2.4 Execution of Environment Variable

Change the environment variable configuration and follow the below steps:

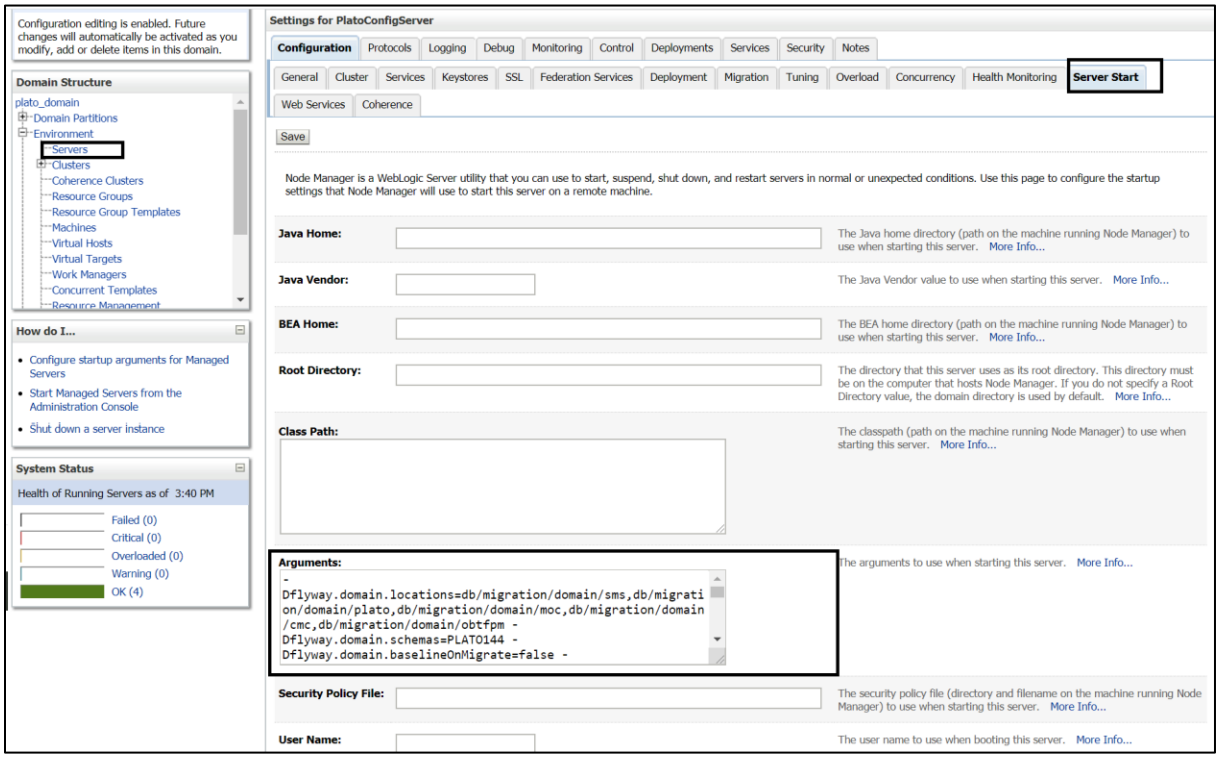
2.4.1 Plato Config Service Startup Parametrization

2.4.1.1 Plato Services Deployment

1. Create a managed server for plato-Config service and set the service startup parameter
2. Deploy the other plato services in another managed server. (both plato services and plato config services should not be deployed in the same managed server)

Follow the below steps to deploy the other plato services:

1. Login to the weblogic server console
2. Select servers in the “Domain Structure” section.
3. Select the managed server (managed server where the plato_config service got deployed)
4. Go to Configuration
5. Go to “Server Start” section
6. Go to Arguments section and update the plato config service parameter as available in the OSDC path OBTFPM_INITIAL_SETUP\Config



2.4.2 Domain Server Parameterization

The below domain server parametrization should be done for all the domain servers which are created in the server where the micro services are going to be deployed.

1. Go to the weblogic installation path (FMW installation path) in the Weblogic server where the plato, sms, common core, mid office core and OBTFPM services are installed

2. Go to location : Middleware/Oracle_Home/user_projects/domains/plato_domain/bin

3. Modify the setDomainEnv.sh file and add the JAVA_OPTIONS parameter as explained below:

```
WLS_MEM_ARGS_64BIT="-Xms2048m –Xmx12288m"

export WLS_MEM_ARGS_64BIT

JAVA_OPTIONS="${JAVA_OPTIONS} -DflywayTask=migrate -Dflyway.enabled=true -
Dspring.flyway.enabled=true -Dplato.services.config.uri=http://whf00ixg.in.oracle.com:7005  -
Dplato.service.logging.path=/scratch/Oracle/Middleware/Oracle_Home/user_projects/domains/pl
ato_domain/logs -Dplato.service.env=OSDC "

export JAVA_OPTIONS
```

Note: The above domain server parameterization is not required for the domain where the plato config server is deployed.

The Memory argument parameter needs to be changed based on the service deployment and transaction volume.

In case the Operating system is 32 bit server, it is required to update the variable WLS_MEM_ARGS_32BIT

3. Domain and Cluster Configuration

3.1 Common Core Domain Configuration

3.1.1 Prerequisites

- Machine should have Java JDK1.8.0_240 has installed.
- Oracle Fusion Middleware 19c (19.6) 12.2.1.4.0 has to be installed on the machine.

