1. ANNEXURE - 2

1.1 Introduction

This guide is a supporting document for the installation of Zipkin and ELK. You can find the reference in the respective installation guides.

2. Document Tracing Zipkin

2.1 Installation of Zipkin

You can download and run the application to install Zipkin.

2.1.1 Download and Running

Zipkin works as an independent application and it can be downloaded as a runnable jar from the official website of Zipkin <u>https://zipkin.io/</u>. The latest version of Zipkin needs a Java version above 8.

The direct download link of jar is as follows:

https://search.maven.org/remote_content?g=io.zipkin&a=zipkin-server&v=LATEST&c=exec

The downloaded jar can be executed using the java –jar JAR_NAME command.

The configuration of Zipkin can be done environment variables. The port of the Zipkin can be set using QUERY_PORT environment variable.

The application starts on the port number assigned for QUERY_PORT environment variable or its default value of 9411. The web UI of Zipkin can be accessed at http://localhost:PORT.

2.2 Zipkin User Interface

The basic layout of Zipkin looks as follows:

Service Name	~	Span Name	~	Remote Service Name	~	Lookback		
zipkin	~	all	~	all	~	15 minute	25	
Annotation Query				Duration (µs) >=	Limit		Sort	
For example: http.path=/	foo/bar/ and	cluster=foo and cache.miss		Ex: 100ms or 5s	10		Longest First	*
Please select the criteria fo	your trace lo	okup.						
Please select the criteria for	your trace lo	okup.						

We can find the traces of required API calls and services using the above search options given in the user interface. The search options given in the user interface are self-explanatory and there is another UI option (Try Lens UI). It is given a different user interface with same functionality.

Service Name		Span Name		Remote Service Name		Lookback		
zipkin	~	all	\sim	all	~	1 hour		*
Annotation Query				Duration (µs) >=	Limit		Sort	
For example: http.path=/f	oo/bar/ and	cluster=foo and cache.miss		Ex: 100ms or 5s	10		Longest First	٣
Find Traces								
Showing: 4 of 4							JSON	•
Services: zipkin								-
2.163s 5 spans zipkin 100%								
pkin x5 2.163s							18 minutes	s a
1.449s 4 spans								
zipkin 100%								
pkin x4 1.449s							22 minutes	s a
1.430s 4 spans								
tipkin 100%								

The list of the traces can be seen like the above screen. Some error API calls are made to showcase how to track errors. The blue listings show the successful API hits and the red listings indicate errors. Each block indicates a single trace in the listings.

Duration: 2.16	Services: 1	Depth: 3	Total Spa	ins: 4		JSON 🛓
zipkin x4						
Services		432.639ms	865.278ms	1.298s	1.731s	2.1
zipkin zipkin	-2.163s : http:/api1 - 1.001s : api1		- - 0			
zipkin				1.068s : http:/api2 -		
				1.001s : api2		

Opening an individual trace shows the below shown screen.

The above shown image describes the time taken for each block. There are 2 custom spans created inside 2 service calls, so there are total of 4 blocks. The time taken for individual block can be seen above. Clicking an individual block shows the following details.

	Date Time	Relative	Time	Annotation	Address			Search
intestigate by	9/10/2019, 4:11:23 PM			Server Start				
	9/10/2019, 4:11:25 PM	2.163s		Server Finish				
Duration: 2.163s	Kara		Value					JSON 🛓
	Кеу		Value					
Expand All Collap	ose http.host		localhost					
	http.method		GET					
zipkin x4	http.path		/api1					
ervices	http.status_code		200				731s	
	2.16 http.url		http://loca	alhost:8080/api1				
zipkin .	mvc.controller.class		Controller					
zipkin · · ·	myc.controller.method	mvc.controller.method api1						
_	spring.instance_id							
	Show IDs							
	traceId	9d63	642d72ab6	5f9f				
	spanId	9d63	8642d72ab6	5f9f				

The details of the specific span block are shown above and the logging events can also be seen in the Zipkin UI as small circular blocks. An example of error log is shown below:

