": 1588582461960,
      "taskOutcome": "PROCEED",
      "taskPriority": "H"
    }
  }
}

```

The following screen depicts the sample workflow:

1.3 How to Create Domain and Cluster Configuration

This section contains the following sub-sections:

- Domain Creation Configuration
- Post Domain Creation Configurations

1.3.1 Domain Creation Configuration

Perform the following steps for domain and cluster configuration:

NOTE: Name need not to be same as provided in Screenshot.

1. Open `/oracle_common/common/bin` and run **config.cmd** (or **.sh** if operating system is linux). Create domain with required cluster and server configurations. Refer to the screenshots below.
2. Select **Create a new domain** and provide domain name. For example, **platoinfra_domain**.

3. Click **Next** to create simple domain with default templates.

4. Set password and confirm, click **Next** to proceed.

5. Select **Domain Mode** as **Production** and select **JDK**.

6. Select **Administration Server** and **Topology** in advanced configurations.

7. Edit the port and host configurations as required and click **Next**.

The screenshot shows the 'Administration Server' configuration page. The left sidebar lists the configuration steps, with 'Administration Server' highlighted. The main area contains the following fields:

- Server Name: AdminServer
- Listen Address: All Local Addresses
- Listen Port: 7001
- Enable SSL: ☐
- SSL Listen Port: (empty)

A note at the bottom states: 'The name must not be null or empty and may not contain any : , = * ? % / _ cloned.'

Navigation buttons at the bottom include: Help, < Back, Next >, Finish, and Cancel.

8. Add managed servers and provide meaningful **Server Name**, edit listen address and port as required.

The screenshot shows the 'Managed Servers' configuration page. The left sidebar lists the configuration steps, with 'Managed Servers' highlighted. The main area contains a table of managed servers and buttons to add, clone, delete, or discard changes.

Buttons: + Add, Clone, X Delete, Discard Changes

Server Name	Listen Address	Listen Port	Enable SSL	SSL Listen Port
Config_Server	All Local Addresses	7003	☐	Disabled
Discovery_Server	All Local Addresses	7004	☐	Disabled
Api_Gateway_Server	All Local Addresses	7005	☐	Disabled
Plato_UI_Config_Server	All Local Addresses	7006	☐	Disabled
Plato_Orch_Server	All Local Addresses	7007	☐	Disabled
Plato_Feed_Server	All Local Addresses	7008	☐	Disabled
Plato_Batch_Server	All Local Addresses	7009	☐	Disabled
Plato_Alerts_Management_Se	All Local Addresses	7010	☐	Disabled

Navigation buttons at the bottom include: Help, < Back, Next >, Finish, and Cancel.

9. Add clusters one for each **managed servers**.

Fusion Middleware Configuration Wizard - Page 8 of 17

FUSION MIDDLEWARE

+ Add - Delete Discard Changes

Name	Listen Port	SSL Listen Port	Enable SSL
------	-------------	-----------------	------------

Help < Back Next > Finish Cancel

11. Assign clusters with servers.

12. Add **Machine/Unix Machine** based on operating system and configure **Name**, **Node Manager Listen Address** and **Node Manager Listen Port** as required.

13. Map all managed servers under the machine created.

14. Skip or configure **Virtual Targets** and **Partitions** as required.

15. Check the **Configuration Summary** and confirm creating domain.

16. Click **Finish** to complete the procedure.

1.3.2 Post Domain Creation Configurations

Once finished, refer oracle fusion middleware documents for more details on how to start admin server, node manager and managed servers.

1. Open `/user_projects/domain/platoinfra_domain/bin`
2. Perform all the Environment Setup steps such as setting -D parameters, Embedded Weblogic Setup and changes required for OAuth.