3.1.2 Steps to Create Domain

It is recommended to have different managed server in one domain for each application. For Creating Domain and Configuration refer to ANNEXURE-1 "**How to create and Cluster Configuration".**

4. Data Sources Creation

4.1 Pre-requisite

Database and application setup for PLATO has to be performed prior to deployment setup.

4.2 Data Sources List

The table below lists the data sources to be created on each domain prior to deployment of applications onto managed servers.

obtfpm-shipping-guarantee-services	jdbc/OBTFPMSHIPPINGTEEDS	OBTFPM

Note: In case the above data sources are already mapped to the same managed server, ignore the applicable steps.

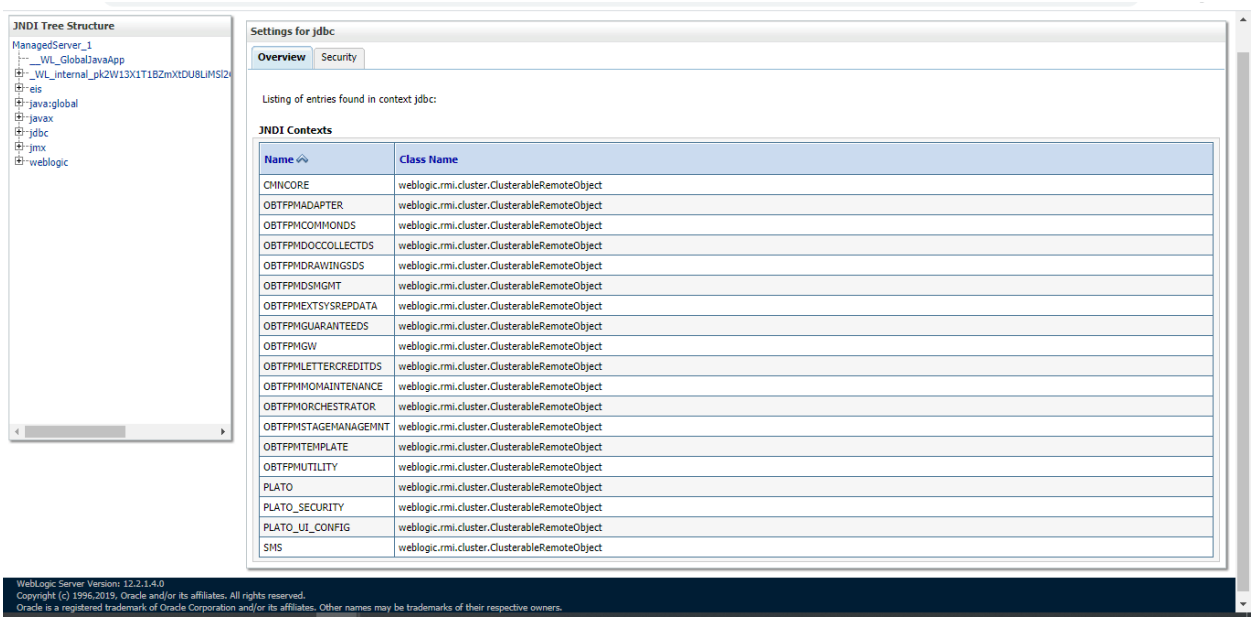
4.3 Creating Data Source

For creating data source, refer ANNEXURE-1 "**How to create Data sources section".**

4.4 Checking JNDI Access for Server

To make sure that the services are deployed, do the following steps:

1. Open weblogic and go to **Servers** under **Environment** on the left side of the Console.
2. Go to **Configuration→ General** and select **View JNDI Tree.**
3. Select **jdbc** which displays the following screen and make sure that the data source (JNDI) name are available:



All these data sources must be listed here (also MIDOFFICECORE if it is a separate schema) under JNDI Contexts.

5.3 Steps to Deploy as Application

To deploy application, refer ANNEXURE-1. “**How to deploy section**”.

6. User Interface Installation

6.1 Introduction

This section would help you to install the OBTFPM UI on designated environment. It is assumed that all the prior setup is already done related with WebLogic managed server creation. It is recommended to use dedicated managed server for OBTFPM UI.

The installation procedure includes a series of steps that are defined in subsequent sections for the deployment of services.

6.2 Domain and Cluster Configuration

6.2.1 Prerequisites

Machine should have Java JDK1.8.0_240 has installed.
Oracle Fusion Middleware 19c (19.6) 12.2.1.4.0 has to be installed on the machine.

6.2.2 Create Domain and Cluster Configuration

Refer “Annexure-1” document, section 1.3.

6.2.3 Post Domain Creation Configurations

Refer “Annexure-1” document, section 1.3.1.