Duration: 1.026s Services: 1 Depth: 2 Total Spans: 5 Image: 5 Imag	earch	Go to trace	Try Lens UI	Dependencies	trace View Saved Trace	ystem behavior Find a	Investigate sy
Services 205.134ms 410.267ms 615.401ms 820.534ms E zipkin -1.026s : http://api1 - - - zipkin -1.001s : api1 - - - -	ISON 🛓			Total Spans: 8	Depth: 2	_	
zpkm - 1.001s:api1	1.026s			410.267ms	205.134ms	1.026r - http://api1	Services
	0					1.001s : api1	zipkin

Clicking the **Error** portion gives the clear detail about the error and where the error has arised. AN example is shown below:

	•								
	Date Time		Relative Time	Annotation	Address				
ation: 1.026s	9/11/2019, 6:09:01 PM			Server Start					
	9/11/2019, 6:09:02 PM		1.026s	Server Finish					
and All Collapse	Кеу	Value							
in x3	error	error Request processing failed; nested exception is org.springframework ServerErrorException: 500 null							
0.36	http.host	.host localhost							
-1.026	http.method	ethod GET							
	http.path	.path /api1							
	http.status_code	500							
	http.url	http://localhost:8080/api1							
	mvc.controller.class BasicErrorController								
	mvc.controller.method	ntroller.method errorHtml							
	spring.instance_id	eswarp	erabathini.in.oracle.co	om:Zipkin					

If the Lens UI is used in Zipkin, the above screen shots are not applicable, but are relatable to the Lens UI as well.

Traces of the application can be found using Traceld, which can be found in the debug logs of the deployment when spring-cloud-sleuth is included in the dependencies (Included in spring-cloud-starter-zipkin dependency). Clicking the **Dependencies** tab gives the dependency graph info between micro-services. An example dependency graph is shown below:

Zipkin	Investigate system beha	vior Find a trace	Dependencies		
Start time	2018-02-19	13:30	End time 2018-02-20	13:39	Analyze Dependencies
fronten	d	todos-api		log-message-processor	

3. Monitoring ELK

3.1 Introduction

ELK Stack was a collection of the following open-source products:

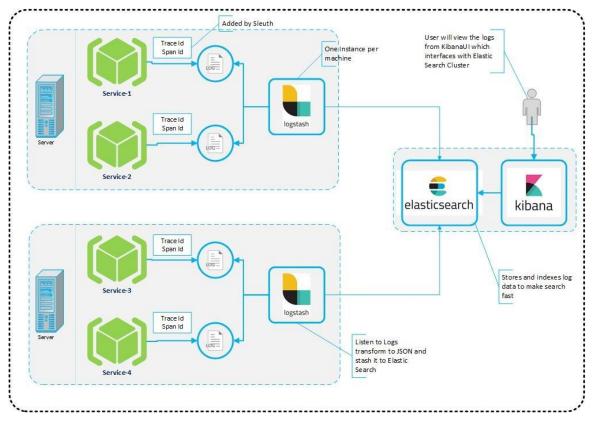

- Elasticsearch
- Logstash
- Kibana

Elasticsearch is an open source, full-text search and analysis engine, based on the Apache Lucene search engine. Logstash is a log aggregator that collects data from various input sources, executes different transformations and enhancements and then ships the data to various supported output destinations. Kibana is a visualization layer that works on top of Elasticsearch, providing users with the ability to analyze and visualize the data.

Together, these different components are most commonly used for monitoring, troubleshooting, and securing IT environments. Logstash take care of data collection and processing, Elasticsearch indexes and stores the data, and Kibana provides a user interface for querying the data and visualizing it.

3.2 Architecture

The below architecture provides a comprehensive solution for handling all the required facets:

Spring cloud Sleuth also provides additional functionality to keep trace of the application calls by providing us a way to create intermediate logging events. Thus, the Spring Cloud Sleuth dependency must be added to applications.