3. Run `startWeblogic.cmd` (or `.sh` if operating system is linux).
4. Open `/user_projects/domains/platoinfra_domain/bin`.
5. Run `setNMJavaHome.cmd` (or `.sh` if operating system is linux).
6. Open `/user_projects/domains/platoinfra_domain/nodemanager`.
7. Edit `nodemanager.properties` as required (securelistner = false if ssl and keystore is not given).
8. In admin console, select the following options in sequential order:
 - a. **Machines**
 - b. **platoinfra_Machine**
 - c. **Node Manager**
 - d. **Type**
 - e. **Plain**
 - f. **Save**
9. Open `/user_projects/domains/platoinfra_domain/bin`.
10. Run `startNodeManager.cmd` (or `.sh` if operating system is linux)
11. Start all managed servers.
12. Login to console and verify servers and clusters. Refer to the screenshots below:

The screenshot shows the Oracle WebLogic Admin Console interface. On the left, the 'Domain Structure' tree is visible, with 'Servers' selected under 'Environment'. The main content area is titled 'Configuration' and 'Control'. It contains a table of servers with the following columns: Name, Type, Cluster, Machine, State, Health, and Listen Port. The table lists 10 servers, including AdminServer, Api_Gateway_Server, Config_Server, Discovery_Server, Plato_Alerts_Management_Server, Plato_Batch_Server, Plato_Feed_Server, Plato_Orch_Server, Plato_UIL_Config_Server, and Plato_UIL_Server. The AdminServer is in a 'RUNNING' state with 'OK' health, while the others are in 'SHUTDOWN' state with 'Not reachable' health.

Name	Type	Cluster	Machine	State	Health	Listen Port
AdminServer(admin)	Configured		platoinfra_Machine	RUNNING	OK	7001
Api_Gateway_Server	Configured	Api_Gateway_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7005
Config_Server	Configured	Config_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7003
Discovery_Server	Configured	Discovery_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7004
Plato_Alerts_Management_Server	Configured	Plato_Alerts_Management_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7010
Plato_Batch_Server	Configured	Plato_Batch_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7009
Plato_Feed_Server	Configured	Plato_Feed_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7008
Plato_Orch_Server	Configured	Plato_Orch_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7007
Plato_UIL_Config_Server	Configured	Plato_UIL_Config_Cluster	platoinfra_Machine	SHUTDOWN	Not reachable	7006
Plato_UIL_Server	Configured		platoinfra_Machine	SHUTDOWN	Not reachable	7006

Welcome, Connected to: platoinfra_domain

Home > Summary of Deployments > Summary of Servers > Summary of Machines

Summary of Machines

A machine is the logical representation of the computer that hosts one or more WebLogic Server instances (servers). WebLogic Server uses configured machine names to determine the optimum server in a cluster to which certain tasks, such as HTTP session replication, are delegated. The Administration Server uses the machine definition in conjunction with Node Manager to start remote servers.

This page displays key information about each machine that has been configured in the current WebLogic Server domain.

1.4 How to Create Datasource

Perform the following steps to create data source:

1. Start **AdminServer**, **Node Manager** and make sure all the **managed servers** (targets) are in running mode.
2. Select the following options in sequential order:
 - a. **Services**
 - b. **Datasources**
 - c. **New**
 - d. **Generic Datasource**

3. Give datasource **Name** and **JNDI Name**, and click **Next**.

The screenshot shows the 'Create a New JDBC Data Source' wizard. At the top, there are navigation buttons: 'Back', 'Next' (highlighted), 'Finish', and 'Cancel'. Below this is the section 'JDBC Data Source Properties' with the text: 'The following properties will be used to identify your new JDBC data source.' and a note '* Indicates required fields'. The first question is 'What would you like to name your new JDBC data source?'. The '* Name:' field contains 'PLATO'. The second question is 'What scope do you want to create your data source in?'. The 'Scope:' dropdown is set to 'Global'. The third question is 'What JNDI name would you like to assign to your new JDBC Data Source?'. The 'JNDI Name:' text area contains 'jdbc/PLATO'. The fourth question is 'What database type would you like to select?'. The 'Database Type:' dropdown is set to 'Oracle'. At the bottom, there are navigation buttons: 'Back', 'Next' (highlighted), 'Finish', and 'Cancel'.

4. Select **Thin for Service Connections** (Instant) and click **Next**.

The screenshot shows the second step of the 'Create a New JDBC Data Source' wizard. At the top, there are navigation buttons: 'Back', 'Next' (highlighted), 'Finish', and 'Cancel'. Below this is the section 'JDBC Data Source Properties' with the text: 'The following properties will be used to identify your new JDBC data source.' The 'Database Type:' is set to 'Oracle'. The question is 'What database driver would you like to use to create database connections? Note: * indicates that the driver is explicitly supported by Oracle WebLogic Server.' The 'Database Driver:' dropdown is set to '*Oracle's Driver (Thin) for Service connections; Versions:Any'. At the bottom, there are navigation buttons: 'Back', 'Next' (highlighted), 'Finish', and 'Cancel'.

5. Uncheck support for Global Transactions.

Home > Summary of Deployments > Summary of Servers > Summary of JDBC Data Sources

Create a New JDBC Data Source

Back Next Finish Cancel

Transaction Options

You have selected non-XA JDBC driver to create database connection in your new data source.

Does this data source support global transactions? If yes, please choose the transaction protocol for this data source.