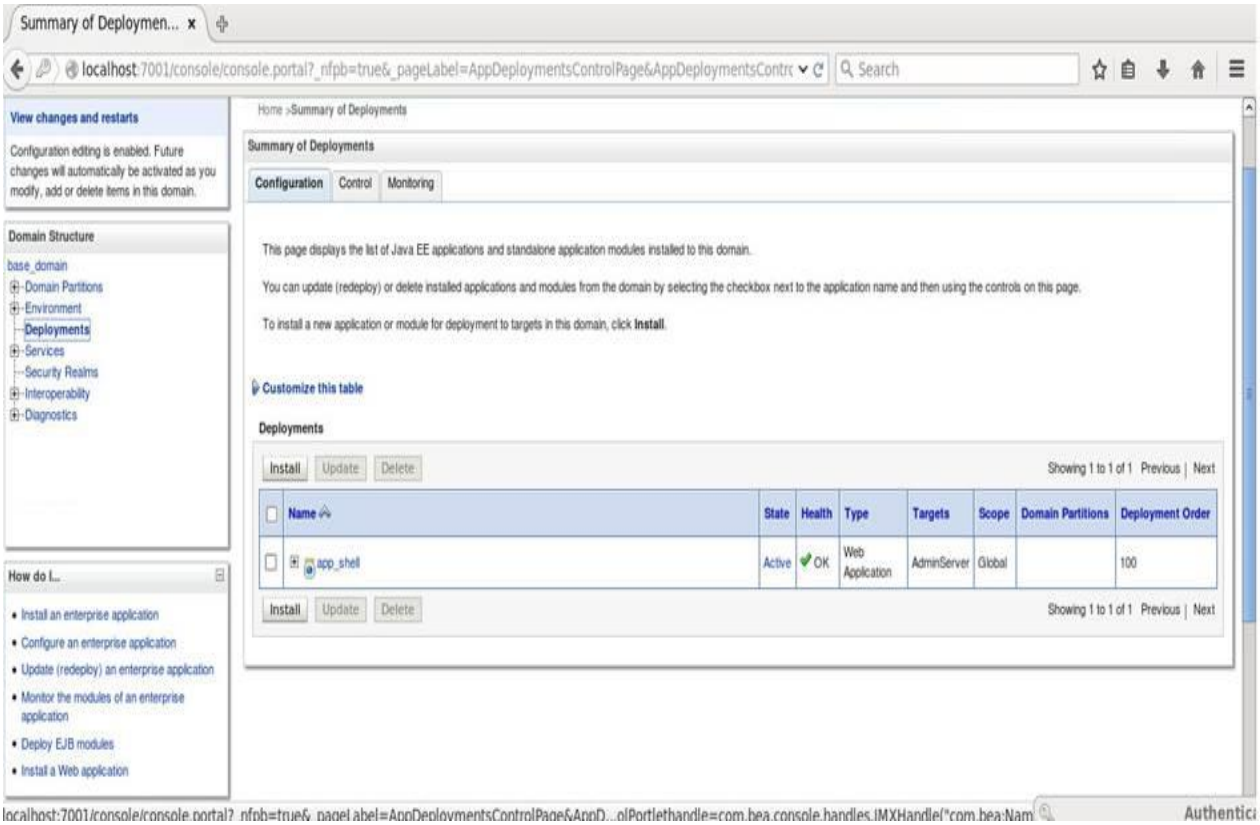
6.3 Deployments

6.3.1 Steps to Deploy as application

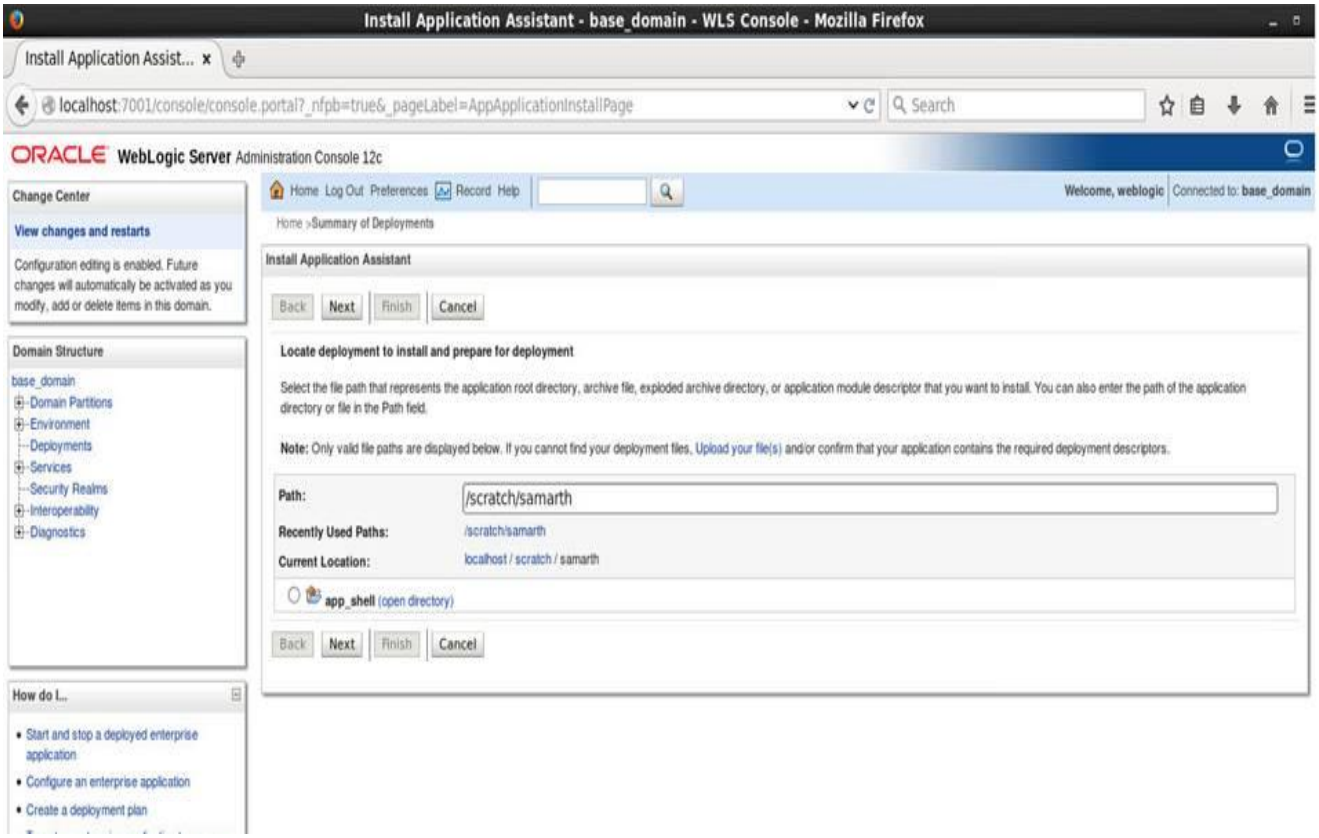
[Note: Server names, Domain names need not to be same as this doc provides]

