1. Introduction

1.1 About this Guide

This Observability Guide provides guidance to users to use tools that can enable observe the Oracle Banking Microservices architecture (OBMA) suite of products better. The sections provide tools that can enable a user to:

- 1. Observe the spans associated in various API calls and the response of each API.
- 2. Aggregate logs and interpret out of log searches

The Observability guide discusses recommended tools to enhance monitoring and observability aspects of the OBMA products.

1.2 Audience

This guide is intended for the implementation teams.

1.3 **Document Accessibility**

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc

1.4 List of Chapters

This manual is organized into the following topics.

	Chapter	Description
1.	Introduction	This chapter that introduces the audience to the contents of the document.
2.	Observability improvements using Zipkin Traces	This chapter explains possible ways and benefits of using tools like Zipkin to enhance troubleshooting possibilities.
3.	Observability improvements Logs using ELK stack	This chapter explains the possible log aggregation and search features that can be availed using ELK stack.
4.	Troubleshooting Kafka issues	This chapter explains the steps to troubleshoot basic issues in Kafka
5.	Troubleshooting Flyway issues	This chapter explains the steps to troubleshoot Flyway issues during deployment.
6.	Acronyms, Abbreviations and Definitions	This provides Acronyms, abbreviations and their definitions

1.5 **Prerequisites**

The prerequisites are as follows:

- Basic understanding of Microservice architecture.
- Basic understanding application log analysis using tools.
- Basic understanding DB changes.

1.6 General Prevention

Do not make any changes to Flyway scripts manually.

1.7 Best Practices

The best practices are as follows:

- It is ideal to have ELK stack installed on a separate VM outside the product VMs to ensure flow of logs in case of app crash.
- Log levels can be adjusted to INFO and above to enable relevant logs to flow in.

ORACLE

2. Observability improvements using Zipkin Traces

This section describes the troubleshooting procedures using the Zipkin Traces.

2.1 <u>Setting Zipkin Server</u>

Refer below document for installation document for Zipkin installation https://docs.oracle.com/cd/F37097_01/PDF/Installation_Guide/ANNEXURE-2.pdf

2.2 Login to Zipkin

Perform the following steps for the troubleshooting using Zipkin Traces:

1. Launch the Zipkin URL.

Note: The basic layout of Zipkin is shown in Figure 1.

Figure 1: Layout of Zipkin

				okback	
	all	✓ all	× 1	15 minutes	
		Duration (µs) >=	Limit	Sort	
o and cache.miss	cluster=foo and c	Ex: 100ms or 5s	10	Longest First	•
o and cache.miss	cluster=foo and c				

- 2. Use the search option to find the traces of required API calls and services.
- **Note:** The search options given in the user interface are self-explanatory, and there is another UI option (Try Lens UI). It is given a different user interface with the same functionality. The list of the traces can be seen as shown in *Figure 2*. Error API calls are made to showcase how to track errors. The blue listings show the successful API hits, and the red listings indicate errors. Each block indicates a single trace in the listings.

Figure 2: List of Traces

Service Name	Span Name	Remote Service	Name Lo	ookback
zipkin	✓ all	✓ all	~][1 hour 🔹
Annotation Query		Duration (µs) >	= Limit	Sort
For example: http.path=/foo	o/bar/ and cluster=foo and cac	he.miss Ex: 100ms or	5s 10	Longest First 🔹
Find Traces				_
Showing: 4 of 4 Services: zipkin				JSON 🛓
163s 5 spans				
pkin 100%				
kin x5 2.163s				18 minutes a
.449s 4 spans				
pkin 100%				
kin x4 1.449s				22 minutes a
430s 4 spans				

- 3. Open the individual trace to the details of the trace.
- **NOTE:** *Figure 3* shows an individual trace when it is opened. It also describes the time taken for each block. As the two custom spans are created inside two service calls, you can find a total of four blocks. The time taken for an individual block can be seen in *Figure 3*.

Figure 3: Individual Trace

		mvc.controller.class	BasicEr	rorController		
		mvc.controller.method	errorHt	tml		
		spring.instance_id	eswarp	erabathini.in.oracle.co	om:Zipkin	

- **NOTE:** If the Lens UI is used in Zipkin, the above Figures are not applicable but are relatable to the Lens UI as well. Traces of the application can be found using Traceld. The Traceld can be found in the debug logs of the deployment when *spring-cloud-sleuth* is included in the dependencies (included in *spring-cloud-starter-zipkin* dependency).
- 6. Click **Dependencies** tab to get the dependency graph info between micro-services. An example dependency graph is shown in *Figure 7*.