☐ **Supports Global Transactions**

Select this option if you want to enable non-XA JDBC connections from the data source to participate in global transactions using the *Logging Last Resource (LLR)* transaction option. Emulate Two-Phase Commit.

☐ **Logging Last Resource**

Select this option if you want to enable non-XA JDBC connections from the data source to emulate participation in global transactions using JTA. Select this option only if your application conditions.

☐ **Emulate Two-Phase Commit**

Select this option if you want to enable non-XA JDBC connections from the data source to participate in global transactions using the one-phase commit transaction processing. With this option, the data source can participate in the global transaction.

☒ **One-Phase Commit**

Back Next Finish Cancel

6. Give database connection details and click **Next** to test connection.

Summary of JDBC Data Sources

Configuration | Monitoring

A JDBC data source is an object bound to the JNDI tree that provides database connectivity through a pool of JDBC connections. Applications can look up a data source on the JNDI tree and then borrow a database connection from a data source.

This page summarizes the JDBC data source objects that have been created in this domain.

Upload a deployment to the Administration Server

Click the Browse button below to select an application or module on the machine from which you are currently browsing. When you have located the file, click the Next button to upload this deployment to the Administration Server.

Deployment Archive: Browse... plato-discovery-service-5.1.0.war

Upload a deployment plan (this step is optional)

A deployment plan is a configuration which can supplement the descriptors included in the deployment archive. A deployment will work without a deployment plan, but you can also upload a deployment plan archive now. This deployment plan archive will be a directory of configuration information packaged as a .jar file. See related links for additional information about deployment plans.

Deployment Plan: Browse... No file selected.

Install Application Assistant

Back Next Finish Cancel

Choose installation type and scope

Select if the deployment should be installed as an application or library. Also decide the scope of this deployment.

The application and its components will be targeted to the same locations. This is the most common usage.

☒ Install this deployment as an application

Application libraries are deployments that are available for other deployments to share. Libraries should be available on all of the targets running their referencing applications.

☐ Install this deployment as a library

Select a scope in which you want to install the deployment.

Scope: Global

Back Next Finish Cancel

6. Select target servers/clusters on which application has to be deployed and the **Next**.

Summary of Security Realms

A security realm is a container for the mechanisms—including users, groups, security roles, security policies, and security providers—that are used in a WebLogic Server domain, but only one can be set as the default security realm, which is reserved for domain administrative purposes.

This Security Realms page lists each security realm that has been configured in this WebLogic Server domain. Click the name of the realm to view its configuration.

[Customize this table](#)

Realms (Filtered - More Columns Exist)

Groups

[New](#) [Delete](#)

☐ Name	Description
☐ AdminChannelUsers	AdminChannelUsers can access the admin channel.
☐ Administrators	Administrators can view and modify all resource attributes and start and stop servers.
☐ AppTesters	AppTesters group.
☐ CrossDomainConnectors	CrossDomainConnectors can make inter-domain calls from foreign domains.
☐ Deployers	Deployers can view all resource attributes and deploy applications.
☐ Monitors	Monitors can view and modify all resource attributes and perform operations not restricted by roles.
☐ Operators	Operators can view and modify all resource attributes and perform server lifecycle operations.
☐ OracleSystemGroup	Oracle application software system group.

[New](#) [Delete](#)

5. Add the relevant details and click **OK**. The new group will be created.

The screenshot shows the 'Create a New Group' dialog box. On the left, there is a 'Domain Structure' tree with 'temp_domain' selected. Below it, a 'How do I...' section lists 'Create groups', 'Modify groups', and 'Delete groups'. The main area of the dialog is titled 'Create a New Group' and contains the following fields:

- Group Properties:** A section with a note: 'The following properties will be used to identify your new Group. * Indicates required fields'.
- Name:** A text field containing 'Developers'.
- Description:** A text field containing 'Group for Developers'.
- Provider:** A dropdown menu showing 'DefaultAuthenticator'.

At the bottom of the dialog are 'OK' and 'Cancel' buttons.

6. Click **Users** tab, and click **New** to create user.

The screenshot shows the 'Users and Groups' tab in the Oracle WebLogic Server console. The left sidebar is the same as in the previous screenshot. The main area is titled 'Settings for myrealm' and has tabs for 'Configuration', 'Users and Groups', 'Roles and Policies', 'Credential Mappings', 'Providers', and 'Migration'. The 'Users and Groups' tab is active, and the 'Users' sub-tab is selected. Below the sub-tabs, there is a table of users:

Users (Filtered - More Columns Exist)	
Name	Description
LCMUser	This is the default service account for WebLogic Server Lifecycle Manager configuration updates.