Steps to Deploy archives as application on weblogic is same for all the above except for managed server and domain where we deploy will differ. Find the below screenshots to see how deployment of archive as application is done on weblogic.

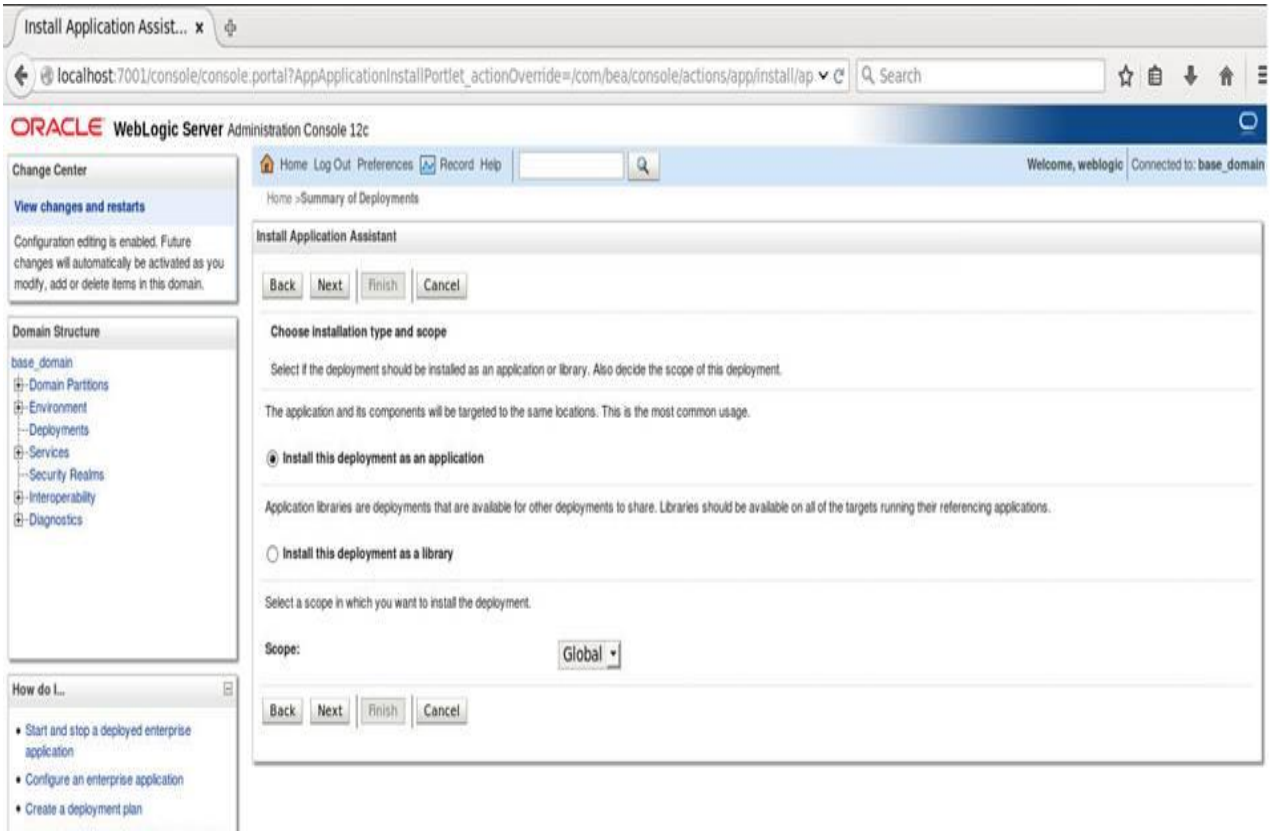
1. Copy the application war file available under UI/APP/ARCHIVE folder.
2. Open Weblogic console and navigate to the Deployments.