Figure 7: Sample Dependency Graph

Zipkin Investigate system bel	havior Find a trace	Dependencies		
Start time 2018-02-19	13:30	End time 2018-02-20	13:39	Analyze Dependencies
	todos-api		log-message-processor	
frontend	auth-api		users-api	

2.3 Zipkin Issues

2.3.1 Application service not registered

Perform the following steps to find the cause of this error:

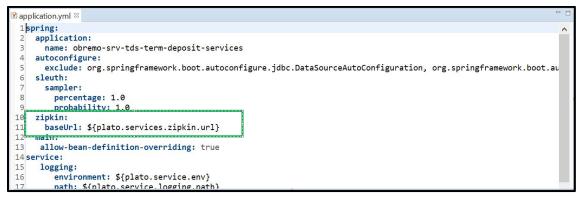

1. Check the applications, which are sending the trace report to zipkin server from **Service Name** drop-down list.

Figure 8: Find Traces

Service Name Span Name	Lookback		
obremo-srv-bcn-branchcommon-V all V	1 hour		v
Annotation Query	Duration (µs) >=	Limit	Sort
For example: http.path=/foo/bar/ and cluster=foo and cache.miss	Ex: 100ms or 5s	10	Longest First ~

2. If the required application is not listed in Zipkins, check the application.yml file for zipkin base URL configuration. The shipped application.yml should have the zipkin entry.

Figure 9: Application.yml File

Note: Every service should have spring-cloud-sleuth-zipkin dependency added in build gradle file for the service to generate and send trace Id and span Id.

Compile group: 'org.springframework.cloud', name: 'spring-cloud-sleuth-zipkin', version: '2.1.2.RELEASE'.

2.3.1.1 404 error

If there is 404 error, check if the **zipkin-server.jar** is running in the system where the application is deployed.

To check this execute the following command

netstat -ltnup | grep ':9411'

Output should be like:

tcp6 0 0 :::9411

LISTEN

10892/java

Here 10892 is the PID.

...*

2.3.1.2 Unable to change zipkin default port number

Zipkin default port number is not editable. Hence, verify that the port 9411 is available to start Zipkin-server.jar file.

ORACLE

3. Observability improvements Logs using ELK stack

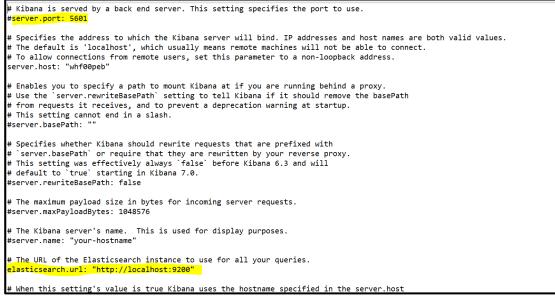

This section describes the troubleshooting procedures using the ELK Stack.

3.1 Setting up ELK

Perform the following steps:

- 1. Download the Elastic search from https://www.elastic.co/downloads/elasticsearch
- 2. Kibana download https://www.elastic.co/downloads/kibana
- 3. Logstash download https://www.elastic.co/downloads/logstash

Figure 12: ELK Setup

Default port for Elastic search- 9200 and Default port for Kibana- 5601

3.1.1 Step to run ELK:

Perform the following steps:

- 1. Run the elasticsearch.sh file present inside /scratch/software/ELK/elasticsearch-6.5.1/bin
- 2. Configure Kibana to point the running instance of elastic search in kibana.yml file as below
- 3. Configuring Logstash consists of 3 steps:
- a) **Input** This configuration is required to provide the log file location for the Logstash to read from.
- b) **Filter** Filters in logstash is basically used to control or format the read operation(Line by line or Bulk read)
- c) **Output** In this section we provide the running elastic search instance to send the data for persisting.

Figure 13: Logstash Configuration

```
input {
  file {
    file {
      type => "java"
      path => "/scratch/Software/Weblogic_Installation/user_projects/domains//base_domain/logs/obremo-srv-cmn-transaction-services.log"
      codec => multiline {
          pattern => "Transation Ended!"
          negate => "true"
          what => "next"
        }
    }
}
filter {
    #If log line contains tab character followed by 'at' then we will tag that entry as stacktrace
    if [message] =~ "\tat" {
        grok {
            match => ["message", "^(\tat)"]
            add_tag => ["stacktrace"]
        }
    }
}
output {
    stdout {
        codec => rubydebug
    }
# Sending properly parsed log events to elasticsearch
    elasticsearch {
        hosts => ["localhost:9200"]
    }
}
```

3.1.2 Accessing Kibana

The Kibana can be accessed as shown below:

Figure	14:	Accessing	Kibana

3.1.3 Steps to setup dynamic log levels in OBMA services without restart

plato-logging-service is dependent on two tables which are to be present in the PLATO schema (JNDI name: jdbc/PLATO). The two tables are as follows:

PLATO_DEBUG_USERS: This table will contain the information about whether the dynamic logging will be enabled to a user for a service. The table will contain have records where DEBUG_ENABLED values for a user and a service will have values 'Y' or 'N' and depending on that plato-logger will enable dynamic logging.