3.3 Installing and Configuring ELK

To install and configure ELK Stack, make sure the versions of the 3 software are same. Download the latest version of the following:

- Logstash
- Elastic Search
- Kibana

The installation guides are given below.

- Logstash : https://www.elastic.co/guide/en/logstash/current/installing-logstash.html
- Elastic Search : <u>https://www.elastic.co/guide/en/elasticsearch/reference/current/install-</u> elasticsearch.html
- Kibana : https://www.elastic.co/guide/en/kibana/current/install.html

Follow the process as given in the following sub-sections, after completing the download process of ELK.

3.3.1 Setup

The setup includes the following steps:

- Start Elastic Search
- Setup Logtash and Start
- Setup Kibana and Start

3.3.1.1 Start ElasticSearch

1. Go to Elasticsearch root folder and use nohup to start the Elasticsearch process as below:

> nohup ./bin/elasticsearch

3.3.1.2 Setup Logstash and Start

1. Create a new **logstash.conf** file that provides the required file parsing and integration to Elasticsearch.

logstatsh.conf:

```
#Point to the application logs
input {
    file {
        type => "java"
        path => "/scratch/app/work_area/app_logs/*.log"
        codec => multiline {
            pattern => "^%{YEAR}-%{MONTHNUM}-%{MONTHDAY} %{TIME}.*"
            negate => "true"
            what => "previous"
        }
    }
    #Provide the parsing logic to transform logs into JSON
    filter {
```

```
#If log line contains tab character followed by 'at' then we
will tag that entry as stacktrace
  if [message] =~ "\tat" {
   grok {
     match => ["message", "^(\tat)"]
     add_tag => ["stacktrace"]
   }
  }
 #Grokking Spring Boot's default log format
 grok {
   match => [ "message",
               "(?<timestamp>%{YEAR}-%{MONTHNUM}-%{MONTHDAY}
%{TIME}) %{LOGLEVEL:level} %{NUMBER:pid} --- \[(?<thread>[A-Za-
z0-9-]+)\] [A-Za-z0-9.]*\.(?<class>[A-Za-z0-
9#_]+)\s*:\s+(?<Logmessage>.*)",
               "message",
               "(?<timestamp>%{YEAR}-%{MONTHNUM}-%{MONTHDAY}
%{TIME}) %{LOGLEVEL:level} %{NUMBER:pid} --- .+?
:\s+(?<Logmessage>.*)"
             1
  }
   # pattern matching logback pattern
   grok {
          match =>
{ "message" => "%{TIMESTAMP IS08601:timestamp}\s+%{LOGLEVEL:seve
rity}\s+\[%{DATA:service},%{DATA:trace},%{DATA:span},%{DATA:expo
rtable}\]\s+\[%{DATA:environment}\]\s+\[%{DATA:tenant}\]\s+\[%{D
ATA:user}\]\s+\[%{DATA:branch}\]\s+%{DATA:pid}\s+---
\s+\[%{DATA:thread}\]\s+%{DATA:class}\s+:\s+%{GREEDYDATA:rest}"
}
  }
 #Parsing out timestamps which are in timestamp field thanks to
previous grok section
 date {
    match => [ "timestamp" , "yyyy-MM-dd HH:mm:ss.SSS" ]
 }
}
#Ingest logs to Elasticsearch
output {
 elasticsearch { hosts => ["localhost:9200"] }
 stdout { codec => rubydebug }
```

2. Start Logstash process

>nohup ./bin/logstash -f logstash.conf

3.3.1.3 Setup Kibana and start

1. Navigate to the **kibana.yml** available under <kibana_setup_folder>/config and modify the file to include the below:

```
#Uncomment the below line and update the IP address to your
host machine IP.
server.host: "xx.xxx.xx"
#Provide the elasticsearch url. If this is running on the same
machine then you can use the below config as is
elasticsearch.url: "<u>http://localhost:9200</u>"
```

2. Start Kibana process using the below command:

```
>nohup ./bin/kibana
```

A view of the Kibana dashboard is given below:

		9