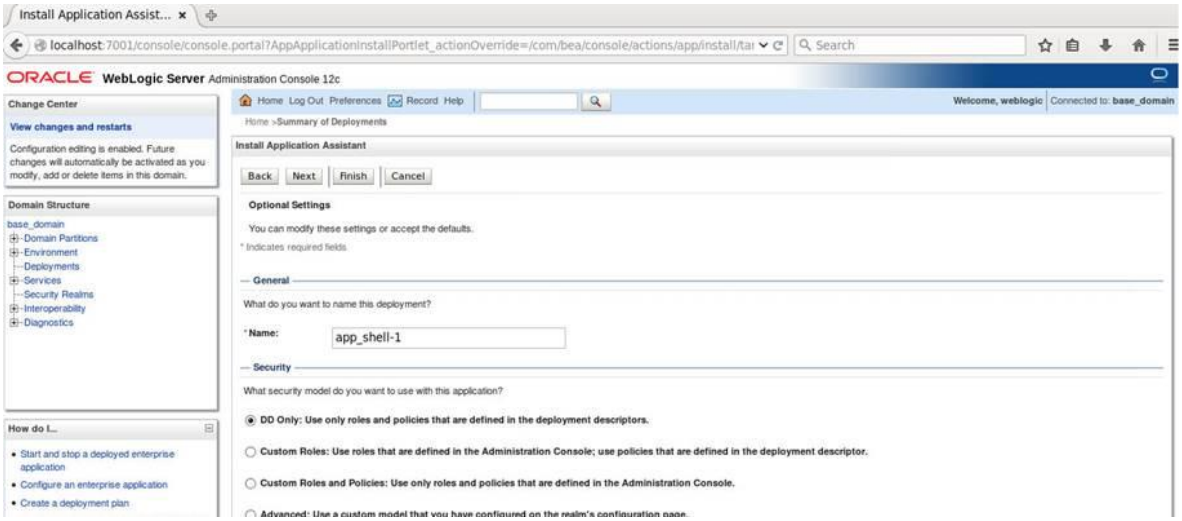
3. Click on install and click on Upload your files, locate the war and select it, click on next.



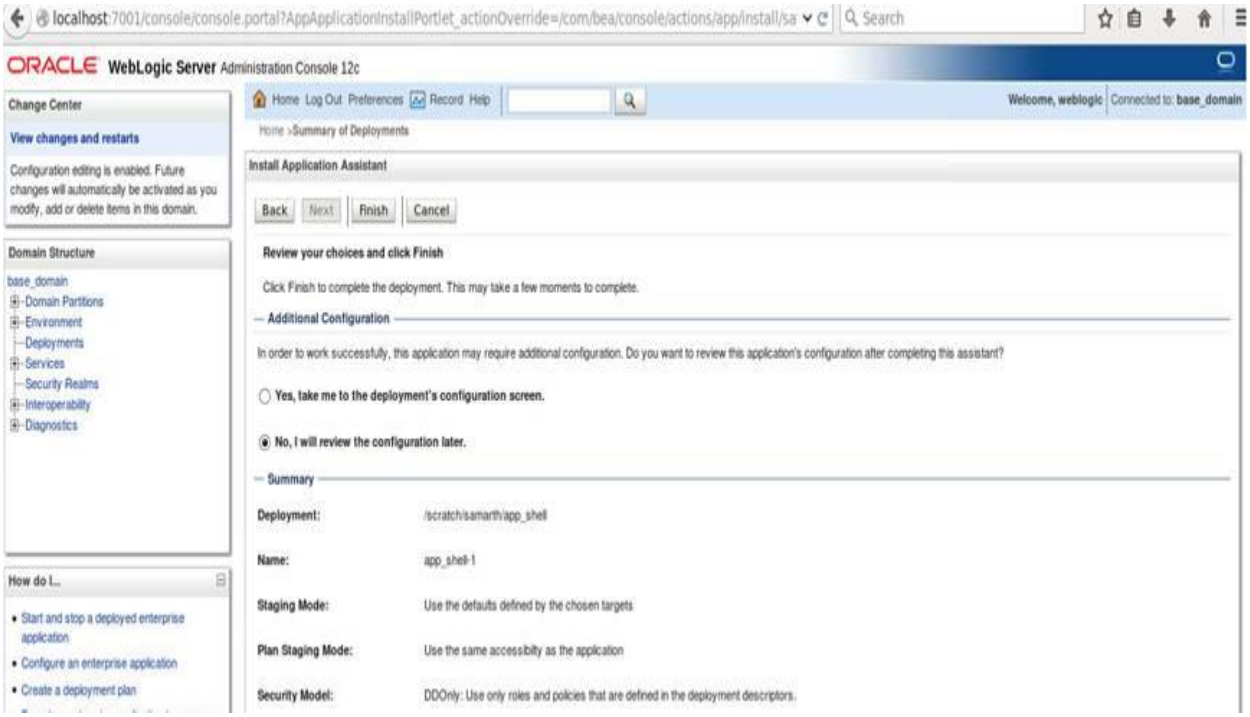
4. Check the option install this deployment as an application option and click Next.