Figure 15: PLATO_DEBUG_USERS

	∯ ID	DEBUG_ENABLED	SERVICE_CODE	<pre>\$ USER_ID</pre>
1	2	Y	plato-logger-ref	soham
2	3	Y	platoref	soham

PLATO_LOGGER_PARAM_CONFIG: This table will contain the key-value entries of different parameters that can be changed at runtime for the dynamic logging. The values that can be passed are as follows:

Figure 16: PLATO_LOGGER_PARAM_CONFIG

🗩 🍓 🛃 🕽	📌 🤮 🚘 💥 📭 💷, I Sortui IFRen				
() ID	MODIFY_FIELD	<pre> PARAM_NAME </pre>	AB1 PARAM_VAL		
1	3 N	LOG_PATH	C:\\NewWeblogic\\user_projects\\domains\\base_domain\\logs		
2	2 N	LOG_LEVEL	INFO		
3	1 N	LOG_MSG_WITH_TIME	Y		

- a) LOG_PATH: This will specify a dynamic logging path for the logging files to be stored. Changing this in runtime will change the location of the log files at runtime. If this value is not passed then by default the LOG_PATH value will be taken from the -D parameter of "plato.service.logging.path"
- b) LOG_LEVEL: The level of the logging can be specified on runtime as "INFO" or "ERROR" etc. The default value of this can be set in the logback.xml.
- c) LOG_MSG_WITH_TIME: Making this 'Y' will append the current date into the logfile name. Setting the value of this as 'N' will not append the current date into the filename.

3.1.4 Searching for logs in Kibana

The URL for searching logs in Kibana is https://www.elastic.co/guide/en/kibana/current/search.html

3.1.5 How to export logs for tickets

Perform the following steps to export logs:

- Click on the Share button from the top menu bar.
- Select the CSV Reports option.
- Click on the Generate CSV button.

4. Troubleshooting Kafka issues

4.1 Kafka Health

4.1.1 Verifying Kafka Health

Run the below command and verify

\$ netstat -tinp | grep :9092 (9092 is default port of kafka)

Expected output

4.1.2 Verify Zookeeper health

1. Kafka instance will not start if Zookeeper is not yet started Run the below command and verify

\$ netstat -tlnp | grep :2181 (2181 is default port of zookeeper)

tcp6 0 0 :::2181 :::* LISTEN 19936/java

To debug, check if any the permissions of kafka log folder are correct. The log folder path can be found by looking at the value of the property "*log.dirs*" in the *server.properties* file of Kafka installation.

4.2 **Prometheus and Grafana**

4.2.1 Prometheus Setup

Prometheus is an open-source project which helps monitoring of the applications metircs. It is widely used for the monitoring of Kafka and its metrics. The installer for Prometheus can be downloaded Prometheus from https://prometheus.io/download/.

4.2.2 JMX-Exporter Setup

A JMX-Exporter application is used to integrate with the Kafka broker as a Java agent to expose the values of JMX MBeans as an API. The JMX-Exporter is in turn used by the Prometheus to fetch the values of the JMX metrics.

Download the latest jmx_prometheus_javaagent jar file from the maven repository in the Kafka directory along with the bin, config directories.

This can be used to monitor consumer_lag.

https://repo1.maven.org/maven2/io/prometheus/jmx/jmx_prometheus_javaagent/0.15.0/jmx_prometheus_javaagent-0.15.0.jar

Set the KAFKA_OPTS variable to the desired value to execute the jar as a java agent.

export KAFKA_OPTS="\$KAFKA_OPTS -

javaagent:\$PWD/jmx_prometheus_javaagent-0.15.0.jar=7071:\$PWD/kafka-

0-8-2.yml"

We can choose the port according to our preference.

Restart Kafka Broker.

4.2.3 Grafana Setup

Perform the following steps:

- 1. Download Grafana from Grafana website: https://grafana.com/grafana/download in the standalone application mode and extract its contents.
- 2. Go to the bin folder in the extracted contents and start the Grafana server.
- **Note**: Grafana should start on the default port 3000 (HOST:3000). The default user and password for Grafana are admin/admin.

Grafana can be integrated with the Prometheus instance installed above using the below steps:

- Click on the Grafana logo to open the sidebar.
- Click on "Data Sources" in the sidebar.
- Choose "Add New".
- Select "Prometheus" as the data source.
- Click "Add" to test the connection and to save the new data source.

4.2.4 Prometheus Metrics

The Prometheus Metrics are as follows:

- process_cpu_seconds_total
- http_request_duration_seconds
- node_memory_usage_bytes
- http_requests_total
- process_cpu_seconds_total

5. Troubleshooting Flyway issues

This section describes the troubleshooting procedures for the flyway issues.

5.1 **Failed Migrations**

5.1.1 Success column verification

Perform the following steps for the success column verification:

- 1. Check the *flyway_schema_history* table to identify the migration record with *success* column as '0'
- 2. Delete the record with status as '0'
- 3. Restart deployment

5.1.2 Migration checksum mismatch for a version

Perform the following steps:

- Ensure the flyway script is not manually updated before deployment.
- If yes, then replace with original and restart deployment

5.1.3 Placeholder errors

Pass the placeholder values using setUserOverrides.sh in Weblogic. Alternatively, these issues can be debugged from Weblogic console during deployment, also the application specific logs can be verified for further inputs.