OracleSystemUser	Oracle application software system user.
weblogic	This user is the default administrator.

At the bottom of the table are 'New' and 'Delete' buttons.

7. Enter the required details for the user. After completing click **OK**. The user will be created.

The screenshot shows the 'Create a New User' dialog box. On the left, there is a 'Domain Structure' tree with 'temp_domain' selected. Below it, a 'How do I...' section lists 'Create users', 'Modify users', 'Delete users', 'Create groups', and 'Manage users and groups'. The main area of the dialog is titled 'Create a New User' and contains the following fields:

- User Properties:** A section with a note: 'The following properties will be used to identify your new User. * Indicates required fields'.
- Name:** A text field containing 'testuser'.
- Description:** A text field containing 'user for testing'.
- Provider:** A dropdown menu showing 'DefaultAuthenticator'.
- Password:** A text field with masked characters (dots).
- Confirm Password:** A text field with masked characters (dots).

At the bottom of the dialog are 'OK' and 'Cancel' buttons.

8. Click on the newly created user to assign the newly created user to some group.

The screenshot shows the Oracle WebLogic Security Configuration console. The breadcrumb trail is: Home > temp_domain > Summary of Security Realms > myrealm > Users and Groups > ADMINUSER1. The page title is 'Settings for ADMINUSER1'. There are tabs for 'General', 'Passwords', 'Attributes', and 'Groups'. The 'Groups' tab is active. A 'Save' button is at the top left of the main content area. Below it, a message says 'Use this page to configure group membership for this user.' The 'Parent Groups' section has two columns: 'Available' and 'Chosen'. The 'Available' column lists: AdminChannelUsers, Administrators, AppTesters, CrossDomainConnectors, Monitors, and OracleSystemGroup. The 'Chosen' column lists: Deployers and Operators. The 'Deployers' group is selected in the 'Chosen' list. A 'Save' button is at the bottom right of the main content area.

1.9.3 Oracle Banking Microservices Architecture Security Config Table Entries

Connection details for the embedded LDAP of weblogic (assuming the admin server is running on 10.99.99.10:7001) are given below:

Connection Details:

URL: ldap:// 10.99.99.10:7001

Server Base: dc={DOMAIN_NAME} (in our case it would be dc=ldap_domain)

User Search Base: ou=people,ou=myrealm

Server User: cn=admin

Server Credentials: As setup in step Point 3 under 1.8.1

Security Config Table Entries:

ID	VALUE	Description
LDAP_URL	ldap:// 10.99.99.10:7001	Valid LDAP Server address with port.
LDAP_SERVER_USER	cn=admin	LDAP server login username
LDAP_SERVER_BASE	dc=ldap_domain	LDAP Server Base
LDAP_SERVER_CREDENTIAL	ylksiMFfjVbfcpA7Qheh8Q==	LDAP server credentials in encrypted form(For Encryption steps, refer to Encrypted Utility section below)
LDAP_USER_SEARCH_BASE	ou=people,ou=myrealm	LDAP User Search Base
LDAP_PROVIDER	EMBEDDED_WEBLOGIC	Which LDAP Provider to be used. Also, if this row is not present in this table, then In-House Spring Plato LDAP will be used.

1.10 Oracle Analytic Server Setup

This section contains the following sub-sections:

- Prerequisite
- Start BI Server
- Upload BI Reports
- Test BI Reports

1.10.1 Prerequisite

Perform the following steps:

- Machine should have Java JDK1.8.0_271 has installed
- Oracle Analytics Server 5.5.0

1.10.2 Start BI Server

Perform the following steps to start BI server:

1. Start the weblogic server and analytics server.
2. Check the weblogic console whether analytics server is running.

1.10.3 Upload BI Reports

Perform the following steps to upload BI reports:

1. Login to the Analytics server console.
2. Open the OSDC and check for the report Catalog object **\{unzip folder\}\REP\{reportfilename}.xdrz** or any other Catalog objects listed below:

Catalog Object	Extensions Supported
Data Model	.xdmz
Folder	.xdrz
Report	.xdoz
Style Template	.xssz
Subtemplate	.xsbz

3. Upload the catalog object to Analytics Server.

1.10.4 Test BI Reports

Perform the following steps to generate BI reports:

1. Open the application, and go the **Reports** section of the application.
2. Choose the report generation criteria. For example, **Start Date** or **End Date**.
3. Choose the format of the report.
4. Generate the report.

NOTE: If the format of the report selected is PDF, a PDF report will be generated.