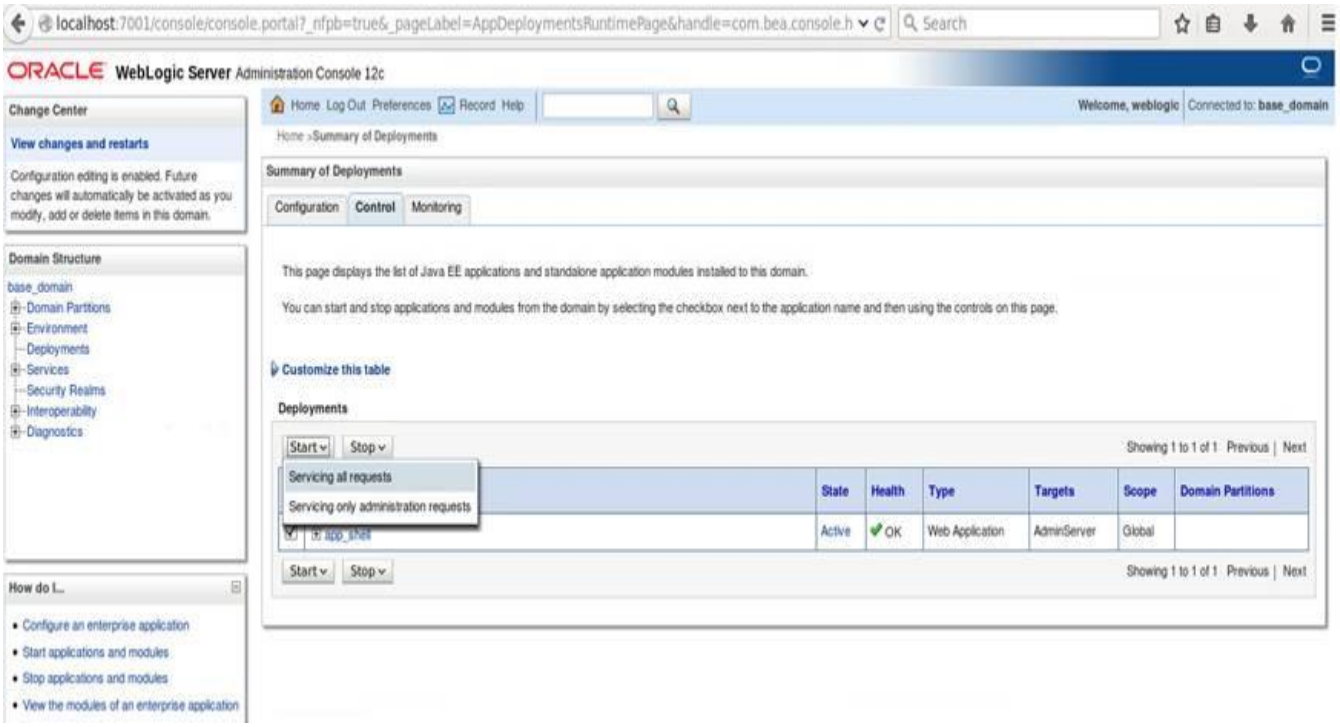
5. Name the deployment and click Next.



6. Check the option "No I will review the configuration later" and click Finish.



7. Navigate to the control tab click on start and select the option "servicing all requests".



6.4 Restart and Refresh

Once everything is deployed, restart all the managed servers. And for each application call path "/refresh" for refreshing the configuration properties.

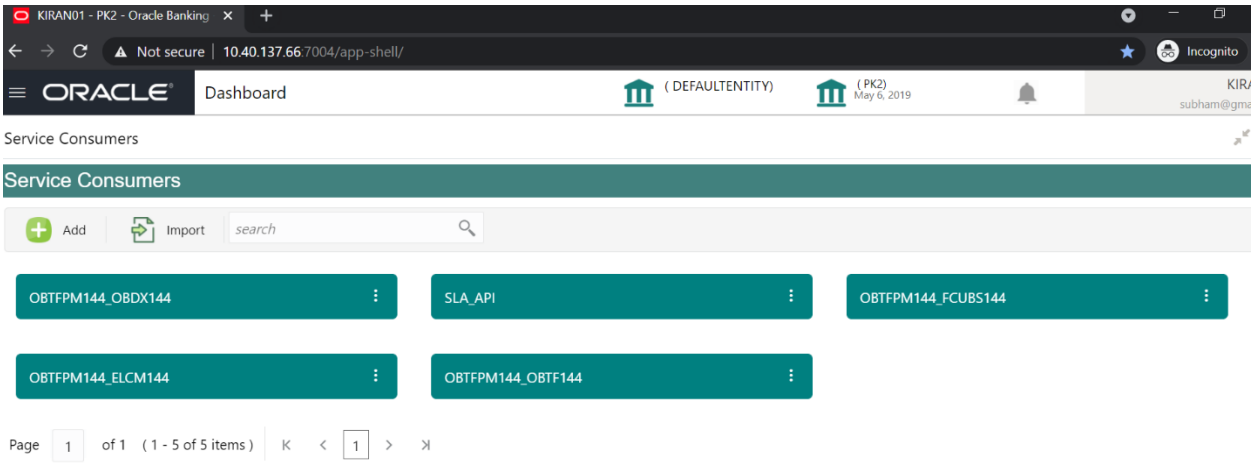
6.4.1 Restarting Servers

Refer "Annexure-1" document, section 1.6.

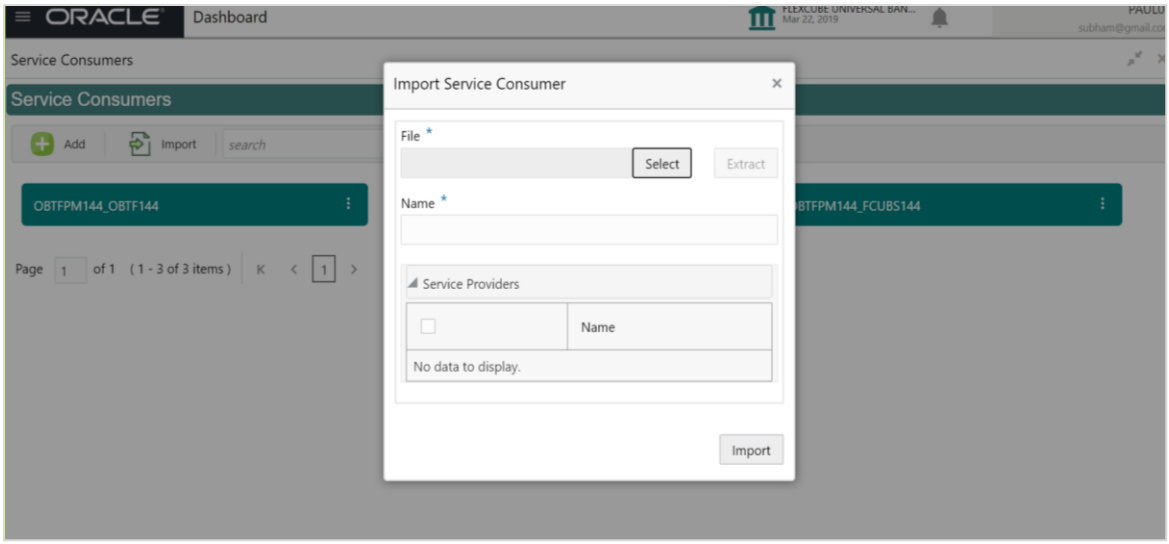
7. OBRH – configuration Deployment

Follow the below steps to deploy the OBRH configuration through the OBTFPM UI application.

1. Login to the Application.
2. Go to Common core → Routing Hub → Service Consumers. System will launch the OBRH service provider screen as shown below:



3. Click on the **Import** button and select the obrh configuration artifact (json) as mentioned in section “5.2.7”.



8. Conductor Process Installation

This section would help you to install the OBTFPM Conductor based process on designated environment. It is assumed that all the prior setup is already done related to Netflix Conductor.

8.1 OBTFPM Processes

Deploy the following list of conductor processes for OBTFPM. The deployable units are available in the OBTFPM_PROCESSES folder in the OSDC.

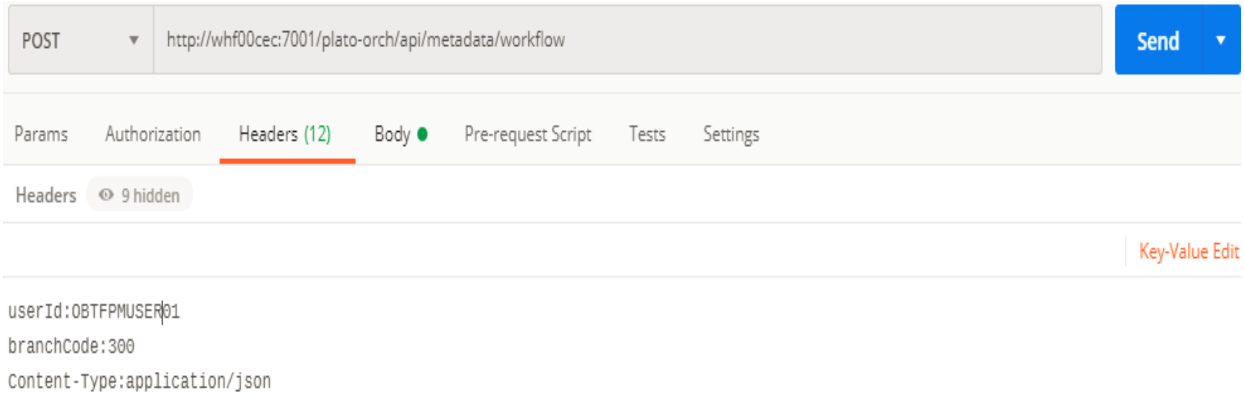
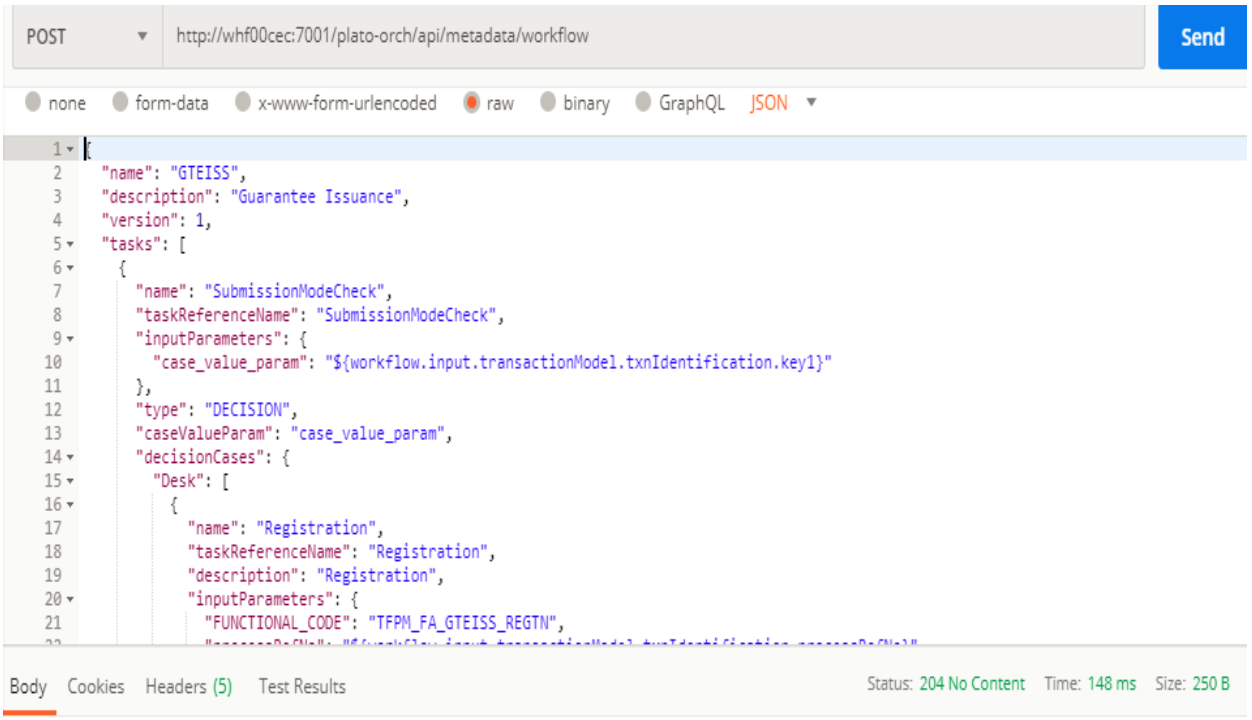
Note: Server names, Domain names need not to be same as this document provides.

Note: Steps to Deploy a process remains the same for all the process files.

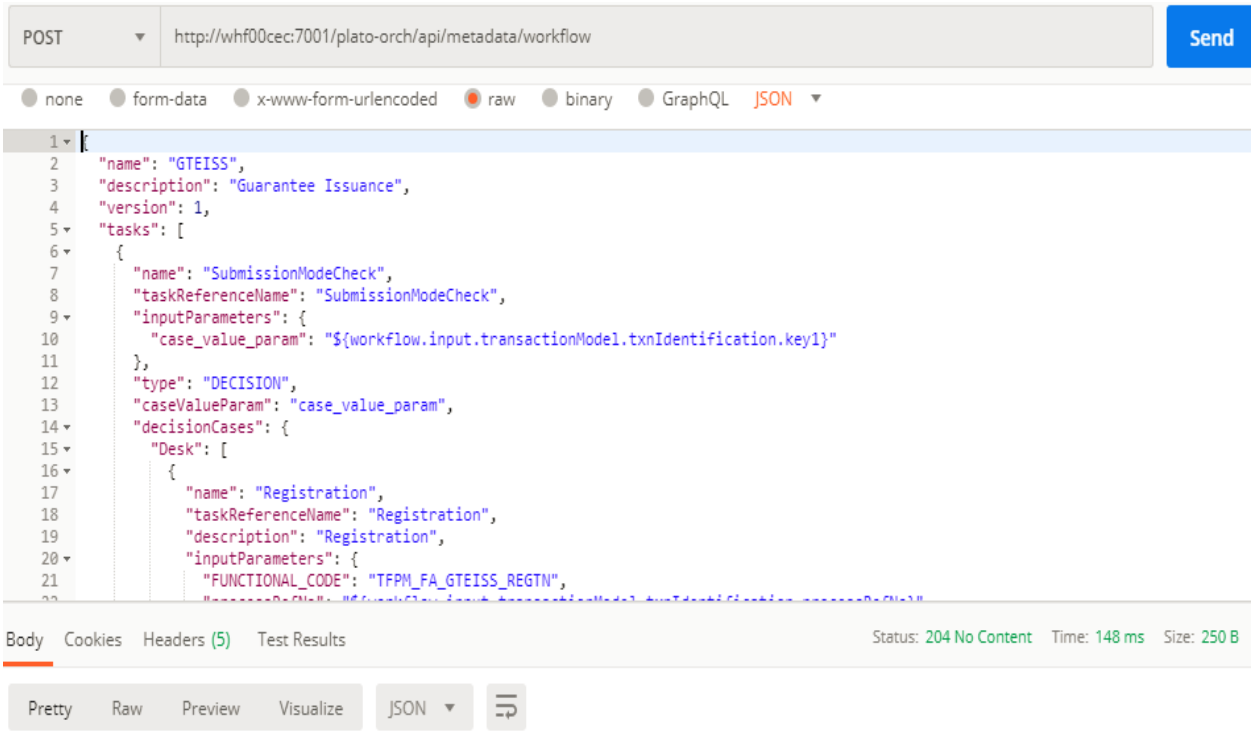
1. Launch the Postman.
2. Create a new Request (if not done already) and select “POST” method. Use the “PUT” method to update the already deployed process.
3. Input the header params and conductor url (http://LOCALHOST:PORT/plato-orch/api/metadata/workflow) as shown below.



4. Paste the body of the request with the content from the process file.



5. Click “Send”. Make sure the response status “204” is returned from server.



9. Restarts and Refresh

Once everything is deployed, restart all the managed servers. And for each application call path “/refresh” for refreshing the configuration properties.

9.1 Restarting Servers

Refer “Annexure - 1” document, section 1.6.

10. Logging Area

10.1 Introduction

This part of the document will talk about the logs area where after deployment of Common Core Applications in WebLogic server.

10.1.1 Logging Area

Trade Finance Application writes logs in the below area of the server-
<WEBLOGIC_DOMAIN_CONFIG_AREA>/logs/<<micro-service-name>>.log
Let's assume a domain has been created OBTFPM with managed_server name called OBTFPM in the following area of the server

/scratch/oracle/middleware/user_projects/domains/OBTFPM. Logging area for Trade Finance would be /scratch/oracle/middleware/user_projects/domains/OBTFPM/logs/<<micro-service-name>>.log
